World Asterisms Project

An Introduction to the Sky Cultures of the World

Volume One: World Asterism Handbook

Version 2025.6

© Charles Ennis, Sunshine Coast Centre, RASC 2025

Dedication:

This handbook is dedicated to Nairn Robertson.

In August of 2015 the Sunshine Coast Centre of the RASC received a phone call from Tina Robertson. She told us her 19-year-old son Nairn had just been given a telescope by the *Make a Wish Foundation* (Meade LX90 10" Schmidt Cassegrain with all the accessories: about $4000 worth of observation gear). "Would you teach him how to use it," she asked? Nairn had not eaten in five years at the time of that call: he'd been fed through an intravenous drip. Since his 5th year Nairn's insides had been overproducing things that were damaging his innards.

Nairn was the most impressive young man. Always positive and motivated. Never a word of complaint, even though you *knew* he was constantly in pain. Always a smile on his face. His family had been told he'd not live beyond his 5th year. Nairn was a fighter: He wasn't going down without a fight. Nairn was an accomplished pianist and poet. Nairn was the best volunteer the animal rescue centre ever had. He was ardent about astronomy. The RASC gave Nairn a free membership.

Nairn not only learned to use the Meade LX 90, he became qualified to use the 16" Celestron EdgeHD Schmidt Cassegrain at our SCC Observatory. He was absolutely thrilled to be searching the skies on his own.

Then, a few months later… Nairn went back into Sechelt Hospital. We all thought, "It's just a setback. We'll get him back." Every month our Centre brought an astrophysicist or cosmologist to the Sunshine Coast to speak to our members and the public, and we told every one of them "You're not leaving the Coast until you've seen Nairn." We brought them to the hospital where they did presentations and discussions in his hospital room. Months passed. Nairn came out and tried to build up his strength to return to observing the skies.

But then Nairn went back into hospital. We received the news that Nairn was being sent to the University of Calgary to receive a transplant operation: They were going to transplant his entire intestines, this pancreas, and his spleen. We all held our breath… Nairn survived the operation, but this along with years of fighting this chronic condition finally proved too much. A few weeks later, exactly two weeks past Nairn's 20th birthday, he passed away.

We were honored to attend the family's First Nations memorial service. I got to hold the eagle feather and address the two First Nations present, telling them of Nairn's passion for astronomy, and our desolation at the loss of such a fine young man.

Nairn's family donated the telescope to the Sunshine Coast Centre. Nairn's telescope, bearing a memorial plaque, is available to youth visiting our observatory so that they can explore the skies and experience Nairn's passion.

A few years later, on the anniversary of Nairn's passing, we've learned that Nairn's uncle Dean got a star named for him. The star Nairn can be found at:

- RA 1h 21m 19.09s
- DEC +58° 19' 54.8"

Acknowledgements:

This project was made possible by the generosity and assistance of many people. In no particular order:

Thanks to Brian Lucas, a member of my Sunshine Coast Centre of the RASC for putting the idea in my head to discover the sky lore of the Shishálh First Nation back in 2015, which got me looking up sky cultures from all over the world.

Thanks to Danny Sklazeski, a member of my Sunshine Coast Centre, RASC, for introducing me to telescopic asterisms in the first place.

Thanks to Magda Streicher for sharing her information on telescopic asterisms.

Thanks to Allendria Brunjes, editor-in-chief of SkyNews magazine for her advice and support.

Thanks to Dave Chapman of the Halifax Centre for inspiring me to take this on through his work with the Mi'kmaq First Nations to recover their sky lore.

Thanks to the members of the RASC Inclusivity and Diversity Committee and the RASC Observing Committee for all their support and assistance.

Thanks to Randall Rosenfeld FRASC, RASC Archivist and Director of the Dorner Telescope Museum for his assistance in hunting down publications and papers and providing historical information and advice.

Thanks to Rose Steele for her assistance with the translations from Kaykavian (Croatian).

Thanks to ethnoastronomer Tsimafei Avilin of the National Academy of Sciences of Belarus for generously sharing his research results.

Thanks to Auke Slotegraaf of the ASSA for all the help he provided with research materials, translations, and observations.

Thanks to Dr. Robert S. Fuller**,** Dr. Ray Norris, Dr. Treavor M. Leaman, Dr. Dunae W. Hamacher, Dr. Steven R. Gullberg, Dr. Michelle Gantevoort, and all the rest of the members of the Australian ethnoastronomical team for advice and for sharing their research.

Thanks to Dr. Roslyn Frank at the University of Iowa for her help with Basque and Lenape sky lore.

Thanks to Dr. Shandin Pete at the University of British Columbia for help with Salish sky lore.

Thanks to Dr. Alejandro López, National Scientific and Technical Research Council, for his advice and for sharing his research.

Thanks to Dr. Jonas Persson and Dr. Christian Etheridge for sharing their knowledge of Norse sky lore.

Thanks to John MacDonald at the Nunavut Research Institute for his support and assistance on Inuit sky lore.

Thanks to Karrie Berglund of Digitalis Educational Solutions, Inc., for her support and for creating so many skies on Stellarium (Inuit, Chinese, Navajo, and Egyptian).

Thanks to Chris Vaughan, Digital Starlab Certified Presenter and Trainer, Senior Astronomer and Earth Scientist and many other things for helping me find telescopic asterisms by reaching out on his YouTube shows.

This research has made use of the Stellarium planetarium created by Zotti, G., Hoffmann, S. M., Wolf, A., Chéreau, F., & Chéreau, G. (2021). The Simulated Sky: Stellarium for Cultural Astronomy Research. Journal of Skyscape Archaeology, 6(2), 221–258. https://doi.org/10.1558/jsa.17822

RASC World Asterisms Project:

Foreword:

It is my hope that this World Asterisms Project will eventually give the average member of the Royal Astronomical Society of Canada (and everybody else out there) access to all the world's sky cultures.

The RASC Inclusivity and Diversity Committee, which I cofounded in 2018 with Heather Laird, decided to take this project on in 2021. We knew that there were other perspectives of the sky out there. The Halifax Centre of the RASC had already been collaborating with the Mi'kmaq First Nations to create presentations on their sky lore. The RASC was already selling a Native Skywatchers Planisphere with Dakota/Lakota/Nakota, Ininew, and Ojibwe sky cultures. And so, in June 2021 I began digging through literature and the internet seeking those sky cultures, collecting research papers, textbooks, and observing logs. We started working with other First Nations to recover sky lore. So far, I've found over 17,000 asterisms from over 590 sky cultures, and I know that there are more out there.

When I started this project, the Royal Astronomical Society of Canada didn't have any sort of asterism observing program, and I realized that part of this World Asterisms List was going to be asterisms that could not be viewed with the unaided eye. I entered a discussion with RASC Observing Committee members, some of whom quickly responded that they liked telescopic asterisms. I understand this: I was introduced to telescopic asterisms like Kemble's Cascade and Brocchi's Cluster by Danny Sklazeski of the Sunshine Coast Centre of the RASC (who is a contributor to the lists in this handbook). Asterisms can be a lot of fun and are popular at outreach events. I started with a PDF listing 112 telescopic asterisms that someone had shared with RASC members years earlier which turned out to be an Astronomical League Asterism Observing Program from 2016. My RASC colleagues also gave me a short list of large-scale asterisms: I was assured that these were asterisms that "everyone in the world knows about" and I am sure that they believed it. I immediately recognized many of these asterisms, as over the years I'd seen my colleagues using them, and I'd used them myself. However, once I got a couple of weeks into the research that followed, I had some revelations about these initial lists. Some of the objects on this initial list were indeed found repeatedly in various forms in the skies of other cultures: Examples included Orion, the Square of Pegasus, the W of Cassiopeia, and the Fishhook of Scorpius. However, some of those supposedly ubiquitous asterisms only showed up in a handful of places, and *some didn't show up anywhere else*. At the same time, I noticed that there were asterisms not on that initial list that showed up *repeatedly* amongst the asterisms I found around the world. Some of these were in the southern hemisphere, and it became clear that original lists had been compiled by Western observers in the northern hemisphere who were unfamiliar with anything in the skies of the southern hemisphere. However, some of these global asterisms were from northern sky cultures and it was obvious that they were being either disregarded or dismissed for some reason.

My RASC colleagues will undoubtedly smile when they recognize some of these asterisms, but some will probably scratch their heads when other asterisms they expect to see there only show up once in the big list of all the world's asterisms. Some will probably also raise their eyebrows at some asterisms that they are not familiar with. One senior member of the RASC Observing Committee initially seemed overwhelmed when he realized the size and scope of this project as he thought that this was an "observing program" involving thousands of asterisms. "How can you say that you've observed them all?" he asked me. I explained that on this list of world asterisms you'll find ploughs, wagons, wains, carriages, carts, chariots, wheels, bears, bears being chased by hunters or animal predators, elk, camels, bison bulls, lizards, caribou, herons, coyotes, wolves, forelegs of bulls, loons, oxen, otters, broody hens with chicks, crustaceans, rabbit nets, salmon weir, backsides of snakes, big headed men, revolving men, men shot (for stealing snares), thieves, lost hunters, shepherds, oxherds, birth women,

blue women, brothers, sisters, girls, boys, sons, godmothers, grandfathers, spirits, buddhas, sages, boats, rowboats, canoes, rudders, canes, buckets, dippers, ladles, saucepans, butcher's cleavers, cactus hooks, cradles, bows and arrows, fishers, burning briars and shields and the one thing that all these asterisms have in common is that they are all the same seven stars in Ursa Major: The Big Dipper. People from different places on this planet see different things even if they're looking at the exact same thing you are because they come from different social, educational, and cultural backgrounds. This is an ethnoastronomical project, a cultural project, not specifically an observing project, though I would encourage the reader to view these stars to see if you can see the same patterns these people from other places on our planet have seen.

This World Asterism Project is a massive challenge involving many different languages, alphabets, dialects, translations (which don't necessarily agree with one another), and sources (which don't necessarily agree with one another). Some of the earliest sources date back to before we had archeologists (we called them antiquarians then) and certainly before anyone had thought of ethnoastronomy. Some of those early sources are obviously interpreting what they report through racist lenses. Their standards of reporting in those early days often left a lot to be desired, partially because their knowledge of the subject was limited, partially because their means of communicating their discoveries with each other was limited compared to what we have now, and partially because there were no standard star charts before the IAU standardized them in 1922. Some of my information comes from archeoastronomical research which mostly looks at solar, lunar, planetary and stellar alignments of structures and not necessarily at what the cultures that built those structures called these objects in the sky or what those stellar alignments represent: This can't be helped for the oldest structures, which date to prehistoric times. Some researchers can only report that a certain star, such as Sirius or Canopus, or a star cluster, such as the Pleiades, was in use as part of a culture's calendar, but not what the people who used it called it, nor whether they associated it with anything. Some researchers report tantalizing lists of names of asterisms but have no information at all on where these asterisms are in the sky: Sometimes this is because these peoples no longer remember their ancestor's skies. I have included all asterisms on my asterism list whether we can locate them in the sky or not: 308 at present. We hope that further research will lead to us filling in this missing information. As ethnoastronomical research continues, more discoveries will be made, and this list of asterisms will grow.

Many of the antique celestial charts depict the constellations as if viewed from outer space looking down at our Earth. Abd al Rahman al Sufi had charts depicting both the view from below and above in his *Book of Fixed Stars*, and this may have been an influence. Some include the geographic map as a background, making it even harder to separate out the constellations. Of course, this "outer space" view reverses the constellations, so to use it you must reverse the pattern in your mind to match it to the stars overhead.

We're trying to list all the different perspectives of the sky, what culture they came from (as precisely as we can) and if possible, who created or recorded them. It is a mistake to assume that you can trace sky lore in any culture back to some "golden age" when everyone in a particular culture agreed on what was in their sky. Such an age never existed at any time in history. In every age in every society that has ever been you've had differences of opinion and perspectives. Variations occur within cultures as storytellers and knowledge keepers with different styles pass on the stories from one generation to the next. You frequently see variations in the sky cultures within a given society, varying from location to location even though it is the same people. You only have to look at the history of the IAU constellations or the changing names of some of the star clusters and nebula out there to see this. Our skies are constantly

evolving as new perspectives are applied to it, and perspectives vary from place to place. You will find many examples below of how people used the sky to honor patrons or notable people which are not recognized in neighbouring lands, and which became obsolete when later generations rejected or replaced them.

I've done my best to list the descriptive names of each asterism alphabetically under an English translation that will make them accessible to most of the members of the RASC, along with whatever names given to them by the culture that used them. The exceptions are:

- Where I don't have an English translation, in which case I list the asterism alphabetically under the name I have from the culture that uses it, or
- Where the name of the asterism is the name of a place, person, figure, or being.

I've listed all these asterisms with their name in the original language and alphabet of that culture if I can find it along with any variations in spelling the names of these asterisms that I've encountered to enhance the reader's ability to find them. I have not grouped asterisms by sky culture because by listing them alphabetically by subject you can more easily see the themes that cross cultures. In each instance I do identify the sky culture where the asterism originated if I can: Sometimes these get passed along through different generations and cultures far beyond their point of origin. For the oldest asterisms we can only identify a culture that they came from. For the newest ones we can often identify the person who first described them. If I don't have a specific source, I just list the sky culture as "Western", because I know that amateur astronomers in modern Western cultures use it.

I do my best to organize the listings under each title in chronological order to make it easier to see how names and descriptions evolve.

Because most ethnoastronomical research papers and many older sources use the Bayer classification system to describe stars I've used this where possible. To make it easier for the reader who is not familiar with the Greek alphabet I've included the name of each star along with the Greek letter assigned to that star, so you don't have to find a table of the Greek alphabet to look it up: I've always been frustrated by having to find a table in a star chart to decipher Greek letters. Flamsteed is used where there is no Bayer classification, and where neither is applicable, I use the HIP and HD catalogues, and most recently the Gaia DR3. Recent additions from other sources such as the IAU's NameExoWorlds campaign do include some stars from other catalogues.

The tables for all these asterisms (see Volume 2) give their location in the sky (right ascension and declination). If the asterism is more than one star, I pick a central or brightest star as an easy location point. When I can, I describe in detail the stars and the lines they create or the expanse of dark nebulae that some of them are made up of to help the observer locate them. In a few cases, we know basically which IAU constellation the asterism resides in, but not precisely which stars are involved: In those few cases I list the IAU constellation(s) that they are to be found in.

Most of these asterisms are quite easy to find with the unaided eye in a dark sky, it is simply a matter of understanding how perspectives in other cultures make them appear different to those cultures. For example, to someone at my latitude (49˚ north), Orion can be interpreted as a human figure, but for those closer to the equator, Orion is often viewed from a sideways perspective relative to mine, and so many cultures at that latitude see this group of stars as a plough or a spear trap. People in the southern hemisphere orient themselves 180 degrees in the opposite direction to the way we do in the northern hemisphere, viewing the stars in the sky as moving from right to left rather than left to right as northern dwellers do. People in the southern hemisphere also do not have a polar star, so

everything in the sky moves. This results in quite different views of the sky: Not only different stars in each hemisphere but a “mirror image” of the sky when you compare the two hemispheres.

I have done my best to list the peoples of these sky cultures under the names that they would prefer to be known by and not some exonym assigned to them by colonial powers.

This is a massive undertaking and a work in progress as ethnoastronomers across the world continue to unearth new information and recover lost information. If a reader has corrections or additions, I welcome them.

Respectfully, Charles Ennis

RASC List of World Asterisms

An asterism is simply a pattern or group of stars in the night sky. The oldest depiction of an asterism is a representation of Orion on a mammoth ivory carving found in a cave in the Ach valley in Germany in 1979 which is believed to be 32,000 years old. The oldest collection of asterisms is a sky map in a cave in Armintxe, Spain, which archaeologists estimate to be between 12,000 and 14,000 years old and which depicts horses, ibex, bison, and a river. Some of the earliest written records of asterisms are recorded in the ancient Indian astrological text *Veddanga Jyotisha* (1400 – 1200 B.C.E.) and the MUL.APIN tablets of the Babylonians (c. 1000 B.C.E.).

The word "asterism" comes from the Greek "asterismos" ("marking with stars")", which is derived from their word for a star, "aster" and doesn't show up in the English language until the 1590s. Many cultures around the world identified asterisms in their skies, though some cultures in places like China and Korea used systems of hundreds of "official asterisms" instead (more on this below). In ancient times there was no distinct difference between asterisms and constellations in Classical skies: In his book *Naturalis Historia*, Pliny the Elder (23 – 79 C.E.) lists 72 asterisms, not constellations. Hipparchus (c. 190 – 120 B.C.E.) created a list of 48 constellations and Claudius Ptolemy (c. 100 – 170 C.E.) developed these in his *Mathēmatikē Syntaxis* (Μαθηματικὴ Σύνταξις; Latin *Syntaxis Mathematica*), later titled *Hē Megalē Syntaxis* (Ἡ Μεγάλη Σύνταξις, *The Great Treatise*; Latin: *Magna Syntaxis*). A 12th century Latin translation of an earlier Arabic translation of Ptolemy's work called the *Almagestum* or the *Almagest* listed these 48 constellations which eventually became some of the modern IAU constellations.

The word "constellation" is derived from the Latin word for star, "stella". The word *constellacioun* first appeared in English in the early 14th century, from the Old French *constillacion* ("conjecture of (planets)") and directly from the Latin *con* ("with", "together") + the past participle of *stellare* ("to shine", from *stella*, "star"). That entry was in Geoffrey Chaucer's *Wife's Prologue*, c. 1386: "I folwed ay myn inclinacioun/By vertu of my constelacioun." Chaucer also wrote *A Treatise on the Astrolabe* in 1391.

The difference between asterisms and constellations today is that constellations have become formally mapped out regions of the sky and all the celestial objects within that region. In 1922 the International Astronomical Union (IAU) adopted the 48 Ptolemaic constellations and another 40 that were created for the Southern hemisphere by astronomers and uranographers (celestial cartographers) such as Johann Bayer (1572 – 1625) and Abbé Nicolas Louis de Lacaille (1713 – 1762) for use in professional astronomy, and in 1928 the IAU adopted official constellation boundaries dividing up the entire sky. Those constellations are the constellations an amateur astronomer finds on a star map today. The IAU has a page describing these official constellations: https://www.iau.org/public/themes/constellations/

If you are new to astronomy, or if you are venturing into a hemisphere of our skies that you are unfamiliar with, or if you are unfamiliar with the genitive terms that I will be using to describe stars throughout this handbook, you will find all 88 IAU constellations and their locations in this list of World Asterisms.

One of the aspects of colonialism was a view that the people that had been conquered were "primitive" and that their views of the world and the sky were not scientific. The *African Heritage New Dictionary of Cultural Literacy* defines Cosmology as: *A system of beliefs that seeks to describe or explain the origin and structure of the universe. A cosmology attempts to establish an ordered, harmonious framework that investigates time, space, the planets, stars, and other celestial phenomena. In so-called primitive societies, cosmologies help explain the relationship of human beings to the rest of the universe and are therefore closely tied to religious beliefs and practices*. You'll find that the sky cultures that we describe

here are scientific if viewed from this perspective. There was a time when people in our Western culture were convinced that the Sun revolved around the Earth and actively persecuted anyone who believed anything different. We've since accepted that this is not the case, but we still don't completely understand many things about our universe and are constantly updating our theories. Examining the world's asterisms, you'll find this happening everywhere.

Asterisms and constellations are always snapshots of the culture that put them there. If you examine Ptolemy's 48 patterns from the *Almagest*, you'll see animals, mythological figures, and even scientific instruments (the triangle) that were familiar to his people in his time. If you examine the 40 additional constellations added in the 1920s by the IAU, you'll find air pumps, engraving tools, a compass, a sextant, a microscope, and a telescope, all of which were familiar to people of that time. As you read through the asterisms listed in this handbook, you'll certainly get glimpses into the culture of the peoples who put them there. To understand a people's skies, you must understand their culture. You need to understand what the basis of their existence is, how their societies work, how they feed themselves and defend themselves and get along in the world. Their sky cultures are a reflection of their society.

In ancient times before the printed page, people used the sky as:

- A calendar, and/or
- A divination system, and/or
- A navigational tool, and/or
- A weather prediction system, and/or
- A place to honor:
    - Their deities
    - Their ancestors, or
    - Their culture.

This is a practice that continues to this day.

Many of the official IAU constellations contain asterisms which are regularly used by amateur astronomers to navigate the night sky. In modern usage, asterisms do not have officially recognized boundaries or names and can often cross the boundaries of two or more IAU constellations or star clusters. For the purposes of this book, any time I refer to a constellation, it means one of these official IAU constellations unless otherwise stated. Between the 12th and early 20th century European astronomers often created new "constellations" to honor royalty or the achievements of notable persons: Unless these later became IAU constellations (and some did), I refer to these as asterisms as well. For some asterisms I use the name that culture uses to describe them, such as ziqpu (a Babylonian term), nakshatra (a Vedic term), gyukar (a Tibetan term) or xing guan (this being the Chinese term for their star patterns).

Ancient astronomy was conducted without telescopes. To the ancient astronomer asterisms were large-scale structures of bright stars that one could view with the unaided eye. Some of the larger scale asterisms can be easily identified across multiple cultures, such as the asterism known as the Big Dipper, the Wain, or the Plough in European cultures. Patterns of stars that we now call the constellations Ursa Major, Cassiopeia, Orion, Scorpius, Crux and Centaurus appear in the sky maps of multiple cultures, and I will go into this in much more detail below. These large-scale asterisms are very useful today to the beginning amateur astronomer as they provide markers in the sky that allow

them to “star hop” to objects such as globular clusters, nebulae, and galaxies (and even smaller asterisms).

With the advent of telescopes, astronomers started identifying patterns beyond the ability of the unaided eye to see them. Many asterisms visible to the unaided eye consist of stars within open star clusters, examples being the Pleiades cluster (Messier 45) and the Hyades cluster (NGC 2169). The difference between a star cluster and an asterism is that stars in a star cluster are all close to one another in space. An asterism is simply a pattern of stars where the stars may be aligned so that they appear to form a group, but in fact the stars may be greatly separated in space and unrelated. Some popular asterisms overlap star clusters. Some groups of stars were originally thought to be star clusters by early astronomers as their parallax measuring methods were not precise enough. Many of these star clusters have been downgraded to “asterisms” once the distances to the various stars were remeasured using more precise instruments utilizing satellites: I’m not going to list such asterisms on this list unless they have specific patterns that observers have identified and named.

With the advent of astrophotography, even more patterns were identified in the skies, and these discoveries of course generated a whole new series of telescopic asterisms with names.

One of the things that you’re going to discover using this handbook is that cultures the world over have viewed the same bright stars and have come up with different interpretations of what they saw. Over the years astronomers from different eras and cultures have repeatedly renamed asterisms, so many asterisms on my list are known by multiple names. Different generations within each culture came up with new names for the same patterns. For example, NGC 2301, an open cluster in the IAU constellation Monoceros discovered by William Herschel in 1786, became known as “Copeland’s Golden Worm” in the 19th century, named by English astronomer Ralph Copeland (1837 – 1905). Later, it became the “Great Bird” or “Sea Bird Cluster”. More recently, when fans of J. K Rowling’s *Harry Potter* series viewed the sky, it was renamed “Hagrid’s Dragon”.

If you are hoping to see exactly the same patterns in the sky that your ancient ancestors saw, I am afraid that you are in for a disappointment. There are three reasons for this.

The first is that ALL stars move. This isn’t something that you’re going to notice in your lifetime, because those movements on the vast scales involved appear to be quite slow. However, over thousands of years these movements become very noticeable. The patterns recorded in records like the Babylonian MUL.APIN tablets are simply not in those same locations today. There is a Korean star map, the Cheon-Sang-Yeol-Cha-Bun-Ya-Zi-Do, which was carved on stone in 1395 C. E. but was based on a map made 2,000 years earlier. It represents 1,467 stars in about 190 asterisms. Many of these star patterns no longer match up with the sky we view today. When and where the stars of IAU constellations appear in the sky changes over the years. For example: The stars of Hydra lay along the celestial equator 4,600 years ago, but now they are inclined more than 30 degrees away from the celestial equator. There are two parts to this:

One problem is precession: 7,500 years ago, the vernal equinox was in the IAU constellation Gemini, 4,500 years ago it was in the IAU constellation Taurus, and 3,000 years ago in the IAU constellation Aries. It moved from Aries to the IAU constellation Pisces about the time Hipparchus discovered the precession of the equinoxes. It recently moved to Aquarius. Axial precession causes the axis of the earth to describe a circle in the sky over 25,700 years, meaning that a succession of stars becomes the pole star, the 14 stars being:

- Alpha (α) Cephei (Alderamin) in the IAU constellation Cepheus
- Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus

- Alpha (α) Draconis (Thuban) in the IAU constellation Draco
- Alpha (α) Lyrae (Vega) in the IAU constellation Lyra
- Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor
- Beta (β) Cephei (Alphirk) in the IAU constellation Cepheus
- Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor
- Delta (δ) Cygni (Fawaris) in the IAU constellation Cygnus
- Gamma (γ) Cephei (Errai) in the constellation Cepheus
- Iota (ι) Cephei in the IAU constellation Cepheus
- Iota (ι) Draconis (Edasich) in the IAU constellation Draco
- Iota (ι) Herculis in the IAU constellation Hercules
- Kappa (κ) Draconis in the IAU constellation Draco
- Tau (τ) Herculis in the IAU constellation Hercules

The other problem is relative proper motions. Ursa Major looked more like a bear 125,000 years ago. 4,000 years ago, Alpha (α) Boötis (Arcturus) was located near the center of the IAU constellation Boötes and not at its southern tip as it is now. Between the 4th and 2nd millennium B.C.E. Alpha (α) Draconis (Thuban) was the northern pole star. About 14,000 years ago Alpha (α) Carinae (Canopus) was within 10 degrees of the southern celestial pole. Today the southern pole star is Sigma (σ) Octantis.

Ethnoastronomers are constantly calculating the positions of stars in ancient skies to check out sight lines of ancient observatories or accounts of ancient asterisms. Your grandchildren's grandchildren are not going to be able to see the sky you are viewing today: They'll have fresh patterns to interpret.

The second reason is that the large-scale patterns in the sky that make up most of the reading in this book are no longer visible to many modern observers: Two thirds of the world's population can no longer see these stars from their location on Earth due to the local misuse of artificial light at night. Unless you seek out one of the shrinking dark sky areas on the face of the Earth or use some wide field optics and filters, you're simply going to be unable to see the fainter stars involved. For our own health and safety and the welfare of the denizens of ecosystems the world over, we need to change the way we use artificial light. Doing so would not only save us billions of dollars, but we'd also be able to clearly see those star patterns once more.

The third reason is the damaging effects of colonialism. Invaders tend to try to replace the culture of the conquered peoples with their own. It wasn't until very recently that efforts were made to recover Belarussian, Macedonian, Romanian, Basque, and Sardinian sky cultures. Residential school systems in North America were specifically designed to erase First Nations culture and language, and that included sky lore. It was only recently that much of the wayfaring knowledge of the Hawaiians and other peoples of the Pacific was recovered. Much of the sky knowledge of the Aztecs and Mayans was lost due to the efforts of Spanish conquest. Some conquerors and priests did create codices which recorded such knowledge and brought these codices back to Europe, but these codices were often disregarded and many lost. For example, the *Paris Codex* (*Codex Peresianus* or *Codex Pérez*), one of three pre-Columbian Mayan books dating to between 900 – 1521 C.E., was long forgotten until in 1859 the priest Leon Rosny found it in a chimney corner of the National Library of Paris: It had suffered substantial damage, and much was lost. As a result, some of the skies of the peoples I describe seem rather empty, and that may give you the impression that these people were unimaginative and didn't have much up there. This is not the case.

This corrosive colonial behaviour destroyed trust in these cultures for any outsiders, and this presents a challenge for ethnoastronomers hoping to record this knowledge. Many of these cultures are initiatory and the knowledge is not meant to be carelessly shared outside of the clan or tribe involved. Many of these peoples do not have anyone who can act as a spokesperson or knowledge keeper for their sky culture: Various elders have pieces of the puzzle, but no one has the whole story. Ethnoastronomers and researchers gather these pieces from these elders over the years and attempt to reassemble their lost skies. For example, we have the names of over 300 asterisms on this list but do not yet know precisely where they are located in the sky.

While I hold enormous respect for the sky-cultures that I describe in this handbook, I fully realize that my understanding of these hundreds of cultures and their stories or dreamlines is limited: It would take a lifetime's work to fully understand even a handful of these sky cultures. I do not presume to be able to present their stories as one of their knowledge keepers would. Mi'kmaq elder Albert Marshall created the learning concept of "Etuaptmumk" or "Two-Eyed Seeing" in 2004. This is learning to see using the strengths of both cultures. The RASC Halifax Center has for many years developed a working relationship with the Mi'kmaq peoples using this "Two Eyed-Seeing" approach: The astronomers of the Halifax Centre tell the public about the stars involved, and the Knowledge Keepers of the Mi'kmaq tell their stories of the asterisms. Following their lead, while I describe the stars involved in these asterisms in this handbook and give as many details as possible of what they are seen to be and what names they are known by, I do not attempt to give more than a few details of what stories lay behind these asterisms. For the stories you must go to the internet and seek out the stories told by their Knowledge-Keepers, many of which are available on YouTube, or the websites of the cultures involved. Volume Three, the *World Asterism Sky Cultures Resource List*, will be useful in giving you access to many of these. If these cultures don't have knowledge keepers or spokespeople to present these sky cultures at present, it is my hope that this World Asterisms Project will help them to recover their sky cultures and that someday someone will step in to become the caretaker of their sky knowledge and act as a spokesperson. Until that time, I'll do the best I can to be a steward of this information.

All cultures have their own names for the stars, and throughout this handbook you'll see me repeatedly using the modern translations of the 1025 Arabic names for stars that one sees on modern star maps. Many of these names were corrupted when translated from Arabic into Latin in the early 12th century, sometimes extremely. This often changed their meaning or left the name meaningless. Other names were mistakenly transferred from one star to another, so that a name might now refer to a different Greek or Arabic constellation entirely rather than the one of the star's origins. For example, we have no idea whether Betelgeuse is the original name of the star that currently bears that name in the IAU constellation Orion, and we don't even know for sure how it is meant to be spelled or even pronounced (I've seen four different opinions on pronunciation). It wasn't until 2015 that the International Astronomical Union created a Working Group on Star Names to standardize names in common use for stars: This had to happen as not only were many of those traditional names associated with multiple star systems, but more and more exoplanets were being discovered and people wanted names for them. This led to their creation of the NameExoWorlds Campaign in which they assigned each country of the world a star with only a catalogue name which had a confirmed exoplanet and asked them to name these. This resulted in a wonderful collection of themed names. I have included all the official IAU star names in this list and if that star has a named exoplanet, that name is listed under the listing for that star.

This is a list of asterisms, not a star catalogue. That said, many of these sky cultures involve story lines or dream lines which involve collections of asterisms of all sizes and include individual stars. Some sky cultures use few, if any, "connect-the-dots" asterisms and rely on individual named stars to tell their

stories. As the entire pattern of asterisms in each grouping is also a pattern with a particular theme or story, and as the names of these stars are part of that pattern, representing characters or concepts in these stories, these single star names must be included.

Some cultures utilize asterisms exclusively, such as the Chinese, Koreans, and Japanese, whose asterisms have similar origins and resemble one another in shape, positions, and names, so I should take a moment here to describe how those systems work.

The earliest xing guans come from the systems created by Wuxian (巫咸) of the Shang Dynasty (16th century B.C.E. - 1046 B.C.E.), Gan De (甘德) and Shi Shen (石申) of The Warring States Period (475–221 B.C.E.). Chen Zhuo (陈卓) summarized the xing guans of Wuxian, Gan De, and Shi Shen in the Three Kingdoms period (220 – 280 C.E.). The earliest complete Chinese star map is the DunHuang star map (8th century). Pan Nai (潘鼐) restored the xing guans from the Xinyixiangfayao Star Map from the Song Dynasty in his *The History of Stellar Observation in China*. Qi Rui (齐锐) and Wan Haoyi (万昊宜) also restored the xing guans of the Song Dynasty in the book *Roving China Heavens.* The xing guans listed below for the 3 Kingdoms to Ming Dynasty are from the Huangyou star map of 1052 C.E.

The Chinese kept detailed observations of the sky prior to the 18th century, when Western astronomy brought into China by Catholic missionaries such as Ferdinand Verbiest (1623 – 1688) began to be adopted instead. The Chinese use asterisms they call xing guan (Chinese: 星官; pinyin: xīngguān). The 300 Chinese xing guans I have listed under the plain heading “Chinese” come from Yixiangkaocheng (Chinese: 儀象考成; pinyin: yíxiàngkǎochéng), an imperial record of astronomy finished in 1756, which is the major reference to the traditional Chinese xing guans and star names used today. The difference between a xing guan and a constellation is that while constellations define areas of the sky, a xing guan only refers to a pattern of stars. Unlike asterisms, xing guans have official status in Chinese sky lore.

The Chinese named stars by combining the name of their xing guan with a number, usually reflecting the star's position within this Xingguan. When fainter stars were observed with better instruments in the era of Yixiangkaocheng, they were named by combining the name of the xing guan this star was nearest to with an augmentation number. Yixiangkaocheng lists 3,083 stars. Although modern Chinese astronomers now use IAU constellations, traditional Chinese star names are still in common usage today, even more common than Bayer/Flamsteed designations.

The number of Xing guan varies in different eras of Chinese history. New Xing guans were made when fainter stars were observed, and some old Xing guans were abolished when the pattern could no longer be observed (mainly due to proper motions). The earliest xing guan system is that created by the 3rd century astronomer Chen Zhuo (陈卓). He linked the Shi’s, Gan’s and Wuxian’s Xing Guans into one Xing Guan System of 1464 stars and 283 Xing Guans.

The four Xiangs (象, “view”, “show”, “appeared”) are large xing guans representing mythical animals:

- Zhuque (朱雀), a red bird or phoenix representing the power of fire, the south, the back, and the summer.
- Xuanwu (玄武), a combination of snake and turtle, representing the darkness, the power of water, the north, the front, and the winter.
- Qinglong (青龙), the blue dragon, representing the east, the right, and the spring.
- Baihu (白虎), the white Tiger, representing the west, the left, and the autumn.

Korean asterisms first appear in the *Records of the Grand Historian* (史記) in the Han dynasty describing the Xia dynasty in about 2000 B.C.E. The Cheon-Sang-Yeol-Cha-Bun-Ya-Ji-Do star map of the Chosun Dynasty, carved in stone, depicts the sky between the 1st centuries B.C.E. and C.E.

The Korean asterisms are organized into three won (三垣; 3 borders) and 28 su (二十八宿, that is, 28 asterism groups). The three won have 3 "villages" (or "cities") which contain each group of asterisms:

- TaeMiWon (太微垣; Big low border): 19 asterisms, 78 stars.
- ZaMiWon (紫微垣; Violet low-border): 37 asterisms, 165 stars.
- CheonShiWon (天市垣; Sky market border): 19 asterisms, 91 stars.

Their 291 asterisms and 1466 stars are divided into four groups related to deities of the cardinal points and each has 7 asterism groups:

- CheongRyong (青龍; blue-dragon, deity of east): 48 asterisms, 186 stars.
- Gaak (角): 11 asterisms.
- Haang (亢): 7 asterisms.
- Zeo (氐): 11 asterisms.
- Baang (方): 8 asterisms.
- Shim(心): 2 asterisms.
- Mi(尾): 6 asterisms.
- Ki(箕): 3 asterisms.
- BaekHo (白虎; white-tiger, deity of west): 56 asterisms, 301 stars.
- Gyu (奎): 9 asterisms.
- Ru (婁): 6 asterisms.
- Wii (胃): 7 asterisms.
- Myo (昴): 9 asterisms.
- Pil (畢): 15 asterisms.
- Zaa(觜): 3 asterisms.
- Saam (參) 7 asterisms.
- ZuZak (朱雀; red-phoenix, deity of south): 46 asterisms, 240 stars.
- Zeong(井): 21 asterisms.
- Kui (鬼): 7 asterisms.
- Ryu (柳): 2 asterisms.
- Seong (星): 5 asterisms.
- Zaang (張): 2 asterisms.
- Ik (翼): 2 asterisms.
- Jin(軫): 8 asterisms.
- HyeonMu (玄武; black-turtle, deity of north): 66 asterisms, 405 stars.
- Duu (斗): 10 asterisms.
- Wuu (牛): 11 asterisms.
- Yeo (女): 8 asterisms.
- Heo (虛): 10 asterisms.
- Wii (危): 11 asterisms.
- Shil (室): 11 asterisms.
- Byeok (壁): 5 asterisms.

The earliest Japanese star map is the Kitora star map, painted between the 7th and 8th centuries C.E. The Japanese have lunar mansions like the Chinese and Koreans but did not adopt extensive systems of asterisms as the Chinese and Koreans did.

The Postclassic Paris Codex (755/6 C.E.) is the best evidence of thirteen Mayan "zodiacal" constellations. They also appear in the Madrid Codex, but not in a formal zodiacal sequence as in the Paris Codex. The following table shows how the Mayans paired constellations. There are three birds in this list of zodiacal asterisms, one of which is probably the muan bird ("bird 2"- a type of owl). There is one asterism whose identity is unclear. Note that these Mayan constellations are like the K'iche' ones and some are beyond the relatively narrow band of the ecliptic.

Date	**Dawn Set & Longest Visibility**	**Dawn Rise & First Visibility After Conjunction**
10 November	Rattlesnake (Pleiades)	Bird 1 (Libra)
8 December	Turtle (Orion)	Scorpion (Scorpius)
5 January	Muan Bird (Gemini)	Fish-Snake (Sagittarius)
2 February	Frog (Cancer)	Bird 3 (Capricorn)
1 March	Peccary (Leo)	Bat (Aquarius)
29 March	? (Virgo)	Skeleton (Pisces)
26 April	Bird 1 and ? (Libra and Virgo)	Ocelot (Aries)
24 May	Scorpion (Scorpius)	Rattlesnake (Pleiades)
21 June	Fish-Snake (Sagittarius)	Turtle (Orion)
19 July	Bird 3 (Capricorn)	Muan Bird (Gemini)
16 August	Bat (Aquarius)	Frog (Cancer)
13 September	Skeleton (Pisces)	Peccary (Leo)
11 October	Ocelot (Aries)	? (Virgo)

Asterisms range from simple shapes of just a couple of stars to much more complex collections of large numbers of stars and even asterisms nested within larger asterisms. Star clusters inside nebulae are an example of this. Many of the large-scale asterisms listed below consist of bright stars visible to the unaided eye of the observer in a dark sky, covering large areas of the sky above, while the small-scale asterisms listed below generally consist of stars of similar brightness viewed at the telescope eyepiece, making them stand out against a background of fainter stars. I've described all these asterisms, large and small scale, in detail below and listed their locations in Volume 2.

When exploring other sky cultures of the world one discovers that many of them, particularly those in the southern hemisphere, don't just include patterns of stars, star clusters, galaxies such as the Andromeda Galaxy and the Magellanic Clouds, and nebulae such as the Orion Nebula or Lagoon Nebula. They include dark or "empty" patterns of the sky. A telescopic example from Western culture is the Horse Head nebula (Barnard 33). An example from Arab culture is their manzil (moon station) Al-Baldah, which is the empty area of sky between their moon stations Al-Naayem and Saad Al-Thabih (see Ostriches and Slaughter Prevailed, below). Many of the peoples of the Southern hemisphere use the Coal Sack Nebula beside the IAU constellation Crux in their sky lore. The Coal Sack Nebula did not appear in earlier catalogues such as the New General Catalogue (NGC) or Index Catalogues (IC), but it does appear in the Caldwell Catalogue of Sir Patrick Caldwell-Moore (1923 – 2012), as Caldwell 99, and it certainly appears in the sky lore of multiple cultures of the southern hemisphere. The Quechua of the central Andes identify dark clouds (yana phuyu) in the Milky Way as a snake, a toad, a tinamou, a mother llama with her baby, and a fox pursuing llamas and stars only appear in one of these (Alpha (α)

Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) being the mother llama's "eyes"). One way of looking at these "dark asterisms" is figures outlined against a background of stars, which makes them asterisms.

Many star clusters and nebulae such as the Lagoon Nebula (Messier 8) are visible to the unaided eye in a dark sky. Many of these have been named and some repeatedly. Some are star nurseries full of stars that form a part of the image which inspired the names they have been assigned, others are the remnants of novae that left a white dwarf and an interesting pattern which inspired a name. NOTE: Some star clusters and nebulae such as the Eta (η) Carinae nebula or Omega (ω) Centauri globular cluster have names descriptive of their location and not anything people might have imagined while viewing them. I don't include those names in this list of the world's asterisms. This is true for galaxies too: Most galaxies are telescopic asterisms. Quite a few are named for the IAU constellation that they are found in, and I don't include most of those types of names here. I do include those with such names that are visible to the unaided eye. All the galaxies with names that indicate a cultural influence are included in this list. I've included names of telescopic objects that were named for the persons who discovered them, as this is one of the purposes of asterisms: To commemorate people.

All the cultures that I describe below have their own names and stories for our Milky Way. I did not originally intend to list all those names: When I started putting together this list of world asterisms, I didn't think of something as large as our galaxy as an asterism. Then I discovered not only asterisms that cover the entire sky, like the Tailed Man of the Dene, but I discovered the aforementioned dark nebulae silhouetted against the Milky Way as well as discovering that the Milky Way was an inseparable part of the stories behind their asterisms alongside it. So, you'll find Appendix One dedicated to names for the Milky Way in this handbook, over 460 so far.

The world's sky cultures all have names and stories for the Sun, the Moon, and the planets, and those are listed in Volume 4 (*Solar System Objects Handbook*) and Volume 5 (*Solar System Objects List*). These are included in this fashion as although they are not asterisms, they are part of the stories and dreamlines of the sky cultures involved, and planets such as Venus were originally thought to be wandering stars. I include Lunar Mansions, Stations of the Moon, and Nakshatra in the first three volumes as they are all, of course, asterisms related to the Moon's passage across the sky.

Lunar Mansions, Stations of the Moon, Nakshatra, Ziqpu, and Zodiacs:

In the modern Western world familiar to the members of the RASC, we are used to a solar calendar with leap years to keep it in synchronization with the seasons and with a zodiac divided into twelve parts or signs related to time, each an IAU constellation located on the ecliptic.

The Chinese have a zodiac with twelve parts also, but their cycle corresponds to years, not months, and is represented by twelve animals, where in the modern Western zodiac only some of the constellations represent animals, despite the word zodiac coming from the ancient Greek zōdiakòs kýklos (ζῳδιακός κύκλος), meaning "cycle or circle of animals". The Chinese zodiac has been adopted in other cultures including Cambodian, Cham, Gurung, Japanese, Korean, Thai, Myanmar, Mongolian, Bulgar, and Vietnamese systems.

Each sign of the Chinese zodiac is linked to a month of the solar year, therefore also linked to a season. So, each Chinese lunar month can approximately be associated with one or more of the signs of the Western zodiac. However, these Chinese zodiacal signs are not asterisms, so you won't find them listed in this handbook.

Many of the world's sky cultures used lunar calendars as well or instead of the solar ones. This resulted in them mapping lunar stations in the sky to keep track of their lunar calendars. These lunar stations appear in multiple cultures around the world, including Chinese, Indian, Arabian, Cambodian, Persian, Thai, Manchurian, Japanese, Mongolian, and Egyptian sky cultures.

Babylonian star charts such as MUL.APIN list culminating asterisms called ziqpu stars ("upright stars"). These pass overhead in sequence during the night to serve as a timekeeping system. The Babylonian sky cultures also list asterisms which they described as "Gods who stand in the path of the Moon, through whose region the Moon during a month [passes repeatedly] and keeps touching them", which is a form of lunar stations. They also group asterisms and stars into Tikpi stars, Masu stars, and Lumasi stars.

The ancient Egyptians had a system of 36 decans (ˈdɛkənz; Egyptian bꜣktw or baktiu, "[those] connected with work"). These appeared first appeared in the 10th Dynasty (2100 B.C.E. on coffin lids and in The Fundamentals of the Course of the Stars, a text in the Orireion complex (New Kingdom, 19th Dynasty, Seti I, c. 1300 B.C.E.). These were asterisms used to divide the 360-degree ecliptic into 36 parts of 10 degrees each, both for theurgical and heliacal horological purposes. The decans each appeared, geocentrically, to rise consecutively on the horizon throughout each daily earth rotation. The rising of each decan marked the beginning of a new decanal "hour" (Greek hōra) of the night, and they were used as a sidereal star clock beginning by at least the 9th or 10th Dynasty (c. 2100 B.C.E.). Because a new decanic star group reappears in the eastern sky at dawn right before the Sun rises, the ancient Greeks called them dekanoi (δεκανοί; pl. of δεκανός dekanos) or "tenths". Prior to the Old Kingdom the Egyptians used a lunar calendar and if the heliacal rising of Sirius occurred in the last eleven days of the lunar calendar their priests added an intercalary month to bring the calendar back into synchronization with the solar calendar.

Thirty-six decans appear in the Dodekaoros system described by the astrologer Teucrus (1st century B.C.E.) and Byzantine astrologer Rhetorius (600 C.E.). This is a disk whose inner band has two concentric disks depict the sun (sol) as Apollo and moon (luna) as Phoebe. The outer band depicts the Greek zodiac, dividing the disk into 12 segments. This system appears in the *Daressy Zodiac* of the Roman Imperial Period, a marble plaque discovered by Georges Daressy in a Cairo antiquities shop in Cairo before 1901. On the *Daressy Zodiac* includes the Dodekaoros system, with each sign of the zodiac is divided into 3 paranatellonta, as well as twelve dodecatemories ("twelve memories"). The paranatellonta are non-zodiacal constellations that rise and set at the same time as zodiacal

constellations which could be used to keep track of time: This system appeared between 85 – 165 B.C.E. (Thompson 2019).

This Dodekaoros system also appears on the Planisphaerium Bianchini or Tabula Bianchini, named by 18th century Italian philosopher Francesco Bianchini: This is an astrological dicing board dating to the 3rd century C.E. This has five concentric circles, the innermost depicting the twelve animals of the Dodecahōros Chaldaikē or Chaldean Zodiac, the next two depicting the Greek signs of the zodiac, the next the 36 decans, and the outer the prosōpa, facies ("faces/persons") representing planetary deities or rulers associated to them. Of the 36 decans only the figures of eight have survived on recovered fragments.

The paranatellonta and decans appear in two principal constellation systems of the Graeco-Roman world: the Sphaera Graecanica ("Greek Sphere") and the Sphaera Barbarica ("Barbarian Sphere"), the latter name referring to its Babylonian and Egyptian sources. Nigidius Figulus (1st century B.C.E.) mentions the Sphaera Barbarica in his *Sphaera*. Its influence appears in Vedic and Western astrology. Teukros, Antiochus, and Vettius Valens all mention Egyptian constellations on the Sphaera Barbarica, and Figulus, Varro, Manilius, and Maternus mention Babylonian constellations (Thompson 2019). The Sphaera Graecanica is mentioned by Critodemo, Cicero, Nigidius, Dorotheos, Manilius, Maternus, Asclepiades, Valens, Antiochos, and Teucrus (Thompson 2019).

Decans eventually gave way to lunar stations but continued to be used in medieval Islamic astrology, Renaissance astrology, and 19th century Theosophy, and in cosmology, astrology, theurgy, and hermeticism.

In early Arabic culture there was a calendar of "rain stars" called naw (plural anwa' or anwa'a): These are stars who's rising or setting shortly before sunrise signals the onset of rains or other events. Qutrub (d. 821 C.E.) recorded the name of the rain star and a line of rhymed prose (saj'a) which describes it and a shorter list of lunar stations including a list of ten Auspicious Asterisms (as-su'ud). The earliest complete extant list of anwa' is *Kitab al-azmina wa talbiyat al-jahiliya* (*The Book of Seasons and the Consecrating Prayers of the Age of Ignorance*) by the Persian philologist and Qur'anic commentatory Qutrub. (d. 821 C.E. whose complete name is Abu 'Ali Muhammad b. al-Mustanir), which includes multiple calendars of his day. The most extensive surviving list of anwa' is the *Kitab al-anwa' (The Book of Rain Stars)* of Persian philologist and grammarian Ibn Qutayba (d. 889, whose complete name is Abu Muhammad 'Abdallah b. Muslim al-Dinawari). Ibn Qutayba listed astronomical knowledge and avoided adopting foreign (especially Greek) sciences. In later Arabic culture the zodiac was known as the "Girdle of the Castles" (Dorn 1829).

Later this was expanded into "stations of the moon" ("Manazilu ʾl-Qamar" منازل القمر) or "manzil". The earliest record of the stations of the moon appears in the works of Abd al-Malik Ibn Habeeb (d. 852) on the authority of Malik ibn Anas (d. 795). This is a system of 28 asterisms: All but one manzil has 13 days, the last, Al-Jabah, having 14 days to add up to 365 days. Each manzil locates the moon in the sky during its 28-night cycle. This system was adopted by the Arabs in the pre-Islamic period, prior to the 7th century C.E. Each manzil starts at the setting of one of the stars or asterisms, which compose a moon mansion in the west at dawn and the rising of its opposite moon mansion, at the same time, in the east. The manzil is given the name of the setting moon mansion. *The Book of Anwa'a* by Ibn Qutaybah (828 – 889) lists the detailed descriptions of each Manzil or Anwa'a and the times of their heliacal rising.

Bedouins used the same system but simplified it by having their year cycle begin with the heliacal rising of al-Thurayyā, the Pleiades, in the beginning of summer, and then using 13 days for each station

of the moon, except for al-Ǧabhah, to which they assigned 14 days. They also used the monthly Moon/Pleiades conjunction and other stars for keeping time.

In Hindu and Indian astronomy, one finds lunar mansions called “Nakshatra” (Sanskrit: नक्षत्रम्): Brennand spells this “nacshatra” in his *Hindu Astronomy* in 1896. These divide the ecliptic into 28 sectors. Their names are related to a prominent star or asterisms in or near the respective sectors. Some systems use the asterism Kritika (the Pleiades) as a starting point, others use Chitrā (the star Alpha (α) Virginis - Spica) in the asterism Ashvini (see below).

In classical Hindu scriptures such as the *Mahabharata* and *Harivamsa*, Daksha is said to have created the nakshatras. In Hinduism, Daksha (Sanskrit: दक्ष, literally "able, dexterous, or honest one") is a divine king-rishi (“sage”) who is one of the Prajapati, the agents of creation. He is also a Manasputra, mind created son of the creator god Brahma. The nakshatra are personified as daughters of Daksha and as wives of Chandra the Hindu Moon God, or alternatively the daughters of the Vedic sage Kashyapa. Chandra has a mansion for each of his 27 wives and spends time in each of them as he traverses the sky.

In the older *Atharvaveda* a list of only 27 stars or asterisms was adopted because when you map the ecliptic in equal divisions this way, you get segments of 13˚ 20’ instead of 12˚ 51.43’. This left the nakshatra Abhijit out. This older version inspired lunar mansions in other neighboring cultures, as you will see below. Later they adopted 28 lunar mansions as they do in Chinese, Korean, and Japanese systems, which meant that the nakshatra were no longer equally spaced.

Nakshatra stars form opposing pairs in the lunar path across the sky, revolving around celestial north, marking the hours of the night and he seasons of the year and dividing the year into 12 luni-solar months, each of which contains roughly 3 nakshatras. The each nakshatra is related to the first stars visible near the new moon at sunset. In this system, the Moon rises two nakshatra further on each month. Unadjusted, this system would require 19 years for the moon to realign with the stars, requiring the addition of an extra month about every three years to maintain the alignment. In Northern calendars the luni-solar month is determined by the full moon, and in the Southern calendar by the new moon.

Vedic astronomy also had a version of signs of the zodiac, called Rashi.

In Meitei (Manipuran) culture, these lunar mansions are known as Apaknga.

In Chinese, Korean, and Japan-ese sky cultures, these 28 moon stations were known as lunar mansions (Chinese: 宿) or “xiù” (typically spelled “Sieu” in older English textbooks). The earliest complete list in Chinese sky lore dates to a tomb dating from 433 B.C.E. The Chinese and Koreans grouped these into three enclosures shown in the table below for comparison. The Japanese called these lunar stations sei shuku.

Culture	Enclosures		
Chinese	Purple Forbidden Enclosure (Zǐwēiyuán (紫微垣))	Supreme Palace Enclosure (Tàiwēiyuán (太微垣))	Heavenly Market Enclosure (Tiānshìyuán (天市垣))
Korean “Villages” (Won (“borders”-	Violet Low Border (ZaMiWon (紫微垣))	Big Low Border (TaeMiWon	Sky Market Border (CheonShiWon

三垣)		(太微垣))	(天市垣))

Chinese, Korean, and Japanese lunar mansions were divided into four categories related to mythical "talismanic" animals, with each category containing seven Luminaries. This table shows the similarities between the three cultures:

Associations	Lunar Mansions		
	Chinese	Korean (su - 二十八宿)	Japanese
East, Spring, Azure/Blue Dragon (Chinese Dōngfāng Cānglóng (东方苍龙), Korean CheongRyong (青龍), Japanese Seiryuu (**青龍**))	Jiǎoxiù (角宿) Horn	Gaak (角) Dignity of King	Su Boshi (horns)
	Kàngxiù (亢宿) Neck	Haang (亢) Neck of Dragon	Ami Boshi (Neck)
	Dīxiù (氐宿) Root	Zeo (氐) House of Queen	Tomo Boshi (Root)
	Fángxiù (房宿) Room	Baang (方) Royal Hall	Soi Boshi (Chamber)
	Xīnxiù (心宿) Heart	Shim (心) Seat of Emperor	Nakago Boshi (Heart)
	Wěixiù (尾宿) Tail	Mi (尾) Yard for Empresses	Ashitare Boshi (Tail)
	Jīxiù (箕宿) Winnowing Basket	Ki (箕) Winnow	Mi Boshi (Basket)
North, Winter, Black Tortoise, Black Warrior (Chinese Běifāng Xuánwǔ (北方玄武), Korean HyeonMu (玄武), Japanese Genbu (**玄武**))	Dǒuxiù (斗宿) Dipper	Duu (斗) Officer for Jewel	Hikitsu Boshi (Dipper)
	Niúxiù (牛宿) Ox	Wuu(牛) Cow Leading Man	Inami Boshi (Cow)
	Nǚxiù (女宿) Girl	Yeo (女) Court Lady	Uruki Boshi (Woman)
	Xūxiù (虛宿) Emptiness	Heo (虛) Empty House	Tomite Boshi (Emptiness)
	Wēixiù (危宿) Rooftop	Wii (危) Warehouse of Sky	Umiyame Boshi (Rooftop)
	Shìxiù (室宿) Encampment	Shil (室) Palace of Emperor	Hatsui Boshi (Room, Encampment)
	Bìxiù (壁宿) Wall	Byeok (壁) Eastern Wall	NanameB oshi (Wall)
West, Fall, White Tiger (Chinese Xīfāng Báihǔ (西方白虎), Korean BaekHo	Kuíxiù (奎宿) Legs	Gyu (奎) Armory	Tokaki Boshi (Stride)
	Loúxiù (娄宿) Bond	Ru (婁) Watchtower	Tatara Boshi (Hill)
	Wèixiù (胃宿)	Wii (胃) Stomach of	Ekie Boshi (Stomach)

(白虎), Japanese Byakko (**百虎**))	Stomach	Tiger	
	Mǎoxiù (昴宿) Hairy Head	Myo (昴) Ear and Eye of Sky	Subaru Boshi (Stopping Place)
	Bìxiù (毕宿) Net	Pil (畢) General of Border	Amefuri Boshi (Net)
	Zīxiù (觜宿) Turtle Beak	Zaa (觜) Son	Toroki Boshi (Turtle Snout)
	Shēnxiù (参宿) Three Stars	Saam (參)Three Stars	Kagasuki Boshi (Investigator)
South, Summer, Red/Vermillion Bird/Phoenix (Chinese Nánfāng Zhūquè (南方朱雀), Korean ZuZak (朱雀), Japanese Suzaku (**朱雀**))	Jǐngxiù (井宿) Well	Zeong (井) Eastern Well	Chichiri Boshi (Well)
	Guǐxiù (鬼宿) Ghosts	Kui (鬼) Eye of Sky	Tamahome Boshi (Ogre)
	Liǔxiù (柳宿) Willow	Ryu (柳) Officer of Kitchen	Nuriko Boshi (Willow)

You'll note that while the stars involved in these lunar mansions in the three sky cultures match (with minor variations), the translations of the names often match between the Chinese and Japanese versions, but not necessarily with their Korean counterparts.

The Tibetans had 27 lunar houses called rGuy sKar Ner brGyad ("twenty-eight running stars") or gyukar, influenced by older *Atharvaveda* sky lore, and by the Chinese lunar mansions in that their asterisms were relative to the ecliptic and not the celestial equator. These lunar houses were called gyukar and unlike the Vedic system they only use one star, like the yogataras from Indic sky lore: The rest of the asterisms are ignored. Their names are listed in the text *Ornament of Stainless Light*. The Tibetans recognized twelve zodiacal asterisms ("khyim"), many of which resemble Ptolemy's.

The Barmar people of Myanmar used a system heavily influenced by Vedic and Hindu astronomy, and like the Vedic system, used the twelve signs of the Western zodiac, and lunar mansions they called yathi (ရာသီ [jàðì]). They have 27 lunar mansions called nekkhat ((နက္ခတ် [nɛʔkʰaʔ]) and unlike the

Vedic system, the nekkhat use varying widths (between 5˚ - 26˚) for each. They also recognize a "lost" 28th nekkhat, Abizi (အဘိဇိ; Sanskrit: Abhijit).

The Mongolians had a lunar calendar that had an animal to represent each year in a similar fashion to the Chinese calendar. They assigned each animal a star in the Big Dipper asterism in Ursa Major, which is a variant of the old Seven Buddha Sutra (see Seven Buddhas, below).

Another version of lunar stations is found in the Celtic Sequani Calendar, which was first discovered on 2nd century bronze tablets found in a well at the headwaters of the Seine near Coligny in 1897. Other examples have since been found. It is a sophisticated 19-year cycle using intercalary time to periodically bring it back into synchronization just like modern calendars use leap years. Without going into a great deal of detail, this Gaulish calendar designates a first magnitude star or stars rising on the Eastern horizon at sunrise and setting on the Western horizon at sunset called "PRIN" or "Prinni" ("guiding stars"). Each month starts at the first quarter moon as this will be visible in the afternoon and when the moon becomes full this will place it close to these guiding stars and their position in relation to the phases of the moon were used as part of this calendar. These PRIN are listed below. Many asterisms were referred to as Prinnios, which according to Boutet (2001) is derived from the Gaulish "Prennes" ("trees" or "wood") and can also be translated as "destiny" or "divining".

Among the K'iche', certain constellations become the "sign of the night" as they move into a position opposite to the Sun and become visible for the longest period of time, in other words, when they cross the meridian at midnight:

- In December their sign of the night is the IAU constellation Orion,
- In mid-January their sign of the night is the IAU constellation Gemini
- In late February their sign of the night is the star Alpha (α) Leonis (Regulus) in the IAU constellation Leo,
- In mid-March their sign of the night is the Big Dipper asterism in the IAU constellation Ursa Major, and
- In early April their sign of the night is the star Alpha (α) Crucis (Acrux) in the IAU constellation Crux.

The World's Asterisms:

This is a list of over 15,000 asterisms identified by more than 590 sky cultures examined. Some of them are identical to modern IAU constellations, others are quite different, and some are portions or combinations of modern constellations. They are all listed in a table with their locations (right ascension and declination) in Volume 2. As previously mentioned, moon stations/mansions from the world's sky cultures are included. All the asterisms listed here are large-scale asterisms that can be viewed with the unaided eye except in the cases where I have noted that they are "telescopic", meaning you need to use binoculars or a telescope to view them: these telescopic asterisms are indicated by a name in **bold** characters in the list in Volume 2 and by the word **telescopic** in **bold** in the descriptions in this handbook: **Telescopic** asterisms listed here have magnitudes greater than 6, which is the limit for unaided viewing (over 4,000 so far).

2:

There are two **telescopic** "2" asterisms:

- One is the cluster Collinder 367 in the IAU constellation Sagittarius. Size 37' X 37'. René Merting on the *Faint Fuzzies* website describes this as "a 2, in the north a somewhat too narrow arc that inclines south, to the south is a star line that marks the straight line of the 2, which is not quite upright but at 45° to the west is inclined- a good 15 stars form the 2". Size 30'.
- This telescopic asterism is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764. John Herschel's General Catalogue of 1864 lists it as GC 4402. American astronomer Dave Mitsky describes it as "an elongated number 2". Size 25'. It is also known as the Horseshoe Nebula, the Checkmark Nebula, the Duck, the Goose, the Omega Nebula, Swan Nebula, and Lobster Nebula.

3:

There are three **telescopic** "3" asterisms:

- One is Greg's 3, which is made up of nine stars in the IAU constellation Leo. This is a rather angular number "3" which also could be interpreted as a number "7". It includes the stars HIP 47211 and HIP 47233A. This was discovered by English amateur astronomer Greg Parker in the spring of 2013. German astronomer René Merting lists it on the *Faint Fuzzies* website. Size 16' X 12'. This can also be seen as a Sigma (Σ).
- One, Pakan's 3, is made up of 8^{th} to 9^{th} magnitude stars 3 degrees southwest of the open cluster Messier 50 in the IAU constellation Monoceros that looks like a backwards number "3". This was listed in Edmonton RASC member Randy Pakan's *Midnight Ramblings IA* logbook in February 1989 and again in March 1989. In his *Midnight Ramblings 1A* logbook entry for 24 February 1988 he calls it "Managé a Trois", but on most telescopic asterism lists it is listed as "Pakan's 3". American astronomer and author Phil Harrington describes it as a "McDonald's M" after the restaurant chain logo and made it Harrington 18 on his list. This is Lorenzin 15 on American astronomer Tom Lorenzin's list. John Chiravalle calls it the "Tooth". Size 28' X 17'.
- One is in the IAU constellation Puppis and is Ennis 72 on the observing list of Canadian astronomer Charles Ennis. Size 80' X 50'. This is ~ twelve 5^{th} – 9^{th} magnitude stars including HIP 37089, double star HIP 36961, double star HIP 36817B, Gaia DR3 5615389982535032960, SAO

174044, Gaia DR3 5618286783353998336, HD 60123, HIP 36667, HIP 36721, and HD 60496. This includes stars of Corder 1369 on Jeffrey Corder's list.

3D Christmas Light Ball:

This **telescopic** asterism is the globular cluster NGC 5139 (Caldwell 80) in the IAU constellation Centaurus. It is listed in the *General Catalogue* of 1864 as GC 3531 and in John Herschel's catalogue as h 3504. It is also known as "Omega Centauri" (see below), the Ice Cream Cone (see below), the Snowball (see below), and the "Star in the Cloud on the Horse's Back" (see below), which was how it was described by Ptolemy (c.100 – c.170). South African astronomer Pierre de Villiers describes it as a "3D ball of flickering Christmas lights (white)" in his observations in 2016 in the Bonnievale SSP (Night Sky Caravan Park). Size 30'.

4-H Cluster:

This **telescopic** asterism is the open cluster NGC 1664 in the IAU constellation Auriga. It was discovered by English astronomer William Herschel in 1786, who listed it as "VIII 59" in his catalogue. It is GC 907 in the *General Catalogue* of 1864. It is also known as the Four-Leaf Clover (see below), and the Kite (see below).

7:

There are six **telescopic** "7" asterisms:

- One, also known as the Lucky 7, is located at the border between the IAU constellations Perseus and Cassiopeia. It is made up of thirteen stars of 5th to 7th magnitude, including the stars 1 and 2 Cassiopeiae and HIP 113498 and 112998. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011, on Bruno Alessi's BDCC 7.6 list, is listed as "1-2 Cas" by John Raymond, and Corder 4805 by Jeffrey Corder. Size 125'.
- One is from a list of asterisms by American astronomer and author Phil Harrington. You'll find it between the IAU constellations Hercules and Serpens, halfway between the stars Gamma (γ) Herculis and Gamma (γ) Serpentis. The top corner of the "7" is the star Kappa (κ) Herculis next to 8 Herculis and the base of the "7" is the star 48 Serpentis.
- One is Kernya 5, listed by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Hercules. Kernya describes it as "a chain made up of 7.5 – 11 magnitude stars, resembling a distorted number '7', its extent close to 1 degree."
- One is Corder 3806 in the IAU constellation Lyra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 45'. This includes the stars HIP 94852, 94680, 94677, 94671, and 94630.
- One is in the IAU constellation Leo and is Ennis 51 on the observing list of Canadian astronomer Charles Ennis. Size 25'. This is six 8th – 9th magnitude stars staring at HIP 46761 and running through SAO 117753, and SAO 117754 to Gaia DR3 587792319139786752 then across through SAO 117759 to SAO 117765.
- One is in the IAU constellation Ursa Major and is Ennis 56 on the observing list of Canadian astronomer Charles Ennis. Size 10'. This is six 9th – 10th magnitude stars starting at SAO 15888 and running up to SAO 15887 and across through two stars . This is also known as Corder 2399 (see Hook, below).

9:

This **telescopic** asterism "Star Nine" is from the asterism list of American astronomer John Davis resembles a number "9" and is made up of stars in the IAU constellation Delphinus. A loop of stars forms the top of the number "9" including the stars HIP102206A, 102188, 102131A, 102077, and 102147. From HIP 102147 a line of 9th magnitude stars forms the rest of the number "9".

37:

This **telescopic** asterism resembling the number "37", also known as the Shopping Cart Cluster or Little Pleiades, is in open cluster NGC 2169 in the IAU constellation Orion. It was discovered by William Herschel in 1784 who listed it as "VIII 24" in his catalogue. It is GC 1361 in the General Catalogue of 1864. It includes the stars HIP 29106, 29126A and B, 29127, and 29121. American astronomer Steve Coe (1949 – 2018) noted that "what is bizarre is that the cluster members form the numerals '3' and '7'. It is a shame that this is not M-37, you couldn't miss it." This is O'Meara 33 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). NOTE: The Pleiades cluster is also often referred to as the "shopping cart", and as this asterism resembles the Pleiades, it also resembles a shopping cart. It is also known as the Sorority Cluster (see below).

83:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. South African astronomer Magda Streicher writes in the DOCdb database that "it forms the letter [sic] 83 with an asterism of five stars going out from the letter [sic] 8". It is also known as the Hole in a Cluster, Nefertiti's Headpiece, the Smoke Ring, the Bicycle, or the Reliquary.

A:

This **telescopic** asterism, also known as Weisman 1, is in the IAU constellation Sextans. This was discovered by Bram Weisman of the Houston Astronomical Society. It includes double star HIP 50622A at the bottom corner of the "A".

Aa:

This Polynesian star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and is the zenith star for Tahiti and Fiji.

A-Sah:

This Egyptian decan "A-Sah" was in the IAU constellation Gemini (Belmonte 2016). In later Hellenistic texts it was named "Phu-hor". In the Testament of Solomon, it became "Kourtael" or "Kurtaêl", Aristobulus of Paneas called it "Parquia", in Greek Hermeticism it became "Pepisoth", in Latin Hermeticism "Azuel", Roman astrologer Julius Firmicus Maternus called it "Tepis" or "Atosoae", Cosmas of Maiuma (d. 760) called it "Praxidike", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Tepisatosoa" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ᴛɪᴛᴀɴ" ("Titan"). This has been depicted as a crowned, winged woman holding thunderbolts in her right hand and a flask in her left.

Aaron:

This German asterism is made up of stars of the IAU constellations Grus and Phoenix and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Aaron al Grus &

Phenix". German poet Philip von Zesen (1619 – 1689) also listed it under this name. It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Aaron's Staff:

This Finnish asterism "Aaronin sauva" is the Belt of Orion asterism in the IAU constellation Orion.

Aba al-Sihil:

This Bedouin star "Aba al-sihil" (أبا السهل) is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus.

Abakukas' Star:

This Lithuanian asterism "Abakuko žvaigždė" is the IAU constellation Cassiopeia.

Abantiades:

This Greek asterism "Abantiades" is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899 and relates to the grandfather of Perseus.

Abdomen of the Fish:

See Belly of the Fish, below.

Abel:

This German asterism "Abel the Just" is a combination of the stars of the IAU constellations Dorado and Volans and the Large Magellanic cloud and was listed by German poet Philipp von Zesen (1619 – 1689) and by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Abel Al Piscus Volant, Doradus, Nubec minor".

Abhrayanti:

This Vedic star from the *Taittiriya Brahmana* is 23 Tauri (Merope) in the IAU constellation Taurus as listed by Leitz in 2019. It is part of their asterism Krttika (see Cutters, below).

Abiding Assemblage of Sirius:

This Polynesian asterism from the Tuamotu Archipelago "Muihanga-hetika-o-Takurua" is the IAU constellation Canis Major.

Abigail:

This German asterism is the IAU constellation Andromeda. John Hill lists this in his *Urania* in 1754, attributing it to "Hartsdorf", which would be German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658). Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675 and also attributes it to Harsdörffer. However, it was the German poet Philipp Von Zesen (1619 – 1689) who gave this name to Andromeda. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 attributes this to "the Mosaicists", specifically German astronomer Wilhelm Schickard (1592 – 1635).

Aborted Ullucu:

The stars of this Quechua asterism, “Sullu Ullucu” are unidentified at present (Urton 1981). An Ullucu is a type of tuber (Ullucus tuberosis).

Abrachaleus and Aphellan:

This asterism is the IAU constellation Gemini. This name is listed in Johann Bayer’s *Uranometria* (1603) as “Abrachaleus & Aphellan seu Auellar“ (“Abrachaleus and Aphellan or Auellar”).

Abraham and Isaac:

This German asterism is the IAU constellation Centaurus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Abraham and Isaac al Centaurus”. This asterism later appears in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and in John Hill’s *Urania* in 1754 and is listed by R. H. Allen in his *Star Names* in 1899.

Abraham’s Children:

This German asterism “Asellos Abrahamum” is the open cluster Messier 44 (NGC 2632) in the IAU constellation Cancer. This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Abraham’s Ram:

This German asterism is the IAU constellation Aries and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675 but attributes it to Schickard and expands the name to “Abraham’s Ram offered in the Room of Isaac”. “Aries Abraha” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. “Abraham’s Ram” appears in John Hill’s *Urania* in 1754.

Absalom’s Hair:

This German asterism is the IAU constellation Coma Berenices and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. “Crines Absalomi” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. It appears in John Hill’s *Urania* in 1754. Edward Sherburne lists it as “Absolom’s Head of Hair” in his *Sphere of Marcus Manilius* in 1675, which he attributes to German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658).

Absalom’s Mother:

This asterism “Absalomi Matrum” is the IAU constellation Andromeda and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Absolutno:

This telescopic asterism is Czech star XO-5 in the IAU constellation Lynx. It was given this name in the IAU NameExoWorlds campaign (magnitude 12.13). Absolutno is a fictional miraculous substance in the

sci fi novel *The Factory of the Absolute* by Czech writer Karel Čapek. It has an exoplanet named Makropulos, which comes from Čapek's play the *Markopulos Affair*.

Absorbed Arm:

This Coptic lunar station "Upeuritôs" is made up of stars in the IAU constellations Capricorn and Aquarius and was listed by Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as "Sive Brachium Absorptum" ("the absorbed arm") and "Beatitudo" ("happiness"). R. H. Allen lists it as "Upeuritos" in his *Star Names* in 1899 and translates this as "discoverer".

Absyrthe:

This French asterism is the IAU constellation Auriga as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1702 – 1807). Absyrthe is the young brother of Medea in Greek myth.

Abt's Star:

This telescopic asterism is the double, rotating variable star HIP 55106 (HD 98088) in the IAU constellation Crater (magnitude 9.4). It is named for German American astrophysicist Helmut Abt.

Abundant Harvest:

This Hebrew asterism "Bethūlah" is the IAU constellation Virgo. Edward Sherburne lists it as "Bethula" in his *Sphere of Marcus Manilius* in 1675, and John Hill lists it as "Bethula" in his *Urania* in 1754. . R. H. Allen lists it as "Bethūlah" in his *Star Names* in 1899.

This Syrian asterism "Bethulta". is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. It is listed as "Bethulo" in John Hill's *Urania* in 1754.

Abundant One:

This Babylonian star from the MUL.APIN tablets, "Hengallayu", is Alpha (α) Boötis (Arcturus).

Abundant One of Ursa Major:

This **telescopic** asterism "Opimus Úrsae Majóris" is the spiral galaxy NGC 3938 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "I 203". It became GC 2597 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "many magnificent outer arms".

Academy Star:

This Chinese Chenzhuo xing guan "Panxing" is the star Theta (θ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Acamar:

See River's End, below.

Accompanied by Two of Boötes:

This **telescopic** asterism "Bicomitátus Boótis" is the edge-on intermediate spiral galaxy NGC 5529 in the IAU constellation Boötes. It was discovered in 1785 by William Herschel who listed it as "III 414". It became GC 3822 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because the galaxies NGC 5527 and MCG+6-31-87 are companions of NGC 5529.

Accurate Scale Beam:

This modern Arabic asterism " Al Mīzān al Ḥakk" is the Belt of Orion in the IAU constellation Orion. Compare this to their asterism Scale Beam, below.

Acerra:

This Greek asterism is the IAU constellation Ara, and John Hill lists it in his *Urania* in 1754, attributing it to Festus, who is likely the Roman procurator Porcius Festus (d. 62 C.E). An acerra (λιβανωτρίς) was a Greek incense box used during sacrificial rites and according to Festus was a small altar placed before the dead, on which incense was burnt.

Acetes:

This asterism is the IAU constellation Delphinus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) and Italian astronomer Giovanni Battista Riccioli (1598 – 1671). Acetes was a pirate-pilot who protected Bacchus on his voyage to Naxos.

Acheron:

This Greek asterism "Acheron" or "Acheront" is made up of stars of the IAU constellations Sculptor, Horologium, Dorado, and perhaps Hydrus as listed by the 8th century B.C.E. poet Homer (Mosenkis, date n/k). In Greek mythology this was a river in Hades. Mosenkis writes that this name is Phoenician in origin.

Acherousia:

This Greek asterism is possibly the Large Magellanic Cloud as listed by the 8th century B.C.E. poet Homer (Mosenkis, date N/K). This is a lake or swamp in Hades.

Achird:

This star is Eta (η) Cassiopeiae in the IAU constellation Cassiopeia. It was first listed under this name in the *Skalnate Pleso Atlas of the Heavens (Atlas Coeli Skalnaté Pleso*), created for the Czechoslovak Astronomical Society in 1948 by Czech astronomer Antonín Bečvář and published in 1950. The IAU Working Group on Star Names approved the name Achird for Eta (η) Cassiopeiae A in 2017.

Accumulated Water:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star 71 Geminorum in the IAU constellation Gemini.

This Chinese xing guan "Jīshuǐ" (积水) is the star 65 Aurigae in the IAU constellation Auriga.

This Chinese Chenzhuo xing guan "Jishui" is the star 71 Geminorum in the IAU constellation Gemini.

Achernar:

See River's End, below.

Achieved Equilibrium of Eridanus:

This **telescopic** asterism "Aequilibráta Erídani" is the elliptical galaxy NGC 1172 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as "II 502". It became GC 636 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Acrab:

See Scorpion, below.

Acrisioniades:

This Greek asterism "Acrisioniades" is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899 and relates to the father of the mythological hero Perseus.

Acrux:

This star is Alpha (α) Crucis in the IAU constellation Crux. This is an American name for the star that emerged in the 19th century and was commonly used by the mid-20th century. Illingworth, Valerie, ed. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985 lists this star as "Acrux". The IAU Working Group on Star Names approved the name Acrux for Alpha (α) Crucis Aa in 2016.

Active of Aries:

This **telescopic** asterism "Actuósus Aríetis" is the spiral galaxy NGC 972 in the IAU constellation Aries. It was discovered in 1784 by William Herschel who listed it as "II 211". It became GC 560 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its "intense star formation activity".

Activity:

This Kaykavian asterism "'Agneci" is the IAU constellation Aries.

Actor:

This Latin star "Becrux Mimosa" is Beta (β) Crucis in the IAU constellation Crux. The modern name "Becrux" is a contraction of this. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Mimosa" for this star. The IAU approved the name Mimosa for Beta (β) Crucis.

Acubens:

See Claws, below.

Acute Angle of Virgo:

This **telescopic** asterism "Oxygónia Vírginis" is the lenticular galaxy NGC 5084 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as II 313". It became GC 3491 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “there is a slight difference of inclination between the bright inner disk and the fainter outer disk.”

Adam:

This English asterism is the IAU constellation Hercules as described by English author and amateur astronomer Frances Rolleston (1781 – 1864). She may have been influenced by the asterism Ramus Pomifer (see Apple Branch, below).

Adam and Eve:

This German asterism is the IAU constellation Gemini.

Adam’s Bull:

This asterism is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. He does not specify the source.

Adam’s Former Concubine:

This asterism “Adami olim Concubina” is an alternate name for the asterism “Medusa’s Head” (see below) in the IAU constellation Perseus and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Adam’s Staff:

This Finnish asterism “Aatamin sauva” is the Belt of Orion asterism in the IAU constellation Orion.

Adera:

This star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. Richard A. Proctor’s *A New Star Atlas* (1887) appears to list this name for Sirius in “Table V- Star Names”.

Adhafera:

See Braid, below.

Adhara:

See Virgin, below.

Adhil:

See Tail, below.

Aditi:

Aditi, whose name means “boundless”, “limitless”, or “innocence”, is a Vedic Goddess of motherhood, unconsciousness, the past, the future, and fertility. She is the mother of Indra, Varuna, Parjanya, Mitra, Ansh, Pushan, Dhatri, Aryaman, Surya, Bhaga, Vishnu, Savitr, and Lord Varama. There are two stars associated with this Vedic Goddess:

- One is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini.
- One is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Ivanković 2021). This is described in the Rig-Veda as “Aditer anīkam” (“Aditi’s Face”).

Adjacent to Canes Venatici:

This **telescopic** asterism “Affínis Cánum Venaticórum” is the lenticular galaxy NGC 4111 in the IAU constellation Canes Venatici. It was discovered by William Herschel in 1788. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy is situated close to the border of the constellations Canes Venatici and Ursa Major”.

Administrative Centre:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curve of six stars in the IAU constellation Ursa Major:

- 23 Ursae Majoris: “Shangjiang” (“Great General”),
- 29 Ursae Majoris: “Cijiang” (“Second General”) or “Shangshu” (“Royal Secretary”),
- Phi (ϕ) Ursae Majoris: “Guixiang” (“Distinguished Premier”) or “Taichang” (“Minister of Justice”),
- Theta (θ) Ursae Majoris: “Silu” (“Deified Judge of Rank”) or “Sizhong” (“Deified Judge of Disaster”) or “Sili” (“Senior Judge”),
- 15 Ursae Majoris: “Siming” (“Deified Judge of Life”) or “Siguai” (“Deity in Charge of Monsters”) or “Taishi” (“Court Historian”). This is the determinative star in this asterism.

This Chinese xing guan “Wénchāng” (文昌) is a curve of stars in the IAU constellation Ursa Major: Upsilon (υ), Phi (ϕ), Theta (θ), 15, and 18 Ursae Majoris.

This Chinese Chenzhuo xing guan Wenchang (文昌) is a “U” shaped line of stars in the IAU constellation Ursa Major: Starting at Omicron (ο) Ursae Majoris (“Shangjiang” (“Great General”) it runs through Tau (τ) Ursae Majoris (“Cijiang” (“Second General”), 23 Ursae Majoris (“Shangshu” (“Royal Secretary”), Nu (ν) Ursae Majoris (“Sizhong” (“Deified Judge of Disaster”), and Theta (θ) Ursae Majoris (“Siguan” (“Deity in Charge of Monsters”)), to 15 Ursae Majoris (“Dali” (“Minister of Justice”).

Adorned with Sapphires of Hydra:

This **telescopic** asterism “Sapphirátus Hýdrae” is the galaxy ESO 565-11 (PGC 26918) in the IAU constellation Hydra. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the beautiful inner ring of bright blue dots around the nucleus of this galaxy resembling a string of sapphires”.

Adrenedepha:

See Adra, above.

Admired of Antlia:

This **telescopic** asterism “Mirándus Ántliae” is the spiral galaxy NGC 2997 in the IAU constellation Hydra. It was discovered in 1793 by William Herschel who listed it as “V 50”. It became GC 1923 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Admonisher of Draco:

This **telescopic** asterism "Mónitor Dracónis" is the interacting spiral galaxy NGC 6786 in the IAU constellation Draco. It was discovered by Lewis Swift. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy… is in the company of a smaller playful looking galaxy UGC 11415. With a little bit of fantasy the big galaxy with its extended arm pointing to the smaller one could be interpreted as a superintendent admonishing his pupil".

Advance Guard:

This Korean asterism "Eodeubaenseu Gadeu" (어드밴스 가드) is a line of five stars in the IAU constellations Draco and Hercules: Iota (ι) Herculis and Gamma (γ) Draconis, Beta (β) Draconis (Rastaban), Nu (ν) 2 Draconis, and Xi (ξ) Draconis.

Adze:

This Anutan asterism "Toki" is the IAU constellation Delphinus. The head of the adze is the three stars Gamma (γ) 2 Delphini, Delta (δ) Delphini, and Alpha (α) Delphini (Sualocin), with the two stars Beta (β) Delphini (Rotanev) and Epsilon (ε) Delphini forming the "handle".

This Barasana asterism "Sioruhu" is the belt and sword of Orion in the IAU constellation Orion (Hugh-Jones 2006). Compare this to the Tukano asterism "Sioyahpu" (see Adze Handle, below).

This Egyptian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Gingerich 1983, Krupp 1997, Hardy 2003). This adze was used to touch the mouth of the deceased pharoah in a ceremony called Opening the Mouth, which was meant to restore life to his Ka in the afterlife.

Adze Handle:

The Tukano asterism "Sioyahpu" or "Cabo do Enxó" (literally – "instrument to carve wood") is made up of stars in the IAU constellation Orion (Cardoso 2007): The belt of Orion (Cardoso 2015, Cardoso 2016) plus the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix). The Tukano also call this "Circulo de Dança" (see Circle dances, below). Compare this to the Barasana asterism "Sioruhu" (see Adze, above). Another variation listed by Bucur (2022) is the "fish net".

Aesacus:

This Greek asterism is the IAU constellation Ophiuchus. In Greek mythology Aesacus was the son of King Triam of Troy. His lover Hesperia is killed by a snake and in his grief, he is turned into a diving bird in the sky.

Aesculapius:

There are two Greek asterisms named "Ἀσκληπίος" ("Asklipíos" or "Asclepios") or "Oesculapius" for the mythical physician Aesculapius:

- One is the IAU constellation Draco. Aesculapius was the son of Apollo and God of Medicine. This is a reference to the Staff of Aesculapius, a rough branch with a snake wrapped around it, which is the symbol of the medical profession today. Compare this to Snake Climbing a Tree (below).
- One is the IAU constellation Ophiuchus, who is the Snake Bearer (see below) and so is naturally associated with Aesculapius and his staff.
    - *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this

constellation as “Di quell che tiene il serpe da I piu detto Esculapio”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.
    - Johann Bayer’s *Uranometria* (1603) lists the name “Aesculapius” for Ophiuchus.
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Aesculapius” as an alternate name for Ophiuchus.
    - The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch gives “Aesculapii” as an alternate name for Ophiuchus.
    - This is listed in John Hill’s *Urania* in 1754 as Asclepius.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Esculapius”.

Africa:

This **telescopic** asterism is reflection nebula NGC 1999 (vdB 46, LBN 979, Ced 55i) in the IAU constellation Orion. This was discovered by English astronomer William Herschel in 1785 who listed it as “IV 33” in his catalogue. It is GC 1202 in the *General Catalogue* of 1864. American astronomer Paul Alsing (2006) at the McDonald Observatory wrote “many observers said it looked like Africa”. It is also known as the Thirteenth Pearl Nebula (see below) and the Rubber Stamp Nebula (see below), and the Black Eye Nebula.

African Buffalo Horns:

This **telescopic** asterism is two connected chains of 7th magnitude stars curving around reflection nebula Messier 78 in the IAU constellation Orion, reported by the Stellar Society of Bulgaria. This nebula was discovered by French astronomer Pierre Méchain in 1780 and included in Charles Messier’s list that same year. From HIP 27510 two lines run out to form the “horns”:

- One from 27510 through 27545 to 27452
- One from 27510 through 27423 to 26893

After the Bride:

This Latin asterism “Persis Bridemis” is the IAU constellation Lupus.

- Johann Bayer’s *Uranometria* (1603) lists the name “Persis Bridemis” for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Persis Bridemis”.

Agala:

This asterism is the IAU constellation Ursa Major as listed in John Hill’s *Urania* in 1754: Hill describes this as an Arabic name for this constellation, but we have found no Arabic names that match this.

Agena:

This star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus as listed by American uranographer Elijah Burritt (1794 – 1838). The meaning is obscure, but American astronomer Donald Howard Menzel suggests that it is a combination of the Greek letter Alpha (α) and the word “γόνυ” (“gónу” or “gena”), which means knee. This is a similar process by which the name Bungula (see below) was probably formed for Alpha (α) Centauri.

Agenor:

This Latin asterism "Agenoreus" is the IAU constellation Taurus and refers to Agenor, the father of Europa, who was seduced by Zeus in the form of a bull. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists "Agenor" as an alternate name for this constellation.

Agha:

This Vedic asterism from the *Rig Veda* is the stars Alpha (α) Leonis (Regulus), Eta (η) Leonis, Gamma (γ) Leonis, Zeta (ζ) Leonis, and Epsilon (ε) Leonis. The *Brhat Samhita* lists only five stars (Leitz 2109).

Agitator:

This asterism is the IAU constellation Auriga: Agitator was a common name for the IAU constellation Auriga as late as the 16th century:

- It is listed as "Agitator" in editions of the 8th century *Revised Aratus Latinus*.
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Agitator"
- "Agitator is listed in the 11th century *De signis caeli ("of the signs of heaven*").
- The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depicts him riding in a chariot, holding a shield in front of him. The Oxford 644 and Padua 27 editions show him holding a spear and looking over his right shoulder. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Auriga in a chariot. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict him holding a single thong flail in his raised right hand and a cap on his head and two small goats stand on his left arm with a larger goat standing in front of him. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Agitator without a chariot and horses and without a goat: He is holding two animals on his outstretched left arm that resemble rabbits. The Montecassino 3 manuscript of *De signis caeli* depicts Agitator kneeling to the right, with the Kids on his outstretched left arm and a goat standing in front of him. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts Agitator in a biga holding a two-thong flail and omits the kids.
- The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts "Agitator" as a nude bearded male as viewed from behind, kneeling on his left knee with a goat on his left shoulder and reins and harness in his right hand.
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Agitator" as a fully armoured knight walking away from us to our right holding a three thong whip in his right hand and having a goat perched on his left shoulder.
- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Agitator sive Auriga vel Erichthonius" ("Agitator or Auriga or Erichthonius") as a nude bearded male, running to our right, with a goat perched on his left shoulder.
- A work by Gerard de Malynes (1585 – 1627), an independent merchant who was the English commissioner in the Spanish Netherlands, listed this asterism as "Agitator".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Agitator" as an alternate name for Auriga.

- The name “Agitator” is listed as an alternative name for Auriga in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Aeritonio” (“Erichthonius”), “Agitator”, “Auriga”, and “Heniochus” and depicts him as a nude bearded male viewed from behind kneeling on his left knee with a got sitting on his left shoulder.

Aglaea of Coma Berenices:

This **telescopic** asterism “Aglaéa Cómae Bereníces” is the barred spiral galaxy NGC 4314 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as “I 76”. It became GC 2881 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): Aglaea is the latinized name of one of the Three Graces.

Agni:

There are two Vedic stars named for their God of fire (indeed, his name means “fire”):

- One is Beta (β) Tauri (Elnath) in the IAU constellation Taurus. R. H. Allen lists it as a “Hindu” name in his *Star Names* in 1899. W. Brennand lists “Agni” in his *Hindu Astronomy* in 1896.
- One is Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion (Vahia 2014).

Aguti:

This Carib asterism “Akuliyuman” or “Akuli” represents the Aguti (Dasyprocta aguti), a rodent native to Central America. This constellation should rise under that of the Awara Palm along with the asterism “Akusiwei”, representing an aguti eating the fruits of this tree (Magaña, and Jara, 1982). Its location is unknown at present.

Ahirbudhnya:

This Vedic asterism is Gamma (γ) Pegasi and Alpha (α) Andromedae (Alpheratz) as listed by the maharshi Parasara (Leitz 2019). The *Taittiriya Bramhamana* and *Atharvaveda Parisistha* list four stars, probably including the entire Square of Pegasus, and in the *Brhat Samhita* eight stars are listed (Leitz 2019).

Ain:

See Eye, below.

Ainalrami:

See Eye of the Archer, below.

Ainu House on Posts:

This Ainu Nociw (“asterism”) is made up of stars of the IAU constellation Cancer. The quadrilateral formed by Delta (δ) Cancri, Gamma (γ) Cancri, Eta (η) Cancri, and Theta (θ) Cancri is the “house” with the open cluster M 44 inside. Lines from Delta (δ) Cancri to Alpha (α) Cancri (Acubens) and from Theta (θ) Cancri to Beta (β) Cancri (Tarf) are the stilts.

Aiolos:

This Greek star "Aiolos" is the A type star HD 95086 in the IAU constellation Carina (magnitude 7.36). It received this name in the IAU's NameExoWorlds competition in 2022. Ailos (Αίολος) is a mythological keeper of the winds. It has an exoplanet, HD 95086B, "Levantes" (Λεβάντες) which is a name for easterly winds.

Air Pump:

This German asterism "Luft Pumpe" is the IAU constellation Antlia as listed by German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820).

Airplane:

There are two **telescopic** "airplane" asterisms:

- One is Cseh 5 listed by Hungarian astronomer Viktor Cseh, which is in the IAU constellation Serpens. Cseh describes it as a "faint group of stars whose five members form a small plane flying towards the south. It measures just 3' X 2'".
- One is Harrington 12 on the asterism list of American astronomer Phil Harrington: It is also known as the Party Balloon or the Arrow Cluster. It is made up of eight 7 — 8th magnitude stars in the IAU constellation Cassiopeia 40 arcminutes northwest of open cluster Messier 52 (which it appears to be dive bombing). Size 70' X 70'.
    - Five stars form the front of the "fuselage" and "wings": 4 Cassiopeiae, HIP 115218, HIP 115245, HIP 115141 and HIP 114904A, and
    - The "tail" is formed by nine stars including HIP 114227, 114212A, and 113947.

Airy Trigon:

This astrological asterism is the IAU constellations Aquarius, Gemini, and Libra. R. H. Allen lists this in his *Star Names* in 1899.

Aja:

This Hindu asterism is the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899.

Akakaaga:

This Bahima asterism is the Pleiades cluster in the IAU constellation Taurus.

Akh of Meskhetyu:

This ancient Egyptian star "Akh" or "Ak" is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major (Belmonte 2016) and is part of their asterism "Meshketyu" (see Bull's Foreleg, below). This was found in the temple of Hathor in Dendera (Hoffmann 2017). It was used as a reference point in the sky in a ceremony called Stretching the Cord (Krupp 1983). NOTE: We currently don't know what "Akh" means.

Akiri-doge:

This Bororo asterism is the Pleiades cluster in the IAU constellation Taurus.

Akusiwei:

This Carib asterism “Akusiweiyuman” or “Akusiwei” rises under the constellation of the Awara Palm along with the asterism “Aguti” (Magaña, and Jara, 1982). Its location is unknown at present.

Al-Faras al-A’zam:

This Arabic asterism “al-Faras al-A’zam” is the IAU constellation Pegasus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Al Jawza’:

This Arabic asterism is the IAU constellation Orion, who they saw as a female giant in the sky. She appeared in the poetry of Muhalhil (d. 531 C.E.). This is how she is described:

- Her “head” is the stars Lambda (λ) and Phi (ϕ) 1 and 2 Orionis, and these latter two stars are called the Circular Mark.
- Her “shoulders” are the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix),
- The three stars of the belt of Orion are a string of pearls (see String of Pearls, below),
- Her “feet” are the stars Kappa (κ) Orionis (Saiph) and Beta (β) Orionis (Rigel).
- Her “left hand” is the star Xi (ξ) Geminorum and in it she is holding a bow (see Bow of Al Jawza’, below).
- Her “right hand” is the star Pi (π) 3 Orionis and in it she is holding hair braids (see Hair Braids of Al Jawza’, below).

Al-Jawza is a proper name for a woman: This is a female figure in the sky, but its origins are obscure. The modern Arabic word “jauzah” means walnut, and this has led to some interesting theories on how the name originated or even what it is a name for. For example, English Admiral Henry William Smyth writes that “Jauza” is a name for the Pleiades, “the wall-nut” in his *Bedford Catalogue* in 1844, and elsewhere translates it as “al-jaúzá, the belted sheep”. There is an ancient Arabic story about how Al Jawza’ was promised to a man named Suhayl, represented by the star Canopus (see Glorious, below). Suhayl lives across the “river” (the Milky Way) with his two sisters, represented by the stars Alpha (α) Canis Majoris (Sirius) and Beta (β) Canis Majoris (Gomeisa), who become their asterisms the Teary-Eyed Woman (see below) and the Bleary-Eyed Woman (see below). On the morning of the wedding something awful happens, and Al Jawza is found dead, so Suhayl flees across the river, and one of the sisters also crosses to comfort him. In the 8th century when Arabic astronomers translated Greek texts, Al Jawza was transferred to the IAU constellation Gemini, as they interpreted the name as meaning in the middle of something and this seemed to fit being in the middle of the twins. They interpreted the Greek constellation Orion as “al-jabar” (“the giant”), although Orion’s bow is on the opposite side of the asterism from their original asterism Al Jawza and the female figure Al Jawza disappeared from the sky (Adams 2018):

- “al-Jauzā’” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- A 14th century Christian Spanish astrolabe #4560 lists “al jawzā” (King 2002).
- “Geuze” and “Algauza” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- John Hill gives the name “Giauza” as an Arabic name for the IAU constellation Gemini in his *Urania* in 1754.

This Bedouin (Western Saudi Arabia) asterism “al-Ǧawzā”, “al-Jawza”, or “al-Ǧawā” (الجوزا) is the IAU constellation Orion. This name was later latinized to “Elgeuze”, “Geuze”, and “Jeuze”

- Dutch lawyer Hugo Grotius (1583 – 1645) listed it as “Geuzazguar”.
- Johann Bayer’s *Uranometria* (1603) lists “Elgeuze” and “Geuze”.
- Robert Hues lists “Elgeuze” as a name for Orion and for Gemini in his *A Learned Treatise of Globes* in 1659.
- NOTE: Some Bedouin groups give this name to the belt of Orion only.

Al-Ma’refa:

This Arabic asterism “Al-Ma’refa” is the IAU constellation Lyra as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Al-Mjaidih:

The Bedouin (Tayef region) star “al-Mğaidiḥ” (المجيدح) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Al-Muqil:

This Arabic star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Al-Saidaq:

This Arabic star “Al-Saidaq” is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Al-Shitā’:

This Arabic star “Al-Shitā’” is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Al Sufi’s Cluster:

The open cluster Collinder 399 in the IAU constellation Vulpecula was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010): He described it as being between the ninth star of Aquila and the constellation Sagitta and that it contained stars of the 4th, 5th, and 6th, magnitude. This is now more commonly known as the “Coat Hanger” asterism (see Coat Hanger, below). Italian astronomer Giovanni Battista Hodierna “rediscovered” it in 1654. While this asterism is typically listed in the West as a **telescopic** asterism, it was originally discovered with unaided eye observations in dark skies.

Al Ruzam:

This Arabic star “Al Ruzam” is Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars*. The meaning is uncertain.

Al Sahja:

This Arabic star is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by Robert H. West in *Popular Astronomy* in January 1895. West was a professor at the Syrian Protestant College in Beirut. R. H. Allen lists this in his *Star Names* in 1899. Compare this to the Arabic asterism Al Ṣadāk (see Test, below).

Al-Subeh:

This Arabic asterism "Al-Subeh" is the IAU constellation Lyra as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Al Taḥāyī:

This Arabic star "Al Taḥāyī**"** is Lambda (λ) Orionis in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars* and listed by R. H. Allen in his *Star Names* in 1899.

Al-'Uqāb:

This Arabic asterism is the IAU constellation Aquila as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Aladdin's Lamp:

This **telescopic** asterism is in the IAU constellation Cassiopeia and was listed in *Pattern Asterisms* by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 401. The "lamp's flame" is Iota (ι) Cassiopeiae. The "lamp" includes the stars HIP 12821, 12641, 12297, 11984, and 12132. Size 50' X 35'.

Aladfar:

See Talons, below.

Alarevo:

This asterism is the IAU constellation Scorpius as listed in John Hill's *Urania* in 1754: He describes this as "the Syriac name" of this constellation.

Alarm Clock:

This Romanian asterism "ceas deşteptător", also known as the "Three Balls" (see below) is the Hyades cluster in the IAU constellation Taurus (Lite, Lodina, and Ignat 2018).

Alasia:

This **telescopic** Cypriot star is HIP 90004 (HD 168746) in the IAU constellation Serpens, which was given the ancient name of Cypress in the IAU NameExoWorlds campaign in 2019. It is magnitude 7.95. It has an exoplanet named Onasilos, which is the name of the oldest recorded doctor in Cyprus, recorded on the 5th century B.C.E. Idalion tablet.

Alava:

This star is Eta (η) Serpentis in the IAU constellation Serpens. It is listed under this name in Stellarium.

Albaldah:

See Town, below.

Albahor:

This English star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by English author Geoffrey Chaucer (c.1340s – 1400) in his *Treatise on the Astrolabe*. This name was widely used on medieval astrolabes. The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists it as "Albahor Sirius".

Albania:

This asterism "Albania" was made up of stars of the IAU constellation Coma Berenices by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Albania and is depicted as crossed armoured arms with each hand holding what looks like a fan.

Albali:

See Swallower, below.

Albino Butterfly Nebula:

This **telescopic** asterism is planetary nebula is NGC 2440 in the IAU constellation Puppis, which was discovered by English astronomer William Herschel in 1790 who listed it as "IV 64" in his catalogue. It is GC 1567 in the *General Catalogue* of 1864. This is O'Meara 38 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the Burning Ember Nebula, the Bat Nebula, the Kiss Nebula, and the Little Lips Nebula.

Albireo:

This is the star Beta (β) 1 Cygni in the IAU constellation Cygnus. It is believed that the name originated in an ancient Greek name "Ornis" ("hen") for Cygnus, which became "urnis" in Arabic. The etymology of this is uncertain. It might have originated in a name associated to Cygnus in the 1515 edition of the *Almagest*: "ab ireo", which later appeared as "Albirco", "Abbireo", and "Alberio". There are multiple theories regarding what inspired the name "ab ireo", but I don't find any of them convincing:

- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists the name "Albireo" for this star.
- Johann Bayer's *Uranometria* (1603) lists the name "Albireo" for this star.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Albireo".
- American uranographer William Croswell (1760 – 1834) lists this double star as "Albireo" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Albireo" it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Al Bireo".

- "Albireo" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Albireo".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Albireo".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Albireo" for this star.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Albireo… the thrilling pair".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and 14th edition (1959) list "Albireo" for this double star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Albireo" for this star.
- The IAU Working Group on Star Names approved the name Albireo for the star Beta (β) 1 Cygni Aa in 2016.

Alcaid:

See Leader of the Mourning Maidens, below.

Alcides:

This Greek name "Glory of Hera" is the IAU constellation. Hercules Alcides was one of the original names for the mythical figure Hercules and was used by the Roman poet Ovid (b. 43 B.C.E.):

- Johann Bayer's *Uranometria* (1603) lists "Alcides" for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Alcides" as a name for Hercules.
- "Alcides" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Alcyone:

This Greek star is Eta (η) Tauri in the Pleiades cluster in the IAU constellation Taurus. Alcyone is a character in Greek myth. Her name derives from the Ancient Greek "Ἀλκυόνη" or "Alkuónē" derived from "alkyon" or "αλκυων" ("kingfisher"):

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Alcione", "Alcinoe", and "Altorich", and other variations include "Altione".
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) labels this star "Pleyades".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alcyone".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Alcyone"
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Alcyone" for this star.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Alcyone" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alcyone".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alcyone" for this star.

- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alcyone" for this star.
- The IAU approved the name Alcyone for the star Eta (η) Tauri A.

Alcyoneus:

This telescopic asterism is a giant Fanaroff-Riley class II radio galaxy 3.5 billion light years (1.1 gigaparasecs) from Earth, with host galaxy SDSS J081421.68+522410.0 in the IAU constellation Lynx. Alcyoneus or Alkyoneus was a traditional giant opponent of Hercules.

Alev and his Children:

This Estonian asterism "Alev" is the Pleiades cluster in the IAU constellation Taurus. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique. This is a reference to Alev, the ancestor of a race of heroes in Estonian mythology.

Alien:

This Vedic asterism "Nistyā" is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed in the *Taittirīya Brāhmana* (Ivanković 2021). The more common name for this nakshatra is "Svāti" (see Very Good, below).

Alien Ship:

This **telescopic** asterism is the planetary nebula NGC 7009 (Caldwell 55) in the IAU constellation Aquarius. It was discovered by English astronomer William Herschel in 1782 who listed it as "IV 1". It is GC 4628 in the *General Catalogue* of 1864. This was the first deep sky object to be discovered using a reflector telescope. Size 1' X 0.7'. South African astronomer Magda Streicher describes it as reminding her "of an alien ship in the dark of the night approaching us". It is also known as the "Saturn Nebula" (see below).

Alighting Vulture:

There are two Arabic asterisms with the name "an-Nisr ul-Wāqi'" (النسر الواقع) or "al-nasr al-wāqi'", translated as "alighting vulture", "swooping vulture", or "falling eagle", and this forms part of the Arabic asterisms Two Vultures (see below) and "Landing Eagle", see below:

- The first is the star Alpha (α) Lyrae (Vega) in the IAU constellation Lyra, which appears in many places:
  - "al-Nasr al-Wāqi'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - This is listed as "Nasr wāqī'" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992). This was later latinized to "Vega" which appeared in the *Alfonsine Tables* (1215 – 1270) but in other editions as "Wega" (Kunitzsch 1986).
  - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "nasr wāqi'" for this star and the Hebrew name "nesher nofel".

- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-nasr al-wāqi" and the Hebrew name "ha-nesher ha-nofel".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists Al-nasr al-wāqi'".
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "nasr wāqi'" and the Hebrew name "nesher nofel".
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Alvaca" (Dekker 2000).
- The 14th century Christian Spanish #4560 astrolabe lists "Uega" (King 2002): King translates this as "falling eagle".
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Wega".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this as "Wega".
- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as "Wega".
- German astronomer Johann Bayer (1572-1625) also listed it as "Wega".
- French scholar Joseph Justus Scaliger (1540 – 1609) lists this star as "Waghi"
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists this star as "Vuega" and "Vagieh".
- Johann Bayer's *Uranometria* (1603) lists both "Vega" and "Wega" for this star and the name "Nesrussakat" for Lyra.
- Translator Giuseppe Simone Assemani (1687 – 1768) lists this star as "Veka".
- Dorn (1829) lists this as "El waki" and describes this as "Falling Vulture" as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "VVEGA" which is likely a misinterpretation of "Wega".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) labels this star "Lucida Lyræ" and gives the names "Lyra" and "Vultur Cadens" to the constellation.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this star "Wega".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Wega".
- American uranographer William Croswell (1760 – 1834) lists this star as "Lyra α" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Vega" in his *Celestial Atlas* and in his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Wega" and his *Bedford Catalogue* in 1844 lists "Wega… from Wáki, in the compound name of al nesr al wáki, the falling eagle."
- It is listed as "Wega" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Wega".

- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Vega".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Vega".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Vega".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Vega".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Vega" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Vega" and describes it as "Falling (eagle)".
- R. H. Allen lists it as "Wāḳiʿ" in his *Star Names* in 1899 and insists that the proper modern name should be "Wega".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the names "Vega" and "Wega" for this star, but his 14th edition (1959) only lists the name "Vega".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Vega".
- Vega is now the IAU approved name for Alpha (α) Lyrae.

- The second, later latinized to "Nasr Alwaki" is an asterism of stars in the IAU constellation Lyra: Alpha (α) Lyrae (Vega), Epsilon (ε) Lyrae, and Zeta (ζ) Lyrae:
    - The name Nasr Alwaki I is now assigned to Zeta (ζ) 1 Lyrae and Nasr Alwaki II to Zeta (ζ) 2 Lyrae.
    - John Chilmead (1899) lists this as "Alvaka", which he derived from Robert Hues' *A Learned Treatise of Globes* (1659) where Hues lists it as "Alvakah".

NOTE: R. H. Allen writes that the Arabic name "Al Naṣr al Sākiṭ" was listed by French scholar Joseph Justus Scaliger (1540 – 1609) as another name for this asterism, describing the meaning as "synonymous" and giving German astronomer Johann Bayer's variation "Nessrusakat" and translator Giuseppe Simone Assemani's "Nessrusakito".

Alioth:

See Fatty Tail of a Lamb, below.

Alioure:

This asterism is the IAU constellation Gemini as listed in the 1515 edition of the *Almagest* as listed in R. H. Allen's *Star Names* in 1899. The origin is obscure.

Aljanah:

All Father:

This Wurundjeri and Gunai star “Bunjil” or “Beral” is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus. Bunjil is a primary hero and all father in their dream lines.

This Mara and Moporr star “Bunjil” is the star Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Dawson 1881). Hamacher (2011) lists it as “Buunjill”.

This Kulin star “Bunjil” is the star Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Hamacher 2011).

This Wiradjuri, Kamilaroi, and Euahlayi asterism “Baiame” or “Mungan-ngaua” is the IAU constellation Orion.

NOTE: The Yuin call this all-father figure Daramulun, though the name Daramulan is given by other Australian peoples as the name of the wife of the all-father and is associated with the emu. Other Australian peoples call the “all father” Goin, Mangan-Ngana, Nepele, Nurunduri, Oorundoo, and Ngurunderi.

All that is Beautiful:

This Gabonese star “Itonda” is HIP 108375 (HD 208487) in the IAU constellation Grus and was given this name in the IAU NameExoWorlds campaign. This is a Myene name meaning “all that is beautiful”. This has an exoplanet named Mintome. Mintome, in Fang mythology, is a mythical land where a brotherhood of brave men live.

Alligator:

This Lacandon asterism is the IAU constellation Ursa Major.

Alligator’s Eye:

This **telescopic** asterism is the lenticular galaxy NGC 5363 in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784. It was listed under this name by American astrophotographer Mark Hanson on the Astrophotography page on Facebook on 2025-5-8.

Ally’s Braid:

This **telescopic** asterism is a chain of seven stars between magnitude 8.8 – 6.95 southeast of Eta (η) Tauri (Alcyone- hence the name) in the Pleaides cluster in the IAU constellation Taurus, including the

stars HIP 17692 and 17684. It was discovered by amateur astronomer Stephen Saber and listed in Steve Coe's Saguaro Astronomical Club Asterism Database. German astronomer Robert Zebahl lists it as "Ally's Plait" on his *Faint Fuzzies* website. Size 45' x 15'.

Almach:

See Caracal, below.

Almond of Pavo:

This **telescopic** asterism "Amýgdala Pavónis" is the barred spiral galaxy NGC 6782 in the IAU constellation Pavo. It was discovered in 1834 by John Herschel who listed it as h 3789 and later as GC 4488 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "pointed oval inner ring."

Almuredin:

This Arabic star is Epsilon (ε) Virginis in the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. It is an old name and its meaning obscure.

Alnair:

See Bright One, below.

Alnasl:

See Arrowhead, below.

Alnilam:

See String of Beads, below.

Alnitak:

See Girdle, below.

Along It, it is Regularly Dreamt of:

This Dena'ina asterism "Beghunutsik' elyashi" is the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021).

Aloe:

This asterism "Aloue" is the IAU constellation Perseus. This name is listed in Johann Bayer's *Uranometria* (1603).

Aloros:

This Akkadian star is Alpha (α) Arietis (Hamal) in the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899. Allen cites Robert Brown's *Researches Into the Origin of the Primitive Constellations of the Greeks, Phoenicians and Babylonians* (1899) as listing this name. Aloros is a mythical king of Akkad. Brown associates it with the Assyrian name "Ailuv" and the Hebrew name "Ayil".

Alpha:

This Gallic asterism is the IAU constellation Delphinus. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. It is part of his asterism "Crux Maior" (see Major Cross, below).

Alpha Argus:

This German star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. It was given this name by German uranographer Johann Bayer in 1603 as it was then part of the asterism Argo's Ship (see below). It became Alpha (α) Carinae in 1763 when French astronomer Nicolas Louis de Lacaille (1713 – 1762) divided Argo's Ship into the constellations Vela, Puppis, and Carina.

Alpha Oak:

This English star with the Latin name "Alpha Roboris" is Beta (β) Carinae (Miaplacidus) in the IAU constellation Carina as named by English astronomer Edmund Halley (1656 – 1742). It was part of his asterism "Robur Carolinum" (see Charles' Oak, below).

Alphard:

See Solitary One, below.

Alphecca:

See Bright One of the Broken Ring, below.

Alphecca Opening:

John Hill lists the latinized name "Al Phecca Apertio" as an Arabic name for the IAU constellation Corona Borealis in his *Urania* in 1754. The Arabs called the star Alpha (α) Coronae Borealis "(Nayyir) al-Fakkah" (see Bright One of the Broken Ring, below).

Alpheratz:

See Navel of the Mare, below.

Alpherg:

See Emptying, below.

Alphirk:

See Flock of Sheep, below.

Alphræganus:

This asterism "Alphræganus" or "Azalange" is the IAU constellation Serpens as listed in John Hill's *Urania* in 1754: Hill claims this to be "a name by which some, who are fond of obscure words, have called the constellation" and goes on to say that "they call it an Arabic name of that constellation" and that he recognizes that "it is not properly such". Hill goes on to say that the Arabic name is "Al Hauwa", "Al Haugue", "Alhangue", or "al Hangue" which is incorrect. The Arabic name for Serpens is actually

“Al’aqeaa” (“snake”), but their name for Ophiuchus (the “snake man”) is “ul-Ḥawwā'” and their asterism “al-ḥayya”, later latinized to “Al Hayya”, (see Serpent, below) is stars in the IAU constellation Draco.

Altar:

This Greek asterism “Θυμιατήριον”or “thysiastírion” is the IAU constellation Ara as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as originally described by Ptolemy (c.100 – c.170) in his *Almagest*:

- Johann Bayer’s *Uranometria* (1603) lists “Altare vel Altaarium” for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Altare vel Altarium” for this constellation.

- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 lists it as “Altare Thumiamatis” and depicts it as a cubical altar with carrying poles attached to the sides.

This Italian asterism “Altare” is the IAU constellation Ara.

This French asterism “Autel” is the IAU constellation Ara.

Altar for Sweat Lodge:

This is an alternate name for the Ininew star Keewatin Atchakos (see Going Home Star, below- Buck 2016).

Altar of Heaven:

This Akkadian star is Psi (ψ) Pegasi inside the Square of Pegasus in the IAU constellation Pegasus (Leitz 2019). It is part of the asterism Field (see below).

Alterf:

See Eyes, below

Alub:

This Persian asterism is the IAU constellation Aquila.

Aludra:

See Virgin, below.

Alula Australis:

See First Leap of a Gazelle, below.

Alula Borealis:

See First Leap of a Gazelle, below.

Alya:

See Fatty Tail of a Lamb, below.

Amadioha:

This **telescopic** Igbo star Amadioha is HIP 29550 (HD 43197) in the IAU constellation Canis Major, which was given this name by the IAU NameExoWorlds campaign (magnitude 8.95). Amadioha is their God of Thunder. It has an exoplanet named Equiano, which is the name of a writer and abolitionist from Ihaila, who fought for the abolition of the slave trade.

Amalthean Goat:

This asterism “Capra illa Amalthea” (“that Amalthean Goat”) is the IAU constellation Capricornus as listed by English linguist John Minsheu (1560 – 1627). This is the goat that suckled the God Zeus. This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Caprae Amaltheae Jovix nutricis”.

This star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Johann Bayer's *Uranometria* (1603) lists "Amalthea" as a name for this star. John Hill's *Urania* in 1754 lists "Amalthea": It is a reference to the Greek asterism "Capra and Haedi" also known as "the Goatlings" (see Kids, below). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Amalthea" as a name for Capella.

Amanouzume-no-mikoto:

Amanouzume-no-mikoto (天宇受売命), is a Japanese Goddess of female attendants and in Japanese sky culture is the IAU constellation Orion. Orion's "sword" is the hem of her cloak.

Amansinaya:

This **telescopic** Filipino star "Amansinaya" is WASP-34 in the IAU constellation Crater and received this name in the IAU NameExoWorlds Campaign. It is magnitude 10.37. Aman Sinaya is one of two trinity deities in Tagalog mythology and is the primordial deity of the ocean and protector of fishermen. It has an exoplanet named Haik. Haik is the successor of Aman Sinaya as God of the sea.

Amazon Star:

See Female Warrior, below:

Amba:

This Vedic star from the *Taittiriya Brahmana* is Eta (η) Tauri (Alcyone) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, below).

Ambartsumian's Knot:

This **telescopic** asterism is NGC 3561, a pair of interacting galaxies in the IAU constellation Ursa Major. John Herschel listed it as h 835 and later as GC 2326 in his *General Catalogue* of 1864. It is also known as the Guitar (see below). It is named after Armenian astrophysicist Viktor Ambartsumian (1908 – 1996). Steinicke (2022) describes it as "30" S of NGC 3561".

Ambiguous of Virgo:

This **telescopic** asterism "Ambifárius Vírginis" is the intermediate spiral galaxy NGC 4941 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as I 40. In John Herschel's catalogue it is h 1520. It is 3383 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the difficulty in classifying this galaxy.

Ambushed:

This Latin star "Insidiata" ("ambushed" or "besieged") is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by German poet Philipp von Zesen (1619 – 1689). R. H. Allen translates this as "lurking one" in his *Star Names* in 1899.

Amegrameth:

This asterism is the IAU constellation Ara as listed in John Hill's *Urania* in 1754: Hill describes it as "one of the Arabic names", but the Arabic name of this constellation is "Almabkhara" (see Censer, below).

Amend Fault:

This Korean asterism “Jalmos-eul Sujeonghada” (잘못을 수정하다) is a line of two stars in the IAU constellation Lacerta: 6 and 13 Lacertae.

American Goose:

This German and Italian asterism “Anser Americanus” is the IAU constellation Tucana as listed by German astronomer Johannes Kepler (1571 – 1630) and Italian astronomer Giovanni Battista Riccioli (1598 – 1671). Kepler also listed the name “Toucan”:

- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Toucan” with the subtitle “Anser Americanus” and depicts a Toucan with a branch in its beak.
- Tucana is listed under this name in John Hill’s *Urania* in 1754.
- German uranographer Adolf Stieler (1775 – 1836) listed Tucana on his planisphere as “American Gans”.
- American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “The American Goose” as a long-billed goose walking.

Ammon:

This asterism “Ammon” or “Jupiter Ammon” is the IAU constellation Aries. Johann Bayer’s *Uranometria* (1603) lists “Jupiter Ammon” as a name for Aries. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Jupiter Ammon”. John Hill’s *Urania* in 1754 lists “Jupiter Ammon”: Hill describes it as “a name which some old writers call the sign Aries”. This asterism is listed in an “Ancient Zodiac of Egypt” in *Hindu Astronomy* by W. Brennand in 1896 as “Amun”. Brennand has labelled this illustration “from the Barberini Museum”, which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d’Arte Antica. This depicts a man with horns carrying a staff in each hand and also gives the name “Hammon” (see Hammon, below). Aries did not appear at all in ancient Egyptian skies and its stars appeared as part of the asterism Sheep (see below) in Seleucid skies. Amun or Amun-Ra is a sun God in ancient Egypt. Brennan attributes the name Amun for this constellation to the 5th century Roman author Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennan writes that the “Ram was assimilated to Jupiter Ammon” by Macrobius.

Ammonite of Ursa Major:

This **telescopic** asterism “Ammonoídes Úrsae Majóris” is the spiral galaxy NGC 4041 in the IAU constellation Ursa Major. William Herschel listed this as “I 252”. John Herschel listed this as h 1054 and later as GC 2672 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Amos:

This German asterism “Amos” is the IAU constellation Boötes as described by German poet Philipp von Zesen (1619 – 1689). Amos was a herdsman in the Bible.

Amphion and Zethus:

This Greek asterism is the IAU constellation Gemini. Amphion and Zethus were twin sons of Zeus, whose mother was Antiope. Johann Bayer's *Uranometria* (1603) lists "Amphion and Zethus". This name is listed as an alternate name for Gemini on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638). This name is listed as an alternate name for Gemini in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Amphitrite:

This Latin asterism is the IAU constellation Delphinus as listed by the Roman poet Ovid (b. 43 B.C.E.). Amphitrite was a Goddess of the sea and wife of Neptune. Another version is "Persuasor Amphritites" ("the Persuador Amphritite"). Johann Bayer's *Uranometria* (1603) lists the alternate name "Amphritites" for Delphinus. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Amphrites" as an alternate name for Delphinus.

Amphion's Lyre:

This Latin asterism "Lyra Amphionis" is the IAU constellation Lyra.

Amphitryoniades:

This Greek asterism "Amphitryoniades" is the IAU constellation Hercules as listed in R. H. Allen's *Star Names* in 1899 and is a reference to Hercules' foster father Amphitryon.

Amphora:

This asterism is the IAU constellation Aquarius as listed by Iranian astronomer Abu Rayhan Al Bīrūnī (973 – c.1050) and by R. H. Allen in *Star Names*. Allen also notes that "some Latin imitator" had used this name for the Great Square of Pegasus (see below).

Ample Curves of Draco:

This **telescopic** asterism "Colpódes Dracónis" is the barred spiral galaxy NGC 4319 in the IAU constellation Draco. William Herschel listed this as "I 276". John Herschel listed it as h 1210 and later as GC 2888 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its "two wide open arms".

Ampoule of Triangulum:

This **telescopic** asterism "Ampúlla Triánguli" is the elliptical galaxy NGC 750 (Arp 166) in the IAU constellation Triangulum. This was discovered in 1784 by William Herschel who listed it as "II 222". It is GC 455 in the *General Catalogue* of 1864. Its partner, NGC 751, was discovered by Irish astronomer Bindon Stoney in 1850: It became GC 5200 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave as "this pair of galaxies apparently looks like a small bottle with a swollen belly).

Amru:

This Syrian asterism "Amru" or "Emru" is the IAU constellation Aries.

Amzil:

This Ayt Xebbac star (Arabic: elɛeyyub) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Souag 2019).

Anadolu:

This Turkish star "Anadolu" is WASP-52 in the IAU constellation Pegasus and received this name in the IAU NameExoWorlds Campaign. It is the name of the Turkish homeland. It has an exoplanet named Göktürk, which refers to the historical origin of the Turkish people and was created as a state in Turkey in the 5th century C.E.

Anak Datu:

This Sama star "Anak Datu" is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Santos et al 2019). Ambrosio (2008) lists it as "Anakdatu". This is a fisherman spearing fish with a three pronged spear (see Three Pronged Spear, below).

Anala:

This Vedic star is Gamma (γ) Geminorum in the IAU constellation Gemini.

Añañuca:

This **telescopic** Chilean star "Añañuca" is the red dwarf star GJ 367 in the IAU constellation Vela (magnitude 10.15). It received this name in the IAU's NameExoWorlds competition in 2022. Añañuca (Phycella cyrtanthoides) is the name of a red wildflower that grows from the Coquimbo region to the Maule region, whose colour alludes to that of the star GJ 367. It has an exoplanet, GJ 367b, "Tahay". Tahay (Calydorea xiphioides) is a small flower endemic to central Chile that only blooms between 7 and 8 hours during the year. This is a reference to this exoplanet's year, which is only 7.7 hours.

Ancestral Temple:

See Yingshi, below.

Ancha:

See Haunch, below.

Anchor:

This Māori asterism "Te Taki-o-Autahi", "Mahutonga" (Best 1922, Orchiston 2017), "Kahhui O Mahuntonga" ("flock of Mahutonga") or "Te Punga" is the IAU constellation Crux. This is the anchor of the Great Boat of Tama Rereti (see below). The rope connecting this boat to the anchor is "Te Taura-O-Te-Waka-O-Tamarereti" (see Rope of the Great Boat of Tama Rereti below).

There are seven **telescopic** "anchor" asterisms:

- One is the HII region Sh2-51 and B 312 in the IAU constellation Sagittarius.
- One in the IAU constellation Hercules, Do Dz 5, is made up of four stars with two inside the curve.
- One is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654. It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. It was given this name by American astronomer Wayne Schmidt, who describes it as an anchor 60 arcminutes tall.

- One is in the IAU constellation Fornax and is Corder 406 on the observing list of American astronomer Jeffrey Corder. The six stars are magnitude 8.5 – 9.5 and include HIP 12084 and 12106. Size 15'.
- One is in the IAU constellation Gemini and is Ennis 6 on the observing list of Canadian astronomer Charles Ennis. Size 45' X 35'. This is a curve of five stars: HD 58990, HD 58969, HIP 36307, the double star 63 Geminorum, and HIP 36152, with the double star 36232 forming the top of the anchor's "shaft". NOTE: The curve of stars is Corder 1344 on Jeffrey Corder's list.
- One is in the IAU constellation Gemini and is Corder 1263 on the observing list of American astronomer Jeffrey Corder. Size 65'. This is nine stars between magnitude 5.5 and 8.5. The "shaft" of the anchor is the stars HIP 34267 and 34358. The "curve" of the anchor is the row of stars including HIP 34497, HIP 34428, the double star HIP 34247A, and HIP 34043.
- One is in the IAU constellation Canis Minor and is Ennis 46 on the observing list of Canadian astronomer Charles Ennis. Size 80' X 75. The "shaft" is the line between HIP 36200 through HD 58994, HIP 36365, and HD 59433 to Delta (δ) Canis Minoris. The curve of the anchor is an arc of six stars between 5^{th} – 9^{th} magnitude including HIP 36618, HD 59927, Delta (δ) 1 Canis Minoris, the double star HIP 36557, HIP 36492, and 36331: This curve is listed as Corder 1360 on Jeffrey Corder's observing list.

Anchor of Leo:

This **telescopic** asterism "Áncora Leónis" is the Magellanic barred spiral galaxy NGC 3664 (Arp 5) in the IAU constellation Leo. It was discovered by Wilhelm Tempel in 1879. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its resemblance to an anchor.

Ancient Chariot:

This Korean asterism "Godae Byeong-geo" (고대 병거) is a triangle of stars in the IAU constellations Hydra, Libra, and Lupus: 2 Lupi, 58 Hydrae, and Sigma (σ) Librae.

Ancient Star:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Niuxing" is HIP 62572A in the IAU constellation Ursa Minor.

This Chinese Chenzhuo xing guan "Niuxing" is the star HIP 65595 in the IAU constellation Ursa Minor. It is part of their xing guan "Northern Pole". It is also known as "Celestial Pivot".

Andiatis:

This Celtic (Gaulish) star "Andiatis" ("superior") Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major Boutet (2014). Compare this to the Vedic asterism Bhrigu (see below). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, below).

Andrew:

This asterism "Andrew" or "Saint Andrew the Apostle" is the IAU constellation Taurus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures: Schiller depicts Andrew as a seated long haired bearded male holding a large wooden cross. This is listed in the

Harmonia Macroscosmica of Dutch uranographer Andreas Cellarius in 1661 as "S. Andrew Al Taurus". This constellation appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Andrew's Star:

This variable star is HIP 26712 (HD 37519) in the IAU constellation Auriga (magnitude 6). It is named for Irish astronomer A. David Andrews (b. 1933), who first observed this variable star.

Andromeda:

Andromeda's brightest stars, Beta (β) Andromedae (Mirach) and Alpha (α) Andromedae (Alpheratz) are only number 55 and 56 on the list of 90 brightest stars, but the stars of this constellation appear in 252 of the asterisms listed in this handbook.

The IAU constellation Andromeda (IAU abbreviation And), "the woman chained", was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) as "Ἀνδρομέδη" ("Andromédi"). It was named by the Greeks after the Greco-Roman myth of Perseus, in which this hero rescues Andromeda from a rock in the sea to which she is chained. It became one of Ptolemy's 48 original constellations in the 2nd century, appearing as ᾽Ανδρομέδα ("᾽Andróméda") in his *Almagest* and including stars in the IAU constellations Andromeda and Perseus as follows:

- Her "head" is the star Alpha (α) Andromedae (Alpheratz), with the base of her "neck" being Delta (δ) Andromedae,
- Her "right shoulder" is the star 29 Andromedae with an "arm" running through Rho (ρ), Theta (θ), and 17 Andromedae to Lambda (λ) Andromedae,
- Her "left" shoulder is the star Epsilon (ε) Andromedae with an "arm" running through Zeta (ζ) Andromedae to Eta (η) Andromedae,
- Her "skirt" is defined by a "belt" of the stars Beta (β) Andromedae (Mirach), Mu (μ) Andromedae, and Nu (ν) Andromedae, with the bottom edge of the "skirt" being Tau (τ) Andromedae, Chi (χ) Andromedae, and Phi (ϕ) Andromedae,
- Her "right leg" runs between Phi (ϕ) Andromedae and Phi (ϕ) Persei, and
- Her "left leg" runs between Tau (τ) Andromedae and Gamma (γ) 1 and 2 Andromedae.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a female in an ankle length robe with her hands raised skyward.

The globe of the 2nd century Farnese Atlas depicts this constellation as a female in an ankle length robe with her hands raised skyward (Stevenson 1921).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Andromeda standing with arms outstretched and a shackle on each wrist.

Euripides (480 – 408 B.C.E.) and Sophocles (d. 406 B.C.E.) both wrote plays entitled *Andromeda*, but only fragments of both survive. Andromeda appears occasionally in the poems of Sappho as a rival poetess.

Andromeda appears in the Leiden *Aratea* (816) as a woman standing facing us, naked from the hips upwards, with her outstretched arms chained to posts (Katzenstein & Savage-Smith, 1988).

This constellation appears in editions of the 8th century *Revised Aratus Latinus:*

- Several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) depict her with the sleeves of her robe hanging over her elbows,
- In the Vat Reg lat 1324 edition she is naked to the waist,
- In several editions (Paris BN 12957, Gottweig 7 (146), Siena L. IV. 25, Vat Reg lat 1324) Andromeda is standing in front of water between plants,
- In two editions (St Gall 250, St Gall 902) Andromeda is wearing a trefoil hair ornament.

Andromeda was depicted by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in three ways in his *Book of the Fixed Stars* in 964 (Hafez 2010):

- The first is as a woman with her arms outstretched,
- The second is as a woman with her arms outstretched with a fish covering her legs.
- The third is as a woman with her arms outstretched with two fishes covering her legs.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Andromeda two ways on four pages. She is shown in full length robes, a tikka, earrings and bracelets with arms outstretched on all four pages. There are no indications of chains or shackles on her. On the first page she is looking to our left and on the next she is looking to our right. On the third and fourth pages she is depicted as she is on the first two, except that a pair of fish superimposed in front of her midsection. The smaller fish represents the northernmost "fish" of Ptolemy's constellation Pisces. The larger fish is the Arabic asterism "the Great Fish" (see below).

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad depicts Andromeda as a female in a full-length robe standing with arms outstretched and looking to her left. There are no shackles or chains.

The Laon 422 manuscript of 11th century *De signis caeli* depicts her nude standing between two segmented columns. The Rouen 26 manuscript of *De signis caeli* depicts her in a long gown between two wooden columns. The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli ("of the signs of heaven*") depict Andromeda in a short skirt, with a cloak draped over her left shoulder exposing her right breast, resting her hands on what look like tree stumps. The Dijon 448 manuscript of *De signis caeli* depicts Andromeda naked to the waist, with her wrists tied to two large plants to either side. The Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Andromeda between toilet articles with a large dragon curled at her feet. The Klosterneuberg 685 manuscript shows Andromeda alone.

The Doha manuscript (1125) of al-Sufi's *Book of Fixed Stars* depicts Andromeda on one page as a woman wearing a knee-length robe and a hat with three points. Her arms are outstretched, and she has bracelets on her wrists and ankles. On the other page she is depicted almost the same except that she is now shown wearing ankle length trousers with her outfit.

The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) describes partly clothed "Andromeda" as being female in the upper half and male in the lower half. She is depicted as having her arms chained to trees to either side.

The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts Andromeda nude to the waist. The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Andromeda facing to the rear with her right hand raised.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Andromeda as a female facing us, naked from the waist up. Her arms are extended to her sides. She has bracelets on each wrist, but no chains are depicted.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Andromeda as a long-haired figure facing us with arms outstretched to each side, the right hand raised as if in greeting. There is no indication of shackles, but it is labelled "al-mar'a al-musalsala" ("the chained woman").

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Andromeda fleeing Mc Gurk, Patrick (1966).

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Andromeda as a female wearing a full-length belted robe. She is seated with her arms outstretched but not shackled in any way.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Andromeda as a frowning female in calf length green robes with her arms extended out to her sides. A pair of overlapping fish, one large and one small, are depicted in front of her chest.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Andromeda" as a nude figure viewed from behind. A chain runs from their raised left hand, winds around the figure's middle twice, and then runs to their extended right hand.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Andromeda as a nude figure viewed from behind. The figure's arms are outstretched and a segmented double line which appears to represent a chain runs from one wrist to the other across the figure's back. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Andromeda as a long-haired figure viewed from behind. The figure's arms are extended to either side with chains hanging from wrist shackles. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Andromeda as a female in knee length skirts whose arms are extended to either side

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Andromeda as a curly haired human, its sex indeterminate, wearing knee length robes. The figure's arms are extended to either side where they are tied to trees.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts "Andromeda" as a robed female with extended sleeves with her arms outstretched to either side.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts "Andromedam" as a robed female facing us with arms outstretched.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This

depicts a woodcut of Andromeda standing between two leafless trees with her wrists tied to them. She is dressed in a short tunic and oddly, appears to have male genitalia.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Andromada (sic)" as a nude female facing away from us. Her right wrist and right ankle are tied to a tree. A chain runs across her back from wrist to wrist. Her left wrist is tied to another tree.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Andromeda as a figure facing us in a knee length robe. The figure has short hair and its gender is indeterminate. Its hands are out to its sides in a "shrugging" gesture. It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts her in a similar fashion, but in this case she is looking to her right. It is not labelled in either case.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Andromeda nude and facing away from us, squatting with a shackle on her left wrist attached to a chain that runs across her back to her left hand. The end of this chain beyond her hand is attached to a ring.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts nude and facing away from us, squatting with a shackle on her left wrist attached to a chain that runs across her back to her left hand. The end of this chain beyond her hand is attached to a ring, in a similar manner to Heinfogel's earlier charts.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Andromeda" as a long haired figure with its back to us, clothed in calf length robes. Her arms are extended to either side with a chain draped over her wrists which runs across her back. A celestial globe (1522) of Schöner depicts a nude, short-haired person with their back to us with the chain draped in the same fashion.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Andromeda in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Andromeda" as a nude female facing away from us holding a chain which runs under her armpits and across her back.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Di Andremeda". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Andromeda".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Andromeda as a nude female with her back to us kneeling on her left knee. Her arms are extended to her side with shackles on her wrists and a chain runs around her waist.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Andromeda in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Andromeda" as a nude female who is seated, her wrists shackled with a chain that crosses in front of her, looking to our left.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Andromeda" as a woman in a full length robe as viewed from the rear. Her arms are outstretched and she is looking to her left, but there are no chains or shackles.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Andromeda" as a female nude from the waist up with her outstretched arms chained to rocks on either side.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "Andromeda" as a nude female with shackled arms outstretched and chains on her ankles.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Andromeda" as a female viewed from the rear. She is wearing a skirt. Her arms are raised and a chain leads from a shackle on her left wrist to her right hand which is holding the chain, which ends in a ring.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Andromeda" as a long haired female viewed from the rear with her arms outstretched. She is wearing an ankle length dress and her wrists are shacked with chains.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Andromeda as a woman viewed from behind with her wrists chained.

Andromeda is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

Johann Bayer's *Uranometria* (1603) depicts "Andromeda" as a woman naked from the waist up, her wrists chained to two rocks. Bayer lists these names for Andromeda: "Andromeda, Mulier Cathenata, Carens Ominio Viro, Virgo Deuota, Persea, Vitulus Marinus Cathenatus".

The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Andromeda" and depicts her as a female facing us, naked from the waist up, with her wrists chained at shoulder height.

German uranographer Johann Bayer (1572 – 1625) depicts this in his Uranometria in 1603 as a woman naked from the waist up with her wrists chained to two rocks: Her right wrist shackle is connected by a chain to a shackle around her waist.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Andromeda" for this constellation.

"Andromeda" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a female naked from the waist up with her wrists chained at shoulder height.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Andromeda" as a female with her back to us

wearing full-length robes. Her left hand is pointing at something in front of her. Her right arm is extended with a shackle attached to a chain.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Andromeda as a crouching woman viewed from behind. He is naked from the waist upwards and has her arms extended to either side with her wrists shackled with chains to rocks.

Andromeda is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661. She is depicted from behind with her wrists shackled to a chain.

Ismael Boulliau's Ad astronomus Monita duo (1667) depicts Andromeda as a smiling female in calf length robes with her arms extended out to her sides. A pair of overlapping fish, one large and one small, are depicted in front of her chest. This is almost identical to the early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141, except that manuscript is colored and shows Andromeda frowning.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Andromeda" as a female viewed from behind with her right wrist shackled and chained. She is wearing drapery around her waist.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Andromeda as viewed from behind, her wrists chained, wearing a red skirt with gold lining.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Andromeda" as a female viewed from behind with her left wrist shackled and chained.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Andromeda" as a woman as viewed from behind, with her stretched out arms shackled and chained.

The philologist Philipp Karl Buttmann (1764 - 1829) named her "Anroneda".

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Andromeda" and "Ἀνδρομέδη" and depicts her as a seated female, naked from the waist up. Her arms are extended to her sides with her wrists shackled and another shackle is around her waist. She looks upward for assistance.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Andromeda as a female nude from the waist up, viewed from the rear, with her left wrist shackled to a rock.

Andromeda is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: She is depicted as a seated woman with her raised wrists shackled and her breasts exposed.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Andromeda" facing away from us, nude from the waist up, her wrists shackled to either side.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Andromeda" as a female naked from the waist up, facing away from us and looking over her left shoulder. Her arms are raised to either side with shackles on her wrists.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Andromeda as a female viewed from behind with her robes down around her waist and her wrists chained.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Andromeda as a seated female. She is naked from her waist up. Her arms are extended to her sides where they are shackled to rocks with chains and another chain runs to a large shackle around her middle.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Andromede" as a woman with her wrists chained to a rock.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Andromeda" as a female viewed from the rear, naked from the waist up, with her wrists chained.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Andromede" as a female naked from the waist up who has her arms raised and has a shackle and chain on her right wrist on his northern hemisphere chart. Later in a close-up chart she is depicted as seated, with her arms outspread and shackles on both wrists. The 1778 edition lists this constellation as "Andromede" and depicts her as a female with her raised wrists shackled and her breasts exposed.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Andromeda" and depicts it as a female with drapery around her middle with her raised arms shackled.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists "Andromeda" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Andromeda" as a female viewed from behind wither right arm shackled and chained.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Andromeda" as a female nude from the waist up, viewed from behind, with her arms chained to either side.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists Andromeda and depicts her as a female facing away from us with her wrists shackled.

American uranographer William Croswell (1760 – 1834) depicts Andromeda on his *Mercator Map of the Starry Heavens* in 1810 as a female viewed from behind, naked from the waist up, with her raised wrists shackled and chained.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Andromeda it in his *Celestial Atlas* in 1822: She is depicted as a female with a garment that exposes her left breast and has both her wrists and ankles shacked with chains. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts Andromeda as a seated female, naked from the waist up, shackled at both wrists and ankles.

"Andromeda" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a female nude from the waist up, with her right wrist and waist chained to a rock on one side and her left wrist chained to a rock on the other side.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict Andromeda as a female viewed from the rear, drapery coming down from her left shoulder, with both wrists shackled to chains.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Andromeda" as a seated male with her raised arms shackled and chained.

Andromeda is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. *Urania's Mirror* depicts her wearing chained shackles on her wrists and around her waist and is wearing a garment that leaves her left breast exposed.

"Andromeda" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): She is depicted as a seated woman in a long robe with her wrists shackled at shoulder height to either side.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Andromeda, The Chained Lady" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation simply as "Andromeda".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Andromeda" in his *Star Atlas* (1893).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Andromeda".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Andromeda".

While many charts and globes show Andromeda as a white woman, as did the 1st century Roman poet Manilius, who described her as "nivea cervice" ("snowy neck") some show her as black. The Roman poet Ovid (b. 43 B.C.E.) suggests this in his "patriae fusca colore suae" ("his country's brown colour") although he placed her in India as Herodotus did.

Standard IAU charts depict Andromeda as three lines of stars radiating out from Beta (β) Andromedae (Mirach):

- One runs to Gamma (γ) 1 Andromedae,
- One runs through Mu (μ) Andromedae to Nu (ν) Andromedae, and
- One runs through Delta (δ) Andromedae to Alpha (α) Andromedae (Alpheratz), which it shares with the constellation Pegasus.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Andromeda in his book *The Stars - A New Way to See Them* (1952):

- Her "head" is the star Alpha (α) Andromedae (Alpheratz),

- Her “body” is the triangle of stars Beta (β) Andromedae (Mirach), Delta (δ) Andromedae, and Pi (π) Andromedae,
- One “arm” runs from Delta (δ) Andromedae to an “elbow” at Zeta (ζ) Andromedae to a “hand” at the stars Eta (η) and 36 Andromedae.
- One “arm” runs from Pi (π) Andromedae to a “wrist” at Iota (ι) Andromedae and a “chain” formed by the stars Lambda (λ), Kappa (κ), and Omicron (ο) Andromedae,
- One “leg” runs from Beta (β) Andromedae (Mirach) to a “knee” at Upsilon (υ) Andromedae to a “foot” at Gamma (γ) 1 and 2 Andromedae, and
- One “leg” runs from Beta (β) Andromedae (Mirach) through Mu (μ) Andromedae to a “knee” at Nu (ν) Andromedae through Phi (φ) Andromedae to a “foot” at 51 Andromedae.

Sky and Telescope Magazine, founded in 1941, depicts Andromeda in their magazine and publications like this:

- Her “head” is Alpha (α) Andromedae (Alpheratz), with a line running to Delta (δ) Andromedae forming her “neck”,
- Her “body” is the triangle of the stars Delta (δ) Andromedae, Beta (β) Andromedae (Mirach), and Pi (π) Andromedae,
- One “arm” runs from Delta (δ) Andromedae through Epsilon (ε) and Zeta (ζ) Andromedae to Eta () Andromedae,
- One “arm” runs from Pi (π) Andromedae to a “wrist” at Iota (ι) Andromedae,
- A chain of the four stars Lambda (λ), Kappa (κ), Iota (ι), and Omicron (ο) Andromedae form her “shackle”,
- Her “legs” are two lines of stars running out from Mirach:
    - One runs to Gamma (γ) 1 Andromedae, and
    - One runs through Mu (μ), Nu (ν), and Phi (φ) Andromedae to 51 Andromedae.

Andromeda Galaxy:

This asterism is Messier 31, a spiral galaxy in the IAU constellation Andromeda, named for Andromeda, a princess who was the wife of Perseus in Greek mythology. It was first formally described by Persian astronomer Abd al Rahman al Sufi in his *Book of Fixed Stars* in 964: He called it a “nebulous smear” or “small cloud”.

- The German astronomer Simon Marius (1573 – 1625) was the first to publish a telescopic description of this galaxy in 1611 in *De Mundo Joviali*.
- This was listed in the General Catalogue of 1864 as GC 116 and the New General Catalogue of 1888 as NGC 224.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this galaxy as the “Great Nebula in Andromeda”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), calls this the “Great Nebula”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the “Great Nebula in Andromeda”.
- William Denning’s *Telescopic Work for Starlight Evenings* (1891) lists this as the “nebula in Andromeda” and the “Great Nebula in Andromeda”.

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) calls this the "Great Nebula" and his 14th (1959) describes this as the "Great Nebula in Andromeda".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns calls this the "Great Nebula".

Andromeda One:

This **telescopic** asterism is a dwarf spheroidal galaxy in the IAU constellation Andromeda which is a satellite galaxy of the Andromeda Galaxy (M 31). It was discovered by Dutch-Canadian astronomer Sidney van den Bergh with the Mount Palomar Observatory in 1970.

Andromeda's Head:

This English asterism is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda. R. H. Allen writes in his *Star Names* in 1899 that this dates to the 18th century. It may have been influenced by the Babylonian asterism Anunitu (see below) which had this galaxy as Anunitu's head.

Andromeda's Parachute:

This American telescopic asterism is the gravitationally lensed quasar J014709+463037 in the IAU constellation Andromeda. This name was listed in the *Deep Sky Forum* by Alvin Huey in February 2019.

Andromede:

This Egyptian asterism is one of the paranatellonta of the second decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). Mosenkis describes this as the "middle part of Cetus".

Anfac:

This Welsh asterism is the IAU constellation Scorpius. Anfac was a fearful monster eventually captured and imprisoned by Hu Gadarn (see below).

Angel Nebula:

There are two **telescopic** Angel asterisms:

- One is the reflection nebula NGC 2170 (vdB 67, LBN 994, Ced 63) in the IAU constellation Monoceros. This was discovered in 1784 by English astronomer William Herschel who listed it as "IV 19" in his catalogue. It is GC 1362 in the *General Catalogue* of 1864.
- One is the integrated flux nebula Mandel-Wilson 2 in the IAU constellation Ursa Major. It is also known as the Dust Angel Nebula.

Angel Wing:

This **telescopic** asterism PGC 29031 is a galaxy in the IAU constellation Leo.

Angelic of Canes Venatici:

This **telescopic** asterism "Angélica Cánum Venaticórum" is the intermediate barred spiral galaxy NGC 5377 in the IAU constellation Canes Venatici. It was discovered in 1787 by William Herschel who listed it as "I 187". It became GC 3716 in the *General Catalogue* of 1864. This name appears in *The Catalogue of*

One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy bears some apparent resemblance to a winged angel."

Angelfish:

This **telescopic** asterism is the globular cluster Messier 71 (NGC 6838) in the IAU constellation Sagitta. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745 and included in French astronomer Charles Messier's catalogue in 1780. It is listed in John Herschel's General Catalogue of 1864 as GC 4520.

Anger:

This Kiribati star "Un" or "Na Un" is currently unidentified (Trussel and Groves 1978).

Angetenar:

See Bend of the River, below.

Angiras:

This Vedic star "Añgiras", "Angirā", or Bharadvàja is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014, Bhagwath 2019). It is listed in R. H. Allen's *Star Names* in 1899. This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Angle:

This Arabic star "az-Zāwiyah" (الزاوية) or "Al Zāwiah" is Eta (η) Virginis in the IAU constellation Virgo, later latinized to "Zawiah" or "Zaniah". The IAU approved the name Zaniah for the star Eta (η) Virginis Aa.

Angle of the Barking Dog:

This Arabic star "Zāwiyat ul-ʿAwwā'" (زاوية العواء) or "zawiyat al-'awa'", translated as "angle of the howling dogs" or "angle of the barking dog", is Beta (β) Virginis in the IAU constellation Virgo, later latinized to "Zavijava":

- Italian astronomer Giuseppe Piazzi (1786 – 1846) listed this star as "Zavijah".
- English Admiral Henry William Smyth's *Prolegomena* in 1844 lists "Zavijava" and his *Bedford Catalogue* in 1844 lists "Zavijava… which is corrupted from Záwijat al'auwà, i. e., the stars of the barker, or barking bitch", attributing the name Zavijava to Piazzi.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Zavijava".
- R. H. Allen lists the name "Zāwiat al 'Awwā'" in his *Star Names* in 1899 and attributes it to Persian astronomers Zakariyya' al-Qazwini (1203 – 1283), 16th century Arabic astronomer Al Tizini, and Persian astronomer Ulugh Beg Mirza (1394 – 1449), and claims that it is a name for Gamma (γ) Virginis.
- The *Standard Dictionary of Facts (*1908 – 1924) lists it as "ZarijanSmyth goes on to say that the astronomer Kazwini called it "Záwiyah al 'auwà, the barker's corner" and later defines it as "the barker's corner".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the names "Zawijah" and "Zavijava" for this star, but the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) only lists the name "Zawijah".

- The IAU approved the name Zavijava for Beta (β) Virginis.

This Persian star “Laouiyet al Aoua” is Gamma (γ) Virginis in the IAU constellation Virgo as listed in the *Calendarium* of 17th century astronomer Al Achsasi Al Mouakket and is part of the asterism Barking Dog (see below).

This Latin star “Angulus Latratoris” is Gamma (γ) Virginis in the IAU constellation Virgo.

Angle of the Howling Dogs:

See Angle of the Barking Dog, above.

Angled Woman:

This Hungarian asterism “Részögös Asszony” appears to be the stars of the IAU constellation Andromeda. The celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism.

Angry Dog:

This Xhosa asterism is Lambda (λ) Scorpii and Upsilon (υ) Scorpii in the IAU constellation Scorpius (Holt and Slotegraaf 2022).

Angry Giant:

This Lokono (Arawak- middle Rio Negro region and Guiana highlands) asterism “Baukur” is the IAU constellation Orion (Rybka 2018). The twin sons of the Sun killed the angry giant Baukur and sent him into the sky. The setting of Orion’s belt marks the start of their new year.

Angular of Ursa Major:

This **telescopic** asterism “Angulátus Úrsae Majóris” is the edge-on barred spiral galaxy NGC 2654 in the IAU constellation Ursa Major. It was discovered by Wilhelm Tempel in 1882. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because “the central bulge of this edge-on galaxy has a rather square-like, angular form”.

Aniara:

This **telescopic** Swedish star is HIP 57820 in the IAU constellation Ursa Major (magnitude 7.85) and was given this name by the IAU NameExoWorlds campaign. It is the name of a spaceship in a poem by the same name by Harry Martinson. It has an exoplanet named Isagel, which is the name of the pilot of that spaceship.

Animal:

This Dakota/Lakota/Nakota asterism “Tayamnipa” (“born of three relatives”) is an animal, perhaps a buffalo. This asterism is actually the “head” of this animal, the Pleiades cluster in the IAU constellation Taurus. Other parts of this animal are “Animal’s Backbone”, “Animal’s Ribs” and “Animal’s Tail (see below).

Animal Carcasses:

This Mapuche asterism is the Magellanic Clouds. The Milky Way is the hunting field of rheas, Crux is the bolas being used to hunt animals, and the Pleiades cluster are the rhea’s nest.

Animal's Backbone:

This Dakota/Lakota/Nakota asterism "Taymnichankahu" is Orion's belt in the IAU constellation Orion and is part of their asterism "Animal" (see above).

Animal's Ribs:

This Dakota/Lakota/Nakota asterism "Tayamnituchuhu" is stars in the IAU constellation Orion: Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) and is part of their asterism "Animal" (see above).

Animal's Tail:

This Dakota/Lakota/Nakota star "Tayamnisinte" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and is part of their asterism "Animal" (see above).

Aniruddha:

This Vedic star is Epsilon (ε) Orionis (Alnilam) in the belt of Orion in the IAU constellation Orion (see Orion below).

Ankaa:

See Phoenix, below.

Ankle of the Horse:

This Arabic star "ka'b al-faras" is Kappa (κ) Pegasi in the IAU constellation Pegasus:

- This appears in the abbreviated form "Cabi" on the 14th century astrolabe #4560 from Christian Spain (King 2002).
- NOTE: This does not appear elsewhere and is not a standard star found on astrolabes, though it does appear on some astrolables of Muhammad ibn Fattuh al-Khama iri of Seville ca 1225 (King 2002).

Ankle of the Rein Holder:

This Arabic star "kaʿb ðīl-ʿinān" (العنان) or "Ḳabḍ al ʿInān", later latinized to "Kabdhilinan" or "Kabalinan" is Iota (ι) Aurigae in the IAU constellation Auriga:

- Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) listed it as "Al Ḳaʿb dhiʿl ʿInān".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-ka'b al-ayman li-dhīl 'l'inān" ("the right ankle of the rein holder, Auriga").
- It is also known by the shorter name "Al-Kab " (كعب ذي), later latinized to "Alkab":
- This star is listed as "Alkab" on the astrolabe described by English author Geoffrey Chaucer in his *Treatise on the Astrolabe* in 1391. Its modern name is Hassaleh (see below).
- NOTE: R. H. Allen wrote that this name was given to the star Gamma (γ) Aurigae in his *Star Names* in 1899 and later also writes that it was a name for Beta (β) Tauri (Elnath) and translates the name as "heel of the rein holder".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Kab'dhí-l-inán, i.e., heel of the rein-holder" and also identifies it as Beta (β) Tauri (Elnath) but goes on to claim that it is "entered on several star catalogues as [Gamma] γ Aurigae".

Anomalous of Pisces:

This **telescopic** asterism "Anómalus Píscis" is the spiral Seyfert galaxy NGC 7603 (Arp 92) in the IAU constellation Pisces. This became GC 6178 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy caused sharp controversy about redshift interpretation between Halton Arp and most other astronomers".

Anonymous:

This star with the Latin name "Anonyma" is a double star (magnitudes 7.5 and 9) within 2 arcminutes of Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed in R. H. Allen's *Star Names* in 1899. Allen writes that it appears in "Poole's Celestial Handbook", which would be the Poole Bros. *Celestial Handbook* of 1892, written by Jules A. Colas. German astronomer Hermann Joseph Klein (1844 – 1914) lists "Anonyma" in his *Star Atlas* (1893).

Anser:

See Goose, below.

Ant:

This Boorong and Wotjobaluk asterism "Collenbitchick" is the double star Alpha (α) Capricornus (Algedi) in the IAU constellation Capricornus as listed by Stanbridge (1857), Morieson (1999) and Hamacher and Frew (2010). This is the uncle of Totyarguil and rescued his remains from bunyips (water monsters). This double star is seen as his fingers feeling for the bank of the river.

There are three **telescopic** "ant" asterisms:

- One is the planetary nebula Mz 3 in the IAU constellation Norma. It was discovered in 1922 by American astronomer Donald Howard Menzel. It is called this as it resembles the head and thorax of an ant. It is also known as the Chamber of Horrrors.
- This is an alternate name for the Peanut Nebula (see above).
- One is PGC 32907, a galaxy in the IAU constellation Leo.

Ant Egg Star:

See Bush Food, below.

Anta:

This Vedic asterism is the IAU constellation Pisces as listed in R. H. Allen's *Star Names* in 1899.

Antamarda:

This Hindu asterism is the IAU constellation Andromeda.

Antarctic of Mensa:

This **telescopic** asterism "Antárctica Ménsae" is the barred spiral galaxy IC 2051 in the IAU constellation Mensa. This was first recorded by American astronomer DeLisle Stewart (1870 – 1941). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is located at a latitude that corresponds with a spot on Antarctica on Earth."

Antares:

See Rival to Ares, below.

Antares Nebula:

This **telescopic** HII region is IC 4606 (LBN 1107/1108, Ced 132/134, vdB 107) in the IAU constellation Scorpius.

Antar's Star:

This Arabic star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. R. H. Allen writes in his *Star Names* in 1899 that Antar or Antarah was a warrior hero of the Golden Muʿallaḳāt, seven famous selected Arabian poems inscribed in letters of gold on silk, or Egyptian linen, suspended in the Ka'bah at Mecca.

Anteater:

This Ticuna asterism "Tchatü" is made up of the stars of the IAU constellations Triangulum Australe, Corona Australis, Norma, and Ara. His "eyes" are Alpha (α) Trianguli Australis (Atria) and Beta (β) Trianguli Australis and his "tail" is Corona Australis. Anteater fights with the Jaguar "Ai" (see Jaguar, below).

This Apinajé asterism is likely similar to the Ticuna asterism "Tchatü" (above) and is believed to be fighting a jaguar (Lima and De M. Figueirôa, 2007).

Anteater Nebula:

This **telescopic** asterism is the reflection nebula NGC 6726 in the IAU constellation Corona Australis. It was discovered by German astronomer Albert Marth (1828 – 1897) observing from Malta. It is GC 5935 in the *General Catalogue* of 1864. Scottish astronomer Robert T.A. Innes (1861 – 1933) referred to it as part of a complex nebula he calls "Schmidt's Nebula" in 1896: This would be Johann Friedrich Julius Schmidt, who was director of the National Observatory of Athens from 1858 – 1884. It is also known as the "Baboon Nebula".

Antecedent Dog:

This Arabic star "al kelb al mutekaddem" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Antelope:

This Kamia asterism is the belt of Orion in the IAU constellation Orion.

This Vedic rashi "Makara" or "Makar" as listed in the Vedic *Candragarbha-parivarta* (Boutet 2014, Kotyk 2017, Bhagwath 2019, Rath 2022) is the IAU constellation Capricornus. This Chinese phonetically translated "Makara" from the Vedic *Candragarbha-parivarta* in 566 as "Mojialuo" (Kotyk 2017). W. Brennan lists it as "Macara" in his Hindu Astronomy in 1896 and translates it as "sea monster" and Boutet describes it as a crocodile or dolphin. The Chinese translation of the Sūryagarbha-parivarta from 585 describes it as "Makara Deity" (Kotyk 2017). It is also known as "Ushas" (see below). Ushas is the daughter of the God Prajapati. Ushas transforms herself into an antelope to escape the attentions of her father Prajapati (see below) who transforms himself into a male antelope to pursue her (Vahia 2014). There is another version of this story where they turn themselves into Deer (see Deer, above). Bhagwath (2019) writes that it represents the energy of the God Bhaga.

This Myanmar yathi (zodiac constellation) “Makara” (မကာရ) is the IAU constellation Capricornus.

This Sinhalese asterism “Makra” is the IAU constellation Capricornus.

This Tamil asterism “Makaram” is the IAU constellation Capricornus.

This Southern Paiute asterism is the IAU constellation Taurus (Gillard 2021).

Antelope Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Capricornus it as “Makara Deity” (Kotyk 2017). Compare this to the Vedic asterism Makara (see Antelope, above).

Antelope of Crater:

This **telescopic** asterism “Dorcádius Cratéris” is the spiral galaxy NGC 3981 (Arp 289) in the IAU constellation Crater. It was discovered in 1785 by British astronomer William Herschel who listed it as “III 274”. It became GC 2628 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the head of an antelope can be recognized… the nucleus can be seen as the large bright eye and the extending spiral arms as the horns and neck.”

Antennae Galaxies:

This **telescopic** asterism the “Antennae” or the “Antennae Galaxies” is NGC 4038 and NGC 4039 (Caldwell 60/61, Arp 244), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. It was given this name by American astronomer Harlow Shapley (1885 – 1972) and South African astronomer John S. Paraskevopoulos (1889 – 1951) because of the two long “tails” of stars, gas, and dust ejected from the collision, resembling an insect’s antennae. This is also known as the Ring Tail Galaxy (see below), the Snorter (see below), the “Little Shrimp”, and the Mosquito Larvae (see below). It is Arp 244 in Arp’s *Atlas of Peculiar Galaxies*. In *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) they are listed as the Northern Antenna of Corvus (“Anténna Boreális Córvi”), the Southern Antenna of Corvus “Anténna Austrális Córvi”, and together as Antennae of Corvi (“Antennae Corvi”).

Antinoos:

This Greek asterism “swan” was part of Ptolemy’s constellation Eagle (᾽Αετός – see Eagle, below) which is now the IAU constellation Aquila. The “Eagle” is holding Antinoos in its claws:

- The “body” is a line between a “tail” at the star Theta (θ) Aquilae through the stars 62 Aquilae, Eta (η) Aquilae and Delta (δ) Aquilae,
- One “leg” runs from Eta (η) Aquilae to a “knee” at 42 Aquilae and a “foot” at Kappa (κ) Aquilae,
- Another “leg” runs from Delta (δ) Aquilae to a bend at Lambda (λ) Aquilae. From here two lines run out:
    - One short line goes to 12 Aquilae, and
    - The other goes to a bend at 32 Aquilae and ends at 41 Aquilae.

The earliest recorded instance of the use of this antique constellation was on a celestial globe by the German uranographer Caspar Vogel in 1536. It is tucked into the area above the left wing of the IAU constellation Aquila between Aquila and the IAU constellation Delphinus where Ptolemy (c.100 – c.170) had it between Aquila and Sagittarius.

Mercator put Antinoos on his celestial globe in 1551 with six stars.

German astronomer Johann Bayer put Antinoos in his *Uranometria* in 1603 but did not distinctly list its stars and gave it the name Ganymedes (see Ganymede, below).

German astronomer Johannes Kepler listed Antinoos in his *Stella Nova* in 1606 and in his *Tabulae Rudolphinae*.

Longomontanus (Danish uranographer Christian Longberg) listed Antinoos in his *Astronomica Danica* in 1640.

John Flamsteed (1646 – 1719) listed it in his *Historia Coelestis* as "Aquila Antinous" and "Aquila cum Antinoo" ("Aquila with Antinoo").

Hungarian Jesuit astronomer Abbé Maximilian Hell listed Antinoos in his *Ephemerides Astronomicae* of 1769 and 1770.

German astronomer Johann Elert Bode (1747 – 1826) listed Antinoos, but German astronomer Friedrich Wilhelm Argelander omitted it from his *Uranometria Nova* of 1843, although he did show it as part of the constellation Aquila.

This influenced British botanist John Hill in 1754 when he created his asterism "Pinna Marina" (see Mussel below). Hill lists Antinous in his *Urania* in 1754, attributing it to Polish astronomer Johannes Hevelius (1611 – 1687).

Compare this to the Latin asterism Antinous, below.

Antinous:

This Latin asterism "Antinoüs" or "Antinous" was a repurposing of the asterism "Ganydmede" (see below) which appears in the *Almagest* of Claudius Ptolemy (100 – 177 C.E.). It was created in 132 by the emperor Hadrian (76 – 138 C.E.) who rebranded it to commemorate one of his lovers. This was reported by Roman statesman Cassius Dio (155 – 235 C.E.) and author Royston Lambert in the 1984 book *Beloved and God: The Story of Hadrian and Antinous*.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Jove (not Antinous) riding the eagle Aquila Mc Gurk, Patrick (1966).

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Antinous as a nude figure with long curly hair riding on the back of Aquila. The figure has its left arm around the neck of Aquila the eagle, and in his right hand he is carrying a spear.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts the earliest known graphical representation of Antinous on a globe or chart (Dekker 2010).

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Antinous as a nude male with is back to us, falling to his knees on a plinth as if trying to escape Aquila, which is diving above him.

Gerardus Mercator (1512 – 1594) included Antinous on his 1551 celestial globe. Antinous is depicted as a nude male kneeling on a plinth with his arms outstretched. Aquila is depicted flying to our right over his head.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Aquila seu vulture volans sydus 16" ("the eagle, or flying vulture, 16 stars") as a male with his back to us, seated on a plinth, turning as if to reach something to his left. Aquila is flying to our right over his head.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) does NOT depict Antinous.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Antinous" as a nude male being lifted off of a plinth by Aquila.

Dutch uranographer Willem Janszoon Blaeu (1571 - 1638) depicts Antinous on his celestial globe of 1602 (Stevenson 1921).

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Antinous" as a nude child being carried by Aquila.

Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists Antinous as a separate asterism from Aquila. Since this was published by Johannes Kepler after Tycho's death, it is not known if this was his decision or Tycho's: Kepler listed it separately as "Antinous" in 1606.

German uranographer Johann Bayer (1572 – 1603) depicts it as "Ganymedes" in his *Uranometria* in 1603 as a flying eagle carrying a young nude male with shoulder length hair.

"Antinous" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a nude child being carried by Aquila.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists "Antinous" as a constellation.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts Antinous as a nude youth kneeling with arms extended as he is picked up off of a plinth by Aquila.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts only the upper half of Antinous, who is shown as a curly haired child. The lower part of his body is below the edge of the dome.

Antinous appears in Robert Hues' *A Learned Treatise on Globes* in 1659.

Antinous is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this asterism "Antimous" and shows this as a nude child being carried by the flying eagle Aquila.

Edward Sherburne lists Antinous in his *Sphere of Marcus Manilius* in 1675.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Antinous” as a nude child below Aquila.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Antinous” as a nude child below Aquila.

Antinous is listed by Polish astronomer Johannes Hevelius (1611 – 1687) in his *Prodromus Astronomiae*, which includes his *Catalogus Stellarum Fixarum* (1690). Hevelius depicts it as a youth with drapery wound around him brandishing a bow and arrow to our right. Antinous is being carried by the eagle Aquila.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Antinous as a nude youth armed with a bow and arrow.

Antinous is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a nude male child waving his right hand. In Flamsteed’s Historiae Coelestis britannicae (1725) he lists it by three different names: “Aquila Antinous”, “Aquila vel Antinous (“Aquila, or Antinous”)”, and “Aquila cum Antinoo (“Aquila with Antinous”).

Corbinianus Thomas depicts “Antinous” as a child holding a long ribbon which winds across his middle in his *Mercurii philosphici firmamentum firmianum* (1730).

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Antinous” as a nude child being carried by Aquila: Antinous is drawing a bow and arrow.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Antinous as a youth drawing a bow and arrow being carried by Aquila.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Antinous as a curly haired male being carried away by Aquila. Antinous has just dropped a bow and arrow from his right hand.

John Hill lists Antinous as part of Aquila in his *Urania* in 1754.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Antinous” and depicts him as a nude male waving his right hand, as does the 1778 edition.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”der Adler und Antinous“ and depicts it as an eagle in flight to our left carrying a nude child. The stars of Antinous are extended by Bode to the edge of Scutum.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Antinous” as a nude child below Aquila.

“Antinous” is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801): It is depicted as a child being carried by Aquila.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists Antinous and depicts him as a nude young man armed with a bow and arrow.

American uranographer William Croswell (1760 – 1834) depicts "Antinous" on his *Mercator Map of the Starry Heavens* in 1810 as a child being carried by Aquila.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Antinous in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): He is depicted as a curly haired young man in a toga with a bow and arrow in his right hand.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Antinous" and refers to stars in this constellation with the suffix "Antinoi".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Antinous" as a male drawing a bow and arrow being carried by Aquila.

"Antinous" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. He is depicted as holding a bow and several arrows in his right hand and a single arrow in his left hand.

Antinous is listed in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873: Webb describes it as a "now usually thrown in to [sic]Aquila".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), states: "A constellation called Antinous,… is represented on some maps as occupying the lower portion of the space given to Aquila". Serviss incorrectly claims that Antinous "was invented by Tycho Brahe".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists Antinous as a separate constellation beside Aquila.

R.H. Allen describes it this way in his *Star Names* in 1899:

- Head: Eta (η) and Sigma (σ) Aquilae
- Body: Theta (θ), Iota (ι), Kappa (κ), Lambda (λ), Nu (ν), and Delta (δ) Aquilae.

Allen notes that "Flamsteed omitted σ and ν from his catalogue but added i". Allen lists the names "Puer Adrianaeus" ("Hadrian's Boy"), "Bithynicus" ("the Bithynian"), "Phrygius" ("the Phrygian"), "Pincerna" or "Pocillator" ("the cup bearer").

Antler:

This early Celtic (Gaulish) asterism "Antosclo" is the IAU constellation Libra, abbreviated as "Ind" in the *Book of Ballymote* (Boutet 2017).

Antlia:

None of the stars of this constellation are brighter than 4th magnitude and show up in 42 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Ant) "Machine Pneumatique" ("pneumatic machine") was first described by French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) in 1751-2 to commemorate the air pump invented by French physicist Denis Papin (1647 – 1713). Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "la Machine Pneumatique" as a glass pressure vessel on

top of a round table over a cylindrical device on a stand with curved legs. In 1763 Lacaille Latinized the name to “Antlia Pneumatica”.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Machine Pneumatique” as a table with a bell jar and a pump.

This German asterism “Luft Pumpe” is the IAU constellation Antlia as listed by German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820). Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Luftpumpe“.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed this constellation in his *Celestial Atlas* in 1822 as “Antlia Pneumatica”.

English astronomer John Herschel suggested changing this to “Antlia” in 1844 and this was later adopted by the IAU as the shorter name takes up less space on a globe or star chart.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated label “Antlia Pneumat”: He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Antlia Pneumatica” as an air pump.

“Antlia Pneumatica” is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Antlia, The Air Pump” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Antlia” and describes it as the “Air Pump”.

The 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) lists “Antlia” and gives the “original form” as “Antlia Pneumatica”.

The standard IAU charts show this constellation as a line of two stars: Alpha (α) Antliae and Eta (η) Antliae. Czech astronomers Horovka Hlad and Weiselová Polechová (1988) expand this in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*: Their version is a line running from Iota (ι) Antliae to Alpha (α) Antliae where it takes a turn and runs to Epsilon (ε) Antliae. *Sky and Telescope Magazine*, founded in 1941, depicts Antlia in their magazine and publications the same way as Hlad et al.

Anu Crown:

This Babylonian asterism “MUL.A.NU.AGA” or “MUL.a-nu-AGA” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the Hyades cluster in the IAU constellation Taurus.

This Akkadian asterism “anu agu” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the Hyades cluster in the IAU constellation Taurus.

Anubis:

This ancient Egyptian asterism is the IAU constellation Canis Minor. Anubis (Ancient Greek: Ἄνουβις, Egyptian: inpw, Coptic: ⲁⲛⲟⲩⲡ Anoup) was their God of death and the afterlife and usually depicted as a canine or a man with a canine head (Belmonte 2016). Other experts identify Canis Major as this Egyptian asterism (Berio 2014).

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts both Anubis seated and standing (Bullinger 1882, Seiss 1882).

John Hill lists this asterism in his *Urania* in 1754.

German Jesuit astronomer Athanasius Kircher (1602 – 1680) used this name for the Egyptian decan "Qet" (see below).

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Latrator Anubis" as a name for Alpha (α) Canis Majoris (Sirius).

This Egyptian star is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in the 19th dynasty Cairo Calendar (Hardy 2003).

Anuket:

This Egyptian Dendera asterism is made up of stars of the IAU constellations Puppis, Pyxis, and Vela (Hoffman 2017). Anuket was the Goddess of the Nile flood and is depicted seated holding up vessels in each hand. The central star is Gamma (γ) Pyxidis, from which three lines run out:

- One goes out to Theta (θ) Pyxidis,
- One goes to Lambda (λ) Velorum, and
- One runs through Rho (ρ) Puppis to Xi (ξ) Puppis.

Anunitu:

This Babylonian asterism from the MUL.APIN tablets "MUL.A.NU.NI.TUM", "MUL.an-nu-ni-tum" (Hunger 1992), or "A.NU.NI.TUM" (Bartel van der Waerden 1974, Boutet 2014) represents the Goddess Anuniti (Ištar of Sippar), also known as Anunitu, Anunitum, or Annunitum. It is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as "MUL.AN.NU.NI.TUM". It is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "da-nu-ni-tum", "mul a-nu-ni-tum" or "dis-tar min" (Koch-Westenholz 1995), and "mul is-ha-ra" or "Ishara" (Kock-Westenholz 1995). Anunitum was a Mesopotamian Goddess of war and an aspect of Ishtar and the tutelary Goddess of Sippar-Amnanum. It is made up of the stars of the IAU constellations Andromeda and Pisces:

- Her "head" is the Andromeda Galaxy, Messier 31,
- Her "body" is an irregular quadrangle of stars with Nu (ν) and 32 Andromedae as the "neck" below M 31, her right side running from 32 Andromedae through Delta (δ) Andromedae to the bottom corner at Zeta (ζ) Andromedae, and her left side running down from Nu (ν) Andromedae through Mu (μ) Andromedae and Tau (τ) Piscium to a bottom corner at Upsilon (υ) Piscium,
- Her "left arm" runs from Mu (μ) Andromedae to Beta (β) Andromedae (Mirach), and
- Her "right arm" runs from Delta (δ) Andromedae to 29 Andromedae.

This Akkadian asterism “Anunītu” (Hunger 1992) or “Lulīmu” from the Astrological Reports to the Kings of the late Assyrian period (~900 – 600 B.C.E.) or “dA-nu-ni-tum” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MUL.A.NU.NI.TUM” above. This asterism appears in later Seleucid sky lore.

This Sumerian asterism “mul dnu.nu” the from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MUL.A.NU.NI.TUM” above.

This asterism is the IAU constellation Boötes as listed in John Hill’s *Urania* in 1754: He incorrectly describes it as an Arabic name for this constellation and translates it as “caller out”.

Anything Pendant:

This Persian asterism “Al Dhawāib” is the stars Omicron (o) 1 and 2 Orionis and Pi (π) 1, 2, 3, 4, 5, and 6 Orionis according to the 15th century Persian astronomer Ulugh Beg.

This Borgian asterism is Omicron (o) 1 and 2 Orionis and Pi (π) 1, 2, 3, 4, 5, and 6 Orionis. They are listed by this name on the Borgian globe of 1225.

Anzu:

This Assyrian star “Anzu” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is unidentified. Anzu was a divine storm-bird in Sumerian and Akkadian culture.

This Babylonian “MUL.IM.DUGUD” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is unidentified. Anthony Hope lists it as “dIM.DUGUD.MUSHEN” or “Anzu” in his *A Guide to Ancient Near Eastern Astronomy* in 1996. Anzu was a divine storm-bird in Sumerian and Akkadian culture.

This Neo-Babylonian (Chaldean) star “mul anse.kur.ra” from the Great Star List (636 – 539 B.C.E.) is unidentified (Koch-Westenholz 1995).

Ao-Kai:

This Māori asterism, also known as “Matariki” (“chief’s eyes”, “small face” or “small eyes”), “Tātai o Matariki”, “Hoko-kumara” or “Huihui o Matariki” (“the assembly of Matariki”) is the Pleiades cluster in the IAU constellation Taurus.

Ao-tea:

This Māori asterism “Ao-tea” is one of the Magellanic Clouds (Orchiston 2017).

Ao-Uri:

This Māori asterism “Ao-uri” is one of the Magellanic Clouds (Orchiston 2017).

Aotahi:

This Māori star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. Aotahi was a character of their mythology who was tapu (sacrosanct or holy, to be left alone) and was suspended “outside Tanu’s basket” (the Milky Way).

Aotearoa:

This is the Māori name for New Zealand, but they also use it for the star Alpha (α) Aquilae (Altair) in the IAU constellation Aquila. This is one of the stars in the Navigator’s Triangle (see below).

Ape:

This Greek lunar mansion is stars in the IAU constellation Gemini and is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis writes that this "resembles a monkey's head".

On the Daressy Zodiac of the Roman Imperial Period an ape or baboon appears next to a goat-fish representing Capricornus.

Apep:

This **telescopic** asterism is a triple star system WR 70-16 (2 MASS J16005047-5142449) containing a Wolf-Rayet binary star and a supergiant star in the IAU constellation Norma. Apep is a serpent deity who was the mortal enemy of the sun god Ra in Egyptian mythology. It was named by a team lead by Joseph Callingham of ASTRON (the Netherlands Institute for Radio Astronomy), who studied the system between 2016 – 2018 using data from the ESO's VLT. The high rotational speed forms the dust thrown off by this triple system into a "serpentine" shape.

Aper:

This Greek asterism is the IAU constellation Hercules. This is the name of the boar killed by Hercules as his fourth labour. Johann Bayer's *Uranometria* (1603) lists the name "Aper" for this constellation.

Apes:

This Arabic asterism "al-qurūd", later latinized to "al kurud" or "Kurud" is the stars Theta (θ) Columbae ("Elkurud" or "Kurud I") and Kappa (κ) Columbae (Kurud II) listed by the 16th century Arabic astronomer Al Tizini.

Aphrodite:

This Greek asterism is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. She is cognate with the Babylonian Goddess Ishtar, who was called "Ἀστήρ" ("Astír") by the Greeks.

Apis:

This asterism is the IAU constellation Taurus as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. Apis was the divine bull worshipped at Memphis as an incarnation of their god Ptah and appears on the Narmer Palette (c. 3150 B.C.E.). This "Ancient Zodiac of Egypt" also lists the name "Osiris" for this constellation (see Osiris, below), though the Egyptians associated their God Osiris with the IAU constellation Orion, not Taurus. Brennan attributes the name Apis for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

Apollo:

This Greek star "Ἀπόλλων" ("Apóllon"), or "Apollo" is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini. This is a name assigned by Latin and medieval astronomers to the star Alpha (α) Geminorum (Castor): See Apollo and Hercules, below:

- "Anelar" is listed in the 15th century *Alfonsine Tables*.
- This became "Ἀπέλλων" ("Apéllon") in the Doric dialect, which later became the names "Afelar", "Aphellon", "Aphellan", "Apullum", "Aphellar", "Avellar", "Avelar" (as listed by German astronomer Petrus Apianus (1495 – 1552))
- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists this star as "Anhelar".
- Johann Bayer's *Uranometria* (1603) lists this as "Anelar" and attributes it to Petrus Apianus.
- "Aphellar" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as an alternate name for Castor.
- Robert Hues lists "Apellar" and "Aphellan" in his *A Learned Treatise of Globes* in 1659.
- German poet Philipp von Zesen (1619 – 1689) called it "Phoebus", which is another name for Apollo.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this asterism "Castor al Apollo".
- John Hill lists the name "Apollo" in his *Urania* in 1754, describing it as "a name by which some have called the constellation Gemini" without specifically identifying who these people might be.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists Castor as "Apollo vel Castor" it in his *Celestial Atlas* in 1822.

This Latin asterism "Apollonis" or "Apollonis Imago" ("the image of Apollo) is the IAU constellation Ophiuchus. "Apollonis Imago" is listed as an alternate name for Ophiuchus in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Mosenkis (date n/k) writes that Hesiod associated Apollo with the IAU constellation Sagittarius and his lyre with the IAU constellation Lyra. NOTE: This Latin asterism "Apollinis" is also used for the IAU constellation Lyra, referring to the lyre of Apollo.

This Egyptian asterism is one of the paranatellonta of the decans of Gemini as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Sagittarius.

Apollo and Hercules:

This Latin asterism is the IAU constellation Gemini as listed by Marcus Terentius Varro (116 – 27 B.C.E.). Apollon was a Greek name for Castor (see Apollo, above) and Heracles or Hercules a name for Pollux (see Heracles, below):

- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists "Apollonis" and "Herculis" as alternate names for Gemini.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Apollo et Hercules" as an alternate name for Gemini.
- "Apollo and Hercules" is listed as an alternate name for Gemini in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Hercules vel Pollux" and "Apollo vel Castor" in his *Celestial Atlas* in 1822.
- This name for Gemini is also listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which

is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennand writes that Macrobius associated the constellation Gemini "to the inseparable brothers Horus and Harpocrates". The Seleucids did call this constellation Harpocrates (see below), but Harpocrates was a Roman name for Horus as a child and not the name of a brother of Horus.

Apollo's Assessor:

This French asterism with the Latin name "Phoebi Assessor" is the IAU constellation Cygnus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Apollo's Cup:

This German asterism "Apollinis" the IAU constellation Crater as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) "Poculum Apollinis" ("Apollo's cup") is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Apollo's Lyre:

This asterism "Lyrae Apollinis" is the IAU constellation Lyra as listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638). Johann Bayer's *Uranometria* (1603) lists "Apollinus" as a name for Lyra.

Apostrophe of Fornax:

This **telescopic** asterism "Apóstrophus Fornácis" is the edge-on barred spiral galaxy NGC 1406 in the IAU constellation Fornax. It was discovered in 1835 by John Herschel who listed it as 2572 in his catalogue and later as GC 751 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "shows some resemblance to the punctuation mark apostrophe".

Appearing to Have Two Eyes of Leo:

This **telescopic** asterism "Pseudobinoculátus Leónis" is the barred spiral galaxy NGC 3507 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "IV 7". It became GC 2290 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "the combination of the bright nucleus and a foreground star only 24 arcsec from the nucleus creates the impression of two nuclei, or two eyes".

Apple:

This asterism "Elix" ("Apple") is the IAU constellation Ursa Major. This name is listed in Johann Bayer's *Uranometria* (1603).

This **telescopic** asterism is Gebauer 4 (SG 4) in the IAU constellation Cygnus. German amateur astronomer Sarah Gebauer discovered this in 2023 while observing the coloured double star HJ 1470.

Robert Zebahl describes it on the *Faint Fuzzies* website: The many stars arranged in clusters of pairs form the outline of a summery apple".

Apple Branch:

R. H. Allen writes in his *Star Names* in 1899 that a 1488 Venetian illustrator (not identified) of a star chart of 1st century scholar Gaius Julius Hyginus showed an apple tree with a serpent wrapped around its trunk by what is now the IAU constellation Hercules: This is probably a reference to the serpent guarding the apple tree in the garden of the Hesperides, which is part of the myth of Hercules.

Polish astronomer Johannes Hevelius (1611 – 1687) placed an apple branch in the "right hand" of Hercules and called it "Ramus Pomifer": It is between Hercules and the IAU constellation Lyra: Iota (ι), Tau (τ), Nu (ν), and Phi (ϕ) Herculis. Other images of Hercules by Hevelius have him holding some serpents he calls "Cerberus" (see Cerberus, below).

German astronomer Johann Bayer (1572-1625) listed it as a "Zweig" ("branch") placed in Hercules right hand, as did German astronomer Friedrich Wilhelm Argelander (1799 – 1875), but German astronomer Eduar Heis (1806 – 1877) put it in Hercules "right hand" with two vipers, which is a reference to the asterism Cerberus (see below).

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels this "La Vove de Laier" and depicts this as an apple branch in Hercules' right hand.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Rameau et Cerbere" as a branch with three serpents entwined.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this as "Cerberus et Ramus Pomosus" in his *Celestial Atlas* in 1822: It is depicted as an apple branch in Hercules' left hand along with a three-headed serpent.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists "le Rameau et Cerbere" ("the twig and Cerberus") and depicts this as an apple branch with two serpents entwined in the branches being held by Hercules.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) depicts an apple branch with three serpents in Hercules' left hand.

R. H. Allen lists it as "Ramo" in his *Star Names* in 1899 and notes that "the French" combined it with the asterism Cerberus (see above) as "Rameau et Cerbère" and the Italians as "Remo e Cerbero".

Apple Core Nebula:

This **telescopic** asterism is the planetary nebula Messier 27 (NGC 6853) in the IAU constellation Vulpecula. It was discovered by French astronomer Charles Messier in 1764. It is GC 4532 in the *General Catalogue* of 1864. It is also known as the Dumbbell Nebula (see below), the Double-Headed Shot (see below) and the Diabolo Nebula (see below).

Apples of the Hesperides:

This Greek asterism is either the Pleiades cluster or the Hyades cluster in the IAU constellation Taurus as listed by as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k).

April Rainers:

This is a name for the Hyades cluster in the IAU constellation Taurus from an old English folk song, *Green Grow the Rushes O*, and is a reference to spring showers.

Apron:

This Arabic star "al-Mi'zar" (المئزر) which means "apron", "girdle", or "waistband", is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major, later latinized to "Mizar", "Mizat", and "Mizra". Mirach is a variant of the Arabic star Al-Maraqq (see Waist Cloth, below) which is Beta (β) Andromedae (Mirach) and Mirak is a Latinization of the Arabic star Loins (see below):

- German astronomer Johann Bayer (1572-1625) listed it as "Micar" and "Mirach" and translated that as "the flank".
- Johann Bayer's *Uranometria* (1603) lists "Micar" and "Mizar" for this star.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Mirac & Miraz" and as "Mirzaron".
- This star is labelled in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Mirac".
- Robert Hues also translates this as "the flank" in his *A Learned Treatise of Globes* in 1659.
- French scholar Joseph Justus Scaliger (1540 – 1609) listed it as "Mirak":
- American uranographer William Croswell (1760 – 1834) lists "Mizar" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Mizar" in his *Celestial Atlas* in 1822.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Mizar" as does his *Vorstellung Der Gestirne* (1782).
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists "Mizar".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Mizar".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Mizar": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Mizar, which means a waist apron".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Mizar".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists "Mizar" for this star.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Izar", "Mizar" and "Mirach" as names for this star but only lists "Mizar" in his "Table V- Star Names".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Mizar".
- R. H. Allen suggests this as a name for the star Epsilon (η) Boötis in his *Star Names* in 1899, probably because it is similar to the star's Arabic name "al-Izar" (see Girdle, below).

- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Mizar" and describes it as a "girdle".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Mizar" and claims that it was discovered to be a binary by Riccioli in 1662.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) as well as his 14th edition (1959) lists "Mizar" as a name for Beta (β) Andromedae, Epsilon (ε) Bootis, and Zeta (ζ) Ursae Majoris.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name "Mizar" for this star.
- The IAU approved the name Mizar for Zeta (ζ) Ursae Majoris Aa.

Apus:

None of the stars of this constellation are brighter than 4th magnitude and they show up 28 times on this list of World Asterisms.

This IAU constellation "bird of paradise" (IAU abbreviation Aps) was first depicted on a celestial globe in late 1597 by Flemish astronomer Petrus Plancius (1552 – 1622): This was published by Amsterdam cartographer Jocodus Hondius the Elder (Joost de Hondt 1563 – 1612) 1598 – 1602 as "Paradysvogel" and "Apis Indica". Its name refers to the bird of paradise, but its Greek name "Apus" (apous) means "without feet": This is because Plancius wrongly believed that the bird of paradise didn't have feet because the first examples brought to Europe had their feet and wings removed.

Dutch historian Paulus Merula (1558 – 1607) lists it as both "Paradijsvoghel" ("bird of paradise") and "Avis Paradisi".

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius lists "Paradijs Vogel" with the subtitle "Apis Indica" and depicts it as a bird of paradise with no feet.

Dutch uranographer Willem Blaeu (1571 – 1638) in listed it as "Apes Indica" on his globe of 1602 and as as the Greek "Apous Indica" on his globe of 1603.

German astronomer Johann Elert Bayer (1572 – 1625) lists "Apis" and "Apis Indica" in his *Uranometria* in 1603.

Dutch navigator Frederick de Houtman's catalogue of fixed stars (1603) lists this constellation as "De Paradijs Voghel".

German astronomer Johannes Bayer lists it as both as "Apis" and "Apis Indica" in his *Uranometria* of 1603 and shows it as a bird with no feet.

Apis is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Apous" and "Apis seu Avis Indica, Avis Paradisi". Bartsch also gives the local name "Paradiz Vogel".

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Apus" and "Avis Indica" for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts "Apis Indica" as a bird of paradise with no feet.

German poet and uranographer Philipp von Zesen (1619 – 1689) listed it under the Greek name "Apous".

Apus is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627 as "Avis Indica".

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Apis Indica" as a bird of paradise with no feet.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Apis Indica".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Apous Indica" and depicts it as a bird with no legs.

Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 labels this constellation "Apous". Sherburne also gives the variation "Apis" (Compare this to Apis, above), as well as "Avis Indica" ("Indian Bird"), "Avis Paradisi" ("Bird of Paradise"), and "Manu codiata" ("with a greedy hand").

Apus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 as "Apus Avis" and "Inidica" and on his 1678 chart of the southern sky as "Apus" and depicts it on that chart as a bird without feet.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Apus" as a bird with no legs. Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Apus" as a bird with no legs. The central star is Gamma (γ) Apodis from which three lines run out:

- One to Alpha (α) Apodis,
- One to Delta (δ) Apodis, and
- One through Beta (β) to Zeta (ζ) Apodis.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "L'oyseau Indien", "Avis Indica", and "OPNIΣ INΔKH" and depicts it as a bird with no feet.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Paradisea al Apus Indicus" and depicts it as a bird without feet.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Apus as a bird with no feet.

Apus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Apus" as a bird with no legs.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts this as a bird with no legs and labels it "Apus Avis Indica".

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Apus as a bird with no feet.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Apus as a bird with no feet.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "l'Oiseau de Paradis" as a bird of paradise with no legs.

French astronomer Abbé Nicolas Louis de Lacaille Lacaille (1713 – 1762) reduced this constellation in size in the 1750s, removing some stars representing "tail feathers" to create the constellation Octans (see below). Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts it as a bird with no feet.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Apus" as a bird with no feet.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Oiseau Indien" as a bird with no feet on its southern hemisphere chart but labels it "l'Oiseau de Paradis" on a later closeup chart.

John Hill lists Apus in his *Urania* in 1754 and gives the additional names "Avis Indica" and "Avis Paradisiaca" (a mixture of the Latin word for "bird" and the Italian word for "heavenly").

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Paradis Vogel" and depicts it as a bird with no feet.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Paradisea" as a bird of paradise with no feet.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Apus" as a bird in flight with no feet.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Apus the Bird of Paradise" as a bird of paradise in flight.

"Apus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Apus, The Bird of Paradise" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Apus" and describes it as the "Bird of Paradise" and incorrectly attributes it to Bayer.

American artist and illustrator Hans Augusto Reyersbach (H. A Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Apus in his book *The Stars - A New Way to See Them* (1952): The IAU standard asterism is a bent line running from Alpha (α) Apodis to a bend at Gamma (γ) Apodis to Beta (β) Apodis. Rey makes a triangle of the stars Beta (β) Apodis, Gamma (γ) Apodis, and Delta (δ) 1 Apodis with a line from this last star to Alpha (α) Apodis. Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Apus the same way as Rey in their *Hvězdná obloha*

2000.0. Praha: Geodetický a kartografický podnik, as does *Sky and Telescope Magazine*, founded in 1941.

Aqhat:

This Hittite asterism is the IAU constellation Orion. Aqhat was a mythical hunter armed with a bow.

Aqua:

See the Greek asterism Water, Below.

Aquarius:

None of the stars of this constellation are brighter than 3rd magnitude and they appear in 305 of the asterisms listed in this handbook, but none of the stars of this constellation rate amongst the 90 brightest stars.

This IAU constellation (IAU abbreviation Aqr) first appeared in Babylonian star catalogues as "the Great One" (see Great One, below). The Greeks originally depicted it simply as a vase pouring a stream of water down onto what is now the IAU constellation Piscis Austrinus. In Aratus' poem *Phaenomena* (270 B.C.E.) and in Ptolemy's *Almagest* (2nd century) it is listed as Ὑδροχόος ("Ὑdrochóos" - see Water Carrier below).

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Aquarius as a figure walking to our left (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts Aquarius as a nude male facing towards us with an upturned vase in his left hand.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Aquarius as a male standing facing away from us wearing some sort of hat with an upturned vase in his right hand from which water is pouring.

The globe of the 2nd century Farnese Atlas depicts "Aquarius" as a nude male viewed from the rear, facing to our right (Stevenson 1921): He is pouring water from a vase in his right hand and his left hand is concealed in front of him.

This constellation appears in editions of the 8th century *Revised Aratus Latinus*:

- In all editions Aquarius is a man walking or standing to the right, using both hands to hold an urn upside down from which water is pouring,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) he has a halo,
- In several editions (Paris BN 12597, Gottweig 7 (146), Siena L. IV. 25) Aquarius is naked to the waist,
- In some editions (Prague IX C 6, St Gall 250, St Gall 902) Aquarius wears a short tunic and calf-length cape,
- In some editions (Dresden DC 183, Vat Reg lat 1324, Munich 560) Aquarius is wearing long robes,
- In three editions (Paris BN 12597, Dresden DC 183, and Prague IX C 6) Aquarius is looking over his shoulder.

Aquarius appears in the Leiden *Aratea* (816) as a nude male facing us with a ribbon of fabric wound loosely about him holding an overturned amphora in both hands from which stars are pouring (Katzenstein & Savage-Smith, 1988). Later editions show the water being poured by Aquarius is shown as a separate asterism, Aqua (see Water, below).

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquarius facing us, with a cloak over his left arm and holding the bottom of an urn in his extended right arm.

The 9th century Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquarius holding this urn with both hands.

The 9th century Austin, TX, Ransom Ms 29 and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquarius nude holding an urn in his left hand, while the Paris BN n.a. 1614 manuscript shows him wearing a long cloak.

The 9th century Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquarius holding the urn in his left hand and his mantle in his right.

The 9th century Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts Aquarius walking to the right on the stream he pours from an upturned urn in his left hand. The Los Angeles, Getty Ludwig XII, 5 manuscripts of the *De ordine ac positione stellarum in signis* depicts Aquarius holding an upside down urn behind his back with his right hand raised in salute.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Aquarius as a clean-shaven male with curly hair, wearing a skull cap and a knee-length robe. One page shows him turned slightly to our left, waving with his extended left hand and holding an overturned vase in his right hand from which water is pouring. The other page has him turned slightly to our right, waving with his right hand and pouring with his left hand.

The Oxford Laud 644 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") depicts Aquarius cloaked with a hood, while the Padua 27 manuscript shows him nude. The Dijon 448 manuscript of *De signis caeli* depicts him in a sort of kilt holding a water pouring urn upside down in both hands. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Aquarius holding the urn upturned in both hands. In the Zwettl and Klosterneuberg manuscripts he is nude except for a cap and cape and in the two Paris manuscripts and the Vat Lat 643 manuscript he is wearing pants. The Durham Hunter 100 manuscript of *De signis caeli* depicts him dressed in a short tunic and cape, pouring water from an urn upside down in both hands, and looking over his shoulder to the left. The Montecassino 3 manuscript of *De signis caeli* depicts him standing to the right with no water pouring from his urn. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts Aquarius with a spear.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Aquarius running to the right with an upturned urn raised in his left hand.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Aquarius as a male facing us. His right arm is extended outwards and he is pouring water from a cup in his left hand.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r,

depicts Aquarius as a male in a red ankle length robe with arms outstretched. His hands appear to be empty, but water is streaming from his left palm.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Aquarius and Capricorn in the same scene Mc Gurk, Patrick (1966).

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form "AQVARI" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Aquarius as a male in a knee-length tunic and cap. He is turned slightly to our left. He is gesturing outwards with his left hand and is holding an overturned urn on his right shoulder from which water is pouring.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Aquarius" as a nude male viewed from behind. He has a folded cloth held up in his left hand and has an overturned urn under his right arm which is pouring water.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Aquarius" as a nude male viewed from behind holding a folded cloth aloft in his left hand and having an overturned urn under his right arm which is pouring water.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Aquarius as a male holding up a long cloth in his left hand that winds around his body to his feet. He is facing away from us holding an overturned urn in his right hand. The urn is pouring water down to Piscis Austrinus. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Aquarius as a nude male with long hair. He is holding a three-prong rake in his left hand and is holding an overturned vase in his right hand from which water is pouring.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts Aquarius as a nude male with a peaked cap walking to our left. He is holding and overturned single-handled pitcher in both hands from which water is pouring.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. "Aquarius" is depicted as a long-haired male in a tunic, cape, pants, and boots, holding an upturned amphora in both hands. Water pours from this amphora into a circular tray at his feet.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Aquarius as a male in a thigh length tunic holding an overturned amphora in both hands from which a stream of stars is flowing.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Aquarius as a nude male facing to our right pouring water from a vase held in both hands.

Aquarius appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as the lower half of a male facing us with an overturned vase pouring water in his right arm and holding a cloth in his left hand: This is labelled with the astrological sign for Aquarius.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "AQRI(VS)" as a male in a loincloth as viewed from behind. He is holding a folded cloth in his left hand and his right forearm is on top of an overturned urn from which water is flowing down to the mouth of Piscis Austrinus.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Aquarius as a nude male walking, turned slightly to our right. He is waving with his right hand and pouring water from a cup in his left hand. It is not labelled. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts it in the same manner but reversed, facing to our left.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Aquarius as a clean-shaven nude male with curly hair as viewed from behind. He is looking to his left and is holding a cloth in his left hand. His right hand raised to shoulder level: His right leg is raised slightly and a vase from which water is pouring is laying on its side, held between his right elbow and his right thigh.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Aquarius as a clean-shaven nude male with curly hair as viewed from behind. He is looking to his left and is holding a cloth in his left hand. His right hand raised to shoulder level: His right leg is raised slightly and a vase from which water is pouring is laying on its side, held between his right elbow and his right thigh.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Aquarius" as a nude male as viewed from behind. He is looking towards his raised left hand, which is holding a folded cloth, and has his right arm through the handle of an overturned urn from which water is pouring down onto Piscis Austrinus.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "AQVARIVS" as a nude male facing away from us holding a cloth in his left hand and looking over his left shoulder. He is walking to our right with his right arm through the handle of an urn, from which water is pouring.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Aquarius in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Aquarius" as a nude male facing away from us, kneeling on his left knee, holding a cloth in his outstretched left arm. He has his right arm through a handle of an overturned urn from which water is pouring. This stream of water is labelled "Effuslo Aquarii" ("a stream of water").

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "De l'Aquario".

The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Water Bearer”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Aquarius as a clean-shaven nude male with curly hair who is kneeling on his left knee with his back to us. He is looking to his left, and his left arm is extended with a drinking cup in his left hand. His right arm is through the handle of an overturned amphora resting on his right thigh. Water is pouring from this amphora.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Aquarius in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Aquarius as a nude male holding a cloth in his right hand and having an amphora hooked on his left forearm and is labeled with the astrological symbol for Aquarius.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Aquarius” as a nude male facing away to our right. He is holding aloft a beaker in his left hand and has an amphora tucked under his right elbow from which water is pouring.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “Aquarius”. This chart has two halves, one showing the northern hemisphere, and one what was known of the southern hemisphere. On the “northern” side Aquarius is shown as a nude bearded male holding aloft a cloth in his left hand and seeming to hold an overturned urn pouring water in the angle of his right elbow. On the “southern side”, unlike most depictions of Aquarius, as a nude bearded male facing to our left. He is holding a cloth out in his left hand and is gesturing with his right hand, and he has an urn on his lap that is pouring water.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Aquarius” as a nude male viewed from behind, looking to his left. He is holding up a cloth in his left hand. His right arm is through the handle of an overturned amphora resting on his right thigh, pouring water.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Aquaris” as a nude male facing away from us. He is holding a folded cloth out to his left in his left hand and is holding the handle of an upended urn in his right hand. Water is streaming down out of the urn.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Aquarius” as a younger nude male with drapery wound around him. With both hands he holds an overturned amphora which is pouring water on his left side.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Aquarius as a nude male viewed from behind. He is holding a banner of cloth in his left hand and an overturned amphora in his right hand from which water is pouring.

Aquarius is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1603) depicts this in his *Uranometria* in 1603 as a man wearing a cap with a drapery wound around him viewed from behind: He is pouring water from an amphora whose handle is around his left arm and his right hand is holding aloft one end of his drapery. Bayer lists these names for this constellation: “Aquarius, Deucalion, Ganymedes, Aristaeus, Cecrops, Fusor aquae, Hydridurus, aquae Tyrannus, Wasserman, Edeleu”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Aquarius” as a nude male viewed from behind holding his drapery in his left hand and holding an overturned amphora in his right hand which is pouring water.

“Aquarius” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a male with a furry cap and a sort of kilt who is facing us, kneeling on his left knee. He is pouring water from an overturned amphora in his right hand and holding up a cloth in his left hand.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Aquarius” for this constellation.

“Aquarius” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a male in a loin cloth holding a cloth in his left hand and having an overturned amphora under his right arm from which water is flowing.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Aquarius” as a nude male viewed from behind, turned slightly to our right, kneeling on his left knee. He is holding up a cloth in his left hand. His right forearm is through the handle of an overturned urn resting on his right thigh. Water is pouring from this urn.

Aquarius is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: He is depicted as a nude male viewed from behind, pouring water from a vase in his right hand.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Aquarius as a nude male viewed from behind with a cloth draped over his right shoulder and pouring water from an urn with his right hand and holding a piece of cloth in his left hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Aquarius” as a nude male viewed from the rear holding a cloth in his right hand and an overturned amphora from which water is pouring in his left hand.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Aquarius” as a male viewed from behind holding a cloth in his left hand and an overturned amphora in his left hand. NOTE: This illustration conceals the head of Aquarius behind Equuleus and his lower limbs behind Piscis Austrinus.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Aquarius” a young nude male viewed from the rear, kneeling on his right knee, with a cloth in his left hand and his right arm through the handle of an amphora from which water is pouring.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Verseau”, “Aquarius”, and Υδροχόος and depicts it as a nude male that is kneeling. His left arm is extended out

with his hand holding a drapery that is inflated into a billowing screen behind him. The handle of an overturned vase is hooked over his extended left wrist and the vase is pouring water.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Aquarius as a male viewed from behind with some drapery around his middle holding a cloth in his right hand and holding an upturned vase in his right hand from which water is pouring.

Aquarius is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a young male with a drapery across his middle. He is holding one end of this drapery in his left hand and is holding an upturned jug of water in his right hand.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Aquarius".

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Aquarius" as a male kneeling on his right knee, facing away from us, with his left arm through the handle of an upturned amphora and a cloth raised in his right hand.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Aquarius as a nude male viewed from behind holding a cloth in his left hand and cradling and upturned urn under his right arm which is pouring water.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Aquarius as a nude male walking away from us to our left. He is wearing a soft cap and has a drapery wound around him and is holding up one end of it in his right hand. His right hand is holding an overturned urn which is pouring water.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts Le Verseur d'Eau" as a male facing away from us holding a cloth in his right hand and an upturned amphora in his left arm.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Verseau" as a young male with a drapery across his middle. He is holding one end of this drapery in his left hand and is holding an upturned jug of water in his right hand. This is also how it appears in the 1778 edition.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Aquario" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Aquarius" as a nude male viewed from the rear, kneeling on his left knee, holding a cloth in his left hand and an overturned amphora pouring water in his right hand.

Aquarius is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Aquarius of Waterman": He is depicted as a male facing us pouring water from an overturned vessel in his right hand and holding up a cloth in his left hand.

American uranographer William Croswell (1760 – 1834) depicts “Aquarius the Water Bearer” on his *Mercator Map of the Starry Heavens* in 1810 as a walking bearded male viewed from behind: His right hand is holding an upturned vase pouring water.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as the “Wassermann” and depicts him as facing away from us, pouring water from an upturned squat amphora in his left hand and holding what appears to be a drinking horn in his right hand. The various editions of Bode’s *Jahrbuch* also use this name. Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Wassermann” and depicts him as a male with drapery around his middle holding an upturned vase in his right hand and a cloth in his left hand. The water pouring out of the vase is being swallowed by Piscis Austrinus.

“Aquarius” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a male with his back to us kneeling on his right knee with an overturned amphora on his left arm from which water is pouring and holding a cloth in his right hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Aquarius in his *Celestial Atlas* in 1822: This is depicted as a bearded male wearing a laurel wreath cradling an upturned vase pouring water in his right arm and holding Jamieson’s asterism “Norma Nilotica” in his left hand (see Nilometer, below).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Aquarius” as a bearded male with a cloth around his loins. He is holding one end of the cloth in his right hand and has an overturned urn in his left arm.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Aquarius” as a seated bearded male in a toga cradling a tipped over vase in his right arm from which the “Fluvius Aquarii” is pouring.

This is listed as Aquarius in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. He is depicted as a seated male wearing a laurel wreath on his head: He has a cloth draped over his middle holding an upturned urn in his left arm and a wand in his right hand.

“Aquarius” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a male facing us pouring water from a vase in his right hand and waving a cloth in his right hand.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Aquarius, The Water Bearer” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Aquarius, the Water-Bearer”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Aquarius” in his *Star Atlas* (1893) and describes it as the “Water-carrier”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Aquarius” and describes it as the “water carrier”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Aquarius: The Water Bearer."

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Aquarius in his book *The Stars - A New Way to See Them* (1952):

- His "head" is the quadrilateral of stars Alpha (α) Aquarii (Sadalmelik), Gamma (γ) Aquarii, Eta (η) Aquarii, and Pi (π) Aquarii, with Zeta (ζ) 1 and 2 Aquarii as his "eyes",
- His body is a line between Alpha (α) Aquarii (Sadalmelik) and Beta (β) Aquarii (Sadalsuud),
- HIs "arm" runs from Alpha (α) Aquarii (Sadalmelik) to an "elbow" at Theta (θ) Aquarii to a "hand" at Lambda (λ) Aquarii,
- His "water vessel" is the quadrilateral of stars Lambda (λ), Tau (τ), Delta (δ), and Psi (ψ) 1 and 2 Aquarii, with a triangular "spout" formed by Psi (ψ) 1 and 2, Phi (ϕ), and Lambda (λ) Aquarii,
- The "stream of water" is two lines of stars running from Psi (ψ) 1 and 2 Aquarii:
    - One runs to 88, 89, and 86 Aquarii,
    - One runs to 98, 99, and 101 Aquarii,
- His "legs" run from Beta (β) Aquarii (Sadalsuud):
    - One runs to a "foot" at Iota (ι) Aquarii, and
    - One runs to a "knee" at Nu (ν) Aquarii, and a "foot" formed by 7, Mu (μ), and Epsilon (ε) Aquarii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) have a different version of Aquarius in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*:

- One winding line of stars runs from Epsilon (ε) Aquarii through Nu (ν) Aquarii, Beta (β) Aquarii (Sadalsuud), Alpha (α) Aquarii (Sadalmelik), Gamma (γ) Aquarii, and Theta (θ) Aquarii to Iota (ι) Aquarii.
- One winding line of stars runs from Theta (θ) Aquarii through Lambda (λ) Aquarii, Tau (τ) Aquarii, Delta (δ) Aquarii, 88 Aquarii, and 98 Aquarii to Omega (ω) 2 Aquarii.
- A "Y" shaped part branches off Gamma (γ) Aquarii, including Zeta (ζ) 1 and 2 Aquarii, Eta (η) Aquarii, and Pi (π) Aquarii.

Sky and Telescope Magazine, founded in 1941, depicts Aquarius in their magazine and publications like this:

- His "head" is a quadrilateral of the stars Alpha (α) Aquarii (Sadalmelik), Gamma (γ) Aquarii, Zeta (ζ) 1 Aquarii, and Pi (π) Aquarii, with an extra line running from Zeta (ζ) to Eta (η) Aquarii,
- His "body" is a line between Sadalmelik and Beta (β) Aquarii (Sadalsuud),
- Two lines run out from Sadalsuud to form legs:
    - One to Iota (ι) Aquarii, and
    - One through Mu (μ) Aquarii to Epsilon (ε) Aquarii,
- An "arm" runs from Sadalmelik to an "elbow" at Theta (θ) Aquarii and a "hand" at Lambda (λ) Aquarii,
- The "vase" is a five-sided figure of the stars Lambda (λ), Tau (τ), Delta (δ), Psi (ψ) 1 and 2 Aquarii, and Phi (ϕ) Aquarii.

- Two lines of stars running out from Psi (ψ) 2 Aquarii representing the water pouring from the "vase":
    - One to 88 Aquarii, and
    - One to 98 Aquarii.

Variations on the name found in English texts include Aquary and Aquarye.

Aquarius Dwarf:

This **telescopic** asterism is the irregular galaxy PGC 65367 in the IAU constellation Aquarius. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Mínimus Aquárii" ("Very Small of Aquarius").

Aquarius River:

This asterism "Fluvius Aquarii" is the asterism Pouring Forth of Water (see below) as listed by American astronomer Elijah Burritt (1794 – 1838). Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Fluvius Aquarii" in his *Celestial Atlas* in 1822. *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, includes "Fluvius Aquarii".

Aquatic Monster:

This German asterism "Belua Aquatica" is the IAU constellation Lyra as described by German poet Philipp von Zesen (1619 – 1689). He was probably mistranslating the Greek ""Χέλυς ὀλίγη" ("Chélys olígi"- see Tortoise Shell, below) which was a common early name for this constellation.

Aquila:

Aquila is an easy to spot bent cross shape containing the 12th brightest star, Alpha (α) Aquilae (Altair) which is one of the stars of the Summer Triangle (see below) or Navigator's Triangle (see below). The stars of Aquila appear in 303 of the asterisms of the sky cultures of the world.

This IAU constellation (IAU abbreviation Aql) originated in the asterism "Eru" (see Eagle below) from the Babylonian MUL.APIN tablets. In Greek mythology Aquila was "Αετός Δίας" ("Aetos Dios"), the eagle that carried the thunderbolts of their God Zeus. In his *Almagest*, Ptolemy (c.100 – c.170) called it "᾽Αετός" ("Aetos" -see Eagle, below). An early influence on this constellation may have been the Egyptian asterism from the Old Kingdom (3100 B.C.E.) Falcon of Horus (see Falcon of Horus below).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as an eagle in profile with wings extended. Later charts and texts often include the obsolete constellation Antinous (see above).

The globe of the 2nd century Farnese Atlas depicts "Aquila" as an eagle standing with wings slightly spread (Stevenson 1921).

Aquila appears in the Leiden *Aratea* (816) as an eagle with wings spread, facing to our right but looking over its right shoulder (Katzenstein & Savage-Smith, 1988): It is standing on an arrow (which is Sagitta).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- Several editions merge this constellation with Sagitta.

- The Dresden DC 183, Paris BN 12957, and Prague IX. C. 6 editions have the eagle facing right with his head turned back over his right wing standing on Sagitta.
- The Cologne 83 II edition shows Aquila looking over its right shoulder,
- The St Gall 250, St Gall 902, Ps Bede DSC and Montecassino 3 editions show Aquila as a wading stork or heron.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquila standing on a left facing arrow. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Aquila standing on a right facing arrow. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts Aquila with its head in front of his right wing.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Aquila as an eagle standing with its wings raised as if about to take flight. On one page it is facing to our right and on the other to our left.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Aquila standing on Sagitta, with the arrow facing left and his head touching his left wing. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Aquila standing looking over his right wing while standing on an arrow. The Durham Hunter 100, Freiburg im Breisgau 35, and Montecassino 3 manuscripts of *De signis caeli* omit the arrow.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Aquila as a landing eagle which appears to be trying to pick up the arrow of Sagitta.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) lists Aquila.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Aquila as a black eagle about to take flight, facing to our right.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Vultur Volans" as a diving eagle.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Aquila as a diving bird. It is not labelled, and the drawing is poor.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Aquila as a diving hawk holding the arrow Sagitta. It is not labelled.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Aquila" as an eagle walking to our right looking over its left wing with its wings unfurled.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Jove riding the eagle Aquila Mc Gurk, Patrick (1966).

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Aquila on one page as an eagle standing on a rock with its wings spread, looking back behind itself. On another page it shows Aquila in a similar position, but with a nude Antinous on its back.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts "Aquilam" as an eagle with wings raised facing to our right and looking over its right shoulder. An arrow is depicted between its legs.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Aquila as an eagle with wings raised facing to our right and looking over its right shoulder. An arrow is depicted between its legs.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Aquila" as a barely visible bird.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Aquila as an eagle standing on an arrow (Sagitta). It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts it in the same fashion.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel labels this constellation "Vultur Volas (sic)" and depicts it as an eagle with its wings partially folded.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) labels this constellation "Vultur Volas (sic)" and depicts it as an eagle with its wings partially folded.

Aquila appears on some old charts and the *Ilkhanian Tables* under the Latin name "Vultur Volans" ("flying vulture"), which is a reference to the Arabic asterism Flying Vulture (see below). Gores for a celestial globe by German polymath Johannes Schöner (1477 – 1547) from 1515 list "Vultur Volans" but those from 1534 and 1535 list "AQUILA" (Dekker & Lippincott, 1999). Celestial globe gores (1517) of Schöner depicts "Vultur Volans" as a diving eagle.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists this constellation as "AQVILA" and "Vultur Volans".

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "AQVILA" as an eagle flying to our right.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Aquila as an eagle with wings outstretched.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Aquila in the same manner as Dürer et al.

The celestial globe depicted in Hans Holbein's *Double Portrait of Jean de Dinteville, the Bailly of Troyes, and Georges de Selve, Bishop of Lavaux* (more commonly known as "*The Ambassadors*") from 1533 lists the abbreviated "VVLTVR V" (Dekker & Lippincott, 1999).

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Aquila" as an eagle in flight with an arrow (Sagitta) overlapping its right wing.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "De l'Aquila". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Eagle".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Aquila as an eagle diving at Antinous.

A celestial globe atop a planetary clock modified by Oronce Fine in 1553 (the "Paris Globe") lists "VVLTVR VOLANS" (Dekker & Lippincott, 1999).

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists "Aquila, sev Vultur Volans" for this constellation in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Aquila" as an eagle with spread wings.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Aquila seu vulture volans sydus 16" ("the eagle, or flying vulture, 16 stars") as a male with his back to us, seated on a plinth, turning as if to reach something to his left. Aquila is flying to our right over his head.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a diving eagle at right angles to the Milky Way. The label is unintelligible.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Aquila" as an eagle in flight to our right. Plancius has omitted Antinous.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Vultur Volans Aquila" as a diving eagle flying to our right carrying Antinous.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Aquila" as an eagle in flight carrying an arrow (Sagitta). NOTE: Antinous is not depicted.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists "Aquila" and depicts it as an eagle in flight to our right carrying Antinous.

Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists this constellation as "Aquila seu Vultur Volans" ("a flying eagle or vulture").

Aquila is depicted by German astronomer Johann Bayer (1572-1625) in his Uranometria (1603) as an eagle in flight as viewed from above carrying Antinous (see above). Bayer lists these names for Aquila: "Aquila, Iouisales, Vultur Volans, Ganymedis raptrix, Seruans Antinoum, Aliis Alcar, Alcair, Atair".

"Aquila" is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as an eagle in flight to our right carrying Antinous.

"Aquila" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who also lists the name "Vultur Volans" and depicted as an eagle in flight to our left carrying Antinous.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Aquila o Vultur Cadens" and depicts it as a diving eagle. There is a nude bearded man seated on a stool below the eagle which clearly is meant to represent Antinous but is not labelled.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Aquila seu Vultur Volans" for this constellation.

"Aquila" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as an eagle in flight to our left carrying Antinous.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Aquila" as an eagle diving to our right, picking up Antinous from a plinth.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Aquila as a diving eagle carrying Antinous.

Aquila is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Aquila as an eagle in flight carrying "Antimous" (see Antinous, above): There is an arrow through the left wing of Aquila which is not labelled but probably represents Sagitta.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Aquila" as an eagle in flight with an arrow (Sagitta) overlapping its right wing.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Aquila" as an eagle in flight with a branch in its beak and with an arrow (Sagitta) overlapping its left wing.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Aquila" as an eagle in flight to our right carrying Antinous (see Antinous, above).

Aquila is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as an eagle in flight.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Aquila as an eagle in flight.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Aquila" as an eagle in flight to our left carrying Antinous.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Aquila as an eagle in flight carrying Antinous (see Antinous, above).

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Aquila as a diving eagle carrying Antinous.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "l'Aigle" as an eagle in flight carrying Antinous.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Aquila" as an eagle in flight carrying Antinous.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "L'Aigle" ("the eagle") as an eagle in flight carrying Antinous, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der Adler und Antinous" and depicts it as an eagle in flight to our left carrying a nude child.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Aquila" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Aquila" as an eagle in flight with an arrow (Sagitta) through its left wing.

Aquila is listed in Scottish uranographer Alexander Jamieson's *Celestial Atlas* in 1822: It is depicted as an eagle in flight.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Aquila" as an eagle in flight.

Aquila is depicted in *Urania's Mirror* in 1852 as an eagle in flight.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Adler" and depicts it as an eagle diving.

"Aquila" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as an eagle in flight carrying a naked youth: This youth is Antinous (see above) but is not labelled as such.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this constellation as "Vultur Volans".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Aquila" as an eagle in flight to our right carrying Antinous.

Aquila is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877) as "Aquila et Antinous": It is depicted as a eagle flying to our left carrying a male youth with his arms spread.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Aquila, The Eagle" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Aquila, the Eagle".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Aquila" in his *Star Atlas* (1893) and describes it as "The Eagle".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Aquila" and describes it as an "Eagle".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Aquila".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) slightly redesigned the lines of Aquila in his book *The Stars - A New Way to See Them* (1952). The standard IAU charts have a line running from Alpha (α) Aquilae (Altair) to Delta (δ) Aquilae: Rey has this running from Gamma (γ) Aquilae to Delta (δ) Aquilae to make the line of stars Gamma (γ), Alpha (α) and Beta (β) Aquilae (Alshain) look more like an eagle's head.

Sky and Telescope Magazine, founded in 1941, depicts Aquila in their magazine and publications like this:

- Its "head" is the line of three stars Beta (β) Aquilae (Alshain), Alpha (α) Aquilae (Altair), and Gamma (γ) Aquilae with a line from this last star to Delta (δ) Aquilae representing the "neck",
- Its "body is a line between Delta (δ) Aquilae and Lambda (λ) Aquilae with the line continuing to 12 Aquilae to form a "tail",
- The "wings are interconnected triangles:
- One "wing" is made up of Delta (δ), Lambda (λ), and Zeta (ζ) Aquilae with a short line running from this last star to Epsilon (ε) Aquilae, and
- One "wing" is made up of Delta (δ), Lambda (λ), Eta (η), Theta (θ), and Iota (ι) Aquilae.

Aquilaris:

This Latin asterism is the IAU constellation Lyra and was so named as it was often depicted as having an eagle in the background as if carrying it (see Aquila, above).

Aquitenens:

This Latin asterism is the IAU constellation Aquarius as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.) and listed in R. H. Allen's *Star Names*.

Ara:

None of the stars of this constellation are brighter than 3rd magnitude and they show up in 82 of the asterisms in this handbook.

In Greek mythology the IAU constellation Ara represented the altar where their Gods made offerings and formed an alliance before defeating the Titans. The ancient Greeks couldn't see far enough south to see all of what is now considered to be part of that constellation, so to them it looked like an altar on the horizon. Ptolemy (c.100 – c.170) listed it as "Θυμιατήριον" or "Thymiatírion" (see Altar, above) in his *Almagest* and Proclus (412 – 485) also used this name. The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a table with two levels and a box on top.

Ara appears in the Leiden *Aratea* (816) as an hourglass shaped altar with flames rising from the top (Katzenstein & Savage-Smith, 1988).

This constellation is depicted in editions of the *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) it is depicted as a multi-story structure with flames coming out of windows or vents,
- In the Prague IX C 6 this structure only has three windows,
- In the Vat Reg lat 1324 edition it is depicted as a chateau with four corner turrets,
- In the Cologne 83 II edition it is depicted as a square altar with four legs with flames on top.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Ara as a two-story box. The Dijon 448 manuscript of *De signis caeli* depicts a two-story brick structure with a tiled roof. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Ara as a lantern-like structure with a triangular top.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Ara as an hourglass shaped altar with flames rising from it.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Ara as a vase with flames coming out of the top.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Ara as an altar.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts "Thuribulum" as a three-legged basin with flames rising from it.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Ara as a hourglass shaped altar with flames rising from the top.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Ara as a cubical altar with smoke rising from it, but does not label it, but at ff.170v-171r it is depicted as a cubical altar with flames rising from it labelled "Sacrum thuribulum vel Vas".

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Ara as a multi-layered rectangular altar with an altar cloth and two candles on top.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Ara as a vase shaped altar with flames rising from the top.

"Ara" appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a square altar with flames rising from the top.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. "Ara" is depicted as a stone altar with two steps leading up to it. Two small dragons fly about the flames on top.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Ara as a cubical altar on legs with flames on top. It is not labelled.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Ara as an altar with flames on top.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Ara as an altar with flames on top.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Ara” as a cubical altar with flames on top.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Ara in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Ara” as a rectangular platform with flames and smoke rising from it.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De l’Altare”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Hearth or Censer”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Ara as a three level square altar with flames and smoke rising from the top.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Lar sieu Thuribulum, vel ara” as a cubical altar with burning sticks on top.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a square altar with flames rising from the top. The label is unintelligible.

Flemish cartographer Jodocus Hondius (Joost de Hondt 1563 – 1612) includes Ara on his 1598 globe and on his *Hemelglobe* (1600) and depicts it as a rectangular altar with flames rising from the top.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Ara” as a two-level rectangular altar with flames and smoke rising from the top.

“Ara” is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a two-level rectangular altar with flames and smoke rising from the top with the subtitle “Thuribulon”.

Ara is omitted from Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

Dutch navigator Frederick de Houtman’s catalogue of fixed stars (1603) lists this constellation as “Het Outaer”.

German uranographer Johann Bayer (1572 – 1603) depicts this as a rounded “fire vessel” on three legs in his *Uranometria* in 1603. Bayer lists these names for this constellation: “Ara, Thuribulum, Auieno, Altare vel Altarium, Capellae Pharus, Sacrarium, Lar, Puteus, Templum, Focus, Prunarum Conceptaculum, Ignitabulum, Batillus”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists the names "Thuribulum" and "Ara" and depicts it as a decorated altar with flames rising from it.

"Ara" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a cubical altar with no smoke or flames.

Ara is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

"Ara" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a cubical altar with flames rising from it.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Ara" as a cubical altar with flames and smoke rising from the top.

Ara is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 which depicts a stone altar with flames on top.

English astronomer Edmund Halley's chart of 1678 depicts Ara as an altar with flames and smoke rising from it and Ara is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 as "Thuribulum".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Ara" with the subtitle "Thuribulum" and depicts it as smoke and flames rising from atop a two-tier altar.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, and *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Ara" as a cubical altar with smoke rising from it.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Ara al Thuribulum" as a tripod stand with a bowl full of fire on top.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Ara as a stone altar with smoke rising from it.

Ara is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: This is depicted as an altar with smoke rising from the top.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Ara" as a cubical altar with flames and smoke rising from the top.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Ara" as a single level rectangular altar with smoke and flames rising from the top.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Ara as a square altar.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Ara as an hourglass shaped altar with smoke rising from the top.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "L'Autel" as a cubic altar with flames on top.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "l'Autel" as a bowl on a tripod stand with flames rising from it.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Autel" as a rectangular single level altar with flames on top, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Altar" and depicts it as a rectangular altar with flames rising from the top.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Ara as a three level altar with flames rising from the top.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Ara" as a cubical altar with smoke rising from it.

Ara is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Altaar": It is depicted as an altar with smoke rising from it.

American uranographer William Croswell (1760 – 1834) depicts "Ara the Altar" on his *Mercator Map of the Starry Heavens* in 1810 as a cubical brick altar with smoke rising from it.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Ara" as a cubical altar with flames on top.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Ara" in his *Celestial Atlas* in 1822: It is depicted as an altar with smoke rising from the top.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Ara the Altar" as an altar with flames rising from the top.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich bears the label "Ara" but has no illustration for it.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Ara, The Altar" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Ara" and describes it as an "Altar".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) slightly redesigned the lines of Ara in his book *The Stars - A New Way to See Them* (1952). The standard IAU lines form a bent four sided figure with one side running through Gamma (γ) and Beta (β) Arae: Rey places Gamma (γ) and Beta (β) Arae in the middle and runs a straight line from Delta (δ) Arae to Theta (θ) Arae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Ara in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as an "H" shape, with one line of stars from Delta (δ)

Arae through Gamma (γ) Arae and Beta (β) Arae to Alpha (α) Arae, another line from Eta (η) Arae through Zeta (ζ) Arae to Epsilon (ε) 1 Arae, and a line connecting Beta (β) and Zeta (ζ) Arae.

Sky and Telescope Magazine, founded in 1941, depicts Ara in their magazine and publications as a four-sided figure with two bent sides made up of Alpha (α), Epsilon (ε) 1, Zeta (ζ), Eta (), Delta (δ), Gamma (γ), and Beta (β) Arae with a line running from Alpha (α) Arae to Theta (θ) Arae.

Arabib:

This asterism "Arabib" is the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899. Hill does not identify the culture this comes from, writing that it is "unexplained".

Aratai:

This Kiribati asterism "Aratai" or "Nei Aratai" is possibly the star Beta (β) Persei (Algol) in the IAU constellation Perseus (Trussel and Groves 1978).

Arbitration:

This Gaulish asterism "Elembiui Prinnios" is the IAU constellation Virgo and appears in the Coligny Calendar (Boutet 2001). Compare this to their asterism Month of the Stag Guiding Star (see below).

Arc de Triomphe:

This telescopic asterism is open cluster NGC 2439 in the IAU constellation Puppis, which was discovered by English astronomer John Herschel in 1847. It is GC 1566 in the *General Catalogue* of 1864. American astronomer Steve Coe (1949 – 2018) described it as a "Arc de Triumph [sic]" and as a "horseshoe shape" (see "Horseshoe" below). It is also known as the "Bold Arrow Cluster" (see below).

Arc of the King:

This asterism is a curve of six stars in the IAU constellation Cepheus. It starts at Beta (β) Cephei (Alfirk) and runs through 11, 24, 31, and Pi (π) Cephei, ending at Gamma (γ) Cephei. The name is a reference to Cepheus.

Arcadian Star:

This Latin asterism "Arcadium Sidus" is the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names*. Allen attributes it to Sophocles (d. 406 B.C.E.), but Sophocles was a Greek author and unlikely to have used a Latin name. English poet John Milton (1608 – 1674) called it "Star of Arcady" in his *Comus*.

Arcalis:

This **telescopic** Andorran star is HIP 72845 (HD 131496) in the IAU constellation Boötes (magnitude 7.8) and was given this name by the IAU NameExoWorlds campaign. Arcalis is a mountain peak in Northern Andorra where the sunlight passes through a hole in the mountain twice a year. It has an exoplanet named Madriu, which is a glacial valley and river that runs through the southeast portion of Andorra and is part of the Madriu-Perafita-Claror UNESCO World Heritage Site.

Arcas:

This Greek asterism "Arkos" or "Arcas" is the IAU constellation Ursa Major. In Greek myth the Goddess Hera turned Callisto into a bear in a fit of rage and her husband Zeus turned Calisto's son Arcas into a bear in the sky to prevent him from hunting Callisto. In another other version Zeus turns Arcas into the constellation Boötes.

This star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed in the Maass 1989 manuscript of the 11th century *De signis caeli ("of the signs of heaven*"), which also lists "Arcus" and "Arcades qui et Boötis, custos plaustri" ("Arcades and Boötis, keeper of the cart"). The Germanicus text in Aberyswyth 735C manuscript of *De signis caeli* lists "Arcus" and the Hyginus text in Leiden 8° 15 manuscript of *De signis caeli* lists "Arcades": He is depicted in these two manuscripts as a wild man wearing an animal skin. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict "Arcas" holding a tube-like piece of drapery away from his cloak with his right hand. The Montecassino 3 manuscript of *De signis caeli* lists "Arcas" and "Boites" and depicts him holding a lion's pelt in his right hand and a curved stick in his left hand. The Freiburg im Breisgau 35 manuscript of *De signis caeli* lists "Bootes" and "Arcasis". Johann Bayer's *Uranometria* (1603) lists "Arcas" as an alternate name for Boötes.

"Arcas" is listed in John Hill's *Urania* in 1754.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Arcas" as a name for Boötes.

Archangel Stars:

This asterism is four stars representing the archangels (Van der Waerden, 1953; Pannekoek 1961):

- Michael (watcher of the east): Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.
- Oriel (watcher of the west): Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.
- Raphael (watcher of the north): Alpha (α) Leonis (Regulus) in the IAU constellation Leo.
- Gabriel (watcher of the south): Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus.

This was derived from the earlier Persian Four Guardians of Heaven, below.

Archer:

An archer appears as a constellation on Babylonian tablets preserved at the British Museum (Massoume 2001).

This Greek asterism "Τοξότης" ("Toxótis") or "Τοξευτής" ("Toxeftís") is the IAU constellation Sagittarius as listed by Eratosthenes (d.194 B.C.E.), Hipparchus (190 – 120 B.C.E.), Plutarch (c.46 – 119), and Ptolemy (c.100 – c.170). Aratus (315 – 240 B.C.E) called it this and "Ρύτωρ τόξου" ("Rýtor tóxou" or "bow stretcher") in his *Phaenomena* (270 B.C.E.). Other Greeks called it "Τοξευτήρ" ("Toxeftír"). Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) listed it as "Arcitenens" (which is used for their God Apollo and the constellation Sagittarius, or Archer) as did 4th century poet Decimus Magnus Ausonius and German astronomer Johann Bayer in his Uranometria (1603). R. H. Allen notes in this *Star Names* in 1899 that English orientalist Thomas Hyde (1636 – 1703) lists it as "Βελοκράτωρ" ("Velokrátor") with the suggested translation "Drawer of the Arrow". This is how it is described in Ptolemy's *Almagest*:

- The "bow" is the stars Epsilon (ε) Sagittarii, Mu (μ) Sagittarii, and Lambda (λ) Sagittarii, with the "arrow" being a line between the stars Gamma (γ) Sagittarii, and Zeta (ζ) Sagittarii. Aratus (315 – 240 B.C.E) called this "Τόξον" ("Tóxon" or "bow"- see Bow, below).

- His “head” is formed by the stars Psi (ψ) Sagittarii, 41 Sagittarii, Xi (ξ) 1 and 2 Sagittarii, Nu (ν) 1 and 2 Sagittarii, and HIP 93498.
- His “left arm” holding the bow goes from a “shoulder” at Sigma (σ) Sagittarii to an “elbow” at Phi (ϕ) Sagittarii to a “hand” at Delta (δ) Sagittarii.
- His “right arm” that is drawing the arrow is a curve from a “shoulder” at Psi (ψ) Sagittarii through Chi (χ) 1 Sagittarii, 52 Sagittarii, and HIP 95865A to a “hand” at Zeta (ζ) Sagittarii,
- His upper “body” runs from HIP 93667 through HIP 95456 to a quadrilateral of stars forming his “rear end”: Omega (ω) Sagittarii, 29 Sagittarii, 62 Sagittarii, and 59 Sagittarii.
- His “rear legs” are two lines of stars running out from Theta (θ) 1 Sagittarii:
    - One goes out to a “hoof” at Kappa (κ) 1 and 2 Sagittarii, and
    - The other goes out to a “knee” at HIP 98761 and a “hoof” at Iota (ι) Sagittarii.
- There are two lines of stars forming his “front legs”:
    - One runs from HIP 94986 to a “knee” at Alpha (α) Sagittarii and a “hoof” at the stars Beta (β) 1 and 2 Sagittarii, and
    - The other runs from HIP 93149 to a “knee” at HIP 91918 to a “hoof” at Eta (η) Sagittarii.

This Arabic asterism “al-Rāmī” is the IAU constellation Sagittarius as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

John Hill gives the name Archer for the IAU constellation Sagittarius in his *Urania* in 1754, as does English Admiral Henry William Smyth in his *Bedford Catalogue* in 1844.

NOTE: This Greek asterism appears on the Daressy Zodiac of the Roman Imperial Period alongside a falcon.

This German asterism “Schütze” is the IAU constellation Sagittarius as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). R. H. Allen lists the Saxon name “Scytta” in his *Star Names* in 1899. See Sagittarius, below.

This Turkish asterism “Yai” is the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899. John Hill lists it as “Y’ac” in his *Urania* in *1754*. Hill translates this term as “arrow, and figuratively, and archer”.

This Arabic asterism “Artashir” (آرتشر) is the IAU constellation Sagittarius.

This Syrian asterism “Keshta” is the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899. John Hill lists it as “Keshto” in his *Urania* in 1754.

This Persian asterism “Kamān” or “Nimasp” is the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899. “Kaman” is listed by John Hill in his *Urania* in 1754.

This Etruscan asterism “Fars” is the IAU constellation Sagittarius.

This Hebrew asterism “Keshet” is the IAU constellation Sagittarius as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud* and is related to their month Kislev. John Hill lists it as “Kesheth” in his *Urania* in 1754 as does R. H. Allen in his *Star Names* in 1899, though Allen also points out that Giovanni Battista Riccioli (1598 – 1671) lists it as “Kerto”.

This Hungarian asterism “Íjász” is the IAU constellation Orion. It is also known as “Nimrod” (see below), and Reaper (see below).

This Romanian asterism “Arcaş” or “Arcaşul” is made up of stars of the IAU constellation Sagittarius (Ottescu 2009, Lite, Lodina, and Ignat 2018):

- A quadrilateral of stars is at one end: Lambda (λ), Delta (δ), Epsilon (ε), and Phi (ϕ) Sagittarii,
- From Phi (ϕ) Sagittarii a line runs out to Sigma (σ) Sagittarii, and
- From Lambda (λ) Sagittarii, a bending line runs through 28, Xi (ξ), Omicron (ο), Eta (η), and 43 Sagittarii to Rho (ρ) 1 Sagitarii.

This Japanese sei shuku or lunar station “Ashitare Boshi” appears in the “Painting of the Deities Forms of the Five Planets and Twenty-Eight Lunar Stations” (五星二十八宿神形図) as an archer (Kotyk 2018). See “Tail” below.

This Ainu Nociw (“asterism”) “Kimun kur-nociw“ is made up of the stars of the IAU constellations Canis Major, Orion and Puppis. The stars of Canis Major represent a kneeling archer drawing a bow and arrow:

- The top of the archer’s head is Theta (θ) Canis Majoris,
- The archer’s hand holding the bow is Alpha (α) Canis Majoris (Sirius),
- His left foot is Pi (π) Puppis and his left knee Epsilon (ε) Canis Majoris,
- His right foot is Rho (ρ) Puppis and his right knee is Eta (η) Canis Majoris,
- The archer is shooting an arrow at a stag (Orion) with the belt of Orion being the arrow striking the deer.

Archer Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Sagittarius as “Shè shén” (射神) or “archer deity” (Kotyk 2017).

Arches Cluster:

This asterism is a star cluster in the IAU constellation Sagittarius and is one of the densest known in the Milky Way. It was discovered by Nagata et al in 1995. However, you won’t see it in visible wavelengths: You need a radio telescope to see this one.

Archer of Ursa Major:

This **telescopic** asterism “Sagittárius Úrsae Majóris” is the grand design spiral galaxy NGC 3310 (Arp 217) in the IAU constellation Ursa Major which is classified as a starburst galaxy. English astronomer William Herschel discovered this in 1789 and listed it as IV 60 in his catalogue. It is GC 2158 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “the combination of the extended arm at the western side of this galaxy and the jet pointing in a northwestern direction, [resembling] a bow and arrow” It is also known as the Bow and Arrow Galaxy (see below).

Arcturus:

See Guardian of the Bear, below.

Arcturus Major:

This asterism is the constellation Ursa Major as listed by Isidore of Seville (560 – 636). Isidore described Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as "Arcturus Minor". Arcturus Major also appears in editions of the *Revised Aratus Latinus* (8th century) as a name for Ursa Major. The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Arcturus Major", as does Kauffmann's translation of the *De ordine ac positione stellarum in signis* in 1888. This relates to the asterism Guardian of the Bear (see below) from which the name of the star Arcturus is derived.

Arcturus Minor:

This star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by Isidore of Seville (560 – 636). Isidore described Ursa Major as "Arcturus Major". The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Arcturus Minor" for this constellation, as does Kauffmann's translation of the *De ordine ac positione stellarum in signis* in 1888. This relates to the asterism Guardian of the Bear (see below) from which the name of the star Arcturus is derived. Johann Bayer's *Uranometria* (1603) lists "Arcturus Minor" as an alternate name for Boötes and attributes it to Isidore.

This asterism is the IAU constellation Ursa Minor as listed in editions of the *Revised Aratus Latinus* (8th century).

Areola of Virgo:

This **telescopic** asterism "Aréola Vírginis" is the elliptical galaxy NGC 4552 (Messier 89) in the IAU constellation Virgo. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Argelander's Star:

There are two stars with this name:

- One star is HIP 57939 or Groombridge 1830, a high proper motion star in the IAU constellation Ursa Major (magnitude 6.45). It is named for German astronomer Friedrich Wilhelm Argelander, who discovered its high proper motion in 1842.
- One **telescopic** star is HIP 54035 or Lalande 21185, a nearby red dwarf star in the IAU constellation Ursa Major (magnitude 7.52). It is named for German astronomer Friedrich Wilhelm Argelander, who discovered its high proper motion in 1857.

Argo:

This Greek asterism Ἀργω , later latinized to "Argo Navis", "Argus Navis", or simply "Navis" ("ship") or "Argo" was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and was one of the 48 original constellations in Ptolemy's *Almagest* (2nd century). It is named for the ship of the mythical character Jason, who is said to have sailed in this ship named "Argo" with his Argonauts to Colchis in search of the Golden Fleece. Cicero (106 – 43 B.C.E.) called it "Argolica Navis" ("Argonautica Ship"), "Argolica Puppis" ("Argonaut's Poop Deck"), "Argoa Puppis" ("Argo's Stern") and ("Argo the Hulk"). Roman poet Sextus Propertius (55 – 15 B.C.E.) called it "Iasonia Carina" ("Jason's Keel"). The Roman poet Ovid (b. 43 B.C.E.) called it "Pagasaea Carina" and "Pagasaea Puppis" after the Thessalian seaport where Jason's ship was built. Plutarch (c.46 – 119) stated that it was inspired by the Egyptian ship of Osiris.

Here is the description of Ptolemy's original asterism, made up of stars of the IAU constellations Carina, Puppis, Pyxis, and Vela:

- The "ship" is a bent loop of stars starting at the "prow" with Psi (ψ) Velorum and running back along the "top deck" through Lambda (λ) Velorum, and Zeta (ζ) Puppis, to Rho (ρ) Puppis at the "stern",
- The line then runs through Xi (ξ) Puppis, Omicron (ο) Puppis, Nu (ν) 1 Puppis, n Puppis, Sigma (σ) Puppis, Chi (χ) Carinae, Delta (δ) Velorum, and Kappa (κ) Velorum and back to Psi (ψ) Velorum,
- The "mast" is the line of stars e Velorum, Beta (β) Pyxidis, Alpha (α) Pyxidis, and Gamma (γ) Pyxidis, and
- The "rudder" is a line of two stars: Gamma (γ) Velorum and Alpha (α) Carinae.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts this asterism as the front half of a galley with a lion's head at the bow, with a sort of "house" in the bow and a row of overlapping shields.

This constellation appears in the 8th century *Revised Aratus Latinus*:

- It is depicted in the Vat Reg lat 1324 edition as a full ship,
- In several other editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) it is shown as half a ship, cut off on the right side, with two oars and a structure resembling a house on the deck,
- In the Paris BN n.a. 1614 manuscript this ship has a three-pronged end.

"Argo Navis" is mentioned in the Leiden *Aratea* (816) and depicted as the front end of a galley with a single mast.

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Navis, quae Graecos Argo nominator" ("The ship, which the Greeks call the Argo").

The 9th century Berlin 130, Madrid 3307, Monza F.9/176, Vat lat 645, Munich 210, Vienna ÖNB 387, Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Argo Navis as a ship with two oars and a tri-prong bow. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict an animal head on one end of the ship. The Paris BN 12117 manuscript of the *De ordine ac positione stellarum in signis* depicts this animal head with a bell on its tongue and disembodied hands on the oars. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts a building on board.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Argo as a complete single masted galley.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Argo Navis". The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict half a ship, with a banner or flag on the mast and two shields on the deck and below it there is a small dog's head except in the Klosterneuberg manuscript, where the dog's head appears at the top of the mast. The Zwettl manuscript has additional dog's heads at the bow and stern. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict half a ship with a small building on the deck and two oars. The Durham Hunter 100 manuscript of *De signis caeli* depicts an animal head at the bow.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Argo as a complete sailing ship with a single mast and two steering paddles.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Argo as half a ship.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Argo as a full single masted ship with a crow's nest and two steering oars sailing to our right.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Argo as a complete sailing galley with a crow's nest. It is sailing to our left. It has a rudder and two oars.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts Argo as a full single masted ship with a crow's nest and two steering paddles. The figurehead of this ship is a dog's head.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Argo as a single masted sailing ship with a crow's nest and two steering paddles. The figurehead is difficult to see as it is in the crease between the pages, but it appears to be the head of a dog. It is unlabelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts only the stern end of Argo at the edge of the astrolabe. It is not labelled

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts the crow's nest and topsail and the top of the poop deck of Argo: The rest of the ship are off the edge of the vault.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Argo as the rear end of a single masted galley with two steering oars.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Argo as a single masted galley sailing to our left.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Argo as a single masted galley sailing to our left.

This constellation appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as "Argo" and is depicted as the stern of a single masted ship with twin rudders sailing into a cloud to our left.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels it both "Argo" and "Nauis" and depicts it as the front half of a galley which abruptly ends midships.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Navis vel Argus" as the back end of a ship with a single mast and lowered sail. The ship has two steering oars.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Argo as a complete sailing ship with a crow's nest and two steering paddles/

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel labels this asterism “Argonavis” and depicts it as a galley with two oars and a shortened stubby mast.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts “Argonavis” as the rear half of a ship entering clouds or fog: The ship has a mast with a crow’s nest at the top and two steering paddles.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Argo Navis” as a complete single masted ship with two steering oars sailing to our right.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts this as the front half of a single masted galley.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts “Argonavis” in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Argonavis” as a ship with a single mast entering clouds heading to our right.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De la Nave chiamata Argo”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Argo” and “Ship”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Argo as the rear half of a ship sailing into a cloud or fog. It has a single mast with a crow’s nest and two steering paddles.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Argo ” as the front half of a ship with double rudders and one mast emerging from the clouds: This has a structure with a peaked roof at one end.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Argus sieu Nauis” (“Argus or Navis”) as a double masted sailing ship with two large rudders sailing to our right. The entire ship is shown.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) labels this “le Grande [unintelligible]” and depicts it as the front half of a single masted galley emerging to our right from a cloud.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Argo” as the rear half of a single masted ship with a crow’s nest sailing into a cloud or fog.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Argo Navis” as the rear end of a single masted ship.

Flemish cartographer Jodocus Hondius (1563 – 1612) included this constellation on his globe in 1598.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels this asterism “Argo” and depicts it as the back half of a single masted galley with twin rudders.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts this asterism as an entire double masted ship flying a Dutch flag.

“Argo Navis” is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1603) depicts this constellation in his *Uranometria* in 1603 as the rear end of a galley which is sailing to our left with its front end concealed by some rocks: There is two men on the deck, one wearing a helmet and holding some sort of pole and another steering the ship. Bayer lists these names for this asterism: “Navis, Argonavis, Currus Volitans, Navis Iasonis, Archa Nohae, Markeb, Sephina”.

Dutch navigator Frederick de Houtman’s catalogue of fixed stars (1603) lists this constellation as “Argo Navis, het Schip”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Argo Navis” as the front half of a galley sailing to our left out of a cloud. It has shields lining the gunwales

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Argo Navis” for this constellation.

“Navis” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as an entire single masted galley.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Arca Noachi” as a two masted sailing ship moving to our right.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 both as “Argo Navis” and as “Arca Noachi”: It is depicted as a two masted sailing ship.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this asterism “Argo Navis” and depicts it as the front half a multi-oared galley with a mast with sail furled and a figurehead emerging from a cloud.

“Argo Navis” is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and is labelled simply “Argo” on his southern sky chart of 1678 where it is depicted as the middle of a sailing ship with two masts flying flags bearing a cross.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Argo Navis” as a sailing ship, but only the mast, sail and a flag are showing above the rim of the planisphere.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Argo Navis” as the front half of a galley with a single mast and shields lining the rails sailing to our left.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this asterism "Argo Navis al Arca Noe" ("Argo's Ship or Noah's Arc") and depicts it as the front half of a galley emerging from a cloud. The ship's rails are lined with rectangular shields, and the figurehead is a ram's head.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this asterism "Argo Navis" and depicts it as the front half of a galley with a single mast emerging from a cloud.

This asterism is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as "Navis": It is depicted as a sailing ship with two masts. The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778 this asterism is listed as "le Navire" ("the vessel").

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Argo as the front half of a galley sailing to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Argo Navis" as the front half of a galley emerging from clouds. A row of shields depicting human faces line the rails.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts "Argo Navis" as a single masted ship with round shields lining the rails.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Argo as the back half of a single masted galley. The front half is obscured by cliffs. There are two armoured males on deck.

John Hill lists "Navis" as a name of this asterism in his *Urania* in 1754, which was a common name for it in his time, abbreviated to "Nav" or "Arg" on charts.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "le Navire" as the front half of a galley emerging from clouds: This has a strange short mast with a long cross piece to one side over which fabric is draped.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Naviere" as the front half of a sailing ship emerging from behind some rocks.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Argo Navis" as the front half of a galley with a single mast.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Navire" as half of a single masted galley.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "das Schiff" in the text and "Schiff" on the charts, depicting it as the front half of a single masted galley.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Nave" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer labels this "Argo noehi" and "Argo navis" and depicts it as a three masted sailing ship.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Argo Navis" as the front half of a single masted galley sailing to our left.

This constellation is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Tschip Argo" and depicted as the front half of a single masted galley.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Schiff Argo".

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Argo Navis the Ship" as the front half of a galley.

American uranographer William Croswell (1760 – 1834) depicts "Argo Navis the Ship" on his *Mercator Map of the Starry Heavens* in 1810 as the front half of a galley with a square sail: Three armoured Argonauts with round shields stand at the rail.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation as "Argo Navis" in his *Celestial Atlas* in 1822: it is depicted as the front of a ship with a mast and with a lion figurehead on the front.

"Argo Navis" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as the front half of a single masted sailing vessel. NOTE: On another chart Argelander depicts "Puppis", "Carina", and "Vela".

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Argo Navis.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Argo Navis" as the rear half of a single masted galley sailing to our right.

"Argo" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as the front half of a single masted ship.

This constellation is listed as "Argo Navis" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism as "Ship Argo" on the charts but just "Argo" in the text.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as "Argo, Jason's Ship".

William Denning's *Telescopic Work for Starlight Evenings* (1891) lists "Argo Navis".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Argo Navis" in his *Star Atlas* (1893) and describes it as the "Ship Argo", though Klein often refers to it simply as "Navis" in this book.

English astronomers Crossley, Gledhill, and Wilson list double stars in Argo such as "γ Argus" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).

American astronomer Winslow Upton's *Star Atlas* (1896) lists "Argo Navis" as and describes it as "Ship Argo".

The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists both "Argo" and its parts (Carina, Puppis, and Vela). By his 14th edition Argo becomes a reference directing you to the other three.

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists the name of this former constellation simply as "Argo".

This constellation was a huge asterism in the southern hemisphere that was 28% larger than the next largest and had 160 stars visible to the unaided eye. Because it was so unwieldy, in 1755 French astronomer Abbé Nicolas Louis de Lacaille divided Argo Navis into three constellations now in use by the IAU: Carina (the keel), Puppis (the poop deck) and Vela (the sails). The center star for this combined asterism is Gamma (γ) Velorum (Regor). De Lacaille also created the constellation Pyxis ("compass") out of the stars beside these three. NOTE: Lacaille replaced Bayer's original designations with ones that more closely represented the stellar magnitudes of the stars for each of the three new constellations, keeping the Greek letters of the Bayer star classifications for Argo Navis, so Carina has stars in the first part of the Greek alphabet, Vela has the middle letters, and Puppis has the end of the Greek alphabet.

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Argo" even though this is after the IAU eliminating it in 1922: This probably was left in this edition as the first edition of this atlas came out in 1910.

This French asterism "Navire Argo" is the asterism Argo's Ship.

This Italian asterism "Nave Argo" is the asterism Argo's Ship.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) reassembles Argo's Ship in his book *The Stars - A New Way to See Them* (1952):

- One end of the ship is a "figurehead" of the stars HIP 51576, 52468, 53253, 51849, and 50371.
- The "deck" of the ship is a line of stars running from HIP 50371 through Iota (ι), Epsilon (ε), Chi (χ), and Gamma (γ) Carinae, Zeta (ζ) and Rho (ρ) Puppis to Xi (ξ) Puppis.
- The "rear" end of the ship is described as a "transom" and is made up of the stars Xi (ξ), Omicron (ο), 3, p, k, and m Puppis.
- The "keel" is the line of stars from p Puppis through Pi (π) Puppis, Nu (ν) Puppis, Alpha (α) Carinae (Canopus), Beta (β) Carinae (Miaplacidus), Omega (ω) Carinae, and Theta (θ) Carinae, returning to the aforementioned "figurehead" (NOTE: the line from Canopus to Miaplacidus thus overlaps the constellation Volans),
- The "sail" is the constellation Vela,
- The "tiller" becomes a line of stars in the IAU constellations Puppis and Pyxis, starting at Zeta (ζ) Puppis and running through Beta (β) and Alpha (α) Pyxidis to Gamma (γ) Pyxidis.

Argo the Hulk:

Cicero (106 – 43 B.C.E.) called Ptolemy's Argo's Ship (see Argo's Ship, below) "Argolica Navis" ("Argonautica Ship"), "Argolica Puppis" ("Argonaut's Poop Deck"), "Argoa Puppis" and "Argo the Hulk".

Argonautica Ship

Cicero (106 – 43 B.C.E.) called Ptolemy's asterism Argo's Ship (see Argo's Ship, below) "Argolica Navis" ("Argonautica Ship"), "Argolica Puppis" ("Argonaut's Poop Deck"), "Argoa Puppis" and "Argo the Hulk".

Argonaut's Poop Deck:

Cicero (106 – 43 B.C.E.) called Ptolemy's asterism Argo's Ship (see Argo's Ship, below) "Argolica Navis" ("Argonautica Ship"), "Argolica Puppis" ("Argonaut's Poop Deck" or "Argonaut's Stern"), "Argoa Puppis" and "Argo the Hulk".

Argo's Keel:

This Latin asterism "Carina Argoa" is Ptolemy's asterism Argo's Ship (see Argo's Ship, below).

Argo's Raft:

This Latin asterism "Argo Ratis" is Ptolemy's asterism Argo's Ship (see below).

Argus:

This Egyptian asterism is one of the paranatellonta of the decans of Sagittarius and Capricornus as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Canis Major.

Ariadne's Coiled Hair:

This asterism is the IAU constellation Corona Borealis as listed in R. H. Allen's *Star Names* in 1899. Compare to Ariadne's Hair (below).

Ariadne's Constellation:

This Latin asterism "Ariadnaea Sidus" is the IAU constellation Corona Borealis as listed by the Roman poet Ovid (b. 43 B.C.E.). Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Corona Boreal" and "Ariadna Constelacion (Ariadne's Constellation)". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Ariadne" as a name for this constellation.

Ariadne's Crown:

This Latin asterism "Ariadnaea Corona", "Corona Ariadnae", or "Corona Ariadnes" is the IAU constellation Corona Borealis:

- *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "del la corona d'Ariadna". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.
- Johann Bayer's *Uranometria* (1603) lists this constellation as "Corona Ariadnae".
- "Corona Ariadnaea" is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638.

- "Corona Ariadnae" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. John Hill listed it in his *Urania* in 1754. R. H. Allen writes in his *Star Names* in 1899 that in the Middle Ages it was often shortened to "Adrian" or "Adriane" and that this name Ariadne's Crown was "a favorite object with youthful observers" in his day.

Ariadne's Hair:

This Greek asterism is the IAU constellation Coma Berenices as described by Eratosthenes (d.194 B.C.E.). Compare to Ariadne's Coiled Hair (above).

This asterism is the open cluster Melotte 11, the Coma Berenices Cluster.

Ariadne's Necklace:

This Minoan asterism is the IAU constellation Corona Borealis. The Uppsala Archaeoastronomical Project proposed this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne's Tribe in Tacoma, Washington in November 2023.

Ariadne's Tiara:

This English asterism is the IAU constellation Corona Borealis as described by Keats in his *Lamia*.

Ariadne's Wreath:

This Egyptian asterism is one of the paranatellonta of the 3rd decan of Libra as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Corona Borealis.

Aries:

The brightest star in Aries is Alpha (α) Arietis (Hamal) at number 49 on the list of 90 brightest stars. None of its stars are brighter than 2nd magnitude. The stars of this constellation appear in 211 of the asterisms in this handbook.

The IAU constellation Aries (IAU abbreviation Ari) first appeared in the Babylonian MUL.APIN tablets as "the Hired Man" (see below), although archeologists have located boundary stones dating from 1350 to 1000 B.C.E. that depict a zodiacal Ram. The Greeks turned this Babylonian "MUL.HUN.GA" ("hired man"), into a ram (Aries) possibly due to a translation error. The character "LU" is a determinative for "people" in Sumerian, but has no use in Babylonian, so they used another character "LU", meaning "ram". In Akkadian this is "Agru" which sounds like "o kriou", which is Greek for "ram".

Aries is the golden ram from Greek mythology that rescued Phrixus and Helle on the orders of the God Hermes. This constellation appears as "Κριός" or "Crius" (see Ram, below) in Ptolemy's *Almagest* (2nd century), and John Hill lists this name in his *Urania* in 1754. Another Greek name for this constellation is "Αἰγόκερως" or "Aigókeros", though this is more commonly used in reference to the IAU constellation Capricorn. Aries ("ram") is the name that the Romans gave to this constellation.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Aries as a ram (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a ram running to the left, looking back over his left shoulder: The vernal equinox point is marked between the front legs of Aries.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Aries the same as the Kugel Globe.

This constellation appears in the Leiden *Aratea* (816) as a ram leaping to the right through a circle while looking back over its right shoulder (Katzenstein & Savage-Smith, 1988): The circle represents the vernal equinoctial colure, which, according to Eudoxan astronomy, passes through the middle of this constellation.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Aries with a belt around his middle. The Los Angeles, Getty Ludwig XII, 5 and Paris BN lat 8663 manuscripts of the *De ordine ac positione stellarum in signis* depict Aries looking rearward. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts a ring around the middle of Aries.

Aries is listed several editions of the 8th century *Revised Aratus Latinus*:

- Several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6, Gottweig 7 (146), Siena L. IV. 25) show him looking over his shoulder while moving to the left with a disc around his middle (there's that vernal equinoctial colure again),
- In the Paris BN n.a. 1614, Munich 560 and Vat Reg lat 1324 editions Aries is looking forwards,
- In the Cologne 83 II edition he is moving to the right and looking over his shoulder and has a ring around his middle.

It appears in the *Epitome Catasterismorum*, a summary of the lost Katasterismoi ("constellations" or "placings among the stars") attributed to Eratosthenes of Cyrene (c. 276 – 195 B.C.E.), the 15th century *De Astronomica* ("the astronomy"), also known as the *Poeticon Astronomicon*, attributed to the Roman historian Gaius Julius Hyginus (1st century B.C.E.), the *Scholia Basileensia* (MS AN.IV.18) of Fulda (820 – 835), De ordine ac positione in signis, a 9th century text, the *Aratus Latinus*, and the *Scholia Strozziana.* In the *Scholia Basileensia* it appears as a ram looking back over its right shoulder, but without the circle. The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists it as "Ariues".

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son offers right and left profile views of Aries on one page. Both depict a ram with curly horns. One is going to our left, looking over its left shoulder and the other is going to our right, looking over its right shoulder.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts as a ram laying down, facing to our left but looking over its left shoulder.

Aries appears as a ram looking over its left shoulder in the 11th century *De signis Caeli*. The Padua 27 manuscripts of *De signis caeli* depicts a belt around his middle. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict him with a long tail, leaping to the left. All but the Klosterneuberg and Zwettl manuscripts show a ring around his middle. The Durham Hunter 100 manuscript of *De signis caeli* depicts Aries walking to the left.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Aries as a ram.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Aries as a ram laying down facing to our left, looking over its left shoulder.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-1406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict the triangle of Deltoton (Triangulum) on the head of Aries Mc Gurk, Patrick (1966).

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists Aries (Dekker 2007).

Geoffrey Chaucer (c.1340s – 1400) and some other English writers between the 14th and 16th centuries gave it the Italian name "Ariete", which also appeared in some Latin texts in the 17th century.

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Aries as a Ram galloping to our left, looking over its left shoulder.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Aries as a ram galloping to our left, looking over its left shoulder.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Aries" as a ram laying down facing to our left and looking over its left shoulder.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Aries" as a ram facing to our left looking over its left shoulder.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Aries as a small four-legged creature resembling a dog with is walking to our left and looking over its left shoulder. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Aries as a ram trotting to our left. The ram is looking straight ahead.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Aries" as a ram walking to our right. The ram is looking straight ahead.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Aries as a ram running to our right looking over its right shoulder.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Aries" as a ram walking to our left while looking over its left shoulder.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Aries as a ram running to our left looking over its left shoulder.

Aries appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a ram lying down facing to our right, looking over its right shoulder, and labelled with the astrological sign for Aries.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Aries" as a ram looking over its shoulder.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Aries as a ram running to our left, looking over its left shoulder. It is not labelled. Real Academia de Historia, manuscript D-97, f.104v – 105r depicts this reversed, with Aries running to our right.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial planispheres made in 1503 by Conrad Heinfogel depicts "Aries" as a ram facing to our left looking over its left shoulder.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Aries as a ram leaping out of a cloudy ring.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depict "Aries" as a ram galloping to our left and looking over its left shoulder.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Aries" as a ram facing left, looking over its left shoulder, with a cloudy ring around its middle.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Aries as a ram walking to our left. It is looking straight ahead.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Aries in the same manner as Dürer et al.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Montone, o vero Ariete". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Ram".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Aries as a ram laying down facing to our left, looking over its left shoulder.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Aries" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Aries as a ram lying down facing to our left, looking over its left shoulder, and labels it with the astrological symbol of Aries.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Aries” as a ram running to our left, looking over its left shoulder.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Belier” as a ram laying down, facing to our right, looking over its right shoulder.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Aries” as a ram galloping to our left, looking over its left shoulder.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Aries” as a ram running to our left who is looking over his left shoulder.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) “Aries” as a ram leaping to the right through a large ring. The ram is looking over its right shoulder.

Aries is listed on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) and depicted as a ram lying down, facing to our left.

Aries is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1603) depicts Aries as a ram running to our right, looking over its right shoulder, in his *Uranometria* in 1603. Bayer lists these names for Aries: “Aries, Princeps signorum coelestium, Dux gregis, Aequinoctialis, Veruex, Chrysomallus, Jupiter Ammon, Arietinum Caput, Elhemal, Elhamel”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Aries” as a ram lying down to our left looking over its left shoulder.

“Aries” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a ram lying down, facing to our right, looking over its right shoulder.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) depicts “Aries” as a ram running to our left, looking over its left shoulder.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Aries” for this constellation.

“Aries” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a ram lying down facing to our right, looking over its right shoulder.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Aries” as a lamb (no horns) laying down facing to our left, looking over its left shoulder.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Aries as a lamb laying down facing to our right, looking over its right shoulder.

Aries is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Aries as a white ram looking back over its left shoulder.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Aries” as a ram lying down looking over its right shoulder.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Aries” as a ram lying down facing left looking back over its left shoulder.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Aries” as a ram lying down facing to our left with the ram looking over its left shoulder.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Belier”, “Aries”, and “Κριός” and depicts a ram laying down facing to our left looking over its left shoulder.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Aries as a ram running to the right looking over its right shoulder.

Aries is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a galloping ram looking over its right shoulder.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as “Aries”.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Aries” as a ram laying down facing right, looking over its right shoulder.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Aries as a running Ram with a cloudy ring around its middle.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Aries as a ram running to our right, looking over its right shoulder.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Belier” as a ram.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Belier” (“the ram”) a ram galloping to our right, looking over its right shoulder.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Aries” as a ram lying down looking over its left shoulder.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Aries” as a goat facing to our left looking over its left shoulder.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) as well as editions of his *Jahrbuch* lists this constellation as “Widder”.

American uranographer William Croswell (1760 – 1834) depicts Aries on his *Mercator Map of the Starry Heavens* in 1810 as a ram lying down and looking over its left shoulder.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Widder" and depicts it as a ram running to our right looking over its right shoulder.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Aries in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a ram lying down and looking over its right shoulder.

"Aries" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a ram lying down facing to the right, looking over its right shoulder.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Aries" as a ram running to our left, looking over its left shoulder.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Aries" as a ram lying down facing to our right looking over its right shoulder.

Aries is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. He is depicted seated facing to the right, looking over his right shoulder.

"Aries" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a ram trotting to our right, looking over its right shoulder.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its chart as the "Ram" but refers to it as "Aries, the ram" in the text.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Aries, The Ram" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Aries, the Ram".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Aries" in his *Star Atlas* (1893) and describes it as "The Ram".

American astronomer Winslow Upton's *Star Atlas* (1896) lists "Aries" as and describes it as a "Ram".

The celestial map of Sandor Nagy (1915) lists this constellation as "Kos" and depicts it as a Ram.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Aries" as "the Ram".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Aries in his book *The Stars - A New Way to See Them* (1952):

- His "head" is the triangle of stars Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan) and Lambda (λ) Arietis,
- His "tail" is the triangle of stars 41, 39, and 35 Arietis,
- His "body" is formed by 41, 35, Alpha (α), Eta (η) and Epsilon (ε) Arietis,

- One “leg” runs from Epsilon (ε) Arietis to a “foot” at Delta (δ) Arietis, and
- One “leg” runs from Eta (η) Arietis to a “foot” at Gamma (ϕ) 1 and 2 Arietis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Aries in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of the three stars Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) Arietis.

Arion’s Lyre:

This Latin asterism “Lyra Arionis” is the IAU constellation Lyra. This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Aristaeus:

This Greek asterism is the IAU constellation Ophiuchus. Aristaeus was a minor God, son of Cyrene and Apollo, and the discoverer of many pastoral arts such as beekeeping and cheese making. Johann Bayer’s *Uranometria* (1603) lists Aristaeus as a name for Aquarius.

Ark of the Covenant:

This asterism is a combination of the stars of the IAU constellations Corvus and Crater and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Arca Foederis” This is listed in Edward Sherburne’s Sphere of Marcus Manilius in 1675 and in John Hill’s *Urania* in 1754 (where Hill only mentions Crater) and in R. H. Allen’s *Star Names* in 1899.

Arkab:

See Hamstring, below.

Arkab Posterior:

See Hamstring, below.

Arkab Prior:

See Hamstring, below.

Arkenstone of Thrain:

This **telescopic** asterism is the globular cluster Messier 22 (NGC 6656) in the IAU constellation Sagittarius. It was discovered by German amateur astronomer Abraham Ihle in 1665 and included in Charles Messier’s catalogue in 1764. It is GC 4424 in the *General Catalogue* of 1864. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham’s Celestial Handbook* that it had always seemed to him “that J. R. R. Tolkien, in his delightful fantasy The Hobbit, unwittingly created an exquisite description of M22 when he spoke of the fabulous jewel called the ‘Arkenstone of Thrain’: ‘It was as if a globe had been filed with moonlight and hung before them in a net woven of the glint of frosty stars.”

Arki:

This Babylonian ziqpu "mulMAS.TAB.BA EGIR-i" from cuneiform text AO 6478 (Schaumberger 1952) is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. Compare this to the ziqpu Arkiti (see below).

Arkiti:

This Babylonian ziqpu "mulSUDUN ANSU EGIR-ti" or "Arkiti" from cuneiform text AO 6478 (Schaumberger 1952) is Xi (ξ) Boötis in the IAU constellation Boötes. Schaumberger indicates that the other star is Omicron (ο), Pi (π), or Zeta (ζ) Boötis. Compare this to the ziqpu Arki (see above).

Arm:

This Arabic star is Epsilon (ε) Persei in the IAU constellation Perseus and is part of their asterism Al Thurayya (see Little Abundant One, below).

This Latin star "Brachium" is Sigma (σ) Lyrae in the IAU constellation Lyra and was approved as a name for Sigma (σ) Lyrae A by the IAU Working Group on Star Names in 2016.

This Vedic star "Bahu" or "Bāhú" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed as listed in the *Maitrayani Samhita* and *Kathaka Samhita* (Leitz 2019) and the Rig-Veda and *Taittirīya Brāhmana* (Ivanković 2021) and in R. H. Allen's *Star Names* in 1899. It is an alternate name for their nakshatra Ardra (see Moist One, below).

This Persian star "Besn" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Armlet:

This Coptic lunar mansion "Κλαρία" or "Klaria" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899, who translates it as "armlet" and gives the alternate name "Bestia seu Statio Typhonis" ("beast or typhoon station"), attributing this to Athanasius Kircher (1602 – 1680). Yeats listed it as "the shoulder blade of the twin" in *A Vision* in 1917, basing it on German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, where Kircher describes it as "scapulas Geminorum" ("shoulder of Gemini"), indicating that they placed it somewhere in Gemini. Kircher also gives the supposedly Arabic name "Albenaab". Edward Sherburne in his *Sphere of Marcus Manilius* lists "Klaria" as the IAU constellation Cancer in 1675.

Arm of Sacrifice:

This Coptic lunar station "Ὀπέυτυς", "Opéytys", "Eupeutōs", "Opeutus", or "Hopeutus" is made up of stars in the IAU constellation Capricornus and was listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. German Jesuit astronomer Athanasius Kircher (1602 – 1680) listed it under the name "Brachium Sacrificii" in his *Lingua Aegyptiaca Restituta* in 1636. John Hill lists "Hopeutus" in his *Urania* in 1754. Yeats lists it as "The Sacrifice of Arm" in *A Vision* in 1917.

Arm of the North:

This Poluwatese star "Pááyefang" is Gamma (γ) Aquilae in the IAU constellation Aquila (Holton et al 2015) and is part of their asterism Mailap (see above). NOTE: "Pää" can be translated as "arm" or "wing".

Arm of the South:

This Poluwatese star "Pááyéér" is Beta (β) Aquilae (Alshain) in the IAU constellation Aquila (Holton et al 2015) and is part of their asterism Mailap (see above). NOTE: "Pää" can be translated as "arm" or "wing".

Arm Sockets of the Crab:

This Latin star "Acetabula" is Alpha (α) Cancri (Acubens) in the IAU constellation Cancer as listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*.

Armadillo:

This Tukano asterism, "Pamõ" or "Tatu", is the IAU constellation Delphinus. Cardoso (2015) lists it as the stars of Aquila and Delphinus (Cardoso 2015, Cardoso 2016). This asterism is divided into "Pamõ Oaduhka" ("Armadillo's bone"), "Pamõ Duhpoa" ("Armadillo's head"), "Pamõ Ohpu" ("Armadillo's body"), and "Pamõ Pihkoro" ("Armadillo's tail"), each related to a particular flood season.

This Barasana asterism "Hamo" is the IAU constellation Corona Borealis (Hugh-Jones 2006, Kemp et al 2022).

This Tupi asterism "Tatu" is the IAU constellation Corvus (De Freita Mourão 2009).

This Wichi asterism was first noted in 1935 but the stars have not been identified (Mariani 2017).

Armadillo's Bone:

This Barasana asterism is a line of three stars near the IAU constellation Corona Borealis (Hugh-Jones 2006). In Barasana mythology the Moon is thought to come down to Earth during eclipses as an armadillo and devour bones of the dead.

Armed King:

This Irish asterism "Caomai" is the IAU constellation Orion, listed as "early Irish" by R. H. Allen in his *Star Names* in 1899.

Armed One:

This Arabic asterism "Al Ḥāmil Luzz" ("armed one" or "spear bearer"), latinized to "Alkameluz", is a line of three stars in the IAU constellations Boötes and Canes Venatici. This is how it is put together:

- The "body" is Alpha (α) Boötis (Arcturus), 12 Boötis, and AW Canum Venaticorum (HIP 67665).
- The "Spear" is a line of three stars crossing the line of stars forming the "High One": Epsilon (ε) Boötis, Eta (η) Boötis, and Tau (τ) Boötis. At each end of the "spear" is a "tassel":
- The "Rear Spear Tassel" or "Flag of the High One" is the star Upsilon (υ) Boötis.
- The "Front Spear Tassel" is the star Rho (ρ) Boötis.

This is part of the Arabic asterism Uplifted Ones (see below).

The Armed One shows up in later atlases and charts:

- Johann Bayer's *Uranometria* (1603) lists "Kolanza" as a name for Alpha (α) Boötis (Arcturus).

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Azimech" and "Azimeth" as names for Boötes.
- German poet Philipp von Zesen (1619 – 1689) listed it as "Al Kameluz".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists "Kolanza"
- German astronomer Johann Bayer (1572-1625) as "Kolanza".
- Variations include "Azimeth Colanza".

Armory:

This Korean lunar mansion "Gyu" is a rough oval of stars in the IAU constellations Andromeda and Pisces. From Nu (ν) Andromedae (next to the Andromeda Galaxy, Messier 31) at one end, one side runs through Mu (μ) Andromedae and Beta (β) Andromedae (Mirach), 82 Piscium, Tau (τ) Piscium, Upsilon (υ) Piscium, Phi (φ) Piscium, and Chi (χ) Piscium, ending at Psi (ψ) Piscium. From Psi (ψ) Piscium the other side runs back through Eta (η) Piscium, Zeta (ζ) Piscium, Epsilon (ε) Piscium, Delta (δ) Piscium, and Eta (η) Piscium, and HIP 2942 and 32 Andromedae, ending back at Nu (ν) Andromedae.

Armour Winged:

This Latin asterism "Armiger Ales" is the IAU constellation Aquila.

Armpit:

This Latin star with the Late Latin name "Ascella" is Zeta (ζ) Sagittarii in the IAU constellation Sagittarius, and this name appears in the 1515 edition of the *Almagest*. The IAU Working Group on Star Names approved Ascella as the name for Zeta Sagittarii A in 2016.

This Latin star "Rutilicus" is Zeta (ζ) Herculis in the IAU constellation Hercules. This is a corruption of the Latin word "titillicus" ("armpit") which indicates the location of this star in the constellation:

- R. H. Allen incorrectly suggested that it may have been derived from "the diminutive of rutilus, 'golden red' or 'glittering'" in his *Star Names* in 1899: This may be because the 1515 edition of the *Almagest* lists it as "Rutillico" but Allen also admits that the 1551 edition adds "penes axillam seu scapulam" ("resting on the axilla or shoulder") which is a clear indication of what the name means.
- Johann Bayer's *Uranometria* (1603) lists "Rutilicum" as a name for Beta (β) Herculis (Rasalgethi).
- "Rutilicum" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who describes it as "brachium dextrum" ("right arm").
- German astronomer Christian Ludwig Ideler (1776 – 1846) suggested it was derived from "rutellum", the diminutive of "rutrum", a sharp instrument of husbandry or war.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Rutilicus": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- The *Century Cyclopedia* of 1894 lists "Rutilico".
- NOTE: The name Rutillicus has also been used to describe the star Beta (β) Herculis (Kornephoros).

Arms of the Scorpion:

This Latin asterism "Brachia Scorpij Viligio" ("the arms of the scorpion watch") is the IAU constellation Libra as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Army:

This Chinese star “Bu” from the Three Kingdoms to the Ming Dynasty is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

Arneb:

See Hare, below.

Arrernte Boy:

This Luritja star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Maegraith 1932). Maegraith writes that this represents an Arrernte boy who is the “child of Acrux and Mimosa of marriage class Paltara” who “lives with his parents in the creek Ulbaia, the Milky Way.”

Arrernte Camp:

This large Arrernte asterism is made up of the stars of the IAU constellations Musca, Pavo, Grus, and Piscis Austrinus: This is the stars of Musca plus Alpha (α) Piscis Austrini (Fomalhaut), Alpha (α) Pavonis, and Beta (β) Gruis. The Arrernte and Luritja peoples divided the sky between them, with this being the Arrernte camp (Clarke 2009). The Milky Way divides the sky into these two camps. See Luritja Camp (below) for the other.

Arrernte Man:

This Arrernte star is Beta (β) Trianguli in the IAU constellation Triangulum as listed by Maegraith in 1932. Maegraith writes that this represents an Arrernte man who is “father of Beta Centauri” (see Luritja Cousin, below) and who belongs to the Knaria marriage class.

Arrernte Woman:

This Arrernte asterism is Alpha (α) Trianguli in the IAU constellation Triangulum as listed by Maegraith in 1932. Maegraith writes that this represents an Arrernte woman who is “mother of Beta Centauri” (see Luritja Cousin, below) and belongs to the Ngala marriage class.

Arrival of Macassans:

This Yolgnu asterism is the IAU constellation Scorpius (Hamacher and Norris 2011).

Arrow:

This Mesopotamian star “KAK.SI.DI” from the *Three Stars Each* tablet from 1100 B.C.E. is Alpha (α) Canis Majoris (Sirius). It is part of their asterism “Ban” (see Bow, below).

This Babylonian and Sumerian star “MUL.KAK.SI.SÁ” listed in the Ura = hubulla XXII list (Yigal, Block, and Horowitz 2015), “KAK.SI.SÁ” or “shukudu” (Anthony 1996), or “MUL.GAG.SI.SA” (Hunger 1992, Parpola 1993) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.), and “mugag-si-sá” in star names and constellations on planisphere K 8538 (Koch 1989) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is listed in the Babylonian star catalogue BM 78161 (Liechty 1988) as “kak-si-sa” and as the star Beta (β) Canis Majoris (Mirzam). It is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul kak.ban” or “mul kak.si.sa” (Koch-Westenholz 1995). Holberg writes in his *Sirius* in 2007 that “Kak-shisha has been translated variously as ‘the dog who leads’ and ‘a Star of the South’”. One Egyptologist suggests that this is possibly the IAU constellation Canis Minor (Berio 2014).

This Babylonian star “kak-si-sa” in the Babylonian star catalogue BM 78161 (5th – 7th century B.C.E.) is Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major.

This Akkadian star “šu-ku-du”, “šiltaḫu”, “šukūdu”, or “sukudu” (Hunger 1992, Parpola 1993, Panaino 1999) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is Alpha (α) Canis Majoris (Sirius).

This Assyrian star “GAG.SI.SA” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This Persian star “KAK.SI.DA” from the list of Lumasi Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is Alpha (α) Canis Majoris (Sirius) as listed by Alfred Jeremias in *Handbuch der Altorientalischen Geisteskultur* in 1929. Ernst Weidner lists it as “kak-si-sa” in his *Fixsterne* in 1971. In later Persian culture it was known as "Tir” or “arrow” (Holberg 2007).

This Asterism “sukudu” from the list of Lumasi stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the stars Alpha (α) Canis Majoris in the IAU constellation Canis Major and Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Boll 1918).

This Greek asterism “Oistos” (Ὀιστός – “arrow”) is the IAU constellation Sagitta as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as originally described by Ptolemy (c.100 – c.170) in his *Almagest*: It is identical to the modern IAU constellation Sagitta except the star Eta (η) Sagittae is missing.

This Arabic asterism “al-Sahem” (سهم) is the IAU constellation Sagitta as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Vedic asterism is the belt of Orion in the IAU constellation Orion (see Orion below). The Vedic names for the three stars are:

- Usa: Zeta (ζ) Orionis (Alnitak),
- Aniruddha: Epsilon (ε) Orionis (Alnilam), and
- Chitralekha: Delta (δ) Orionis (Mintaka).

There are two Arabic asterisms with the name “Sahm” (سهم):

- One is the IAU constellation Sagitta.
    - Giovanni Batista Riccioli (1598 – 1671) lists it as “Schaham”.
    - John Chilmead lists it as “Alsoham” in his *A Learned Treatise of Globes* in 1889, which he derived from Robert Hues’ *A Learned Treatise of Globes* (1659).
    - John Hill lists the names “Sah’m” or “Al Sah’m” in his *Urania* in 1754
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “El sahm, the arrow” and describes it as being depicted with this name on “the Dresden globes” and appearing as “Sham” in the Palermo Catalogue.
    - R. H. Allen lists “Al Sahm” in his *Star Names* in 1899. and Italian astronomer Giovanni Piazzi (1786 – 1846) as “Sham”.
- One, later latinized to “Sham” or “Alsahm” is the star Alpha (α) Sagittae in the IAU constellation Sagitta. In 2016 the IAU approved the name Sham for Alpha (α) Sagittae.

This Northern Andean asterism “Jorge Trujillo” is an arrow created by the stars Beta (β) Cassiopeiae (Caph), Alpha (α) Cassiopeiae (Shedar), Gamma (γ) Cassiopeiae (Navi), Delta (δ) Cassiopeiae (Ruchbah)

and Kappa (κ) Cassiopeiae in the IAU constellation Cassiopeia (Quinatoa 2018). This "arrow" is being held by the warrior Ana Jaramillo de Velastegui (see Warrior, below).

This Khoikhoi asterism "≠ab" the sword of Orion in the IAU constellation Orion (Alcock 2014). This is the arrow of Tsui //Goab (see below).

In Jū/Wãsi and Nama sky lore the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus represents the husband of the daughters of their Sky God Gao ǂN!a. The daughters are the Pleiades cluster in the IAU constellation Taurus. When Gao ǂN!a shot his arrow (Orion's sword) at three zebras (the belt of Orion) it fell short (see Orion below). He didn't recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching. Some versions add that he left his bag of ostrich eggs in the sky (see Bag of Ostrich Eggs, below).

This Chukchi, Koryak, Yakut, and Nganasan star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. This is related to their asterism Hunter (see Hunter, below).

This Suku Bali asterism "Ru" is the belt of Orion in the IAU constellation Orion.

This Yana asterism "Coyote's Arrow" is the belt of Orion in the IAU constellation Orion.

This Chemehuevi asterism is the sword of Orion in the IAU constellation Orion and part of their asterism Hunters (see Hunters, below).

This German asterism is the IAU constellation Sagitta as described by German poet Philipp von Zesen (1619 – 1689), who imagined it as the arrow shot by Joash at Elisha's command, or an arrow shot by Jonathan at David.

The stars of this Tanacross asterism "k'a'" are unidentified at present (Cannon 2021).

This Sahtúotine star "k'I" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Cannon 2021).

This Chinese Chenzhuo xing guan "Shi" is the stars Omicron (o) 1 & 2 Canis Majoris in the IAU constellation Canis Major.

There are eight **telescopic** "Arrow" asterisms:

- One is in the IAU constellation Fornax is made up of 6th magnitude stars one degree west of the galaxy NGC 1365. It is also known as "Chi (χ) 1 2 3", which is a reference to the three stars that it contains: Chi (χ) 1, 2, and 3 Fornacis. This is listed by South African astronomer Auke Slotegraaf in his observations from Sutherland in 2009 and in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011.
- One is the Bold Arrow Cluster, open cluster NGC 2439 in the IAU constellation Puppis, which was discovered by English astronomer John Herschel in 1847. It is GC 1566 in the *General Catalogue* of 1864.This has also been described as a "Horseshoe" see below, and "Arc de Triomphe" (see above).
- One is open cluster Collinder 65 in the IAU constellation Orion and is found on the asterisms list of American astronomer John Davis, who calls it "Orion's Arrow".
- One is Sánta 69, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as an "arrow-like asterism of 15 nearly equal 11 – 12 [magnitude] stars" in the IAU constellation Puppis.
- One is in the IAU constellation Andromeda and is Corder 62 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. It is centered on Sigma (σ) Andromedae, and includes HIP 1579, 1333A, 1403, and 1336A. Size 60' X 30'.

- One, the Arrow Cluster, is made up of eight 7th to 8th magnitude stars in the IAU constellation Cassiopeia 40 arcminutes northwest of open cluster Messier 52. Five stars form the "arrowhead": 4 Cassiopeiae, HIP 115218, HIP 115245, HIP 115141 and HIP 114904A. This is also known as the Party Balloon (see below) or Airplane (see above).
- One is six stars in the IAU constellation Pegasus, forming an arrow pointing at the star Gamma (γ) Pegasi (Algenib). This is Corder 36 on the observing list of American astronomer Jeffrey Corder. A triangle of three 8th – 9th magnitude stars including HIP 856 form the "arrowhead" and a line of three 9th – 10th magnitude stars form the shaft. Size 30'.
- One is globular cluster NGC 6934 (Caldwell 47) in the IAU constellation Delphinus. It was discovered by English astronomer William Herschel in 1785 who listed it as "I 103". It is GC 4585 and 4586 in the *General Catalogue* of 1864. South African astronomer Magda Streicher (1998) described it as an "arrow shape" and goes on to say that "to the south a few minutes away a bright star leads the way with other stars to form an arrow which points away to the south."
- One is made up of stars of the IAU constellation Scutum. It was posted by American astronomer "NYJohn S" on *Cloudy Nights* in September 2022. Its "shaft" is the stars HIP 92322, HIP 92351, HD 174225, and Gaia DR3 4251988451630286976. The "arrowhead" is the "V" of stars HD 174515, HD 174514, HIP 92510, HD 174395 and S Scuti. NYJohn S describes it as an arrow or spear, so I've chosen the first suggestion.

Arrow and Hunter:

This Seri asterism is the IAU constellation Taurus (the Hunter) and the star Alpha (α) Aurigae (Capella-the Arrow).

Arrow Applied to the Arc:

This Latin asterism "Sagitta arcui applicate" is the IAU constellation Sagittarius.

Arrow Bearer:

This asterism with the Greek name "Οϊστοφόρος" or "Οϊstofóros" was depicted on a Turkish globe as the IAU constellation Boötes according to German astronomer Johann Bayer (1572-1625).

Arrow Chain:

This **telescopic** asterism has the name Arrow Chain as it is a colorful chain of about nine stars alongside the three-star "arrow" of the IAU constellation Sagitta, a triangle made up of Alpha (α) Sagittae (Sham), Beta (β) Sagittae and Delta (δ) Sagittae. The chain starts with Zeta (ζ) Sagittae at one end and runs through a line of stars including HIP 97135 and 96936 to Sham. This is Lorenzin 4 and is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011. Size 35' X 10'. Jeffrey Corder lists this as Corder 3989.

Arrow Game:

This Lakota star "Oglechkutepi" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Arrow of the Three Knots:

This Vedic asterism "iṣus trikāṇḍā" is the belt of Orion in the IAU constellation Orion (Panaino 1999).

Arrowhead:

There are two Arabic stars wit this name:

- One, “Zujji n-Nashshāba” (زُجِّ النشابة), later latinized to “Nushaba” or “Nash” is the star Gamma (γ) Sagittarii in the IAU constellation Sagittarius:
    - Edward Sherburne lists it as “Zugi al Nushaba” in his *Sphere of Marcus Manilius* in 1675.
    - The IAU is considering approving the name Nash for Gamma (γ) 1 Sagittarii A.
- One, “al-naşl” (النصل), literally meaning “the point of the arrow”, later latinized to “Alnasl”, “Al Nasl”, “Nash”, “El Nasl”, or “Alnasr” is the star Gamma (γ) 2 Sagittarii in the IAU constellation Sagittarius as listed by 16th century Arab astronomer Al Tizini:
    - R. H. Allen listed “Al Nasl” in his *Star Names* in 1963.
    - The IAU approved the name Alnasl for the star Gamma (γ) 2 Sagittarii.

This Sahtúotine star “k’ı̨ dáre” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Cannon 2021).

This Babylonian asterism from the MUL.APIN tablets “Gagsisa” is the star Alpha (α) Canis Majoris (Sirius), with a triangle of stars around it: 7 and 20 Canis Majoris with HIP 31827 at the tip. It is part of their asterism “Quastu” (see Bow, below).

There are nine **telescopic** “arrowhead” asterisms:

- One, also known as the Unicorn’s Horn, is made up of six blue/white 8th to 9th magnitude stars in the IAU constellation Monoceros 7 degrees north of Alpha (α) Canis Majoris (Sirius) near the star HIP 32064. Size 7’X 6’. This is Harrington 5 on the asterisms list of American astronomer Phil Harrington and Corder 1152 on Jeffrey Corder’s list.
- One is the open cluster NGC 7510 in the IAU constellation Cepheus, which was discovered by English astronomer William Herschel in 1787 who listed it as “VII 44”. It is GC 4902 in the *General Catalogue* of 1864. It is also known as the Dormouse (see below).
- One is the globular cluster Messier 71 (NGC 6838) in the IAU constellation Sagitta. It was discovered by Swiss astronomer Philippe de Chéseaux in 1745 and included in French astronomer Charles Messier’s list in 1780. It is listed in John Herschel’s General Catalogue of 1864 as GC 4520.
- One is Sánta 203, listed in 2015 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “little arrowhead shape asterism… of stars 11.5 – 14 [magnitude]” in the IAU constellation Lacerta.
- One is Simonic 9 from the list of Hungarian astronomer Ilona Simon Mogyorósi, which is in the IAU constellation Eridanus. This is Ennis 14 listed by Canadian astronomer Charles Ennis. Size 180’.
- One is Cseh 34 listed by Hungarian astronomer Viktor Cseh, which is in the IAU constellation Pictor. Cseh describes it as a “3’ X 2’ small star group whose four members form an arrowhead.
- One is in the IAU constellation Canes Venatici and was listed as Corder 2414 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 9’. This includes the stars HIP 62490, 62545, 62594, and 62634.
- One is the open cluster Messier 11 (NGC 6705) in the IAU constellation Scutum. It was discovered by German astronomer Gottfried Kirch in 1681. It is listed in John Herschel’s General Catalogue of 1864 as GC 4437. American astronomer Walter Scott Houston describes it as forming “an arrow-head”. It is also known as the Wild Duck Cluster (see below), the July Salt and Pepper Cluster, the Scutum Salt and Pepper Cluster (see Salt and Pepper, below), the Cluster of the Shield of Sobieski (see below), and “V” (see below).

- One is “Mucronátus Fornácis” (“arrowhead of Fornax”), which is the barred spiral galaxy NGC 1255 in the IAU constellation Fornax. It was discovered by American astronomer Edward Emerson Barnard in 1883. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it the name “Mucronátus” (“Having a sharp point”) as it “looks like an arrowhead”.

Arrows:

This Teleut asterism is made up of two stars:

- The arrow that hit its target is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion which is a blood red colour (Kuperjanov 2006). The Hunter, represented by the star Sirius (see Hunter, below) is hunting three deer (the belt of Orion).
- An arrow that fell short is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Kuperjanov 2006).

Arsenal:

This Chinese xing guan “Kùlóu” (库楼) is a long bending line of stars in the IAU constellation Centaurus: Starting at Zeta (ζ) Centauri, the line goes to a bend at Eta (η) Centauri, then through Theta (θ) Centauri to another bend at 2 Centauri. From here it runs through d Centauri to a bend at f Centauri, then through Gamma (γ) and Tau (τ) Centauri to a final bend at HIP 60517, ending at Sigma (σ) Centauri. Their xing guan “Railings” (see below) is in the middle of the big curve, and all around it is a series of two-star xing guans called “Pillars in Horn Mansion” (see below).

This Chinese Chenzhuo xing guan “Kùlóu” is roughly question mark pattern of stars in the IAU constellations Centaurus and Lupus. Starting at Zeta (ζ) Centauri the line runs through Alpha (α) Lupi, Eta (η) Centauri, Theta (θ) Centauri, Iota (ι) Centauri, HIP 64348, and Gamma (γ) Centauri to HIP 60710, then looping back through Sigma (σ) Centauri and Tau (τ) Centauri to Gamma (γ) Centauri.

Arsenal Added 1:

This Chinese xing guan “Kùlóu Zēng I” (库楼增一) is the globular cluster NGC 5139, Omega Centauri.

Ārt:

This Egyptian decan “Ārt” was in the IAU constellation Taurus. In later Hellenistic texts it was named “ϫωογ” (“Xau”). In the *Testament of Solomon*, it became “Horopel”, 2nd century Jewish philosopher Aristobulus of Paneas called it “Gisan”, in Greek Hermeticism it became “Soou”, in Latin Hermeticism “Jaus”, 4th century Roman astrologer Julius Firmicus Maternus called it “Suo” or “Asicat”, Cosmas of Maiuma (d. 760) called it “Charis”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Asicath” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲥⲉⲣⲁⲡⲓⲥ” (“Serapis”). It has been depicted as a ram’s head with curls with scepters resting on its shoulders.

Art Car:

This American asterism is the IAU constellation Capricornus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is depicted as a car shaped like a shoe.

Arteries:

This Arabic star “al-niyāţ” (النياط) translated as “the aorta” or “the arteries”, later latinized to “Alniyat” or “Al Niyat” is Sigma (σ) Scorpii in the IAU constellation Scorpius. It has this name as it is next to Antares, which they called “Heart of the Scorpion”:

- “al-Nīyāt” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al niyát, the praecordia, or out-works of the heart”.
- The IAU approved the name Alniyat for the star Sigma (σ) Scorpii Aa1.

Artist:

This American asterism is made up of stars of the IAU constellation Andromeda and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Arthur’s Chariot:

This English asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Ottescu 2009).

Arthur’s Harp:

This Welsh asterism “Talyn Arthur” is the IAU constellation Lyra as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909).

Arthur’s Plough:

In John Lydgate’s *Troy Book* (early 1400s) he associates King Arthur with the IAU constellation Ursa Major, calling the Big Dipper asterism “Arthouris Plowe” (Pinard 2022). Victorian folklorist Marie Trevelyan (1852 – 1922) lists “Arthur’s Plough Tail” as a Welsh name for Ursa Major in her *Folk-lore and Folk-stories of Wales* (1909). Ian Freer (2004) lists it as the “Great Plough Tail”.

Arthur’s Wain:

This Celtic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Pinard 2022). It appears in Walter Scott’s *Lay of the Last Minstrel* in 1805.

Arthur’s Yard:

This is a Welsh name for the IAU constellation Orion as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). Freer (2004) lists this simply as the “Yard”.

Aruadorka Kerencséje:

This Hungarian asterism “Aruadorka Kerencséje appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts it as a figure seated on the ground, facing to our right, who appears to be reading a book. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Arula:

This Greek asterism is the IAU constellation Ara.

Arundhati:

This Vedic star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. It is part of their asterism Seven Sages (see below).

As rup e noka-nociw:

This Ainu asterism is the IAU constellation Gemini.

As-Shali:

This Bedouin star "as-Shali" (السهلي) or "al-Shali" is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus.

Asar Battlefield:

This Norse asterism "Asar Bardagi" is the IAU constellation Auriga. This is the battlefield where they believe that the battle Ragnarok will occur. Compare this to the Old Icelandic asterism "Battle of the Æsir" (below).

This Saxon asterism "Asenkampf" is the IAU constellation Auriga as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Asare:

This Xerénte star is Beta (β) Orionis (Rigel) in the IAU constellation Orion. Asare is a cultural hero and half-brother to the Sururu Brothers, which is their name for the Pleiades (see Sururu Brothers, below). NOTE: Dechend (1975) lists this as Kappa (κ) Orionis in the IAU constellation Orion.

Asbila:

This asterism is the IAU constellation Draco as listed in John Hill's *Urania* in 1754: He describes it as "one of the old Greek names of that constellation", but I can find no record of this.

Ascella:

See Armpit, above.

Asclepius:

This Egyptian asterism is one of the paranatellonta of the decans of Scorpius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Ophiuchus. The 11th century *De signis caeli ("of the signs of heaven*") lists this as a name for Ophiuchus. Asclepius is the son of Apollo and Coronis in Greek mythology and becomes a hero and God of medicine.

Asellus Australis:

See Southern Donkey Colt, below.

Asellus Borealis:

See Northern Donkey Colt, below.

Asellus Secundus:

See Second Donkey Colt, below.

Asellus Tertius:

See Third Donkey Colt, below.

'Ash:

This Hebrew asterism from their *Tanakh*, "'Ash" (עָשׁ ʻĀš), or "'Ayish" (Rubin 2019) may be the Hyades cluster, the star Alpha (α) Boötis (Arcturus), the IAU constellation Ursa Major, or even the planet Venus as the "evening star". In his *Urania* in 1754, John Hill describes it as the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga and then later describes it as a Hebrew term for "moth" and associates it with the Pleiades. Edward Sherburne lists it as "Ash" and "Aish" in his *The Sphere of Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "'Aïsh" as Arcturus. R. H. Allen writes in his *Star Names* in 1899 that it is related to the Arabic asterism Daughters of the Bier (see below) which would make it Ursa Major.

Ashdena:

This asterism is the IAU constellation Draco as listed in John Hill's *Urania* in 1754. He describes this name as "Persian". There are multiple stars in this constellation with Arabic names relating to hyenas, wolves, and jackals that could have been corrupted to arrive at this name, including "'aḍ-Ḍibaāʿ" (see Hyena, below), "'adh-Dhi'bayn" (see Two Hyenas, below), and "adzh Dzhi'bayn" (see Two Wolves, below).

Ashera:

This Bedouin asterism from the Negev desert is made up of stars of the IAU constellations Ursa Minor and Cepheus. This is the Caananite fertility Goddess Ashera, cognate with the Phoenician Astarte. Her head would be in the area of Alpha (α) Ursae Minoris (Polaris), and her body aligned with Cepheus (Steiner 2016).

Ashtaroth:

This star is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Ashtaroth, the Syrian Venus".

Ashvins:

This Vedic star "Ashvins" " is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in the Rig-Veda (Ivanković 2021). The Ashvins or Aśvin (meaning "horse possessors"), also known as "Ashwini Kumara" and "Asvinau" are twin Hindu gods associated with medicine, health, dawn and sciences. They are guardians travelling in a chariot drawn by horses that are never weary. Ushas is often described as their consort (see Ushas, below). The heliacal rising of this star marked the beginning of the Vedic year, and the twins represented the light and dark halves of the year.

Asilki:

This Belarussian asterism is the constellation Orion (Avilin 2009). Asilki bagatyr is the name of an epic Belarussian hero. It is also known as "Traiko" (see Three Times, below), "Karomyselko" (see Small Yoke, below), "Grabli" (see Rake, below), "Kastsy" (see Mowers, below), "Try Karali" (see Three Kings,

below), “Kasar” (see Mower, below), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, below), “Tri Siostry” (see Three Sisters, below), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Matawila” (see Wheel, below), “Kosy” (see Scythes, below), “Kigachi ragachy” (see Shaft of a Plough, below), “Kryzhe” (see Cross, below), “Lisa” (see Fox, below), and “Trohkutnaia” (see With Three Corners, below).

Asiňao:

This Carib asterism “Asiňaoyuman”, “Asiňao”, or “Achinnao” represents a Carib who became a star. It is said to cause high winds, rains, and lightning, but its present location is unknown (Magaña, and Jara, 1982).

Asleha:

This Hindu asterism is the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Asmeat:

See Albez, above.

Asp:

This Greek lunar mansion “Egyptian Asp” is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis is unsure whether this is stars in Lynx, Eridanus or Orion.

Asperand of Centaurus:

This **telescopic** asterism “Asperánda Centaúri” is the barred spiral galaxy NGC 3742 in the IAU constellation Centaurus. It was discovered by John Herschel in 1828. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this as it resembles an asperand (@).

Asphalt Path:

This **telescopic** asterism is the dark nebula Barnard 168 (LDN 1055) in the IAU constellation Cygnus. Size 100’X 20’. René Merting describes it on the *Faint Fuzzies* website: “The dark nebula starts faintly in the west and then pulls east as a dark well-defined tube… south of the nebula a prominent star chain pulls from SW to NE and ends near Cr 470.” NOTE: This is next to IC 5146, the Cocoon Nebula (see below). It is Lorenzin 12 on Tom Lorenzin’s list and listed in Gary Seronik’s *Binocular Highlights* and in Steve Coe’s *Best of Barnard’s Dark Nebulae*. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024). It is also known as the Caterpillar (see below), and the Dark Cigar (see below).

Aspidiske:

See Shield, below.

Aspiring of Virgo:

This **telescopic** asterism “Aspirans Vírginis” is the lenticular galaxy NGC 4856 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “I 68”. It became GC 3337 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because they consider it to be “a transition case between and SO and Sa type”.

Assai Fruit:

This Barasana asterism is unidentified stars in the area of the IAU constellation Corvus (Hugh-Jones 2006). This is the fruit of the Euterpe oleracea, a type of palm.

Assembly:

This KhoiKhoi asterism “/hũseti” or “/kxũseti” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014).

This Tuareg asterism “El-Djema’at” is made up of a rough triangle of stars in the IAU constellation Ursa Major: The stars Psi (ψ), Lambda (λ), Mu (μ), Nu (ν), and Xi (ξ) Ursae Majoris (Holbrook 2020). They are a group conspiring to kill a black woman, Polaris. This is part of a larger asterism Black Woman (see below).

Assembly of Matariki:

This Māori asterism “Huihui o Matariki”, also known as “Matariki” (“chief’s eyes”, “small face” or “small eyes”), “Tātai o Matariki”, “Hoko-kumara” or “Ao-Kai” is the Pleiades cluster in the IAU constellation Taurus.

Assembly of Sirius:

The Māori call the star Alpha (α) Canis Majoris (Sirius) “Rehua” so this Māori asterism “Te Huinga-o-Rehua, also called “Te Putahi-nui-o-Rehua” and “Te Kahui-Takurua”, ("The Assembly of Rehua" or "The Assembly of Sirius") included both the IAU constellations Canis Minor and Canis Major, along with some surrounding stars.

Assert:

This “Arabic” name for the IAU constellation Cancer is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

Assistant:

This Chinese xing guan “Fǔ” (辅), the full name being “Assistant of Northern Dipper” or “Vassal of Northern Dipper”, is the star 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major, which the Chinese call the Northern Dipper (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Fu” is the star 80 Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Astarte:

This Phoenician asterism is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. Astarte or Ashtoreth is a Hellenized form of the ancient Near Eastern fertility Goddess Ashtart or Athtart, closely related to Ishtar.

Asterion:

See “Stars” below.

Asterope:

This star “Asterope” or “Sterope” is the double star 21 Tauri in the IAU constellation Taurus. Sterope is one of the Pleiades sisters in Greek mythology, and this is part of the Pleiades cluster:

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as “Asterone” in his *Celestial Atlas* in 1822.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists the name “Asterope” for this star.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists “Asterope”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list “Asterope” for this star.
- The IAU has approved the name Asterope for 21 Tauri A.

Astraea:

There are two Greek asterisms named for the Goddess Astraea, whose name means “star maiden” or “starry night”:

- One is the IAU constellation Libra: Astraea is the virgin goddess of justice, innocence, purity, and precision, which is why her name is associated with Libra.
- One is the IAU constellation Virgo: Astraea is associated with this constellation as she is a virgin. “Astraea” is listed as an alternate name for Virgo in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes Libra as constellation as the “scales of Astraea (Virgo)”.

Astrologer:

This Chinese xing guan “Hòu” (候) is the star 55 Ophiuchi in the IAU constellation Ophiuchus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Hou” is the star Alpha (α) Ophiuchi (Rasalhague) in the IAU constellation Ophiuchus.

Astronomical Observatory:

This Chinese xing guan “Língtaí” (灵台) is a shallow triangle of stars in the IAU constellation Leo: 58, 59, and 63 Leonis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Língtái” is a triangle of stars in the IAU constellation Leo: 75 Leonis, 65 Leonis, and 61 Leonis.

Astronomical Tube:

This English asterism “Tubus Astronomicus” was a common name for the IAU constellation Telescopium (see below) in the 18th century.

Asumpha:

This star is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed by John Chilmead in his *A Learned Treatise on Globes* in 1889 and in R. H. Allen's *Star Names* in 1899. Chilmead attributed this to Abbasid astronomer Abū al-ʿAbbās Aḥmad ibn Muḥammad ibn Kathīr al-Farghānī (Alfraganus, d 861 C.E.). English astronomer Francis Baily (1774 – 1844) listed this as "Serpha", and Allen writes that English orientalist Thomas Hyde (1636 – 1703) changed it to "Mutatrix" (Latin for "mutator").

Asvatthah:

This Vedic star is Gamma (γ) Aquilae in the IAU constellation Aquila as listed in the *Kataka Samhita* (Leitz 2019).

Asymmetrical of Sextans:

This **telescopic** asterism "Dyssýmmetrus Sextántis" is the intermediate spiral galaxy NGC 3023 in the IAU constellation Sextans. It was discovered by Édouard Stephan in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as its symmetry is broken by its interaction with nearby galaxy NGC 3018.

At the End is a Tail:

This Hebrew star "Be-sof ha-zenav" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major as listed in the star list of Abraham Bar Hiyya in 1104 (Goldstein 1985).

Atakoraka:

This **telescopic** Togo star "Atakoraka" is WASP-64 in the IAU constellation Canis Major (magnitude 11) and received this name in the IAU NameExoWorlds Campaign. This is the name of the Atacora, the largest mountain range in Togo. It has an exoplanet named Agouto: Agouto ("Mount Agou") is the highest mountain in this range.

Atargatis:

This asterism is the IAU constellation Virgo. Atargatis (known as Derceto by the Greeks) was the chief Goddess on Northern Syria, representing fertility and well being. "Atargatis" is listed in Johann Bayer's *Uranometria* (1603) as a name for Virgo. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Atargatis" as an alternate name for Virgo.

Athebyne:

See Two Wolves, below.

Athene:

This Egyptian asterism is one of the paranatellonta of the first decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). Mosenkis describes this as the "tail" of the IAU constellation Cetus plus stars of Triangulum. However, Triangulum is quite a distance away and the triangular constellation Sculptor is right next to the "tail" of Cetus.

Athlete's Foot Galaxy:

This **telescopic** asterism "Fußpilzgalaxie" or "Athlete's Foot Galaxy" is the spiral galaxy NGC 7025 in the IAU constellation Delphinus. It was discovered by German astronomer Albert Marth in September 1863. It is GC 5984 in the *General Catalogue* of 1864. It was listed under this name by German astronomers Robert Zebahl and René Merting on their *Faint Fuzzies* website. They gave it this name as it is situated at the foot of the Toadstool asterism (French 1, see Toadstool, below).

Atik:

See Shoulder of Al Thurayya, below.

Atlantides:

This Greek asterism is the Pleiades cluster in the IAU constellation Taurus as listed by as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k). The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists Atlantides. The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch also lists "Atlantides" as a name for the Pleiades. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), mentions this alternative name for the Pleiades. The Pleiades were also known as the Dodonides (see below).

Atlantis:

This star is 17 Tauri (Electra) in the IAU constellation Taurus as listed by Roman poet Ovid (b. 43 B.C.E.) and as listed in R. H. Allen's *Star Names* in 1899. This is a reference to Electra's father Atlas.

Atlantis of Octans:

This **telescopic** asterism "Atlántis Octántis" is the doubled barred spiral galaxy NGC 7098 in the IAU constellation Octans. This was discovered in 1835 by John Herschel who listed it as h 3876 and later as GC 4686 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the structure of this galaxy with its impressive inner and outer rings is reminiscent of Plato's description of the legendary city of Atlantis".

Atlas:

This Greek asterism is the IAU constellation Orion as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k).

This Greek star "Atlas" or "Pater Atlas" is the triple star 27 Tauri in the Pleiades cluster in the IAU constellation Taurus. In Greek mythology Atlas was a Titan condemned to hold up the sky for eternity and was the father of the Pleiades:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) named it "Pater Atlas".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Atlas" in his *Star Atlas* (1893).
- English astronomers Crossley, Gledhill, and Wilson list "Atlas" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Atlas".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Atlas".

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list this star as "Atlas".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Atlas".
- The IAU has approved the name Atlas for 27 Tauri Aa1.

Atlas Born:

This Greek asterism "Ἀτλάγενης" ("Atlágenis") is the Pleiades cluster in the IAU constellation Taurus as listed by the Greek poet Hesiod (d. ~650 B.C.E.) and is listed in R. H. Allen's *Star Names* in 1899.

Atoms for Peace:

This **telescopic** asterism is NGC 7252 (Arp 226), an interacting galaxy in the IAU constellation Aquarius. It was discovered in 1785 by English astronomer William Herschel who listed it as "III 458". It is GC 4780 in the *General Catalogue* of 1864. It is a reference U.S. President Dwight D. Eisenhower's "Atoms for Peace" speech in December 1953: The merging galaxies resemble nuclear fusion, and the giant loops resemble electron orbits. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Pacífica Aquárii" ("peace-maker of Aquarius").

Atri:

This Vedic star "Atri" or "Daksa" is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014, Bhawath 2019). R. H. Allen lists it in his *Star Names* in 1899. Atri is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Atria:

Atria is the star Alpha (α) Trianguli Australis in the IAU constellation Triangulum Australe. The name is a contraction of "Alpha Trianguli Australis" and was approved by the IAU Working Group on Star Names in 2016.

Atropos of Draco:

This **telescopic** asterism "Átropos Dracónis" is the edge-on spiral galaxy NGC 5981 in the IAU constellation Draco. It was discovered by Irish physicist George Stoney in 1850. It became GC 4127 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is "the westernmost member of a beautiful trio, which is reminiscent of the three Fates (Greek Moirai)." Atropos ("she who cannot be turned") was one of those three Fates. This is part of the NGC 5982 Cluster which is also known as the Dragon Slayer Group.

Attack:

This Chinese xing guan "fa" (伐) ("attack" or "behead") is the belt and sword of Orion in the IAU constellation Orion. It appears in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.).

Attack (Adjunct to the Three Stars):

This Chinese Chenzhuo xing guan “Fa” is made up of stars of the IAU constellation Orion:

- The center is the three stars of the Belt of Orion asterism: Zeta (ζ) Orionis, Epsilon (ε) Orionis, and Delta (δ) Orionis,
- The “Left Foot” is Kappa (κ) Orionis,
- The “Right Foot” is Beta (β) Orionis (Rigel),
- The “Left Shoulder” is Alpha (α) Orionis (Betelgeuse), and
- The “Right Shoulder” is Gamma (γ) Orionis.

Atutahi-ma-Rehua:

This Māori star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

‘Au-kele-nui-a-iku:

This Hawaiian star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is named for a hero of Hawaiian legends.

Audiens:

This star “et nominator Audiens” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed in the 1515 edition of the *Almagest* and 1521 edition of the *Alfonsine Tables*. This doesn’t make much sense and R. H. Allen describes this in his *Star Names* in 1899 as seeming “unintelligible unless the word be a misprint for ‘Audens’, the Bold One”.

Auger:

To the Macedonians the “Svirdl” or “Svrdəl” (“the auger”) is found in the “Priest’s Straw” (“Popova Slama”- their name for the Milky Way). This is their name for the Northern Cross (see below) in the IAU constellation Cygnus (Cenev 2004 & 2014). It is also known as the Big Cross (see below).

This German asterism “Bohrer” is an alternate name for the asterism Terebellum (see Drill, below), given to that asterism by German astronomer Christian Ludwig Ideler (1776 – 1846).

Aumea:

This Polynesian (Cook Islands) star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen describes it as associated to “Sirius in their legend of the Pleiades”. Allen lists this as the “Hervey Islands” which is the former name given to the southern islands in the Cook Islands by Captain James Cook in the 18th century.

Aunt Margaret’s Mirror:

This is a **telescopic** asterism inside the open cluster Collinder 69 in the IAU constellation Orion. The star Lambda (λ) Orionis is the “mirror” and a straight line of three stars ending in HIP 26212 is the “handle”. NOTE: *My Aunt Margaret’s Mirror* was a short story in Sir Walter Scott’s *The Keepsake for MDCCXXIX*, which was published in December 1828. I do not know if this is a reference to that story.

Auriga:

The stars of this pentagon of constellations appear in 364 of the asterisms of the world’s sky cultures, which is not surprising since Alpha (α) Aurigae (Capella) is the 6th brightest star.

The IAU constellation Auriga (IAU abbreviation Aur) was first recorded by the Mesopotamians as a constellation "Gam" ("scimitar", "crook", or "throwing stick"- see Crook, below). The Greek Poet Aratus (315 – 240 B.C.E) mentioned it in his poem *Phaenomena* (270 B.C.E.). Many Greeks associated Auriga with the mythical hero Erichthonius of Athens, the son of the smith God Hephaestus: Erichthonius is credited with the invention of the quadriga, a four-horse chariot, which is why the modern constellation is referred to by some modern cultures as the "charioteer". Another Greek myth associates this constellation with Myrtilus, charioteer son of Hermes. Ptolemy (c.100 – c.170) called it "'Ηνίοχος" ("'Iníochos") in his *Almagest* (see Charioteer, below). One ancient Greek name for this is Eniochos ("rein holder"). The name Auriga ("charioteer") is a Roman name for this constellation, and another Roman variation of this name is Aurigator ("driver").

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Auriga as a male figure holding harness in his hands walking to our right (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a charioteer in a biga.

Auriga appears in various forms in the 8th century Revised Aratus Latinus:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Auriga is a figure kneeling to the right with a flail in his right hand and two kids standing on his outstretched left arm,
- In the Cologne 83 edition he has two goats on his outstretched arm,
- In the Paris BN 12957 edition there is a goat standing in front of Auriga,
- In the Paris BN n.a. 1614 edition there are no goats shown and Auriga is in a horse drawn cart,
- In the Vat Reg lat 1324 edition he is in a horse-drawn cart accompanied by rabbits instead of goats,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) Auriga is depicted with a halo.

This constellation appears in the Leiden *Aratea* (816) as a crowned male in long robes and a cape, holding a whip in his right hand: He has a goat perched on his left shoulder and is holding baby goats in his left hand.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Auriga driving a biga and carrying kids on his left forearm, except the Vat lat 645 manuscript omits the kids. The Vat Reg lat 309 manuscript of the *De ordine ac positione stellarum in signis* depicts a beardless charioteer and no kids, but the Paris BN 12117 manuscript depicts a long flowing beard and kids on his right forearm. The Los Angeles, Getty Ludwig XII, 5 and Paris BN lat 8663 manuscripts of the *De ordine ac positione stellarum in signis* omit the chariot and goats, replacing the kids with some unidentified animals. The Los Angeles, Getty Ludwig XII 5 manuscript of the *De ordine ac positione stellarum in signis* depicts rabbits rather than kids and has Auriga holding a lamprey like creature.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Auriga as a clean-shaven male with ear length hair. He is wearing a turban, pants, and knee-length robes. On one page he is turned slightly to our left, holding harness in front of him with his right hand and brandishing a two-thong whip in his left hand. On the other page he is turned slightly to our right, holding harness in front of him with his left hand and brandishing a two-thong whip in his right hand.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Auriga with the reins and a flail in his left hand.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Auriga as a seated male in full dress and wearing a turban. His right arm is crossed in front of him, and his left hand is holding a two-thong whip.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Auriga as a bearded male charioteer wearing a turban. He is squatting facing partially to our left, holding reins in front of him in his right hand and brandishing a two thong whip in his left hand.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Auriga in a chariot Mc Gurk, Patrick (1966).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Auriga as a male in calf length robes stepping to our right. He has what appears to be a skull cap helmet on his head. He is holding harness in his right hand and holding reins in front of himself with his left hand.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Agitator" as a nude male viewed from behind. He is kneeling on his left knee, has harness draped over his right wrist, and has a goat perched on his left shoulder. He is looking at this goat.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Auriga as a figure striding to our right as viewed from behind. There is a goat perched on the figure's left shoulder and the figure has harness draped over his extended right forearm. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Auriga as a curly haired figure running to our left while looking over his left shoulder. The figure appears to be swinging a set of harness in his left hand and has a goat perched on his right shoulder. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Auriga as a male in a knee length tunic running to our left. He has a goat perched on his left shoulder and is carrying a pair of kids in his left elbow.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Auriga as a male standing in what appears to be a four wheeled quadriga pulled to our right by four horses. He is crowned. His right hand is holding an upright pole in the right rear corner of this wagon. His extended left hand is holding the reins of the horses. Two kids are perched on the back of his left hand and a goat is perched on his left shoulder.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Auriga as a male in a knee length tunic running to our left. He has a goat perched on his left shoulder and is carrying a pair of kids in his left elbow.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Auriga as a male in a rectangular biga being drawn to our right by two horses. He is holding a spear in his right hand.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Auriga aut Agitator" is a male viewed from the rear. He is wearing a tunic, boots, and a brimmed hat holding harness in his right hand and what appears to be a wheel in his left hand. He has a goat perched on his left shoulder.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, labels this constellation "Agitator". He is depicted as a bearded nude male kneeling on his left knee as viewed from behind. He is looking to his left and a goat is perched on his left shoulder. In his right hand he is holding reins and harness.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Auriga as a nude male who appears to be seated and turned slightly to our left. He appears to have a club raised in his left hand and holding a whip and harness in front of his crotch in his right hand. It is not labelled. Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Auriga in a similar fashion: Here we see him turned slightly to our right and that what he is holding in his right hand is a whip and what he is holding in front of his crotch with his left hand is harness.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Agitator" as a fully armoured knight walking away from us to our right holding a three thong whip in his right hand and having a goat perched on his left shoulder. A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) depicts "Erichthonius" as a nude male with his back to us. He is holding harness in his right hand and has a goat perched on his left shoulder.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "ERICHTHONIVS" as a nude male viewed from behind. He is kneeling on his left knee and looking over his left shoulder. There is a goat perched on his left shoulder, and he is holding harness for a horse in his right hand.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as Eniochus the "Rein Holder" and Auriga the "Charioteer".

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) labels this constellation "Erichthonius" and depicts him as a nude male facing away from us kneeling on his left knee. He has a goat perched on his left shoulder and his holding harness in his right hand.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Auriga as a nude male with is back to us, kneeling on his left knee. He is looking to his left at a goat perched on his shoulder. It is hard to tell if he has anything in his left hand: Some straight lines fanning out beneath this hand suggest a multi thonged whip.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Auriga, qui et Heniochus, sev Erichtonius" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Erichthonius" as a male in thigh length tunic, tall boots, and a jaunty hat with a feather in it, holding reins and harness in his left hand and a whip in his right hand. A goat labelled "Capra" is perched on his right shoulder.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Agitator sive Auriga vel Erichthonius” (“Agitator or Auriga or Erichthonius”) as a nude bearded male, running to our right, with a goat perched on his left shoulder.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a male in medieval clothing holding harness in his right hand and having his left fist on his left hip. There is a goat perched on his shoulder. The label beside this figure is unintelligible but is certainly not “Auriga”.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Auriga” as a clean-shaven nude male viewed from behind. He is kneeling, turned slightly to our right, looking over his left shoulder. His left hand is concealed and his right hand is holding a whip and harness. No goats are depicted.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Auriga” as a nude male viewed from the rear who appears to be in the process of kneeling. He is holding harness in his right hand and is looking over his left shoulder, where a goat and kids are perched.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) describes this constellation as “Est etiam Aurigae facies, siue Atthide terra Natus Erichthonius” (“It is also the face of Auriga, or Attide, the land where Erichthonius was born”). Grotius depicts Auriga as a young crowned male in a long robe and cape walking to our right. He is holding a whip in his right hand, the handle of which is resting on his right shoulder. A goat is perched on his left shoulder and he is holding two more in his left hand.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Auriga” as a male viewed from behind who is kneeling. He is holding a whip and harness in his right hand and there is a goat perched on his left shoulder. His left hand is holding two baby goats behind his back. The alternate name “Aurigator” is also listed.

German uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a charioteer viewed from behind walking away from us holding a three-thong whip and reins in his left hand: He has a goat perched on his right shoulder and has two baby goats in his right hand behind his back. Bayer lists these names for this constellation: “Auriga, Aurigator, Agitator currus, Custos caprarum, Myrtilus, Retinens habenas, Erichtheus, Erichthonius, Habenifer, Habens hircum capellas hoedos oleniam capram, Mulus clitellarus, Alhaiot, Alharod”.

“Auriga” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a male in a thigh length tunic kneeling on his left knee. He has a whip and harness in his right hand and is cradling a goat with his left arm. Batsch lists the alternative name “Aurigator”.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Aeritonio” (“Erichthonius”), “Agitator”, “Auriga”, and “Heniochus” and depicts him as a nude bearded male viewed from behind kneeling on his left knee with a got sitting on his left shoulder.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Auriga”, “Heniochus”, and “Ericthonius” for this constellation.

"Auriga" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a male with a pointed hat and a thigh length tunic holding a whip and harness in his right hand and cradling a goat under his left arm.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Auriga vel Erichthonius" as a clean shaven nude male kneeling with is back to us, turned slightly to our right. He is holding a two thong whip and harness in his right hand. His left hand is behind his back supporting two kids and a goat.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Auriga as a kneeling male viewed from behind, turned slightly to our left. He has a soft cap on his head. His left hand is holding harness, and his right arm is cradling a goat and two kids behind his back.

Auriga is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Auriga vel Erichtonius" and is depicted as a seated nude male facing away from us holding a whip and harness in his right hand. An animal resembling a goat is clinging to his back.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Auriga" as a nude male viewed from behind kneeling on his right knee holding a whip and reins in his left hand and cradling a goat on his right shoulder.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation both "Auriga" and "Erichthonius" and depicts him as a robed male viewed from behind with a goat on his left shoulder and a whip and reins in his right hand.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Auriga" a male in a calf length tunic and feathered cap as viewed from the rear, knees bent, holding reins and harness in his right hand and cradling a goat and its kids on his right shoulder with his left arm.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Auriga" and "'Ηνίοχος" as well as "Le Char…" (the end of this word is off the edge of the image I am using) and depicts it as a bearded male who is kneeling in a knee length tunic. He is cradling a goat and her kids in his right arm and is looking toward them. In his left hand he is holding a whip with two thongs.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Auriga as a male in a green toga and a red cap with his back to us, facing right, with a goat perched on his right shoulder.

Auriga is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: He is depicted as a seated bearded male wearing furry boots. He is holding reins in his right hand and cradling a goat in his left arm.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Auriga" as a male seated facing us cross legged holding a whip in his right hand and cradling a goat in his left arm.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Auriga" as a kneeling male facing away from us with a whip and harness in his left hand. He has a goat on his right shoulder and his holding a pair of kits behind his back in his right hand.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Auriga as a robed male viewed from behind holding reins in his right hand with a goat on his right shoulder.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Auriga as a male kneeling with is back to us, slightly turned to his left. He is wearing a knee length tunic a soft cap. He has harness and a three-thong whip in his left hand. He is holding his right hand behind his back where in his palm he holds two kids. A female goat is perched on his right shoulder and Auriga's face is turned towards it.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Auriga" as a male viewed from the rear, looking to his left. He is wearing a hat with a feather and a short tunic. He is holding a goat in his left arm and a harness and a whip in his right hand.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Cocher" as a seated male looking over his left shoulder, cradling a goat ("le Chevre") in his left arm on its northern hemisphere chart. On a later close-up chart it is labeled "le Cocher d'Ericton" and he is shown holding reins and harness in his right hand and is cradling at got labeled "la Chevre" as well as a kid in his left arm.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Auriga" as a nude male kneeling with his back to us holding reins and harness in his right hand and cradling a goat on his left shoulder.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Auriga" as a kneeling male holding a whip in his left hand and cradling a goat in his right arm.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Auriga vel Markab" (both terms translating as "driver") in his *Celestial Atlas* in 1822: He is depicted as a seated male in a knee length tunic wearing a furry cap and boots and holding a goat and two baby goats in his left arm and reins and horse bit in his left hand. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts him the same way but simply labels this constellation "Auriga".

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Auriga the Waggoner" as a male with a furry cap and a goat perched on his right shoulder.

"Auriga" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a male facing away from us with knees bent, holding a whip and harness in his left hand. He has a goat on his right shoulder and his cradling a baby goat in his right hand behind his back.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Auriga" as the upper half of a male facing to our right cradling a goat in his left arm.

Auriga is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. He is depicted seated, dressed in a knee length tunic, wearing what appears to be a furry cap: He has a she-goat and two kids gathered in his left arm and is holding a horse bit and reins in his right hand.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this constellation as "Le Cocher d'Ericton". He is depicted seated, wearing a knee length tunic, wearing a feathered cap and furry boots. He is holding reins and a bit in his right hand and is cradling a goat in his left arm.

"Auriga" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877). He is depicted as a seated figure facing us in a long tunic holding a whip in his right hand: A goat is perched on his left shoulder, and he is holding two kids in his left hand.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as "Auriga, the charioteer or wagoner".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Auriga, The Waggoner" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Auriga, the Charioteer".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Auriga" in his *Star Atlas* (1893) and describes it as "The Waggoner".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Auriga" and describes it as the "Charioteer".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Auriga".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Auriga in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart depicts this constellation as the ring of stars Beta (β) Aurigae (El Nath), Theta (θ) Aurigae, Beta (β) Aurigae (Menkalinan), Alpha (α) Aurigae (Capella), Zeta (ζ) Aurigae, and Iota (ι) Aurigae, with the star Beta (β) Aurigae being connected to Taurus. Rey depicts this constellation this way:

- His "head" is the triangle of stars Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), and Delta (δ) Aurigae,
- His body is formed by Alpha (α), Beta (β), Eta (η), Iota (ι), and Theta (θ) Aurigae, and
- One "arm" runs from Alpha (α) Aurigae to an "elbow" at Epsilon (ε) Aurigae to a "hand" at Zeta (ζ) Aurigae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Auriga in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* the same as the IAU standard version except they omit the line between Beta (β) Aurigae and Iota (ι) Aurigae.

Sky and Telescope Magazine, founded in 1941, depicts Auriga in their magazine and publications as the oval of stars depicted on standard IAU charts with two additions:

- Lines run out from Alpha (α) Aurigae (Capella) and Beta (β) Aurigae to Delta (δ) Aurigae, forming a triangle, and
- A line runs from Capella through Epsilon (ε) Aurigae to Zeta (ζ) Aurigae.

Auriga Salt and Pepper Cluster:

See Salt and Pepper below.

Auriga's Hexagon:

This Western asterism is in the IAU constellations Auriga and Taurus. It is made up of the stars Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), Theta (θ) Aurigae, Beta (β) Tauri (Elnath), Iota (ι) Aurigae, and Zeta (ζ) Aurigae. This name was listed in May 2023 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/).

Aurvandil:

This Norse asterism "Orwandil" is the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899, though he does not identify the source, and modern ethnoastronomers don't agree with this. Orwandil is a corruption of the Old Norse name "Aurvandil", which appears in Old English as "Ēarendel", Old High German as "Aurendil", and Lombardic as "Auriwandalo". The Old High German Aurendil also appears as "Orentil" or "Orendel". Aurvandil was a warrior in Norse mythology and appears in the asterism Aurvandil's Toe (see below).

Aurvandil's Toe:

This Norse asterism "Aurvandil's Toe" or "Orendel's Toe" is the IAU constellation Corona Borealis. Aurvandil ("luminous one") was a Norse warrior hero mentioned in the Skáldskaparmál section of Snorri Sturluson's Prose Edda: When his toe froze the God Thor threw it up into the sky. Bender pointed out in 2020 that the Viking name for toe is "tá", so the original name might be "Aurvandil's Tá". As Corona Borealis is a spring constellation indicating the end of winter, and as a similar story appears in Gesta danorum written by Saxo Grammaticus, this seems to be the most likely asterism involved (Persson 2022). Some suggest that it is the star Beta (β) Orionis (Rigel) as this is the foot of Orion, however it is depicted in the 1934 *Nördliche Sternhimmel* sky map of O. S. Reuter based on the work of German astronomer Johann Elert Bode (1747 – 1826) as Corona Borealis. In Old English this name is Éarendel, which is referred to as the morning star in the Old English poem *Crist I* (ll. 104–108) by Cynewulf. J. R. R. Tolkien (1892 – 1973) used the name "Ēarendel" for the evening star in his *Lord of the Rings* trilogy. R. H. Allen incorrectly lists Beta (β) Orionis (Rigel) as "Aurvandil's Toe", probably because he also identifies Orion as Aurvandil (see above). In the 2nd edition of Allen's *Star Names* this is shifted to the star 80 Ursae Majoris (Alcor), and Ferguson (2009) and Grant (1990) also suggest this. However, in 2020 Bender states that "no proper or individual Viking (or Anglo-Saxon) name for Alcor for Aurvandril's [sic] toe is known" but points out that the shape of Corona Borealis fits the description of the end of a toe or toenail. Grim in 1882 and Littleton in 2002 suggest that Aurvandil's toe may be Venus as the morning star.

This Saxon asterism "Aurvandilsta" is the IAU constellation Corona Borealis as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Auspice of Auspices:

This Arabic asterism “sa’d as-su’ud”, called “Auspice of Auspices”, “Luck of Lucks”, “Luckiest of the Lucky Stars”, or “Lucky Stars of the Lucky Ones” is one of their Auspicious Asterisms. It later became the Arabic and Bedouin manzil “Saad Al-Saud”, “Saʿd al-suʿūd”, “Al Sa’d al Su’ud”, (سعد السعود),“Saʿd bulaʿ” (سعد بلع), “Saʿdu ʾs-Suʿud” (سَعْدُ ٱلسُّعُود) or “ʾAs-Suʿud” (ٱلسُّعُود),later latinized to “Sadalsuud” or “Sadalsud”:

- The earliest version of this on the list of Auspicious Asterisms is in the IAU constellations Aquarius and Capricornus and is the stars Beta (β) Aquarii (Sadalmelik) and Xi (ξ) Aquarii. Ibn Qutaybah (828 – 889) later included the star Lambda (λ) Capricorni, and other lists include 46 Capricorni.
- Dorn (1829) lists this as the “Beneficent Star of Fortune” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “sa’d as su’úd, the luckiest of the lucky”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) gives the name “Sadalsuud” to Beta (β) Aquarii.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Sadalsuud” and “Sadalsund” for Beta (β) Aquarii, but the 14th edition (1959) lists “Sadalsuud” for this star.
- The IAU approved the name Sadalsuud for the star Beta (β) Aquarii A.

This Yemeni manzil “Sa’d al-su’ūd” is made up of stars of the IAU constellation Aquarius and Capricornus (Varisco 1995): 46 Capricorni, Beta (β) Aquarii (Sadalmelik) and Xi (ξ) Aquarii. This appears in the *Kitāb al-Tabşira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Auspice of Lambs:

This Arabic asterism “Sa'ad ul-Biham” (سعد البهام), “Saʿd al Bahāim”, or “sa’d al’bah’aim”, its name later latinized to “Baham” or “Bihām”, called “Auspice of Lambs”, “Luck of the Young Beasts”, “Good Luck of the Two Beasts”, or “Lucky Star of the Young Sheep” is a line of two stars: Theta (θ) and Nu (ν) Pegasi in the IAU constellation Pegasus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986):

- Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed just Theta (θ) Pegasi and in the 17th century *Calendarium* of Al Achsasi al Mouakket three stars are listed: Theta (θ), Zeta (ζ), and Nu (ν) Pegasi.
- Dorn (1829) lists this as “Beneficent Star of the Hero” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- R. H. Allen’s *Star Names* in 1899 lists this asterism. Compare this to “Bright Fortunate One of the Two Beasts”, (below).
- The IAU approved the name Biham for the star Theta (θ) Pegasi.

Auspice of Rain:

This Arabic star “al-Saʿad ul-Maṭar” (سعد مطر) or “Al Saʿd al Maṭar”, known as the “Auspice of Rain” or the “Lucky Star of Rain” is Eta (η) and Omicron (ο) Pegasi in the IAU constellation Pegasus, later latinized

to “Sadalmatar” or “Matar”. Some sources only list Eta (η) Pegasi. This asterism heralds the heavy rains of autumn:

- Dorn (1829) lists this as “Beneficent Star of Rain” as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- R. H. Allen translates it as “fortunate rain” in his *Star Names* in 1899 and notes that both stars appear on American uranographer Henry Whitall’s planisphere (1871).
- Robert Burnham also translates this as “the Fortunate Rain” in his *Burnham’s Celestial Handbook* in 1978.
- Matar is the name approved by the IAU for Eta (η) Pegasi Aa.

Auspice of the Aspiring One:

This Arabic asterism “Saʿad al-Humām” (سعد الهمام), later latinized to “Homam” (in the1814 *Palermo Catalogue*), “Homan”, or “Al Hammam” has been translated as “Auspice of the Aspiring One”, “Lucky Star of the High Minded” or “Lucky Star of the One with Great Endeavor”:

- It is found in the IAU constellation Pegasus and was listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449). This is a line of two stars: Zeta (ζ) Pegasi and Xi (ξ) Pegasi.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Homam… from Sa’d al homâm, the hero’s happy star.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists Zeta (ζ) Pegasi as “Homan”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Homam” and “Homan” for this star, but his 14th edition (1959) only lists “Homam” for this star.
- Burnham (1978) translates this as “Lucky Star of the Hero” and notes that English linguist and historian Thomas Hyde (1636 – 1703) “derived it from “Al Hammam”, which seems to mean “The Whispering One”.
- The IAU approved the name Homam for the star Zeta (ζ) Pegasi A.
- NOTE: R. H. Allen translates this as “Lucky Star of the Hero” in his *Star Names* in 1899 and writes that English orientalist Thomas Hyde (1636 – 1703) believed the original name was “Al Hammām” (“Whisperer”). Dorn (1829) translates this as “Beneficent Star of the Hero”.

Auspice of the Exalted One:

This Arabic asterism “saʿd al-bāriʿ” (سعد بارع) or “Saʿad ul-Bāriʿ, later latinized to “Sadalbari”, is Mu (μ) and Lambda (λ) Pegasi in the IAU constellation Pegasus. This has been translated as “Auspice of the Exalted One”, “Lucky Star of the Splendid One”, “Good Luck of the Excelling One”, “Lucky Star of the Excellent One”, and “Auspicious Star of the Splendid One” and is part of their list of Auspicious Asterisms. The IAU approved the name Sadalbari for Mu (μ) Pegasi in 2016.

Auspice of the King:

This Arabic asterism “Saʿad ul-Malik” (سعد الملك) or “sa’d al-malik”, later latinized to “al Sa’d al Malik”, “Sadalmelik”, or “Sadalmelek”, and called “Auspice of the King” or “Lucky Star of the King”, is a line of

two stars in the IAU constellation Aquarius and is part of their list of Auspicious Asterisms: Alpha (α) Aquarii and Omicron (ο) Aquarii. Some sources include 32 Aquarii:

- Zakariya al-Qazwini (1203 – 1283) and Ulugh Beg Mirza (1394 – 1449) listed the name "Al Saʿd al Mulk",later latinized to "Sadalmulk".
- American astronomer Elijah Burritt (1794 – 1838) listed it as "El Melik" and "Phard".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Sadalmelik" and his *Bedford Catalogue* in 1844 lists "Sadalmelik, properly Sa'd al melik, the king's lucky star"; but others read Sa'd al mulk, the lucky star of the kingdom".
- This is listed as "Sa'd el Melik" in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Sadalmelik" as a name for Alpha (α) Aquarii.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Sadalmelik" and interprets this as an Arabic name meaning "king's lucky star".
- "Sadalmulk" is translated by R. H. Allen in his *Star Names* in 1899 as "Lucky One of the Kingdom".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Sadalmelik" and "Sadalmulk" for Alpha (α) Aquarii, but the 14th edition (1959) lists "Sadalmelik" for this star.
- The IAU approved the name Sadalmelik for the star Alpha (α) Aquarii A and the name Sadalmulk is used for Omicron (ο) Aquarii but not approved by the IAU.

Auspice of the Slaughterer:

This Arabic asterism "Saʿad udh-Dhābiḥ" (سّعد الذّابح) or "Al Saʿd al Dhābiḥ", later latinized to "Dabih", "Dahabeh", and "Dschäbbe", is a line of two stars in the IAU constellation Capricornus: One is the five-star system Beta (β) Capricorni, and the other is Alpha (α) Capricorni (Algedi):

- Dorn (1829) lists this as "Beneficent Star of the Butcher" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sa'd adh dhábih."
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Dshabeh": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. Compare this to the later asterism Lucky Star of the Slaughterer, below.
- W. Brennand lists this as "Al-Dabih" in his *Hindu Astronomy* in 1896 and describes it as "four stars in Capricorn".
- R. H. Allen lists it as "Dabih Major" in his *Star Names* in 1963.
- The name Dabih was approved for the star Beta (β) 1 Capricorni Aa by the IAU.
- NOTE: "Dabih Minor" is the star Beta (β) 2 Capricorni in the five-star system Beta (β) Capricorni. It got this name as Beta (β) 1 Capricorni Aa is "Dabih" or "Dabih Major".

Auspice of the Wooden Tents:

This Arabic asterism "Saʿad ul-Akhbiyyah" (سعد الاخبية) or "sa'd al'akhbiya", its name later latinized to "Sadachbia", "Sadalachbia", or "Sadachiba", is four stars in the IAU constellation Aquarius and is part of

their list of Auspicious Asterisms. It is translated as “Auspice of the Wooden Tents” or “Lucky Star of the Tents” and consists of the stars Gamma (γ) Aquarii, Eta (η) Aquarii, Zeta (ζ) Aquarii, and Pi (π) Aquarii. Three of the stars represent the three poles used in a “khiba’”, the traditional wooden tent, with one star in the middle:

- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Sadachbia…derived from the Arabian sa’d al akhbiyah, the lucky star of hidden things.”
- W. Brennand lists this as “Al-Achbiya” in his *Hindu Astronomy* in 1896.
- R. H. Allen notes in his *Star Names* in 1899 that people have mistranslated this as “Lucky Star of Hidden Things or Hiding Places”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Sadachbia” for this star.
- The IAU approved the name Sadachbia for the star Gamma (γ) Aquarii Aa.
- NOTE: This later became the manzil Lucky Stars of the Tent Dwellers (see below).

Auspicious:

This Vedic asterism “Sidhya” is in the IAU constellation Cancer and is the stars Gamma (γ), Delta (δ), and Theta (θ) Cancri (Ivanković 2021). It is also known as “Pusya” (see Nourisher, below).

Auspicious Asterisms:

This is an early Arabic system of Auspicious Asterisms (“as-su’ud”) or “Fortunate Stars” (“Al Suʿūd al Nujūm”) consisting of pairs of stars (one being composed of four stars), all located in the IAU constellations Aquarius, Capricornus, and Pegasus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Su ‘udu l nujúm”. When manzils (lunar stations) were later created, some of these Auspicious Asterisms were incorporated into those. They are:

- Auspice of the Exalted One: sa’d al-bari’
- Auspice of the Aspiring One: sa’d al-humam
- Auspice of the Wooden Tents: sa’d al’akhbiya
- Auspice of Rain: sa’d matar
- Auspice of Lambs: sa’d al’bah’aim
- Auspice of the King: sa’d al-malik
- Auspice of Auspices: sa’d as-su’ud
- Voracious Auspice: sa’d bul’
- Scattering Auspice: sa’d Nashira
- Auspice of the Slaughterer: sa’d adh-dahbih

Variations of the names are all listed here: Bright Fortunate One of the Two Beasts, Lucky One of the Kingdom, Lucky Star of Nashirah, Lucky Star of Rain, Lucky Star of the Camel Striving to Get Pasture, Lucky Star of the High Minded, Lucky Star of the King, Lucky Star of the Slaughterer, Lucky Star of the Splendid One, Lucky Star of the Tents, Lucky Star of the Young Sheep, Lucky Stars, Lucky Stars of the Lucky Ones, Lucky Stars of the Swallower, and Lucky Stars of the Tent Dwellers.

Auspicious Star of the Splendid One:

See Auspice of the Exalted One, above.

Australian Kestrel:

This Boorong asterism “Karik Karik”, also known as the “Spear Thrower” was listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). It is made up of stars of the IAU constellations Sagittarius and Scorpius:

- The tip of the “tail” is Lambda (λ) Scorpii,
- The “body” is a line running through the star Kappa (κ) Scorpii, and
- The “wingtips” are the stars Eta (η) Scorpii and Eta (η) Sagittarii.

NOTE: This is the Australian Kestrel (Falco Berigora).

This Wotjobaluk asterism “Karik Karik” is Lambda (λ) and Nu (ν) Scorpii in the IAU constellation Scorpius (Hamacher 2011).

Austronotus:

This is an unusual asterism because it never actually existed. Before European explorers began to map the southern skies, it assumed that as there was a north star and a constellation associated with it, there must be a southern equivalent. They created Austronotus to be this constellation (once they found it). Of course, there isn’t a naked eye star that could serve as a “south star” for navigators: The IAU constellation in which the southern celestial pole is located is Octans, and its closest principal star is Delta (δ) Octantis, which is just over 6° away from the south celestial pole:

- The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Austronotus as a rather androgynous looking centaur galloping to our left holding carnations in its outstretched hands.
- The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Austronotus as a half human, half cow, leaping to our left. She holds bunches of flowers in each of her outstretched hands. She has 9 stars around her head, one in each fore-hoof, two in her chest, three in her hind flank, three in her left hind foot and three in her tail.
- The Vat Urb lat 1358 manuscript depicts Austrontus as a male centaur.
- The planispheres in Florence Laur 89 sup 43 and Madrid 8282 both depict the human half of Austronotus as a nude female with long hair.
- The planispheres in Vat Barb lat 77 and Vat Urb lat 1358 depict the human half of Austronotus as a short-haired male figure. The animal half is either a lion or, perhaps, a dog.
- A male Austronotus also appears in London BL Add 15819, fol. 62r: He is carrying flowers like those found in Vat urb lat 1358.

Autahi:

This Māori star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Autumn:

This Venda asterism “Tshifhefho” is the Large Magellanic Cloud. It is unsure what the seasonal association is here.

Autumn Star:

This Kaurna star “Parna” is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Hamacher 2011 & 2015, Clarke 2015). Its rising marked the beginning of the wet season, “Wadlworngatti”. Parna was the father of the Tinniinyaranna (see Young Hunters, below).

This Ngarrindjeri star is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus. Its rising marked the beginning of the wet season.

This Greek star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as it appears in the 8th century B.C.E. poet Homer's *Iliad* (Theodossiou et al 2011).

Auxiliary Road:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star Delta (δ) Cassiopeiae in the IAU constellation Cassiopeia.

This Chinese xing guan "Fùlù" (附路) is the star Zeta (ζ) Cassiopeiae in the IAU constellation Cassiopeia. The IAU approved Fulu as the name for Zeta (ζ) Cassiopeiae.

There are two Chinese Chenzhuo xing guans by the name "Fùlù" in the IAU constellation Cassiopeia:

- One is the star HIP 5361.
- One is the star Phi (ϕ) Cassiopeiae.

Avery's Island:

This **telescopic** asterism is the open cluster NGC 2353 in the constellation Monoceros, which was discovered in 1785 by William Herschel who listed it as "VIII 34" in his catalogue. It was GC 1506 in the *General Catalogue* of 1864. It was named for English Captain Avery, who in 1695 captured a ship belonging to the Great Mogul of India and retired to an island a rich man. The person who chose this name was Astronomy Magazine contributing editor Stephen James O'Meara, and is O'Meara 37 in his *Hidden Treasures Catalogue* (2007).

Avid of Aries:

This **telescopic** asterism "Polygónius Aríetis" is the interacting spiral galaxy NGC 935 (Arp 276) in the IAU constellation Aries. It was discovered by Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called its interaction with its partner NGC 935 as "avid, desiring grasping".". It's partner, IC 1801, they called "Desirous of Aries" (see below).

Avior:

This English star "Avior" is Epsilon (ε) Carinae in the IAU constellation Carina. This name was assigned to the star by H.M. Nautical Almanac Office in the late 1930s during the creation of *The Air Almanac* for the Royal Air Force. It is uncertain why this name was chosen: The memoirs of the Superintendent of H.M. Nautical Office at the time, Donald Sadler, do not explain this choice. It was later approved by the IAU.

Awara Palm:

This Carib asterism "Awarayuman" or "Awara" represents the Awara Palm (Astrocaryum segregarum) and announces the short dry season in January when the fruits of this palm are ripe. Its present location is unknown (Magaña, and Jara, 1982).

Axe:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of three stars in the IAU constellation Sculptor: Gamma (γ) Sculptoris (the determinative star), HIP 115833, and Beta (β) Sculptoris.

This Chinese xing guan "Fùyuè" (傅说) is the star G Scorpii in the IAU constellation Scorpius. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. The IAU approved the name Fuyue for G Scorpii.

There are two Chinese Chenzhuo xing guans called "Fūyuè":

- One is a bent line of three stars in the IAU constellation Aquarius: HIP 113204, 113673, and 113562.
- One is the star HIP 87261 in the IAU constellation Scorpius.

This Romanian asterism or "Barda" ("axe") or "Topor" or "Toporul" ("little axe") is the IAU constellation Perseus (Ottescu 2009, Lite, Lodina, and Ignat 2018). Alpha (α) Persei (Mirfak) and Beta (β) Persei (Algol) are "Coada Bardei" ("axe's tail") while Mirfak alone is "Muchia Bardei" ("axe edge"). Gamma (γ) and Eta (η) Persei are the "Gura Bardei" ("axe's tongue").

This **telescopic** asterism is in the IAU constellation Ursa Major and is listed as Corder 2158 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size40' X 25'. A triangle of five stars including HIP 54979, 54992, and 55073 is the "axe head". The "handle" runs down through two 9^{th} – 10^{th} magnitude stars to HIP 55218.

Axe of the Grindstone:

This Arabic asterism "'Fa's al Rahā" is an oval of stars in the IAU constellation Ursa Minor: It starts with a star they call "The Kid" (al-Juday), Alpha (α) Ursae Minoris (Polaris) and runs around through HIP 62572A, 4 Ursae Minoris, 5 Ursae Minoris, Beta (β) Ursae Minoris (Kochab), Zeta (ζ) Ursae Minoris, Epsilon (ε) Ursae Minoris, and Delta (δ) Ursae Minoris. Their asterism Two Oryx Calves (see below) is attached at Kochab. "'Fa's al Rahā" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). Sufi appears to have gotten this from the Persian polymath Abū Hanīfa al-Daīnawri (d. 895).

Axle Hole:

This Arabic star "Al Fass" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899.

Axolotl:

See Water Animal, below.

Ayela:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Ayeyarwady:

This **telescopic** Myanmar star "Ayeyarwady" is HIP 13993 (HD 18742) in the IAU constellation Eridanus (magnitude 7.81) and received this name in the IAU's NameExoWorlds Campaign. It is their name for the

Irrawaddy River. It has an exoplanet named Bagan, which is the name of one of its ancient cities beside this river.

Az-u:

This Persian (Achaemenid Period 539 – 331 B.C.E.) asterism "Az-u" from the K 250 and VAT 9418 lists as listed in Franz Boll's *Ancient Observations of Coloured Stars* in 1918 is not yet identified.

Azazel:

This German asterism is the IAU constellation Capricornus as listed by German poet Philipp von Zesen (1619 – 1689) and astronomer Guillaume Postel (1510 – 1581). Azazel was the Scapegoat of Leviticus. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this scape goat, attributing it to Postellus.

Azelfafage:

See Horse Track, below.

Azha:

See Ostrich Nest, below.

Azha Al Naam:

This is listed as the "Arabic name" for the IAU constellation Corona Australis in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754. Sherburne translates "Az'ha Al Naâm" as "Nidus Struthonius, ['Ostrich Nest'] as being near two Stars in the Leg of Sagittarius called Al Naâim, whereof one is called Al Naâm al Sadir, i. e. Struthio adiens aquam ['An ostrich going to the water'], the other Al Naâm Al Wârid, i. e. Struthio rediens ab Aqua {'an ostrich returning to the water']". This is a misinterpretation of the Arabic asterism awwal al-naʿām" or "awwil al naʿāmāt (see First Ostrich, below), which is the star Eta (η) Ceti in the IAU constellation Cetus and is part of their asterism Hen Ostriches (see below).

Azure Emperor:

This Chinese star "Cangdi" from the Three Kingdoms to Ming Dynasty is Omicron (o) Leonis in the IAU constellation Leo and is part of their xing guan Seats of the Five Emperors (see above).

Azure One of Reticulum:

This **telescopic** asterism "Cyáneus Retículi" is the barred spiral galaxy NGC 1559 in the IAU constellation Reticulum. It was discovered by James Dunlop in 1826. This became 2634 on John Herschel's list and later GC 843 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Azure One of Ursa Major:

This **telescopic** asterism "Azúreus Úrsae Majóris" is the barred spiral galaxy NGC 3319 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed as "III 700". It became GC 2165 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One*

Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its colour.

B:

One is the open cluster NGC 3766 (Caldwell 97) in the constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "III 7" in his catalogue. It is GC 2468 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster, Hilda's Cluster, the Eye, and the Rich Man's Jewel Box. South African astronomer Pierre de Villiers (2016) describes it as an "open cluster with a 'B' shape".

Bā:

This Chinese star "Bā" from the 3 Kingdoms and Ming Dynasty Period is the star Epsilon (ε) Serpentis in the IAU constellation Serpens and is part of their xing guan Heavenly Market West Wall (see below).

Baade's Galaxy A:

This **telescopic** asterism PGC 2906 is a galaxy in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in December 1785. It is named for American astronomer Walter Baade (1893 – 1960) and is next to the Andromeda Galaxy.

Baade's of Cetus:

This **telescopic** asterism "Baádius Céti" is the irregular dwarf galaxy IC 1613 (Caldwell 51) in the IAU constellation Cetus. It was discovered by Max Wolf in 1906. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor Walter Baade, who identified this galaxy as a nearby system".

Baade's Window:

This is an area relatively free of interstellar dust in the IAU constellation Sagittarius. It was discovered by Walter Baade in the mid 1940s.

Baaltis:

This Assyrian asterism "Baaltis", "Belat", "Belit", or "Beltis" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Baaltis is the wife of the God Bel.

Baayami:

This Ngiyampaa (Ngemba) asterism representing their mythical hero is made up of stars in the IAU constellations Lepus, Orion, and Taurus (Fuller et al 2014):

- His "head" is the star Beta (β) Orionis (Rigel),
- One "arm" runs to Alpha (α) Tauri (Aldebaran),
- One "arm" runs down through the sword of Orion to a "boomerang" in his hand made up of the stars Theta (θ) Leporis, Eta (η) Leporis, Zeta (ζ) Leporis, Alpha (α) Leporis (Arneb) and Beta (β) Leporis (Nihal), and
- His "feet" are the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix).

Baba:

This Egyptian decan “Baba” was in the IAU constellation Pisces. In later Hellenistic texts it was named “ϰγ” (“Biu”). In the Testament of Solomon, it became “Autoth” or “Autothith”, Aristobulus of Paneas called it “Achaf”, in Greek Hermeticism it became “Tetimo”, in Latin Hermeticism “Fambais”, 4th century Roman astrologer Julius Firmicus Maternus called it “Acha” or “Atapiac”, Cosmas of Maiuma (d. 760) called it “Okeanos”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Archatapias” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ρεφαν” (“Rephan”). This has been depicted as an old man in a blue robe wrapped from chest to heels with a flask in his right hand.

Babaniman:

This Kiribati star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Trussel and Groves 1978).

Babcock’s Star:

This **telescopic** rotating variable star, “Babcock’s Star” or “Babcock’s Magnetic Star” is HIP 112247 in the IAU constellation Lacerta (magnitude 8.82). It was named for the astronomer who found it: American astronomer Horace W. Babcock (1947).

Baboon Nebula:

This **telescopic** asterism is the reflection nebula NGC 6726 in the IAU constellation Corona Australis. It was discovered by German astronomer Albert Marth (1828 – 1897) observing from Malta. It is GC 5935 in the General Catalogue of 1864. Scottish astronomer Robert T.A. Innes (1861 – 1933) referred to it as part of a complex nebula he calls “Schmidt’s Nebula” in 1896: This would be Johann Friedrich Julius Schmidt, who was director of the National Observatory of Athens from 1858 – 1884. A photo on the Sky page of Facebook by American astrophotographer Chuck Ayoub bore this name on 1 August 2025. It is also known as the “Anteater Nebula”.

Baby:

This Polish asterism “Niemowlę” is the Pleiades cluster in the IAU constellation Taurus. This “baby” asterism appears elsewhere in central and eastern Europe.

Baby Camel:

This Arabic star is HIP 86782 in the IAU constellation Draco and is in the middle of their asterism Mother Camels (see below).

This Tuareg asterism “Aourâ” is the stars of the Little Dipper minus the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Holbrook 2020). Polaris represents a black woman, Lemkechen (see Black Woman, below) who is holding this baby to be suckled by her mother, “Tâlemt” (see Mother Camel, below).

Baby Dumbbell Nebula:

This **telescopic** asterism is planetary nebula PK 086-08.1 in the IAU constellation Cygnus.

Baby Eagle Nebula:

See Vulture Head Nebula (below).

Baby Llama:

This Inca asterism “Uñallamacha”. (“baby llama” or “suckling baby llama”) is part of their asterism “Yana Llama”, “Yacana”, or “Yaqana” (see Black Llamas, below), which represents a mother llama and its baby (Gamarra & Gamarra 2009, Urton 1981 & 2022). The body of the mother llama is the dark nebulosity in the Milky Way stretching between the IAU constellations Centaurus and Scorpius and the baby llama is suckling at her mother’s breast.

This Quechua asterism “Llamita” (Ciancia 2018) is identical to the Inca asterism “Uñallamacha” (above). This is also known as “Mamalita” (see Woman, below).

Baby Nebula:

See Soul Nebula.

Baby Pointers:

This asterism is Corder 2014 in the IAU constellation Carina and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 110’. This asterism is the stars p and q Carinae, which point to the False Cross (see below).

Baby Scorpion:

See Scorpion below.

Baby Snakes:

This Estonian asterism “Põhjamadu” is the IAU constellation Draco and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Bacchus’ Stars:

This Latin asterism “Bacchi Sidus” is the IAU constellation Leo. Bacchus was often associated with this constellation in ancient times. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Bacchi Sidus”.

Back:

This Arabic star “Dhur” (ظهر) is Delta (δ) Leonis in the IAU constellation Leo. Compare this to Lion’s Back, below.

Back Leg:

This Latinized Arabic star is Mu (μ) Ursae Majoris in the IAU constellation Ursa Major. This is listed on the 14th century astrolabe #4560 from Christian Spain as “Rigorca”, which is probably derived from “Rig(el) Orsa(e), a combination of Arabic and vernacular Latin for “rijl Ursae” (King 2002): King notes that the proper Arabic form would be “rijl al-dubb”, the “back leg of the Bear”.

Back of Al Jawza:

This Bedouin (Western Saudi Arabia) asterism “Ẓahr al-Ǧawzā” (ظهر الجوزا) is the belt of Orion in the IAU constellation Orion (see Orion below, and Al Jawza, above).

Back of the Bear:

This Arabic star "Kāhil ud-Dubb" (كاهل الدّب) is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major. It comes from "żahr ad-dubb al-akbar" (ظهر الدب الاكبر) meaning "the back of the Greater Bear":

- This is listed as "Zahr al-dubb al-akhbar" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) and Savage-Smith translates this as "brighter of the two calves": This star was part of the Arabic asterism "Two Calves" (see below).
- This was later latinized to "Dubhe" (in the *Alfonsine Tables*- Kunitzsch 1986), "Dubbe", "Dubon", "Dubb" (first appearing in the 15th century *Alfonsine Tables*), "Ak Dubb", and Robert Browning, in his *Jochanan Hakkadosh*, listed "Dob".
- Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Edub" (Dekker 2000).
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "Dubhe".
- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Dubhe".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Dubhe"
- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as "Dubhe".
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists "Dubhe" for this star.
- Johann Bayer's *Uranometria* (1603) lists the names "Dubhe" and "Ovae in Humero" ("eggs on the shoulder") for this star.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Dubhe vel Dubon" and "Dubolacharo" for this star.
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists "Dubhe".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Dubhe".
- American uranographer William Croswell (1760 – 1834) lists this star as "Dubhe" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Dubhe" in his *Celestial Atlas* in 1822.
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Dubhe".
- English Admiral Henry William Smyth's *Prolegomena* in 1844 lists "Dubhe" and his *Bedford Catalogue* in 1844 lists "Dhuhr dub-al-akbar, the back of the Great Bear."
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Dubhe".
- This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Dubhe": The author is unknown, but it is based on the Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Dubhe".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Dubhe".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Dubhe".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Dubhe".

- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Dubhe" and describes it as "She-bear".
- R. H. Allen listed the Arabic name "Ṭhahr al Dubb al Akbar" in his *Star Names* in 1899.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Dubhe" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Dubhe".
- The IAU approved the name Dubhe for Alpha (α) Ursae Majoris A.

Back of the Crane:

This asterism is Corder 4632 in the IAU constellation Grus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This is the stars Beta (β), Delta (δ) 1 and 2, Mu (μ) 1 and 2, Lambda (λ), and Gamma (γ) Gruis.

Back of the Lion:

This Arabic star "Zhahr al-Asad" is Delta (δ) Leonis in the IAU constellation Leo:

- "Zhahr al-Asad" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Zhahr al-Asad" is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "zahr al-asad".

Back of the Mouth of the Twins:

This Babylonian star "Arkū-sha-pu-u-mash-mashu" is Mu (μ) Geminorum in the IAU constellation Gemini as listed in R. H. Allen's *Star Names* in 1899. This seems unlikely as this star is located in the foot of the "twin" Castor. It is more likely to be Rho (ρ) Geminorum.

Back of the Snake Man's Hand:

This Arabic star "Mu'akhkhir Yad ul-Ḥawwā'" (مؤخّر يد الحوّاء) is Epsilon (ε) Ophiuchi in the IAU constellation Ophiuchus. It was later latinized to "Yed Posterior". The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as "Yed". Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Yed". The IAU approved the name Yed Posterior for Epsilon (ε) Ophiuchi.

Back Side of the Bucket for Water Pouring:

This Arabic and Bedouin manzil "Al-Muakhar", "al-Mwaḫḫar", "Al-Muhhar" (المؤخر), "Farghu ʾd-Dalū ʾl-Muqdim" (فَرْغُ ٱلدَّلْو ٱلْمُقْدِم), or "ʾAl-Muqdim" (ٱلْمُقْدِم) is in the IAU constellation Pegasus and is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab). An earlier version is their asterism Second Spout (see below):

- Dorn (1829) lists this as "Second Aperture of the Bucket" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

- W. Brennand lists this as “Al-Pherg-Al-Muacher” in his *Hindu Astronomy* in 1896.
- NOTE: John Hill lists “Mosalsala” or “Al Mosalsala” as “one of the Arabic names” of the IAU constellation Andromeda in his *Urania* in 1754. It is probably a misinterpretation of this asterism, which is part of their asterism “Dilu Albir” (see Well Bucket, below).

This Yemeni manzil “al-Fargh al-Mu’akhkhar” is in the IAU constellations Andromeda and Pegasus and is the stars Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296). NOTE: These two stars appear as the Arabic and Bedouin manzil Front Side of the Bucket for Water Pouring (see below).

This Persian asterism “Miyan” is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) as listed in R. H. Allen’s *Star Names* in 1899.

This Sogdian asterism “Bar Farshat” is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) as listed in R. H. Allen’s *Star Names* in 1899.

This Khorasmian asterism “Wabir” is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) as listed in R. H. Allen’s *Star Names* in 1899.

Backbone of the Serpent:

This Arabic star “Al Faḳār al Shujāʿ” is Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra.

- Variations include “Suhel al Fard”.
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “al-ward alladhī fī ‘unq al-shujā” and the Hebrew name “ha-adom she-hu’ be-savar ha menasse’h” (“The red that is in the neck of the victor”).
- “Al Faḳār al Shujāʿ” is listed in R. H. Allen’s *Star Names* in 1899.

Backside of the Lion:

This Arabic asterism “Al ‘Ajz al Asad” (عجز الأسد), translated as “Backside of the Lion” or “Rump of the Lion”, is the IAU constellation Corvus as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050). This is close to, but not part of the earlier Arabic asterism Lion (see below):

- John Hill lists this as “Aigar al Asad” and gives the Latin translation “Clunes Leonis” (“buttocks of a lion”) in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “’Azal al Asad, the lion’s rump”.

This Persian (Achaemenid Period 539 – 331 B.C.E.) star “GIS KUN A” is Theta (θ) Leonis in the IAU constellation Leo (Hunger and Sachs 1988).

Backward Galaxy:

This **telescopic** asterism is NGC 4622, a face on unbarred spiral galaxy with a prominent ring structure in the IAU constellation Centaurus: It is a member of the Centaurus Cluster (NGC 4622, 4616, 4622B, 4679, and 4709). This was discovered by English astronomer John Herschel in 1847 who listed it as “h 3409”. It is GC 3156 in the *General Catalogue* of 1864. It is called this as most of its spiral arms lead the rotation,

where in most galaxies they trail the rotation: It does have an inner "trailing" arm. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Anticámpe Centaúri" ("counterwinding of Centaurus").

Backwards 5:

This **telescopic** asterism that resembles a backwards number "5" is in the IAU constellation Hercules. The brightest star is at the end of the curve in the "5", HIP 81312 (magnitude 7.1). All the rest of the stars in this asterism are around 11th magnitude except for the one at the other end (magnitude 8.75). It is located 1 degree southwest of Zeta (ζ) Herculis. Size 20' X 10'. This is Harrington 23 in the asterism list of American astronomer Phil Harrington, and it is listed by Robert Zebahl on his *Faint Fuzzies* website. Jeffrey Corder lists it as Corder 3072.

Backwards F:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is a backwards "F" which can be found in the IAU constellation Eridanus two degrees south of the star 21 Eridani. It includes the stars HIP 16989, 16960, 17063, 17088, and 17143.

Backwards Gamma:

This **telescopic** asterism is in the IAU constellation Taurus and is Corder 601 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This includes HIP 18046 and 18106. Size 12'.

Backwards L:

This **telescopic** asterism is in the IAU constellation Eridanus and is Corder 587 on the observing list of American astronomer Jeffrey Corder. Size 60'. This includes HIP 17744, 17727, and the double star HIP 17895.

Backwards S:

This **telescopic** asterism is in the IAU constellation Capricornus and is Corder 4554 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is twelve 7th – 9th magnitude stars including HIP 108717 and 108716.

Backwards Sigma:

This **telescopic** asterism is in the IAU constellation Eridanus and is Ennis 62 on the observing list of Canadian astronomer Charles Ennis. Size 95' X 20'. This is nine 6th – 9th magnitude stars resembling a backwards capital Greek letter Sigma (Σ) including HD 26704, HIP 19689, HIP 19626, SAO 131027, Gaia DR3 3203688506352880256, HD 26641, SAO 131032, HIP 19700 and HD 26599. This includes stars of Corder 642 on Jeffrey Corder's observing list, which Corder describes as "nearly check mark shaped".

Baden:

This asterism "Baden" is made up of the stars of the IAU constellation Triangulum Australe by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This is depicted with a gold crown having a pair of antlers rising from it.

Next to this is another crown with a slightly different set of antlers attached which appears to be made up of the stars of the IAU constellation Musca: The label for this asterism starts with an “S” but is otherwise unintelligible in the JPEG I was examining.

Badwuja’s Brother:

This Kokatha and Ngalea star is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Baekdu:

This Korean star is 8 Ursae Majoris in the IAU constellation Ursa Major and received this name in the IAU NameExoWorlds campaign. Baekdu is the highest mountain on the Korean peninsula, situated in North Korea. It has an exoplanet named Halla, which is the name of the highest mountain in South Korea and considered sacred.

Bag of Hupas:

This Filipino asterism “Supot ni Hupas” is the Pleiades cluster in the IAU constellation Taurus (Santos et al 2019). Chau (2008) lists it as “Supot ni Hudas”..

Bag of Ostrich Eggs:

This Jū /’hoansi asterism is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014).

Bagdei:

This asterism was created to help memorize the principal stars of the IAU constellation Cassiopeia under their Bayer designations (β, α, γ, δ, ε, ι) and was listed in R. H. Allen’s *Star Names* in 1899. Allen attributes it to American astronomer Charles Augustus Young.

Bagir:

This “Turkish” name for the IAU constellation Sagittarius was listed by John Hill in his *Urania* in 1754.

Bahuchara Mata:

This Hindu star is Beta (β) Leonis (Denebola) in the IAU constellation Leo. R. H. Allen lists it as “Bahu” in his *Star Names* in 1899: This is an alternate name for their nakshatra Ardra (see Moist One, below). Bahucara Mata is the Hindu goddess of chastity and fertility.

Bahula:

This Vedic asterism is the Pleiades cluster in the IAU constellation Taurus as appearing in the *Rig Veda* (Leitz 2019).

Bahumehi:

This Guipunave asterism is the IAU constellation Crux. R. H. Allen lists this as a principal fish of the “Pareni Indians” in his *Star Names* in 1899.

Baieti:

This Kiribati star “Baieti” is currently unidentified (Trussel and Groves 1978).

Baikare:

This Kiribati star “Baikare” is probably the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Trussel and Groves 1978).

Bailer of Makali’i:

This is the Hawaiian star line “Ke Ka o Makali’i”. This “bailer” scoops up Ka Hei-Hei o Na Keiki, the IAU constellation Orion (see Cat’s Cradle of the Children, below and Orion below) and the Makali’i, the Pleiades cluster. Its main stars north to south are:

- Hokulei: Alpha (α) Aurigae (Capella),
- Nanamua: Alpha (α) Geminorum (Castor),
- Nanahope: Beta (β) Geminorum (Pollux),
- Puana: Alpha (α) Canis Minoris (Procyon), and
- ‘A’a: Alpha (α) Canis Majoris (Sirius).

Delta (δ) Orionis (Mintaka) is an important star in this line because it rises/sets directly east or west giving the navigator an easy pointer star for direction. Beta (β) Canis Majoris (Mirzam) and Ke Ali’I Kona i Ka Lewa (Alpha (α) Carinae (Canopus)) connect to create a southern pointer. ‘Ekekeuehuehu (Theta (θ) Aurigae (Mahasim) and ‘Ekekeu’ena’ena (Beta (β) Aurigae (Menkalinan)) connect to form a northern pointer.

Baireke:

This Kiribati star “Baireke” is an unidentified star in their asterism “Kabairekereke” (see above) in the IAU constellation Scorpius (Trussel and Groves 1978).

Bairikaki:

This Kiribati star “Bairikaki” is currently unidentified (Trussel and Groves 1978).

Baitaere:

This Kiribati star “Baitaere” or “Nei Baitaere” is currently unidentified (Trussel and Groves 1978).

Baker’s Daughters:

This Teutonic asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen reports a Teutonic tale of Jesus being refused a loaf of bread by a baker, whose daughters secretly give Jesus a loaf. As a reward they become the Pleiades, while the baker becomes a cuckoo.

Baker’s Peel:

This Gaelic asterism “Crannarain” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen writes that this name was “a title shared with Ursa Major”.

Bakodlãk:

This Chakavian asterism is the IAU constellation Taurus.

BAL.UR.A:

This Babylonian asterism “BAL.UR.A” is listed by Bartel van der Waerden in his *Science Awakening II: The Birth of Astronomy* in 1974. The identity of this star is not known.

Balance:

This Babylonian asterism from the MUL.APIN tablets “RIN” is an alternate name for the asterism “Scales” (Boutet 2014). See Scales, below.

This Arabic asterism “Altawazun” (التوازن) is the IAU constellation Libra.

This Latin asterism “Bilanx” is the IAU constellation Libra as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

This Tibetan khyim (zodiac constellation) “Sangwa” or “Srang” is the IAU constellation Libra (Johnson-Groh 2013).

This Vedic rashi “Tulā” or “Tula” is the IAU constellation Libra as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022). The Chinese phonetically translated of “Tula” from the Vedic *Candragarbha-parivarta* in 566 as “Douluo” (Kotyk 2017). W. Brennan lists it as “Tula” in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists it as “Thula” and writes that it represents the energy of the God Tvashtha.

This Tamil zodiac asterism “Tulam” or “Tolam” is the IAU constellation Libra.

This Romanian asterism “Balanţa” is the IAU constellation Libra (Ottescu 2009). It is also known as the “Scales” (see below).

Balances of the Book of Daniel:

This German asterism is the IAU constellation Libra as listed by German poet Philipp von Zesen (1619 – 1689). Edward Sherburne lists this in his *Sphere of Marcus Manil*ius in 1675.

Balayang:

This Kulin Nations star “Balayang” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Massola 1968, Hamacher 2011).

Bald Ship:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). Freer (2004) speculates that this refers to a ship without sails and may be the stars of the Hyades in the IAU constellation Taurus, or the stars of the IAU constellation Auriga.

Balick:

This “Turkish” name for the IAU constellation Pisces was listed by John Hill in his *Urania* in 1754 and in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

Balk of Caelum:

This **telescopic** asterism “Trábs Caéli” is the barred spiral galaxy NGC 1572 in the IAU constellation Caelum. It was discovered in 1835 by English astronomer John Herschel who listed it as 2639 and later as GC 849 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ball and Chain:

There are two telescopic “ball and chain” asterisms:

- One is Corder 4218 in the IAU constellation Vulpecula and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 6'. Corder describes it as "a nice circle of 6 stars at the southern end and a chain of 4 or 5 stars that are almost attached to the north side of the circle". These stars are all 10^{th} – 11^{th} magnitude.
- One is Corder 4710 in the IAU constellation Cepheus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. The "chain" is an arc of stars magnitude 5.5 – 9, starting at 30 Cephei and running through HIP 111701, 111639, 111431, and 111316, to 111174. The "ball" starts at HIP 111174 and includes HIP 110919, 110841, 110634, and 110706, then through three more 7^{th} to 8^{th} magnitude stars to complete the circle.

Ball Bearer of Horologium:

This **telescopic** asterism "Pilúlifer Horológii" is the barred spiral galaxy NGC 1493 in the IAU constellation Horologium. It was discovered by James Dunlop in 1826. John Herschel listed it as 2600 on his list and later as GC 795 in his General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to its "many small bright knots".

Ball Game of Octans:

This **telescopic** asterism "Pililúdium Octántis" is the lenticular galaxy NGC 6438 in the IAU constellation Octans. It was discovered in 1835 by John Herschel who listed it as h 3701 and later as GC 4330 in his *General Catalogue* of 1864 This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this system consists of two perturbed galaxies and a well shaped round one."

Ball Game of Piscis Austrinus:

This **telescopic** asterism "Sphaeromachía Píscis Austríni" is the elliptical galaxy NGC 7176 in the IAU constellation Piscis Austrinus. This was discovered in 1834 by John Herschel who listed it as h 3911 and later as GC 4733 in his *General Catalogue* of 1864. This galaxy is part of a group of interacting galaxies including NGC 7173 (GC 4730), 7174 (GC 4731), and 7176. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 7173 and NGC 7176 are round systems, resembling balls, while NGC 7174 with its freakish dust bands looks like the active player."

Ball Game of the Stars:

This Aztec asterism "Citlaltlachtli" is the IAU constellation Gemini. The rectangular "ball court" is defined by the stars Beta (β) Geminorum (Pollux), Alpha (α) Geminorum (Castor), Mu (μ) Geminorum (Tejat), and Gamma (γ) Geminorum (Alhena). It is said that the movement of the ball within the playing field refers to the movement of the sun and moon.

Ball of Flour of Ursa Major:

This **telescopic** asterism "Óffa Úrsae Majóris" is the elliptical galaxy NGC 5322 in the IAU constellation Ursa Major. It was discovered in 1790 by William Herschel who listed it as "I 256". It became GC 3671 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is "ball like".

Ball of Fornax:

This **telescopic** asterism "Pila Fornácis" is the elliptical galaxy NGC 1399 in the IAU constellation Fornax. It was discovered in 1835 by John Herschel who listed it as h 2569 in his catalogue and later as GC 748 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ball Player of Leo:

This **telescopic** asterism "Pilárius Leónis" is the intermediate spiral galaxy NGC 3227 (Arp 94) in the IAU constellation Leo which is interacting with a dwarf elliptical companion. It was discovered by Prussian astronomer Heinrich d'Arrest and became "II 29" in William Herschel's catalogue and GC 2089 in the *General Catalogue* of 1864. This is O'Meara 18 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it "has the appearance of a juggler throwing a ball in the air."

Balor:

This Celtic (Irish) star may be Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Mosenkis, N/K date). Balor was an evil giant with a large eye who led the Fomorians in Irish mythology who was killed by his grandson Lugh of the Tuatha Dé Danaan, causing his eye to go up into the sky. This is interpreted as becoming the sun in Irish mythology, but Mosenkis is connecting it with Antares here.

Baltic Sea:

This Swedish asterism is the IAU constellation Draco. Swedish explorer Olaus Rudbeck (1630 – 1702) saw this constellation as symbolizing the Baltic Sea according to English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Bamboo:

This Anutan asterism "Te Kope" is a line of stars in the IAU constellation Grus, starting at the star Gamma (γ) Gruis (Aldhanab), running through Beta (β) Gruis (Tiaki) and ending with Epsilon (ε) Gruis.

Bamboo Joints:

This Japanese asterism "Take no Fushi" is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001). This is related to their asterism Two Sisters (see below).

Banana:

There are three **telescopic** "banana" asterisms:

- One is in the IAU constellation Antlia and is listed as Corder 1964 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 30'. This curving asterism includes the stars HIP 50030, 49997, 49883A, and 49767.
- One is Pothier 7 in the IAU constellation Cassiopeia. Robert Zebahl lists it on his *Faint Fuzzies* webpage, where René Merting describes it "at 64X [as being] elongated like a banana." HIP 2454 is at one end of the "banana". Size 7' X 3'.
- One, the Banana Nebula, is HII region NGC 3199 in the IAU constellation Carina. This was discovered in 1847 by English astronomer John Herschel who listed it as h 3239 in his catalogue.

It is GC 2067 in the *General Catalogue* of 1864. It is also known as the "Carina Smile" (see below).

Band of Orion:

This asterism is the Belt of Orion asterism in the IAU constellation Orion: Zeta (ζ) Orionis (Alnitak), Epsilon (ε) Orionis (Alnilam) and Delta (δ) Orionis (Mintaka). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism, citing Job xxxviii.31.

Banga n waro:

This Kiribati asterism is made up of stars surrounding Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Trussel and Groves 1978). One of their names for Canopus is Te Waro (see below).

Banjan:

This Wardaman star is Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion (Cairns and Harney 2003).

Bank Spread:

This Korean asterism "Eunhaeng Seupeuledeu" (은행 스프레드) is a line of three stars in the IAU constellation Capricornus: Upsilon (υ) and Tau (τ) Capricorni and HIP 102026.

Banner:

This Chinese Chenzhuo xing guan is a bent line of five stars in the IAU constellation Sagittarius: Xi (ξ) Sagittarii, Omicron (ο) Sagittarii, Pi (π) Sagittarii, 43 Sagittarii, Rho (ρ) Sagittarii, and Nu (ν) Sagittarii.

Banner of Three Stars:

This Chinese xing guan "Shēnqí" (参旗) is made up of a line of stars in the IAU constellation Orion. Despite the name, this line contains nine stars: Omicron (ο) 1 and 2, 6, and Eta (η) 1, 2, 3, 4, 5, and 6 Orionis. This is the "shield" of Orion. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Shēnqí" is a bending line of stars in the IAU constellation Orion: 15 Orionis, 11 Orionis, Omicron (ο) 2 Orionis, 6 Orionis, and Pi (π) 1, 2, 3, 4, and 5 Orionis.

Banner of Wine Shop:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Leo: Xi (ξ) Leonis (determinative star), 6 Leonis, and 10 Leonis.

This Chinese xing guan "Jiǔqí" (酒旗) is a bent line of three stars in the IAU constellation Leo: Psi (ψ), Xi (ξ), and Omega (ω) Leonis.

This Chinese Chenzhuo xing guan "Jiǔqí" is a triangle of stars in the IAU constellation Cancer: Pi (π) 1 & 2 Cancri, Alpha (α) Cancri (Acubens), and Kappa (κ) Cancri.

Banyan Star:

This Dravidian star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Leitz 2019). The *Rig Veda* describes a Banyan Tree in the sky.

Baptizing Jordan:

This German asterism "Jordanem Baptizans" is the IAU constellation Aquarius and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Bar:

There are two **telescopic** "bar" asterisms:

- One is in the IAU constellation Centaurus and was listed as Corder 2319 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 40' X 15'. This is a narrow rectangle of five 8th magnitude stars including HIP 59761, 59717, and 59657.
- One is Corder 3838 in the IAU constellation Sagittarius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25' X 15'. This is an elongated group of 5 8th – 9th magnitude stars including HIP 95122A and 95135.

Bar and Ring of Cetus:

This **telescopic** asterism "Trabianulátus Céti" is the barred spiral galaxy IC 302 in the IAU constellation Cetus. It was discovered by French astronomer Stéphane Javelle in 1892. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Bar Bearer of Draco:

This **telescopic** asterism "Tígnifer Dracónis" is the barred spiral galaxy NGC 6140 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "III 740". It became GC 4190 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the bar… in the central region in this galaxy".

Bar Stars:

This Estonian asterism "Vardatähde" is the belt of Orion asterism in the IAU constellation Orion (Kuperjanov 2003).

Bara:

This Persian asterism "Bara", "Bere", or "Berre" is the IAU constellation Aries.

Bara ni Kaue:

This Kiribati asterism is made up of stars of the IAU constellation Cepheus (Trussel and Groves 1978).

Baraitoa ae Nei Teraata:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Baraitoa eat e Are:

This Kiribati asterism is made up of four stars of the IAU constellation Hercules plus four stars of the IAU constellation Ophiuchus (Trussel and Groves 1978).

Baraitoa tew ae ni ma:

The stars of Kiribati asterism (Tabiteuea Is.) are currently unidentified (Trussel and Groves 1978).

Barani:

See Bearer, below.

Barantonga:

This Kiribati star "Barantonga" or "ana bara Ntonga" is currently unidentified (Trussel and Groves 1978).

Barbed of Eridanus:

This **telescopic** asterism "Hamátus Erídani" is the elliptical galaxy NGC 1421 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as "II 291". It became GC 762 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to the "hooky form at the north side of this galaxy".

Barbell Nebula:

This **telescopic** asterism is the planetary nebula Messier 76 (NGC 650) in the IAU constellation Perseus. This was discovered by French astronomer Pierre Méchain in 1780 and included in Charles Messier's catalogue. It was listed in the General Catalogue of 1864 as GC 386. It was first recognized as a planetary nebula in 1918 by American astronomer Heber Doust Curtis. Robert Burnham lists this name in his *Burnham's Celestial Handbook* in 1978. It is also known as the Butterfly Nebula, the Little Dumbbell Nebula, and the Cork Nebula.

Barbeque:

This Carib asterism "Siritjo sura-rï" has two versions, both representing the barbeque that Epietembo (see One-Legged Hunter) took up into the sky (Magaña, and Jara, 1982):

- One is the stars of Ursa Major,
- One is stars of Andromeda and Pegasus.

Barbeque Fork:

This **telescopic** asterism, Lorenzin 1, is found in the IAU constellation Taurus. A string of stars running east-west form the handle near the star Zeta (ζ) Tauri (Tianguan). This line starts at HIP 27120 and runs through HIP 26967 and 26912 to a triangle of stars forming the "handle" including HIP 26684. From HIP 27120 two curving lines form the prong tips, with the stars HIP 27205A and 27214 at one tip. Size 55' X 100'. It is found in *Pattern Asterisms* by American astronomer John A. Chiravalle.

Barbeque of the Sucker Catfish:

This Carib asterism "Pakamu suri-rï" or "Pakamu" is made up of stars of the IAU constellation Corvus, though which ones is not clear (Magaña, and Jara, 1982).

Barbon's Galaxy:

This **telescopic** asterism is PGC 71938 in the IAU constellation Pegasus. It is named for Italian astronomer Roberto Barbon (b. 1938).

Bark:

This Seleucid asterism “MA.GUR”, which they interpret as the hull of a ship, is the IAU constellation Corona Australis and does not appear in earlier Babylonian sky lore.

Bark Canoe:

This Salish asterism “ƛiyéʔ” is made up of the stars of the IAU constellations Gemini and Orion (Pete 2023). Compare this to the Yolgnu asterism “Boat and Fishline” (see below) and the Chinook asterism “Big Canoe” (see below). One end of the “canoe” is Alpha (α) Orionis (Betelgeuse) and the other end is Beta (β) Orionis (Rigel). The Belt of Orion is the seat across this “canoe”. Five male friends who built the canoe are represented by the stars Gamma (γ) Geminorum, Betelgeuse, Rigel, Gamma (γ) Orionis, Iota (ι) Orionis, and Kappa (κ) Orionis. NOTE: The story describing the creation of this asterism should only be told in the winter month. It is also known as “People Working” (see below).

Barker:

This Phoenician asterism “Hannabeah” is the IAU constellation Canis Major.

Barking Dog’s Face:

This **telescopic** asterism is the open cluster and reflection nebula NGC 7129 (vdB 146, LBN 497, Cr 441, Ced 196) in the IAU constellation Cepheus. It was discovered in 1794 by English astronomer William Herschel who listed it as “IV 75”. It is GC 4702 in the *General Catalogue* of 1864. The dog’s head is facing us, with largest of the three nebulae here, which is surrounding the star cluster, is the “dog’s snout”. The barking mouth is formed by dust clouds at one end. The two smaller reflection nebulae alongside are its “eyes”. Size 8’. This is Ennis 94 on the observing list of Canadian astronomer Charles Ennis. It is also known as the “Small Cluster Nebula” (see below), “Cosmic Rosebud”, and the “Cosmic Rose”.

Barley God:

This Egyptian asterism “Smati Osiris” is the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899.

Barnard’s E:

This **telescopic** asterism the “Triple Cave”, “Barnard’s E”, the “Double Dark Nebula” or the “E Nebula” is the dark nebulae Barnard 142 and 143 in the IAU constellation Aquila. This is named after American astronomer Edward Emerson Barnard (1857 – 1923), who created the Barnard Catalogue of dark nebula.

Barnard’s Galaxy:

This **telescopic** asterism is NGC 6822 (Caldwell 57), a barred irregular galaxy in the IAU constellation Sagittarius. It is named for American astronomer Edward Emerson Barnard (1857 – 1923), who discovered it in 1884. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Barnardínus Sagittárii” (“Barnard’s of Sagittarius”).

Barnard’s Loop:

This **telescopic** asterism is HII region Barnard’s Loop or Barnard’s Arc is in the IAU constellation Orion. It is part of the Orion molecular cloud complex and contains the Horse Head Nebula (see below) and Orion Nebula (see below). It covers a region of about 10° X 15°. In is named for American astronomer Edward Emerson Barnard (1857 – 1923) who photographed it in 1903.

Barnard's Merope Nebula:

See Merope Nebula (above).

Barnard's Star:

Barnard's Star is a red dwarf in the IAU constellation Ophiuchus (BD +04°3561a)) whose proper motion was measured by American astronomer Edward Emerson Barnard in 1916. It was first recorded on Harvard University photographic plates in 1888 and 1890. The IAU Working Group on Star Names approved this name for the star in 2017. It was also known as the "Greyhound of the Skies" due to its rapid motion.

Barragbarrag:

This Wardaman asterism is the stars Nu (ν) Cygni and Beta (β) Cygni (Albireo) in the IAU constellation Cygnus (Cairns and Harney 2003).

Barred Spiral:

This **telescopic** asterism Sánta 152, listed in 2009 by Hungarian astronomer Sánta Gábor, is a group of 9th – 14th magnitude stars in the IAU constellation Cancer. Gábor describes it as a "barred spiral like asterism, very nice, along NS… cluster-like, chain [of] 9 stars at the end of Omega [ω] 2 Cancri cascade".

Barramundi:

This Wardaman star "Guamba" or "Guwamba" is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Cairns and Harney 2003) and one of the stars in their asterism "Little Fishes" (see below).

Barred of Virgo:

This **telescopic** asterism "Trábiger Vírginis" is the barred lenticular galaxy NGC 4665 (4664) in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who incorrectly wrote down the location on his first observation and later observed it again, listing these observations as "II 39" and "I 142", the second time listing the correct location. This resulted in it being listed as GC 3196 and GC 3197 in the *General Catalogue* of 1864, which is why it ended up listed in the NGC twice. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Barrel:

This Latin asterism "Dolium" is the IAU constellation Aquarius. It is probably a Latinization of the Syrian "Daulo" or Persian "Dūl" (see Water Carrier, below). R. H. Allen lists it in his *Star Names* in 1899 as "water bucket".

Barrel of Meal:

This German asterism is the IAU constellation Piscis Austrinus as listed in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It appears in John Hill's *Urania* in 1754. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Hydria Sarepthara Al Piscis Notus": This translates as "Jar of Sarephthara" and Piscis Notus is an earlier name of

Piscis Austrinus. Edward Sherburne lists it as "the Barrel of Meal of the Widdow [sic] of Sarephtha" in his *Sphere of Marcus Manilius* in 1675.

Barred Owl:

This Mi'kmaq star "Ku Ku We" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. It is part of their asterism Muin and the Seven Hunters (see below).

Barren Lands:

This Hawaiian star "Ka Mole Honua" is Alpha (α) Crucis (Acrux) in the IAU constellation Crux.

Barrukill:

This Marra and Moporr asterism is the pentagon of stars that form the "head" of the IAU constellation Hydra: Epsilon (ε), Delta (δ), Sigma (σ), Eta (η) and Rho (ρ) Hydrae (Hamacher 2011).

Baršÿtje:

This Chakavian asterism is the IAU constellation Draco.

Bartholomew:

This German asterism "Bartholomew" or "Saint Bartholomew the Apostle" is the IAU constellation Scorpius as listed in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Bartholomew Al Scorpio". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Base of the Bear's Tail:

This Arabic star "al-Maghriz" (مغرز) or "Al Meghrez" is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major, later latinized to "Megrez":

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Megrez… from the Arabian Maghrez al dub al akbar, the root of the Great Bear's tail."
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Megrez": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Megrez".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Megrez".
- R. H. Allen translates this in his *Star Names* in 1899 as "root of the tail".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Megrez" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Megrez".
- The IAU approved the name Megrez for Delta (δ) Ursae Majoris.

Base of the Bowl:

This Arabic star “Qā’idat al-bātīyah” is Alpha (α) Crateris (Alkes) in the IAU constellation Crater as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Base of the Cup:

This Latin star “Fundus Vasis” is Alpha (α) Crateris (Alkes) in the IAU constellation Crater. Johann Bayer’s *Uranometria* (1603) lists “Fundis Vasis”.

Base of the Haystack:

This Estonian asterism “Kuhjalava” is the IAU constellation Corona Borealis (Kuperjanov 2006).

Base Ribs of a Canoe:

This Kiribati asterism “boto n aiai” or “te botonaia” is the Hyades cluster in the IAU constellation Taurus (Trussel and Groves 1978). They list it also as a name for the principal star, Alpha (α) Tauri (Aldebaran).

Baseball Cap:

This telescopic asterism is in the IAU constellation Aries and is Ennis 33 on the observing list of Canadian astronomer Charles Ennis. The “brim” of the cap is formed by the stars HIP 14621 and 14610 and a couple of 9th magnitude stars (Gaia DR3 112315804270897408 and Gaia DR3 112316938142256640). The “cap” is an arc of the double star HIP 14548, Gaia DR3 112382187285410304, Gaia DR3 112386241734515840, Gaia DR3 112392735725049984, and HD 19446. Size 40’.

Baseball Diamond:

This is a Canadian name for the Great Square asterism (see below) in the IAU constellation Pegasus that Kirsten Vanstone of the Toronto Center informs us was created by her Centre in for the 1991 Major League Baseball season.

Basilica of the Stars:

This Latin star “Basilica Stella” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Basket:

This Japanese sei shuku or lunar station “Mi Boshi” is a quadrilateral of stars in the IAU constellation Sagittarius: Delta (δ), Epsilon (ε), Eta (η), and Gamma (γ) Sagittarii. Some versions leave out Eta (η) Sagittarii.

This Rapanui asterism “He Kete” or “Kete” is the Hyades cluster in the IAU constellation Taurus (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

This Hawaiian asterism is the IAU constellation Corona Borealis (Kemp et al 2022).

This asterism “Cestus” is in the IAU constellation Cassiopeia. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 describes this “cestus of the seated Lady” as Eta (η) Cassiopeia “forming the apex of a right-angled triangle” with Alpha (α) Cassiopeiae (Schedar) and Beta (β) Cassiopeia (Caph).

Basket for Mulberry Leaves:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a rough triangle of stars in the IAU constellations Draco: HIP 92549, 91985, 89401, 89047, and 88732 and 46, 45, and 39 Draconis (with 39 Draconis being the determinative star).

This Chinese xing guan "Fúkuāng" (扶筐) is a rough triangle of stars in the IAU constellation Draco: 39, 45, 46, 48, 49, 51, and Omicron (o) Draconis. Compare this with the Korean asterism "Basket for Silkworm" (below): Mulberry leaves were fed to silkworms.

This Chinese Chenzhuo xing guan "Fúkuāng" is a roughly "V" shaped asterism of stars in the IAU constellations Cepheus, Cygnus, and Draco: From 64 Draconis two lines run out:

- One runs through Theta (θ) Cephei and Eta (η) Cephei to HIP 102431, and
- One runs through 66 Draconis and HIP 98073 to 33 Cygni.

Basket for Silkworm:

This Korean asterism "Nue Baguni" (누에 바구니) is four lines of stars (one forked) radiating out of the star Omicron (o) Draconis in the IAU constellation Draco:

- One line goes to 46 Draconis,
- One line goes to 45 Draconis,
- One line goes to 39 Draconis, and
- One line goes through HIP 91915A to HIP 91315 where it branches out to 42 Draconis in one direction and 36 Draconis in another.

Compare this with the Chinese xing guan "Basket for Mulberry Leaves" (above): Mulberry leaves were fed to silkworms.

Bastard:

Two Chinese stars from the Three Kingdoms to the Ming Dynasty bore the name "Shuzi":

- One is the star Tau (τ) Scorpii in the IAU constellation Scorpius and is part of their asterism Heart (see below).
- One is the star 5 Ursae Minoris in the IAU constellation Ursa Minor.

There are two Chinese Chenzhuo xing guans called "Shuzi"

- One is the star Tau (τ) Scorpii in the IAU constellation Scorpius.
- One is the star 5 Ursae Minoris in the IAU constellation Ursa Minor. It is part of their xing guan "Northern Pole".

Bastet:

This Egyptian star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003). Bastet or Bast is a Goddess of cats, women's secrets, childbirth, fertility, and protection of the home.

Bat:

This Mayan asterism "Zool" is made up of stars of the IAU constellations Sculptor and Cetus:

- The "body" is the star Beta (β) Ceti (Diphda),
- The "wing" on one side is bounded by the stars Eta (η) Ceti and Alpha (α) Sculptoris, and

- The “wing” on the other side is bounded by the stars Iota (ι) Ceti and Iota (ι) Sculptoris.

NOTE: In the postclassic *Paris Codex* this Mayan asterism has become the IAU constellation Aquarius.

This Tharumba star “Wunbula” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This star with the Latin name “Vespertilio” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by 17th century Dutch astronomer Hugo Grotius (Huig de Groot, 1583 – 1645), who thought this was the correct translation of the original Greek name (Hafez 2010). Compare to Rival to Ares (below).

Bat and His Wives:

This Tharumba asterism “Munowra” is three stars in the IAU constellation Canis Major: Alpha (α) Canis Majoris (Sirius), Beta (β) Canis Majoris (Mirzam), and Delta (δ) Canis Majoris (Alwazn). It represents the bat “Wunbula” and his two wives “Murrumbool” (Mrs. Brown Snake) and “Moodtha” (Mrs. Black Snake).

Bat Nebula:

See Albino Butterfly nebula, above.

Bat of Canes Venatici:

This **telescopic** asterism “Vespertílio Cánum Venaticórum” is the galaxy MCG +06-28-44 (Mrk 54) in the IAU constellation Canes Venatici. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this “couple of merging galaxies resembles a flying bat”.

Baten Kaitos:

See Belly of the Sea Monster, below.

Batena:

This Kiribati star “Batena” is currently unidentified (Trussel and Groves 1978).

Batere:

This Kiribati star “Batere” or “Nei batere” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Trussel and Groves 1978).

Bath:

This Latin asterism “Bathilus” is the IAU constellation Ara and is listed under the name “Bathillus” by John Hill in his *Urania* in 1754.

Bathsheba:

This German asterism is the IAU constellation Cassiopeia as listed in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. “Bathseba” is listed as a name for Andromeda in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. It appears in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and in John Hill’s *Urania* in 1754. Bathsheba was the mother of Solomon. NOTE: Stevenson (1921) writes that Schiller named this “Maria Magdelena”.

Batiga:

This “Persian” name for the IAU constellation Crater was listed by John Hill in his *Urania* in 1754.

Batignon:

This “Tuscan” name for the IAU constellation Eridanus was listed by John Hill in his *Urania* in 1754.

Batirara:

This Kiribati star “Batirara” is currently unidentified (Trussel and Groves 1978).

Battery of Volta:

This asterism was created by British physician and Egyptologist Thomas Young in 1806 using two stars in the IAU constellation Pegasus to honor Volta’s invention of the electric battery: 1 and 9 Pegasi.

Battle Axe (Adjunct to Eastern Well):

This Chinese Chenzhuo xing guan “Yue” is the star Eta (η) Geminorum in the IAU constellation Gemini.

Battle Axe (Vassal of Well):

This Chinese xing guan “Yue” from the Three Kingdoms to the Ming Dynasty is the star Eta (η) Geminorum in the IAU constellation Gemini. NOTE: this is on the edge of the Jellyfish Nebula (Gemini A) IC 443.

This Chinese xing guan “Yuè” (钺(附井宿)) is a line of two stars coming off the corner of their xing guan “Well” (see below) in the IAU constellation Gemini: Mu (μ) and Eta (η) Geminorum.

Battle Chariots:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of three stars in the IAU constellation Libra: 12, KX, and Sigma (σ) Librae (with Sigma Librae being the determinative star).

This Chinese xing guan “Zhènchē” (阵车) is a three-star line in the IAU constellations Hydra and Lupus: 58 and 60 Hydrae and 2 Lupi.

This Chinese Chenzhuo xing guan “Zhènchē” is a triangle of stars in the IAU constellation Libra: Sigma (σ) Librae, HIP 73184, and 12 Librae.

Battle of the Æsir:

This Old Icelandic asterism is the IAU constellation Auriga. Compare this to the Norse asterism “Asar Battlefield” (above).

Battledore Racket:

This Italian asterism “la Racchetta” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899. Battledore is an early version of Badminton.

Bau n Rimoa:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Bau n Rimwimata:

This Kiribati asterism “Bau n Rinwimata” is the stars Sigma (σ) and Tau (τ) Scorpii in the IAU constellation Scorpius (Trussel and Groves 1978).

Bavaria:

This asterism "Bavar" was created of the stars of the IAU constellation Perseus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents Bavaria and is depicted as a green sphere with a gold band running around its equator and a gold band running from front to back over the top with a cross atop it.

Beacon:

This Korean asterism "Bonghwasbul" (봉홧불) is a quadrilateral of stars in the IAU constellation Cancer: Iota (ι), Rho (ρ) 2, Tau (τ), and Sigma (σ) 3 Cancri.

Beacon Fire:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Cancer: Chi (χ) Cancri (the determinative star), Phi (ϕ) Cancri, Upsilon (υ) 1 Cancri, and Lambda (λ) Cancri.

This Chinese xing guan "Guàn" (爟) is a quadrilateral of four stars in the IAU constellation Cancer: 15, Phi (ϕ) 1, Lambda (λ), and Psi (ψ) Cancri. Nearby is the star Kappa (κ) Geminorum, which the Chinese call "Pile of Firewood".

This Chinese Chenzhuo xing guan is a "box" of stars in the IAU constellation Cancer: Iota (ι) Cancri, Rho (ρ) 1 & 2 Cancri, Tau (τ) Cancri, and Sigma (σ) Cancri

Beak:

This Chinese Chenzhuo xing guan is a line of two stars in the IAU constellation Orion: Lambda (λ) Orionis and Phi (ϕ) 1 & 2 Orionis.

Beam:

This Latin asterism "Toma" is the three stars of the "handle" of the Big Dipper asterism in the IAU constellation Ursa Major as listed by English linguist John Minsheu (1560 – 1627): Epsilon (ε), Zeta (ζ), and Eta (η) Ursae Majoris. R. H. Allen writes in his *Star Names* in 1899 that this term originated with Roman writer Quintus Ennius (d. 169 B.C.E.) and that it was adopted by Roman statesman Marcus Tulius Cicero (d. 43 B.C.E.), Roman poet Publius Ovidius Naso (Ovid, d. 17 B.C.E.), Roman poet Publius Papinius Statius (d. 96 C.E.), and Roman polymath Marcus Terentius Varro (112 – 27 B.C.E.).

This Romanian asterism "Rază" is the IAU constellation Sagitta (Ottescu 2009). This is found only in Northern Romania.

Beam of the Scale:

This Persian star "šāhin tarāzu" (شاهین ترازو) is the star Gamma (γ) Aquilae in the IAU constellation Aquila:

- This was later latinized to "Shahin Tarazed", "Tarazed", and "Tarazad.
- English Admiral Henry William Smyth's *Prolegomena* lists "Tarazed" and his *Bedford Catalogue* in 1844 lists "sháhin tárá-zed, the soaring or star-striking falcon": This is Smyth confusing this

asterism with the star “aš-šāhīn” or “Alshain” which is Beta (β) Aquilae (see Peregrine Falcon, below).

- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Tarazed”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as “Tarazed”.
- In 2016 the IAU approved the name Tarazed for this star.

Bear:

This ancient Vedic asterism from the *Rig Veda*, “Ṛkṣa” (ऋक्ष), is the Big Dipper Asterism in the IAU constellation Ursa Major (see Big Dipper below).

This Wampanoag (Algonquin) asterism "Maske" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper below).

This Lenape asterism “Maxkw” is the Big Dipper asterism in the IAU constellation Ursa Major (Frank 2021).

This Diné asterism “Shash” is the IAU constellation Sagittarius (Childrey 2008).

This Skidi asterism is the IAU constellation Sagittarius. Brady (2013) reports that a Skidi “sky map dated earlier than the arrival of the white settlers in the sixteenth century apparently shows a constellation of a bear using the same stars as Ursa Major (Hagar 1900: 92, Buckstaff 1927: 282; also see Frazier 1979)”.

In eastern Siberia the bucket of the Big Dipper asterism in the IAU constellation Ursa Major is a bear: Delta (δ) Ursae Majoris (Megrez), Gamma (γ) Ursae Majoris (Phecda), Beta (β) Ursae Majoris (Merak), and Alpha (α) Ursae Majoris (Dubhe). The hunters are the handle of the Big Dipper (see Hunters, below).

This Ainu asterism “Siarasarus Kamuy Noka nociw” (シアラサルシ カムイ) is the IAU constellation Ursa Major.

This Hebrew asterism “Dōbh” (דוב) is the IAU constellation Ursa Major.

This Phoenician asterism “Dub” is the IAU constellation Ursa Major.

This Romanian star “Ursul” is Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). The next two stars in the handle of the Big Dipper are the oxen pulling the Great Chariot (see below) and are frightened by the Bear. Cthor’sompare to Wolf (below).

Bear and Three Hunters:

This Musquakie (Iroquois) asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). The bucket of the dipper is the bear, and the stars of the handle are the hunters. The double stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) are to the Musquakie peoples a small dog called “Hold Tight” (see below). Compare this to Muin and the Seven Hunters, below.

Bear Carrier:

This asterism “Portitor Ursae” is the IAU constellation Boötes as described by 1st century Roman poet Publius Papinus Statius.

Bear Claw Galaxy:

See Bear’s Paw.

Bear Claw Nebula:

This **telescopic** asterism is planetary nebula Sh2-200 in the IAU constellation Cassiopeia.

Bear Driver:

This English asterism is the IAU constellation Boötes. It is derived from the Greek asterisms Bear Watcher (see below) and Guardian of the Bear (see below). *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists the names "Bear Driver" and "Bear Diver", the later of which is probably a typographical error.

Bear Hunting Arcas:

This German asterism "ursum in venatione insectans Arcas" ("Bear hunting Arcas") is the IAU constellation Ursa Major as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Bear of Maenalis:

This Latin asterism "Maenalia Arctos", "Maenalis", or "Maenalis Ursa" is the IAU constellation Ursa Major and is a reference to a high mountain in Arcadia. Johann Bayer's *Uranometria* (1603) lists the name "Maenalis" for Ursa Major.

Bear Watcher:

This Greek asterism "Ἀρκτοφύλαξ" or "Arktofýlax" ("bear watcher" or "bear keeper") later latinized to "Arctophylax" or "Artophilaxe", is the IAU constellation Boötes and is related to the Greek myth of Arcas and Callisto. In one version of the myth Zeus turns Callisto into a bear and her son Arcas into the constellation Boötes. Compare this to the asterism Arcas, above. Eudoxus of Cnidus (4th century B.C.E.) lists this name and attributes it to Hipparchus (c. 190 – 120 B.C.E.). 7th century B. C.E. Greek poet Hesiod lists this name in his *Works and Days*.

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "qui Graece Arctophylax" ("who in Greek is Arctophylax") as does Kauffmann's translation of the *De ordine ac positione stellarum in signis* in 1888.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This lists "Arctophilax" as a name for Boötes but also gives the name "Boetes".

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Herdsman" and "Bear Keeper".

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Arctophylax" as a young male in a tunic with a crook in his right hand resting on his right shoulder gesturing to the left with his left hand in a sort of warding gesture.

Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists "Arctophylax" as a name for Boötes.

Johann Bayer's *Uranometria* (1603) lists "Arcturus" and "Arctos Major" as alternate names for Ursa Major.

The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Arctophylax" for Boötes.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) list the names "Arctophylax" and "Bootes" for this constellation.

Robert Hues lists "Arctophylax" as a name for Boötes in his *A Learned Treatise of Globes* in 1659.

John Hill lists "Arctophylax" as a name for Boötes in his *Urania* in 1754.

American uranographer William Croswell (1760 – 1834) depicts "Bootes Arctophylax" on his *Mercator Map of the Starry Heavens* in 1810 as a male in a kilt and boots with the leashes of Canes Venatici in his right hand and a club in his left hand.

Bear with a Little Boy:

This French asterism with the Latin name "Ursa cum Puerulo" is the IAU constellation Ursa Major as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). This is a reference to the mythical figure Arcas.

Bearded of Boötes:

This **telescopic** asterism "Barbátus Boótis" is the spiral galaxy NGC 5676 in the IAU constellation Boötes. William Herschel listed this as "I 189". John Herschel listed this as h 1842 and later as GC 3935 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the elongated, vague southwestern part of this galaxy makes it look like a bearded head."

Bearer:

This Vedic nakshatra (lunar mansion) "Bharani" ("bearing star") is in the IAU constellation Aries and is the stars 35, 39, and 41 Arietis. It is related to Yana, God of the dead. Ivanković (2021) lists this as "Bháranī", lists the earlier name "Apabháranī" (see Taking Away, below) and relates it to the deity Yama, who is God of death and dharma. It is listed as "Bháranī" in the *Atharveda* (Leitz 2019, Ivanković 2021). Leitz identified it as "the star Arietis": Of course, Arietis is a suffix which could be applied to any star in Aries. Leitz also lists this as appearing on the nakshatra lists of the maharshis Varahamihir and Parasara. W. Brennand lists this as "Bharani" in his Hindu Astronomy in 1896 and translates this as "Yoni or Bhaga". Bhagwath (2019) lists the Yoni as the symbol of this nakshatra: Yoni is a symbol of the Goddess Shakti and Bhaga is the Vedic God of wealth.

This Tibetan gyukar (lunar house) "Bra Nye" or "Dranye" is in the IAU constellation Aries and is the star 35 Arietis (Johnson-Groh 2013).

This Myanmar nekkhat (lunar mansion) "Barani" (ဘရဏီ) is in the IAU constellation Aries and is the stars 35, 39, and 41 Arietis.

Bearer of the Demon's Head:

This Arabic asterism "Hamil Ras Alshaytan" (حامل رأس الشيطان) is the IAU constellation Perseus:

- "Hāmel Ra's al-Ghūl" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Robert Hues lists this as "Chamil Ras Algol" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists the name as "Hamil" or "Hamil Ras Al Ghul" in his *Urania* in 1754
- English Admiral Henry William Smyth lists it as "Hámil rás al ghúl" in his *Bedford Catalogue* in 1844 and adds the German "Träger des Medusenkopfe".
- R. H. Allen lists it as "Hāmil Rāʿs al Ghūl" in his *Star Names* in 1899. Allen lists the variation "Almirazgual" as appearing in "Moorish Spain", as does Robert Burnham in his *Burnham's Celestial Handbook* in 1978.

Bearer of Medusa's Head:

This German asterism "Träger des Medusen Kopf" is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899.

Bearing a Knot of Perseus:

This **telescopic** asterism "Nodifera Pérsei" is the barred lenticular galaxy NGC 1023 (Arp 135) in the IAU constellation Perseus. This galaxy was discovered in 1784 by William Herschel who listed it as "I 156". It became 244 on his son John Herschel's list and GC 574 in the *General Catalogue* of 1864. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 10. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its faint dwarf companion (NGC 1023A) appearing as "a hazy knot". It is also known as the Perseus Lenticular Galaxy.

Bearing a Tail of the Phoenix:

This **telescopic** asterism "Caudifera Phoenicis" is the spiral galaxy NGC 92 in the IAU constellation Phoenix. It is part of Robert's Quartet (see below). It is 2319 in John Herschel's catalogue and GC 46 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it appears to have a long "tail".

Bears and Dragon:

This Latin asterism "Arcto et Draco" is the IAU constellations Ursa Major, Ursa Minor, and Draco as labelled on many manuscripts and books as late as the 17th century. This is because Draco winds around between the two "bears".

Bear's Den:

This Iroquois asterism is the IAU constellation Corona Borealis.

This Mi'kmaq asterism "Mskegwŏm" is the IAU constellation Corona Borealis (Kemp et al 2022). This is Muin's den (see Muin and the Seven Hunters, below).

Bear's Head:

This Lenape asterism is the IAU constellation Corona Borealis (Frank 2021).

Bear's Lodge:

This Dakota/Lakota/Nakota asterism **"**Mato Tipila" ("Bear's Lodge" or "Bear's Tipi") is the brightest stars of the IAU constellation Gemini.

Bear's Paw:

This **telescopic** asterism the "Bear's Paw" or "Bear's Claw" is NGC 2537 (Arp 6), a blue compact dwarf galaxy in the IAU constellation Lynx. It was discovered in 1788 by English astronomer William Herschel who listed it as "IV 55" in his catalogue. It is GC 1629 in the *General Catalogue* of 1864. This name appears as "Árctopus Lýncis" ("bear paw of Lynx") in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

It is also known as the Bear Claw Galaxy.

Beast:

This Greek asterism "Θηρίον" ("Thiríon") is the IAU constellation Lupus as originally described by Aratus (315 – 240 B.C.E), Hipparchus (190 – 120 B.C.E.), and Ptolemy (c.100 – c.170) in his *Almagest*. Vitruvius called it "Bestia" ("beast"), Hyginus "Hostia" (one of the meanings being "sacrificed animal"), which became "Hostolia" ("sacrifices") as listed by German astronomer Johann Bayer(1572-1625). Cicero (106 – 43 B.C.E.) called it "Quadripes Vasta" ("Vast Four Legged").

An early Latin name is "Belua" ("monster"). Ptolemy's "beast" looks like this:

- The "body" starts at the base of the "neck" at the star Gamma (γ) Lupi, then runs through Mu (μ) Lupi on the back to the "backside" at Zeta (ζ) Lupi and then down through Alpha (α) Lupi, Beta (β) Lupi and Delta (δ) Lupi to Gamma (γ) Lupi again,
- The "neck" is the line of two stars Gamma (γ) and Eta (η) Lupi,
- The "head" is the triangle of stars Eta (η), Theta (θ) and Psi (ψ) Lupi,
- A "tail" runs from Zeta (ζ) Lupi to Rho (ρ) Lupi,
- The "back leg" runs from Alpha (α) Lupi to the double star Tau (τ) Lupi, and
- The "front leg" runs from Delta (δ) Lupi to HIP 73493.

"Bestia" appears in editions of the 8th century *Revised Aratus Latinus* as a merger of the stars of Centaurus and Lupus.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "the Beast held by the Centaur".

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Bestia Centauri, sive Lupus" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Bestia Centauri siue Lupis" as a wolf with a spear point in its jaws. Centaurus is not depicted in this illustration: He appears in another illustration where Lupus is off the edge of the page.

Italian astronomer Giovanni Battista Riccioli (1598 – 1671) called it "Bestia Centauri" ("centaur beast") and "Victima Centauri" ("victim of a centaur"): Lupus is right next to the IAU constellation Centaurus, so could be seen as the centaur's prey.

Flemish cartographer Jodocus Hondius (Joost de Hondt 1563 – 1612) listed "Fera" on his globe in 1598 and on his *Hemelglobe* (1600) and depicts it as a wolf being speared by Centaurus.

Johann Bayer's *Uranometria* (1603) lists "Bestia", "Bestiola", and "Hostiola".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Fera” and “Bestiola” as alternate names for Lupus.

This Egyptian Dendera asterism (Hoffmann 2017) is basically identical to the Babylonian asterism Uridimmu (see Mad Dog, below).

Beast of Prey:

This Arabic asterism “Alwahsh Aljariha” (الوحش الجارحة) is the IAU constellation Lupus. This is influenced by the Greek asterism Therion (see Beast, above).

Beastly:

This Latin asterism “Bellua” is the IAU constellation Cetus.

- Johann Bayer’s *Uranometria* (1603) lists “Bellua”.
- “Bellua” is listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Beatitude of Beatitudes:

This Coptic lunar station “Upeuineutês” is the stars Beta (β) Aquarii (Sadalsuud) and Zeta (ζ) Aquarii in the IAU constellation Aquarius and was listed by Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as ”Beatitudo Beatitudinum” (“beatitude of beatitudes”) and “Sive Brachium Absconditum” (“or the hidden arm”). R. H. Allen lists it as “Upuineuti” in his *Star Names* in 1899 and translates that as “foundation”.

Beautiful:

There are two stars with the Latin name “Pulcherrima” (“beautiful” or “loveliest”):

- One is Epsilon (ε) Boötis in the IAU constellation Boötes. The 1st edition (1910) and 14th editions of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) lists “Pulcherrima” for this star.
- One is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major. “Pulcherrima” listed in Richard A. Proctor’s *A New Star Atlas* (1887), translated as “most beautiful” and described “as a name given by modern astronomers to express the extreme beauty of this double star (orange and green) viewed with a good telescope”.

This **telescopic** Taiwanese star “Formosa” is HIP 56508 (HD 100655) in the IAU constellation Leo and was given this name in the IAU NameExoWorlds campaign. It is magnitude 6.44. Formosa is the name of Taiwan in the 17th century. This star has an exoplanet named Sazum (“water”), a traditional name for a township in Nantou county where the famous Sun-Moon lake is found.

Beautiful Arms of Coma Berenices:

This **telescopic** asterism “Callipéchys Cómae Bereníces” is the barred spiral galaxy NGC 4548 (Messier 91) in the IAU constellation Coma Berenices. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “its broad gracefully curved spiral arms”.

Beautiful Boy:

This Egyptian star "Tja-nefer" is probably Alpha (α) Virginis in the IAU constellation Virgo and is mentioned in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty). It is part of their asterism Serket (see below).

Beautiful Eddy of Centaurus:

This **telescopic** asterism "Callidínes Centaúri" is the galaxy ESO 384-53 (PGC 50325) in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Beautiful Eye:

This Basque star "Begi-erderra" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Knörr 1999, Frank 2021) and is part of their asterism Eagle (see below).

Beautiful Eye of Leo:

This **telescopic** asterism "Calópis Leónis" is the barred spiral galaxy NGC 3351 (Messier 95) in the IAU constellation Leo. It was discovered by Pierre Méchain in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Beautiful Eyelids of Eridanus:

This **telescopic** asterism "Calleblépharus Erídani" is the barred spiral galaxy NGC 1187 in the IAU constellation Eridanus. It was discovered in 1784 by William Herschel who listed it as III 245". It became GC 640 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as to them it resembled "an eye with beautiful eyelids".

Beautiful Face:

This Basque star "Begi Urdina" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Knörr 1999, Frank 2021).

Beautiful Firebrand:

This Rapanui star "Tau Ehu" or "Tau Ahu" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

Beautiful Gate of Dorado:

This **telescopic** asterism "Callípyla Dorádus" is the barred spiral galaxy NGC 1617 in the IAU constellation Dorado. It was discovered in 1826 by Scottish astronomer James Dunlop and listed by John Herschel as 2651 and later as GC 875 in Herschel's *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Beautiful Manes of Ursa Major:

This **telescopic** asterism "Cállithrix Úrsae Majóris" is the spiral galaxy NGC 3394 in the IAU constellation Ursa Major. It was discovered in 1791 by William Herschel who listed it as "II 872". It became GC 2215 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the "beautiful manes at the northern side of this galaxy".

Beautiful of Ursa Major:

This **telescopic** asterism “Cállimus Úrsae Majóris” is the spiral galaxy NGC 3893 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as “II 738”. It became GC 2559 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Beautiful Star:

This Ligurian star “Ste´ra Pulare” or “Be´la Sˇte´ra” is Alpha (α) Ursae Minoris (Polaris).

This Romanian star “Luceafărul cel Frumos” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Ottescu 2009).

Beaver Galaxy:

This **telescopic** asterism PGC 59867, is a galaxy in the IAU constellation Draco.

Beautiful Hair of Cetus:

This **telescopic** asterism “Callícomus Céti” is the barred spiral galaxy NGC 271 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as II 446. It is GC 154 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Beautiful Ring of Grus:

This **telescopic** asterism “Callicýclus Grúis” is the spiral galaxy IC 5240 in the IAU constellation Grus. It was discovered by William Henry Finlay in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this barred galaxy is decorated with an almost perfect outer ring”.

Beaver Stars:

This Anishinaabe asterism “Amik Anung” is the IAU constellation Gemini (Lee et al 2014).

This Ininew (Cree) asterism “Amisk Achak” is the IAU constellation Gemini (Lee et al 2014).

Becklin-Neugebauer Object:

This object is in the IAU constellation Orion. American astronomer Eric Becklin and Gerry Neugebauer discovered the Becklin-Neugebauer Object (BN) in the Orion molecular cloud in 1967, which is believed to be a protostar. BN is next to Theta (θ) 1 C in the IAU constellation Orion. It is only visible in infrared.

Becklin’s Star:

This double star is Theta (θ) 1 and 2 Orionis in the IAU constellation Orion. American astronomer Eric Becklin and Gerry Neugebauer discovered the Becklin-Neugebauer Object (BN) in the Orion molecular cloud in 1967, which is believed to be a protostar. BN is next to Theta (θ) 1 C.

Becoming Light as Day:

This Hawaiian star **“**Pi’ikea” is Beta (β) Ceti (Diphda) in the IAU constellation Cetus.

Bed With One Leg Missing:

This Dravidian and Munda asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). This is found in Western Bengal, Bihar, Orissa, and Madhya Pradesh.

Bee:

This Chinese xing guan "Mìfēng" (蜜蜂) is made up of four stars in the IAU constellation Musca: Alpha (α), Beta (β), Gamma (γ), and Delta (δ) Muscae.

This Flemish asterism "Apes", also known as "Musca Borealis" (see Northern Fly, below) and "Lilium" (see Fleur-de-lis, below) was created by the Flemish astronomer Petrus Plancius (1552 – 1622) in 1612, using stars of the IAU constellation Aries: 33, 35, 39, and 41 Arietis. Plancius' celestial globe (1613), published in Amsterdam by Pieter van der Keere, depicts this as a bee next to Aries.

Compare this to the Vedic nakshatra (lunar mansion) "Bharani" (see Bearer, above):

- "Apis" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a bee.
- The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts "Apis" as a bee.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Apes" as a bee above the back of Aries.
- Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Musca" as a fly next to Perseus.
- A celestial pocket globe created by British uranographer Herman Moll in 1719 labels this "Musca" and depicts it at the feet of Perseus.

This German asterism "Apis" is the IAU constellation Musca, which was first described in 1597 (see Musca, below). A celestial globe (late 1597) of Flemish astronomer Petrus Plancius published by Amsterdam cartographer Jodocus Hondius the Elder lists Apis as well as a celestial globe (1613) of Plancius published in Amsterdam by Pieter van der Keere. French astronomer Abbé Nicolas Louis de Lacaille renamed it Musca ("fly") in 1752, and it was that name that survives for this IAU constellation:

- Johann Bayer lists this constellation in his *Uranometria* in 1603.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) used the names "Apis" ("bee") and "Musca" ("fly") for this constellation.
- The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Apis" and "Musca" for this constellation.
- This asterism is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Apes".
- The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels it "Musca" and depicts it as a bee.
- English astronomer Edmund Halley (1656 – 1742) called it "Musca Apis".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this constellation as "Musca Apis" and depicts it as a fly.
- John Hill lists "Apis" in his *Urania* in 1754.
- French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) called it "Apes".

- German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this asterism "Musca" and depicts it as a bee.
- This asterism appears in English astronomer John Flamsteed's *Atlas* of 1781 under the name "Apes".
- American uranographer William Croswell (1760 – 1834) labels this asterism "Musca" on his *Mercator Map of the Starry Heavens* in 1810 and depicts it as a fly.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Musca Borealis" in his *Celestial Atlas* in 1822.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Musca Borealis" as a fly.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Musca Borealis": The author is unknown, but it is based on Jamieson's *Celestial Atlas*. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts it but does not label it.
- It appears as a bee on Stieler's Planisphere of 1872 as "Biene".
- Some French charts list it as "Abeille".

Bee Swarm:

The Uppsala Archaeoastronomical Project proposed the Pleiades cluster in the IAU constellation Taurus for this Minoan asterism. The bee swarming season is at its height at the Blessing of the Ships.

Beegerer:

This Palawa star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. This is a name from the journals of George Augustus Robinson, a missionary, in 1831 (Hamacher 2011).

Beehive:

This Asháninka asterism is the Coal Sack Nebula (Caldwell 99) in the IAU constellation Crux (Urton 2016). A nearby dark nebula is a digging stick used to pry open the Beehive (see Digging Stick, above).

This Belarussian asterism "Gniazdo" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009). This relates to the inner part of the hive where frames with honeycombs are placed.

There are three **telescopic** "beehive" asterisms:

- One is the open cluster Messier 44 (NGC 2632) in the IAU constellation Cancer. It was first described by Galileo in 1609 and added to French astronomer Charles Messier's catalogue in 1769. Although it is best viewed with a telescope, it can be seen with the unaided eye in a dark sky: In ancient times it was known as Praesepe (see Manger below). It appears in the Chinese xing guan "Ghosts" (see below):
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "the Praesepe, metaphorically rendered Bee-hive".
    - The General Catalogue of 1864 lists this as GC 1681 and John Herschel lists it in his catalogue as h 517.
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as "Praesepe, or the Beehive".
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Presepe… the Beehive".

    - The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as "Praesepe (the Bee-hive) of the ancients. NOTE: Praesepe actually means "manger" (see Manger, below).
- One is the Little Beehive, Messier 41 (NGC 2287) in the IAU constellation Canis Major, so named due to its resemblance to Messier 44 (see above). Although it is best viewed with a telescope, it was first described by Aristotle around 325 B.C.E. with unaided eye observations and "rediscovered" by Giovanni Battista Hodierna in 1654. In the *General Catalogue* of 1864 it is GC 1454 and in John Herschel's catalogue it is h 411.
- One is the open cluster IC 4665 in the IAU constellation Ophiuchus. This was discovered in 1745 by Swiss astronomer Phillipe Loys de Chéseaux. Despite its brightness, it was not catalogued by Charles Messier or William Herschel. American astronomer Edward Emerson Barnard (1857 – 1923) recorded it, which resulted in it becoming IC 4665 in the *Index Catalogue*. It is also known as the Summer Beehive, Poseidon's Trident, Lambda, "Q", Mini Grus, or the Black Swallowtail Butterfly.

Beemim:

See Bend in the River, below.

Bees:

This Kamilaroi asterism "Wurrul" is the Pleiades cluster in the IAU constellation Taurus as listed by William Ridley in 1875.

This Tupi Guarani asterism "Eixu", "Eichú", or "Ceiuci" is the Pleiades cluster in the IAU constellation Taurus. This is also a feather in the cap of Homem Velho ("the Old Man"- see below). Compare this to their asterism Vespeiro (see Wasp Nest, below).

This Guarani asterism "Eichú" is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

This Tupi asterism "Seixu" is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

Beetle:

This Greek asterism is the IAU constellation Cancer as described by the Greek poet Aratus (315 – 240 B.C.E.) in his *Phenomena*. Aratus may have been influenced by the earlier Egyptian asterism Scarab (see below).

Beetle of Cetus:

This **telescopic** asterism "Cárabus Céti" is the barred spiral galaxy NGC 428 in the IAU constellation Cetus. It was discovered by English astronomer William Herschel, who listed it as II 622. John Herschel listed it the General Catalogue of 1864 as GC 238. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its resemblance to a beetle.

Begetters:

This Babylonian, Hindi, and Urdu asterism "Parvin" (پروین or پروی Parvī) is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen lists this in his *Star Names* in 1899 and translates it as "begetters".

This Persian lunar station “Parv”, “Perv”, “Perven”, “Pervis”, “Parvig”, “Parviz”, “Peren”, or “Parur”, is the Pleiades cluster in the IAU constellation Taurus (Panaino 1999) and is listed in R. H. Allen’s *Star Names* in 1899. Persian polymath and astronomer Omar Khayyam (1048 – 1131) called them “Parwin” and “Parven”.

This Sogdian and Khorasmian asterism “Parvi” and “Parur” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

This Zoroastrian asterism “Paoiriiaēinī” is the Pleiades cluster in the IAU constellation Taurus (Panaino 1999).

Beginning of Darkness Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the seventh month, Giamonios (“the beginning of darkness”) is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Benigni). Their PRIN for the eighth month, Simivisonnios (see Half the Course of the Sun Guiding Star, below) is also Altair. Compare to their asterism Giamoni Prinnios (see Bull, below).

Beginning of Light Guiding Stars:

The Celtic PRIN or guiding stars in the Sequani Calendar in the first month, Samonius (literally “the beginning of light”), are the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Benigni). This relates to the many Celtic myths involving twins.

Beheading:

This Korean asterism “Chamsu” (참수) is a winding line of stars in the IAU constellations Hydra and Virgo: 52, 51, 50, Eta (η), and 47 Hydrae, and 89 Virginis.

Beid:

See Eggs, below.

Bekatha:

This Egyptian decan “Bekatha” was in the IAU constellation Libra. In later Hellenistic texts it was named “ⲥⲟⲩⲭⲱⲥ” (“Sob‿χos”). In the Testament of Solomon, it became “Madero” or “Naôth”, Aristobulus of Paneas called it “Zercuris”, in Greek Hermeticism it became “Sphoukou”, in Latin Hermeticism “Psineus”, Roman astrologer Julius Firmicus Maternus called it “Seuichut” or “Senichut”, Cosmas of Maiuma (d. 760) called it “Erinys”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Serucuth” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲍⲉⲟⲩⲇⲁ” (“Zeuda”). This has been depicted as an old man with a belt, holding up his left hand and holding a flask in his right.

Belel:

This **telescopic** Senegalese star is HIP 95124 (HD 181342) in the IAU constellation Sagittarius and got this name in the IAU NameExoWorlds campaign. It is magnitude 7.55. Belel is a rare source of water in the north of Senegal. It has an exoplanet named Dopere, which is the name of the area in northern Senegal where Belel is located.

Bélénos:

This French star “Bélénos” is HIP 6643 (HD 8574) in the IAU constellation Pisces and was given this name in the IAU NameExoWorlds campaign. It is magnitude 7.12. It is derived from the name Belenus, who was the Gaulish God of light, the Sun, and death. This star has an exoplanet named Bélisama: This is the Gaulish Goddess of fire, the hearth, and metallurgy and glasswork.

Belet Balati:

This Babylonian ziqpu “mulGASAN.TIN” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Belet-ili:

This Chaldean asterism “dingir.mah du-at.an.u.ki” or “be-let te-lil-ti” (Koch-Westenholz 1995) from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti. It is associated with Belet-ili, creator of heaven and earth and Goddess of purification.

Belhadi:

This Ayt Xebbac star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Souag 2019).

Bell Board:

This Romanian asterism “Toaca” is the Great Square asterism in the IAU constellation Pegasus (Ottescu 2009). It represents the bell board hung beside a monastery.

Bellatrix:

See Female Warrior, below.

Bellerophon:

This French asterism is the IAU constellation Auriga as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). Bellerophon was the mythical Greek hero that killed the Chimera and tamed the winged horse Pegasus.

This Greek asterism “Bellerophon” or “Bellerophontes” is the IAU constellation Pegasus. Bellerophon was the mythical Greek hero that killed the Chimera and tamed the winged horse Pegasus. Johann Bayer’s *Uranometria* (1603) lists the names “Bellerophon” and “Bellerophontes”.

Bellows:

This Ikoots asterism “Mahc̓oy Roob” is the Hyades cluster in the IAU constellation Taurus.

Belly:

This Coptic asterism “Koliôn” is 35, 39, 41 and Mu (μ) Arietis in the IAU constellation Aries. English author W. B. Yeats listed this name in *A Vision* in 1917, deriving this from the works of German astronomer Athanasius Kircher (1602 – 1680), who listed it in his *Lingua Aegyptiaca Restituta* in 1636 and described it as “statio connectens triangulum prope ventrem cæli” (“connecting station, a triangle near the whale’s belly”).

Belly of the Fish:

This Arabic manzil “Al Baṭn al Ḥūt” or “batn al-hut” (بطن الحوت) or “Buṭnu ʾl-Ḥūt” (بَطْنُ ٱلْحُوت), translated as “belly of the fish” or “abdomen of the fish”, is the star Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda:

- “Al Baṭn al Ḥūt” is listed by Qutrub (d. 821 C.E.) and Ibn Qutayba (d. 889 C.E.):
- “Baṭn al Ḥūt” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964, however it may be 12 Andromedae (Hafez 2010).
- This appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). Dorn writes that Ulugh Beg Mirza (1394 – 1449) called it “Side of the Chained Lady”. It is also part of their asterism Well Bucket Rope (see below) and Heart of the Fish (see below) and is part of their asterism al-hut (see Great Fish, below), which is in turn part of their asterism complex Two Fish (see below).
- It is listed as “Batn al-hût” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Batn’al-hút, or the fish’s belly”.

This Yemeni manzil “Baţn al-hūt” is the star Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Belly of the Sea Monster:

This Arabic star “batn qaytus”, “Baṭni Qayṭus” (بطن قيطوس), or “Al Baṭn al Ḳaiṭos” is Zeta (ζ) Ceti in the IAU constellation Cetus, later latinized to “Baten Kaitos”:

- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists “Batencaitoz” (Dekker 2000).
- “Batn Qaytus” appears in the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).
- A 13th century astrolabe treatise of Pseudo-Messahalla, both translated from a treatise by the Andalusi astronomer Maslama al Majriti (950 – 1007). (King 2002).
- A 14th century Christian Spanish astrolabe #4560 lists “Panta Caitos” translated from a treatise by the Andalusi astronomer Maslama al Majriti (950 – 1007). (King 2002). Dekker (2000) lists this as ”Patancaitoz”.
- On the rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum this is listed as “Patacaitoz”The 15th century *Alfonsine Tables* list it as “Batenkaiton” and “Batenel Kaitos” (Kunitzsch 1986).
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists the name “Venter” (“belly”).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Venter Ceti” (“whale’s belly”).
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists “Baten Kaitos”
- Johann Bayer’s *Uranometria* (1603) lists “Baten Ketos”, “Baten Kaitos”, and “Batanel Kaitos”.

- "Betenkaitos" and "Batnolkitosi" are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this "Bata Kaytos".
- Robert Hues (1659) lists it as "Boten Elkaitos".
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Bata Kaitos al Ceti Ventris Borea".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Bata Kaitos".
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Baten Kaitos" as does Bode's *Vorstellung Der Gestirne* (1782).
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Baten Kaitos" in his *Celestial Atlas* in 1822.
- John Chilmead (1899) lists it as "Boten".
- This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Batan el Kaitos": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "batn Kaïtós, the belly of Cetus".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Baten al Kaitos".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Baiten el Kaitos"
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Batenkaitos" on its chart.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Baten Kaitos".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Baten Kaitos" for this star.
- The IAU approved the name Baten Kaitos for Zeta (ζ) Ceti Aa. Compare this to Breast of the Sea Monster, below.

Belocrator:

This "Greek" name for the IAU constellation Sagittarius was listed by John Hill in his *Urania* in 1754.

Belonging to the Lion of Leo:

This **telescopic** asterism "Leónidas Leónis" is the dwarf galaxy UGC 5470 (Leo I) in the IAU constellation Leo. It was discovered by Albert George Wilson in 1950. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named "Leo A, Leo B, and Leo I" with related names (see Lion's Son, below, and Like a Lion, below).

Belonging to the Uninhabited Spot:

This Persian asterism “Min al Az’al” is the stars Delta (δ), Epsilon (ε), Eta (η), Rho (ρ), and Sigma (σ) Hydrae in the IAU constellation Hydra according to the Persian astronomer Ulugh Beg Mirza (1394 – 1449). This was later latinized to “Minazal” (I through V) and assigned to these stars:

- Delta (δ) Hydrae: Minazal I,
- Eta (η) Hydrae: Minazal II,
- Epsilon (ε) Hydrae: Minazal III,
- Rho (ρ) Hydrae: Minazal IV, and
- Zeta (ζ) Hydrae: Minazal V.

Belt:

This Kamilaroi asterism “Ghutur” is the belt of Orion in the IAU constellation Orion. It is part of their asterism Beraiberai (see Leader, below).

This Kamilaroi and Euahlayi asterism “Buurr” is the belt of Orion in the IAU constellation Orion (Fuller et al 2014). It represents the hair belt of the hero Baayami, although for the Kamilaroi and Euahlayi the constellation Orion does NOT represent Baayami. NOTE: In their culture the hair belt represents the umbilical to the mother.

This Ngiyampaa (Ngemba) asterism “Buurr” is the belt of Orion in the IAU constellation Orion. It represents the hair belt of the hero Baayami, and for the Ngiyampaa the constellation Orion DOES represent Baayami (see Baayami, above).

There are two Arabic asterisms which translate as “belt”:

- One, “Al Nijāq” is the Belt of Orion in the IAU constellation Orion:
    - “Nitāq al-Jauzā’” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- One, “al-Minṭaqah” (المنطقة) or “Al Mintakah” is Delta (δ) Orionis in the IAU constellation Orion, later latinized to “Mintaka”. This an end star in the belt of Orion.
    - “Mintaqat al-Jauzā’” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “al-mutaqaddim fr ‘l-mintaqa”.
    - American uranographer Elijah Burritt (1794 – 1838) listed it as “Minitika”.
    - John Hill lists this as “Mintaka al Giacena” in his *Urania* in 1754 and describes it as “the stars that form the belt of Orion” as does R. H. Allen in his *Star Names* in 1899.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Mintakah al jauza, the giant’s belt”.
    - English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Mintaka”.
    - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this star as “Mintaka”.
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Mintaka” for this star.
    - The IAU approved the name Mintaka for the star Delta (δ) Orionis Aa.

This Latin asterism “Balteus” is the belt of Orion in the IAU constellation Orion as listed by Roman general Germanicus (d. 19 C.E.) and in R. H. Allen’s *Star Names* in 1899. Allen also lists 1st century Roman poet Ovid’s “Zona”, which can be translated as “belt” or “girdle”. In his *Star Names* in 1899 Allen describes this asterism as “the Balteus, or Belt” of Orion and attributes it to roman playwright Titus Maccius Plautus (c.254 – 184 B.C.E.) and Roman polymath Marcus Terentius Varro (116 – 27 B.C.E.).

This Greek asterism “Ζώνη” (“Zóni”) is the belt of Orion in the IAU constellation Orion as listed by Aristotle (384 – 322 B.C.E.) and in R. H. Allen’s *Star Names* in 1899.

Belt of Al Jawza’:

This Arabic asterism “nitaq al-jawza’” is the belt of Orion in the IAU constellation Orion. The stars are Zeta (ζ) Orionis (Alnitak- 33rd brightest star), Epsilon (ε) Orionis (Alnilam- 29th brightest star) and Delta (δ) Orionis (Mintaka- 67th brightest star). It is also known as the String of Pearls (see below) or the Jeweled Belt of Al Jawza’ (see below).

Belt of Hippolyta:

This Greek asterism is the belt of Orion in the IAU constellation Orion as listed by as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k). Hippolyta was the queen of the Amazons.

Belt of Orion:

This asterism is three stars in the IAU constellation Orion: It is derived from the older Arabic asterism Belt of Al Jaawza’ (see above). The stars are Zeta (ζ) Orionis (Alnitak- 33rd brightest star), Epsilon (ε) Orionis (Alnilam- 29th brightest star) and Delta (δ) Orionis (Mintaka- 67th brightest star). *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this. See Orion, below.

Belt of the Barker:

This Persian star “minṭáqa al awwa” (منطقة العوّاء), later latinized to “Mintek al Aoua”, is Epsilon (ε) Boötis in the IAU constellation Boötes as listed in the17th century *Calendarium* of Al Achsasi al Mouakket. R. H. Allen lists it as “Al Minṭakah al ʻAwwā” and translates it as “Belt of the Shouter”.

This Arabic star “Mintakah ‘al auwá” is Epsilon (ε) Boötis in the IAU constellation Boötes as listed by English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844: Smyth attributes this name to 16th century Arab astronomer Al Tizini.

This Latin star “Cingulum Latratoris” is Epsilon (ε) Boötis in the IAU constellation Boötes. Johann Bayer’s *Uranometria* (1603) lists this star as “Cingulum” and attributes this to the Alphonsine Tables.

Belvedere of Sky:

This Korean asterism “Haneul-ui Belbedele” (하늘의 벨베데레) is a quadrilateral of stars in the IAU constellation Taurus: 126, 119, 111, and 116 Tauri.

Bend:

This Arabic asterism “al-‘awa’” (العواء), “Al-Uwwa” or “ʾAl-ʿAwwāʾ” (ٱلْعَوَّاء) is in the IAU constellation Virgo and is the stars Beta (β) Virginis (Zavijava), Eta (η) Virginis (Zaniah), Gamma (γ) Virginis (Porrima), Delta

(δ) Virginis and Epsilon (ε) Virginis (Vindemiatrix). It is part of the Arabic asterism Lion (see below). The meaning of the ancient Arabic "al-ʿAwwā'" is uncertain. It resembles a medial Arabic letter kaf (ﻜـ), the final form of the Arabic letter alif (ﺎ) or an English capital L, which has led to some translating this as "the turn" or "the bend" (see Bend, above). This is also known as Howling Dogs (see below).

Bend in the Neck of the Camel:

There are three Arabic asterisms with this name:

- One is the Arabic and Bedouin manzil "ʾAl-Hanʿah" (ٱلْهَنْعَة), translated as "bend in the neck of the camel" or "stoopness in the neck of the camel", or "brand on the neck of the camel". This is the stars Gamma (γ) Geminorum (Alhena) and Xi (ξ) Geminorum in the IAU constellation Gemini.
    - "Al-Han'a" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - It was later latinized to "Al-Hanaah", "Alhena", or "Elhenaat" (this last one by Italian astronomer Giovanni Battista Riccioli (1598 - 1671)).
    - W. Brennand lists it as "Al-Henah" in his *Hindu Astronomy* in 1896 and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
    - This is listed as "Alhena, from al-hen'ah, a ring or brand on a horse's neck" in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844, which is a misinterpretation of the asterism "Al-Hekaah" (see Mark on the Horse's Hide, below).
- R. H. Allen lists this as Gamma (γ), Mu (μ), Nu (ν), Eta (η), and Xi (ξ) Geminorum in his *Star Names* in 1899 and writes that Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) called it "Winding". However, Allen also points out that this is the Arabic asterism Camel's Hump (see below), so it appears that he is confusing the two. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al-hen'ah" and describes this as Eta (η) and Mu (μ) Geminorum.
- One is the star Gamma (γ) Geminorum in the IAU constellation Gemini:
    - Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Alhena".
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alhena".
    - The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alhena" for this star.
    - The name "Alhena" was approved for Gamma (γ) Geminorum Aa by the IAU Working Group on Star Names in 2016.

This Yemeni manzil "Han'a" Gamma (γ) Geminorum (Alhena) and Xi (ξ) Geminorum in the IAU constellation Gemini (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Bend in the River:

This Arabic star "ʿArjat un-Nahr" (عرجة النهر) which translates as "bend in the river" or "curve in the river" and also appears as "Al Ḥināyat al Nahr" is Tau (τ) Eridani in the IAU constellation Eridanus:

- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "Augetenar" (Dekker 2000).

- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as "Angenetar".
- This was later latinized to "Angetenar" in the *Alfonsine Tables* (Kunitzsch 1986)
- It is listed as "Anchenetenar" or "An Anchat al Nahr" by Joseph Justus Scaliger (1540 – 1609).
- It is listed as "Angetenar" by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).
- The IAU approved the name Angetenar for the star Tau (τ) 2 Eridani.

This Greek asterism is the stars Upsilon (υ) 1, 2, 3, and 4 Eridani (50, 52, 43, and 41 Eridani) in the IAU constellation Eridanus. In the *Almagest*, Ptolemy (c.100 – c.170) called Epsilon (υ) 2 Eridani "hē kampē" ("the bend in the river"). Later Arab writers translated this to "bhmn", later latinized to "Beemin", and "Beemun". Some later writers incorrectly assume this came from the Hebrew תאומים (te'omim), meaning "twins," producing "Theemin" and "Theemun". Robert Hues listed both "Beemin" and "Theemin" in his *A Learned Treatise of Globes* in 1659. German astronomer Christian Ludwig Ideler (1776 – 1846) assumed it came from the Hebrew "Bammaʾyim" ("in the water"). Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "Theemim". Several stars have names derived from this source:

- Upsilon (υ) 1 Eridani has been called Beemim and Beemim III.
- Upsilon (υ) 2 Eridani was assigned the name Theemin by the IAU Working Group on Star Names in 2017 but has also been called Theemini.
- Upsilon (υ) 3 Eridani was assigned the name Beemim by the IAU Working Group on Star Names in 2017 but has also been called Theemim, Theemin, and Beemim II.
- Upsilon (υ) 4 Eridani has the name Beemim I.

Bend of Teivi:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Bend of the Hand:

This Arabic star is Sigma (σ) Persei in the IAU constellation Perseus.

Bender of Camelopardalis:

This **telescopic** asterism "Curvátor Camelopardális" is the spiral galaxy UGC 3714 in the IAU constellation Camelopardalis. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its warped shape due to nearby UGC 3697.

Benedict:

This German asterism "Benedict" or "Saint Benedict Among the Thorns" is the IAU constellations Serpens and Ophiuchus (Serpentarius) and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures: Benedict is Ophiuchus and the "thorny bush" is Serpens. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Benedictus cum Spinis Eiuaad al Serpentarius cum Serpente". This probably leads to it appearing in

Edward Sherburne's *Sphere of Marcus Manilius* in 1675 as a name for Ophiuchus, but later in John Hill's *Urania* in 1754 as a name for Serpens.

Benedict's Galaxy:

This **telescopic** asterism is the barred spiral galaxy NGC 4314 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "I 76". It became GC 2881 in the *General Catalogue* of 1864. American astronomer Fritz Benedict studied this extensively in 1976. This name was posted by American astronomer Dragan Nikin on the *Deep Sky Forum* in January 2016.

Beneficent Arm:

This Latin asterism "Υπευθέριαν" or "Brachium beneficum" is made up of stars in the IAU constellation Aquarius as mentioned by German Jesuit scholar Athanasius Kircher (1602 – 1680), who described it as "Egyptian". R. H. Allen translates it as "Place of Good Fortune" in his *Star Names* in 1899 and describes it as a Coptic lunar station. It is the stars Alpha (α) Aquarii (Sadalmelik), Gamma (γ) Aquarii, Zeta (ζ) Aquarii, and Eta (η) Aquarii.

Benetnasch:

See Daughters of the Bier, below.

Benjamin:

This German asterism is the IAU constellation Lupus as described in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. German poet Philipp von Zesen (1619 – 1689) described it as the wolf to which Jacob likened Benjamin.

Bennu:

See Phoenix, below.

Bent Arms of Triangulum:

This **telescopic** asterism "Cámpimus Triánguli" is the spiral galaxy NGC 672 in the IAU constellation Triangulum. It was discovered in 1786 by English astronomer William Herschel who listed it as "I 157". It became GC 396 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the sharp curves of the arms of this galaxy".

Bent Back Turtle:

This Tzotzil (of Zinacantán) asterism "Vuku Pat" is made up of stars of the IAU constellations Ursa Major, Boötes, and Leo and represents a bent backed turtle or old man (Milbrath 1999). Compare this to the Mayan asterism "Aak" (see Turtle, below).

Bent Fan:

This **telescopic** asterism in the IAU constellation Cygnus is also known as the Red Necked Emu or Spiral. It is close to open cluster Do Dz 3. All the stars in this asterism are blue/white except one red star and they are all 9th magnitude including 29 Cygni.

Bent One of Ursa Major:

This **telescopic** asterism “Curvus Úrsae Majóris” is the Seyfert 2 galaxy UGC 6527 in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the curved shape of this lenticular galaxy”.

Bent Plough:

The Irish asterism “Camchéachta” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper below). The symbol of the Starry Plough ultimately became a symbol of Irish Republican and left-wing movements in Ireland. Compare this to the earlier Celtic asterism Plough (see below).

Bent Propeller:

This **telescopic** asterism is Le-Wa J2108.8+0621 in the IAU constellation Equuleus. René Merting describes it on the Faint Fuzzies website: “At 45x, the interesting, well-structured star pattern spontaneously looks like a bent propeller. Overall, a long star chain can be seen from northeast to east, sweeping westward and finally southwestward, where a small star grouping of faint, slightly nebulous-looking stars sparkles. Below this overall arc, further faint stars can be seen, forming two more star chains and possibly representing a four-armed octopus.” The principal stars are Gaia DR3 1733722510342754176, HD 201331, Gaia DR3 1733737388109821824, and Gaia DR3 1733738457556751488.

Bent Stick:

This Russian asterism “Bent Stick” or “Crooked Stick” is a five-sided figure in the IAU constellation Orion. It starts at Nu (ν) Orionis and runs around through Xi (ξ) Orionis, 69 Orionis, Chi (χ) 2 and Chi (χ) 1 Orionis. This is also known as Orion’s Cudgel (see below), Cudgels (see below), and the Grandmother’s Cudgels (see below).

Bentang Gumarang:

This Sundanese asterism is the Pleiades cluster in the IAU constellation Taurus (Iskandar 2016).

Bentang Karita:

This Baduy and Sundanese asterism is the Pleiades cluster in the IAU constellation Taurus (Iskandar 2016). This is a kikandayan tani, an indicator to decide the start of the farming season.

Bentang Kerti

This Sundanese asterism is the Pleiades cluster in the IAU constellation Taurus (Iskandar 2016).

Bentang Kidang:

This Baduy and Sundanese asterism is the belt of Orion in the IAU constellation Orion (Iskandar 2016). This is a kikandayan tani, an indicator to decide the start of the farming season.

Bentang Ranggeuy:

This Sundanese asterism is the Pleiades cluster in the IAU constellation Taurus (Iskandar 2016).

Bentang Wuluku:

This Sundanese asterism is the belt of Orion in the IAU constellation Orion (Iskandar 2016).

Beol:

This Korean star is Delta (δ) Ursae Majoris (Megrez) in the IAU constellation Ursa Major.

Beop:

This Korean star is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major.

Berehynia:

This **telescopic** Ukrainian star is HAT-P-15 in the IAU constellation Perseus and was given this name in the IAU NameExoWorlds campaign. It is magnitude 12.41. This is a national Goddess of waters and riverbanks. It has an exoplanet named Tryzub, a gold trident which is the most recognized ancient symbol of the Ukraine.

Berenice's Bush:

This English asterism is the IAU constellation Coma Berenices as described in Thomas Hill's *Schoole of Skil* in 1599. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Berenice's Bush" and attributes it to Hill. R. H. Allen writes in his *Star Names* in 1899 that Geoffrey Chaucer (c.1340s – 1400) and Spenser also used this name.

Berenice's Hair:

This English asterism which first appears in 1601 as "Berenices' haire" is the IAU constellation Coma Berenices. Dutch uranographer Willem Janszoon Blaeu (1571 - 1638) depicted it as "Bernice's Hair" on his celestial globe of 1062 (Stevenson 1921). It appears in Robert Hues' *A Learned Treatise on Globes* in 1659 and in John Hill's *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Berenice's Hair". *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Berenice's Hair" on its charts and in its text, describing it as a "beautiful cluster".

Berenice's Hair Clip:

This **telescopic** asterism is NGC 4565 (Caldwell 38), an edge-on spiral galaxy in the IAU constellation Coma Berenices. It was discovered in 1785 by English astronomer William Herschel who listed it as "V 24": Herschel described it as a "lucid ray 20' long or more, 3' or 4' broad". It is GC 3106 in the *General Catalogue* of 1864. It is also known as the "Needle Galaxy" (see below).

Berenice's Lock's:

The Latin name "Crines Berenices" was given by German astronomer Petrus Apianus (1495 – 1552) to the IAU constellation Coma Berenices in 1536. The *Astronomicum Caesarium* (1540) of Petrus Apianus lists it as "Crines Berenices Trahe".

Dutch uranographer and cartographer Gerardus Mercator called it "Berenicis Crinis" on his globes. It also appears as "Crines".

Berenice's Periwig:

This English asterism is the IAU constellation Coma Berenices as described in the poem *Hudibras* by English poet Samuel Butler (1613 – 1680).

Berri:

This “Persian” name for the IAU constellation Aries was listed John Hill in his *Urania* in 1754.

Berry of Virgo:

This **telescopic** asterism “Báca Vírginis” is the elliptical galaxy NGC 4365 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “III 901”. It became GC 2920 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its round shape.

Bessel’s Star:

This double star is 61 Cygni B in the IAU constellation Cygnus. German astronomer Friedrich Bessel measured its large proper motion (seventh highest) in 1838, but this was originally noted by Italian astronomer Giuseppe Piazzi (1786 – 1846) 34 years earlier. It is also known as Piazzi’s Flying Star (see below). *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), mentions “Bessel’s Star”.

Betelgeuse:

See Hand of al-Jauzā, below.

Betta Fish:

This Singaporean **telescopic** asterism is the supernova remnant G296.5+10.0 in the IAU constellation Centaurus, discovered in 1974 and photographed by astrophotographer Marco Lorenzi. It is also known as the Mermaid Nebula (see below).

Between the Legs:

This Japanese star “Intercrus” is 41 Lyncis in the IAU constellation Lynx. This Latin name was submitted to the IAU NameExoWorlds campaign by the Okayama Astro Club in Japan in December 2015 and approved for the star by the IAU in 2015. It has an exoplanet named Arkas.

Beyond the Milky Way of Cygnus:

This **telescopic** asterism “Translácteus Cýgni” is the interacting galaxies UGC 11453 in the IAU constellation Hercules. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “at the edge of the Milky Way, [and]… similar to our Milky Way galaxy”.

Beyond the Yoke:

“Eri-Uedon” is a proposed early Celtic name for the IAU constellation Sagittarius from the *Book of Ballymote* through an etymological reconstitution (Boutet 2014).

Bhrigu:

This Vedic star “Bhrigu”, “Bhrgu”, or “Kasyapa” is Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Bhagwath 2019). Boutet (2014) lists it as Gamma (γ) Ursae Majoris. This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Bicycle:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. South African astronomer Magda Streicher writes in the DOCdb database that it resembles a bicycle. It is also known as the Hole in a Cluster, "83", Nefertiti's Headpiece, the Smoke Ring, the Bicycle, or the Reliquary.

Bidelman's Helium Variable Star:

This rotating variable star is a Centauri in the IAU constellation Centaurus. It is named for American astronomer William P. Bidelman who noted the variability of its helium lines in 1965.

Bidelman's High-Latitude Be star:

This **telescopic** double star is HIP 71064 (HD 127617) in the IAU constellation Boötes (magnitude 8.73). It is named for American astronomer William Pendry Bidelman (1918 – 2011).

Bidelman's Peculiar Star:

This **telescopic** variable star is KS Persei (HIP 22365, HD 30353) in the IAU constellation Perseus (magnitude 7.76). It is named for American astronomer William Pendry Bidelman who noted it in a paper entitled *The Peculiar Star HD 30353* in 1949.

Bier:

The "Italian" name "Cataletto" is given for the Big Dipper asterism in the IAU constellation Ursa Major in John Hill's *Urania* in 1754, in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844, and in R. H. Allen's *Star Names* in 1899. Compare this to the older Arabic asterism Daughters of the Bier, below.

This Hebrew asterism "'Āsh" or "'Ayish" is the "dipper bowl" of the Big Dipper asterism in the IAU constellation Ursa Major and appears in the Book of Job, ix.9, and xxxviii.32. Compare this to the older Arabic asterism Daughters of the Bier, below. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a name for Ursa Major, and translates it as "bier": This is a reference to the Arabic asterism Daughters of the Bier (see below).

Bier of Lazarus:

This asterism "Feretrum Lazari" is in the IAU constellation Ursa Major and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It appears in John Hill's *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a "bier or sarcophagus" and attributes it to Kircher. This is the Big Dipper asterism in the IAU constellation Ursa Major, with the stars of the "handle" of the Big Dipper being the mourners:

- Mary Magdalen or Magdalen: Epsilon (ε) Ursae Majoris (Alioth)
- Martha: Zeta (ζ) Ursae Majoris (Mizar), and
- "Ancilla" (Latin for "maid"): Eta (η) Ursae Majoris (Alkaid).

NOTE: Hill gives the name "Filiae Feretri Majoris" for these three stars, but the translation of this Latin name is "daughter of the elder", which indicates that it probably refers to only one of these three stars. Edward Sherburne mentions this asterism in his *Sphere of Marcus Manilius* in 1675. German Jesuit scholar Athanasius Kircher (1602 – 1680) and Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Na'ash Laazar" (a reference to the Arabic asterism Daughters of Na'sh, see below) and

described the three stars as Mary, Martha, and Ellamath. Anglo-Irish art historian Anna Brownell Jameson (1794 – 1860) listed Mary, Martha, and Martilla or Marcella in her *Sacred and Legendary Art*, and English astronomer William Henry Smyth (1788 - 1865) lists "Feretrum" as Mary, Martha, and Magdalen and attributes this to German Jesuit astronomer Athanasius Kircher (1602 – 1680). Compare this to the older Arabic asterism Daughters of the Bier, below.

Bifurcated of Cetus:

This **telescopic** asterism "Bifurcátus Céti" is the spiral galaxy NGC 908 in the IAU constellation Cetus. This was discovered in 1786 by William Herschel who listed it as "I 153". It became GC 536 in the *General Catalogue* of 1864. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 9. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as one of its arms is bifurcated.

Big Back Wheels:

This Lithuanian asterism "Didieji Grįžulo Ratai" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper below).

Big Bear:

This Greek asterism ""άρκτος μεγάλη" ("Arktos Megale") is the IAU constellation Ursa Major as listed by Ptolemy (c.100 – c.170) which also appears on the 2nd century Tabula Bianchini:

- The "body" runs from the star 23 Ursae Majoris through Alpha (α) Ursae Majoris (Dubhe), Delta (δ) Ursae Majoris, Gamma (γ) Ursae Majoris, Beta (β) Ursae Majoris (Merak), and Phi (ϕ) Ursae Majoris to Upsilon (υ) Ursae Majoris.
- The "head" runs from 23 Ursae Majoris through Tau (τ) Ursae Majoris, Sigma (σ) 1 and 2 Ursae Majoris, Rho (ρ) Ursae Majoris, to a "nose" at Omicron (ο) Ursae Majoris, to Upsilon (υ) Ursae Majoris.
- The "ear" is the triangle of stars Sigma (σ) 1 and 2 Ursae Majoris, 24 Ursae Majoris, and Rho (ρ) Ursae Majoris,
- The "back legs" runs from Gamma (γ) Ursae Majoris to Psi (ψ) Ursae Majoris where it splits into two lines:
- One runs to Mu (μ) Ursae Majoris and
- One runs to Lambda (λ) Ursae Majoris,
- The "front legs" runs from Phi (ϕ) Ursae Majoris to Theta (θ) Ursae Majoris where it splits into two lines:
- One runs to Kappa (κ) Ursae Majoris, and
- One runs to Iota (ι) Ursae Majoris.

This Armenian asterism "Մեծ Արջ" ("The Big Bear") is the IAU constellation Ursa Major.

This Ininew (Cree) asterism "Mista Muskwa" is the Big Dipper asterism in the IAU constellation Ursa Major (Buck 2016). This bear was pursued by the "Tehpakoop Pinesisuk" (see Seven Birds, below). Compare this to Muin and the Seven Hunters, below.

Big Bird:

This Woleaian asterism “Mannap” is made up of the of the IAU constellations Carina, Canis Major, and Canis Minor (Holton et al 2015). The “head” of the bird is Alpha (α) Canis Majoris (Sirius). One wing extends to Alpha (α) Canis Minoris (Procyon), and the other to Alpha (α) Carinae (Canopus).

Big Bison:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is made up of the stars of the IAU constellation Cassiopeia: The central star is Psi (ψ) Cassiopeiae from which three lines of stars emerge:

- One curving line runs through Epsilon (ε) Cassiopeiae, HIP 8115A, Phi (ϕ) Cassiopeiae, and HIP 3334, ending at 6 Cassiopeiae,
- One runs out to Iota (ι) Cassiopeiae, and
- One runs out to 50 Cassiopeiae.

Big Black Meteoric Star:

This Skidi star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Krupp 1983). They considered it to be one of the four pillars of heaven.

Big Black Snake:

This Tupi asterism “Boiunaçu” is the IAU constellation Scorpius (De Freita Mourão 2009). This snake swallowed a macaw egg, “Ararasopiá” (See Macaw’s Egg, below). The setting of the “head” of this snake in November indicated the beginning of the flooding season of local rivers, these floods being called “Boiunaçu Iuquicé” (“Boiunaçu floods”).

Big Canoe:

This Chinook asterism is the belt of Orion in the IAU constellation Orion. It is in a race with the Little Canoe (see below). The river is the Milky Way, and the fish is the star Alpha (α) Canis Majoris (Sirius). Compare this to the Salish “Bark Canoe” (see above) and the Yolgnu “Boat and Fishline” (see below).

Big Carriage:

This Macedonian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Cenev 2014).

Big Cart:

This Serbian asterism “Velika kola” is the Big Dipper asterism in the IAU constellation Ursa Major.

Big Crab:

This Ikoots asterism “Minč” is the “head” of the IAU constellation Hydra: Epsilon (ε), Delta (δ), Sigma (σ), Eta (η), and Rho (ρ) Hydrae.

Big Cross:

This Macedonian asterism is the Northern Cross (see below) in the IAU constellation Cygnus (Cenev 2014). It is also known as the “Svirdl” (see Auger, above). Compare this to their asterism “Krst” (see Cross, below).

Big Dipper:

The Big Dipper asterism includes the seven brightest stars in the IAU constellation Ursa Major, and Ursa Major includes six of the 90 brightest stars in the sky. People in the Western world today call it the Big

Dipper, the Plough or Charles's Wain, but as you can see from the many entries in this handbook, elsewhere it is known by many other names. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the Big Dipper. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists the name "Big Dipper" for this asterism.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Dipper" and "Ursa Major".

The four stars that form the bowl of the Big Dipper are: Alpha (α) Ursae Majoris (Dubhe- 34th brightest star), Beta (β) Ursae Majoris (Merak- 80th brightest star), Gamma (γ) Ursae Majoris (Phecda, Phad or Phekda- 86th brightest star), and Delta (δ) Ursae Majoris (Megrez or Kaffa, which doesn't appear in the list of 90 brightest stars). The stars forming the handle of the Big Dipper are Epsilon (ε) Ursae Majoris (Alioth or Aliath- 32nd brightest star), the binary star Zeta (ζ) Ursae Majoris (Mizar- 52nd brightest star) and 80 Ursae Majoris (Alcor) situated at the bend in the handle, with the star Eta (η) Ursae Majoris (Alkaid or Benetnatsch- 40th brightest star) at the end of the handle. The stars Dubhe and Merak at the end of the bowl of the Big Dipper create a line that points at the current North Celestial Pole and the star Alpha (α) Ursae Minoris (Polaris), the North Star.

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists "Big Dipper: US name for the Plough".

Big Dog:

This asterism "Canis Magnus" is the IAU constellation Canis Major. This name is listed in Johann Bayer's *Uranometria* (1603).

Big Eagle:

This Kaska asterism "Ahdā Cho" may be the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021).

Big Early:

This Tibetan khyim (zodiac constellation), also known as "Karma Mindrup" (see below) or "Karma Karchen", is probably the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Big Fish:

This Latin asterism "Piscis Magnus" is the IAU constellation Piscis Austrinus:

- "Piscis Magnus" is listed in the Munich 210 manuscript of the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*").
- Johann Bayer's *Uranometria* (1603) lists "Piscus Magnus".
- The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") lists "Piscis Magnus" and "Auster" (which is a Roman name for the south wind).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Piscis Magnus".
- "Piscis Magnus" appears in John Hill's *Urania* in 1754.

This Egyptian asterism is one of the paranatellonta of the decans of Capricornus as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Telescopium.

Big Fishhook of Maui:

This Hawaiian asterism "Ka Makau Nui O Maui" ("The Big Fishhook of Maui") represents the Demigod Maui's fishhook. It is the "tail" of the IAU constellation Scorpius.

Big Göncöl:

This Hungarian asterism "Nagy Göncöl" is the IAU constellation Ursa Major. Göncöl was a mythological táltos ("shaman") who could cure any disease. It is also known as "Göncöl" (see below).

Big-Headed Man:

This Tutchone asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Big Low Border:

This is one of the three enclosures in Korean sky culture, "Keun Naj-eun Gyeong-gye" (큰 낮은 경계) also known as Tall Fence, the others being Purple (Violet) Low Border and Sky Market Border (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs above). This two-part Korean asterism is a pair of star lines:

- Left Executor: This is a line of stars in the IAU constellations Coma Berenices and Virgo: 42 Comae Berenices, and Epsilon (ε), Delta (δ), Gamma (γ), and Eta (η) Virginis.
- Right Executor: This is a line of stars in the IAU constellations Leo and Virgo: Beta (β) Virginis (Zavijava), and Sigma (σ), Iota (ι), Theta (θ), and Delta (δ) Leonis.

Big One:

This is an alternate Dëne Suhne name, "Hochol" or "Hochok", for their asterism "Yéhda" (see Traveler, below (Cannon 2021)).

Big Otter:

This Barasana star "Timi Haigu" or "Timi Hesau" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Hugh-Jones 2006).

Big Plough:

This Irish asterism is the IAU constellation Ursa Major. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015).

Big Rudder Stars:

This Vietnamese asterism "Sao Bánh Lái Lớn" is the Big Dipper Asterism in the IAU constellation Ursa Major (see Big Dipper above).

Big Sky:

This is an alternate Lower Tanana name, "Yochwx", for their asterism "Nogheyoli" (see One Who Continuously Walks, below).

Big Snake:

This Diné asterism “Tlish Tsoh” is made up of stars of the IAU constellations Canis Major and Puppis (Childrey 2008).

This Karajá asterism “Inuni-kau” is dark nebulosity of the Milky Way near the IAU constellations Serpens and Ophiuchus (De Freita Mourão 2009).

Big Star:

This Caribou Inuit star “Ubluriakjuak” or “Udluriaralu” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This !O Kung, //Gana, and Naron star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Alcock 2014).

Big Talisman

This Hungarian asterism “Büs táltos” appears on the celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a crowned king seated on a throne facing to our left. He is holding a sceptre in his right hand. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Big Wagon:

This Belarussian asterism “Вялікі Воз” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Big Wheels:

This Belarussian asterism “Bal’shyia Kaliosy” is the IAU constellation Ursa Major (Avilin 2009).

Big Wild Duck:

This Tongan asterism **“**Toloalahi” is made up of stars of the IAU constellations Carina and Vela. This diamond-shaped asterism is composed of four stars: Delta (δ) Velorum (Alsephina), Kappa (κ) Velorum (Markeb), Epsilon (ε) Carinae (Avior) and Iota (ι) Carinae (Aspidiske). It is related to their asterism Twins (see below).

Big Woodpecker:

This Lacandon star “äh ch’uhum” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Milbrath 1999).

Big Yard for Chariots:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of stars with a quadrilateral at one end in the IAU constellations Cygnus and Lacerta:

- The quadrilateral is the stars 72 Cygni (the determinative star), 74 Cygni, 79 Cygni, and HIP 107856.
- The line runs from HIP 107856 through HIP 109831, and 6 Lacertae, ending at 11 Lacertae.

This Chinese xing guan “Chēfǔ” (车府) is made up of stars of the IAU constellations Cygnus and Lacerta. A line of stars runs from 15 Lacertae through 11 and 2 Lacertae, and Rho (ρ) Cygni to a bend at 59 Cygni, where it then runs on through Xi (ξ) Cygni, ending at 74 Cygni.

This Chinese Chenzhuo xing guan “Chēfǔ” is made up of stars of the IAU constellations Cygnus and Lacerta: At one end is the loop of stars 79 Cygni, 72 Cygni, 70 Cygni, and HIP 107129. From 79 Cygni a line runs through HIP 109754 and 6 Lacertae to 11 Lacertae.

Biggest of Leo Minor:

This **telescopic** asterism “Máximus Leónis Minóris” is the galaxy 3C 236 (ICRF J100601.7+345410) in the IAU constellation Leo Minor. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this is “one of the largest known radio galaxies and even one of the largest known objects in the universe”.

Biggest Snake:

This Latin asterism “Maximus Anguis” is the IAU constellation Draco as listed by Vergil (70 – 19 B.C.E.). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Maximus Anguis”.

Bighorn Sheep:

This Seri star “Mojet” is Delta (δ) Orionis (Mintaka) in the IAU constellation Orion.

Biham:

See Auspice of Lambs, above.

Bihi:

This Caribbean star is Alpha (α) Canis Majoris in the IAU constellation Canis Major and is part of their asterism Troi Rois (see below).

Billhook:

This Latin star “falx ītalica” or “Falx Italica” is 38 Boötis in the IAU constellation Boötes.

Bintang Suraya:

This Malay asterism “Bintang Suraya” is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairduddin 2029). “Suraya” is Malay for “Thurayya”, which is an obvious reference to the Arabic asterism “Al Thurayya” (see Little Abundant One, below). It is also known to the Malay as “Bintang Tujuh” (see Seven Stars, below).

Bipolar Nebula:

This **telescopic** asterism is the planetary nebula NGC 6302 (Caldwell 69) in the IAU constellation Scorpius. It was described by American Astronomer Edward Emerson Barnard in 1884 as a “small hole in the Milky Way” and appeared in the *New General Catalogue* in 1888. It is also known as the Butterfly Nebula (see below) and the Bug Nebula (see below).

Bird:

This Chinese star “Niao” (鸟) or “Niao Hsing” (“bird star”) was mentioned in the Shangshuyaodian 尚书尧典 (Canon of Yao of the Book of Documents- 2300 B.C.E.), a collection of political documents from the legendary Emperor Yao. This is the star Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra.

This Arabic asterism “al-Tā’er” is the IAU constellation Cygnus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Egyptian asterism “Aped” or “Apdu” is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and is made up of the stars of the IAU constellations Perseus and Triangulum:

- The “neck” of the bird is Alpha (α) Persei (Mirfak),
- The “head” of the bird is formed by the three stars 48 and 51 Persei and Gamma (γ) Persei,
- The “wingtips” are the stars Xi (ξ) Persei and Eta (η) Persei,
- The “tail” is the star Alpha (α) Trianguli.

This Latin asterism “Ales” (“bird”), “Avis” (“wings”), “Volucris” (“birds”), or “Aves Veneris” (“the birds come”) is the IAU constellation Cygnus:

- The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists Cygnus as “Avis” and depicts it as a swan in flight as viewed from below.
- The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Cygnus in the same manner as Dürer et al.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Avis” as a name for Cygnus.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Ales” and “Avis”.

This Polynesian (Pukapuka Island) asterism “Te Manu” is a “box” of four stars (which is the four stars of the IAU constellation Corvus): Beta (β) Corvi (Kraz), Delta (δ) Corvi, Gamma (γ) Corvi and Epsilon (ε) Corvi. This is part of the Hawaiian star line “Ka Iwikuamo’o” (see Bone Back Lizard, below).

This Micronesian asterism “Maan” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini and the star Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor.

The postclassic Mayan *Paris Codex* lists three “bird” asterisms, the species of which is uncertain:

- “Bird 1” is the IAU constellation Libra.
- “Bird 2” is the IAU constellation Gemini. Probably a muan bird (a type of owl), but some experts claim it is a cox (black pheasant)
- “Bird 3” is the IAU constellation Capricornus.

NOTE: One of the other two birds in the Mayan sky might be a vulture. Compare this to the Mayan asterism “Ch’oom” (see Vulture, below).

This K’iche asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Milbrath 1999). The name of the bird incorporates the number seven.

There are three **telescopic** “bird” asterisms:

- One is PGC 62946, which is a triple galaxy merger in the IAU constellation Sagittarius. It is also known as the Tinker Bell Triplet.

- One is Corder 2972 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45' X 35'. This is a group of 9th – 10th magnitude stars. Corder describes "the preceding wing" as being "longer and brighter" and the "following wing" as "shorter and fainter" with "two stars that make the feet". The tip of one wing is the star HIP 78894.
- One is Corder 4050 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20'. Corder describes this as "9 faint stars in the shape of a bird in flight. The bird is flying ESE with wings curving and outspread, with a tail trailing WNW. The stars are magnitudes 9 and 10." This includes HIP 98885 and 98405.

Bird Goddess of the Summer Sky:

In *The Myth of the Year*, Benigni, Carter and Ua Cuinn connect the IAU constellation Cygnus to a Bird Goddess of the Summer Sky. Indications of solar cults associated to swans are found on the votive models of carriages drawn by various animals including swans from the Urnfield and Hallstatt phases of European pre-history. Celtic mythology is full of stories involving Goddesses and swans, such as *The Dream of Angus*, the *Wooing of Étain*, the *Children of Manannán Mac Lir*, and *Branwen Daughter of Llyr* in the second branch of the Welsh *Mabinogion*.

Bird in Flight:

There are two **telescopic** "Bird in Flight" asterisms:

- One is in the IAU constellation Pisces and is Corder 163 on the observing list of American astronomer Jeffrey Corder. Corder describes it as "a much elongated group that includes at least 18 stars between magnitudes 8 to 11" which he describes as a "bird with its wings spread out in flight". Corder describes the "body" as "a small clump of stars at the middle that includes an 8th magnitude star". This star is the double star HIP 4687. A curving line on either side of this "body" is the two wings: One "wing" includes HIP 4570 and 4515. One wing includes the double star HIP 4775A.
- One is in the IAU constellation Cygnus and is Corder 4201 on the observing list of American astronomer Jeffrey Corder. Size 40' X 30'. This is 7th – 10th magnitude stars including HIP 101646, and 101770.

Bird Like of Hydra:

This **telescopic** asterism "Ornithódes Hýdrae" is the spiral galaxy NGC 2936 (Arp 142) in the IAU constellation Hydra. It was discovered by German astronomer Albert Marth in 1864, becoming 175 and 176 on his list. It is GC 5497 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to it having the "appearance of a long-necked bird". It is interacting with the elliptical galaxy NGC 2937, which is known as the Egg Galaxy (see above). It is also known as the Penguin (see below) and the Porpoise (see below).

Bird Net:

This Bhil asterism "Mangari" is the Hyades cluster in the IAU constellation Taurus (Orchiston 2021). They use the Mangari to catch jungle babbler birds.

Bird of Flight:

This large Anutan asterism has several parts made up of stars in the IAU constellations Canis Major and Canis Minor and Carina:

- **"**Te Tino A Manu" ("the bird's body") is the star Alpha (α) Canis Majoris (Sirius). Sirius is in the middle with the "wings" running off to either side,
- "Te Kapakau Pakatokerau" ("the north wing"), is a line running from Sirius to the star Alpha (α) Canis Minoris (Procyon), and
- "Te Kapakau Tonga" ("the east wing"), is the star Alpha (α) Carinae (Canopus).

Nearby is the Anutan "Te Kaokao O Manu" (see Bird's Armpit, below).

This Tahitian asterism "Manu" is identical to the Anutan asterism Bird of Flight (above).

Bird of Paradise:

This French asterism "Oiseau de Paradis" is the IAU constellation Apus.

This Italian asterism "Uccello Paradiso" is the IAU constellation Apus.

This German asterism "Paradies Vogel" is the IAU constellation Apus.

This English asterism is the IAU constellation Apus as described in Robert Hues' *A Learned Treatise of Globes* in 1659.

Compare this to Apus (above).

Bird of Phoebus Apollo:

This Latin asterism "Phoebo Sacer Ales" (as described by 1st century Roman poet Marcus Manilius) or "Phoebeīus Ales" as described by 1st century Roman poet Ovid is the IAU constellation Corvus. Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this asterism "Corvus al Phoeba Avis" ("Corvus or Phoebe bird").

Bird of the Satyrs:

This Latin asterism "Avis Satyra" is the IAU constellation Corvus.

Bird of Zeta:

This **telescopic** asterism is the star Zeta (ζ) Ophiuchi in the IAU constellation Ophiuchus. Its companion star blew up in a supernova, pushing this star through molecular gas and dust, causing it to ionize this and form a bright bow-arch around it. Australian astrophotographer Prasun Agrawal used this name on 31 May 2024 on the ZWO Astrophotography Facebook page.

Bird Snare:

This Māori asterism "Te Pewa a Tautoru" or "Te Tuke o Tautoru" is the belt of Orion. For the Māori of Ngati-Porou, a "Pewa" is a bird-perch that supports a snare, also known as a "Mutu" or a "Tuke".

Bird with a Bloodletter:

This Aztec asterism is the IAU constellation Crux (Milbrath 2014).

Bird with Two Eggs:

This Kolam asterism "Bhoria" is the Hyades cluster in the IAU constellation Taurus (Vahia 2014). Alpha (α) Tauri (Aldebaran) is the bird.

Bird's Armpit:

This Anutan asterism "Te Kaokao O Manu" is made up of the stars Delta (δ) and Epsilon (ε) Canis Majoris in the IAU constellation Canis Major, just east of their asterism "Te Tino A Manu" (see Bird of Flight above).

Bird's Beak:

This Chinese xing guan "Niǎohuì" (鸟喙) is a curving line of stars in the IAU constellation Tucana: Epsilon (ε), Zeta (ζ), Rho (ρ), Beta (β) 1 and 2, Delta (δ), and Alpha (α) Tucanae and HIP 118092.

Bird's Head:

This **telescopic** asterism NGC 6745 is an irregular galaxy in the IAU constellation Lyra. It was discovered by French astronomer Édouard Stephan (1837 – 1923). It is actually a trio of galaxies colliding. It is also known as the "Plectrum of Lyra" (see below).

Bird's Nest:

This asterism is NGC 6996 in the IAU constellation Cygnus. This was discovered by French astronomer Guillaume Bigourdan (1851 – 1932). It is GC 4619 in the *General Catalogue* of 1864. German astronomer Robert Zebahl lists it on his *Faint Fuzzies* website. Zebahl describes it as consisting of "a small star cloud surrounded by dark nebulae. The brightest condensation in the southern part of the star cloud is catalogued as NGC 6996, Barnard 353 forms the darkest part of the nest edge to the southeast." Zebahl notes that it "was described in 1927 in the American magazine *Popular Astronomy*". It is also known as "Lady Liberty" (see below) and Schlegel 1.

Bird's Wing:

This Kiribati star "bai ni man", "bai ni man maiaki" or "bai ni man meang" is unidentified at present (Trussel and Groves 1978). It is also translated at "fish's fin".

Birika:

This is a Swahili name for the "teapot" asterism in the IAU constellation Sagittarius (see Teapot, below (Koehle 2011)).

Birringoloo:

This Kamilaroi and Euahlayi asterism is the IAU constellation Musca. Birringoloo is the second wife of Byaame or Baayami, their creator/culture hero. She sits by the campfire of Byaame's camp (the star Alpha (α) Muscae), and all women with girl children who die come to this camp before going on to Bulimah (Heaven behind Warrambul – see below). They wait at this camp until all their girl children have died and come to the camp, and then they can proceed to Bulimah.

Birrugan:

This Gumbayngirr asterism is the IAU constellation Crux (Morelli 2015). Birrugan is a culture hero of the Gumbayngirr who is also associated with the morning star, and with the name Gawnggan, with the morning star.

Birth of Hydra:

This **telescopic** asterism “Pártus Hýdrae” is the interacting pair of spiral galaxies NGC 3058 in the IAU constellation Hydra. It was discovered by Francis Leavenworth in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “this pair of galaxies has the appearance of an animal and its newborn whelp”.

Birth Spirit:

This Kamilaroi, Euahlayi, and Murrawarri asterism “Wadhaagudjaaylwan” is named after the third wife of Byaame or Baayami, their creator/culture hero. Wadhaagudjaaylwan is in the Large Magellanic Cloud and sings to women who are going to have babies. She "sings" the babies to the women on Earth, and she takes the persons that the Old Wiringin in the Small Magellanic Cloud sends to her and sends them back to Earth as babies.

Birth Woman:

This Dakota/Lakota/Nakota asterism “Tun Win”, also known as “Blue Woman” (see below) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Birthing Place:

This French star “Locus Parturientis” is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major as listed by Robert Hues in his *A Learned Treatise on Globes* in 1659, a name which Hues attributes to French scholar Joseph Justus Scaliger (1540 – 1609).

Bison Bulls:

This Arapaho asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Bison Man:

This Babylonian asterism “MUL.GUD.ALIM” is a bison-man made up of stars in the IAU constellation Centaurus and associated with their Sun God Utu-Shamash. It is listed in the Neo-Babylonian (Chaldean) Great Star List (636 – 539 B.C.E.) as “dutu” (Koch-Westenholz 1995).

Bitch:

John Hill gives this as an “Arabic” name for the IAU constellation Cassiopeia in his *Urania* in 1754, explaining “the Arabians were not permitted by their law to draw any human figures, and they therefore retained the chair in this constellation, but displacing the lady they put this quadruped in her head”. Later Hill lists a Latin name, “Canis Fœmina” (“female dog”). This is the location of the Arabic asterism She Camel (see below). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 also lists . “Canis Fœmina” and writes that “the Arabians [have] no passion for delineating the human form, made a dog of Cepheus”.

Bite of the Harrow:

This Seleucid star is Mu (μ) Velorum in the IAU constellation Vela and is part of their asterism Harrow (see below).

This Babylonian and Sumerian star “bite of gis-gan-gur” is Mu (μ) Velorum in the IAU constellation Vela as listed in the BM 78161 catalogue (Liechty 1988).

Bithynicus:

This French asterism is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). This is the name of a Roman senator, Quintus Pompeius Bithynicus.

Bituin Utala:

This Maguindanao star "Bituin Utala" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Santos et al 2019).

Black:

This French asterism "Mulda", believed to be derived from the Greek "Μέλας" ("Mélas") is the IAU constellation Eridanus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). R. H. Allen writes in his *Star Names* in 1899 that this is Lalande interpreting the Egyptian name for the Nile, Khem, which means "black" and refers to the dark silt its flood waters leave behind, this later becoming the Latin name for the Nile, "Melo".

Black Ant:

The stars of this Kiribati asterism "Karinaba" or "na Karinaba" are currently unidentified (Trussel and Groves 1978).

Black Arrow:

This **telescopic** asterism is the open cluster NGC 3532 in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. English astronomer John Herschel (1792 – 1871) described it as "the most brilliant object of the kind I have ever seen". It is also known as the Wishing Well Cluster, the Football Cluster, the Firefly Party, the Fish Cluster, and the Pincushion.

Black Back Fish of Indus:

This **telescopic** asterism "Melanonótus Índi" is the spiral galaxy NGC 7090 in the IAU constellation Indus. It was discovered in 1834 by John Herschel who listed it as h 3872 and later as GC 4679 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this edge-on galaxy shows a dark dust belt at its northeastern edge, bringing in mind a fish with a black back".

Black Bart's Hair:

This **telescopic** asterism is the Coma Berenices Cluster, Melotte 111.

Black Belted of Virgo:

This **telescopic** asterism "Nigricínctus Vírginis" is the barred spiral galaxy NGC 5719 in the IAU constellation Virgo. It was recorded as "II 682" by William Herschel in 1787. It became GC 3971 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it of the "conspicuous dark dust belt of this galaxy". NOTE: John Herschel recorded this in 1828, and George Phillips Bond recorded this in 1853 as NGC 5658.

Black Bottomed Galaxy:

This **telescopic** asterism NGC 247 (Caldwell 62) is an intermediate spiral galaxy in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1784. This is listed as GC 132 in the 1846 *General Catalogue*. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) in a Latin form: "Melampygus Céti" ("black-bottomed of Cetus"). It is also known as the Claw Galaxy (see below) and the Needle's Eye (see below).

Black Browed of Cancer:

This **telescopic** asterism "Melanóphrys Cáncri" is NGC 2775 (Caldwell 48), a field spiral galaxy in the IAU constellation Cancer. It was discovered in 1783 by English astronomer William Herschel who listed it as "I 2". John Herschel listed it as h 564 and later as GC 1771 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to "a remarkable long and thin dust belt at its western edge.

Black Cattle:

This Arabic asterism "Al 'auhakán" is the stars Omega (ω) and 27 Draconis in the IAU constellation Draco as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this and attributes it to "Ulugh Beigh". Also known as Claws of the Wolf (see below).

Black Cockatoo:

This Kokatha and Ngalea star "Warrooboordina" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Leaman and Hamacher 2014, Leaman, Hamacher, and Carter 2016). It is also known as "Fire Carrier". The black cockatoo has a red tail, which explains the association with fire.

Black Crustacean:

This Kiribati star "Antimama" or "Antim'am'a" is an unidentified star in the IAU constellation Gemini (Trussel and Groves 1978).

Black Duck:

This Yuin asterism "Umbarra" (Pacific Black Duck) is the Pleiades cluster in the IAU constellation Taurus (Fuller and Bursill 2021). This is from a Black Duck Songline that the Larrakia Peoples of Southeast Australia share. NOTE: Clarke (2009) also relates a story from this region where the Moon (Throwa) pursues young women represented by the Pleiades into the sky and attributes this to Brothers (1897).

This Kamilaroi and Euahlayi asterism is the Pleiades cluster in the IAU constellation Taurus (Fuller and Bursill 2021). Some versions of their songline describe this as Wood Ducks. Seven young female ducks visit a lake with their parents, who tell them not to play by the reeds. One disobeys and is abducted, is made pregnant, and eventually returns. Their father sends them all into the sky for safety.

Black Eagle:

This Arabian asterism "Al ʿOḳāb" is the IAU constellation Aquila. John Chilmead in his *A Learned Treatise on Globes*, 1889, which was a translation of the Latin work by English geographer and mathematician Robert Hues (1553 – 1632) gives the name "Alhhakhab".

This asterism "Aluk" is the IAU constellation Aquila as listed in John Hill's *Urania* in 1754: He describes it as "a Persian name for that constellation".

Black Emperor:

This Chinese star "Heidi" from the Three Kingdoms to Ming Dynasty is HIP 57646 in the IAU constellation Leo and is part of their xing guan Seats of the Five Emperors (see above).

Black Eye:

There are four **telescopic** "Black Eye" asterisms:

- One is the Black Eye Galaxy, Messier 64 (NGC 4826), a spiral galaxy with prominent dust lanes in the IAU constellation Coma Berenices. It is also known as the "Sleeping Beauty Galaxy" (see below) or "Evil Eye Galaxy" (see below). This was discovered by English astronomer Edward Pigott in March 1779, observed by German astronomer Johann Elert Bode in April of the same year, by French astronomer Charles Messier the following year, and observed by English astronomer William Herschel in 1790. It was William Herschel, writing in his observations that it "contains one lucid spot like a star with a small black arch under it, so that it gives one the idea of what is called a black eye arising from fighting." It is listed in the 1864 General Catalogue as GC 3321 and in John Herschel's catalogue as h 1486. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Black Eye-Nebula". Walter Scott Houston writes that "This galaxy was nicknamed the Black Eye galaxy by Sir Charles Blagden, while observing with William Herschel": This would be the physician Charles Blagden FRS (1748 – 1820). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 also attributes the black eye name to Blagden. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Mélanops Cómae Bereníces" ("black eyed of Coma Berenices").
- One is the Black Eye Nebula, reflection nebula NGC 1999(vdB 46, LBN 979, Ced 55i) in the IAU constellation Orion. This was discovered by English astronomer William Herschel in 1785 who listed it as "IV 33" in his catalogue. It is GC 1202 in the *General Catalogue* of 1864. Herschel described it as "a star with milky chevelure or vB nucleus with milky nebulosity." The Helwan Observatory Bulletin No. 21 of 1920 describes it as a "dense glove with an absolutely dark triangular hole cutting into it." It is also known as the Rubber Stamp Nebula (see below), and "Africa" (see above).
- One is the galaxy NGC 5248 (Caldwell 45) in the IAU constellation Boötes. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 34". It is GC 3615 in the *General Catalogue* of 1864. American astronomer Brian Skiff (1993) describes it as having "a dark patch in the arms to S of centre [making] it look like a 'black-eye'" in the DOCdb database. It is also known as the "Ox Eyed of Boötes".
- One is a pair of dwarf galaxies ~5' north of NGC 1023 (Arp 135) in the IAU constellation Perseus. It was discovered in 1784 by William Herschel who listed it as "I 156". It became 244 on his son John Herschel's list and GC 574 in the *General Catalogue* of 1864. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists NGC 1023 as O'Meara 10. O'Meara describes this as "two tiny galaxy pairs… [which looks] like a set of small eyes,(one of the eyes being a black eye)".

Black Eyed of Coma Berenices:

This **telescopic** asterism "Melanóssus Cómae Bereníces" is the lenticular galaxy NGC 4293 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "V5". It became GC 2867 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "on both sides of the nucleus two black regions can be seen as two black eyes".

Black Feather of Camelopardalis:

This **telescopic** asterism "Nigripínnis Camelopardális" is the barred spiral galaxy IC 334 in the IAU constellation Camelopardalis. It was discovered by British astronomer William Frederick Denning in 1891. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the remarkable dark belt at the eastern side of this deformed galaxy."

Black Hair of Coma Berenices:

This **telescopic** asterism "Nigrípilus Cómae Bereníces" is the intermediate spiral galaxy with a weak inner ring structure NGC 4559 (Caldwell 36) in the IAU constellation Coma Berenices. This was discovered by English astronomer William Herschel in 1785 who listed it as "I 92". It is GC 3101 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the conspicuous dark dust stroke in the southern part of the galaxy that looks like a braid of black hair." This is also known as the Club (see below) and the Koi Fish (see below).

Black Haired of Canes Venatici:

This **telescopic** asterism "Melánthrix Cánum Venaticórum" is the galaxy NGC 5005 (Caldwell 29) in the IAU constellation Canes Venatici. It was discovered in 1785 by William Herschel who listed it as "I 96". It became GC 3437 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the many prominent dark and thin dust lanes".

Black Hole Nebula:

This **telescopic** asterism is dark nebula Barnard 92 in the IAU constellation Sagittarius. American astronomer Edward Emerson Barnard discovered this in 1913 and published it in his paper Dark Regions in the Sky Suggesting an Obscuration of Light, which he opened with the statement: "The so called 'black holes' in the Milky Way are of very great interest." This particular nebula picked up this name as it is one of the densest. Of course this was before the "black holes" that we are familiar with today.

Black Horse:

This Arabic star "Al-Jawn" (الجون) is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major. This word has several meanings, one referring to the black color of a horse or camel but is also used in reference to a white wild donkey or ass:

- "Al-Jawn" is listed by 'Abd al-Rahman al-Sufi (903 – 986).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "khāmis banāt na'sh yusammā al-jawn" ("the fifth of banāt na'sh, called the black horse").

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al jaun, black horse" and later in this catalogue as "a courser".
- NOTE: Hafez (2010) lists this as "al-Jūn" ("the bull") and attributes it to Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964.

Black Leopard:

This Karajá asterism "Aloé" or "Aloé-lubú" is made up of stars of the IAU constellations Carina, Chamaeleon, Puppis, and Volans (De Freita Mourão 2009).

Black Lizard Nebula:

This **telescopic** asterism is dark nebula is Barnard 138 in the IAU constellation Aquila.

Black Llamas:

This Inca asterism "Yana Llama", "Yacana", or "Yaqana" (Gamarra & Gamarra 2009) represents a mother llama and its baby "Uñallamacha". Urton (2022) lists the name of the "mother llama" as "Llama" and that the name "Yacana" came from the Huarochiri manuscript. Ciancia (2018) lists the Andean name as "Llama". The body of the mother llama is the dark nebulosity in the Milky Way stretching between the IAU constellations Centaurus and Scorpius and the baby llama is suckling at her mother's breast: The mother llama's eyes "Llamacnawin" (see Eyes of the Llama, below) are the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar). There is a similar asterism "Catachillay" (see Female Llama below).

Black Magellanic Cloud:

This is an alternate name for the Coal Sack Nebula (see Coal Sack Nebula below) which R. H. Allen in his *Star Names* in 1899 attributes to English astronomer William Henry Smyth circa 1850.

Black Martin:

This English asterism is the IAU constellation Apus as listed in R. H. Allen's *Star Names* in 1899. Allen attributes the name to "our Andrews-Freund" but his reference list at the end of the book does not further identify this person.

Black Rimmed of Indus:

This **telescopic** asterism "Melándetus Índi" is the lenticular galaxy IC 5063 in the IAU constellation Indus. It was discovered by Royal Harwood Frost in 1904. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy has an interesting black dust belt".

Black Rock City:

This American asterism is the IAU constellation Corona Borealis and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Black Scorpion:

This Mayan asterism "Ek Chuuah" from the *Chilam Balam* books is the IAU constellation Scorpius.

Black Spot Nebula:

There are two **telescopic** nebulae by this name:

- One is dark nebula is Barnard 93 in the IAU constellation Sagittarius.
- This is an alternate name for the Black Hole Nebula (see above).

Black Star:

This Chaldean star "ul-gi" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Black Striped of Hydra:

This **telescopic** asterism "Atrilineáta Hýdrae" is the barred spiral galaxy NGC 2763 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as "III 275". John Herschel listed it as h 560 and later as GC 1761 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name in reference to "the remarkable black band in the southern part of this galaxy".

Black Swallowtail Butterfly:

See Beehive, above.

Black Swan:

This Bundjalung asterism "Ginibi" is the IAU constellation Crux (Sharpe 1978). Robinson listed it as "Gineevee" in 1873. The Pointers are a spear thrown to kill the swan (see Pointers, below).

This Gundungurra asterism "Dyin-yook" is the IAU constellation Crux (Mathews 1908).

This Yaegl asterism "Ngaragan" is the IAU constellation Crux as listed by Bob Fuller, who listed the source as "Anon (ethnographic source)".

There are two **telescopic** Black Swan asterisms:

- One is the swan-shaped open cluster Messier 18 in the IAU constellation Sagittarius. It was discovered by French astronomer Charles Messier in 1764. It is listed in John Herschel's General Catalogue of 1864 as GC 4401.
- One is the emission nebula IC 1871 in the IAU constellation Cassiopeia. It was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). This was named by Canadian astrophotographer Francois Theriault on 19 May 2024 on the ZWO Astrophotography Facebook page.

Black Swans:

This Koori asterism is the stars Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae in the IAU constellation Aquila. They are the wives of Bunjil (See Wedge-Tailed Eagle, below).

Black Vulture:

This Carib asterism "Kurumuyuman" or "Kurumu" represents the black vulture (Coragyps atratus). Its present location is unknown (Magaña, and Jara, 1982).

Black Woman:

This Tuareg star “Lemkechen” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Polaris. She is holding a baby camel “Aourâ”, so that the mother camel “Tâlemt” (the Big Dipper) can suckle it. A nearby triangle of stars in the IAU constellation Ursa Major represent “El-Djema’at” (see Assembly, above) , a group who are deliberating to kill Lemkechen, so she must hide (Holbrook 2020).

Blade and Pearl:

This **telescopic** asterism NGC 5746 is a barred spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as “I 126”. It is GC 3987 in the *General Catalogue* of 1864. Astronomy Magazine contributing editor Stephen James O’Meara came up with the name Blade and Pearl. It is also known as the Mini Sombrero Galaxy (see below). This is O’Meara 74 in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Blade of Grass of Leo:

This **telescopic** asterism “Festúca Leónis” is the edge-on spiral galaxy NGC 3501 in the IAU constellation Leo. It was discovered by Édouard Stephan in 1881. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Blaze Star:

This double star is T Coronae Borealis (HIP 78322) in the IAU constellation Corona Borealis. It is a cataclysmic variable star first discovered in outburst in 1866 by Irish astronomer John Birmingham. The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this star as the “Blaze Star”.

Blaze:

This star “Alkurah” is the binary star Xi (ξ) Cephei in the IAU constellation Cepheus. It is also known as “Alkirdah” (see Mark on the Horse Hide, below).

Bleary-Eyed Woman:

There are two Arabic stars with the name “al-Ghumaiṣā'” (الغميصاء) which translates as “bleary eyed one” or “bleary-eyed woman” or “ash-shi’ra al-ghumaysa’” which translates as “Little Bleary-Eyed sister”:

- The first is the star Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Minor:
    - “al-Shi’ra al-Ghumaisa” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - John of London, in a letter to R. De Guedinge (1246) discusses “Algomeysa” (Nothaft 2022).
    - An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “al-ghumaysā” and the Hebrew name “kelev qatan”.
    - This was later latinized to “Gomeisa”, “Algomeyla” (in the 15th century *Alfonsine Tables*), or “Gomelza” (as listed by American uranographer Elijah Burritt (1794 – 1838)).
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Gomeisa, from al ghomeisá, watery-eyed”.
    - English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Gomeisa”.
    - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list “Gomeisa” for this star.

- The IAU approved the name Gomeisa for the star Beta (β) Canis Minoris
- The second is the star Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor:
  - Other variations include “Algomiza”, “Algomeysa”, “Algomyso”, “Alchamizo”, and “Algomeyza”.
  - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic names “al-shi’rā” and “al-ghumaysā” and the Hebrew name “ha-soger ‘eyno” (“one who closes his eye”).
  - The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists this star as “Algomeisa”.
  - A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as “Algomeisa”.
  - Dorn (1829) lists this as “the Syrian Star” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
  - The rete of astrolabe NMM AST 0570 in the National Maritime Museum lists “Algomeiza” (Dekker 2000).
  - The Sloane astrolabe BM SL 54 (1290 – 1300) in the British Museum lists “Algomeiza” (Dekker 2000).
  - A 14th century Christian Spanish astrolabe #4560 lists “Gomiza” and “ghumaysa” and one has “Algomic” (King 2002).
  - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Algomeysa” for this star.
  - A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as “Algomiasa”.
  - This was latinized to “Elgomaisa” and “Algomeiza” by German astronomer Johann Bayer (1572-1625).
  - This was latinized to “Algomisa” by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).
  - Robert Hues lists “Algomiza” in his *A Learned Treatise of Globes* in 1659.
  - This is also known as the Northern Shi’ra.
  - Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star “Orionis al Procyon est Algomeisa”.
  - NOTE: This asterism and the asterism Teary-Eyed Woman (see below) are the “sisters” of Suhayl (see Glorious, above) who was the fiancé of Al Jawza (see Al Jawza, above).

John Hill lists the name “Sheira Al Ghomisa” as a name for the IAU constellation Canis Minor in his *Urania* in 1754. This is clearly a reference to the star Alpha (α) Canis Minoris. He translates this as “Little Dog”, which is another name he assigned to Canis Minor (see Little Dog, below).

Bleiddyd’s Lever:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Blessing:

This Chinese star “Fu” is Phi (ϕ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

Blind:

This Hindu asterism “Andhakā” is the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899.

Blinking Demon:

This star is Beta (β) Persei (Algol) in the IAU constellation Perseus and is so called as it is a variable star.

Blinking Galaxy:

This **telescopic** asterism NGC 6118 is a grand design spiral galaxy in the IAU constellation Serpens. It was discovered in 1793 by English astronomer William Herschel who listed it as “II 402”. It is GC 4180 in the *General Catalogue* of 1864. It has this name as it tends flick in and out of view with different eye positions. It is also known as “Two Pronged Forks of Serpens” (see below).

Blinking Nebula:

This **telescopic** asterism the “Blinking Nebula” or “Blinking Planetary Nebula” is the planetary nebula NGC 6826 (Caldwell 15) in the IAU constellation Cygnus. It is listed as “IV 73” on English astronomer William Herschel’s list. It is GC 4514 in the *General Catalogue* of 1864. It was given this name by English astronomers J. Mullaney and Wallace Mccall: Mullaney writes: “In the early 1960s Wallace McCall and I came up with the nickname because of the planetary’s unusual behavior in the eyepiece – direct vision shows only the central star and a little trace of the nebula itself, while averted vision drowns out the central star with bright blue nebulosity. Alternating back and for the between direct and averted viewing produces and incredible blinking effect.” Size 0.9’ X 0.8’.

Bloody Star:

“Izar Odoltsua” is a Basque name for Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Knörr 1999).

Blooming Dancers of Fornax:

This **telescopic** asterism “Choroéthales Fornácis” is the barred spiral galaxy NGC 1097 in the IAU constellation Fornax. It was discovered in 1790 by William Herschel who listed it as “V 48”. It became GC 610 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Bodifee and Berger describe their naming it thus: “The rather poetic name describes the beautiful swirling appearance of this galaxy with its mysterious faint optical jets. The Greek adjective χοροιθαλ_ς (choroithalès, in Latintranscription choroethales) is a poetic description of dancing girls in the Homeric tradition. The literal meaning of χορ_ς (choros) is a choir of singing dancers, θαλ4ς (thalès) means blooming.”.

Blossom:

This Hawaiian star “Puana” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minoris. This is a new Hawaiian name inspired by the Māori name for this star as the original name was lost.

Blossom Cluster:

This Māori star "Puanga" or "Puanga-rua" is Beta (β) Orionis (Rigel) in the IAU constellation Orion. Some see it as a fruit that Kererū (see Wood Pigeon, below) wants to eat.

Blow Gun:

This Ikoots asterism "Nepep" is the Sickle of Leo asterism in the IAU constellation Leo: Epsilon (ε) Leonis (Algenubi) through Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis (Algieba) and Eta (η) Leonis to the star Alpha (α) Leonis (Regulus).

Blow-dryer:

This **telescopic** asterism Messier 100 (NGC 4321) is a grand design spiral galaxy in the IAU constellation Coma Berenices. It was discovered by French astronomer Pierre Méchain in 1781 and English astronomer William Herschel described it in the *Philosophical Transactions* in 1814. It is listed in the General Catalogue of 1864 as GC 2890 and in John Herschel's catalogue as h 1211. It is also known as the Mirror Galaxy (see below) and the "Hundredth of Coma Berenices" (see below).

Blubber Container:

This Inuit asterism "Uqsuutaattiaq", also known as "Pituag" ("stones supporting lamp"- see Lamp Stand, below), is the stars Alpha (α) Cassiopeiae (Shedar), Beta (β) Cassiopeiae (Caph) and Gamma (γ) Cassiopeiae (Navi) in the IAU constellation Cassiopeia (MacDonald 1998).

Blücher:

This star "Blücher" is a 10th magnitude star within 2 degrees of Polaris listed by R. H. Allen in his *Star Names* in 1899. Allen doesn't clearly identify the source of this name nor give any other details that would more precisely identify it.

Blue:

This Assyrian star "Sa" or "Samu" is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

Blue Eyed of Virgo:

This **telescopic** asterism "Glaucópis Vírginis" is the barred spiral galaxy NGC 5750 in the IAU constellation Virgo. It was discovered in 1787 by William Herchel who listed it as "I 183". It became GC 3990 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the shape of this galaxy, with its remarkable pointed extension at one side and the conspicuous blue ring in the central region, resembles a blue eye".

Blue Flash Nebula:

This **telescopic** asterism is planetary nebula NGC 6905 in the IAU constellation Delphinus. It was discovered by English astronomer William Herschel in 1784 who listed it as "IV 16". It is GC 4572 in the *General Catalogue* of 1864. Size 1.2' X 1.2'. This name was posted on the *Deep Sky Forum* by American astronomer Dragan Nikin in October 2016. It is also known as the Caged Spirit Nebula (see below).

Blue Horse:

This Kazakh asterism “Kökbozat” is the star Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor. Aqbozat and Kökbozat (Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris) represent two horses constantly circling “Timir Qazyq” (“Iron Pole”) which is Polaris.

Blue Horse Head Nebula:

This **telescopic** asterism is the reflection nebula IC 4592 (vdB 100, LBN 1113, Ced 128) in the IAU constellation Scorpius. This was discovered by American astronomer Edward Emerson Barnard (1857 – 1923).

Blue Jaguar:

This Kogi asterism “Neb-Taši”, “Neb-Táshi”, or “Neb-Tashi” (“puma” or “red jaguar”) is identified either as the belt or the sword of Orion in the IAU constellation Orion.

Blue Jay:

This Mi’kmaq star “Tities” is Epsilon (ε) Boötis (Izar) in the IAU constellation Boötes. It is part of their asterism Muin and the Seven Hunters (see below).

Blue Planetary Nebula:

This **telescopic** asterism is planetary nebula NGC 3918 in the IAU constellation Centaurus. It is also known as “The Southerner”. It was discovered by English astronomer John Herschel in 1834, who listed it as h 3365 in his catalogue. John Herschel noted that “It is of a most decided independent blue colour” and made many other references to its blue colour in subsequent observational notes. It is GC 2581 in the *General Catalogue* of 1864. New Zealand amateur astronomer James Henry Pope (1837 – 1913) listed it as “the blue Planetary Nebula near the Southern Cross” in 1881. It is also known as the Southerner (see below): James Andrew mentions the name “Southerner” in his *Neat Southern Planetaries – II* in 1998. NOTE: Many observers have described its colour as green.

Blue Racquetball:

This **telescopic** asterism is planetary nebula NGC 6572 in the IAU constellation Ophiuchus. It was discovered in 1825 by the German astronomer Friedrich Georg Wilhelm von Struve, who called it one of the “most curious objects in the heavens”. John Herschel listed it as h 2000 and later as GC 4390 in the *General Catalogue* of 1864. It is also known as the Emerald Nebula, the Green Nebula, the Turquoise Orb, or the Planet Krypton Nebula. NOTE: Racquetball was invented in 1950, so the name cannot predate this. Walter Scott Houston describes this as a “vivid blue” and Greg Crinklaw described it as a blue planetary nebula. Sue French describes it as “robin’s egg blue” one night and “turquoise” on another.

Blue Snowball:

This **telescopic** asterism the “Blue Snowball” or “Copeland’s Blue Snowball” is the planetary nebula NGC 7662 (Caldwell 22) in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1864 who listed it as “IV 18”. It is GC 4964 in the *General Catalogue* of 1864. English astronomer Thomas William Webb (1807 - 1885) and American astronomer Sherburne Wesley Burnham (1838 – 1921) both noted it’s blue colour in their observations. It was named the “blue snowball” by American amateur astronomer and poet Leland S. Copeland (1886 – 1973) in the February 1960 Issue of *Sky and Telescope*. Size 1’ X 0.7’.

Blue Star:

This Elvish star “Luinil” is probably Beta (β) Orionis (Rigel) in the IAU constellation Orion. English author J. R. R. Tolkien (1892 - 1973) had vague notes on this subject, seeming to link it with the planet Neptune, which is too faint to be seen with the unaided eye. Tolkien’s son Christopher suggests that Rigel is the best candidate, as it would be the partner of the star Borgil (see Red Star, below).

Blue Straggler:

This telescopic asterism is NGC 6397 (Caldwell 86) in the IAU constellation Ara. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1755 who listed it as Lac III 11. It is GC 4311 in the *General Catalogue* of 1864. It is also known as the Golden Nectar Cluster (see below).

Blue Wedge:

This telescopic asterism is Lorenzin 13 in the IAU constellation Centaurus. This is Phi (ϕ) Centauri, Mu (μ) Centauri, and Nu (ν) Centauri.

Blue Woman:

This Dakota/Lakota/Nakota asterism “To Win”, also known as “Birth Woman” (see above) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Bluebird:

This **telescopic** asterism is reflection nebula NGC 6914 in Cygnus. This was discovered by astronomer Édouard Stephan on 29 August 1881. It is also known as the “Eyes”.

Boa:

This Italian asterism “Bogina” is the IAU constellation Ursa Minor as listed in R. H. Allen’s *Star Names* in 1899. Allen describes it as being used by “Italian sailors”.

Boaliri:

This Walpiri and Yolgnu star “Boaliri” is a star in the Pleiades cluster in the IAU constellation Taurus (Fuller & Bursill 2021). Boaliri is the younger of a mythical pair of Wagalag or Wauwalak sisters, daughters of the Djanggawul (important ancestors) who got pregnant by the “wrong men” and were tracked down and punished by the serpent Julunggul by being placed in the sky. The other sister is Garangal (see above) or Waimariwi (see below).

NOTE: In a Yuin version of this story, these sisters come down from the Pleiades and then are sent back.

Boar:

This Celtic asterism is the stars Epsilon (ε) Ursae Majoris (Alioth), Zeta (ζ) Ursae Majoris (Mizar), and Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major (Boutet 2014). Victorian folklorist Marie Trevelyan (1852 – 1922) lists it as the “Woodland Boar” in her *Folk-lore and Folk-stories of Wales* (1909).

Boar Piglet:

This Celtic (Gaulish) asterism “Boar” or “Boar Piglet” is the IAU constellation Ursa Minor (Boutet 2017).

Boars:

This Romanian asterism “Vierii” is the IAU constellation Taurus (Ottescu 2009, Lite 2018).

Boat:

There are two ancient Egyptian boat asterisms:

- One asterism "Wia" is made up of the stars of the IAU constellation Capricornus. The "hull" is a curve of stars from a "prow" at the star 6 Capricorni and running through Beta (β) Capricorni (Dabih) and Psi (ψ) Capricorni to a "keel" at Omega (ω) Capricorni and then through 24 Capricorni and Zeta (ζ) Capricorni to a "stern" at the stars Gamma (γ) and Delta (δ) Capricorni. A "rudder oar" is a line running from 32 Capricorni to 41 Capricorni. This asterism appeared from the New Kingdom (16^{th} — 11^{th} century B.C.E.) onward.
- One is made up of stars of the IAU constellation Scorpius and possibly Sagittarius. Some ethnoastronomers believe that it is connected to the other Egyptian asterism "Khentet" (see Prow, below) which would mean that it would include stars of the IAU constellation Sagittarius. Leitz (1994) relates this to the Sethian decan and Locher (1981) as the middle decan of a large boat asterism containing Alpha (α) Scorpii (Antares). Davis (1985) also places the constellation of the boat in this part of the sky.

This Suku Bali asterism "Perahu" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This Arabic star "az-Zawraq" (الزورق) is Gamma (γ) Eridani in the IAU constellation Eridanus:

- This was later latinized to "Zaurak" and "Zaurac".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Neyyir al Zaurak, or bright star of the boat".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Gamma (γ) 1 Eridani as "Zaurac".
- The 1^{st} edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14^{th} edition (1959) list this star as "Zaurak".
- In 2016 the IAU approved the name Zaurak for Gamma (γ) Eridani.

This Egyptian asterism "Al Zaurak" is the IAU constellation Phoenix as listed by German astronomer Christian Ludwig Ideler (1766 – 1846) and R. H. Allen in his *Star Names* in 1899.

This Ainu Nociw ("asterism") is made up of stars of the IAU constellation Auriga. The star Beta (β) Aurigae (Menkalinan) is a person at one end of the boat, the stars Eta (η) and Zeta (ζ) Aurigae a person at the other end, and the star Alpha (α) Aurigae (Capella) is a person standing in the middle of the boat.

Boat and Fishline:

This Yolgnu asterism "Djulpun" is in the IAU constellation Orion. The three stars of the belt of Orion (Clarke 2015) are the seat across the middle of the boat and the sword of Orion is a line of fish. Djulpun signals the start of the Dry season for the Yolgnu. In one version of the story the stars of the belt are the men Birrupirru, Djandurrngala, and Ngurruwilpil, who are paddling this bark canoe across the sky (Davis 1898, Clarke 2009).

Boat from Heaven:

This Kazakh asterism "Aspan Kayygy" is the Big Dipper asterism in the IAU constellation Ursa Major.

Boats and Lake:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a rough quadrilateral of stars in the IAU constellation Boötes: 20 Boötis (the determinative star), 18 Boötis, 15 Boötis, 14 Boötis, HIP 69585, and HIP 69829.

This Chinese xing guan "Kàngchí" (亢池) is a quadrilateral of stars in the IAU constellation Boötes: 14, 18, and 20 Boötis and HIP 69260.

This Chinese Chenzhuo xing guan "Kàngchí" is an oval of stars in the IAU constellation Boötes: 14, 15, 18, and 20, Boötis and HIP 69829 and 69585.

Bobcat:

This Skidi star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor.

Bode's Galaxy:

This **telescopic** asterism is Messier 81 (NGC 3031) in the IAU constellation Ursa Major. It was named for the German astronomer Johann Elert Bode who discovered it in 1774. It is listed in the General Catalogue of 1864 as GC 1949 and 1953, and in John Herschel's catalogue as h 649. NOTE: Some experienced amateur astronomers may be able to see this with the unaided eye under exceptional observing conditions (O'Meara 1998). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply describes it as "Ursa Major, Nebula". This name appears as "Bodeánus Úrsae Majóris" in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010):

Bogeyman Nebula:

This **telescopic** asterism is the dark nebula LDN 1622 in the IAU constellation Orion. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024).

Boiling Lights:

This Filipino asterism "Moropo" (Bikolano), "Mapolon" (Tagalog), "Maroprop" (Ilokano), "Langaw" (Maguindanaw), "Kufukufu" (Teduray), "Marapuro" (Kanlurang Samar), "Penikapan" (Manobo), "Molopolo" (Bukidnon), "Murupuru" (Tagbanua"), or "San Apon" (Ibaloi), is the Pleiades cluster in the IAU constellation Taurus (Santos et al 2019).

Bolas:

There are three Mapuche asterisms with this name:

- One "Melipal" or "Meli Pal" is the IAU constellation Crux.
- One, "Lükay" or "Xana Lükay" is the IAU constellation Crux (Menares 2008)
- One, "Meli Pal", "Kalolasta", or "Lasta Wagleg" is Alpha (α) Scorpii (Antares), Pi (π) Scorpii, Delta (δ) Scorpii, and Beta (β) 1 Scorpii (Acrab) in the IAU constellation Scorpius (Menares 2008).

NOTE: This asterism represents boleadoras or bolas. This is also known as the Cruiser or the Star Cart.

Bold Arrow Cluster:

See Arrow, above.

Bold Little One of Canes Venatici:

This **telescopic** asterism “Fortículus Cánum Venaticórum” is the irregular Magellanic galaxy NGC 4449 (Caldwell 21) in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1788 who listed it as “I 213”. It is GC 3002 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Box” (see below).

Bold Monster:

This Latin asterism “Monstrum Audax” or simply “Audax” or “Monstrum” is the IAU constellation Draco. The Roman general Germanicus (15 B.C.E. – 19 C.E.) used “Monstrum”. Johann Bayer’s *Uranometria* (1603) lists “Monstrum Germanico”.

Bolt:

This Latin asterism “Vectis” (“lever”, “pole”, or “bolt”) is the IAU constellation Sagitta. Johann Bayer’s *Uranometria* (1603) lists the name “Vectis” as an alternate name for Sagitta. R. H. Allen’s *Star Names* in 1899 lists “Vectis”. Allen translates this as “pole”, but as Sagitta is Ptolemy’s arrow, the interpretation “bolt” (as from a crossbow) seems most likely.

Bomb:

This **telescopic** asterism Cseh 10 listed by Hungarian astronomer Viktor Cseh is a group of stars around the 8th magnitude star TYC 683-583 in the IAU constellation Orion. Cseh describes these as “a small winged bomb in the sky pointing in the outward direction! Very nice!”

Bond:

This Chinese xiù (lunar mansion) “Loúxiù” (娄宿) is a line of three stars in the IAU constellation Aries: Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan- determinative star), and Gamma (γ) 1 and 2 Arietis. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Loú” was associated to matters concerning the Xuzhou territory. This xiù appears in the Tang Dynasty as “Loú” (娄) and was compared to the Vedic nakshatra Ashvini (Kotyk 2017, see Harnessing Horses, below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Loúxiù” is a bent line of three stars in the IAU constellation Aries: Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) 1 Arietis.

Bond's Flare Star:

This **telescopic** variable star is HIP 97394 (V3885) in the IAU constellation Sagittarius (magnitude 10.31).

Bond’s Galaxy:

This **telescopic** asterism is NGC 7793, a flocculent spiral galaxy in the IAU constellation Sculptor. It was discovered by American astronomer George Phillips Bond (1825 - 1865) in 1850 at Harvard College Observatory. It is GC 6233 in the *General Catalogue* of 1864. It is also known as the “Fiery Hair of Sculptor” (see below).

Bone:

This **telescopic** asterism Sánta 81 listed in 2007 by Hungarian astronomer Sánta Gábor is made up of 12 – 13th magnitude stars in the IAU constellation Orion. Gábor describes it as "nice faint, bone-shaped asterism."

Bone Back Lizard:

This is the Hawaiian star line "Ka Iwikuamo'o". The star line starts with the star "Hokupa'a" (Alpha (α) Ursae Minoris (Polaris)) and connects down to "Na Hiku" ("the Seven", see Big Dipper above). "Hokule'a" (Alpha (α) Boötis (Arcturus)) and "Kikianalia" (Alpha (α) Virginis (Spica)) are the two stars in the middle of this star line. "Hokule'a" ("the star of gladness") is the zenith star of Hawai'i, meaning it will be directly overhead when you are at the latitude of the Hawaiian Islands, which makes it very important to Hawaiian navigators. Next to "Hikianalia" is "Me'e" ("the Voice of Joy", see below), a combination of four stars that forms a box. "Me'e" connects down to "Hanaiakamalama", the Southern Cross (see Southern Cross below) which is the southern pointer for "Ka Iwikuamo'o".

Bone Hand

This **telescopic** asterism is made up of the supernova remnants NGC 6992 and NGC 6995 (IC 1340) in the IAU constellation Cygnus. This was posted on the *Astrophotography* Facebook page by German astrophotographer Carsten Freitag on 23 August 2025. The "arm" is NGC 6992, and the bony "hand" is NGC 6995.

Bonobonon Ne Ngutu:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Bookworm:

This **telescopic** asterism is Levy 384 in the IAU constellation Puppis. It is Levy 384 in the observing list of Canadian astronomer David Levy. It is located in the middle of a narrow triangle of the stars HD 69369, 69417, and 69060. American astronomer "Jeffreym" posted the name "Bookworm" on *Cloudy Nights* in February 2022.

Boomerang:

The Boorong have three "boomerang" asterisms:

- The first, "Won", is the IAU constellation Corona Australis as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). This is a boomerang thrown by Totyarguil (see Purple Crowned Lorikeet, below).
- Another Boorong "boomerang", "Womera", is the IAU constellation Corona Borealis. R. H. Allen lists the name as "Woomera" in his *Star Names* in 1899.
- One is in the IAU constellation Lupus and is Corder 2833 on the observing list of American astronomer Jeffrey Corder. Size 350' X 90'. This is Delta (δ) Lupi and the double stars Phi (ϕ) 1 & 2 Lupi, k Lupi, and Nu (ν) Lupi.

This Wotjobaluk asterism "Wom" is the IAU constellation Corona Australis (Hamacher 2011).

This Wardaman asterism is the IAU constellation Musca. This represents a ceremonial boomerang which is part of a sacred area around the IAU constellation Crux where lightning creation beings teach Wardaman customs.

This Kamilaroi asterism "Burran" is the sword of Orion in the IAU constellation Orion. It is part of their asterism "Beraiberai" (see Leader, below).

There are six **telescopic** "boomerang" asterisms:

- One is a semi-circle of stars in the IAU constellation Canis Major. One end starts at 26 Canis Majoris and runs through 27 Canis Majoris, Omega (ω) Canis Majoris, HIP 35044, GY Canis Majoris, and HN Canis Majoris, ending at HIP 34624. "Blue72" posted this on *Cloudy Nights* and "aznuge" posts it in April 2021 and March 2022.
- One is the bi-polar protoplanetary nebula LEDA 3074547 (ESO 172-2) in the IAU constellation Centaurus. This is currently the coolest natural place in the universe with a temperature of 1 K (-272.15°C). It is also known as the Bow Tie and the Centaurus Bipolar Nebula.
- One is the cluster FSR 667 in the IAU constellation Perseus. René Merting on the *Faint Fuzzies* website describes this: "At 71X… a long, curved chain of stars like a boomerang with a bend to the northeast- to the southeast a weaker opposite arc follows."
- One is the open cluster Stock 7 (Markarian 6) in the IAU constellation Cassiopeia. Size 4.5' X 4.5'.
- One is Corder 2761 in the IAU constellation Centaurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 65'. This is a line of 8th – 9th magnitude stars starting at K Centauri and running through HIP 65426, 65413, 65247, and 65112. This includes several double stars.
- One was posted by "idahoeng" on *Cloudy Nights* in March 2022 and is made up of stars of the IAU constellation Canis Major. The curve starts at 26 Canis Majoris and runs through 27 Canis Majoris, Omega (ω) Canis Majoris, HIP 35044, HIP 34924, and HIP 34814 to HIP 34624. Idahoeng suggests that "maybe it's the leach pulled out of Orion's hand as the dog took off running" but others on the list suggested it was a "wagging tail".

Boorong Star Lines:

The Boorong peoples tended not to view individual stars but lines of stars, which would constitute asterisms. There are three groups:

- The first is in the IAU constellations Orion and Taurus and includes Orion's Belt, Alpha (α) Tauri (Aldebaran) in the Hyades cluster, and the Pleiades cluster,
- The second is a triangle of stars in the IAU constellations Aquila, Capricornus, and Lyra: Alpha (α) Lyrae (Vega), Alpha (α) Aquilae (Altair) and Alpha (α) Capricorni (Algedi), and
- The third is stars in the IAU constellations Boötes and Scorpius: Alpha (α) Scorpii (Antares), Lambda (λ) Scorpii (Shaula), Upsilon (υ) Scorpii (Lesath) and Alpha (α) Boötis (Arcturus).

Boot:

There are four **telescopic** boot asterisms:

- One is in the IAU constellation Andromeda and is Corder 53 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder describes it as "15 stars, magnitudes 7 to 9.5. It includes the variable VX Andromedae near the north following end, just following a nice trio of 7th magnitude stars. The group is elongated WNW, then eastward, then NE. Size 100' X 35'.
- One is Corder 3531 in the IAU constellation Telescopium and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 35'. The "heel" of the "boot" is HIP 89866.
- One is in the IAU constellation Eridanus and is Ennis 61 on the observing list of Canadian astronomer Charles Ennis. Size 27' X 20'. This is seven 8th – 9th magnitude stars: Gaia DR3

3244851782154578432, HD 24890, Gaia DR3 3196789964240915200, HD 24987, HD 25013, HIP 18523, and HD 24845. This includes stars of Corder 608 on Jeffrey Corder's list.

- One is in the IAU constellation Ara and is Corder 3239 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 7th – 9th magnitude stars including HIP 84519 and 84472.

Boötes:

The brightest star in this constellation is Alpha (α) Boötis (Arcturus) which is the 4th brightest star in the sky. These stars appear in 370 asterisms of the sky cultures of the world.

This IAU constellation (IAU abbreviation Boo) first appeared in Babylonian sky lore as the asterism "SHU.PA" (see Enlil below). This constellation appears in Homer's *Iliad and Odyssey* (8th century B.C.E.) as "Βοώτης" or "Voótis" ("herdsman") and in Hesiod's poem *Works and Days* (late 8th century B.C.E.). It was mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and in Ptolemy's *Almagest* (2nd century) he was the Ploughman (see Ploughman below). Variations include "Bootres".

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Boötes as a male figure with a club or bone in his right hand and a knife in his raised left hand (Bullinger 1882, Seiss 1882).

This constellation appears in the Leiden *Aratea* (816) as an "Arctophylax" ("bear keeper") wearing an exomis (light tunic) and carrying a shepherd crook in his right hand.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) positions Boötes parallel to the tropic, transected by the equinoctial colure, when he should actually be standing on the tropic.

The globe of the 2nd century Farnese Atlas depicts Boötes as a male in a short tunic viewed from the rear holding a shepherd's crook in his right hand (Stevenson 1921).

"Boötes" appears in the *Leiden Aratea* (816) as a make in a short tunic holding a crook across his shoulder in his right hand and making a warding gesture to his right with his right hand (Katzenstein & Savage-Smith, 1988).

Boötes appears in several forms in editions of the 8th century *Revised Aratus Latinus*:

- In two editions (St Gall 250, St Gall 902) he is shown as nude to the waist, wearing a kilt, with a stick in his left hand and a lion's skin over his outstretched right arm,
- In the Cologne 83 II edition he faces the viewer and it shows him wearing a tunic which leaves one shoulder bare,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) he is shown facing away from us with an animal skin over his left arm,
- In the Prague IX C 6 he is shown carrying a sword rather than a stick,
- In the Paris BN n.a. 1614 edition he is holding a leafy frond,
- In the Vat Reg lat 1324 edition he is shown facing the viewer with a stick in his right hand and his left arm transformed into a wing.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Boötes leaning on a shepherd's staff with the curved end on the ground and his right hand raised above his head. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Boötes holding a curved club or plant in one hand. The Paris BN, 12117 and Vat Reg lat 309

manuscripts of the *De ordine ac positione stellarum in signis* depict Boötes in a short tunic and knee-high boots, holding a sickle in his right hand and his left hand palm upwards. The Los Angeles, Getty Ludwig XII, 5 and Paris BN lat 8663 manuscripts of the *De ordine ac positione stellarum in signis* depict Boötes with a plant in his right hand.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Boötes as a clean-shaven male wearing knee length robes and a turban. On the first page he is turned slightly to our left, holding a crooked stick with a hooked end in his left hand and gesturing skywards with his right hand. On the other page he is turned slightly to our right, holding a crooked stick with a hooked end in his right hand and gesturing skywards with his left hand.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depicts Boötes facing us, wearing a tunic, with bare feet and left shoulder exposed. He is looking over his left shoulder with his right arm outstretched at shoulder height palm upwards and holding a plant in his left hand.

The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) depicts Boötes as a long-haired male farmer, holding a sickle in his right hand and a lance in his left hand with a sheaf of corn at his left side.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Bootes as a male facing us in calf length dress. He is holding a curved stick in his left hand and is gesturing towards Ursa Minor with his right hand.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Boötes as a long-haired male running to our left. His right hand is raised as if in greeting and his left hand is holding a club. It is labelled "al-'awwā" ("the howler").

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Boötes as a bearded male in a calf length robe. He is gesturing skyward with his right hand and holding a long sword in his right hand.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Bactus" as a male in Medieval tunic and tights as viewed from behind as he runs to our right. His left hand is raised skyward towards the north star and he is holding a staff in his right hand.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Boötes as a male striding to our left as viewed from the rear. He is holding a shepherd's crook in his right hand. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Boötes as a male walking to our left wearing shorts. His left hand is raised before him and in his right hand he is carrying a staff. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Boötes as a male in a peaked cap and knee length robes. He is looking to his right and in his right hand holds a sickle. In his left hand he is holding a spear.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is

disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Boetes” as a man with long hair wearing a tunic, pants, sandals, and a wide-brimmed hat with a satchel over his shoulder: He has a scythe raised in his right hand, a sword at his waist, and a spear in his left hand.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Boötes as a bearded male in a toga walking to our left with a stick raised in his right hand and a sword on his left hip.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Arctophilax vel Boetes” as a long-haired male farmer, holding a sickle in his left hand and a lance in his right hand with a sheaf of corn at his left side. The lance is touching the foot of Hercules. Leashes in the same hand holding the lance lead to two dogs which are not labelled.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Bootes as a nude male walking to our right. He is holding a staff or club up in his right hand and his left hand is pointing toward Ursa Minor. It is not labelled.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Bootes” as a bearded nude male walking away from us to our right holding a spear in his right hand and waving with his left hand.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists “Bootes” and depicts him as a nude bearded man walking away from us to the right holding a spear in his right hand and having his left hand raised high as if waving.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Bootes” as an armoured warrior as viewed from behind with his empty left hand raised as if in greeting and holding a staff in his right hand. Leashes lead from his right wrist to two dogs at his feet. A celestial globe (1522) of Schöner (1477 – 1547) depicts “Bootes” as a nude male with his back to us. He is gesturing skyward with his left hand and holding a spear in his right hand.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “Bootes” as a nude male viewed from behind: He is holding a spear in his right hand and his left arm is raised high.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Boötes as a bearded male in a tunic, knee high boots, and brimmed cap. He is walking to our left with a long staff in his left hand and leashes to two following dogs in his right hand.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts “Bootes” in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Bootes” as a nude male walking away from us holding the leashes of three dogs in his raised left hand and a spear in his right hand.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Di Boote, ouer guardian de l’Orse” (“Bootes, our guardian of the Bear”). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Boötes as a nude male with his back to us, walking away to our left. In his left hand he holds a spear, and he is brandishing a scimitar over his head. By his right foot two dogs are running beside him.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Bootes” as a male in a thigh length tunic and wide brimmed hat walking with a spear in his left hand and waving with his right hand.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Arctophylax” as a young male in a tunic with a crook in his right hand resting on his right shoulder gesturing to the left with his left hand in a sort of warding gesture.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a male in medieval costume with some sort of cap. He is holding a spear in his right hand and pointing towards Ursa Major with his left hand. The label is unintelligible.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Bootes” as a male striding to our right, viewed from behind. He is wearing a short sleeved knee length tunic. He is holding a staff in his right hand and appears to be waving at someone with his left hand.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) labels this constellation “Bubulcus” and depicts it as a bearded male in a thigh length tunic and boots who is walking to our right. He is holding up a club in his right hand and is pointing towards celestial north with his left hand.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Bootes” as a male viewed from behind. He is wearing a knee length coat, knee high boots, a brown under tunic, and a broad brimmed hat. He has two clubs in his right hand and is pointing to the sky with his left hand.

German astronomer Johann Bayer (1572 – 1625) lists Boötes in his *Uranometria* in 1603: He depicts him as a bearded man with a scythe raised in his left hand and a hooked staff in his right hand. Bayer lists the names “Boötes, Bubulus, Bubulcus, Q. Ciceroni Bootis, Thegius, Clamator, Vociferator, Plorans, Plaustri Custos, Philomelus, Arcas, Icarus, Lycaon, Isidoro Arcturus Minor, quibusdam (“to some”) Septentrio, Hesychio Orion, Auensrae Canis Iatrans, Ariamech, Aramech, Cheguius or Ceginus, and Lanceator”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Bootes” as a male in a thigh-length tunic as viewed from the rear, with a shepherd’s crook in his right hand and a scythe raised in his left hand.

“Bootes” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a bearded male in a knee length tunic and boots facing away from us with a club in his left hand and a scythe raised over his head in his right hand.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Bootes" and "Arctophilax" and depicts him as a bearded male in a kilt, carrying a spear in his right hand and gesturing to someone behind him with his left hand as he looks over his left shoulder.

"Bootes" is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Bootes" and "Arctophilax".

"Bootes" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a bearded male in a thigh length tunic and boots holding a scythe above his head in his left hand and a bent club in his right hand.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Bootes Bubulcus" as a male standing with is back to us. He is wearing a Ragi fur cap, a knee length coat, and high boots. He has a club in his right hand and is pointing towards celestial north with his left hand.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Bootes as a bearded male as viewed from behind. He is wearing a thigh length tunic and tall boots. He is holding a shepherd's crook in his left hand and is brandishing a sickle over his head in his right hand.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Bootes Bubulcus".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Bootes" and depicts him as a bearded and robed male viewed from the rear holding aloft a sickle in his left hand and holding a staff in his right hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Bootes" as a male in a tunic, pants, boots, and a fluffy cap waving his right hand.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Bootes" as a male in a long tunic, pants, boots and a cap with his left hand raised.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum,* depicts "Bootes" as a bearded male viewed from behind holding a club in his right hand and holding the leashes of two dogs (Canes Venatici) in his raised left hand. The upper dog is "Asterion" and the lower "Chara". Boötes is dressed in a thigh length tunic and sandals.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Bouvier", "Bootes", and "Βοώτης" and depicts it as a bearded male in knee length robes. He is holding a hooked shepherd's staff in his left hand and is brandishing a sickle over his head with his right hand.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Bootes” as a male facing away from us in a tunic holding a club aloft in his right hand and the leashes of two dogs (Canes Venatici) in his left hand.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts “Bootes” as a bearded male in a knee length green tunic with red trim: He is holding a stick in his right hand and leashes of the two dogs of Canes Venatici in his left hand.

This constellation is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729 as “Bootes [sic]”: He is depicted as a bearded male in a kilt-like garment holding a club in his right hand and holding aloft the reins of the two dogs of Canes Venatici in his left hand.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Bootes” as a male in a calf length tunic and boots as viewed from the read. He is holding the leashes of the dogs of Canes Venatici in his raised right hand.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Bootes (sic)” as a male in a knee length tunic as viewed from the rear. In his left hand is a staff and in his raised right hand are two leashes leading to two hounds, “Asterion” and “Chara”.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Boötes as a bearded, long-haired male walking to our left. He is holding a hooked staff in his right hand and is holding aloft a sickle in his left hand, which is also holding two leashes to a pair of dogs who are running to our right.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Bootes” as a bearded male in a tunic and pants holding a shepherd’s staff in his right hand and holding aloft a sickle in his left hand.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Boötes” as a male viewed from the rear, holding aloft a club in his right hand and holding the leashes of two dogs (Canes Venatici) in his left hand.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”der Bootes mit dem Berg Mänalus“ in the text and labels the constellation “Bootes” on the charts, depicting it as a bearded male in a kilt with a club in his right hand and the leashes of two dogs labeled “Die Jagdhunde” and “Chara” and “Asterion” in his left hand.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists “Boote” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Bootes” as a male in tunic, pants, boots, and furry hat, viewed from behind, with leashes for two dogs (Canes Venatici) in his left hand and a forked staff in his right hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Bootes” as a male facing away from us holding aloft a club in his right hand and holding the leashes of two dogs (Canes Venatici) in his left hand.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Bootes” and depicts it as a man with two leashed dogs (Canes Venatici) in his left hand and a raised club in his right hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Bootes” [sic] in his *Celestial Atlas* in 1822: He depicts this as a bearded male in a kilt-like garment carrying a spear in his right hand and holding the leashes of two dogs (Canes Venatici) in his raised left hand. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts “Boötes” as a muscular male in a kilt and boots holding a sickle aloft in his left hand, which is also holding the leashes of two dogs (Canes Venatici). His right hand is holding a staff.

Dorn describes this constellation as “the Crier” in his *Description of the Celestial Globe Belonging to Major-General Sir John Malcolm, G.C.B., K.L.S., &c. &c., Deposited in the Museum of the Royal Asiatic Society of Great Britain and Ireland* in 1829.

“Bootes” is listed on one chart in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a beareded male in a knee length tunic facing away from us with his raised right hand holding the leashes of Canes Venatici. On another he is shown facing us, with a staff in his right hand and holding a scythe over his head in his left hand.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Bootes” as a male in a kilt and boots holding a shepherd’s crook in his left hand and the leashes of two dogs (Canes Venatici) in his raised right hand.

This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Bootes [sic]”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas:* He is depicted as a bearded figure wearing a sort of kilt, holding a spear in his right hand and a serrated sickle and leashes to two dogs in his raised right hand: The dogs are labelled “Asterion” and “Chara”.

“Bootes” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a bearded male facing us in a thigh length tunic, holding a shepherd’s crook in his right hand and the leashes of Canes Venatici in his raised left hand.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as “Boötes, the bear driver… a huntsman grasping a club in his right hand, while in his left he holds by the leash his two greyhounds (Canes Venatici), with which he is pursuing the Great Bear”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Boötes, The Herdsman” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Boötes, the Herdsman, or Bear-Diver”, the latter name probably a typographical error for “Bear Driver” (see above).

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Bootes” in his *Star Atlas* (1893).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Bootes" and describes it as a "Bear Keeper".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Boötes: the Plowman".

In Northern latitudes a kite or ice cream cone shape is created by some stars in the constellation Boötes: Alpha (α) Boötis (Arcturus), Epsilon (ε) Boötis (Izar), Delta (δ) Boötis, Beta (β) Boötis (Nekkar), Gamma (γ) Boötis (Seginus) and Rho (ρ) Boötis.

Standard IAU charts depict Boötes as a kite shape running from Alpha (α) Boötis (Arcturus) through Epsilon (ε) Boötis, Delta (δ) Boötis, Beta (β) Boötis (Nekkar), Gamma (γ) Boötis, and Rho (ρ) Boötis. Two additional lines run out from Arcturus:

- One to Zeta (ζ) Boötis, and
- One through Eta (η) Boötis to Upsilon (υ) Boötis.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Auriga in his book *The Stars - A New Way to See Them* (1952). Rey draws it like this:

- His "hat" is the triangle of stars Delta (δ), Mu (μ) 1, and Beta (β) Boötis (Nekkar),
- His "head" is the stars Delta (δ), Beta (β), Gamma (γ), Rho (ρ), Sigma (σ), and Epsilon (ε) Boötis,
- His "body" is the triangle of stars Epsilon (ε) Boötis, Alpha (α) Boötis (Arcturus), and Zeta (ζ) Boötis, and
- His "arm" runs from Arcturus to the triangle of stars Eta (η), Upsilon (υ), and Tau (τ) Boötis.

Sky and Telescope Magazine, founded in 1941, depicts Boötes in their magazine and publications in the same manner as the standard IAU charts except that they add a line running from Gamma (γ) Boötis to a triangle of the stars Lambda (λ), Theta (θ), and Kappa (κ) 1 and 2 Boötis.

Booths of the Maidens:

This Hebrew asterism "Sukkōth Rᵉnōth" is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899, who translates this as "booths of the maidens" or "tents of the daughters".

Border Patrol:

This Hungarian asterism "Határjáre" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts this asterism as a male in a cloak with a walking stick. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Bordering Fornax:

This **telescopic** asterism "Limitánea Fornácis" is the elliptical galaxy NGC 1404 in the IAU constellation Fornax. It was discovered in 1837 by John Herschel who listed it as 2571 in his catalogue and later as GC 750 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is on the border between Fornax and Eridanus.

Boreal Fish:

This asterism “Pisces Boreales” is the IAU constellation Pisces as described in *Cosmos: A Sketch of a Physical Description of the Universe* by German scientist and explorer Alexander von Humboldt, which was published in five volumes between 1845 and 1862. R. H. Allen lists it in his *Star Names* in 1899.

Borer:

This is an alternate name for the asterism Terebellum (see Drill below).

Born in Fire of Pictor:

This **telescopic** asterism “Ignígena Pictóris” is the lenticular compact dwarf galaxy NGC 1705 in the IAU constellation Pictor. This is 2679 on John Herschel’s list and later GC 937 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010):They gave it this name due to its “intense star formation activity”.

Born Under an Unlucky Star of Cetus:

This **telescopic** asterism “Astrósus Céti” is the spiral galaxy NGC 988 in the IAU constellation Cetus. It was discovered by Édouard Jean-Marie Stephan in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its having 7.1 magnitude star HIP 12055 (HD 16152) in the foreground”.

Borrelly's Star:

This star is probably S Ceti in the IAU constellation Cetus. It is named after French astronomer Alphonse Borrelly (1842 – 1926).

Bosaga:

This Kazakh asterism “Bosaga” is the IAU constellation Gemini.

Bosona:

This **telescopic** Bosnian star is HIP 107251 (HD 206610) in the IAU constellation Aquarius (magnitudfe 8.35). It was given this name as part of the IAU NameExoWorlds campaign. Bosona was the name of their territory in the 10th century. It has an exoplanet named Naron, which is a name for the Neretva River: Its original Celtic name was Nera Etwa, which means “flowing divinity”.

Botein:

See Little Belly of the Ram, below.

Bound:

This Sogdian star “Bastham” is s Zeta (ζ) and Eta (η) Ophiuchi in the IAU constellation Ophiuchus.

Boundary:

This Arabic star “al-nasaq”, later latinized to “Al Nasaq” is Iota (ι) Herculis in the IAU constellation Hercules. It is part of their asterism Northern Line of al-Nasaqān (see below) and Two Lines (see below).

Bountiful:

This Vedic nakshatra (lunar mansion) “Maghā” or “Magha” is the star Alpha (α) Leonis (Regulus) in the IAU constellation Leo. Ivankovic (2021) lists it as “Maghā”, translates this as “munificent”, and associates it with the Pitris, which are the spirits of the departed ancestors. It appears as “Maghāh” in the *Taittirīya Brāhmana* (Ivanković 2021). They also call it “the Great One”. It appears as “Magha” in their *Atharveda* and on the nakshatra list of the maharshi Varahamihir. The maharshi Parasara lists 6 stars in this asterism: Two of them are Alpha (α) Leonis (Regulus) and Eta (η) Leonis (Leitz 2019). Ivanković (2021) describes it as the “sickle” of Leo: Epsilon (ε) Leonis, Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus). W. Brennand lists it as “Magha” in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists its symbol as a royal throne.

This Myanmar nekkhat (lunar mansion) “Maga” (မာဃ) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This Tibetan gyukar (lunar house) “Mchu”, “Chu” or ”Ta Chen” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Johnson-Groh 2013).

Bow:

The ancient Greeks sometimes broke their asterism “Archer” (see above), which later became the IAU constellation Sagittarius, into parts, with the archer’s bow being listed by Aratus (315 – 240 B.C.E) as “Τόξον” (“Tóxon”) and by Cicero (106 – 43 B.C.E.) and Germanicus (15 B.C.E. – 19 C.E.) as “Arcus” and by the Roman poet Ovid (b. 43 B.C.E.) as “Haemonios”.

This Korean asterism “Hwal” or “Likeobeu Hwal” (리커브 활) is in the IAU constellations Canis Major and Puppis:

- The “bow” is the curve of stars from 16 Puppis through 11, Xi (ξ), and k Puppis, Eta (η) Canis Majoris, and Eta (η) Puppis, ending at Sigma (σ) Puppis,
- The “bowstring” is a line from 16 Puppis through Chi (χ) and c Puppis ending at Sigma (σ) Puppis and
- The “arrow” is the triangle of stars Chi (χ) and c Puppis at the “base” of the “arrow” and Delta (δ) Canis Majoris the “tip”.

The Korean asterism “Hwal” shares some stars with the Chinese xing guan “Bow and Arrow” (see below) but is a different pattern of bow.

This Babylonian asterism from the MUL.APIN tablets “Qastu” (Hunger 1992) is made up of the stars of the IAU constellations Canis Major and Columba:

- The center of the tip of the “arrow” is Alpha (α) Canis Majoris (Sirius), with a triangle of stars around it: 7 and 20 Canis Majoris with HIP 31827 at the tip,
- The “arrow shaft” runs from Sirius to Delta (δ) Canis Majoris. Their name for the arrowhead, Sirius, is Gagsisa (see Arrowhead, above),
- The “bow string” runs from Rho (ρ) Canis Majoris to Delta (δ) Columbae, and
- A curve of stars from these two stars up through 24 Canis Majoris is the “bow”.

Hope Anthony (1996) lists this as “BAN (GISH.BAN)” or “qashtu” and describes it as the stars Tau (τ), Delta (δ), Sigma (σ), and Epsilon (ε) Canis Majoris in the IAU constellation Canis Major.

This Akkadian asterism “qa-aš-tum” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified at this ti from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is identical to the asterism Qastu above.

This Sumerian asterism “mul[giš]pan” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is identical to the asterism Qastu above.

This Babylonian asterism is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “MUL.dBAN” or “MUL.BAN” (Hunger 1992) and as “mul.ban” in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is identical to the asterism Qastu above.

The Akkadian asterism “Qastu” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is identical. This Babylonian asterism appears in later Seleucid sky lore.

This Mesopotamian asterism “Ban” from the *Three Stars Each* tablet from 1100 B.C.E. is made up of the stars of the IAU constellations Canis Major and Puppis:

- The star Alpha (α) Canis Majoris (Sirius) “KAK.SI.DI” is an “arrow” pointing at the IAU constellation Orion, and
- The southern stars of Canis Major and part of Puppis are the “bow”.

This Assyrian asterism “Ban” is identical to the Mesopotamian asterism “Ban” (see above).

This Arabic asterism “al-Qaws” (القوس), later latinized to “Kaus”, is three stars in the IAU constellation Sagittarius:

- Epsilon (ε) Sagittarii (Kaus Australis),
- Delta (δ) Sagittarii (Kaus Media), and
- Lambda (λ) Sagittarii (Kaus Borealis).

This then shows up in various catalogues:

- “al-Qaws” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- “Al qaws” is listed on a 14th century Christian Spanish astrolabe #4560 (King 2002).
- Johann Bayer’s *Uranometria* (1603) lists “Elkufu” and “Elkaufu”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Elkuschu” as an Arab name for Sagittarius.
- Other Latinizations include “Elkausu” and Elkusu”
- “Alkauuso” is listed by German professor Wilhelm Schickard (1592 – 1635).
- Robert Hues lists “Elcusu” and “Elcausu” in his *A Learned Treatise of Globes* in 1659.
- John Hill lists “Kaus” as the Arabic name of the constellation Sagittarius in his *Urania* in 1754.

This Babylonian and Sumerian star “Ban” from the star catalogue BM 78161 (Liechty 1988) is Eta (η) Canis Majoris in the IAU constellation Canis Major.

This Pawnee asterism is the IAU constellation Delphinus.

The stars of this Tanacross asterism “dzeht’ii” are unidentified at present (Cannon 2021).

Bow and Arrow:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Canis Major and Puppis:

- The "bow" is a curve of stars starting at Xi (ξ) Puppis and running through HIP 36721, Tau (τ) Canis Majoris, Delta (δ) Canis Majoris, Sigma (σ) Canis Majoris, and Epsilon (ε) Canis Majoris, ending at Kappa (κ) Canis Majoris,
- The "bowstring" runs from Xi (ξ) Puppis through k Puppis and Eta (η) Canis Majoris, ending at Kappa (κ) Canis Majoris, and
- The "Arrow" runs from Eta (η) Canis Majoris through Delta (δ) Canis Majoris to an arrow tip "Shi" at Omicron (o) 2 Canis Majoris (the determinative star).

This heart-shaped Chinese xing guan "Húshǐ" (弧矢) is made up of stars in the IAU constellations Canis Major and Puppis:

- The "bow" is a wavy line of stars starting at Omicron (o) Puppis and running through k Puppis, Eta (η) and Epsilon (ε) Canis Majoris and ending at Kappa (κ) Canis Majoris,
- The "string" is a curve from Omicron (o) Puppis through HIP 38901, and c and n Puppis, to Kappa (κ) Canis Majoris, and
- The "arrow" is Delta (δ) Canis Majoris.

This Chinese Chenzhuo xing guan "Húshǐ" is made up of stars of the IAU constellation Canis Major and Puppis:

- The "bow" is the curve of stars Xi (ξ) Puppis, HIP 36721, Tau (τ) Canis Majoris, Delta (δ) Canis Majoris, Sigma (σ) Canis Majoris, Epsilon (ε) Canis Majoris and Kappa (κ) Canis Majoris.
- The "bow string" runs from Xi (ξ) Puppis through Eta (η) Canis Majoris to Kappa (κ) Canis Majoris.
- The "arrow" runs from Eta (η) Canis Majoris through Delta (δ) Canis Majoris to Omicron (o) 1 & 2 Canis Majoris. NOTE: Omicron (o) 1 & 2 Canis Majoris is also known by the name "Shi" ("Arrow").

This shares some stars with the Korean asterism "Hwal" (see Bow above), but it is a different pattern of bow, more like a recurve bow.

This is the Mongolian asterism "Num Sum", which is their name for the Northern Cross asterism in the IAU constellation Cygnus (Lagain & Rousseau 2015): The wings of Cygnus are the "bow", and the body is the "arrow", with Beta (β) Cygni (Albireo) the "arrowhead".

This Tibetan khyim (zodiac constellation) "gShu" or "Zhu" is the IAU constellation Sagittarius (Johnson-Groh 2013).

This Ainu Nociw ("asterism") "Ku nociw" (クノチゥ) and "Ay nociw" (アイ ノチゥ) is the bow and arrow. Ku is the arc of stars that form the "handle" of the Big Dipper asterism in the IAU constellation Ursa Major: Eta (η) Ursae Majoris, Zeta (ζ) Ursae Majoris, Epsilon (ε) Ursae Majoris, and Delta (δ) Ursae Majoris. Ay is the two stars Beta (β) Ursae Majoris (Merak) and Alpha (α) Ursae Majoris (Dubhe): It is called this as it points at Polaris.

There are two **telescopic** Bow and Arrow asterisms:

- One is listed by René Merting on the *Faint Fuzzies* website and is in the IAU constellation Pegasus. Merting describes this as eight to nine stars with "three dominant stars [forming] an

acute triangle." Merting describes this as an "arrow", but I can see it being interpreted as a bow and arrow: The tip of the "arrow" is HIP 107184 with the shaft running down through a 9.5 and an 8.3 magnitude star. Between these and perpendicular to them is an arc of stars with a 9.35 magnitude star at one end and the rest being 10^{th} – 11^{th} magnitude which forms the "bow".

- One is Raymond 11 in the IAU constellation Sagitta. René Merting describes it on the Faint Fuzzies website: "At 30x I see 5 stars that look like a bow and arrow, the brightest two stars form the ends of the drawn bow, in between three faint stars in a line - the arrowhead is formed by the faintest star in the west". The tip of the "arrow" is HD 192362. The curve of the "bow" is the stars Gaia DR3 1808690206727748992, HD 355070, HIP 192289, Gaia DR3 1808707695834725376, and Gaia DR3 1808706699402125184.

Bow and Arrow Galaxy:

This **telescopic** asterism NGC 3310 is a grand design spiral galaxy in the IAU constellation Ursa Major which is classified as a starburst galaxy. English astronomer William Herschel discovered this in 1789 and listed it as IV 60 in his catalogue. It is GC 2158 in the *General Catalogue* of 1864. This name is posted in the *Deep Sky Forum* by American astronomer Mark Friedman in January 2019. It is also known as the "Archer of Ursa Major" (see above).

Bow of Al Jawza:

This Arabic asterism "qaws al-jawza'" (قوس الجوزاء) is a curve of stars in the IAU constellation Gemini and Monoceros: One end starts at Eta (η) Geminorum and runs through Mu (μ) Geminorum, Nu (ν) Geminorum, Gamma (γ) Geminorum (Az-Zir), Xi (ξ) Geminorum (Al-Maysan), 15 Monocerotis, 13 Monocerotis, and Epsilon (ε) Monocerotis.

Bow of Tsui //Goab:

This Khoikhoi asterism is Pi (π) 1 to 6 Orionis in the IAU constellation Orion (Alcock 2014) and is part of their asterism "/Khunuseti" (see Stars of Spring, below).

Bow Stretcher:

This Greek asterism "Ρύτωρ τόξου" ("Rýtor tóxou") is the IAU constellation Sagittarius as listed by Aratus (315 – 240 B.C.E) and in R. H. Allen's *Star Names* in 1899.

Bow Tie:

One bow tie asterism is created by adding vertical lines to connect the limbs at the left and right of the Keystone of Hercules in the IAU constellation Hercules (see Keystone below), which forms the shape of a butterfly. This is also known as the Butterfly (see below).

There are nine **telescopic** "bow tie" asterisms:

- One is the planetary nebula NGC 40 in the constellation Cygnus. This was discovered by English astronomer William Herschel in 1787 and listed in his catalogue as IV 58. It is GC 20 in the 1864 General Catalogue of John Herschel. This is Caldwell 2 on the list of English astronomer Patrick Caldwell-Moore (1923 – 2012). Size 1.2' X 0.8'.
- This is an alternate name for the Boomerang Nebula (see above).
- This is an alternate name for the "butterfly" asterism created by the IAU constellation Hercules (see Butterfly, below).

- One is Corder 1624 in the IAU constellation Carina and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 70' X 40'. This includes HIP 41464, 41653, 41147, 41223, 41266A, 41285, and 41196 with a double star (HIP 41408) in the middle as the "knot".
- One is in the IAU constellation Eridanus and is Ennis 66 on the observing list of Canadian astronomer Charles Ennis. Size 45' X 20'. This is eight 8^{th} – 9^{th} magnitude stars: One side of the "bow tie" is a triangle defined by HIP 23172, HD 31924, HD 31885 and HD 31847. The other side is a triangle defined by HD 31787, HIP 23006, HD 31635, and HD 31684. This includes stars of Corder 771 on Jeffrey Corder's list, which Corder describes as a "slanted 'Y'."
- One is the open cluster the Theta (θ) Carinae cluster, IC 2602 (Melotte 102, Caldwell 102) in the IAU constellation Carina. It appeared in Abbé Nicholas Louis de Lacaille's original catalogue of 1755. American astronomer Solon Irving Bailey (1854 – 1931) recorded it which resulted in it becoming IC 2602. It was listed by this name in the Astronomy Society of Victoria Journal Vol 24, No. 3, in June 1971 and by South African astronomer Auke Slotegraaf, who describes it as an eastern group of 5 stars forming a bowtie (Orion?) shape. It is also known as the Southern Pleiades (see below).
- One is the open cluster NGC 4609 (Caldwell 98) in the IAU constellation Crux. This was discovered by English astronomer John Herschel in 1847 who listed it as "h 3407". It is GC 3145 in the *General Catalogue* of 1864. South African astronomers Auke Slotegraaf (1992, 2004) and Magda Streicher (1999) described it as a "bowtie shape".
- One is the reflection nebula NGC 2163 (Cederblad 62, LBN 855) in the constellation Orion. Size 3'. At the center of this 11^{th} magnitude nebula is the 13^{th} magnitude variable star LkHa208. This is listed in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This is Ennis 87.
- One is the SB ring galaxy NGC 7787 in the IAU constellation Pisces. It was discovered by Albert Marth in 1864. This name is posted in the Deep Sky Forum in October 2012 by American astronomer Jimi Lowrey.

Bowie's Bolt:

This huge Belgian asterism "Bowie's Bolt" is made up of stars of the IAU constellations Centaurus, Libra, Octans, Triangulum Australe, and Virgo. This was proposed by the Belgian public observatory at Mira to honor the passing of rock star David Bowie at the behest of a Brussel's radio station. The pointed angles of the "bolt" are the stars Alpha (α) Virginis (Spica), Sigma (σ) Librae, Beta (β) Trianguli Australis, Zeta (ζ) Centauri, Delta (δ) Octantis, HIP 64003, and HIP 70069. Marc Jobin lists it on his blog *Espace pour la Vie*.

Bowl:

This Latin asterism "Patera" is the IAU constellation Crater.

- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Crater siue patera" ("Crater or Bowl") as a two handled vessel.
- "Patera" is listed in the 15th century *Alfonsine Tables*. Johann Bayer's *Uranometria* (1603) lists "Patera".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Patera" as an alternate name for Crater.
- "Patera" is listed in John Hill's *Urania* in 1754.

This Micronesian asterism “Seeta” is made up of stars of the IAU constellations Delphinus, Cygnus, and Equuleus.

Bowl of Stars:

This **telescopic** asterism in the IAU constellation Cassiopeia is Corder 4995 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to Raymond Chiravalle. This is a shallow “bowl” with one edge being the stars Sigma (σ) Cassiopeiae, HIP 118077, and HIP 118057 and the other edge being Rho (ρ) Cassiopeiae and HIP 117957 and the stars filling the “bowl” is open cluster NGC 7789 (see Caroline’s Rose, below).

Bowl of the Poor:

This Arabic asterism is the IAU constellation Corona Borealis (Kemp et al 2022). Compare this to the Bedouin asterism Dish of the Poor People (see below).

Box:

There are eight **telescopic** “box” asterisms:

- One is the planetary nebula NGC 6309 in the IAU constellation Ophiuchus. It was discovered by German astronomer Wilhelm Tempel in 1876. It is GC 5851 in the *General Catalogue* of 1864. Chilean astronomer Wouter van Reeven listed this name on the *Deep Sky Forum* in July 2019. It is also known as the Exclamation Mark Nebula and the Shoeprint Nebula. Size 0.3’ X 0.3’.
- One is the planetary nebula NGC 6445 in the IAU constellation Sagittarius. It was discovered by English astronomer William Herschel in 1786 who listed it as “II 586”. It is GC 4333 in the *General Catalogue* of 1864. Size 0.6’ X 0.6’. It is also known as the Crescent Nebula or Little Gem.
- This is also an alternative name for NGC 6818 (see Little Gem Nebula, below).
- One is NGC 4449 (Caldwell 21), an irregular Magellanic type galaxy in the IAU constellation Canes Venatici, which was discovered by English astronomer William Herschel in 1788 who listed it as “I 213”. It is GC 3002 in the *General Catalogue* of 1864. It is also known as the “Bold Little One of Canes Venatici” (see above).
- One is Hickson 61, a quartet of galaxies in the IAU constellation Coma Berenices, three of them edge on to form “sides” of the box:
    - NGC 4175,
    - NGC 4173,
    - NGC 4169, and
    - NGC 4174.
- One is Sánta 138, listed in 2008 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “nice box-shaped asterism of 6 stars, 8 – 11 [magnitude]” in the IAU constellation Serpens.
- One is Sánta 134, listed in 2008 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “box shaped asterism of 6 – 7 stars, 7 – 11 [magnitude], nice” in the IAU constellation Aquarius.
- One is in the IAU constellation Lupus and is Corder 2916 on the observing list of American astronomer Jeffrey Corder. Size 5’. This is four 8^{th} – 9^{th} magnitude stars.

Box Bearer of Virgo:

This **telescopic** asterism "Pyxidóphorus Vírginis" is the barred spiral galaxy NGC 5746 in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as "I 126". It is GC 3987 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because the nuclear region of this galaxy is "boxy". It is also known as the Blade and Pearl Galaxy (see above), the "Mini Sombrero" (see below) and the Boxy Bulge Galaxy (due to the boxy nature of its bulge). This is O'Meara 74 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) where he lists it as "Pyxidóphorus Vírginis".

Box Kite:

This **telescopic** asterism is the open cluster NGC 6281 in the IAU constellation Scorpius. It was posted by "Michael Mc" on *Cloudy Nights* in September 2022. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3664 and later as GC 4265 in the *General Catalogue* of 1864. This is listed in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) as the "Moth Wing Cluster".

Box of Pegasus:

This **telescopic** asterism "Cápsa Pégasi" is the edge-on peculiar lenticular galaxy NGC 7332 in the IAU constellation Pegasus. It was discovered in 1784 by William Herschel who listed it as "II 233". It became GC 4821 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the inner region of this lenticular galaxy has a remarkable boxy shape".

Box on a Stick:

This **telescopic** asterism is the open cluster Messier 47 (NGC 2478) in the IAU constellation Puppis. It was discovered by Giovanni Battista Hodierna before 1654 and included in French astronomer Charles Messier's catalogue in 1771. It is listed in the General Catalogue of 1864 as GC 1594. It was given this name by American astronomer Wayne Schmidt.

Box Turtle:

This **telescopic** asterism is made up of stars of the IAU constellation Andromeda. This was posted on *Cloudy Nights* by American astronomer Dale Smith in February 2024. It is a pentangle of stars defined by 62 Andromedae, HIP 10562, HIP 10403A, HIP 10456, and HIP 10814.

Boxy Bulge Galaxy:

This **telescopic** asterism NGC 5746 is a barred spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as "I 126". It is GC 3987 in the *General Catalogue* of 1864. It is also known as the Blade and Pearl Galaxy (see above) and the Mini Sombrero Galaxy (see below).). This is O'Meara 74 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Boy Adrianaeus:

This French asterism "Puer Adrianaeus" is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Boy Ida:

This Latin asterism “Puer Idaeus” (“the boy Ida”) is the IAU constellation Aquarius and is listed in R. H. Allen’s *Star Names* in 1899. Allen attributes it to 1st century Roman poet Ovid. This is a reference to the cup bearer of Jove. “Puer Idaeus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Boy Raised by His Grandmother:

This Dene Tha’ asterism “Mbetsun Yendéhshéhi” or “Betsoyinilye” may be cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)).

Boy with Bow and Arrow:

This Kumeyaay asterism is the IAU constellation Scorpius.

Boyajian's Star:

This star, also known as “Tabby's Star” (see below) or the “WTF Star” (see below) is KIC 8462852 in the IAU constellation Cygnus (magnitude 11.7). This is an F-type main-sequence star with a highly unusual light curve named after American astronomer Tabetha S. Boyajian: Tabby is a reference to her nickname. It is also known as the “WTF Star” (for “Where’s The Flux?”) and Tabby’s Star.

Boys Dancing:

This Xhosa asterism is Alpha (α) Carinae (Canopus) and N Carinae in the IAU constellation Carina (Holt and Slotegraaf 2022).

Bracelet:

This Ainu Nociw (“asterism”) is made up of stars of the IAU constellation Leo. Alpha (α) Leonis (Regulus), Eta (η) Leonis, and Gamma (γ) 1 Leonis form the bracelet and the stars Zeta (ζ), Mu (μ), and Epsilon (ε) Leonis a tassel.

Brahma-hydraya:

This Vedic star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. W. Brennand lists it as “Bramebridya” in his *Hindu Astronomy* in 1896.

Brahma King:

This Chinese translation “Fàn wáng” (梵王) or “Brahma King” of the Vedic asterism Prajapati from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Orion (Kotyk 2017).

Brahmarishi:

This Vedic asterism “Brahmarishi” is the IAU constellation Cygnus as listed in the *Atharvaveda Parishishta* (Bhagwath 2019).

Brahmi:

See Red One, below.

Braid:

This Arabic star “aḍ-Ḍafiyrah” or “aḏ-ḏafīrah” (الضفيرة), which translates as “braid”, “curl”, or “strand”, is Zeta (ζ) Leonis in the IAU constellation Leo. It is one of the four stars in the Arabic asterism Forehead (see below), which is part of their larger asterism Lion (see below):

- This was later latinized to “al Dafirah” or “Adhafera”.
- “Al-Dafira” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010).
- American uranographer Elijah Burritt (1794 – 1838) listed it as “Aldahfara” and “Aldhafera”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al dafirah, the tresses”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), simply refers to this star as “Zeta Leo”.
- The IAU approved the name Adhafera for Zeta (ζ) Leonis Aa.

Bram-bram-bult:

This Wotjobaluk, Mara, and Moporr asterism “Bram-bram-bult” or “Brambambult” is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar), the Pointer stars (Dawson 1881, Clarke 2009, Hamacher 2011). These are ancestral brothers. Their mother Dok became Alpha (α) Crucis (Clarke 2009): See Dok below. Massola (2003) and Hamacher (2011) listed it as “Bram Bram” and only as Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Bran:

The Welsh associate this mythical protector figure with the IAU constellation Corvus. This Celtic (Welsh) asterism may also be the IAU constellation Equuleus (Mosenkis, date N/K). Bran the Blessed, whose name means “blessed crow”, appears in the Second Branch of the *Mabinogion*. In the myths Bran’s severed head continues to speak, which is why this head-shaped constellation may be associated to him.

Brand in the Neck of the Camel:

See Bend in the Neck of the Camel, above.

Brandenburg Eagle:

This asterism “Branden” was created of stars of the asterism Antinous and the IAU constellations Delphinus and Aquila by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. On this chart it is labeled with the abbreviated “Branden” and is depicted as an eagle with spread wings carrying a mace with a red leaf shape on its back.

Brandenburg Sceptre:

This German asterism “Sceptrum Brandenburgicum” was created in 1688 by astronomer Gottfried Kirsch from the Prussian Royal Society of Sciences. Kirsch used stars between the IAU constellations Eridanus and Lepus, representing the sceptre of the royal family of the Brandenburgs: It is a line of five stars starting at one end at 64 Eridani and running through 60, 59, and 58 Eridani to 54 Eridani. This appears on the following charts:

- This asterism is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) simply as "Scepter" and depicted as a sceptre.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Brandenburgische Scepter" as does his *Vorstellung Der Gestirne* (1782).
- American uranographer Elijah Burritt (1794 – 1838) included this asterism in their atlases.
- American uranographer William Croswell (1760 – 1834) includes "Sceptrum Brandenburgium the Brandenburg Sceptre" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as "Sceptrum Brandenburgium".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Sceptum Brandenburgium" as a scepter.

Brave:

This Arabic asterism "Alshujae" (الشجاع) or "al-Shuja'" is the IAU constellation Hydra:

- "al-Shuja'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- French scholar Joseph Justus Scaliger (1540 – 1609) lists it as "Asvia"
- German Jesuit astronomer Athanasius Kircher (1602 – 1680) lists it as "Aphaak"
- Edward Sherburne's "*The Sphere of Marcus Manilius*" in 1675 lists this as "Alshugia".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as "El Hawick".
- John Hill lists "Asvia" as a name for Draco in his *Urania* in 1754.

Brazier:

This Arabic asterism "al-Majmara" is the IAU constellation Ara as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Latin asterism "Prunarum Conceptaculum" is the IAU constellation Ara.

- The illustrated editions of *De Astronomica* by Hyginus (1488 and 1535) show an altar with flames ascending.
- German astronomer Johann Bayer (1572-1625) listed the Greek name "Εσχάρα" (Éschára or "grid") and "Prunarum Conceptaculum".
- R. H. Allen wrote in his *Star Names* in 1899 that he believed that Bayer meant "Πυράμν" (Pyrámn or "brazier").

Brazilian Pye:

This English asterism is the IAU constellation Tucana, which appears on some early stellar charts by this name, which refers to a variety of magpie and is clearly a reference to Dutch navigator Frederick de Houtman (1571 – 1627) who listed in his catalogue of stars as an "Indian magpie" (see Tucana below). Robert Hues lists this in his *A Learned Treatise of Globes* in 1659.

Break the Enemy:

This Chinese star "Pojun" from the Three Kingdoms to the Ming Dynasty is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Pojun" is the star Eta (η) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Breast:

There are two Arabic stars with the name "as-Ṣadr" (الصدر):

- The first is Alpha (α) Cassiopeiae in the IAU constellation Cassiopeia:
    - The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Schedar".
    - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Scheder".
    - This was later Latinized to "Schedar" in the 15th century *Alfonsine Tables* and "Scheder" in other editions (Kunitzsch 1986).
    - Polish astronomer Johannes Hevelius (1611 – 1687) listed it as "Schedir".
    - Johann Bayer's *Uranometria* (1603) lists the names "Seder", "Scheder", and "Schedar".
    - Other variations include "Shedir", "Shedar", "Shadar", "Sheder", "Seder", "Shedis", and "Zedaron".
    - Robert Hues lists "Scheder" in his *A Learned Treatise of Globes* in 1659 (attributing it to the *Alfonsine Tables*) and "Seder" (attributing that to Joseph Justus Scaliger (1540 – 1609)).
    - Edward Sherburne lists it as "Scheder" in his *Sphere of Marcus Manilius* in 1675.
    - The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Schedir" for this star.
    - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Schedar".
    - American uranographer William Croswell (1760 – 1834) lists "Schedar" on his *Mercator Map of the Starry Heavens* in 1810.
    - William Herschel lists "Shedir" in his *Catalogue of 500 new Nebulae* in 1802.
    - Scottish astronomer Alexander Jamieson (1782 – 1850) listed "Shedir" in his *Celestial Atlas* in 1822.
    - American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Schedir".
    - English Admiral Henry William Smyth lists it as "Schedir… probably a corruption of Al-sadr" in his *Prolegomena* and *Bedford Catalogue* in 1844.
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Shedir": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Schedar".
    - American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Schedar" and translates it as "Breast".
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Shedir".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Schedir", "Shedir", and Schedar", but the 14th edition (1959) only lists this star as "Schedar".
    - Kunitzsch and Smart (2006) list it as "Shedar".

    - German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Schidir".
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star both as "Schedar" and "Shedir".
    - The IAU approved the name Schedar for the star Alpha (α) Cassiopeiae.
- The second, "aṣ-Ṣadr" (الصدر) or "Al Sadr al Dajājah" ("breast of the hen"), is Gamma (γ) Cygni in the IAU constellation Cygnus:
    - It was later latinized to "Sadr" and "Sudr".
    - John Hill lists the name "Sad'r" in his *Urania* in 1754.
    - The IAU approved the name Sadr for the star Gamma (γ) Cygni A.

This Persian asterism "Shuter" is the IAU constellation Cassiopeia.

Breast of the Sea Monster:

There are two Arabic asterisms by this name:

- One, "ṣadr al-qayṭus", later latinized to "Sadr al Kaitos" or "Al Sadr al Ketus" is made up of stars of the IAU constellation Cetus:
    - Rho (ρ) Ceti (Sadr al Kaitos I),
    - Sigma (σ) Ceti (Sadr al Kaitos II),
    - Epsilon (ε) Ceti (Sadr al Kaitos III), and
    - Eta (η) Ceti (Sadr al Kaitos IV).
- One, "Sadr al-qītus" is the star Pi (π) Ceti in the IAU constellation Cetus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Compare this to Belly of the Sea Monster, above.

Breastbone:

This Inuit asterism "Sakiattiak" is the Pleiades cluster in the IAU constellation Taurus (MacDonald 1998). It is also known as "Sharing Foxes" (see below).

Breastplate of Righteousness:

This German asterism is the IAU constellation Cancer as listed by German poet Philipp von Zesen (1619 – 1689).

Brewer's Star:

This **telescopic** magnetic star is HIP 32965 (HD 50169) in the IAU constellation Monoceros (magnitude 8.98). It is named after K. R. W. Brewer.

Briareus of Libra:

This **telescopic** asterism "Bríareus Líbrae" is the intermediate barred spiral galaxy NGC 5885 in the IAU constellation Libra. It was discovered in 1784 by William Herschel who listed it as "II 684". It became GC 4057 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its

multiple arms. Briareus is one of the three hekatoncheires, the hundred armed giants in Greek mythology.

Brick:

The **telescopic** asterism called "The Brick" is a dark nebula located near the center of the Milky Way galaxy in the IAU constellation Sagittarius.

Bride:

This Belarussian asterism “Niavesta” is the IAU constellation Lyra (Avilin 2009). It is also known as “Dva braty” (see Two Brothers, below) and “Sapernik” (see Rival, below).

Bridge Builder of Hercules:

This **telescopic** asterism “Póntifex Hérculis” is the spiral galaxy UGC 10814 (Arp 102) in the IAU constellation Hercules. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “there is a long faint bridge between UGC 10814 and its southern companion MCG+8-31-41”.

Bridge of Donkeys:

This Zulu asterism “isiNdwengama” is currently unidentified (Alcock 2014). Alcock notes that Krige (1950) described this as “Pons Asinorum”.

Bridge of Virgo:

This **telescopic** asterism “Gephýra Vírginis” is the elliptical galaxy NGC 5018 in the IAU constellation Virgo. It was discovered in 1788 by William Herschel who listed it as “II 746”. It became GC 3448 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “NGC 5018 is physically connected to NGC 5022 at the east side and to ESO576-8 at the west side”.

Bridge that Links:

This Inca asterism “Ch’aka Tinkucheq” is the belt of Orion plus Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) in the IAU constellation Orion (Gamarra & Gamarra 2009).

Bridle:

This Assyrian star “Rappu” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) and listed as “mul ra-ap-pu” (Koch-Westenholz 1995) in the Neo-Babylonian (Chaldean) *Great Star List* (636 – 539 B.C.E.) is unidentified.

This Babylonian star “MUL.ra.pu” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is unidentified.

Bright:

This Persian lunar station “Nūr” is the stars Delta (δ) Scorpii, Beta (β) Scorpii (Acrab), and Pi (π) Scorpii in the IAU constellation Scorpius and is listed in R. H. Allen’s *Star Names* in 1899.

Bright Andromeda:

This **telescopic** asterism, under the Latin name Lucida Andromedae, is the galaxy Messier 110. This was observed by French astronomer in 1773 but not included in his Messier List. English astronomer Caroline Herschel recorded it in 1783, and her brother William Herschel described her discovery in 1785. It was added to the Messier List in 1967 at the suggestion of Kenneth Glyn Jones. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). This galaxy is also known as "Edward Young Star".

Bright Beam of Light:

This Bengali star "Bibhā" is HIP 48711 (HD 86081) in the IAU constellation Sextans (magnitude 8.7). It was given this name as part of the IAU NameExoWorlds campaign. Its name is a derivation of the Sanskrit "Vibha" ("bright beam of light"). It has an exoplanet named Santamasa, which is a Sanskrit name for "clouded", a reference to this exoplanet's atmosphere.

Bright Belly of Cetus:

This **telescopic** asterism "Gastrophénges Céti" is the elliptical galaxy NGC 584 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as "I 100". It became GC 342 in the *General Catalogue* of 1864. Astronomer Stephen James O'Meara's Hidden Treasures Catalogue (2007) lists this as O'Meara 6. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has "an extraordinarily luminous bulge". It is also known as the "Little Spindle" (see below).

Bright Cassiopeiae:

This Latin star "Lucida Cassiopeiae" is Alpha (α) Cassiopeiae (Shedar) in the IAU constellation Cassiopeia as listed in John Hill's *Urania* in 1754.

Bright Chair:

This Latin asterism "Lucida Cathedrae" is the IAU constellation Cassiopeia as listed in John Hill's *Urania* in 1754

Bright Crowns:

This Latin asterism "Lucida Coronae" is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis as listed in John Hill's *Urania* in 1754. Later in the text Hill calls it "Nair Phecca".

Bright Fortunate One of the Two Beasts:

This Arabic star "Nāʾir Saʿd al Bahāim" is Zeta (ζ) Pegasi in the IAU constellation Pegasus:

- This name is listed in the 16th century Arabic astronomer Al Tizini
- This name is listed in the 17th century *Calendarium* of Al Achsasi al Mouakket.
- This name is listed by R. H. Allen in his *Star Names* in 1899.
- This name is listed by Robert Burnham in his *Burnham's Celestial Handbook* in 1978. Compare this to their asterism Auspice of Lambs, above.

Bright Lyra:

This star “Lucida Lyra” (“bright Lyra”) or “Lucida Lyrae” (“bright lyre”) is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. “Lucida Lyra” is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661. “Lucida Lyra” and “Lucida Lyrae” are listed in John Hill’s *Urania* in 1754.

Bright Nucleus of Lepus:

This **telescopic** asterism “Clarinucleátus Léporis” is the barred spiral galaxy NGC 1964 in the IAU constellation Lepus. This was listed as “IV 21” by William Herschel. John Herschel listed it as 2860 and later as GC 1170 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Bright One:

This Vedic nakshatra (lunar mansion) “Chitrā”, “Chitra”, “Citrā”, or “Citra” (translated as “bright one”, “shining jewel”, “the pearl,” or “spectacular”) is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo. It is related to the deities Tvastar or Vishvakarma, both craftsman Gods. R. H. Allen lists it as “Citrā” in his *Star Names* in 1899. Leitz (2019) lists “Chitra” as appearing in the *Atharveda,* in the nakshatra list of the maharshi Varahamihir and the maharshi Parasara. Ivanković (2021) lists it as “Citrā” from Rig-Veda, translates it as “brilliant”, and relates it to the Gods Indra (a war and storm deity) and their artisan God Tvastar and craftsman God Visvakarman. W. Brennand lists this as “Chitra” in his *Hindu Astronomy* in 1896 and translates this as “a pearl”. Bhagwath (2019) lists its symbols as a bright jewel or a pearl.

This Myanmar nekkhat (lunar mansion) “Seiktra” (စိတ္တ) is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

This Tibetan gyukar (lunar house) “Nag Pa” or “Nakpa” is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Johnson-Groh 2013).

This Arabic star “an-Nayyir” (النّيّر), later latinized to “Al Na’ir”, “Al Nair”, or “Alnair” is Alpha (α) Gruis in the IAU constellation Grus as listed by 16th century Arabic astronomer Al Tizini:

- English Admiral Henry William Smyth writes in his *Bedford Catalogue* in 1844, that the Arabs gave this name to the star Eta (η) Tauri (Alcyone), as who calls it “Neyyir” as does R. H. Allen writes in his *Star Names* in 1899.
- The name Alnair was approved for Alpha (α) Gruis by the IAU.

Bright One in the Belly of the Centaur:

This Arabic star “Al Nāʾir al Baṭn al Kentaurus” is Zeta (ζ) Centauri in the IAU constellation Centaurus as listed by 16th century Arabic astronomer Al Tizini. It was later latinized to “Al Nair al Kentaurus” and “Baten Kentaurus”.

Bright One of the Boat:

This Arabic star “Nair al Zaurak” (نير أل زورق) is Alpha (α) Phoenicis in the IAU constellation Phoenix. This is also translated as “Yoke of the Boat”.

Bright One of the Broken Ring:

This Arabic star “(Nayyir) al-Fakkah” (نير الفكّة) is Alpha (α) Coronae Borealis in the IAU constellation Corona Borealis:

- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Hebrew name “nezer sefoni” and the Arabic name “al-fakka”.
- Persian astronomer Al Achsasi al Mouakket listed it as “(Nayyir) al-Fakkah” in 1650.
- Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed it as “al-Fakkah” (الفكة – “separated” or “broken up”) and “Al Nāʿir al Fakkah”.
- This is listed as “Nayyir al-fakkah” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as “Alfeca”.
- German uranographer Johannes Stöffler’s Constance Celestial Globe (1493) lists this star as “Alpheta”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Alphena Syrochaldaeis” (“Alphena of the Syrochaldeans”).
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as “Alphakhaco”.
- Other variations include “Alfecca”, “Alfacca”, “Foca”, “Alfeta”, “Alfelta”, “Alfeta”, “Alphecca”, and “Alphekka”.
- Johann Bayer’s *Uranometria* (1603) lists “Alpheta” and “Alphecca seu Alphacca”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Alpheta” and “Alphacca”.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Alphecca”, “Alpheta”, and “Alphakacho”.
- Robert Hues lists it as “Alphecca” in his *A Learned Treatise of Globes* in 1659 and translates it as “untying” or “unloosing”.
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists “Elfeca” (Dekker 2000).
- A 14th century Christian Spanish astrolabe #4560 lists the abbreviated form “Feca” (King 2002). John Hill lists the names “Phecca” and “Al Phecca” in his *Urania* in 1754.
- It was later latinized to “Alphaca” by American uranographer Elijah Burritt (1794 – 1838).
- American uranographer William Croswell (1760 – 1834) lists this star as “Gemma Alphecca” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Alphacca vel Gemma” in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Alphecca, from al fekhah, the dervish’s cup or platter, from the said break in the ring of stars; and it was Naīr al fekkah, the lucida or bright star of the pauper’s platter”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as “Alphecca”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Alphecca”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Alphecca”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Alphecca” and describes it as “the broken dish”.

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Alphecca" and "Alphekka" for this star, but the 14th edition (1959) only lists "Alphecca".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alphecca or Alphekka" for this star.
- The IAU approved the name Alphecca for Alpha (α) Coronae Borealis.

Bright One of the Crown:

This unidentified Arabic star "Al-nayyir min al-iklīl" ("the bright one of the crown") is in the IAU constellation Libra and is listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003). We are unsure which star this is.

Bright One of the Sword:

This Arabic star "nayyir as-sayf" (نيرالسيف), later latinized to "Nair al Saif", is Iota (ι) Orionis in the IAU constellation Orion as listed by 16th century Arabic astronomer Al Tizini. The IAU is considering the name Nair al Saif for Iota (ι) Orionis.

Bright One of Those in the Gorgon's Head:

This Greek star "τῶν ἐν γοργονίῳ ὁ λαμπρός" is Beta (β) Persei (Algol) in the IAU constellation Perseus as described by Ptolemy (c.100 – c.170).

Bright Shield of Piscis Austrinus:

This **telescopic** asterism "Leucáspis Píscis Austríni" is the spiral galaxy IC 5271 in the IAU constellation Piscis Austrinus. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this shield shaped galaxy has a very high surface brightness".

Bright Snake:

This Latin asterism "Lucidus Anguis" is the IAU constellation Serpens as listed by 1st century Roman poet Ovid and 1st century B.C.E. Roman poet Vergil. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Lucidus Anguis" for this constellation.

Bright Star:

This ancient Egyptian star "Ipdjes" is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus. It is also known as "Its Own Count".

Bright Star of A-musen:

This Babylonian and Sumerian star listed in the catalogue BM 78161 (5th – 7th century B.C.E.) is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Liechty 1988).

Bright Star of Syria:

This Arabic asterism "Al Shiʿrā al Shāmiyyah" is the IAU constellation Canis Minor:

- Robert Hues (1659) listed it as "Alsahare Alsemalija" and Aelilaschemali.

- John Chilmead in his *A Learned Treatise of Globes* in 1899 listed it as "Alsahare Alsemalija".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al shi'ra l shámiyah, the bright star of Syria".

Bright Star of the Dish:

This Arabic star "Al Munīr al Fakkah" is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis and is part of their asterism Bowl of the Poor (see above):

- This star appears as "Malfelcarre" in the 15th century *Alfonsine Tables.*
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as "Malphelcane".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it under the Latin name "Clara Stella" ("bright star").

Bright Star of the Furrow:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "SA sa ABSIN" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Hunger and Sachs 1988).

Bright Star of the Hired Man:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL IGI sa SAG HUN" is Beta (β) Arietis (Sheratan) in the IAU constellation Aries (Hunger and Sachs 1988) and is part of their asterism Hired Man (see below).

Bright Star of the Pig:

This Romanian star "Luceafărul Porcesc" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Ottescu 2009). It is called this as the swine awake and start to grunt when it rises, signalling that day is approaching.

Bright Star of the Ribbon of the Fishes:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL KUR sa DUR nu-nu" is Eta (η) Piscium in the IAU constellation Pisces (Hunger and Sachs 1988) and is part of their asterism Tails (see below).

Bright Star on the Tip of Pabilsag's Arrow:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL KUR sa KIR sil PA" is Theta (θ) Ophiuchi in the IAU constellation Ophiuchus (Hunger and Sachs 1988).

Brighter of the Two Calves:

There are two Arabic stars listed under this name:

- One, "'anwar al-farqadayn", "Anwār al Farḳadāin", or "Nāʾir al Farḳadāin" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major. It is part of their asterism Two Calves (see below):
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Anwar al ferkadein the brightest of the two calves, the other being γ [Gamma]".
    - John Chilmead latinized this to "Alferkathan" in his *A Learned Treatise on Globes* in 1889.

- One, “Anwār al-farqadayn” is Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Brightest of Al Henat:

This Arabic star “Nir al Henat” is Gamma (γ) Geminorum in the IAU constellation Gemini as listed in the 17th century *Calendarium* of Al Achsasi Al Mouakket.

This Latin star “Prima τou al Henat”, meaning 'the brightest of Al Henat' is Gamma (γ) Geminorum in the IAU constellation Gemini.

Brightest of the Town:

This Arabic star “nayyir al-baldah” (نير البلدة), later latinized to “Nir al Beldat”, is Pi (π) Sagittarii in the IAU constellation Sagittarius as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650. This is part of their asterism “Town” (see below).

This Latin star “Lucida Oppidi” is Pi (π) Sagittarii in the IAU constellation Sagittarius.

Brightest of Virgo:

This **telescopic** asterism “Claríssima Virginis” is the giant elliptical galaxy NGC 4472 (Messier 49, Arp 134) in the IAU constellation Virgo. It was discovered by Charles Messier in 1777. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)”.

Brightest Star:

This Filipino (Mayayaw Ifugao) star “Agiwa’na” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Masong 2017).

Brightly Whirling of Coma Berenices:

This **telescopic** asterism “Clarivértens Cómae Bereníces” is the spiral galaxy NGC 4501 (Messier 88) in the IAU constellation Coma Berenices. It was discovered by French astronomer Charles Messier in 1781. It is listed in the 1864 General Catalogue as GC 3049 and in John Herschel’s catalogue as h 1312. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Sargasso See (see below

Brigid:

This Celtic (Irish) asterism may be the IAU constellation Virgo. Brigid, Brigit, or Brig (“exalted one”) is a member of the Tuatha Dé Danaan, the daughter of the Dagda. Brigid is associated to wisdom, poetry, healing, protection, blacksmithing, and domesticated animals.

Brilliant Red Star:

This Hawaiian star “Kauluakoko” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. Some refer to it as “’Aua” or “Hoku-‘ula” (“red star”), but this is their name for the star Alpha (α) Tauri (Aldebaran- see Red Star, below).

Brilliant Star:

This Zulu star "inKhwenkwezi" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Slotegraaf 2013).

Brilliant White of Cetus:

This **telescopic** asterism "Rúfa Céti" is the elliptical galaxy NGC 720 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as "I 105". This became GC 431 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its color.

Bringer of the New Year:

This Caribou Inuit asterism "Peggiyttyn" is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila. Compare this to the Inuit asterism "Aagjuuk" (see Two Sunbeams, below).

Bringing Heat:

This Latin star "Aestifer" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Roman statesman Cicero (106 – 43 B.C.E.) and 1st century B.C.E. Roman poet Vergil. It refers to this star indicating the arrival of summer.

Bringing the Chain:

This Latin asterism "Deferens Cathenam" is the IAU constellation Perseus. Johann Bayer's *Uranometria* (1603) lists "Deferens Cathenam" for this constellation. R. H. Allen's *Star Names* in 1899 lists "Deferens Cathenam" for this constellation. It refers to the association of Perseus with Medusa and the chain of Andromeda.

Bringing the Head of Algol:

This Latin asterism "Deferens caput Algol" is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899.

Bringing the Lion:

This Latin asterism "Deferens Leonem" is the IAU constellation Lupus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Bringing the Psalter:

This Latin asterism "Deferens Psalterium" is the IAU constellation Lyra. Johann Bayer's *Uranometria* (1603) lists the name "Deferens Psalterium" for Lyra.

Bristle:

This Arabic asterism "Alshier Alkhashin" (الشعر الخشن) is the IAU constellation Coma Berenices.

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the Pleiades cluster in the IAU constellation Taurus. Compare this to the Babylonian asterism "MUL.MUL" (see Star Star, below).

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is "Zappu" (Hunger 1992, Parpola 1993, Anthony 1996) or "Za-ap-pu" and is identical to the Babylonian asterism MUL.MUL (see Star Star, below).

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL.MUL" is Eta (η) Tauri in the Pleiades cluster in the IAU constellation Taurus (Hunger and Sachs 1988) and is part of their asterism Star Star (see below).

This Arabic star "Al Ḥulbah" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and R. H. Allen in his *Star Names* in 1899.

Britzka of Saint Jacob:

This Belarussian asterism "Brychka sv Iakuba" is the IAU constellation Ursa Major (Avilin 2009). A Britzka is a car similar to a Tilbury cart, which is a light, open two-wheeled carriage.

Broad Brimmed Hat of Hydra:

This **telescopic** asterism "Petasus Hýdrae" is the galaxy ESO 510-13 (PGC 49473) in the IAU constellation Hydra. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the broad warped dust lane".

Brocchi's Cluster:

This is an alternate name for the "coat hanger" asterism in the IAU constellation Vulpecula (see Coat Hanger, below). It is named for American amateur astronomer Dalmero Francis Brocchi (1871 – 1955), who created a map of it in the 1920s. NOTE: It wasn't discovered by Brocchi, it was first recorded by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986), who recorded it as a "small cloud" in Aquila. Therefore, it is an unaided eye asterism, not telescopic.

Broken Arm of Sculptor:

This **telescopic** asterism "Brachifragius Sculptóris" is the spiral galaxy NGC 10 in the IAU constellation Sculptor. It was discovered by John Herschel in 1834. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as one of the arms of the galaxy appears broken.

Broken Down:

This Hungarian asterism "Részoqerobd" ("broken down" or "split into pieces") appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts what looks like some broken up timbers. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Broken Egg Shells:

This Arabic star "al-Qaiḍ" (القيض) is Omicron (o) 2 Eridani in the IAU constellation Eridanus:

- This was later latinized to "Keid".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Keid, from the Arabic al-Kaïd, the eggshells".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Keid" for this star but his 14th edition (1959) does not list it.

- Keid was approved as a name for Omicron (o) 2 Eridani by the IAU.

Broken Engagement Ring:

This **telescopic** asterism, the Broken Engagement Ring, is Sachariassen1, an incomplete circle of stars in the IAU constellation Ursa Major. One end of the broken ring starts at 36 Ursae Majoris and runs through 37, 39, 43, and 44 UMa, ending at HIP 52136. This is also known as the "Tiara" (see below). Size 17'.

Broken Heart:

There are three **telescopic** "broken heart" asterisms:

- One is the open cluster NGC 225 in the IAU constellation Cassiopeia, also known as the Sailboat (see below), "W" (see below), and the Igloo (see below). This was discovered by English astronomer Caroline Herschel in 1784 and recorded by her brother William Herschel in 1788. It is listed as GC 120 in the *General Catalogue* of 1864.
- One is the open cluster NGC 2281 in the IAU constellation Auriga, It was discovered by English astronomer William Herschel in 1784 who listed it as "VIII 74" in his catalogue. It is GC 1451 in the General Catalogue of 1864. Size 15' X 15'.
- One, "Cordifrágius Vírginis" ("Broken Heart of Virgo") is the lenticular galaxy NGC 5363 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "I 6". It became GC 3702 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "a remarkable small dust lane cuts the 'heart' of this galaxy in two". This is O'Meara 72 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Broken in Many Spots of Crater:

This **telescopic** asterism "Multirúptus Cratéris" is the barred spiral galaxy NGC 3887 in the IAU constellation Crater. It was discovered in 1785 by William Herschel who listed it as "I 120". John Herschel listed it as h 979 and h 3360 and later as GC 2554 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "multiple fragmented spiral arms of this galaxy"

Broken Mortar:

This Korean asterism "Buseojin Moleutaleu" (부서진 모르타르) is a quadrilateral of stars in the IAU constellation Capricornus: Psi (ψ), Omega (ω), Zeta (ζ), and 33 Capricorni.

Broken of Boötes:

This **telescopic** asterism "Fráctus Boótis" is the Seyfert galaxy NGC 5548 in the IAU constellation Boötes. William Herschel listed this as "II 194". John Herschel listed it as h 1773 and later as GC 3838 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy shows multiple fragments of spiral arms. The outer arm seems to be a broken ring."

Broken Platter:

This Persian asterism "Kāsah Shekesteh" is the IAU constellation Corona Borealis. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kásheh shekesteh or Scutella fracta".

Broken Ring:

This Arabic asterism is the IAU constellation Corona Borealis. It's brightest star, Alpha (α) Coronae Borealis, known as "(Nayyir) al-Fakkah" (نير الفكّة) or "Alphecca" ("bright one of the broken ring"):

- Corona Borealis was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) as "al-Fakka" and "al-Iklīl al-Shamālī".
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Alfeca" (Dekker 2000).
- "Al Fakkah" was listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 (see Bright One of the Broken Ring, above).
- John Hill listed this as "Kase Shekeste" in his *Urania* in 1754 and gave the Latin translation "Stella Fracta" ("broken star").
- NOTE: English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Alphecca" and his *Bedford Catalogue* in 1844 lists "al helba" for Coma Berenices but doesn't translate it: Al halba (الحلبة) is "the ring" and it may be that Smyth is confusing this with the Broken Ring, Corona Borealis.
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Alphecca" for this star.

Broken Ring of Hydra:

This **telescopic** asterism "Cyclofrágia Hýdrae" is the spiral galaxy NGC 5101 in the IAU constellation Hydra. William Herschel listed this as "II 567". John Herschel listed this as h 3493 and later as GC 3503 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy is characterized by an inner broken ring as well as an external broken ring made by the outer arms".

Broken Spade:

This **telescopic** asterism, Streicher J0615-73, is in the IAU constellation Mensa. It was discovered by South African astronomer Magda Streicher. It is listed on Bruno Alessi's BDCC 7.6 list.

Brolga:

This Kamilaroi and Euahlayi asterism is the Magellanic Clouds, which they see as a mother Brolga (a species of wetland bird). This mother and her daughter were chased into the sky by Wilbaarr, the whirlwind spirit (Fuller et al 2014). Compare this to the asterisms Female Brolga (see below) and Male Brolga (see below). Parker (1905) listed the Euahlayi name as "Bralgah" and described this as a mother and daughter (a great dancer) the Wurrawiberoo (see Whirlwinds Spirits, below) chased into the sky. Ridley listed "Buralga" as the Kamilaroi name in 1875.

Bronze of Centaurus:

This **telescopic** asterism "Ahénea Centaúri" is the peculiar elliptical galaxy NGC 4976 in the IAU constellation Centaurus. John Herschel listed this as h 3468 and later as GC 3413 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its apparent color.

Brooch:

This **telescopic** asterism is Riddle 2 in the IAU constellation Serpens. René Merting lists this group of 5 13th magnitude stars on the *Faint Fuzzies* website as "Broschenhafte" ("Brooch"), noting that "at 72X the brooch-like pattern is recognizable". Size 0.9' X 0.9'.

Brood Hen:

This English asterism is the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

This English asterism is the Pleiades cluster in the IAU constellation Taurus as listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and in R. H. Allen's *Star Names* in 1899.

Brood of Chicks:

This Italian (Piedmont and Ligurian Alps) asterism "Pouizina`" is the Pleiades cluster in the IAU constellation Taurus.

Broody Hen and Her Chicks:

This Basque asterism "Oiloa Kolka Txitekin" is the Pleiades cluster in the IAU constellation Taurus (Frank 2021). This is also known as Hen and Her Chicks (see Hen and Her Chicks, below).

This Italian (Piedmont and Ligurian Alps) asterism "l'Espurzinia`" is the Pleiades cluster in the IAU constellation Taurus.

Brother:

This Anglo-Norman asterism "Frère" is the IAU constellation Gemini.

Brother Gods:

This Latin asterism "Dii Germani" is the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

Brother-in-Law:

This Asháninka asterism is the Pleiades cluster in the IAU constellation Taurus (Urton 2016). The man and family this character is related to is the belt and sword of Orion (see Man and Family, below).

Brother Jebro:

This Micronesian asterism (Marshall Islands) is the Pleiades cluster in the IAU constellation Taurus (see Pleiades below). The other "brother" is "Tumur" (see Brother Tumur, below).

Brother of Ursa Major:

There are two **telescopic** "Brother of Ursa Major" asterisms:

- One, "Synaémus Úrsae Majóris" is the spiral galaxy IC 749 in the IAU constellation Ursa Major. Austrian astronomer Rudolf Ferdinand Spitaler (1849 – 1946) first recorded it.
- One, "Homaémus Úrsae Majóris" is the spiral galaxy IC 750 in the IAU constellation Ursa Major. Austrian astronomer Rudolf Ferdinand Spitaler (1849 – 1946), first recorded it.

This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called them this because NGC 749 and 750 "resemble each other in many aspects… and thus could be considered brothers in the sky."

Brother Tumur:

This Micronesian star (Marshall Islands) is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. The other "brother" is "Jebro" (see Brother Jebro, above).

Brothers:

This Omaha asterism is the IAU constellation Corona Borealis.

This Romanian asterism "Fraților" or "Fraţii" is the IAU constellation Gemini (Ottescu 2009, Lite, Lodina, and Ignat 2018). They call the principal stars Romulus and Remus.

This Kokatha and Ngalea asterism "Boolbarradu" or "Balbaradu" is the Magellanic Clouds. They each have a name:

- "Mugaru" or "Badhu-Wudha" ("right-handed brother"): Large Magellanic Cloud, and
- "Oimbu" or "Kurulba" ("left-handed brother"): Small Magellanic Cloud.

This Papuan (Kiwai Island) asterism has two parts:

- One "brother" is the Southern Cross asterism in the IAU constellation Crux, and
- The other "brother" (and his three-pronged spear) is the IAU constellation Scorpius.

Brothers in a Boat:

This Haida asterism is the Pleiades cluster in the IAU constellation Taurus.

Brother's Grandmother with Torch:

This Tsilhqot'in star is an unidentified morning star at present (Cannon 2021).

Brothers of Lapnuman:

This Nahwal asterism "Nepian Lapnuman" is the Pleiades cluster in the IAU constellation Taurus (Ramík 2019).

Brothers with a Girl:

This Apsáalooke asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Browning Galaxy:

This **telescopic** asterism IC 2431 is a galaxy merger in the IAU constellation Cancer. It was discovered by French astronomer Stéphane Javelle (1864 – 1917).

Bruce Lee Cluster:

This **telescopic** asterism is the open cluster NGC 7160 in the IAU constellation Cepheus. It was discovered by William Herschel in 1789 who listed it as "VIII 67". It is GC 4719 in the *General Catalogue* of 1864. It has recently become known as the Bruce Lee cluster, commemorating this famous martial artist. It is also known as the Swimming Alligator.

Brush Fence:

This Kokatha and Ngalea asterism "Bailgu" is the IAU constellation Aquarius.

Bubble Galaxy:

This **telescopic** asterism NGC 3521 is a flocculent intermediate spiral galaxy in the IAU constellation Leo, which was discovered by English astronomer William Herschel in 1784 who listed it as "I 13" in his catalogue. It is GC 2301 in the *General Catalogue* of 1864. It is also known as the "Cloud Bearing of Leo" (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 56 without a name.

Bubble Nebula:

This asterism is the HII region NGC 7635 (Caldwell 11, SH 2-162, LBN 548, Ced 210) in the IAU constellation Cassiopeia. It was discovered by English astronomer William Herschel in 1787 who listed it as "IV 52". It is GC 4947 in the *General Catalogue* of 1864. Size 15' X 8'.

Bubble of Crater:

This **telescopic** asterism "Búlla Cratéris" is the elliptical galaxy NGC 3704 in the IAU constellation Crater. It was discovered by Wilhelm Tempel in 1878. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Bubbling of Columba:

This **telescopic** asterism "Búlliens Colúmbae" is the spiral galaxy NGC 1792 in the IAU constellation Columba. It was discovered in 1826 by Scottish astronomer James Dunlop. It was listed by John Herschel as 2730 and later as GC 1009 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Bucca Horn:

This Saxon asterism "Bucca Horn" or "Bucca" is the IAU constellation Capricornus as listed by R. H. Allen in his *Star Names* in 1899.

Bucket:

This Lithuanian asterism "Kaušas" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This Latin star "Situla" ("bucket" or "water jar") is Kappa (κ) Aquarii in the IAU constellation Aquarius. R. H. Allen reports in his *Star Names* in 1899 that French astronomer and Catholic priest Pierre Gassendi (1592 – 1655) claimed that the name was derived from the Latin "Sitis" ("thirst") and writes that it was also used for Omicron (ο) Eridani. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists "Situla" for this star. Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Situla" for this star in his *Celestial Atlas* in 1822. "Situla" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Situla" for this star. German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists "Situla" for this star. The IAU approved the name Situla in 2016 for Kappa (κ) Aquarii A.

Bucket Rope:

There are three Arabic stars derived from the name "al Karab":

- One, later latinized to "Alkarab" is Upsilon (υ) Pegasi in the IAU constellation Pegasus. The IAU approved the name Alkarab for the star Upsilon (υ) Pegasi.

- One, later Latinized to “el Khereb” or “Kerb” is Tau (τ) Persei in the IAU constellation Perseus.
- One, Latinized to “Al Karab” or “Kerb” is Tau (τ) Pegasi in the IAU constellation Pegasus.

NOTE: Dorn (1829) lists the stars Tau (τ) and Upsilon (υ) Pegasi as “Rope of a Bucket” appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).

Bucket Rope Knot:

See Well Bucket Rope, below.

Bucking Bronco:

This is an alternate name for the **telescopic** asterism Cowboy on a Bucking Bronco (see below).

Budding of Aries:

This **telescopic** asterism “Gérminans Aríetis” is the dwarf irregular galaxy NGC 1156 in the IAU constellation Aries. This was discovered by English astronomer William Herschel, who listed it as “II 619”. It became GC 627 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its “speckled appearance”.

Buduwamgu:

This Dharawal asterism is the Magellanic clouds (Bursill 2014).

Buduwanung:

This Dharug asterism is the Magellanic clouds (Troy 1993). Variations include “Boo-do-en-ong” and “Mo-loo-mo-long” (Thieberger and McGregor 1994) and “Bu-do-non” (Dawes 1790).

Buffalo:

This Anishinaabe asterism “Mushkoday” or “Beezheeke” is the IAU constellation Perseus (Lee et al 2014).

This Kolam asterism “Sir” is the IAU constellation Lupus (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

This **telescopic** asterism is the open cluster NGC 2546 in the IAU constellation Puppis. It was discovered by French astronomer Abbé Lacaille in 1751 who listed it in his catalogue as Lac II 4. It is GC 1635 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt.

Buffalo Embryo:

This Dakota/Lakota/Nakota asterism “Tayamni” is the Hyades star cluster in the IAU constellation Taurus.

Bug:

This **telescopic** asterism is the planetary nebula NGC 6302 (Caldwell 69) in the IAU constellation Scorpius. It was described by American Astronomer Edward Emerson Barnard in 1884 as a “small hole

in the Milky Way" and appeared in the New General Catalogue in 1888. Barnard gave it this name in 1906, recording in his observations that it "looked like a ghostly bug of some kind, the third mass being the dead and antennae. From its singular appearance I have called it the Bug Nebula". It is also known as the Butterfly Nebula (see below) and the Bipolar Nebula (see above).

Build:

These two Korean asterisms "Jisda" (짓다) are two triangles of stars in the IAU constellation Sagittarius:

- One is the stars Upsilon (υ), Rho (ρ) 1, and 43 Sagittarii, and
- One is the stars Eta (η), Omicron (ο), and Xi (ξ) 2 Sagittarii.

Bulagurrgidam:

This Gumbaynggirr asterism is the belt of Orion in the IAU constellation Orion (Morelli 2015).

Bull:

This Greek asterism "Ταῦρος" ("Tavros") is the IAU constellation Taurus as originally described by Ptolemy (c.100 – c.170) in his *Almagest.* It was typically described as "Τομή" ("Tomí" or "section") or "Προτομή" ("Protomí" or "bust") as it was usually depicted as only the front half of a bull by the Greeks and later by Romans such as the 1st century B.C.E. poet Ovid and Roman statesman Cicero in the 1st century B.C. E., who called it "Sectio Tauri". This is how Ptolemy described it:

- The Hyades cluster, which today is typically presented as the bull's head, is the bull's "backside", with the star Alpha (α) Tauri (Aldebaran) inside the figure,
- The "head" is a quadrilateral of the stars Psi (ψ) Tauri, 44 Tauri, Chi (χ) Tauri, and Phi (ϕ) Tauri,
- From Psi (ψ) Tauri two "horns" run out:
    - One line goes through 41 Tauri to a bend at 24 Tauri ending at Omega (ω) Tauri, and
    - One line goes to the Pleiades cluster,
- The "neck" runs from Chi (χ) Tauri to Upsilon (υ) Tauri,
- The "back" is a curving line from Upsilon (υ) Tauri through HIP 20255, 54 Tauri, and 73 Tauri, to Rho (ρ) Tauri, curving around and containing the Hyades cluster,
- One "leg" runs from Rho (ρ) Tauri through 104 Tauri to a "hoof" at Zeta (ζ) Tauri then back to a "knee" at 106 Tauri, ending at 97 Tauri, and
- The other "leg" starts at the "neck" at Upsilon (υ) Tauri and runs to a "hoof" at Beta (β) Tauri, then back to 94 Tauri.

NOTE: This is listed as a Greek lunar mansion in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). This Greek asterism also appears on the *Daressy Zodiac* of the Roman Imperial Period alongside a dog or jackal. Also, on the *Daressy Zodiac* a bull or ox appears next to their asterism Scorpion (see below).

This Arabic asterism "Althawr" (الثور), later latinized to "Al Thaur", "Altor", and "Ataur" is the IAU constellation Taurus:

- "Al-Thawr" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- A 14th century Christian Spanish astrolabe lists #4560 "al thawr" (King 2002).
- In the 15th century *Alfonsine Tables* it is listed as "El Taur".

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Altaur" and "Altor" as Arab names for Taurus.
- Johann Bayer's *Uranometria* (1603) lists the names "Ataur" and "Altor" for Taurus.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists this as "Altaur vel Attavvro".
- German professor Wilhelm Schickard (1592 – 1635) lists it as "Altauro".
- Robert Hues lists it as "Altor" and "Ataur" in his *A Learned Treatise on Globes* in 1659.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as "Tur".
- It appears as "Taur" in the *Standard Dictionary of Facts*-1908 – 1924.
- In his *Star Names* in 1899, R. H. Allen lists the name "Al Hatt" and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449). NOTE: Edward Sherburne gives this as an "Arabic" name for the IAU constellation Apus in his *Sphere of Marcus Manilius* in 1675. Sherburne is probably mistaking this as a Latinization of the Arabic ""(an-Nisr) uṭ-Ṭā'ir" ("eagle flying"), the Latinization of which included "Althair" (although one would think this would have led him in the direction of Aquila the Eagle, not Apus the Bird of Paradise).

This Egyptian Dendera asterism is basically identical to the Babylonian asterism GU.AN.NA (see Bull of Heaven, below) in the IAU constellation Taurus (Hoffman 2017).

This Hebrew asterism "Shôr" or "Shor" is the IAU constellation Taurus, as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud*, is the first constellation in their Zodiac, and is related to their month Iyar.

This Hittite asterism is the IAU constellation Taurus as listed in the III KUB XXV 37 tablets (Boutet 2014).

This Romanian asterism "Taurul" is the IAU constellation Taurus (Ottescu 2009, Lite 2018).

This German asterism "Stier" is the IAU constellation Taurus:

- Johann Bayer's *Uranometria* (1603) lists the name "Stier" for this constellation.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "der Stier" as an alternate name for Taurus.
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Stier".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Stier".
- The *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826) lists this constellation as "Stier".

This Gaulish asterism "Giamoni Prinnios" is the IAU constellation Taurus and appears in the *Coligny Calendar* (Boutet 2001, 2014).

This Basque asterism "Zezena" is the IAU constellation Taurus ((Knörr 1999, Frank 2021).

This Tibetan khyim (zodiac constellation) "gLang" or "Lang" is the IAU constellation Taurus (Johnson-Groh 2013).

This Persian asterism "Gau" or "Ghav" is the stars Mu (μ) 1 and 2 Sagittarii in the IAU constellation Sagittarius as listed by R. H. Allen in his *Star Names* in 1899.

This Sogdian and Khorasmian asterism “Yaugh” is the stars Mu (μ) 1 and 2 Sagittarii in the IAU constellation Sagittarius as listed by R. H. Allen in his *Star Names* in 1899.

This Hindu asterism “Vrishabha” is the IAU constellation Taurus (Bhagwath 2019) and represents the energy of the God Aryamaan. R. H. Allen lists it as “Vrisha”, “Vrishan”, or “Vrouchabam” in his *Star Names* in 1899.

This Sinhalese asterism “Urusaba” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

This Tamil asterism “Rishabam” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

This Saxon asterism “Fearr” is the IAU constellation Taurus as listed in the 15th century *Anglo Saxon Manual of Astronomy* and R. H. Allen’s *Star Names* in 1899.

This Persian asterism “Tora” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. NOTE: Allen also lists the names “Gau” and “Ghav” for this, but elsewhere lists them as an asterism in Sagittarius (see above).

This Syrian asterism “Taurā” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

This Turkish asterism “Ughuz” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

This Sardinian asterism “su pinnetu” is the IAU constellation Taurus (Putzolu 2019).

Bull:

This Kazakh asterism “Oguz” is the IAU constellation Taurus.

Bull Head:

This Egyptian decan “Bos” is a man with a bull’s head with a flask in his right hand and a scepter in his left, made up of stars of the IAU constellation Scorpius.

Bull Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Taurus as “Chí niú zhī shén” (持牛之神) or “deity of bull” (Kotyk 2017).

Bull of Al Thurayya:

This Arabic star “Thaur al Thurayya” is Eta (η) Tauri in the IAU constellation Taurus as listed by Persian astronomer Al Achsasi al Mouakket in 1650 in his *Calendarium* and by R. H. Allen in his *Star Names* in 1899.

Bull of Heaven:

This Babylonian asterism from the MUL.APIN tablets “GU.AN.NA” (Anthony 1996), “GUD.AN.NA”, or “MUL.GUD.AN.NA” (Hunger 1992) is the IAU constellation Taurus. The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) list this as “MUL.GUD.AN.NA” (Bartel van der Waerden 1974) and it appears on the K 8538 planisphere as “mulgu-an-na” (Koch 1989). The Hyades cluster is

called “Is-le” (See “Jaw of the Wild Bull”, below). This also appears in later Seleucid star lore. R. H. Allen lists the name “Gut-an-na” in his *Star Names* in 1899. Boutet (2014) lists it as “Bull of Anu”.

The Akkadian name for this asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is “Alû/lê” or “Alu” (Hunger 1992) and from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) “as is le-e”: Compare this to Jaw of the Wild Bull, below.

This Sumerian asterism “mulgu-an-na” listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Taurus. This is part of the story of Gilgameš of Uruk.

This Assyrian asterism “GUD.AN.NA” is the IAU constellation Taurus.

This Persian asterism “GU.AN.NA” from the list of Tikpi Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Taurus (Boll 1918, Jeremias 1929). Ernst Weidner lists it as “gu-an-[na]” in his *Fixsterne* in 1971

Bullet:

This **telescopic** asterism is the open cluster Messier 48 in the IAU constellation Hydra. Charles Messier recorded it in 1771, but his declination was off by five degrees. German astronomer Caroline Herschel recorded it correctly in 1783. It was given this name by American astronomer Wayne Schmidt, who describes it as a 30-arc-minute long bullet.

Bullet Cluster:

This American **telescopic** asterism is 1E 0657-56 two colliding clusters of galaxies in the IAU constellation Carina. It is at a comoving radial distance of 1.141 Gpc (3.72 billion ly). Technically it is the smaller cluster that was given this name as it is piercing the larger one. It was a team led by Doug Clowe at the University of Arizona who used the Chandra space telescope to discover the properties of this collision back in 2006.

Bullock Star:

This Manyika star “Ngavi” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Bullock’s Head:

This French asterism with the Latin name “Bubulum Caput” is the IAU constellation Taurus. Johann Bayer’s *Uranometria* (1603) lists “Bubulum Caput” as an alternate name for Taurus. French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) lists “Bubulum Caput”.

Bull’s Foreleg:

This ancient Egyptian asterism “Meskhetyu” or “Meskhetiu” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above): the name translates as “leg of Set” (Krupp 1983). In the Middle Kingdom (c. 2040 - 1782 B.C.E.) it was viewed as simply a bull’s foreleg, but in the New Kingdom (c. 16th – 11th century B.C.E.) it had become an entire bull. The earliest known example is on a sky map on the ceiling of the tomb of Senmut, adviser of Hatschepsut, in Thebes. This interpretation comes from the *Great Magical Papyrus* of Paris (Neugebauer and Parker, 1960). Jean-François Champollion (1790 – 1832), the original translator of the *Rosetta Stones*, called it “Horus Apollo”. It also appears on the ceiling of the Temple of Hathor at Dendera (Hoffman 2017). Other researchers suggest that this “foreleg” is actually the IAU constellation Boötes which forms a more perfect match (Berio 2014). Berio

explains that during the Late Period festival during III Shemu, celebrants threw a bull leg into the sky with the sunrise in Gemini and Boötes setting and in the evening at sunset Boötes would be in upper culmination.

Bulls' Head:

This **telescopic** asterism is the open cluster NGC 6709 in the IAU constellation Aquila. John Herschel listed it as h 2020 and later as GC 4440 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a 15-arc-minute tall bull's head. It is also known as the Flying Unicorn (see below).

Bullseye:

There are two "Bullseye" **telescopic** asterisms:

- One is the open cluster NGC 6704 in the IAU constellation Scutum. It was discovered by German astronomer August Winnecke in 1854. It is GC 4435 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a 40-arc-minute diameter bull's eye. Also known as the Fishhook (see below).
- One is the galaxy LEDA 1313424 in the IAU constellation Pisces. A photograph by the Hubble Space Telescope and follow up data from the W. M. Keck Observatory shows that it has nine rings as a result of a collision with a blue dwarf galaxy. It was named by a team at Yale University in Connecticut (Imad Pasha and Pieter van Dokkum).

This English star "Oculus Tauri" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 and by English Admiral Henry William Smyth in his *Bedford Catalogue* in 1844, and in R. H. Allen's *Star Names* in 1899. It is derived from the original Arabic "Ain al Thaur" (see Eye of the Bull, below).

Bulyan:

This Wardaman star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Cairns and Harney 2003).

Bunch:

This Sardinian asterism "S'udrone" is the Pleiades cluster in the IAU constellation Taurus (Putzolu 2019). This is a bunch of grapes and is related to their asterism Bunch's Driver (see below).

This Slavonic asterism "Kučki", "Kupki", "Hramadka", or "Kupa" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009, 2018).

This Polish asterism "Gromadka" or "Kupa" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Bunch of Flowers:

This Belarussian asterism "Buket Tsvetov" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009).

Bunch of Grain Stalks:

This star is Epsilon (ε) Aquarii in the IAU constellation Aquarius as listed by R. H. Allen in his *Star Names* in 1899.

Bunch of Grapes:

This Greek asterism "Βότρυς" ("Vótrys") is the Pleiades cluster in the IAU constellation Taurus as listed by 1st century B.C.E. philosopher Theon of Alexandria and by R. H. Allen in his *Star Names* in 1899.

This French is the Pleiades cluster in the IAU constellation Taurus (Ottescu 2009).

Bunch's Driver:

This Sardinian star "su trubadore de s'udrone" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Putzolu 2019), a reference to the nearby Pleiades, which they call the "Bunch" (see above).

Bunda:

This Persian lunar mansion "Bunda" is the stars Beta (β) Aquarii (Sadalsuud) and Xi (ξ) Aquarii in the IAU constellation Aquarius.

This Persian star "Bunda" is Xi (ξ) Aquarii in the IAU constellation Aquarius. The IAU approved the name Bunda for the star Xi (ξ) Aquarii A in 2018.

Bungula:

This star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus and is listed by American astronomer Elijah Burritt (1794 – 1838). The origin of this name is obscure: In his *Star Names* in 1899, R. H. Allen suggested that this name is a combination of the Greek letter Beta (β) and the word "ungula" ("hoof"), and the stars Alpha (α) and Beta (β) Centauri (Hadar) are indeed the "front hooves" of Ptolemy's asterism Centaur (see below), although why Beta would be applied to the Alpha star is confusing.

Bunny:

This American **telescopic** asterism is made up of stars of Stock 2 in the IAU constellation Perseus. The "head" is principally defined by the stars HIP 10867, HIP 10844, HD 14025. The "ear" is the stars HIP 10867, HIP 10904, HIP 10968, HD 236958, HD 14320, and HD 14299. The "neck" is between the stars HD 13909 and 13899. The "body" is the main cluster of stars that form Stock 2. The "Bunny" is facing a telescopic "Carrot" (see below). The "Bunny" and "Carrot" were posted by "Jehujones" on *Cloudy Nights* in October 2023.

Burabura n Toa:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Burbidge Chain:

This **telescopic** asterism is a chain of four galaxies including spiral galaxy PGC 2796 in the IAU constellation Cetus. It is named after the astronomer Margaret Burbidge (1919 – 2020).

Burden:

This Rapanui asterism “Tatauro” or “Te Tatauro” is the IAU constellation Crux (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

This Polynesian asterism from the island of Futuna, “Amonga”, is the belt and sword in the IAU constellation Orion. It is part of their asterism Suspended Burden (see below).

Burderde:

This Wardaman star is Beta (β) Scorpii (Acrab) in the IAU constellation Scorpius (Cairns and Harney 2003).

Burin:

This is a French name for the IAU constellation Caelum (see below).

Burnham’s Nebula:

This name is used for two **telescopic** asterisms:

- One is NGC 7026, also known as the Cheeseburger Nebula (see below).
- One is HII region NGC 1555 in the IAU constellation Taurus, commonly known as Hind’s Variable Nebula (see below).

Burning Briar:

This Hobbit asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above) and appears in *The Hobbit* by J. R. R. Tolkien (1892 – 1973).

Burning Brightly:

This Hawaiian star “A’a” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-kau'opae” ("Star for placing shrimp"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

Burning Crown:

This Latin asterism “Ardens Corona” is the IAU constellation Corona Borealis as listed in Virgil’s *Georgics* (29 B.C.E.).

Burning Ember Nebula:

See Albino Butterfly Nebula, above.

Burning of Fire:

This Assyrian star “Mikid-isati” is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Burning One:

This Sogdian star “Widhu” is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

This Khorasmian star “Widhayu” is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Burnt Sacrifice:

This German asterism is the IAU constellation is the IAU constellation Taurus as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675. Sherburne identifies his source as German poet, jurist and translator Georg Philipp Harsdörffer (1607 – 1658).

Burrara:

This Dharawal asterism is the belt of Orion in the IAU constellation Orion (Mathews 1903). Variations include “Duhungagil” (Mathews 1901) and “Murrumwirugan” (Bursill 2014).

Burrmari:

This Wardaman star is Beta (β) Eridani (Cursa) in the IAU constellation Eridanus (Cairns and Harney 2003).

Bush Dog:

This Carib asterism “Awoyuman” or “Awo” represents the Bush Dog (Icticyon venaticus”. Its present location is unknown (Magaña, and Jara, 1982).

Bush Food:

This /Xam star “//xona” or “veldkos” (“bush food”, in this case “bush rice” or “bushman rice”- northern harvester termite larvae or rysmier (Hodotermes mossambicus)) or “ant egg star” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Dechend 1975, Slotegraaf 2013, Alcock 2014). This was an important food source which became available when this star was visible and also an indicator that the aardwolf or maanhaarjakkal (Proteles Cristatus) was available, as it fed on these larvae.

Bush Turkey:

This Kokatha and Ngalea star “Gibbera” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Leaman and Hamacher 2014, Fuller et al 2014, Leaman, Hamacher, and Carter 2016). This is known as the Bush Turkey or Australian Bustard.

This Ngiyampaa (Ngemba) asterism is the IAU constellation Scorpius. The “head” is the “fishhook” of Scorpius and the other end of Scorpius around Alpha (α) Scorpii (Antares) is the turkey’s fan “tail”.

This Ngarrindjeri asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). This is a female bush turkey sitting on her eggs.

NOTE: This is the Australian Brush Turkey, Scrub Turkey, or Bush Turkey, Alectura lathami.

Bushgali:

This Persian asterism “Bushgali”, “Bahi”, or “Goi”, is the IAU constellation Capricornus as listed in R. H. Allen’s *Star Names* in 1899.

Bust of a Horse:

This Greek asterism “Ἵππου Προτομή” (“Íppou Protomí”) or simply “Προτομή” is the IAU constellation Equuleus as originally described in Ptolemy’s *Almagest* in the 2nd century. It is a quadrilateral of stars: Alpha (α) Equulei (Kitalpha), Beta (β) Equulei, Delta (δ) Equulei, and Gamma (γ) Equulei. Georgius

Chrysococcas, a 14th century Greek geographer and astronomer, lists it as "Κεφαλή Ἵππου" ("Kefalí Íppou" or "horse's head") in his *Syntaxis ton Person (Persian Compendium)* and later Latin authors called it "Equi Caput" ("horse head").

- Johann Bayer's *Uranometria* (1603) lists "Sectio Equi" as an alternate name for Equuleus.
- Edward Sherburne translates it as "Sectio Equi" ("section of a horse") in his *Sphere of Marcus Manilius* in 1675.
- John Hill lists it as "Horse's Head" and later as "Protomes" in his *Urania* in 1754.
- Dorn (1829) describes this as "Part of the Horse (the Horse's Head) Sectio Equi" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sectio equi" and "horse's head".

Bust Silhouette:

This **telescopic** asterism is HII region NGC 2359 (SH 2-298. RCW 5, LBN 1041, Ced 94b)in the IAU constellation Canis Major surrounding the Wolf Rayet star WR7. Size 10' X 15'. It was discovered by English astronomer William Herschel in 1785 who listed it as "V 21" in his catalogue. William's son John Herschel described it in 1847 as "a very singular nebula, much like the profile of a bust, (head, neck, and shoulders) or a silhouette portrait". It is GC 1511 in the *General Catalogue* of 1864. It is also known as the "Duck Nebula", the "Duck Head Nebula", the "Flying Eye Nebula", "Thor's Helmet", or the "Whistle Nebula".

Butcher's Cleaver:

This Brythonic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above) as listed in R. H. Allen's *Star Names* in 1899.

Butcher's Shops:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hercules: 95 Herculis (determinative star) and 102 Herculis.

This Chinese xing guan "Túsì" (屠肆) is a line of three stars in the IAU constellation Hercules: 109, 106, and 98 Herculis.

Butchery:

This Korean asterism "Dosaljang" (도살장) is a line of two stars in the IAU constellations Aquila and Hercules: Epsilon (ε) Aquilae and 111 Herculis.

Butler:

This French asterism "Pincerna" is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Butler's Star:

This telescopic flare star is BT Tucanae (HIP 4693, HD 6090) in the Small Magellanic Cloud in the IAU constellation Tucana (magnitude 10.6). It is named for C. J. Butler.

Butt Kuee Tuukuung:

This Mara and Moporr star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Dawson 1881, Clarke 2009, Hamacher 2011). Butt Kuee Tuukuung was a famous ancestor of these people. The stars on either side, Sigma (σ) and Tau (τ) Scorpii, are his wives.

Butterfly:

One butterfly asterism is created by adding vertical lines to connect the limbs at the left and right of the Keystone of Hercules in the IAU constellation Hercules (see Keystone below), which forms the shape of a butterfly. The Saguaro Astronomy Club asterisms list calls this a "Bow Tie" (see above).

Another way of interpreting the brightest stars of the IAU constellation Orion is to see the "belt" (the stars Zeta (ζ) Orionis (Alnitak), Epsilon (ε) Orionis (Alnilam) and Delta (δ) Orionis (Mintaka)) as the body of a butterfly with one wing defined by the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) and the other wing by the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph).

This Wardaman asterism "Milla-Milla" is made up of the stars of the IAU constellation Pegasus (Cairns 1999).

This Elvish (Qenya) asterism "Wilwarin" is the W asterism in the IAU constellation Cassiopeia as listed in the works of J. R. R. Tolkien (1892 – 1973). In Tolkien's earlier notes he called it "Vilvarin".

There are sixteen **telescopic** "butterfly" asterisms:

- One is open cluster Messier 6 (NGC 6405) in the IAU constellation Scorpius: It was first recorded by Italian astronomer Giovanni Battista Hodierna in 1654, although credit for the discovery is usually given to Swiss astronomer Jean-Philippe Loys de Chéseaux in 1746. It is Lac III 12 in de Lacaille's catalogue, and GC 4318 in the *General Catalogue* of 1864. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) describes this as "like a butterfly with open wings". American Astronomer Wayne Schmidt lists it as the butterfly on his list of asterisms, as does American astronomer Phil Harrington and Donald Ware.
- One is the open cluster Messier 93 (NGC 2447) in the IAU constellation Puppis. It was discovered by French astronomer Charles Messier in 1781. It was independently discovered by English astronomer Caroline Herschel two years later. It is listed in the 1864 General Catalogue as GC 1571 and in John Herschel's catalogue as h 3098. The name comes from American astronomer Sherburne Wesley Burnham (1838 – 1921), who noted in *Burnham's Celestial Handbook* that one "perceives the over-all appearance of the cluster as a butterfly with open wings".
- The "Fuzzy Butterfly" is the open cluster NGC 654 in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1784 who listed it as "VII 46". The *General Catalogue* of 1864 lists it as GC 387. It is located 2.5 degrees northeast of Delta (δ) Cassiopeiae and surrounds a F5Ia supergiant star of 7th magnitude.
- The "Southern Butterfly" is open cluster NGC 4833 (Caldwell 105), discovered by Abbé Nicolas de Lacaille in 1751-2 in the IAU constellation Musca. Scottish astronomer James Dunlop and English astronomer John Herschel (1792 – 1871) later catalogued it in the *New General Catalogue*.
- One is open cluster Messier 29 (NGC 6913) in the IAU constellation Cygnus. It was discovered by French astronomer Charles Messier in 1764. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4576. It was given this name by American astronomer Wayne Schmidt, who describes it as a small butterfly.

- One is the planetary nebula NGC 6302 (Caldwell 69) in the IAU constellation Scorpius. It is also known as the Bug Nebula. It appeared in the *New General Catalogue* in 1888 and was first studied and described by American astronomer Edward Emerson Barnard in 1907.
- One is the planetary nebula Messier 76 (NGC 650/651), discovered by French astronomer Pierre Méchain in 1780 in the IAU constellation Perseus and included in Charles Messier's catalogue. William Hershel listed this as "I 193". It was listed in the General Catalogue of 1864 as GC 385/6. It was first recognized as a planetary nebula in 1918 by American astronomer Heber Doust Curtis.
- This is an alternate name for Minkowski's Butterfly Nebula (see below).
- One is planetary nebula NGC 2346 in the IAU constellation Monoceros, known as the Butterfly or the Crimson Butterfly. This was discovered by English astronomer William Herschel c. 1784 who listed it as "IV 65" in his catalogue. It is GC 1500 in the *General Catalogue* of 1864. Size 1' X 0.9'. This is also known as the Hourglass (see below).
- One is NGC 4567 and NGC 4568, a pair of colliding unbarred spiral galaxies in the IAU constellation Virgo: They are part of the Virgo Cluster. These were discovered by English astronomer William Herschel in 1784 who listed them as "IV 8" and "IV 9". His son John Herschel listed them as "1358" and "1359" in his catalogue. They are GC 3108 and GC 3109 in the *General Catalogue* of 1864. They are also known as the Siamese Twins (see below) or the Fish and Chips Galaxies (see below).
- One is the HII nebulosity IC 1318 (LBN 245, Ced 176c) east of the star Gamma (γ) Cygni in the IAU constellation Cygnus. Size 45' X 20'.
- One is the reflection nebula IC 2220 in the IAU constellation Carina. This was first recorded by American astronomer DeLisle Stewart (1870 – 1941) This is also known as the Toby Jug (see below).
- One is in the IAU constellation Fornax and is Corder 530 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This includes HIP 15907, 15842, 15769, and 15833A. Size 40'.
- One is Simonic 1 from the list of Hungarian astronomer Ilona Simon Mogyorósi, which is in the IAU constellation Grus. This is Ennis 11, listed by Canadian astronomer Charles Ennis. Size 120'.
- One, "Papillon", is IC 708, an elliptical galaxy in the IAU constellation Ursa Major. IC 708 was first recorded by American astronomer Lewis Swift, who placed it on his list "IX".
- One, the Glowing Butterfly, is the planetary nebula NGC 2899 in the IAU constellation Vela. This was discovered by English astronomer John Herschel in 1847 and listed as h 3169 on his list. It is GC 1859 in the *General Catalogue* of 1864. It is also known as the Flying Jaw Nebula (see below).

Butting:

There are three Arabic asterisms with the name "an-nath w'an-natib" or just "an-Naṭḥ" (النطح), which means "the butting" or "the butter":

- One is Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) in the IAU constellation Aries. It is also called Horns of the Lamb (see below). English Admiral Henry William Smyth lists "Al nátih" and translates it as "the butt-er" in his Smyth's *Bedford Catalogue* in 1844.
- One is Alpha (α) Arietis in the IAU constellation Aries:
    - "al-Nātih" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

- Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283), Persian astronomer Ulugh Beg Mirza (1394 – 1449), and Syrian astronomer Tayyeb Tizini are reported to have used this name for this star by R. H. Allen, who gives the name as "Al Nāṭiḥ" in his *Star Names* in 1899.
- In the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) this is listed as "al-nātih".
- This was later latinized to "Elnath", "El Nath", "Nath", or "Al Nath".
- American astronomer Elijah Burritt (1794 – 1838) also listed it as "El Nath" and "Al Nāṭiḥ".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "el Nath".

- One is Beta (β) Tauri in the IAU constellation Taurus. It may be called this as it forms one corner of the hexagon of Auriga:
  - American uranographer Elijah Burritt (1794 – 1838) called it "Aurigae".
  - English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Nath" and his *Bedford Catalogue* in 1844 lists "Nath, from Al-nátih, the butting".
  - *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "El Nath".
  - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "El Nath".
  - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Nath".
  - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "El Nath".
  - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Nath".
  - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "El Nath".
  - The IAU approved the name Elnath for the star Beta (β) Tauri Aa.

Button:

This Arabic star "Az Zir", later latinized to "Al Zirr" or "Alzirr", is Xi (ξ) Geminorum in the IAU constellation Gemini as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050). English Admiral Henry William Smyth lists it as "Al-zerr, the button" in his *Bedford Catalogue* in 1844. R. H. Allen lists this in his *Star Names* in 1899.

Buttonhook:

This **telescopic** asterism is a wavy line of bright stars running through the Scutum Star Cloud in the IAU constellation Scutum, starting with the star R Scuti (HIP 92202) near the star Beta (β) Scuti and running down in a line of 5th to 7th magnitude stars including HIP 91960, 91880, 91751 and 91728A to a "hook" of 8th magnitude stars including HIP 91867 and HIP 91933A. Size 75' X 20'. This is on the SAC database and is Corder 1466 and 3633 on Jeffrey Corder's list.

Buu:

This Mabuiag asterism is the IAU constellation Delphinus.

Buzeg:

This “Persian” name for the IAU constellation Capricornus is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. John Hill describes it as a “Turkish” name and spells it “Buzeghall” in his *Urania* in 1754.

Buzzard:

This Chumash star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila. Note: The Chumash saw the condor as a sort of buzzard, so some list this as a condor.

Bwebwe:

The two stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Byaambe’s Campfire:

This Kamilaroi star is Alpha (α) Muscae in the IAU constellation Musca. It is part of their asterism Birringoloo (see above). It is also known as the Fireplace (see below).

Byeissa:

This Myanmar yathi (zodiac constellation) “Byeissa” (ဗြိဿာ) is the IAU constellation Scorpius.

C:

There are twenty-nine **telescopic** “C” asterisms:

- One is in the IAU constellation Lepus and is Corder 862 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 100’ X 40’. Corder describes this as an “elongated group of 18 stars, magnitudes 7 to 9… aligned SW/NE… hooked at both ends… similar to a very thin letter ‘C’”. One end starts at HIP 25829, then runs through stars including HIP 25788A, HIP 25654, HIP 25528, HIP 25454, HIP 25431, HIP 25377, and HIP 25364 before turning and ending at a line of three 8th magnitude stars.
- One is in the IAU constellation Auriga and is Corder 965 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size25’. Corder describes it as “a ‘C’ shaped group of 8 or 9 stars of magnitudes 8.5 through 10. There is also a single 6th magnitude star at the north preceding end as well as a wide double of magnitude 9.9 at the south end.”
- One is Corder 3700 in the IAU constellation Lyra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 15’. This includes the stars HIP 92861, 92869, and 92906.
- One is Corder 3874 in the IAU constellation Dra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 30’. This includes the stars HIP 95978 and 95916.
- One is Corder 4808 in the IAU constellation Pegasus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45’. Seven stars including the stars HIP 113824, 113775, and 113719.
- One is an arc of stars in the IAU constellation Cetus and is Corder 30 on the observing list of Jeffrey Corder. It is a curving arc of eight stars between magnitude 6.5 and 9.5. At one end is the galaxy NGC 45 next to HIP 1102. The line runs through HIP 1046, 1032, 1000, 878, 720, and the double star HIP 636 to HIP 560. Size 65’ X 30’.

- One is in the IAU constellation Monoceros and is Corder 1207 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven stars, four of them 8th magnitude, the other three 10th, including HIP 33188.
- One is in the IAU constellation Lynx and is Corder 1875 on the observing list of American astronomer Jeffrey Corder. Size 90'. This includes the double star HIP 47527A, 43 and 42 Lyncis, the double star HIP 47053A, and HIP 47029.
- One is in the IAU constellation Ursa Major and is Corder 2018 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 8th – 10th magnitude stars including HIP 51163, 51182, 51261, 51403, and the double stars HIP 51525 and 51301A.
- One is in the IAU constellation Carina and is Corder 2030 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is ten 9th magnitude stars including HIP 51467, 51545, and 51415.
- One is in the IAU constellation Antlia and is Corder 2034 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 9th – 11th magnitude stars.
- One is in the IAU constellation Hydra and is Corder 2053 on the observing list of American astronomer Jeffrey Corder. Size 65'. This is five 5th – 7th magnitude stars including HIP 52113, 51884, 51974, and the double stars HIP 52003 and 51933.
- One is in the IAU constellation Carina and is Corder 2130 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 8th – 10th magnitude stars including HIP 54436 and 54408.
- One is in the IAU constellation Centaurus and is Corder 2253 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is nine 7th – 9th magnitude stars including HIP 57682, and 57738 and the double star HIP 57657A.
- One is in the IAU constellation Centaurus and is Corder 2629 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is six 9th – 10th magnitude stars.
- One is in the IAU constellation Ursa Minor and is Corder 2665 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is seven 4th – 9th magnitude stars including HIP 71069 and 70825 and the double star 5 Ursae Minoris.
- One is in the IAU constellation Circinus and is Corder 2788 on the observing list of American astronomer Jeffrey Corder. Size 20' X 20'. This is seven 6th – 8th magnitude stars including HIP 74470, 74195, 74110, and 74147, and the double star HIP 74273.
- One is in the IAU constellation Hercules and is Corder 3138 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 8th – 9th magnitude stars including HIP 82486.
- One is in the IAU constellation Scorpius and is Corder 3249 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is eight 8th – 9th magnitude stars including HIP 84694, 84668, 84638, and 84735.
- One is in the IAU constellation Ophiuchus and is Corder 3286 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is ten 10th – 11th magnitude stars including HIP 85621.
- One is in the IAU constellation Ophiuchus and is Corder 3320 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is eight 6th – 9th magnitude stars including HIP 86198 and 86143.
- One is in the IAU constellation Sagittarius and is Corder 3543 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is twelve 8th – 10th magnitude stars including HIP 90292.

- One is in the IAU constellation Pavo and is Corder 3850 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is six 7^{th} – 8^{th} magnitude stars including HIP 95304 and 95561.
- One is in the IAU constellation Cygnus and is Corder 3911 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is twelve 8^{th} – 10^{th} magnitude stars including HIP 96651.
- One is in the IAU constellation Cygnus and is Corder 4064 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 8^{th} – 9^{th} magnitude stars.
- One is in the IAU constellation Cepheus and is Corder 4403 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is twelve 7^{th} – 8^{th} magnitude stars including HIP 105594, 105610, and 105807 and the double star HIP 105625A.
- One is in the IAU constellation Pegasus and is Corder 4442 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is seven 8^{th} – 10^{th} magnitude stars including HIP 106309 and 106219.
- One is in the IAU constellation Cygnus and is Corder 4467 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is twelve 7^{th} – 10^{th} magnitude stars including HIP 106742, 106597 and the double star HIP 106612A.
- One is in the IAU constellation Capricornus and is Corder 4529 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 7^{th} – 9^{th} magnitude stars including HIP 107845 and the double stars HIP 108072A and 107839A.

Cabin Ghosts:

This Chinese Chenzhuo xing guan is a "box" of four stars in the IAU constellation Cancer: Delta (δ) Cancri, Gamma (γ) Cancri, Eta (η) Cancri, and Theta (θ) Cancri. It contains their xing guan "Cumulative Corpse".

Cacciatore Cluster:

This **telescopic** asterism is globular cluster NGC 6541 (Caldwell 78) in the IAU constellation Corona Australis, which was discovered by English astronomer John Herschel in 1847. It is GC 4372 in the *General Catalogue* of 1864. It is named for Italian astronomer Giuseppe Piazzi's assistant Niccolò Cacciatore (1770 – 1841).

Cactus Hook:

This Walapai asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Cacus:

This Roman asterism "Cacus" is the IAU constellation Ophiuchus as listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844. Smyth calls him the "bad man". In Roman mythology Cacus was a fire breathing giant and the son of Vulcan who was killed by Hercules after terrorizing the Aventine Hill.

Cadet Prince:

This Japanese star is 4 Ursae Minoris in the IAU constellation Ursa Minor. This name comes from the ceiling art in the Takamatsu Zuka Kofun tomb.

Cadmus:

This Greek asterism is the IAU constellation Ophiuchus. Cadmus was the first Greek hero and the greatest, alongside Perseus and Bellerophon, and slayer of monsters before Heracles was created.

Caduceus:

This Greek asterism "Κηρυκεῖον" ("Kirykeíon") is the IAU constellation Corona Australis. The caduceus was the staff of the Greek God Hermes:

- Johann Bayer's *Uranometria* (1603) lists "Caduceus".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Hipparcho Caduceus" as a name for this constellation.
- Edward Sherburne lists the Latin "Caduceum" as one of its names in his *Sphere of Marcus Manilius* in 1675.
- "Caduceus" is listed by John Hill in his *Urania* in 1754.
- R. H. Allen in his *Star Names* in 1899 writes "Hipparchus is said to have known it [by this name]… but this is not found in his Commentary". **Caecius**:

This Greek asterism "Kaikias", "Caecius", or "Caesius", is the IAU constellation Ophiuchus. Caecius is one of their wind Gods ("Ἄνεμοι" or "Winds"), specifically the God of the northeast wind. Dante Alighieri (1265 – 1321) mentions him in his *Inferno*.

Caelum:

None of the stars of this constellation are brighter than 4th magnitude and they only show up in 14 asterisms in this handbook.

This IAU constellation (abbreviation Cae) was created in 1750 by French astronomer Abbé Nicolas Louis de Lacaille from the stars of the IAU constellations Columba and Eridanus. Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts this constellation as crossed engraver's chisels.

It was originally known by the Latin name "Caelum Sculptorium" ("engraver's chisel"), sometimes listed as "Cela Sculptoria", but the name was later reduced to just "Caelum" by English astronomer Francis Baily (1774 – 1844) at the suggestion of English astronomer John Herschel (1792 – 1871), as this name would then take up less space on a star chart. Note: The more common meaning for the Latin word "Caelum" is "sky, heaven, atmosphere", but this isn't the meaning Lacaille had in mind when he created this constellation.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Burin" as an awl.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Grabstichel" and depicts it as two crossed awls tied together.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as "Caela Sculptoris" ("sculptor's heaven"): He indicates the borders of this constellation on the chart but offers no illustration of it.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as "Cela Sculptoris".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Caelum, The Sculptor's Tools" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Caelum" and describes it as a "Sculptor's Chisel".

The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the name "Coelum (Caelum)". The 14th edition (1959) lists "Caelum" and gives the "original form" as "Caelum Sculptoris", describing it as "The Chisel".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., translates "Caelum" as "Chisel".

The standard IAU charts show Caelum as a line of three stars: Beta (β) Caeli, Alpha (α) Caeli, and Delta (δ) Caeli.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Caelum in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of four stars: Gamma (γ) 1 Caeli, Beta (β) Caeli, Alpha (α) Caeli, and Delta (δ) Caeli. *Sky and Telescope Magazine*, founded in 1941, depicts Caelum the same way as Hlad et al.

The French call this asterism "Burin" and the Italians "Burino".

Caesar's Throne:

This Greek asterism "Thronos Caesaris" (θρόνος καισάριος) is the IAU constellation Crux as Pliny the Elder (24 – 79 C.E.) listed it in his *Naturalis Historia*.

Caffau's Star:

This **telescopic** star is an ultra-metal-poor halo dwarf star SDSS J102915+172927 in the IAU constellation Leo (magnitude 16.92). It is named for French astronomer Elisabetta Caffau, who discovered it in 2011. It is one of the oldest known stars and is deficient in carbon, nitrogen, oxygen, and completely devoid of lithium.

Caga Gilgati:

This Akkadian star is Alpha (α) Draconis (Thuban) in the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899. Caga Gilgati was an Akkadian God.

Caged Spirit Nebula:

See Blue Flash Nebula, above.

Cal-gar-le-on:

This Dharug asterism is the Small Magellanic Cloud (Collins 1798).

Calf Pack:

This Sami asterism "Miese-Cora" is an alternate name for the Pleiades cluster in the IAU constellation Taurus (Lundmark 1982). They also call it the "Dog Pack" (see below).

Caiman:

The Amahuaca see the Hyades cluster as the jaw of a caiman that bit off the leg of a man who mistook it for a canoe (Urton 2016). His leg is the Pleiades cluster and the belt and sword of Orion is the man's brother holding a spear to kill the caiman.

This Bororo asterism is made up of the stars of the IAU constellations Auriga, Lepus, Orion, and Taurus:

- The "head" is Lepus,
- The "body" is Orion,
- The "tail" extends through the eastern portion of Taurus and southern portion of Auriga.

Caiman's Jaw:

This Ticuna asterism "Coyatchicüra" is the Hyades cluster in the IAU constellation Taurus. Some Ticuna have drawn the caiman with its body in the IAU constellation Orion, but it is unclear which stars are involved.

Calabash Nebula:

This **telescopic** asterism is protoplanetary nebula OH 231.84 is in the IAU constellation Puppis. The name was first proposed in 1989 in an early paper on its expected dynamics (Icke and Preston 1989).

Calf:

This Arabic star "(al-) Farqad" (فرقد) is Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor:

- "Pherkad" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Pherkad" or "Pherkad Major". NOTE: The name Pherkad Major is a reference to it being part of an optical double star with 11 Ursae Minoris, which is called "Pherkad Minor".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Pherkad Major and Pherkad Minor" for Gamma (γ) Ursae Majoris.
- R. H. Allen lists "this in his *Star Names* in 1899 as "Alifāʿ al Farḳadain" ("dim one of the two calves"), writing that the name applied to both stars. Allen lists it as "Pherkad Major" in the 1963 edition of his book.
- The IAU approved the name Pherkad for Gamma (γ) Ursae Minoris.

California Beach Umbrella:

This Canadian **telescopic** asterism is alongside the California Nebula (Dragon Nebula NGC 1499). The center shaft of the umbrella is a line of stars from Xi (ξ) Persei (Menkib) through HIP 18434, HIP 18081, and 42 Persei to Omicron (ο) Persei. Three stars form the umbrella canopy top are: Zeta (ζ), Omicron (ο), and 40 Persei. The cluster Omicron Persei Cloud (IC 348) is beside Omicron (ο) Persei at the tip of the umbrella. Size 5° X 3°. This is Laurelai 1 on the list of Canadian RASC member Laurel Ennis, posted on 2023 Feb 1.

California Nebula:

This **telescopic** asterism is NGC 1499 (SH 2-220, LBN 756, PGC 3517568, Ced 26) in the IAU constellation Perseus. It was discovered by American astronomer Edward Emerson Barnard in 1884. It has this name as its shape resembles the shape of the state of California. Size 160' X 40'. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., includes the "California Nebula".

California of the Sky:

This French asterism is the IAU constellation Orion as listed by French astronomer Camille Flammarion (1842 – 1925) in his *Astronomie Populaire.*

Californietto Nebula:

This **telescopic** asterism is HII region is SH 2-157 (LBN 537) in the IAU constellation Cassiopeia. It is also known as the Lobster Claw Nebula. It is Lorenzin 8 on Tom Lorenzin's asterism list.

Callisto:

This asterism is the IAU constellation Ursa Major. In Greek myth the Goddess Hera turned Callisto into a bear in a fit of rage and her husband Zeus turned Calisto's son Arcas into a bear in the sky to prevent him from hunting Callisto:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Callisto" as an alternate name for Ursa Major.
- Johann Bayer's *Uranometria* (1603) lists "Callisto" and "Megisto" as names for Ursa Major.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists the names "Ursa Maior", "Helice", and "Casto" for this constellation.
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Ursa Maior" with the subtitle "Calisto".
- John Hill lists "Callisto" as a name for the IAU constellation Ursa Major in his *Urania* in 1754. Later in *Urania*, Hill lists an alternate name for Callisto, "Megisto", as a name for this constellation.

Calm of Ursa Major:

This **telescopic** asterism "Lenítus Úrsae Majóris" is the intermediate spiral galaxy NGC 3756 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed this as "II 784". It became GC 2461 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Calvary Cross:

There are four Quechua asterisms by this name:

- One "Crucero" or "Calvario" is the IAU constellation Crux (Ciancia 2018).
- One, "Calvario Cruz", from Misminay is made up of stars in the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Pi (π) Scorpii, and Sigma (σ) Scorpii. This is also known as the Eastern Cross (Urton 1980).
- One, "Calvario Cruz", is from Misminay made up of stars of the Belt of Orion plus Tau (τ) Orionis and Beta (β) Orionis. This is also known as the "Western Cross" (Urton 1980).
- One, "Calvario Cruz" from Misminay is made up of stars of the IAU constellations Canis Minor, Gemini, Orion, and Taurus (Urton 1980):
    - The "base" of the cross is the belt of Orion,
    - The "top" of the cross is Alpha (α) Geminorum (Castor),
    - The "cross bar" of the cross is Alpha (α) Canis Minoris (Procyon) and Beta (β) Tauri (Elnath).

Calyx:

This **telescopic** asterism is Alessi 10 from the lists of Brazilian astronomer Bruno Alessi, which is in the IAU constellation Aquila. René Merting describes it as a "calyx" on the *Faint Fuzzies* website.

Camas Baking Pit:

This Salish asterism "Sxʷqʷl̓epm" ("one who cooks things in the ground") is the IAU constellation Auriga (Pete 2023). The oval of principal stars represents the women cooking camas: Alpha (α) Aurigae (Capella), Epsilon (ε) Aurigae, Eta (η) Aurigae, Zeta (ζ) Aurigae, Iota (ι) Aurigae, Beta (β) Tauri (Elnath), and Theta (θ) Aurigae. The star clusters in the middle of Auriga (and there are several) are the cooking pit. The women fled into the sky to escape Skunk (X̱stéyy̓eʔ). Camas is a plant in the asparagus family.

Camel:

This Arabic asterism "Al Ajmāl" is the IAU constellation Corvus:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al ajhmal, the camels".
- R. H. Allen lists "Al Ajmāl" as a singular camel in his *Star Names* in 1899.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Hunt 212 (1171) depicts a camel behind Cassiopeia, and the Doha manuscript (1125) of al-Sufi's *Book of Fixed Stars* depicts a camel overlapping Andromeda.

This Taureg asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This English asterism "Camelus, The Camel" is the IAU constellation Camelopardalis. English astronomer Richard Anthony Proctor gave it this name in 1873 and listed it in his *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association" as he believed that shortening the name would make more room on astronomical charts. Of course "Camelopardalis" means "giraffe" not "camel", and this name did not take hold. However, some uranographers, possibly influenced by Proctor, did shorten the name to "Camelopardus" or "Camelopard" on their charts.

In his *Urania* in 1754, John Hill listed this as an "Arabic constellation; it stands in the place of the Hercules". The Arabs did not have an asterism in this location but did have the asterism Mother Camels (see below) nearby in the constellation Draco.

This asterism is the IAU constellation Aquarius as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

This **telescopic** asterism (French 2 on the asterism list of American astronomer Sue French) is in the IAU constellation Hydra. A line of three 7th to 8th magnitude stars including the star HIP 49591 form the "body" with two stars indicating the "hooves" at the end of the "legs" with the brightest star (HIP 49533B) being the top of the camel's "head".

Camel Herder:

This Arabic star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. The Hyades cluster of which this star is a corner is the "Young She Camels" (see below).

Camel Stallion:

There are two Arabic stars with this name:

- One “Al Fahl” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in R. H. Allen’s *Star Names* in 1899.
- One, “al-fanīq” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.
    - “al-fanīq” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - “Al Fanīḳ” is listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050).
    - “Al Fanīḳ” is listed by R. H. Allen’s *Star Names* in 1899.

Camelopardi Hevelii:

As the IAU constellation Camelopardalis appeared in the very popular star atlas of Polish astronomer Johannes Hevelius (1611 – 1687), it was sometimes referred to as Camelopardi Hevelii.

Camelopardalis:

None of stars of Camelopardalis are brighter than 4th magnitude and they appear in 98 of the asterisms in this handbook.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Hunt 212 (1171) depicts a camel behind Cassiopeia, and the Doha manuscript (1125) of al-Sufi’s *Book of Fixed Stars* depicts a camel overlapping Andromeda. This may have been what inspired Flemish astronomer Petrus Plancius in 1613 to create what is now the IAU constellation “Camelopardalis” (IAU abbreviation Cam) or “Camelopardis” (“the giraffe”). A celestial globe (1613) of Plancius published in Amsterdam by Pieter van der Keere depicts Camelopardalis as a giraffe walking to our right.

German astronomer Jakob Bartsch (1600 – 1633) listed Camelopardalis in his *Planisphaerium Stellatum* (1613). Bartsch also lists the Italian name “Giraffa” and the German “Grenff”.

Camelopardalis is depicted on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) but not labelled.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Camelopardalis” as a giraffe facing to our right.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Gyraffe Camelopardalis”.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum,* depicts “Camelopardalis” as a giraffe walking to our right.

Edward Sherburne lists it as “Camelo Pardalis” and “Gyraffa” (“giraffe”) in his *Sphere of Marcus Manilius* in 1675.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “La Giraffe”, “Giraffa”, and “Camelopardalis” and depicts it as a giraffe walking to our right.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts “Camelopardalis” as a giraffe.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Camelopardal” as a giraffe walking to our right.

This is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729 as “Camelopardal”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Camelopardalis as a giraffe walking to our left.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Camelopardalus” as a giraffe walking to our left.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts a giraffe and labels it “Camelopard”.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Camelopar” as a giraffe walking to our right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Giraffe” as a giraffe walking to our left, as does the 1778 edition.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782 lists this constellation as ”Das Cameelopard“ and depicts it as a giraffe walking to our left.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Camelo Pardo di Evelio” (“Camelopardalis of Hevelius”) and “Camelopardo” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Camelopard” as a giraffe walking to our right.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Camelopardalis” but abbreviates this to “Camelopard” on some charts in his *Celestial Atlas* in 1822 and on his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822), which depicts this as a giraffe.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Camelopard”.

American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) depicts “Camelopardalis” as a giraffe.

“Camelopardalus” (sic) is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a giraffe.

English Admiral Henry William Smyth refers to it as “the Camelopard” in his *Bedford Catalogue* in 1844.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Camelopardus” as a giraffe walking to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Camelopardalis” as a giraffe.

This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Camelopardalis": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Camelopardalis" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a giraffe walking to our left.

This constellation is listed as "Camelopardis" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as the "Giraffe".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Camelopardalis" in his *Star Atlas* (1893) and describes it as "The Giraffe".

Irish astronomer John Ellard Gore listed it as "Camelus" in 1894 as part of a translation of *Astronomie Populaire* by Camille Flammarion (1842 – 1925).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Camelopardalis" and describes it as a "Giraffe", incorrectly attributing it to Hevelius.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists this constellation as "Camelopardus".

Another French name for this constellation is "Le Cancre" ("the dunce"). The Italian name is "il Cancro".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Camelopardalis in his book *The Stars - A New Way to See Them* (1952). The standard IAU lines depict a triangle of the stars Alpha (α) Camelopardalis, Gamma (γ) Camelopardalis, and the double star HIP 16228A, with a line running from Gamma (γ) Camelopardalis to the double star HIP 25110. Rey depicts it as follows:

- The giraffe's "body" is a quadrilateral of the stars Alpha (α) Camelopardalis, Gamma (γ) Camelopardalis, HIP 17884, and Beta (β) Camelopardalis,
- One "leg" runs from HIP 17884 to a "foot" at the double star HIP 16228A.
- One "leg" runs from Beta (β) Camelopardalis to a "foot" at 7 Camelopardalis.
- The giraffe's "neck" runs from Alpha (α) Camelopardalis to a bend at HIP 33694 and ends at HIP 29997.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Camelopardalis in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as three lines radiating out from the star Alpha (α) Camelopardalis:

- One runs to Gamma (γ) Camelopardalis,
- One runs through Beta (β) Camelopardalis to 7 Camelopardalis, and
- One runs through HIP 29997 to HIP 33694

Sky and Telescope Magazine, founded in 1941, depicts Camelopardalis in their magazine and publications in the same manner as Hlad et al.

Camels:

This Arabic asterism is the stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), and Kappa (κ) Orionis (Saiph) in the IAU constellation Orion. R. H. Allen lists this in his *Star Names* in 1899 and makes it a part of the asterism Herdsman of the Jauzah (see below).

Camel's Burden:

This Arabic asterism "Al Karb al Ibl" is the IAU constellation Canes Venatici as listed by translator Giuseppe Simone Assemani (1687 – 1768).

Camel's Eye:

This **telescopic** asterism is planetary nebula NGC 1501 in the IAU constellation Ophiuchus which surrounds the variable star CH Camelopardalis. This was discovered in 1787 by English astronomer William Herschel who listed it in his catalogue as "IV 53". It is GC 801 in the *General Catalogue* of 1864. It is also known as the Oyster Nebula (see below) and was described by American astronomer Francis G. Pease (1881 - 1938) as "bearing a resemblance to the convolutions of the brain".

Camel's Hump:

This Arabic asterism "Al Nuḥātai" is the stars Gamma (γ), Mu (μ), Nu (ν), Eta (η) and Xi (ξ) Geminorum in the IAU constellation Gemini:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al nuhhátaï, translating this as "the dual of Nuhát, side or inclination, which affording but little clue, Nahátaï (from nahát) two strangers, the expressed dual of al nuhháh, a large camel's hump" and only includes Mu (μ) and Eta (η) Geminorum.
- R.H. Allen's *Star Names* in 1899 lists this as all five stars.
- This is also known as "Stoopness of the Camel Neck." A Latinization of this name, "Nuhatai" or "Nucatai", has been assigned by some to the star Nu (ν) Geminorum in the IAU constellation Gemini.

Camels Quenching Their Thirst:

There are two Arabic asterisms with the name "al-Nihāl" or "an-Nihāl" (النهال):

- One is a quadrilateral of stars in the IAU constellation Lepus described by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986): Alpha (α) Leporis (Arneb), Beta (β) Leporis, Gamma (γ) Leporis, and Delta (δ) Leporis. This is also known as the "Throne of Jawzā'" (see below) or "the Hindmost Chair of Jawzā'" (see below). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Al nihál, or thirst-slaking camels".
- One is the star Beta (β) Leporis in the IAU constellation Lepus. This was later latinized to "Nihal". American uranographer Elijah Burritt (1794 – 1838) listed it as "Nibal". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 notes that "Nihal" is used for this star but "is more properly applied" to the aforementioned quadrilateral of stars. The IAU approved the name Nihal for the star Beta (β) Leporis A.

Campbell's Star:

This **telescopic** variable star is Campbell's Star or Campbell's Hydrogen Star a Wolf Rayet star HIP 96295 (HD 184738) in the IAU constellation Cygnus (magnitude 8.32). It is named for 19th century American astronomer William Wallace Campbell.

Camp of Elmur:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Campe:

This Greek asterism is the IAU constellation Scorpius as listed by Hesiod (Mosenkis, date n/k). Campe was a monster who guarded the Cyclopes and Hundred Handers in Tartarus. This is related to their asterisms Hundred Handed (see below) and Cyclopes (see below).

Campfire:

This Naron (San) asterism is the Pleiades cluster in the IAU constellation Taurus. They believe their God Huwe sits beside it telling stories.

This Kaurna asterism "Wodliparri" is the dark spaces in the Milky Way, which they see as huts and the bright stars around them as campfires.

This Kamilaroi/Euahlayi star is Beta (β) Orionis (Rigel) in the IAU constellation Orion. It is part of their asterism "Birray Birray" (see Uninitiated Boys, below). The sword of Orion is their fire poker (see Fire Poker, below).

This Arrernte star is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Maegraith 1932). Maegraith writes that this represents a campfire around which many men are sitting.

Campfire Smoke:

This Wotjobaluk asterism "Coomartoorung" is the open cluster Messier 44 (see Beehive, above) in the IAU constellation Cancer (Hamacher 2011). It is the cookfire of the Two Hunters (see below).

Canal:

This Babylonian lunar station "Khigalla" is Gamma (γ), Mu (μ), Nu (ν), Eta (η), and Xi (ξ) Geminorum in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

This Persian lunar station "Rakhvad" is Gamma (γ), Mu (μ), Nu (ν), Eta (η), and Xi (ξ) Geminorum in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

This Sogdian lunar station "Ghathaf" is Gamma (γ), Mu (μ), Nu (ν), Eta (η), and Xi (ξ) Geminorum in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

This Khorasmian lunar station "Gawthaf" is Gamma (γ), Mu (μ), Nu (ν), Eta (η), and Xi (ξ) Geminorum in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

Cancer:

None of the stars of Cancer are brighter than 4th magnitude and they appear in 211 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Cnc) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) as "Καρκίνος" or "Karkínos" and Hipparchus (190 – 120 B.C.E.), and Ptolemy (c.100 – c.170) also used the name "Καρκίνος" (see Crab, below) in his *Almagest* in the 2nd Century C.E. The Greek myth has the Goddess Hera placing this crab in the sky as it had been killed by Hercules and she was an enemy of

Hercules. An earlier version of this asterism appears in the Babylonian MUL.APIN tablets as “AL.LU”, in the *Astrological Reports to the Kings* as “Alluttu” or “MUL.AL.LU” (Parpola 1993, see Crab, below). None of its stars rate a spot on the list of 90 brightest stars but its stars do appear in 193 of the asterisms listed in this handbook. All of the charts listed below depict Cancer (as a crab or crayfish) as viewed from above unless otherwise noted.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Cancer as a scarab beetle (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) orients Cancer so that its pincers do not turn towards Leo.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts this constellation as a crab.

Cancer appears in the Leiden *Aratea* (816) as a crab (Katzenstein & Savage-Smith, 1988).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In the Cologne 83 II edition it is shown facing right.
- In the Siena L. IV. 25 and Ps Bede DSC editions Cancer is placed between the feet of the Gemini twins.

Cancer was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 under the Arabic name “Al-Saratān” (Hafez 2010). The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts this constellation as a two views of a crab: One as viewed from earth and the other as viewed from the sky.

The Oxford Laud 644, Padua 27, and Venice VIII 22 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depicts Cancer facing right. The Klosterneuberg 685, Vat lat 643, Aberystwyth, Sienna L.IV.25 Germanicus, Leiden 8°15 Hyginus, and Zwettl 296 manuscripts of *De signis caeli* depict Cancer between the feet of Gemini.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Cancer as a crab.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Cancer as a crab.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Cancer as a multi coloured crab facing to our right.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form “CANC” (Dekker 2007).

English author Geoffrey Chaucer (c.1340s – 1400) listed it as “Cancre” in his *A Treatise on Astrolabes*, which is a French name (see Crab, below), but the name usually appearing in manuscripts and charts in his day was “Canser” according to R. H. Allen in *Star Names* in 1899.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol.

12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Cancer at the feet of Gemini Mc Gurk, Patrick (1966).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Cancer as a crab.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Cancer" as a crayfish facing to our right.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Cancer as a crab facing to our right. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Cancer as a crayfish facing to our left, but elsewhere it is depicted facing upwards.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Cancer" as a crayfish facing to our right.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Cancer as a crab crawling to our left.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Cancer as a crab crawling to our left.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Cancer" as a crab.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Cancer as a crayfish to the left of Gemini. The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Cancer as a crayfish to the right of Gemini: In the sky it is to the left.

Cancer appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a crayfish and is labelled with the astrological sign for Cancer.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Cancer" as a crayfish.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Cancer as a crab. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Cancer as a crayfish.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known

as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Cancer as a crayfish.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Cancer” as a crab.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Cancer as a crayfish.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Cancer in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Cancer” as a crab.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Cancro”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Crab”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Cancer as a crayfish.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Cancer in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Cancer as a crayfish and it is only labelled with the astrological symbol for Cancer.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Cancer” as a crayfish.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Cancer” as a crayfish viewed from above.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Cancer” as a crayfish moving to our right.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Cancer” as a crab.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Crevice” as a crayfish.

“Cancer” is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a crayfish.

Cancer is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts this as a crab viewed from above in his *Uranometria* in 1603. Bayer lists these names for this constellation: “Cancer, Octipes, Nepa, Astacus, Cammarus, Krebs, Alsartan, Asartan”.

“Cancer” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as a crab.

“Cancer” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a crayfish.

Johannes Kepler’s *Stella Nova in Pede Serpentarii* (1606) lists this constellation as “Crabbi”.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Cancer” for this constellation.

“Cancer” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a crayfish.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Cancer as a crab.

Cancer is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as a crayfish and is labelled “Cancer Alsartan”.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Cancer as a crab.

English astronomer Edmund Halley’s chart of 1678 depicts Cancer as a crab.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Cancer” as a crab.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Cancer” as a crab.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Cancer” as a crayfish.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Crevice”, “Cancer”, and “Καρκίνος” (“crab”) and depicts it as a crab.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Cancer” as a crab.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Cancer as a crab.

Cancer is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a crab.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as “Cancer”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Caneer” as a crayfish.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Cancer" as a crayfish.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Cancer as a crab.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Cancer as a crayfish.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Crevice" as a crayfish.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Cancer" as a crayfish.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this constellation "l'Ecrevide" and depicts it as a crab, but in later close-up charts it is labeled "le Cancer". The 1778 edition labels this "le Crevice" but also depicts it as a crab.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Cancro" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Cancer" as a crayfish.

American uranographer William Croswell (1760 – 1834) depicts "Cancer the Crab" on his *Mercator Map of the Starry Heavens* in 1810 as a crab.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Krebs" and depicts it as a crayfish. The various editions of Bode's Jahrbuch also use this name. Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Krebs", but depicts it as a crab.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Cancer" as a crayfish.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Cancer in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): This is depicted as a crab.

"Cancer" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a crab.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Cancer" as a crab.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cancer" as a crab.

Cancer is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Cancer" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a crab.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Cancer, The Crab" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Cancer, the Crab".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cancer" in his *Star Atlas* (1893) and describes it as "The Crab".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Cancer" and describes it as a "Crab".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Cancer" as "stars that lie irregularly scattered between Gemini, Head of Hydra, Procyon, and Leo".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Cancer".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Cancer in his book *The Stars - A New Way to See Them* (1952). The standard IAU charts show this constellation with a central line running from Gamma (γ) to Delta (δ) Cancri and pairs of lines branching out from these two stars. Rey makes a "body" out of the quadrilateral of stars Gamma (γ), Zeta (ζ) 1 and 2, Beta (β) Cancri (Tarf), and Delta (δ) Cancri, placing Messier 44 (see Beehive Cluster, above) inside this body. One arm runs from Delta (δ) Cancri to Alpha (α) Cancri (Acubens) and one "arm" runs from Gamma (γ) Cancri to Iota (ι) Cancri.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Cancer in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* almost the same as the standard IAU version except that they omit the line between Gamma (γ) Cancri and Chi (χ) Cancri.

Sky and Telescope Magazine, founded in 1941, depicts Cancer in their magazine and publications as three lines of stars radiating out from Delta (δ) Cancri:

- One runs to Beta (β) Cancri (Tarf),
- One runs to Alpha (α) Cancri (Acubens), and
- One runs through Gamma (γ) Cancri to Iota (ι) Cancri.

Cancer Minor:

This Flemish asterism "Lesser Crab" was created in 1612 by Flemish astronomer Petrus Plancius (1552 – 1622) from a group of arrow-shaped stars of the IAU constellation Gemini: HIP 36616 and 68, 74, 81, and 85 Geminorum. A celestial globe (1613) of Plancius published in Amsterdam by Pieter van der Keere depicts this as a small crayfish between Cancer and Gemini. Polish astronomer Stanislaw Luieniecki (1623 – 1675) lists Cancer Minor it in his charts.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Canis Minor" as a crayfish between Gemini and Cancer.

Another version of this obsolete constellation is found in the *Harmonia Macrocosmica* (1660) ("*Cellarius Atlas of Andreas Cellarius*"), made up of stars of the IAU constellation Cancer, including a line through the 5th magnitude stars 3, 5, and 8 Cancri. Bruno Alessi lists it on his BDCC 7.6 list as the "Little Crab" and "Cancer Minor".

Candaen:

John Hill gives this as a "Baeotian" name for the IAU constellation Orion in his *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 also lists this as a "Boeotian" name.

Candelabra:

See Chandelier, below.

Candle and Holder:

There are two **telescopic** "candle and holder" asterisms:

- One is from *Pattern Asterisms: A New Way to Chart the Stars* by John A. Chiravalle. It is in the IAU constellation Hercules and is 1.1˚ in length:
  - The "flame" is the star HIP 88234,
  - The "candle stick" is a line of stars running down from this "flame" through HIP 88302 and 88361 to HIP 88415A,
  - The "base" of the candle holder is a curve of stars running through HIP 88555A, 88415A, and 88232.
- One is the open cluster and emission nebula Messier 16 (NGC 6611, IC 4703, SH 2-49, RCW 165, LBN 67, Cr 375, Mel 198, Ced 159).in the IAU constellation Sagittarius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745-6 and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel's General Catalogue of 1864 as GC 4400. It was given this name by American astronomer Wayne Schmidt, who describes it as a candle holder 12 arcminutes tall.

Candlemas Stars:

This Estonian asterism is stars from the constellation Perseus: Alpha (α) Persei (Mirfak) and Beta (β) Persei (Algol). This is from the island of Saaremaa. NOTE: Candlemas is February 2.

Candlenut Torch:

This Samoan asterism "Tuigālama" is a triangle of stars in the IAU constellation Orion (Fitisemanu 2022): Mu (μ) Orionis and Chi (χ) 1 and 2 Orionis. It is associated with the legend of Ti'iti'iatalaga.

Candy Cane:

This **telescopic** asterism is in the IAU constellation Taurus next to the Pleiades cluster and is Ennis 36 on the observing list of Canadian astronomer Charles Ennis. A line of four 6th – 8th magnitude stars including HIP 17497 at the "base", HD 23353, the double star HIP 17572A in the middle at HD 23464 at the end (Corder 580) ends at a curve of five 9th – 10th magnitude stars: HD 23513, SAO 76181, SAO 76179, Gaia DR3 6497674345246412 8, and Gaia DR3 6497117717485030 4. Size 30' X 15'.

Cane:

This Latin asterism “Canna”, “Calamus”, or “Harundo” is the IAU constellation Sagitta and refers to the reed which was used to make the arrow shaft. Johann Bayer’s *Uranometria* (1603) lists “Arundo” and “Canna”. “Calamus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as well as “Canna seu Arundo” (“his cane with a reed”). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists it as “Arundo”.

This Pomo asterism is the Big Dipper in the IAU constellation Ursa Major (see Big Dipper above).

This asterism is the IAU constellation Aries as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

This **telescopic** asterism Levy 157 is found in the IAU constellation Cygnus. Its seven 9th magnitude stars form a cane. It is from the observational lists of long time RASC member and comet chaser David Levy.

Cane Griddle:

This Tupi asterism “Muquentaúa” is the Hyades cluster in the IAU constellation Taurus (De Freita Mourão 2009). Compare this to the Tupi (São Luís Island) asterism “Seychouioura” (see Fish Grill, below).

Canes Venatici:

The stars of this constellation show up in 111 asterisms in this handbook. Its brightest star is the 3rd magnitude star Cor Caroli.

This IAU constellation (IAU abbreviation CVn) was listed as “unfigured stars” by Ptolemy (c.100 – c.170) in his *Almagest* in the 2nd century C.E. Some of the stars of the IAU constellation Boötes were described by the ancient Greeks as Boötes’ club (“κολλοροβος” or “kollorobos”). When Arab astronomer Hunayn ibn Ishaq (809 – 873) translated this, he didn’t recognize this Greek word, so he made it out to be “al-'aṣā dhāt al-kullāb” (العصا ذات الكُلاب - “staff having a hook”). When Latin translator Gerard of Cremona (1114 – 1187) later attempted to translate this Arabic, he mistook “kullāb ('hook') for “kilāb” ('dogs'). So Boötes’ club became Boötes’ dogs. In 1553 the German astronomer Petrus Apianus depicted Boötes as having two dogs with him, and the idea of Canes Venatici was born.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts two dogs on leashes held by Boötes but does not label them.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Boötes as a bearded male in a tunic, knee high boots, and brimmed cap. He is walking to our left with a long staff in his left hand and leashes to two following dogs in his right hand.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts three leashed dogs, the leashes held by Boötes. The dogs are not labelled at all.

It was Polish astronomer Johannes Hevelius (1611 – 1687) that eventually created it as a separate constellation in 1687, listing it in his *Catalogus Stellarum Fixarum* in 1690 (see Northern and Southern

Dogs, below) as part of his *Prodromus Astronomiae* (1690). It is depicted as the front halves of two dogs running to our left, their hand quarters behind Boötes, their leashes held by Boötes.

A celestial pocket globe created by British uranographer Herman Moll in 1719 does not label Canes Venatici but does label the two leashed dogs, “Chara” and “Asterion”, which are running to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Canes Venatici as two dogs whose leashes are being held by Boötes: This includes the stars “Chara” and “Cor Caroli” (Alpha and Beta Canum Venaticorum).

Canes Venatici is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: This is depicted as two leashed dogs, the leashes being held by Boötes.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Canes Venatici as two leashed dogs running to our right. The name of the constellation does not appear, but the names of these dogs are “Chara” and “Asterio”.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Canes Venatici” as two leashed hounds, “Asterio” and “Chara”.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts this constellation as two dogs whose leashes are being held by Boötes: This includes the stars “Chara” and “Cor Caroli” (Alpha and Beta Canum Venaticorum).

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Boötes as holding two leashes to a pair of dogs who are running to our right.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, does not label Canes Venatici, but shows two leashed dogs, “chara” and “Asterion”, the leashes being held by Boötes.

The French edition, Atlas Céleste, Seconde Édition (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Les Vevrieres” as two dogs whose leashes are being held by “Le Bouvier” on the northern hemisphere chart. On a later close-up chart they are labeled “les Levriers” (“the greyhounds”) and depicted as two leashed dogs, the leashes being held by Boötes. Later still they are referred to as “les Lévriers ou Chiens de chasse”.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation under the abbreviated name “Cani da Cacc.” (short for Cani da Cacciatore” or “hunter dogs”) in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this as “Cani de Caccia” (“hunting dogs”) in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Canes Venatici as two leashed dogs being held by Boötes, but does not label the constellation.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 does not label this but shows two leashed dogs named “Asterion” and “Chara”.

American uranographer William Croswell (1760 – 1834) depicts “Canes Venatici the Greyhounds” on his *Mercator Map of the Starry Heavens* in 1810 as two leashed hounds, the leashes being held by Boötes.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Jagdhunde” and depicts it as two leashed hounds. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists ”die Jagdhunde, Asterion and Chara“.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Canes Venatici” in his *Celestial Atlas* in 1822: He depicts it as two leashed dogs, the leashes being held by Boötes.

“Canes Venatici” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as two leashed hounds running to our right.

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “the Hounds”.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Canes Venatici” as two leashed hounds running to our left, the leashes held by Boötes. The upper dog is labeled “Asterion” and the lower dog is labeled "Chara”.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Canes Venatici” as two leashed hounds, “Chara” and “Asterion”. Their leashes are being held by Boötes.

This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Canes Venatici”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) labels the two dogs “Chara” and “Asterion”.

“Canes Venatici” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as the front half of two leashed hounds running to our right.

English astronomer Richard Anthony Proctor proposed shortening this name to “Catuli” (“puppy”) in 1873 as he believed that shortening the name would make more room on astronomical charts. However, Proctor’s *A New Star Atlas* (1887) lists “Canes Venatici, The Hunting Dogs” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Canes Venatici, the Hunting-Dogs”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Canes venatici” in his *Star Atlas* (1893) and describes it as “The Hounds”.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as “Canes Venatici, the hunting dogs”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Canes Venatici” and describes it as “Hunting Dogs”, attributing it to Hevelius.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Canes Venatici: The Hunting Dogs”.

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists “Canes Venatici” as the “Hunting Dogs”.

Canes Venatici is depicted on standard IAU charts as a line of the two stars Alpha (α) Canum Venaticorum (Cor Caroli) and Beta (β) Canum Venaticorum (Chara).

Canis Major:

It isn’t surprising to me that Canis Major would be found in 415 of the sky cultures of the world since its principal star Alpha (α) Canis Majoris (Sirius) is the brightest star in the sky and its stars Epsilon (ε) Canis Majoris (Adhara), Delta (δ) Canis Majoris (Wezen), Beta (β) Canis Majoris (Mirzam), and Eta (η) Canis Majoris (Aludra) are numbers 22, 36, 46 and 87 on the list of 90 brightest stars.

This IAU constellation (IAU abbreviation CMa), the “Great Dog”, started with the Mesopotamian asterism “Ban” (see Bow, above). This later turned into the Babylonian asterism “Qastu” (see Bow, above). Aratus (315 – 240 B.C.E) called it “ποικίλος” or “poikílos” (“diverse”). The Greeks associated this constellation with Laelaps, a dog which was a gift to Europa from the God Zeus. It later became a hunting dog of Orion and appeared in the works of Aratus (315 – 240 B.C.E) under this name. Homer (8th century B.C.E.) called Sirius Orion’s “Κύων” or “Kýon” (“dog”) in the *Iliad’s* Rhapsody XXII (see Orion’s Dog, below). The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a dog running to our left, as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

Ptolemy (c.100 – c.170) listed it as Κύων (see Dog, below) in his *Almagest*. The ”body” of Ptolemy’s dog is a bent rectangle of stars with the corner stars Alpha (α) Canis Majoris (Sirius), Delta (δ) Canis Majoris, Epsilon (ε) Canis Majoris, and Nu (ν) 2 Canis Majoris. The tip of the “tail” is Eta (η) Canis Majoris. The “paws” are Kappa (κ) Canis Majoris, Zeta (ζ) Canis Majoris, Xi (ξ) 2 Canis Majoris and Beta (β) Canis Majoris (Mirzam).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) the dog is facing left,
- In the Paris BN n.a. 1614 manuscript the dog is facing right,
- In several editions (Dresden DC 183, Paris BN 12597, Paris BN n.a. 1614, St. Gall 902) the dog has a halo around its head and his tongue hanging out,
- In the Vat Reg lat 1324 edition the dog is wearing a collar and a halo,
- In the Munich 560 edition the dog is shown with his tongue hanging out and no halo.

Canis Major appears in the Leiden *Aratea* (816) as a dog with a mane leaping to the left with a bright disk with seven rays emerging from it, this presumably representing the star Sirius (Katzenstein & Savage-Smith, 1988).

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depict Canis Major with a halo, walking to the left with the right paw raised, looking backward over his shoulder. The Padua and Venice manuscripts also show rays of light emanating from his head. The Klosterneuberg 685 manuscript shows dugs, indicating a female, while the Zwettl 296 manuscript shows a furry belly. The Laon 422 manuscript of *De signis caeli* depicts a

halo, but not the Rouen 26 manuscript. The Durham Hunter 100 manuscript of *De signis caeli* depicts him wearing a collar.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Canis Major on one page in both right and left profile. It shows a dog running.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Canis Major as a dog walking to our left.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Canis Major as a dog.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Canis Major as a red dog running to our left.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Canis Major as a collared dog running to our left.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts Canis Major as a dog looking downwards, facing to our left. It is not labelled, but Alpha (α) Canis Majoris (Sirius) is labelled "Alhabor".

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Canis Major as a poorly drawn dog looking down, facing toward our left. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Canis Major as a long-tailed and collared dog running to our left.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Canis Major as a dog with a curly tail running to our right.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Canis Major as a dog with its head held high walking to our left.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Canis Major as a dog facing to our right.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Canis Major as a collared short haired dog running to our left.

Canis Major appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a dog leaping to our right.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Canis Maior" as a dog running to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Canis Maior" as a jumping dog with a collar.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Canis Major as a long-tailed dog running to our right. It is not labelled.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Canis Major as a collared walking dog.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Canis Major as a collared walking dog.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depict "Canis Maior" as a collared dog running to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Canis Major" as a collared dog walking to our left.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Canis Major as a collared dog walking to our right.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Canis Major in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Canis major" as a dog running to our right.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del cane sirio" ("Syrian Dog") and "o ver can maggiore" ("or the Greater Dog"). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Dog".

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Canis Major as a dog walking to our left with its head down.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Canis" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Canis Major" as a dog running to our right with his head lowered.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Canis maior" as a dog running to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "le Grande Chien" as a dog running to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Canis Ma” as a dog leaping to our left.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Canis Major” as a dog running to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels this constellation “Sirius” and states “Talis & custos aderit Canis ore timendo, ore vomit flammam, mebrits contemprior ignis, Sirion hunc Graij prio fuu nomine dicunt” (“Such a guardian will come to the dog with his fearful mouth”). It is depicted as a dog leaping to our left with rays emanating from its head.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Canis Major” as a dog running to our left.

Canis Major is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts Canis Major in his *Uranometria* in 1603 as a collared dog lying down. Bayer lists these names for this constellation: “Canis Major, Australior, Dexter, Secundus, Magnus, Sirius, Canicula, Laelaps”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Canis Major” as a collared dog walking to our left.

“Canis Major” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a dog lying down facing to our right. Batsch also gives the local name “der Grosse Hund”.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Canis Maior” for this constellation.

“Canis Major” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a collared dog lying down facing to our right

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Canis Maior” as a dog running to our left.

“Canes Major” is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and is depicted as a running dog.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Canis Major as a leaping dog.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Canis Major” as a dog with a collar walking to our left.

Canis Major is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and on his southern chart of 1678 as a dog.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Canis Major" as a collared dog running to our left. In Hevelius' *Catalogus Stellarum Fixarum* (1690) it is depicted as a dog running to our right:

- Its "head" is a quadrilateral of the stars Alpha (α) Canis Majoris (Sirius), Iota (ι) Canis Majoris, Gamma (γ) Canis Majoris, and Theta (θ) Canis Majoris, with a "neck" running from Iota (ι) Canis Majoris to Omicron (ο) 2 Canis Majoris,
- Its "body" is a quadrilateral of the stars Omicron (ο) 1 and 2, Delta (δ), and Sigma (σ) Canis Majoris,
- Its "tail" is the line between Delta (δ) and Eta (η) Canis Majoris,
- Its "front legs" are two lines running out from Omicron (ο) 1 Canis Majoris:
    - One to Xi (ξ) 1 and 2 Canis Majoris, and
    - One through Nu (ν) 2 Canis Majoris to Beta (β) Canis Majoris (Mirzam),
- Its "back legs" are two lines running out from Epsilon (ε) Canis Majoris:
    - One to Kappa (κ) Canis Majoris, and
    - One to Zeta (ζ) Canis Majoris.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels and depicts this as a pit bull sort of dog with a massive collar facing to our left.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Orionis Canis Majoris Sirius alhabor" ("I will bring the greater dog of the Orion, Sirius") and depicts it as a dog with a collar with its right side turned toward us looking over its right shoulder.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Canis Major as a dog with a collar.

Canis Major is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a dog with a collar.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Canis Major" as a dog running to our right. This dog has a collar.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Canis Major as a running dog.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Canis Major as a dog with a jeweled collar laying down facing to our right.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "Le Grand Chien" as a running dog.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Grand Chien" as a collared dog lying down.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Le Grand Chien" as a short-haired dog with a collar.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Grosser Hund" and depicts it as a dog wearing a collar running to our right. Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Grosse Hund" in the text and "Grosse Hund" on the charts and depicts it as a collared dog running to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Gran Cane" and "Can Maggiore" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Canis Major" as a running dog.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Canis Major" as a collared dog running to our left.

Canis Major is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Groote Hond" and depicted as a collared dog.

American uranographer William Croswell (1760 – 1834) depicts "Canis Major the Great Dog" on his *Mercator Map of the Starry Heavens* in 1810 as a running dog.

Canis Major is listed by Scottish uranographer Alexander Jamieson in his *Celestial Atlas* of 1822: This is depicted as a dog with a collar.

"Canis Major" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a collared dog lying down facing to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts Canis Major as a dog running to our right.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists the name "rubra Canicula" ("red dog") and attributes this to the Roman poet Quintus Horatius Flaccus (Horace, 65 – 27 B.C.E.).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Canis Major" as a dog running to our left.

Canis Major is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*: This is depicted as a dog wearing a collar.

"Canis Major" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a dog walking to our right looking over its right shoulder.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Canis Major, the Great Dog".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as "Canis Major" and "the Great Dog".

Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) translated it as "Al Kalb al Akbar" ("greater dog") in his *Book of the Fixed Stars* in 964 (Hafez 2010):

- Robert Hues (1659) listed the Arabic name of this constellation as "Alcheleb Alachbar".

- John Chilmead (1899) listed the Arabic name of this constellation as “Alcheleb Alachbar” in *A Learned Treatise of Globes*.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Canis Major” in his *Star Atlas* (1893) and describes it as “The Great Dog”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Canis Major” and describes it as the “Greater Dog”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Canis Major…The Greater Dog”.

The standard IAU charts depict this constellation this way:

- His “head” is the triangle of stars Theta (θ), Gamma (γ) and Iota (ι) Canis Majoris,
- A “neck” runs from Iota (ι) Canis Majoris to Alpha (α) Canis Majoris (Sirius),
- His “body” is a rectangle made by Sirius, Nu (ν) 2, Omicron (ο) 1, Sigma (σ), Delta (δ), and Omicron (ο) 1 Canis Majoris,
- His “tail” runs from Delta (δ) Canis Majoris through Omega (ω) Canis Majoris to Eta (η) Canis Majoris,
- Two lines running from Nu (ν) 2 Canis Majoris form the “front legs”:
- One runs to Beta (β) Canis Majoris (Mirzam), and
- One runs to Xi (ξ) 2 Canis Majoris,
- Two lines running from Epsilon (ε) Canis Majoris form the “back legs”,
- One runs to Zeta (ζ) Canis Majoris, and
- One runs to Kappa (κ) Canis Majoris.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Canis Major in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- A central line of three stars runs from Alpha () Canis Majoris through Omicron (ο) 2 Canis Majoris to Delta (δ) Canis Majoris,
- Two lines of stars run out from Delta (δ) Canis Majoris:
    - One goes to Epsilon (ε) Canis Majoris, and
    - One goes to Eta (η) Canis Majoris,
- Three lines of stars radiate out from Sirius:
    - One goes to Beta (β) Canis Majoris (Mirzam),
    - One goes to Gamma (γ) Canis Majoris, and
    - One goes to Theta (θ) Canis Majoris.

Sky and Telescope Magazine, founded in 1941, depicts Canis Major in their magazine and publications like this:

- His “head” is the triangle of stars Iota (ι), Gamma (γ), and Theta (θ) Canis Majoris, with a line from Iota (ι) Canis Majoris to Alpha (α) Canis Majoris (Sirius), forming a “neck”,
- His “body” is the bending line of stars from Sirius through Beta (β) Canis Majoris (Mirzam), Nu (ν) 2 Canis Majoris, Omicron (ο) 1 Canis Majoris, Epsilon (ε) Canis Majoris, Sigma (σ) Canis Majoris, Delta (δ) Canis Majoris, and Omicron (ο) 2 Canis Majoris,
- His “tail” is a line from Delta (δ) to Eta (η) Canis Majoris.

The Italians call it “Cane Maggiore” and the French “Grand Chien”.

Canis Minor:

The stars of this constellation appear in 136 sky cultures of the world since Alpha (α) Canis Minoris (Procyon) is the 8th brightest star in the sky.

This IAU constellation (IAU abbreviation CMi), the “Lesser Dog”, originated in the Mesopotamian asterism “MASH.TAB.BA” (see Twins, below). In his *Almagest*, Ptolemy (c.100 – c.170) calls this “Προκύων” , which later becomes “προκύων” or “prokýon”, which is “Preceding the Dog”, “One Before the Dog”, or “Harbinger of the Dog”, which was later latinized to “Procyon” and ultimately became the name of Alpha (α) Canis Minoris (see Preceding the Dog, below). While it is clear from Ptolemy’s description that this is some sort of creature, it is unclear as to whether it was meant to be a dog. It appears as Canis Minor in the works of the 1st century Roman architect Vitruvius. It is sometimes given the Latin name “Canis Minisculus” (“Canis Minus”).

Canis Minor appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) this is depicted as a dog leaping to the left,
- In the Prague IX C 6 edition the dog is wearing a collar.

Canis Minor appears in the Leiden *Aratea* (816) as a collared dog leaping to our left.

The Oxford Laud 644 and Padua 27 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depict Canis Minor with a halo. The Durham Hunter 100 manuscript of *De signis caeli* depicts Canis Minor with a collar.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Canis Minor as a dog walking, viewed in right profile. It does not show him in left profile.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Canis Minor as a small dog walking to our left.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Canis Minor as a dog.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Canis Minor as a dog walking to our left.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Canis Minor as a collared dog facing to our right.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts Canis Minor as a collared dog running to our left. It is not labelled, but Alpha (α) Canis Minoris (Procyon) is labelled “Algomeisa”.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Canis Minor as a collared dog walking to our left with its tongue sticking out. It is unlabelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Canis Minor as a tiny dog running to our left.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Canis Minor as a small dog leaping to our right.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Canis Minor as a small dog running to our left.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Canis Minor as a small dog running to our right.

Canis Minor appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a dog with a collar walking to our right and is labelled "Procyon".

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Canis Minor" as a dog running to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Canis Minor Procion" as a collared dog that is walking.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Canis Minor as a small dog running to our right. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts depicts Canis Minor as a collared walking dog.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts "Canis minor" as a dog walking.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Canis Minor as a collared dog walking to our right.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Canicula" as a collared dog walking to our left. A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) depicts "Canis Minor" as a collared dog walking to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Canis Major in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) labels this constellation "Procyon" and depicts it as a dog walking to our left.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "De la Canicula o ver Can minore". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Procyon” and the “Little Dog”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Canis Minor as a dog walking to our left.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Procyon, sive Canis Minor” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Canis Minor” as a dog with a collar walking to our left.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Procyon siue Canis minor” (“Procyon or Canis Minor”) as a dog trotting to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a small dog facing to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Canis Mi” as a collared dog walking to our left.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Canis Minor” as a small collared dog facing to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels Canis Minor “Procyon” and depicts it as a collared dog running to our left.

“Canis Minor” is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a collared dog walking to our left.

Canis Minor is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts this in his *Uranometria* in 1603 as a collared dog walking to our right. Bayer lists these names for this constellation: “Canis Minor, Canis Septentrionalis, Canis Sinister, Canis Primus, Canis Paruus, Antecanis, Morus, Fouca, Algomeiza, Kelbelazguar, Aschere, Aschemie”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Canis Minor” as a collared dog walking to our left.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Canis Minor” and “Procton” for this constellation.

“Canis Minor” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a collared dog running to our right.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Canis minor” as a dog walking to our left.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Canis Minor as a collared dog walking to our right.

Canis Minor is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as a dog with a collar.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Canis Minor" as a dog running to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Petit Chien", "Canis Minor" and "Procyon" and depicts it as a spaniel laying down facing to our left.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts Canis Minor as a dog lying down.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Canis Minor as a walking dog.

Canis Minor is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a dog walking to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts Canis Minor as a dog running to our right, but does not label it Canis Minor: Instead, he only labels its principal star, Procyon.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Canis Minor as a running dog with a collar.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Canis Minor as a dog with a collar walking to our right.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Petit Chien" as a dog with a collar.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le petit Chien" as a dog with a collar walking to our right, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der kleine Hund" in the text and "Kleine Hund" on the charts, depicting it as a collared dog walking to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Can Minore" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Canis Minor" as a trotting dog with a collar.

American uranographer William Croswell (1760 – 1834) depicts "Canis Minor the Less Dog" on his *Mercator Map of the Starry Heavens* in 1810 as a small dog.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this under the abbreviated label "Kl. Hund" and depicts it as a running dog.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Canis Major in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a dog with a collar.

"Canis Minor" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a collared dog walking to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Canis Mi" as a dog facing left.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Canis Minor" as a dog with a collar.

Canis Minor is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: He is depicted wearing a collar.

"Canis Minor" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a dog facing to our right.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Canis Minor, the Lesser Dog".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Canis Minor" in his *Star Atlas* (1893) and describes it as "The Little Dog".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as "Canis Minor" and the "Lesser Dog".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Canis Minor" and describes it as the "Lesser Dog".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists this as "Canis Minor: The Lesser Dog."

Standard IAU charts depict Canis Minor as a line of the two stars Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Majoris (Gomeisa).

French astronomers call it "le Petit Chien" and Italian astronomers "il Cane Minore".

Canoe:

This Chahta asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This Kala Lagaw Ya asterism is the IAU constellation Scorpius which represents the canoe of their mythical figure Thoegay and his first-mate Kang (the star Alpha (α) Scorpii (Antares)).

This Yolgnu asterism is the stars Lambda (λ) Scorpii (Shaula) and Upsilon (υ) Scorpii (Lesath) in the IAU constellation Scorpius. The Yolgnu tell of an older brother who sacrificed his life to save his younger brother who fell out of a capsized canoe (Scorpius). Their ancestors placed them both in the sky as

bright new stars. Ethnoastronomy researchers believe this may be a reference to the supernova CE 393.

This Ngarrindjeri asterism “Yuki” or “Yuuki” is the IAU constellation Crux (Clarke 2009). This canoe belongs to their ancestor Kulda the Meteor Man.

This Rapanui asterism “Nga Vaka” is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Edwards and Edwards 2010, Edwards and Edwards 2010, Edwards 2016, Edwards et al 2018).

This Tahitian asterism “Nga Vaka” is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus and the IAU constellation Crux (Edwards 2015).

The stars of this Kiribati asterism “Wa” or “Te Wa” are currently unidentified (Trussel and Groves 1978).

This Muscogee asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

This Carib asterism “Kuriala” or “Colliara” is the Big Dipper asterism of the IAU constellation Ursa Major (Magaña, and Jara, 1982).

Canoe Guiding Star:

This Hawaiian star “Hoku-ho'okele-wa'a" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as, “A’a” (‘burning brightly”), “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-kau'opae” ("Star for placing shrimp"), “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

Canoe Stars:

This Indonesian asterism “Bintang Biduk” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Canopus:

This Greek star “Κάνωβος” or “Kanôbos” is Alpha (α) Carinae in the IAU constellation Carina as listed in Ptolemy’s *Almagest* (2nd century). Earlier Eratosthenes (d.194 B.C.E.) and Hipparchus (190 – 120 B.C.E.) called it “Κάνωβος” or “Kánovos”. Greek mythology lists Canopus as the name of the pilot of the ship of king Menelaus of Sparta on Menelaus’ quest to retrieve Helen of Troy. It was referred to as “Perigeios” (“perigee”) as it was the most southern bright star visible to the Greeks. Latinized, the name becomes Canopus and some translations of the *Almagest* list it as “Kanupus”:

- This star appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Canopus”.
- Johann Bayer’s *Uranometria* (1603) lists “Canopus”.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Canobus”.
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Canobus Sobel”.
- Astronomer John Flamsteed (1646 – 1719) listed it as “Canobus”.
- Robert Hues lists it as “Canobus” in his *A Learned Treatise of Globes* in 1659.

- Edmond Halley lists this star as "Canobus" in *Catalogus Stellarum Australium* in 1679.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Canopus".
- This star appears as "Canopus" in Flamsteed's *Atlas Coelestis* in 1729.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Canopus", as does the 1778 edition.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Canobus".
- "Canopus" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- William Herschel lists "Canobus" in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) lists "Canopus" on his *Mercator Map of the Starry Heavens* in 1810.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Canopus".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Canopus" and places it in "Argo".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Canopus".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Canopus" and describes it as the "name of Menelaus' pilot".
- Some suggest that the name is derived from the Egyptian Coptic "Kahi Nub" or "golden earth" (R.H. Allen, 1899, W. T. Lynn, 1905). R.H. Allen wrote that Egyptian pharoah Thothmes III (1481 – 1425 B.C.E.) gave it the name "Karbana" (see below). Scottish uranographer Alexander Jamieson (1782 – 1850) lists Canopus in his *Celestial Atlas* in 1822.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the name "Canopus" and describes it as "Alpha (α) Argus".
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists the name "Canopus" for this star and describe it as "Alpha (α) Argus".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Canopus" for this star.
- The IAU Working Group on Star Names approved the name Canopus for Alpha (α) Carinae A in 2016.
- NOTE: Canopus would not have been visible to the ancient Greeks and Romans in their homeland. It was visible to the ancient Egyptians in their homeland.

This Egyptian Dendera star "Kanobus" is Alpha (α) Carine (Canopus) in the IAU constellation Carina (Hoffmann 2017) and part of their asterism Horus (see below).

This asterism "Canopus" or "Cornopus" is the IAU constellation Aquarius as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a female with multiple breasts from which streams of liquid are flowing. In ancient Egyptian skies the stars of Aquarius show up in their asterisms "Giant" (see below) and "Boat" (see above) and in Seleucid skies in their asterism "Great One" (see below). The

Egyptian Dendera star “Kanobus” is part of their asterism “Horus”, which does not include stars from Aquarius at all. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

Canopy:

This Greek asterism “Οὐρανίσκος” (“Ouranískos”) is the IAU constellation Corona Australis as listed by 1st century Greek astronomer Geminus of Rhodes. R. H. Allen translates this as “canopy” in his *Star Names* in 1899.

This Latin asterism “Parvum Coelum” (“canopy” or “little sky”) is the IAU constellation Corona Australis.

Canopy of the Emperor:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a loop of stars in the IAU constellation Cassiopeia: The line starts at 40 Cassiopeiae and runs through 42 Cassiopeiae, Omega (ω) Cassiopeiae, Iota (ι) Cassiopeiae (the determinative star), HIP 12821, and HIP 13367, ending at 48 Cassiopeiae.

This Chinese xing guan “Huágài” (华盖) is a circle of stars in the IAU constellation Cassiopeia. The star in the middle of this “canopy” is 38 Cassiopeiae. The circular “edge” of the “canopy” is the stars 31, 40, 43, 48, Omega (ω), and Psi (ψ) Cassiopeiae, and HIP 5926A.

This Chinese Chenzhuo xing guan Huagai (华盖) is made up of stars of the IAU constellation Cepheus:

- The top of the “canopy” is the curving line of stars Beta (β) Cephei (Alfirk), 11 Cephei, 24 Cephei, 31 Cephei, Pi (π) Cephei, and Gamma (γ) Cephei,
- The bottom of the “canopy” runs from Beta (β) Cephei (Alfirk) through 16 Cephei and HIP 111660 to Gamma (γ) Cephei,

The Canopy of the Emperor initially resembled some ceremonial parasols used by Han emperors, while later depictions evolved into circular or irregular shapes, losing their cultural connotation.

Canopy Support (Adjunct to the Canopy):

This Chinese Chenzhuo xing guan is a hooked line of stars forming the “handle” for their xing guan “Canopy of the Emperor” in the IAU constellation Cepheus. Starting at HIP 111660 it runs through HIP 111242, Rho (ρ) 1 & 2 Cephei, HIP 112519, HIP 113116, HIP 112833, HIP 109693, and HIP 115746 to HIP 5928.

Canopy Support (Vassal of Canopy of the Emperor):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of stars in the IAU constellation Cassiopeia: The line starts with the star 50 Cassiopeiae and runs through HIP 9586A, 49 Cassiopeiae, 47 Cassiopeiae, HIP 9586, HIP 10309, HIP 13055, and HIP 14844, ending at the determinative star, HIP 19461A.

This Chinese xing guan “Gàng” (杠(附华盖) is a bent line of stars in the IAU constellations Camelopardalis and Cassiopeia. This is connected to the xing guan “Canopy of the Emperor” (see above) at the star 48 Cassiopeiae. The line then runs through 50 Cassiopeiae to a bend in the line at 49 Cassiopeiae and then up through HIP 14862 and Gamma (γ) Camelopardalis.

Cantaratos:

This is a name for the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes listed by John Hill in his *Urania* in 1754. Hill attributes this name to 17th century French astronomer Ismaël Boulliau (Bulialdus).

Cape:

This Latin star “Palilicium” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus:

- The *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus lists this star as “Palilicium”.
- Johann Bayer’s *Uranometria* (1603) lists the names “Palilicium” and “Parilicium”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Palilicium”.
- “Palilicium” is listed by Robert Hues in his *A Learned Treatise of Globes* in 1659.
- “Palilicium” is listed by John Hill in his *Urania* in 1754.

Cape Clouds:

This is the Large and Small Magellanic Clouds in the IAU constellations Dorado and Tucana. This name was used by Portuguese and Dutch navigators in the Middle Ages. During Ferdinand Magellan’s circumnavigation of the Earth in 1519-22, Venetian explorer Antonio Pigafetta listed them as dim clusters of stars. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists them as the “Magellanic Clouds” and the “Cape Clouds”. This name is listed in R. H. Allen’s *Star Names* in 1899.

Cape Daisy:

This /Xam star “≠ku-kyam” is either Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Tarazed) in the IAU constellation Aquila. This is part of their asterism the //kohai stars (see above). !Guonni and ≠ku-kyam are sisters of !Gaunu (see Great Star, above) which is the star Altair. We are currently unsure exactly which represents each sister. ≠ku-kyam is a type of flower resembling a daisy, probably the Cape Daisy, Rain Daisy, or Witbotterblom (Dimorphotheca pluvialis).

Capella:

See Small Female Goat, below.

Capella of the Pleiades:

This Bedouin (Negev and Sinai) star “Capella al-'Ayyūq ath-Thurayyā" is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. It is used to point out the position of Al Thurayya (the Pleiades).

Caph:

See Palm, below.

Capibara:

This Carib asterism “Kapiwayuman” or “Kapiwa” represents the capibara (Hydrochoerus capyabara). Its present location is unknown (Magaña, and Jara, 1982).

Capital of Sky:

This Korean lunar mansion “Seong” is made up of a bending line of stars in the IAU constellation Hydra: 35, 32, and 31 Hydrae, HIP 46404A, and Alpha (α), 27, and 26 Hydrae.

Capricorn’s Tail:

This Latin star “Cauda Capricorni” is Alpha (α) 2 Capricorni (Algedi) in the IAU constellation Capricornus. Compare this to the Arabic “al Jady” (see Goat, below).

Capricornus:

Capricornus is a dim constellation with no stars brighter than 3rd magnitude, but its stars appear in 189 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Cap) was first depicted on a cylinder seal from around the 21st century B.C.E. and recorded in Babylonian star catalogues circa 1000 B.C.E. as “MULSUḪUR.MAŠ” or “Suhurmasu” (see Goat-Fish, below), which may have been influenced by the Egyptian asterism Goat Fish (see below). In Greek mythology it is sometimes identified with Amalthea, the goat that suckled the infant Zeus after his mother saved him from being devoured by Cronos. Aratus (315 – 240 B.C.E) mentioned it in his poem *Phaenomena* (270 B.C.E.) as “Ἀιγοκέρως” or “Aigokéros” (see Having Horns, below) and Ptolemy (c.100 – c.170) listed it in his *Almagest* as “Αἰγόκερος” (“Having Horns”, see below), which was later latinized to “Aegoceros”.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Capricornus as a half ram, half fish, swimming to our left (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as half horned and bearded goat, half fish.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Capricornus as a horned goat facing to our left with a fish tail.

The globe of the 2nd century Farnese Atlas depicts “Capricorni” as a half goat half fish facing to our left (Stevenson 1921).

The 4th century Roman poet Decimius Magnus Ausonius called it “Caper” and 1st century Roman poet Marcus Manilius called it “Flexus Caper” (“bent goat”).

The Leiden Aratea (816) depicts Capricornus as a half fish, half goat swimming to our right (Katzenstein & Savage-Smith, 1988).

“Capricorn” is depicted in editions of the 8th century *Revised Aratus Latinus*: In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Capricornus is facing left and possessing a curled tail.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Capricornus as a half goat, half fish and possessing a curled tail. There are two views on one page: One showing him in left profile and the other in right profile.

The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of the 11th century *De signis caeli* depict Capricornus with a band separating the goat and fish halves: In the Paris and Vatican manuscripts this is hairy. The Paris BN 5239 manuscript depicts him with two sets of horns. The Durham Hunter 100 manuscript of *De signis caeli* depicts him with a beard.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Capricornus as a half goat, half fish.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Aquarius and Capricornus in the same scene Mc Gurk, Patrick (1966).

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Capricornus as a creature with the front half of a ram and the back half a green fishes tail.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists "CAPRICORN" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Capricornus as a half goat half fish swimming to our right.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Capricornus" as a half goat, half fish, swimming to our left.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts Capricornus as a half goat, half fish, swimming to our left. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Capricornus as a half goat, half fish swimming to our left. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Capricornus as a half goat, half fish, swimming to our left.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts this constellation as a half goat, half fish, swimming to our left. It appears to be labelled "Capricorna".

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts "Capricornus" as a half-goat, half-fish swimming to our left. It has a wide ring around its middle.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Capricornus as a half goat, half fish swimming to our left.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Capricornus” as half goat, half fish, with its tail tied into a knot.

Capricornus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a half ram half fish facing to our right and labelled with the astrological sign for Capricornus.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Capricornus as a half goat, half fish, swimming to our left. It is not labelled. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts it reversed, swimming to our right.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts Capricornus as a half goat, half fish, swimming to our left. Its tail is tied in a knot.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists “Capricornus” and depicts it with the front half a horned goat and the back half a fish’s tail tied in a knot.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Capricornus” as a half ram, half fish, swimming to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts this constellation as a half goat, half fish swimming to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Capricornus in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts Capricornus as a half goat, half fish (with its tail coiled) facing to our left.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Capricorno”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Goat”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Capricornus as a half goat, half fish, swimming to our left with its tail looped.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Capricornus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Capricornus as a half ram half fish and labels it with the astrological symbol for Capricornus.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Capricornus" as a half ram half fish swimming to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "le Capricorne" as a half goat, half fish, swimming to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Capricornus" as a half goat, half fish swimming to our left.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Capricorns (sic)" as a half goat half fish swimming to our left.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Capricornus" as a half goat half fish swimming to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Capricornus" as a half goat, half fish, swimming to our right.

Capricornus is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1603) depicts this in his *Uranometria* in 1603 with the front half of a goat and the back half a coiled whale's tail. Bayer lists these names for Capricornus: "Capricornus, Poetis Neptunia proles, Aequoris Hircus, Pelagi procella, Caper, Imbrifer, Gelidus, Corniger, Capra, Pan, Aegipan, Algedi, Alcantarus".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Capricornus" as a half ram, half fish moving to our left.

"Capricornus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a half goat half fish lying down facing to our right.

The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Capricornus" for this constellation.

"Capricorn" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a half goat half fish.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this constellation "Capricornus".

Capricornus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Capricornus as a half goat half fish.

English astronomer Edmund Halley's chart of 1678 depicts Capricornus as a half ram, half fish facing to the right.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Capricornus" as half goat and half fish, facing to the left.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Capricornus” as half goat, half fish.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Capricornus” as a half goat, half fish facing to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Capricorne”, “Capricornus”, and “Ἀιγοκέρως” and depicts it as a half goat, half fish swimming to our left.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation “Capricornus in quem Pan a Typhone Gigante mutatus fuit” (“The Capricorn into which Pan was changed by Typhon the Giant”).

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Capricornus as a half goat half fish swimming to the right.

Capricornus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as “Capricornus”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Capricornus” as a half goat half fish swimming to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Capricornus” as a ram with a fish’s tail swimming to the right.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Capricornus as a ram with a fish’s tail.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Capricornus as a half ram, half fish, swimming to our right.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “le Capricorne”.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Capricorne” as a ram.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Capricornus” as a half goat, half fish, swimming to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Capricorne” as a half goat, half fish swimming to our right.

American uranographer William Croswell (1760 – 1834) depicts “Capricornus the Goat” on his *Mercator Map of the Starry Heavens* in 1810 as half goat, half fish.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Capricornus” as a half goat half fish.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Steinbock" ("ibex") and uses this same name in the various editions of his *Jahrbuch*. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Steinbock" and depicts it as a half goat half fish swimming to our right.

Capricornus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Capricornus of Steenbok": It is depicted as a half ram half fish swimming to our right.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Capricornus in his *Celestial Atlas* in 1822.

"Capricornus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a half goat, half fish facing to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Capricornus" as a half fish, half goat, moving to our left.

Capricornus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

"Capricornus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a half ram half goat swimming to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists "Capricornus" but only describes it as containing "no very conspicuous stars".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Capricornus, the Goat".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Capricornus" in his *Star Atlas* (1893) and describes it as "The Goat".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Capricornus" and describes it as a "Goat".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Capricornus: The Sea Goat".

The French call this constellation "Capricorne" and the Italians "Capricorno".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the in his book *The Stars - A New Way to See Them* (1952). The standard IAU lines for this constellation have a triangle of the stars Theta (θ), Iota (ι), and Zeta (ζ) Capricorni with a line running from Iota (ι) Capricorni through Gamma (γ) Capricorni to Delta (δ) Capricorni, and two lines running out from Theta (θ) Capricorni:

- One to Omega (ω) Capricorni, and
- One to Beta (β) Capricorni (Dabih) where it branches off in one direction to Alpha (α) 1and 2 Capricorni (Algedi) and in the other to Psi (ψ) Capricorni.

Rey depicts it like this:

- His “head” is Alpha (α) 1 and 2 Capricorni (Algedi),
- His “body” is the quadrilateral of star Beta (β) Capricorni (Dabih), Rho (ρ) Capricorni, Eta (η) Capricorni, and Theta (θ) Capricorni,
- His “front leg” runs from Rho (ρ) Capricorni through Psi (ψ) Capricorni to a “foot” at Omega (ω) Capricorni,
- His “back leg” runs from Eta (η) Capricorni to a “foot” at 24 Capricorni,
- His “fish tail” is the quadrilateral of stars Theta (θ), Zeta (ζ), 36, and Iota (ι) Capricorni, and
- A line runs from Iota (ι) Capricorni through Gamma (γ) Capricorni to Delta (δ) Capricorni.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Capricornus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a large roughly triangular structure of the stars Delta (δ), Gamma (γ), Iota (ι), Theta (θ), Rho (ρ), Psi (ψ), Omega (ω), 24, Zeta (ζ), and Epsilon (ε) Capricorni with a line running out from Rho (ρ) Capricorni through Beta (β) Capricorni (Dabih) to Alpha (α) 1 Capricorni (Algedi).

Sky and Telescope Magazine, founded in 1941, depicts Capricornus in their magazine and publications as a roughly triangular formation of stars starting at Alpha ()α 1 and 2 Capricorni (Algedi) and running through Beta (β) Capricorni (Dabih), Psi (ψ) Capricorni, Omega (ω) Capricorni, 24 Capricorni, Zeta (ζ) Capricorni, Epsilon (ε) Capricorni, Delta (δ) Capricorni, Gamma (γ) Capricorni, Iota (ι) Capricorni, and Theta (θ) Capricorni.

Captain Hook:

This **telescopic** asterism is the open cluster NGC 6633 in the IAU constellation Ophiuchus. It was discovered by Swiss astronomer Jean-Philippe Loys de Chéseaux in 1745-6 in the IAU constellation Ophiuchus. English astronomer Caroline Herschel rediscovered it in 1783 and her brother William Herschel listed it as VIII 72. It is GC 4410 in the *General Catalogue* of 1864. Some observers see it as resembling the “hook” of Captain Hook, a character in Scottish novelist J. M. Barrie’s 1904 stage play *Peter Pan: or the Boy Who Wouldn’t Grow Up*. It is also known as the Tweedledum Cluster (see Tweedledum and Tweedledee, below), “Kermit the Tadpole” (see below), the Otter and Ball (see below), and the Wasp-Waist Cluster (see below).

Captain of the Bodyguards:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star Alpha (α) 2 Canum Venaticorum in the IAU constellation Canes Venatici.

This Chinese xing guan “Lángjiàng” (郎将) is the star 31 Comae Berenices in the IAU constellation Coma Berenices.

This Chinese Chenzhuo xing guan “Langjiang” is the star Alpha (α) 1 & 2 Canum Venaticorum (Cor Caroli) in the IAU constellation Canes Venatici.

Capuja:

This Hindu asterism is the IAU constellation Cepheus.

Car of Boötes:

This asterism is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen’s *Star Names* in 1899. Allen does not identify the culture involved.

Caracal:

This Arabic asterism "'al-ʿAnāqi", "Al-ʿAnaaqi (عناق الأرض), or "Al ʿAnaḳ al ʿArḍ", " meaning "caracal" or "desert lynx", popularly known as "Al Barīd" and later latinized to "Almach", "Almaak", "Alamak", "Almak", "Almaack", or "Almaac" is the star Gamma (γ) 1 and 2 Andromedae in the IAU constellation Andromeda:

- "al-Anāq" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Wa-sādis banāt na'sh yusammā al-'anāq" ("the sixth of banāt na'sh, called the caracal" is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major as it appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).
- "'al-ʿAnāqi" is listed in the works of Persian astronomer Ulugh Beg Mirza (1394 – 1449) and Syrian astronomer Tayyeb Tizini:
- Some editions of the *Almagest* and the 15th century *Alfonsine Tables* give the name "Alamac" for both the constellation and the star Gamma (γ) Andromedae.
- German astronomer Johann Bayer (1572-1625) listed it as "Alamak", "Almaak", and "Alhames" in his *Uranometria* (1603).
- "Alamac" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues lists it as "Alamac" and "Almaac" in his *A Learned Treatise of Globes* in 1659. It is also known as the She Goat (see below).
- "Alamac" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Alamac".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alamak".
- American uranographer William Croswell (1760 – 1834) lists this star as "Alamach" on his *Mercator Map of the Starry Heavens* in 1810.
- "Alamak" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Alhamah".
- Scottish uranographer Alexander Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists this star as "Alamach".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list "Almach".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Al Maach".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Almach".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Almach".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Almaach".

- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Almach" and describes it as "the bound one".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Almach" for this star.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Almak" and "Almach" for this star, but his 14th edition (1959) only lists "Almak" for Gamma (γ) Andromedae.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Almach".
- The IAU approved the name "Almach" for Gamma (γ) Andromedae A in 2016.

Carafe Galaxy:

This **telescopic** asterism is the galaxy ESO 202-23 (AM 0426-480) in the IAU constellation Caelum. It is part of the Carafe Group (see below). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Úrceus Caéli" ("Carafe of Caelum"). It is also known as the Carafe Nebula.

Carafe Group:

This **telescopic** asterism is a group of galaxies including elliptical galaxy NGC 1595, barred spiral galaxy NGC 1598, and the galaxy ESO 202-23 in the IAU constellation Caelum. NGC 1595 is listed as 2646 by John Herschel and later in his *General Catalogue* of 1864 as GC 863. NGC 1958 became 2647 and GC 865.

Carafe Nebula:

See Carafe Galaxy, above.

Cardinal's Hat:

This asterism was made up of stars of the IAU constellation Scorpius by German astronomer Erhard Weigel (1625 – 99) who produced celestial charts in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as a red wide brimmed circular hat with tassels next to a crossed sword and shepherd's crook with a mitre above it.

Cared For by the Moon:

This Hawaiian asterism "Hanaiakamalama" is the IAU constellation Crux.

Cariboo:

This Dakelh asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005). This is being pursued by hunters represented by the Big Dipper asterism (see Hunters, below).

This Inuit asterism "Tukturjuit" (plural form of cariboo) is the Big Dipper asterism in the IAU constellation Ursa Major (MacDonald 1998).

This Upper Kuskokwim asterism "Midzish" is the Pleaides cluster in the IAU constellation Taurus (Cannon 2021). They are being pursued by two as yet unidentified stars.

This Dene Tha' asterism "Mbedzih" is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Caridean shrimp:

This Tukano asterism "Darsiu", "Darsiew", or "Camarão de Rio" is made up of stars of the IAU constellations Aquarius and Cetus (Cardoso 2007, Cardoso 2016).

- The "tail" is the star T Ceti, with the "body" a line of stars running down through 7 and 2 Ceti, 106, 107, and 108 Aquarii, ending at the star 104 Aquarii,
- From 104 Aquarii, star lines branch out to either side:
    - One line goes out to a bend at the star 101 Aquarii and ends at the stars 98 and 99 Aquarii,
    - The other line runs out to a bend at the star 105 Aquarii and then a junction at 102 Aquarii where it forks:
        - One line goes to HIP 116368, and
        - The other line goes to HIP 116591.

Note: Cardoso (2015) writes that some Tukano see this as mainly stars of Aquarius. The Caridean shrimp is a freshwater shrimp.

Carina:

The stars of this constellation appear in 268 of the world's asterisms, which is not surprising since its principal star Alpha (α) Carinae (Canopus) is the second brightest star in the sky and three other stars rate in the top 90 brightest stars: Beta (β) Carinae (Miaplacidus) 28th, Epsilon (ε) Carinae (Avior) 39th, and Iota (ι) Carinae (Aspidiske) 64th.

The IAU constellation Carina (IAU abbreviation Car) was once part of the larger and older constellation Argo Navis (see Argo's Ship, above), which was ᾿Αργω in the *Almagest* by Ptolemy (100 – 170). As Argo Navis was such a large and unwieldy group of stars, in 1763 French astronomer Abbé Nicolas Louis de Lacaille divided it into three constellations now recognized by the IAU: Carina (the hull or keel), Puppis (the poop deck) and Vela (the sails). Note: Lacaille did not rename the stars, keeping the Greek letters of the Bayer classification of the stars of Argo Navis, so Carina has stars with Bayer classifications in the first part of the Greek alphabet, Vela has the middle letters, and Puppis has the end of the alphabet.

"Carina" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it. NOTE: On another chart in this atlas Argelander depicts "Argo".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Carina, The Keel" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Carina" and describes it as "Keel (of Ship Argo)".

The standard IAU chart depicts Carina as a winding line of stars starting at Beta (β) Carinae (Miaplacidus), running through Omega (ω) Carinae, Theta (θ) Carinae, w Carinae, x Carinae, u Carinae, s Carinae, q Carinae, Iota (ι) Carinae, d Carinae, Epsilon (ε) Carinae, and Alpha (α) Carinae (Canopus) to Nu (ν) Puppis. A star line from Epsilon (ε) Carinae to Gamma (γ) Velorum (Regor) connects Carina to Vela.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Carina in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a constellation separate from Puppis and Vela:

- At one end is a bent five-sided figure made up of Iota (ι) Carinae, Upsilon (υ) Carinae, Beta (β) Carinae (Miaplacidus), Omega (ω) Carinae, and Theta (θ) Carinae.
- From Iota (ι) Carinae a bending line of stars runs through Epsilon (ε) Carinae and Chi (χ) Carinae to Alpha (α) Carinae (Canopus).

Sky and Telescope Magazine, founded in 1941, depicts Carina in their magazine and publications as a winding line of stars from Alpha (α) Carinae (Canopus) through Beta (β) Carinae (Miaplacidus), Omega (ω) Carinae, Theta (θ) Carinae, p Carinae, q Carinae, Iota (ι) Carinae, Epsilon (ε) Carinae, and Chi (χ) Carinae to Gamma (γ) Velorum. They add an additional loop at one end made up of the stars Theta (θ), p, Upsilon (υ), x, y, and z1 and z2 Carinae. NOTE: This Sky and Telescope version overlaps the IAU constellation Volans.

Carina Smile:

This **telescopic** asterism is HII region NGC 3199 in the IAU constellation Carina. This was discovered in 1847 by English astronomer John Herschel who listed it as h 3239 in his catalogue. It is GC 2067 in the *General Catalogue* of 1864. It is also known as the "Banana Nebula" (see above).

Carion:

This Latin asterism is the IAU constellation Cassiopeia and was listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*. This is a reference to Greek smelter and blacksmith Theodorus of Samos in Caria, who Pliny claims is the inventor of the Laconian lock and key, the key resembling the "W" of Cassiopeia. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Carion" and "Laconian Key" as names for Cassiopeia.

Carman:

This English asterism "Carman" (as in "carter") is the IAU constellation Boötes as described by English linguist John Minsheu (1560 – 1627).

Carnabon:

This Greek asterism "Carnabon", "Carnabas", or "Carnabus" is the IAU constellation Ophiuchus. Carnabon is the slayer of Triopas (see below). Johann Bayer's *Uranometria* (1603) lists "Carnabons & Tropias" for this constellation. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Carnabons et Triopas" as an alternate name for Ophiuchus.

Carnation of Lynx:

This **telescopic** asterism "Dianthus Lýncis" is the barred spiral galaxy NGC 2500 in the IAU constellation Lynx. It was discovered in 1788 by William Herschel who listed it as "III 709". It became GC 1607 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "looks as if it is physically touching the cat's paw at the northern edge".

Carob Tree:

There are two Toba asterisms that translate as Carob Tree:

- One, "Ma'pik" is the Pleiades cluster in the IAU constellation Taurus (Gómez 2011).

- The stars of the other, “Tuna”, are unidentified at present (Gómez 2011).This is a name for this cluster in the hot months.

Caroline’s Cluster:

This **telescopic** asterism is the open cluster NGC 2360 (Caldwell 58) in the IAU constellation Canis Major. This was discovered by English astronomer Caroline Herschel in 1785. Her brother William Herschel listed it in his catalogue as “VII 12”. It is GC 1512 in the *General Catalogue* of 1864. It is also known as the Sugar Pile (see below).

Caroline’s Galaxy:

This **telescopic** asterism is NGC 253 (Caldwell 65), an intermediate spiral galaxy in the IAU constellation Sculptor. It was discovered by English astronomer Caroline Herschel in 1783 and observed by her son John Herschel (1792 – 1871) about a half century later. This is listed as GC 138 in the 1846 *General Catalogue*. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) in the Latin form “Carolinianus Sculptoris” (“belonging to Caroline”). It is also known as the Sculptor Galaxy (see below), the Silver Coin (see below), the Sculptor Filament, and the Silver Dollar Galaxy (see below).

Caroline’s Rose:

Open cluster NGC 7789 is a **telescopic** asterism in the IAU constellation Cassiopeia and is named Caroline’s Rose for English astronomer Caroline Herschel, who discovered it in 1783. John Herschel listed it as “”VI 30”. John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864. Its loops of stars and dark lanes look like rose petals. Size 16’ X 16’. English astronomer J. Mullaney described it as a “ghostly open cluster”, which is probably where it picked up the name “Ghost Cluster”. It is also known as the Star Mist Cluster, Herschel’s Spiral Cluster, the Crab Cluster, and the Screaming Skull Cluster. This is listed on Robert Zebahl’s *Faint Fuzzies* website as the “White Rose”.

Carol’s Smiley:

See Smiley Face (below).

Carps:

This Romanian asterism “Crapii” is the IAU constellation Pisces (Ottescu 2009, Lite, Lodina, and Ignat 2018).

Carpenter:

This Babylonian star “Nangar” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. Nangar is an aspect of Marduk.

This Persian asterism NANGAR from the list of Zodiacal Signs in VAT 4956 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Cancer (Bartel van der Waerden 1974).

Carriage:

This Lithuanian asterism “Vežimas” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This Romanian asterism “Trăsura” is the IAU constellation Auriga (Ottescu 2009).

This Belarussian asterism “Kareta” or “Kaliaska” is the IAU constellation Ursa Major (Avilin 2009).

Carriage for King:

This Korean asterism “Wang-eul Wihan Macha” (왕을 위한 마차) is a line of two stars in the IAU constellation Libra: Tau (τ) and Upsilon (υ) Librae.

Carriage with Oxen:

This Macedonian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Cenev 2014).

Carrot:

This American **telescopic** asterism is made up of stars of the IAU constellation Perseus. The “carrot” is the stars HIP 9990, HD 12964, Gaia DR3 506787797134844160, and HIP 10060. The “greenery” at the end of this “carrot” is the stars HD 236950, HD 13123, HD 13049, and Gaia DR3 506885447510110592. This is next to the telescopic asterism “Bunny” (see above). The “Bunny” and “Carrot” were posted by “Jehujones” on *Cloudy Nights* in October 2023.

Carry Us:

This Latin asterism “Geranos” is the IAU constellation Grus as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

Carrying Pole:

This Samoan asterism “Amoga” is a line of stars in the IAU constellations Monoceros and Orion (Fitisemanu 2022). One end is the star Pi (π)-3 Orionis, with the line running through the three stars of the belt of Orion (Delta (δ), Epsilon (ε), and Zeta (ζ) Orionis) to Gamma (γ) Monocerotis; associated with the legend of Tiʻitiʻiatalaga, a zenith star for traveling between Sāmoa and Tonga.

Carrying Stick:

This Anutan asterism **“**Te Aamonga” is a line of three stars in the IAU constellation Aquila, starting with the star Gamma (γ) Aquilae, running through Alpha (α) Aquilae (Altair) and ending with the double star Beta (β) Aquilae (Alshain).

Carrying the Head of a Ghost:

This Latin asterism “Portans Caput Larvae” is the IAU constellation Perseus as listed in R. H. Allen’s *Star Names* in 1899.

Cart:

This Belarusian asterism “Voz” or “Buda” is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009). Compare this to “Voz Faraonksi” (see Pharaoh’s Cart, below) and “Vialiki Voz” (see Large Cart, below).

This Italian (Piedmont and Ligurian Alps) asterism “u Car Gars” or “u Mantenay” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

This Portuguese asterism “Carreta” is the Big Dipper asterism in the IAU constellation Ursa Major as listed by Portuguese poet Luís de Camões and as listed in R. H. Allen’s *Star Names* in 1899.

This Ukrainian asterism “Viz” or “Vizok” (візок) is the Big Dipper asterism in the IAU constellation Ursa Major. It is also sometimes called the “Big Cart” or “Velykyy Vizok” (великий візок).

Cart Pole of the Old Man:

This Babylonian asterism “GISH.KAK dEN.ME.SHÁR.RA” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996. Anthony identifies this as “probably Zeta [ζ] Persei [in the IAU constellation Perseus]”, which would make it part of the foot of their asterism Old Man (see below). As their asterism Old Man doesn’t include a cart, it is probably not an accurate translation. This “Old Man” is depicted with a walking stick, so possibly it is related to that, although that “stick” is a line between 64 Andromedae and 14 Trianguli.

Carter:

This Arabic asterism “Al-Rākib” (“carter” or “driver”) is the IAU constellation Auriga.

This German asterism “Fuhrmann” is the IAU constellation Auriga as depicted in German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820): It is shown as a seated male wearing a hat with a plume holding reins in his left hand cradling a goat in his right arm. Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Fuhrmann” and depicts it the same way. The *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826) also calls this “Fuhrmann”. Compare this to Waggoner, below.

This French asterism “Le Chartier” is the IAU constellation Auriga as listed by French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760). He is depicted as viewed from behind, looking over his right shoulder and holding a whip and reins in his left hand, with a goat perched on his right shoulder.

This Romanian star “Cărăușul” is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). It is seen as the carter driving the oxen of the Great Chariot (see below).

This Estonian asterism “Veomees” is the IAU constellation Auriga and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Cartographer:

This asterism is made up of the stars of the IAU constellation Triangulum by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It depicts a grid map on which is superimposed a compass.

Cartwheel:

There are three **telescopic** “Cartwheel” asterisms:

- One, the Cartwheel Galaxy, is PGC 2248 (ESO 350-40), a lenticular ring galaxy in the IAU constellation Sculptor: It is part of the Cartwheel Galaxy Group. It was discovered by Swiss astronomer Fritz Zwicky in 1941. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010) as “Carpentária Sculptóris” (“cartwheel of Sculptor”).

- One is the open cluster Messier 37 (NGC 2099) in the IAU constellation Auriga. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654 and listed by French astronomer Charles Messier in 1764. The 1864 General Catalogue lists it as GC 1295. John Herschel listed it as h 369. South African astronomer Magda Streicher (1999) described it as a “cartwheel shape”. It is also known as the “Diamond Starburst” (see below), and the “Skull” (see below).
- One is the globular cluster NGC 6752 (Caldwell 93) in the IAU constellation Pavo. This was discovered by Scottish astronomer James Dunlop in 1827. John Herschel listed it as h 3778 and later as GC 4467 in the *General Catalogue* of 1864. South African astronomer Magda Streicher (2006) writes “This is my cartwheel globular very small core from where stars spray out in sircles [sic] just like a wheel.” This is also known as the Starfish (see below).

Carved Marble:

This asterism “Marmor Sculptile” is the IAU constellation Reticulum plus a few stars from the IAU constellation Horologium and was created in 1810 by eccentric American educator and uranographer William Croswell (1760 – 1834). It is depicted on his *Mercator Map of the Starry Heavens* in 1810 as a bust of Christopher Columbus.

Cascade:

There are five “cascade” asterisms:

- One is the asterism Pouring Forth of Water (see below) as listed by American astronomer Elijah Burritt (1794 – 1838).
- One asterism is in the IAU constellation Ursa Major and is Corder 2103 on the observing list of American astronomer Jeffrey Corder. Size 320’ X 75’. This is Omega (ω) Ursae Majoris, HIP 53465, 47 Ursae Majoris, 49 Ursae Majoris, and 51 Ursae Majoris.
- One is in the IAU constellation Ursa Major and is Corder 2534 on the observing list of American astronomer Jeffrey Corder. Size 190’ X 20’. This is 81, 83, 84, and 86 Ursae Majoris.
- One is in the IAU constellation Hercules and is Corder 3346 on the observing list of American astronomer Jeffrey Corder. Size 240’ X 50’. This is 79, 83, 87, and 89 Herculis.
- One is in the IAU constellation Cepheus and is Corder 4765 on the observing list of American astronomer Jeffrey Corder. Size 190’ X 25’. This is four 4^{th} – 5^{th} magnitude stars including HIP 113116, 112833, and 109693 and the double star HIP 112519.

There are 347 **telescopic** “cascade” asterisms:

- One is Cseh 53 listed by Hungarian astronomer Viktor Cseh and is in the IAU constellation Canis Major. Cseh describes it as a “1 degree long cascade, direction SE-NW. It is made up of 9.5 – 11 magnitude stars.”
- One is Sánta 99, listed in 2007 by Hungarian astronomer Sánta Gábor, is a chain of 6^{th} – 13^{th} magnitude stars in the IAU constellation Eridanus. Gábor describes it as “pretty rich, bipolar”.
- One is Kernya 25, listed by Hungarian astronomer Gábor János Kernya, which is a cascade of 11^{th} – 13^{th} magnitude stars in the IAU constellation Triangulum. Kernya notes that “at its base is a

faint galaxy of the NGC 1023 group, UGC 2023" and that "the pair of asterism and galaxy can be easily examined with a 30 cm telescope."

- One is Kernya 30, listed by Hungarian astronomer Gábor János Kernya, which is a cascade of 11th – 14th magnitude stars in the IAU constellation Orion. Kernya notes that "the center is dominated by a striking star, HD 34550". Size 17'. It is also known as the HD 34550 cascade.
- One is Kernya 32, listed by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Cygnus. Kernya describes this as the "HD 203112 cascade" and as a "Milky Way cloud 'stretched' between two brighter stars".
- One is Prestgard 16 on the list of French astronomer Trygve Prestgard, which is in the IAU constellation Cassiopeia. Size 2'. This is about 25' east of HD 17443 and its reflection nebula, vdB 8.
- One is Basel 8 in the IAU constellation Monoceros. Size 30' X 30'. René Merting describes it on the *Faint Fuzzies* website: "At 85X there is an incredibly long conspicuous chain of stars- the stars of this chain seem twisted into each other, and the western end is broadly fanned out- about 30 stars can be seen." This includes HD 259631, HIP 31324, HD 259787, HD 259829, Gaia DR3 3326023296796724096, HD 259991, HD 260052, HD 46710, Gaia DR3 3325974196731176320, and HD 260302.
- One is Lorenzin 2 on American astronomer Tom Lorenzin's list and is located in the IAU constellations Hercules and Ophiuchus. Size 230' X 80'. René Merting lists it on the *Faint Fuzzies* site as a "north-south straight trail." The southern end of the cascade starts at 60 Herculis and runs through 33, 34, and 32 Ophiuchi, to HIP 83308. From here you have a series of pairs of stars: HIP 83083 and 83034A, HIP 82915A and 82870, HIP 82692 and 82615, and HIP 82468 and 82372. The northern end of the cascade is the star HIP 82028.
- One is Lorenzin 4 on American astronomer Tom Lorenzin's list and is located in the IAU constellation Sagitta. Size 25' X 2'. Robert Zebahl lists it on his *Faint Fuzzies* website as a "moderately conspicuous, slightly curved chain of 5 stars. This includes the stars HIP 97982 and 97983.
- One is Persson 1 in the IAU constellation Orion. René Merting lists it on the *Faint Fuzzies* website and describes it as a "double wave composed of eight stars, with the two faintest stars sitting in the east- stellar magnitudes increasing towards the center." Size 70' X 15'. This includes HIP 29371, 29310, 29126A, 29121, 29106, and 29000.
- One is Rinnan's Run, a cascade of stars in the IAU constellation Sextans named after amateur astronomer Dan Rinnan, a member of the Eugene Astronomical Society. The cascade of stars starts at the star 35 Sextantis and runs through a line of stars 3 degrees south southwest including HIP 52455, 52471, 52542, 52591, 52821 to 52856. Size 180'. Tom Lorenzin lists this as Lorenzin 23.
- One is "Lethe", a chain of stars in the IAU constellation Corona Borealis. It is listed on Bruno Alessi's BDCC 7.6 list. In Greek mythology Lethe ("forgetfulness") is the name of a river in Hades: Those who drink from it get forgetfulness.
- One is "Cocytos", a chain of stars in the IAU constellation Hercules. It is listed on Bruno Alessi's BDCC 7.6 list. In Greek mythology Cocytos ("lamentation") is the name of a river in Hades.
- One is Corder 559 in the IAU constellation Perseus, from the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 120' X 30'. It runs NW/SE and starts at the north end at 36 Persei, running down to Nu (ν) Persei.

- One, the “Cancer Cascade”, is in the IAU constellation Cancer and is listed as Corder 1499 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. Size 150’ X 25’. This includes about 30 stars down to 10th magnitude. At one end is Omega (ω) 1 and 2 Cancri.
- One is the “HSL Chain”, is a line of 9th magnitude stars in the IAU constellation Sagittarius next to the star 14 Sagittarii. Size 35’ X 20’. This is Lorenzin 3, Corder 3504, and found on the Saguaro Astronomy Club asterism database.
- One is Corder 2891 in the IAU constellation Ursa Minor and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 65’ X 20’. This is tucked into the Little Dipper next to the star Zeta (ζ) Ursae Minoris. The line starts at the star HIP 76097A and runs through HIP 76309, and 77105 to 77629.
- One is in the IAU constellation Hydra and is Ferrero 20 on Laurent Ferrero’s list of asterisms. Ferrero describes it as a “little cascade of stars” all of which are magnitude 11.
- One, Pakan 4 from Edmonton RASC member Randy Pakan’s *Midnight Ramblings 1A* logbook from March 29, 1989, is a chain of 8th and 9th magnitude stars about 30 arcminutes long near galaxy NGC 3365 in the IAU constellation Sextans (which is what Randy was looking for when he found this asterism). This is Corder 2069 on Jeffrey Corder’s list.
- One is in the IAU constellation Andromeda and is Corder 147 on the observing list of American astronomer Jeffrey Corder. Corder describes this as “a nice chain or arc of 8 stars of 6th, 7th, and 8th magnitudes… elongated east/west.” At one end is the double star HIP 4675 A and from here it runs through double star HIP 4581 A, HIP 4100, HIP 3919, the double star HIP 3779, HIP 3604, and HIP 3252 ending at HIP 2900. Size 120 ‘ X 30’.
- One is in the IAU constellation Pisces and is Corder 204 on the observing list of American astronomer Jeffrey Corder. This starts at HIP 6454 and runs through a chain of 6th – 9th magnitude stars including HIP 6307, 6205, 6154, 5884, and 88 Piscium (HIP 5824). Size 65’ X 35’.
- One is in the IAU constellation Cepheus and is Corder 238 on the observing list of American astronomer Jeffrey Corder. Corder describes this as “a string of 6 stars that form nearly a line north/south. The stars are magnitudes 9 and 10 and include an 11th magnitude double star at the northern end. Size 20’.
- One is in the IAU constellation Pisces and is Corder 243 on the observing list of American astronomer Jeffrey Corder. Corder describes this as a “curving chain of 5… stars, including a double star at the north preceding end (Rho (ρ) and 94 [Piscium]”. The rest of the stars include 97 Piscium, HIP 7359, HIP 7447, 103 Piscium, and 105 Piscium. Size 280’ X 75’.
- One is in the IAU constellation Perseus and is Corder 354 on the observing list of American astronomer Jeffrey Corder**.** This is a line of stars running through the Double Cluster (see below). From HIP 10379 at one end, it then runs through 8 Persei, Chi () Persei, the double star HIP 10816, and 9 Persei, ending at the double star HIP 11174. Size 110’ X 30’.
- One is in the IAU constellation Perseus and is Corder 442 on the observing list of American astronomer Jeffrey Corder. Size 65’. Corder describes it as including “18 stars between magnitude 6.5 and 9.5… elongated SSW/NNE.” At one end is the double star HIP 13124A and it includes HIP 13409, 13462, 13407, 13521, 13550, 13640, and 13965.
- One is in the IAU constellation Cetus and is Corder 446 on the observing list of American astronomer Jeffrey Corder. Size 70’ X 20’. Corder describes this as “a nice chain of seven stars… of 8th and 9th magnitude.” The double star HIP 13526 is at one end.

- One is in the IAU constellation Perseus and is Corder 450 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. Corder describes this as "a nice chain of 6 almost equal stars of magnitude 9.5 to 10… oriented almost in a line… north/south."
- One is in the IAU constellation Taurus and is Corder 561 on the observing list of American astronomer Jeffrey Corder. Size 40'. At one end is the double star HIP 16846A and 10 Tauri. The line then runs through HIP 16926, HIP 17120, HIP 17097, HIP 17132, HIP 17183, and the double star HIP 17147, ending at HIP 17086.
- One is in the IAU constellation Perseus and is Corder 593 on the observing list of American astronomer Jeffrey Corder. Size 80' X 45'. The chain of stars starts at HIP 18188 and runs through HIP 18062, HIP 17839, and the double star HIP 17818A ending at HIP 17665 and also includes several 8th magnitude stars.
- One is in the IAU constellation Camelopardalis and is Corder 790 on the observing list of American astronomer Jeffrey Corder. Size 125' X 20'. Includes HIP 23937, HIP 23865, the double stars HIP 23838A and HIP 23768, HIP 23576, HIP 23509, and HIP 23315.
- One is in the IAU constellation Auriga and is Corder 881 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This starts at HIP 26910 and runs through the double star HIP 26803, HIP 26632, HIP 26585, the double star HIP 26249A, and HIP 25942, ending at the variable star HIP 25877.
- One is in the IAU constellations Taurus and is Corder 914 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is nine stars of 6th to 9th magnitude, including the double stars HIP 27320 and 27222, HIP 26964, HIP 26836, and the double star HIP 26599.
- One is in the IAU constellation Orion and is Corder 923 on the observing list of American astronomer Jeffrey Corder. Size 25' X 5'. This is a chain of five 9th magnitude stars including HIP 27212.
- One is in the IAU constellations Auriga and Camelopardalis and is Corder 939 on the observing list of American astronomer Jeffrey Corder. Size 240' X 90'. It starts at Delta (δ) Aurigae and runs through Xi (ξ) Aurigae, through 32, 24, 18, 16, and 15 Camelopardalis, the double star 11 Camelopardalis, and ends at Beta (β) Camelopardalis.
- One is in the IAU constellation Orion and is Corder 997 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is six stars between magnitude 7 and 9 including HIP 28681, 28668, 28567, 28370, and 28252.
- One is in the IAU constellation Orion and is Corder 1034 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is a chain of nine stars between 6th – 8th magnitude including HIP 29371,HIP 29310, the double star HIP 29126A, and HIP 29121.
- One is in the IAU constellation Auriga and is Corder 1056 on the observing list of American astronomer Jeffrey Corder. Size 90' X 20'. This is a line of ten stars of 7th – 8th magnitude including HIP 29865, 29891, 29904, 29886, 29901, 29914, and 29925.
- One is in the IAU constellation Auriga and is Corder 1124 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. Corder describes this as a "chain of about 12 stars, magnitudes 7 to 9, oriented NW.SE."
- One is in the IAU constellation Monoceros and is Corder 1146 on the observing list of American astronomer Jeffrey Corder. Size 55'. This includes HIP 32288, 32177, 32062, 31446, and the double star HIP 31766.

- One is in the IAU constellation Monoceros and is Corder 1203 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This starts at the double star HIP 33154A and runs through a row of 7^{th} – 9^{th} magnitude stars including HIP 33168, 33175, and 33252.
- One is in the IAU constellation Lynx and is Corder 1214 on the observing list of American astronomer Jeffrey Corder. Size 75' X 25'. This is seven stars of 8^{th} – 9^{th} magnitude including 15 Lyncis, HIP 33542, and 33459.
- One is in the IAU constellation Monoceros and is Corder 1223 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is a chain of six 8^{th} – 9^{th} magnitude stars including the double star HIP 33555A.
- One is in the IAU constellation Lynx and is Corder 1240 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven stars of 7^{th} – 10^{th} magnitude including HIP 34079, 33913, and 33835.
- One is in the IAU constellation Camelopardalis and is Corder 1248 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eleven stars between magnitude 9.5 and 11, including the double star HIP 34082.
- One is in the IAU constellation Gemini and is Corder 1297 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is eight stars between 8^{th} – 9^{th} magnitude including the double star HIP 35070A.
- One is in the IAU constellation Lynx and is Corder 1351 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is ten 9^{th} – 10^{th} magnitude stars with HIP 36297 at one end.
- One is in the IAU constellation Gemini and is Corder 1463 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is twelve stars between magnitude 7.5 and 9 including HIP 39036, 38949, 38893, 38754, 38745, and 38647.
- One is in the IAU constellation Cancer and is Corder 1464 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is a line of 6^{th} – 9^{th} magnitude stars including HIP 38598, the double star HIP 38730, HIP 38874, HIP 38954, HIP 39067, HIP 39164, and the double stars HIP 39343 and 39418.
- One is in the IAU constellation Hydra and is Corder 1537 on the observing list of American astronomer Jeffrey Corder. Size 75' X 25'. This is nine stars between magnitude 7.5 to 10 and includes HIP 40217, 40247, and the double star HIP 40428A.
- One is in the IAU constellation Leo and is Corder 1867 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This starts with a double star (9/8.75 magnitude) and runs through 7 Leonis and an 8.25 magnitude star to another double star, HIP 47035.
- One is in the IAU constellation Leo and is Corder 1871 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is a chain of twelve 8^{th} – 11^{th} magnitude stars including HIP 46922.
- One is in the IAU constellation Leo Minor and is Corder 1886 on the observing list of American astronomer Jeffrey Corder. Size 120' X 30'. This is nine 5^{th} – 8^{th} magnitude stars including 9, 10, 11, and 13 Leonis Minoris and HIP 47436, 47403, 47182, 47162, and 46749.
- One is in the IAU constellation Leo and is Corder 1915 on the observing list of American astronomer Jeffrey Corder. Size 160' X 25'.This is nine 7^{th} – 8^{th} magnitude stars including HIP 48699, the double star HIP 48553, HIP 48309, HIP 48145, the double star HIP 48014, HIP 47852, the double stars HIP 47862A and HIP 47518.

- One is in the IAU constellation Leo Minor and is Corder 2016 on the observing list of American astronomer Jeffrey Corder. Size 55' x 20'. This is a chain of 8th – 9th magnitude stars including HIP 50767 and 50947.
- One is in the IAU constellation Draco and is Corder 2204 on the observing list of American astronomer Jeffrey Corder. Size 40' X 30'. This is six 8th – 9th magnitude stars including the star HIP 56483 and the double stars HIP 56192A and 56599A.
- One is in the IAU constellation Draco and is on the observing list of American astronomer John Raymond, who calls it the "Draco Pseudo Cluster" and on the observing list of American astronomer Jeffrey Corder, who lists it both as Corder 2289 and 2290. Size 45' X 35'. This includes HIP 58798, 58808, the double stars HIP 58567A, HIP 58979A, 58976, and 59017B.
- One is in the IAU constellation Sculptor and is Corder 18 on the observing list of American astronomer Jeffrey Corder. Size 40' X 5'. This is part of the Blanco 1 star group and includes HIP 328, 395 and 585.
- One is in the IAU constellation Sculptor and is Corder 19 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 7th – 9th magnitude stars including HIP 430.
- One is in the IAU constellation Phoenix and is Corder 37 on the observing list of American astronomer Jeffrey Corder. Size 45' x 15'. Includes HIP 1314, 1140, 970, 872, and the double star HIP 730A.
- One is in the IAU constellation Sculptor and is Corder 140 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is six 8th – 10th magnitude stars including HIP 3737 and 3664.
- One is in the IAU constellation Phoenix and is Corder 179 on the observing list of American astronomer Jeffrey Corder. Size 75' X 20'. This is five 7th magnitude stars including HIP 5198, 5099, and 4935 and the double stars HIP 4997 and 4985A.
- One is in the IAU constellation Tucana and is Corder 213 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This includes HIP 6446, and HIP 6221, and the double stars Kappa (κ) Tucanae, and HIP 5842C.
- One is in the IAU constellation Cetus and is Corder 235 on the observing list of American astronomer Jeffrey Corder. Size 90' X 25'. This is four 5th – 6th magnitude stars including HIP 6699 and 6835 and the double stars HIP 6789A and 48 Ceti.
- One is in the IAU constellation Phoenix and is Corder 292 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 8th – 10th magnitude stars including HIP 8692 and 8627.
- One is in the IAU constellation Phoenix and is Corder 293 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is a 6th magnitude star (HIP 8593) and four 8th magnitude stars including HIP 8562 and HIP 8286.
- One is in the IAU constellation Eridanus and is Corder 316 on the observing list of American astronomer Jeffrey Corder. Size 90' X 20'. This is four 6th – 7th magnitude stars including HIP 9825, 9362, 8985, and the double star 9685.
- One is in the IAU constellation Phoenix and is Corder 341 on the observing list of American astronomer Jeffrey Corder. Size 55' X 20'. This is twelve 7th – 9th magnitude stars including HIP 10145, 10067, 10131, 10073, 10133, 10205, 10278, 10254, and the double star HIP 10225.

- One is in the IAU constellation Cetus and is Corder 376 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 8th – 9th magnitude stars including HIP 11234, the double stars HIP 11257A, HIP 11208A, and HIP 11227A.
- One is in the IAU constellation Hydrus and is Corder 425 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 9th – 10th magnitude stars including HIP 12822.
- One is in the IAU constellation Eridanus and is Corder 431 on the observing list of American astronomer Jeffrey Corder. Size 15' X 5'. This is five 8th – 9th magnitude stars including HIP 12944.
- One is in the IAU constellation Horologium and is Corder 498 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is four 5th – 7th magnitude stars including HIP 14765, 14930, 14874, and 14690.
- One is in the IAU constellation Horologium and is Corder 534 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is twelve 7th – 10th magnitude stars including HIP 16087, 16049, 15747, 15757, 15652, 15613, and the double star HIP 15884A.
- One is in the IAU constellation Fornax and is Corder 584 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is five 5th – 7th magnitude stars including Rho (ρ) and Sigma (σ) Fornacis and HIP 17693, 17689 and 17667.
- One is in the IAU constellation Eridanus and is Corder 623 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is six 7th – 9th magnitude stars including HIP 18977 and 19022.
- One is in the IAU constellation Eridanus and is Corder 635 on the observing list of American astronomer Jeffrey Corder. Size 80' X 30'. This is five 6th – 9th magnitude stars including HIP 19511, 19354, 19121, and the double star HIP 19590.
- One is in the IAU constellation Reticulum and is Corder 676 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is eight 9th – 11th magnitude stars.
- One is in the IAU constellation Eridanus and is Corder 696 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is eight 7th – 8th magnitude stars including HIP 21309, 21287, 21154, 21104, 20979, and the double star HIP 20965A.
- One is in the IAU constellation Eridanus and is Corder 712 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 8th – 10th magnitude stars including HIP 21471.
- One is in the IAU constellation Eridanus and is Corder 720 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is five 7th – 8th magnitude stars including HIP 21484, 21512, and 21640.
- One is in the IAU constellation Dorado and is Corder 731 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 5th – 7th magnitude stars including Kappa (κ) Doradus, HIP 22240, 22469, 22844, 23081, 23029, and 23079.
- One is in the IAU constellation Eridanus and is Corder 749 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is seven 6th – 9th magnitude stars including HIP 22657, 22494, and 22439.
- One is in the IAU constellation Caelum and is Corder 767 on the observing list of American astronomer Jeffrey Corder. Size 55' X 15'. This is ten 7th – 8th magnitude stars including HIP 23059, HIP 23007, and the double star HIP 22988.

- One is in the IAU constellation Lepus and is Corder 772 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is six 6th – 9th magnitude stars including HIP 23083 and the double stars HIP 23166A and HIP 22991.
- One is in the IAU constellation Pictor and is Corder 946 on the observing list of American astronomer Jeffrey Corder. Size 140' X 45'. This is six 3rd – 6th magnitude stars including Beta (β) Pictoris, HIP 27621, HIP 27947, Delta (δ) Pictoris, Nu (ν) Pictoris and 61 Pictoris.
- One is in the IAU constellation Pictor and is Corder 982 on the observing list of American astronomer Jeffrey Corder. Size 45' x 30'. This is four 5th – 7th magnitude stars including HIP 28150, 28287, 28435, and 28508. Corder notes that if you add a pair of nearby 8th magnitude stars "the asterism also resembles a 'Y'".
- One is in the IAU constellation Dorado and is Corder 990 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is eight 8th – 11th magnitude stars including HIP 28587, 28179, and 28016, and the double stars HIP 28566A and 28529.
- One is in the IAU constellation Lepus and is Corder 1003 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 7th – 9th magnitude stars including HIP 28601
- One is in the IAU constellation Orion and is Corder 1051 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is eight 8th – 10th magnitude stars including the double star HIP 29770A.
- One is in the IAU constellation Canis Major and is Corder 1075 on the observing list of American astronomer Jeffrey Corder. Size 75' X 30'. This is ten 7th – 9th magnitude stars including HIP 30414, 30207, and 30071, and the double stars HIP 30469A, 30300B, and 30171.
- One is in the IAU constellation Canis Major and is Corder 1175 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 8th – 9th magnitude stars including HIP 32352, 32278, and the double star HIP 32498A.
- One is in the IAU constellation Canis Major and is Corder 1200 on the observing list of American astronomer Jeffrey Corder. Size 80' X 25'. This is twelve 7th – 9th magnitude stars including HIP 33336, 33112, 33075, and 32971.
- One is in the IAU constellation Puppis and is Corder 1256 on the observing list of American astronomer Jeffrey Corder. Size 50' X 25'. This is six 6th – 8th magnitude stars including HIP 34339, 34201, 34137, and 33984.
- One is in the IAU constellation Volans and is Corder 1260 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is four 10th magnitude stars.
- One is in the IAU constellation Puppis and is Corder 1262 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is eight 9th – 10th magnitude stars including HIP 34390, 34396, and the double stars HIP 34353A and 34179A.
- One is in the IAU constellation Monoceros and is Corder 1303 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is twelve 4th – 10th magnitude stars including 20 Monocerotis, HIP 34688, 35231, 35306, 35547, 36080, 36137, 36572, and 36526 and the double stars HIP 34975A, HIP 34975A, 35792, and 35896A.
- One is in the IAU constellation Carina and is Corder 1320 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is ten 8th – 11th magnitude stars including HIP 35650 and 35889. This has a small "L" of three stars in the middle.

- One is in the IAU constellation Puppis and is Corder 1349 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is twelve 6th – 10th magnitude stars including HIP 36222, 36273, and 36267 and the double stars HIP 36264A and 36293A.
- One is in the IAU constellation Puppis and is Corder 1350 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is twelve 7th – 10th magnitude stars including HIP 36328, 36342 and the double star HIP 36246A.
- One is in the IAU constellation Volans and is Corder 1353 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 6th to 9th magnitude stars including HIP 36346 and 36192.
- One is in the IAU constellation Carina and is Corder 1357 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is eight 7th – 9th magnitude stars including HIP 36471.
- One is in the IAU constellation Monoceros and is Corder 1372 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is twelve 7th – 10th magnitude stars including HIP 37142 and 36976.
- One is in the IAU constellation Carina and is Corder 1378 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 4th – 8th magnitude stars including HIP 36942, 36799 and 36682 and the double stars HIP 36854A and 36832.
- One is in the IAU constellation Monoceros and is Corder 1383 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is six 7th – 9th magnitude stars including HIP 37149, 37126, 37129, and 37138.
- One is in the IAU constellation Monoceros and is Corder 1412 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 6th – 7th magnitude stars including HIP 37815, 37647, and 37655.
- One is in the IAU constellation Puppis and is Corder 1426 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 7th – 8th magnitude stars including HIP 38217, 38121, and the double star HIP 38056A.
- One is in the IAU constellation Puppis and is Corder 1443 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 7th – 10th magnitude stars including HIP 38453.
- One is in the IAU constellation Pyxis and is Corder 1629 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is eighteen 8th – 9th magnitude stars including HIP 41718, 41742, 41759, 41640 and the double star HIP 41811A.
- One is in the IAU constellation Pyxis and is Corder 1659 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 8th – 10th magnitude stars including HIP 42414.
- One is in the IAU constellation Vela and is Corder 1685 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is seven 7th – 9th magnitude stars including HIP 43005 and the double star HIP 42901.
- One is in the IAU constellation Pyxis and is Corder 1687 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is a chain of 5th – 8th magnitude stars including HIP 43383, 43358, 43158, 43000, 42923, and the double star HIP 43031A.
- One is in the IAU constellation Vela and is Corder 1709 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is a chain of 7th – 8th magnitude stars including HIP 43717, 43711, 43656, 43707, 43303, and the double stars HIP 43792A and 43187A.

- One is in the IAU constellation Carina and is Corder 1712 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is seven 6^{th} – 8^{th} magnitude stars including HIP 43633, 43566, 43600, 43513, and the double star HIP 43620.
- One is in the IAU constellation Pyxis and is Corder 1815 on the observing list of American astronomer Jeffrey Corder. Size 60' X 45'. This includes Lambda (λ) Pyxidis HIP 46810, 46646, 45805, 45249, and the double stars HIP 46329A and 45001.
- One is in the IAU constellation Vela and is Corder 1829 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is an arc of 7^{th} – 10^{th} magnitude stars including HIP 46214 and 46342.
- One is in the IAU constellation Vela and is Corder 1832 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 9^{th} – 10^{th} magnitude stars including two optical doubles.
- One is in the IAU constellation Antlia and is Corder 1838 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This includes HIP 46558, 46841, 46856, 46810, 46646, 46593, and 46585 and the double star HIP 46578.
- One is in the IAU constellation Antlia and is Corder 1846 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is five 7^{th} – 9^{th} magnitude stars including HIP 46807, 46976, and the double stars HIP 46736 and HIP 46877A.
- One is in the IAU constellation Chamaeleon and is Corder 1870 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is six 7^{th} – 10^{th} magnitude stars including HIP 47186 and the double star HIP 47658.
- One is in the IAU constellation Vela and is Corder 1939 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is five 9^{th} – 10^{th} magnitude stars.
- One is in the IAU constellation Hydra and is Corder 1967 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is five 7^{th} – 8^{th} magnitude stars including HIP 49742, 49839, 49902, 50013, and 50043. Corder describes this as an "arc of four stars" but this looks to me like a straight line of five.
- One is in the IAU constellation Hydra and is Corder 1982 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is seven 8^{th} – 9^{th} magnitude stars including HIP 50284.
- One is in the IAU constellation Vela and is Corder 2017 on the observing list of American astronomer Jeffrey Corder. Size 100' X 20'. This is six 6^{th} – 7^{th} magnitude stars plus some 8^{th} – 9^{th} magnitude stars north preceding, including HIP 51245, 51225, and 51001.
- One is in the IAU constellation Vela and is Corder 2024 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is ten 8^{th} – 9^{th} magnitude stars including HIP 51136, 51174, 51271, 51292 and the double star HIP 51214.
- One is in the IAU constellation Vela and is Corder 2048 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 7^{th} – 9^{th} magnitude stars including HIP 51947, 52230, 52622, 52865 and the double stars HIP 51635A and 52378.
- One is in the IAU constellation Carina and is Corder 2050 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is ten 6^{th} – 7^{th} magnitude stars including HIP 55046, 54931, 54276, 53205, 52730, 52785 and the double stars HIP 55140 and 53556A.

- One is in the IAU constellation Hydra and is Corder 2062 on the observing list of American astronomer Jeffrey Corder. Size 60' X 45'. This is fifteen 8^{th} – 10^{th} magnitude stars including HIP 51860, 52073,and 52292.
- One is in the IAU constellation Leo and is Corder 2092 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is eight 8^{th} – 9^{th} magnitude stars including HIP 53369, and 53207, and the double star 53443.
- One is in the IAU constellation Hydra and is Corder 2104 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is eleven 7^{th} – 10^{th} magnitude stars including HIP 53689 and 53741 and the double star HIP 53684.
- One is in the IAU constellation Vela and is Corder 2107 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 6^{th} – 8^{th} magnitude stars including HIP 53806 and 53836, and the double star HIP 53771.
- One is in the IAU constellation Hydra and is Corder 2148 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is ten 7^{th} – 9^{th} magnitude stars including HIP 54576, 54605, 54704, 54807, 54847, and 55099.
- One is in the IAU constellation Centaurus and is Corder 2153 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is a band of 8^{th} – 10^{th} magnitude stars including HIP 54925 and 54859.
- One is in the IAU constellation Hydra and is Corder 2161 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 9^{th} – 10^{th} magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2248 on the observing list of American astronomer Jeffrey Corder. Size 80' X 30'. This is four 4^{th} – 7^{th} magnitude stars including HIP 57840, 57700, 57340, and the double star HIP 57443.
- One is in the IAU constellation Centaurus and is Corder 2269 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8^{th} – 9^{th} magnitude stars including HIP 58075, 58068, and 58054.
- One is in the IAU constellation Crater and is Corder 2270 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 9^{th} magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2318 on the observing list of American astronomer Jeffrey Corder. Size 15' X 5'. This is six 10^{th} – 11^{th} magnitude stars including HIP 59741.
- One is in the IAU constellation Virgo and is Corder 2324 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 6^{th} – 9^{th} magnitude stars including HIP 59720 and the double star HIP 59750.
- One is in the IAU constellation Chamaeleon and is Corder 2352 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is six 7^{th} – 10^{th} magnitude stars including HIP 60526, 60650, 60770, and the double star HIP 60782A.
- One is in the IAU constellation Centaurus and is Corder 2382 on the observing list of American astronomer Jeffrey Corder. Size 75' X 20'. This is ten 7^{th} – 9^{th} magnitude stars including HIP 61344, 61593, 61679, and the double star HIP 61451.
- One is in the IAU constellation Crux and is Corder 2412 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is ten 7^{th} – 9^{th} magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2420 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is six 7^{th} – 9^{th} magnitude stars.

- One is in the IAU constellation Musca and is Corder 2446 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is ten 8th – 9th magnitude stars including HIP 63563, 63649, and 63761, and the double star HIP 63924A.
- One is in the IAU constellation Centaurus and is Corder 2462 on the observing list of American astronomer Jeffrey Corder. Size 250' X 45'. This is six 5th – 6th magnitude stars including HIP 64472, 64590, 64677, 64851, and 65178, and the double star HIP 64332A.
- One is in the IAU constellation Centaurus and is Corder 2482 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 9th – 10th magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2497 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 7th – 9th magnitude stars including HIP 65409.
- One is in the IAU constellation Hydra and is Corder 2551 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 10th magnitude stars including HIP 67531 and the double star HIP 67479A.
- One is in the IAU constellation Centaurus and is Corder 2560 on the observing list of American astronomer Jeffrey Corder. Size 25'. This includes 4 Centauri, HIP 67652 and the double star HIP 67696A.
- One is in the IAU constellation Virgo and is Corder 2570 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is four 7th – 8th magnitude stars including HIP 68024 and 68107 and the double stars HIP 68001A and 68038.
- One is in the IAU constellation Virgo and is Corder 2575 on the observing list of American astronomer Jeffrey Corder. Size 90' X 25'. This is five 7th magnitude stars including HIP 68776, 68415, 68236, and 67978, and the double star HIP 68110.
- One is in the IAU constellation Centaurus and is Corder 2579 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is twelve 6th – 10th magnitude stars including HIP 68352 and 68474.
- One is in the IAU constellation Circinus and is Corder 2582 on the observing list of American astronomer Jeffrey Corder. Size 120' X 35'. This is a chain of 7th – 9th magnitude stars including HIP 68692, 68584, 68412, 68582, 68341, 68183, 67910, and 67869.
- One is in the IAU constellation Centaurus and is Corder 2584 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is a cascade of 8th – 10th magnitude stars including HIP 68454 and the double star HIP 68448A.
- One is in the IAU constellation Virgo and is Corder 2588 on the observing list of American astronomer Jeffrey Corder. Size 100' X 30'. This is twelve 8th – 9th magnitude stars including HIP 68450, 68505, 68539, 68605, 68718, and 68668, and the double star HIP 68486A.
- One is in the IAU constellation Boötes and is Corder 2591 on the observing list of American astronomer Jeffrey Corder. Size 150' X 30'. This is five 5th – 6th magnitude stars including HIP 68708, 68583, 68508, and 68498, and the double stars HIP 68682, and 68594.
- One is in the IAU constellation Virgo and is Corder 2592 on the observing list of American astronomer Jeffrey Corder. Size 130' X 40'. This is fifteen 8th – 9th magnitude stars and one 4th magnitude star, including Tau (τ) Virginis, HIP 68450, 68505, 68539, 68605, 68718, and 68668 and the double star HIP 68486A.

- One is in the IAU constellation Boötes and is Corder 2607 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is six 6th – 8th magnitude stars including HIP 69248, and 69260, and the double stars HIP 69178 and 69281A.
- One is in the IAU constellation Centaurus and is Corder 2610 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 10th magnitude stars including the double star HIP 69261.
- One is in the IAU constellation Libra and is Corder 2666 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is seven 8th – 10th magnitude stars including HIP 71212, 71152, 71045, and 70469.
- One is in the IAU constellation Hydra and is Corder 2670 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is eight 9th to 10th magnitude stars including HIP 71231.
- One is in the IAU constellation Virgo and is Corder 2685 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is eight 7th – 9th magnitude stars including HIP 71508, 71527, and 71455.
- One is in the IAU constellation Ursa Minor and is Corder 2690 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 9th – 10th magnitude stars including HIP 71514.
- One is in the IAU constellation Draco and is Corder 2703 on the observing list of American astronomer Jeffrey Corder. Size 150' X 60'. This is twelve 6th – 9th magnitude stars including HIP 72664, 72293, 72073, 71911, and 71623, and the double stars HIP 73105A and 72912A.
- One is in the IAU constellation Circinus and is Corder 2708 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is five 7th – 9th magnitude stars including HIP 72048 and 72171.
- One is in the IAU constellations Hydra and Libra and is Corder 2710 on the observing list of American astronomer Jeffrey Corder. Size 200' X 40'. This is 4 Librae and 54, 55, 56, 57 and 58 Hydrae. Astronomer John Raymond calls this asterism "Hydra-Libra" and it is part of the Mini Scorpius asterism (see Scorpion, below).
- One is in the IAU constellation Centaurus and is Corder 2714 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. Corder describes this as a "thick 'bar' of faint stars" including one 7th magnitude star, HIP 72459 in the middle. This includes the double star HIP 72445A.
- One is in the IAU constellation Libra and is Corder 2719 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 9th – 10th magnitude stars including the double star HIP 72593A.
- One is in the IAU constellation Lupus and is Corder 2721 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is nine 8th – 10th magnitude stars including HIP 72608, 72756, and 72841, and the double star HIP 72821A.
- One is in the IAU constellations Serpens and Virgo and is Corder 2723 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is seven 6th – 9th magnitude stars including 1 & 2 Serpentis, HIP 72449, 72226, and 72122 and the double star HIP 72888.
- One is in the IAU constellation Libra and is Corder 2728 on the observing list of American astronomer Jeffrey Corder. Size 100' X 30'. This is fifteen 6th – 9th magnitude stars including HIP 72677, HIP 72525, and 72501, 10 Librae, and the double star HP 72645.

- One is in the IAU constellation Lupus and is Corder 2731 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is five 8th magnitude stars including HIP 73117, 72903, and 72742.
- One is in the IAU constellation Libra and is Corder 2742 on the observing list of American astronomer Jeffrey Corder. Size 105' X 20'. This is Xi (ξ) 1 & 2 Librae, 17 Librae, and 18 Librae.
- One is in the IAU constellation Hydra and is Corder 2743 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is ten 8th – 9th magnitude stars including HIP 73260.
- One is in the IAU constellation Boötes and is Corder 2747 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 10th magnitude stars including the double star HIP 73185A.
- One is in the IAU constellation Boötes and is Corder 2759 on the observing list of American astronomer Jeffrey Corder. Size 75' X 25'. This is Beta (β) Boötis (Nekkar), HIP 73476, HIP 73353, and 40 Boötis.
- One is in the IAU constellation Ursa Minor and is Corder 2768 on the observing list of American astronomer Jeffrey Corder. Size 120' X 60'. This is five 4th – 7th magnitude stars including HIP 73706, 73578, 73623, 73706, and 74082.
- One is in the IAU constellation Ursa Minor and is Corder 2786 on the observing list of American astronomer Jeffrey Corder. Size 120' X 45'. This is eighteen 6th – 9th magnitude stars including 9 Ursae Minoris, HIP 74625, 74453, 74155, 74097, 73784, 734212, and the double star HIP 73135B.
- One is in the IAU constellation Serpens and is Corder 2801 on the observing list of American astronomer Jeffrey Corder. Size 50' X 5'. This is four 7th – 8th magnitude stars including 3 Serpentis and HIP 74585, and 74508.
- One is in the IAU constellation Libra and is Corder 2810 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 9th – 9th magnitude stars including HIP 74892 and 74667.
- One is in the IAU constellation Serpens and is Corder 2831 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is eight 7th – 10th magnitude stars including HIP 75382, 75315, and 75194.
- One is in the IAU constellation Lupus and is Corder 2838 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is five 8th – 9th magnitude stars including HP 75442 and 75400.
- One is in the IAU constellation Lupus and is Corder 2853 on the observing list of American astronomer Jeffrey Corder. Size 15' X 29. This is six 9th – 10th magnitude stars.
- One is in the IAU constellation Libra and is Corder 2886 on the observing list of American astronomer Jeffrey Corder. Size 55' X 15'. This is eight 8th – 10th magnitude stars including HIP 76430 and the double star HIP 76578A.
- One is in the IAU constellation Apus and is Corder 2896 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is five 6th – 9th magnitude stars including HIP 76767, 76481, and the double star HIP 76429A.
- One is in the IAU constellation Lupus and is Corder 2900 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is sixteen 7th – 10th magnitude stars including HIP 76560 and 76821.

- One is in the IAU constellation Serpens and is Corder 2929 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7th – 9th magnitude stars including HIP 77676.
- One is in the IAU constellation Norma and is Corder 2933 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 77614.
- One is in the IAU constellation Triangulum Australe and is Corder 2940 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 6th – 7th magnitude stars including Epsilon (ε) Trianguli Australis, HIP 78346, 77173, and 76934, and the double stars HIP 78279A and 77390A.
- One is in the IAU constellation Apus and is Corder 2951 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 78079.
- One is in the IAU constellation Lupus and is Corder 2959 on the observing list of American astronomer Jeffrey Corder. Size 120' X 30'. This is five 6th – 7th magnitude stars including HIP 78665, 78486, and 78058, and the double star HIP 78196.
- One is in the IAU constellation Corona Borealis and is Corder 2973 on the observing list of American astronomer Jeffrey Corder. Size 170' X 15'. This is four stars including HIP 78276 and the double stars Tau (τ) Coronae Borealis, HIP 78649, and HIP 79358.
- One is in the IAU constellation Norma and is Corder 2976 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is seven 8th – 10th magnitude stars including HIP 78766.
- One is in the IAU constellation Scorpius and is Corder 2996 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 10th magnitude stars.
- One is in the IAU constellation Hercules and is Corder 3012 on the observing list of American astronomer Jeffrey Corder. Size 60' X 15'. This is four 7th – 8th magnitude stars including 13 and 15 Herculis and HIP 79504.
- One is in the IAU constellation Draco and is Corder 3029 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 9th – 10th magnitude stars.
- One is in the IAU constellation Ophiuchus and is Corder 3046 on the observing list of American astronomer Jeffrey Corder. Size 55' X 20'. This is five 7th – 8th magnitude stars including HIP 80266, and 80373, and the double star HIP 80261.
- One is in the IAU constellation Scorpius and is Corder 3071 on the observing list of American astronomer Jeffrey Corder. Size 60' X 10'. This is five 7th – 8th magnitude stars including HIP 80770 and 80875.
- One is in the IAU constellation Norma and is Corder 3076 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th magnitude stars including HIP 81076 and 81071.
- One is in the IAU constellation Hercules and is Corder 3128 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is five 8th magnitude stars including 82415 and 82305.
- One is in the IAU constellation Draco and is Corder 3132 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is five 8th – 9th magnitude stars including HIP 82420.
- One is in the IAU constellation Hercules and is Corder 3134 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is six 9th – 10th magnitude stars with an optical triple star in the middle.

- One is in the IAU constellation Hercules and is Corder 3167 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 8th – 10th magnitude stars.
- One is in the IAU constellation Scorpius and is Corder 3187 on the observing list of American astronomer Jeffrey Corder. Size 70' X 20'. This is nine 8th – 9th magnitude stars including HIP 83252 and 83374 and the double star HIP 83336.
- One is in the IAU constellation Scorpius and is Corder 3190 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 7th – 9th magnitude stars including HIP 83368, 83263, and 83202.
- One is in the IAU constellation Ara and is Corder 3221 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 9th magnitude stars including HIP 84208.
- One is in the IAU constellation Ara and is Corder 3226 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 9th magnitude stars.
- One is in the IAU constellation Scorpius and is Corder 3237 on the observing list of American astronomer Jeffrey Corder. Size 70' X 20'. This is five 6th – 8th magnitude stars including HIP 84612 and the double stars HIP 84709 and 84489.
- One is in the IAU constellation Ophiuchus and is Corder 3242 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is nine 9th – 10th magnitude stars including the double star HIP 84595A.
- One is in the IAU constellation Ophiuchus and is Corder 3246 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 9th – 11th magnitude stars.
- One is in the IAU constellation Ophiuchus and is Corder 3259 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is six 7th – 8th magnitude stars including HIP 84996, 84933, 84930, 84931, and 84951.
- One is in the IAU constellation Ara and is Corder 3270 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 7th – 9th magnitude stars including HIP 85337 and the double stars HIP 85342 and 85326.
- One is in the IAU constellation Apus and is Corder 3272 on the observing list of American astronomer Jeffrey Corder. Size 15' X 10'. This is four 9th magnitude stars including HIP 85328.
- One is in the IAU constellation Serpens and is Corder 3287 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is six 7th – 9th magnitude stars including HIP 85600.
- One is in the IAU constellation Ophiuchus and is Corder 3288 on the observing list of American astronomer Jeffrey Corder. Size 55' X 25'. This is nine 8th – 9th magnitude stars including HIP 85719 and 85632.
- One is in the IAU constellation Scorpius and is Corder 3289 on the observing list of American astronomer Jeffrey Corder. Size 20' X 15'. This is nine 7th – 10th magnitude stars including HIP 85588, 85680, 85701, 85786, and the double star HIP 85641A.
- One is in the IAU constellation Scorpius and is Corder 3293 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is five 7th – 9th magnitude stars including HIP 85811 and 85752.
- One is in the IAU constellation Scorpius and is Corder 3317 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 6th – 8th magnitude stars including Q Scorpii, HIP 86047, 86117, 86119, and 86246, and the double star HIP 86286A.

- One is in the IAU constellation Ara and is Corder 3343 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 7th – 8th magnitude stars including HIP 86516, 86690, 86701, and 86773.
- One is in the IAU constellation Hercules and is Corder 3356 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is four 8th magnitude stars including HIP 87025.
- One is in the IAU constellation Hercules and is Corder 3365 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is nine 9th magnitude stars including HIP 87027 and 87095.
- One is in the IAU constellation Sagittarius and is Corder 3379 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is eight 7th – 9th magnitude stars including HIP 87370, 87227, 87156, 87003, and 86970.
- One is in the IAU constellation Ophiuchus and is Corder 3384 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is five 6th – 9th magnitude stars including HIP 87335, 87415, and 87479.
- One is in the IAU constellation Hercules and is Corder 3451 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is four 6th – 7th magnitude stars including HIP 88669 and 88602 and the double star HIP 88754A.
- One is in the IAU constellation Hercules and is Corder 3454 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 8th – 10th magnitude stars including the double star HIP 88598A.
- One is in the IAU constellation Ophiuchus and is Corder 3463 on the observing list of American astronomer Jeffrey Corder. Size 90' X 40'. This is five 3rd – 7th magnitude stars including 71 & 72 Ophiuchi, and the double star HIP 88728.
- One is in the IAU constellation Corona Australis and is Corder 3466 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is five 9th magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3481 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 9th magnitude stars including HIP 88906 and the double star HIP 88864A.
- One is in the IAU constellation Ophiuchus and is Corder 3493 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is ten 8th – 11th magnitude stars including HIP 89283.
- One is in the IAU constellation Pavo and is Corder 3510 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is four 8th – 9th magnitude stars including HIP 89394.
- One is in the IAU constellation Sagittarius and is Corder 3513 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is twelve 8th – 11th magnitude stars including HIP 89510 and 89454.
- One is in the IAU constellation Hercules and is Corder 3537 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is twelve 5th – 9th magnitude stars including 105 Herculis, HIP 90295, and the double stars HIP 89994A and 90120A.
- One is in the IAU constellation Lyra and is Corder 3551 on the observing list of American astronomer Jeffrey Corder. Size 75' X 30'. This is five 7th – 8th magnitude stars including HIP 90612, 90488, 90393, 90258, and 90079.
- One is in the IAU constellation Pavo and is Corder 3582 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is seven 10th – 11th magnitude stars.

- One is in the IAU constellation Sagittarius and is Corder 3598 on the observing list of American astronomer Jeffrey Corder. Size 70' X 15'. This starts at the globular cluster NGC 6652 and runs through eight 5^{th} – 8^{th} magnitude stars including HIP 91137 and 91020 and the double stars HIP 91014 and 90763A.
- One is in the IAU constellation Sagittarius and is Corder 3600 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 9^{th} – 11^{th} magnitude stars.
- One is in the IAU constellation Hercules and is Corder 3624 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 7^{th} – 8^{th} magnitude stars including HIP 91685, 91659, and 91622.
- One is in the IAU constellation Telescopium and is Corder 3629 on the observing list of American astronomer Jeffrey Corder. Size 100' X 30'. This is fifteen 8^{th} – 9^{th} magnitude stars including HIP 91096, 91211, 91589, 91840, 91844, 91840, and 92077, and the double stars HIP 91301, 91508, and 91928A.
- One is in the IAU constellation Aquila and is Corder 3632 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7^{th} – 9^{th} magnitude stars including HIP 91822, 91855, and 91910.
- One is in the IAU constellation Sagittarius and is Corder 3637 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8^{th} – 9^{th} magnitude stars including the double star HIP 91866.
- One is in the IAU constellation Draco and is Corder 3638 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is four 9^{th} magnitude stars.
- One is in the IAU constellation Lyra and is Corder 3683 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 8^{th} – 11^{th} magnitude stars including HIP 92626, 92641, and 92612 and the double star HIP 92631A.
- One is in the IAU constellation Aquila and is Corder 3685 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 7^{th} – 9^{th} magnitude stars including HIP 92617.
- One is in the IAU constellation Sagittarius and is Corder 3694 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 9^{th} – 10^{th} magnitude stars.
- One is in the IAU constellation Pavo and is Corder 3706 on the observing list of American astronomer Jeffrey Corder. Size 140' X 20'. This is six 7^{th} – 8^{th} magnitude stars including HIP 93535, 93372, 93012, and 92545.
- One is in the IAU constellation Sagittarius and is Corder 3716 on the observing list of American astronomer Jeffrey Corder. Size 150' X 40'. This is six 6^{th} – 7^{th} magnitude stars including HIP 93993, 93498, 93315, 93132, 92780, and the double star HIP 92929.
- One is in the IAU constellation Aquila and is Corder 3798 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is six 7^{th} – 8^{th} magnitude stars including HIP 94638.
- One is in the IAU constellation Sagittarius and is Corder 3809 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is six 9^{th} – 10^{th} magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3842 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is four 7^{th} – 8^{th} magnitude stars including the double star HIP 95159.

- One is in the IAU constellation Sagittarius and is Corder 3905 on the observing list of American astronomer Jeffrey Corder. Size 25' X 20'. This is four 8th – 9th magnitude stars including HIP 96475, 96440, and 96422.
- One is in the IAU constellation Sagittarius and is Corder 3907 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 9th magnitude stars including HIP 96554 and 96531.
- One is in the IAU constellation Aquila and is Corder 3922 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is five 6th – 9th magnitude stars including HIP 96845, 96844, and 96847 and the double star HIP 96840A.
- One is in the IAU constellation Draco and is Corder 3963 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is five 7th – 9th magnitude stars including HIP 96542, 96839, 98382, and 99433.
- One is in the IAU constellation Draco and is Corder 4012 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is four 6th – 9th magnitude stars including HIP 98666.
- One is in the IAU constellation Aquila and is Corder 4016 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is ten 7th – 9th magnitude stars including HIP 98442 and 98455.
- One is in the IAU constellation Sagittarius and is Corder 4019 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 6th – 9th magnitude stars including HIP 98420 and 98485. Corder describes this both as a "chain" or "bar" of stars.
- One is in the IAU constellation Draco and is Corder 4022 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 8th – 10th magnitude stars including HIP 98816 and the double star HIP 98244A.
- One is in the IAU constellation Cygnus and is Corder 4031 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is ten 7th – 9th magnitude stars including HIP 98146, 98493, 98731, 98940, and 99102 and the double stars HIP 98367 and 98734A.
- One is in the IAU constellation Cygnus and is Corder 4041 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is nine 5th – 9th magnitude stars including HIP 98783 and 98746 and the double star HIP 98767.
- One is in the IAU constellation Vulpecula and is Corder 4048 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is ten 8th – 10th magnitude stars including HIP 98873.
- One is in the IAU constellation Sagittarius and is Corder 4073 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is seven 7th – 9th magnitude stars including HIP 99465, 99364, 99305, 99083, and 99022.
- One is in the IAU constellation Cygnus and is Corder 4094 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is eight 7th – 10th magnitude stars.
- One is in the IAU constellation Cygnus and is Corder 4098 on the observing list of American astronomer Jeffrey Corder. Size 20' X 15'. This is nine 8th – 11th magnitude stars including HIP 99905.
- One is in the IAU constellation Capricornus and is Corder 4102 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 8th – 9th magnitude stars including HIP 99901 and 99903.

- One is in the IAU constellation Aquila and is Corder 4111 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is twelve 7th – 10th magnitude stars including HIP 100082 and 100025.
- One is in the IAU constellation Capricornus and is Corder 4112 on the observing list of American astronomer Jeffrey Corder. Size 65' X 35'. This is four 3rd – 6th magnitude stars: Alpha (α) 1 and 2, Nu (ν), and 3 Capricorni.
- One is in the IAU constellation Aquila and is Corder 4122 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is five 6th – 8th magnitude stars including HIP 100247, 100237, and 100232.
- One is in the IAU constellation Cygnus and is Corder 4147 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is twelve 8th – 10th magnitude stars.
- One is in the IAU constellation Vulpecula and is Corder 4163 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7th – 9th magnitude stars including HIP 101054, 101041, 101002, and 100983.
- One is in the IAU constellation Draco and is Corder 4180 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is seven 8th – 10th magnitude stars including HIP 101890.
- One is in the IAU constellation Microscopium and is Corder 4186 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is four 8th – 9th magnitude stars including HIP 101450 and the double star HIP 101465A.
- One is in the IAU constellation Delphinus and is Corder 4210 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is five 5th -7th magnitude stars including Theta (θ) Delphini, HIP 101848, 101943, and 101967. The SAC names this asterism for the star Theta (θ) Delphini.
- One is in the IAU constellations Aquila and Aquarius and is Corder 4211 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is seven 7th – 9th magnitude stars including HIP 101827, 101852, and 101911.
- One is in the IAU constellation Delphinus and is Corder 4233 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is eight 8th – 9th magnitude stars including HIP 102385, 102450, and 102510 and the double stars HIP 102398A, 102400, and 102390A.
- One is in the IAU constellation Cygnus and is Corder 4243 on the observing list of American astronomer Jeffrey Corder. Size 110' X 25'. This is seven 6th – 8th magnitude stars including HIP 102499, 102572, 102801, and 102956 and the double stars HIP 198387, 102712A, 102796A, and 102804.
- One is in the IAU constellation Delphinus and is Corder 4246 on the observing list of American astronomer Jeffrey Corder. Size 120' X 25'. This is five 7th – 8th magnitude stars including HIP 102631, 102680, and 102774.
- One is in the IAU constellation Capricornus and is Corder 4248 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is nine 6th – 10th magnitude stars including HIP 102591, 102658, and 102659.
- One is in the IAU constellation Vulpecula and is Corder 4250 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 7th – 10th magnitude stars including HIP 102815, 102740, and the double star HIP 102728A.

- One is in the IAU constellation Delphinus and is Corder 4256 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 7^{th} – 8^{th} magnitude stars including HIP 102917 and 102878.
- One is in the IAU constellation Cepheus and is Corder 4277 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8^{th} – 9^{th} magnitude stars including the double stars HIP 103461A and 103421.
- One is in the IAU constellation Delphinus and is Corder 4279 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8^{th} – 9^{th} magnitude stars including HIP 103444.
- One is in the IAU constellation Delphinus and is Corder 4300 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is five 8^{th} – 9^{th} magnitude stars.
- One is in the IAU constellation Cepheus and is Corder 4305 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is four 8^{th} – 9^{th} magnitude stars including HIP 103908.
- One is in the IAU constellation Aquarius and is Corder 4306 on the observing list of American astronomer Jeffrey Corder. Size 120' X 15'. This is six 6^{th} – 7^{th} magnitude stars including HIP 103889, 103899, 103931, 103932, and 103926.
- One is in the IAU constellation Indus and is Corder 4341 on the observing list of American astronomer Jeffrey Corder. Size 60' X 15'. This is eight 7^{th} – 9^{th} magnitude stars including HIP 104721, 104621, and the double star HIP 104604A.
- One is in the IAU constellation Pegasus and is Corder 4352 on the observing list of American astronomer Jeffrey Corder. Size 90' X 15'. This is four 7^{th} – 8^{th} magnitude stars including HIP 104967, 104884, 104729 and the double star HIP 104771A.
- One is in the IAU constellation Indus and is Corder 4353 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is six 7^{th} – 9^{th} magnitude stars including HIP 104865, 105110, and the double star HIP 104662A.
- One is in the IAU constellation Cygnus and is Corder 4364 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is fourteen 7^{th} – 10^{th} magnitude stars including HIP 105024, 105036, and the double star HIP 105130.
- One is in the IAU constellation Cygnus and is Corder 4382 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is eight 8^{th} – 9^{th} magnitude stars including HIP 105346 and 105345.
- One is in the IAU constellation Equuleus and is Corder 4384 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is made up of four 9^{th} magnitude stars.
- One is in the IAU constellation Aquarius and is Corder 4389 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is ten 8^{th} – 11^{th} magnitude stars including HIP 105302, 105469 and 105534.
- One is in the IAU constellation Pavo and is Corder 4392 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is seven 8^{th} magnitude stars including HIP 105401 and the double stars HIP 105445A and 105441.
- One is in the IAU constellation Vulpecula and is Corder 4422 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 7^{th} – 8^{th} magnitude stars including HIP 106037.

- One is in the IAU constellation Capricornus and is Corder 4455 on the observing list of American astronomer Jeffrey Corder. Size 45' X 5'. This is four 8th – 9th magnitude stars including HIP 106497, 106441, and 106380.
- One is in the IAU constellation Capricornus and is Corder 4461 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is eight 6th – 9th magnitude stars including 37 and 38 Capricorni and HIP 106561.
- One is in the IAU constellation Pegasus and is Corder 4470 on the observing list of American astronomer Jeffrey Corder. Size 50' X 25'. This is seven 5th – 9th magnitude stars including 4 Pegasi, HIP 106707, and 106660.
- One is in the IAU constellation Pegasus and is Corder 4486 on the observing list of American astronomer Jeffrey Corder. Size 80' X 15'. This is eight 7th – 9th magnitude stars including HIP 107046, 107084, 107100, 107102, 107139, and 107221.
- One is in the IAU constellation Pegasus and is Corder 4501 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is seven 5th – 8th magnitude stars including 12 Pegasi and HIP 107394 and 107498. John Raymond calls this asterism "12" after the middle star 12 Pegasi.
- One is in the IAU constellation Cygnus and is Corder 4506 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 10th magnitude stars including HIP 107540.
- One is in the IAU constellation Pegasus and is Corder 4535 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is made up of seven 9th – 10th magnitude stars.
- One is in the IAU constellation Pegasus and is Corder 4536 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 8th – 10th magnitude stars including HIP 108094.
- One is in the IAU constellation Indus and is Corder 4550 on the observing list of American astronomer Jeffrey Corder. Size 80' X 25'. This is eight 7th – 10th magnitude stars including HIP 108093, 108310, 108631, and 108740.
- One is in the IAU constellation Capricornus and is Corder 4554 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 8th – 9th magnitude stars including HIP 108452, 108522 and the double star HIP 108414.
- One is in the IAU constellation Cygnus and is Corder 4559 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is six 8th – 9th magnitude stars including HIP 108602.
- One is in the IAU constellation Lacerta and is Corder 4577 on the observing list of American astronomer Jeffrey Corder. Size 100' X 40'. This is a thick chain of ten 6th – 8th magnitude stars including HIP 109745, 109121, 109079, 109102, 108933, 108645, and the double stars HIP 109303, 109354, 108845A, and 108774.
- One is in the IAU constellation Pegasus and is Corder 4580 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is six 7th – 10th magnitude stars including HIP 108963 and the double star HIP 108117A.
- One is in the IAU constellation Lacerta and is Corder 4589 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is seven 7th – 9th magnitude stars including HIP 109131, 109157, and 109217.
- One is in the IAU constellation Cepheus and is Corder 4596 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 8th – 10th magnitude stars including HIP 109379.

- One is in the IAU constellation Aquarius and is Corder 4636 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is four 6th – 7th magnitude stars including HIP 109952, 110018, 110060, and 110126.
- One is in the IAU constellation Aquarius and is Corder 4654 on the observing list of American astronomer Jeffrey Corder. Size 60' X 10'. This is six 8th – 9th magnitude stars including HIP 110563 and the double star HIP 110426.
- One is in the IAU constellation Lacerta and is Corder 4684 on the observing list of American astronomer Jeffrey Corder. Size 80' X 20'. This is eight 4th – 9th magnitude stars including 6 Lacertae, HIP 111077 and 111189.
- One is in the IAU constellation Pegasus and is Corder 4690 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is seven 9th – 10th magnitude stars including HIP 111119.
- One is in the IAU constellation Cepheus and is Corder 4694 on the observing list of American astronomer Jeffrey Corder. Size 180' X 30'. This is twenty 5th – 9th magnitude stars including 26 Cephei, HIP 110998, 111387, 111617, 111950, 112169, and 112562.
- One is in the IAU constellation Lacerta and is Corder 4695 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is nine 3rd – 9th magnitude stars including Alpha (α) Lacertae and HIP 111147, 111184, and 111197, and the double star HIP 111164A.
- One is in the IAU constellation Aquarius and is Corder 4708 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is four 6th – 8th magnitude stars including 61 Aquarii, HIP 111506, and 111522.
- One is in the IAU constellation Pegasus and is Corder 4720 on the observing list of American astronomer Jeffrey Corder. Size 120' X 50'. This is sixteen 6th – 9th magnitude stars including HIP 111466, 111526, 111807, 111938, 112138, and 112099, and the double star HIP 111433A.
- One is in the IAU constellation Grus and is Corder 4721 on the observing list of American astronomer Jeffrey Corder. Size 125' X 30'. This is five 6th – 7th magnitude stars including HIP 111815, 111819 and the double stars HIP 111718A, 111643A, and 111594.
- One is in the IAU constellation Pegasus and is Corder 4727 on the observing list of American astronomer Jeffrey Corder. Size 60' X 15'. This is seven 6th – 9th magnitude stars including 40 and 41 Pegasi, HIP 111943, and 111956, and the double star HIP 112076A.
- One is in the IAU constellation Lacerta and is Corder 4737 on the observing list of American astronomer Jeffrey Corder. Size 90' X 45'. This is five 4th – 7th magnitude stars including 11 Lacertae, HIP 112042, 112217, 112351, and 112417.
- One is in the IAU constellation Cepheus and is Corder 4752 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is six 8th – 9th magnitude stars including HIP 112165 and 113108.
- One is in the IAU constellation Pegasus and is Corder 4756 on the observing list of American astronomer Jeffrey Corder. Size 90' X 15'. This is ten 7th – 9th magnitude stars including HIP 112303, 112359, and 112689, and the double star HIP 112495.
- One is in the IAU constellation Lacerta and is Corder 4781 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is four 5th – 8th magnitude stars including HIP 113200 and 113144 and the double star HIP 113222.

- One is in the IAU constellation Octans and is Corder 4785 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is seven 9th – 11th magnitude stars including HIP 113840.
- One is in the IAU constellation Cepheus and is Corder 4787 on the observing list of American astronomer Jeffrey Corder. Size 100' X 30'. This is ten 7th – 9th magnitude stars running through the Cave Nebula (SH 2-155) including HIP 114070, 113947, 113793, 113249, and 113218, and the double stars HIP 113461A, 113306A, and 113301.
- One is in the IAU constellation Aquarius and is Corder 4796 on the observing list of American astronomer Jeffrey Corder. Size 140' X 35'. This is five 6th – 8th magnitude stars including HIP 113896, 113686, 113345, and the double star HIP 113184A.
- One is in the IAU constellation Tucana and is Corder 4801 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 9th magnitude stars including HIP 113548.
- One is in the IAU constellation Pisces and is Corder 4812 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 113727.
- One is in the IAU constellation Aquarius and is Corder 4819 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 11th magnitude stars including the double stars HIP 113779 and 113769B.
- One is in the IAU constellation Pegasus and is Corder 4827 on the observing list of American astronomer Jeffrey Corder. Size 300' X 30'. This is seven 2nd – 10th magnitude stars including Alpha (α) Pegasi (Markab), HIP 113994 and 114049, and the double stars HIP 114081, 114096, 114034, 114183, and 114189.
- One is in the IAU constellation Tucana and is Corder 4848 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is six 9th – 10th magnitude stars including HIP 114731.
- One is in the IAU constellation Octans and is Corder 4849 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is five 6th – 9th magnitude stars including HIP 114550, 114884 and 114993 and the double star HIP 115028A.
- One is in the IAU constellation Pegasus and is Corder 4852 on the observing list of American astronomer Jeffrey Corder. Size 65' X 40'. This is five 6th – 8th magnitude stars including HIP 114863, 114835, 114742, and 114806.
- One is in the IAU constellation Pisces and is Corder 4867 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 9th – 10th magnitude stars including HIP 115050 and 115063.
- One is in the IAU constellation Andromeda and is Corder 4890 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is five 7th – 9th magnitude stars including HIP 115778 and the double stars HIP 115715 and 115655.
- One is in the IAU constellation Pegasus and is Corder 4927 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is four 7th – 8th magnitude stars including HIP 116361, 116378, and the double star HIP 116396.
- One is in the IAU constellation Pegasus and is Corder 4939 on the observing list of American astronomer Jeffrey Corder. Size 120' X 25'. This is ten 6th – 9th magnitude stars including HIP 116965, 116718, 116636, 116502, and 116307 and the double stars HIP 116926A and 116838A.
- One is in the IAU constellation Pegasus and is Corder 4957 on the observing list of American astronomer Jeffrey Corder. Size 40 X 20'. This is twelve 8th – 9th magnitude stars.

- One is in the IAU constellation Pisces and is Corder 4979 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is twelve 8th – 10th magnitude stars including HIP 117529 and the double star HIP 117704A.
- One is in the IAU constellation Aquarius and is Corder 4981 on the observing list of American astronomer Jeffrey Corder. Size 75' X 35'. This is ten 5th – 9th magnitude stars including HIP 117824, 117734, 117414, and 108, 107, 106, 104 and 103 Aquarii. One is made up of stars in the IAU constellation Scutum. It is Hölgye 1 on the list of Hungarian astronomer Attila Hölgye. This is the stars HD 175546, Gaia DR3 4255357703204500480, Gaia DR3 4254985136206134656, HIP 92781, HIP 92746, HD 175020, HIP 92686, and HIP 92654. The stars HD 175209 and 175208 form a right angle at the middle of the cascade.
- One is made up of stars in the IAU constellation Andromeda. It is Dezsi 4 on the list of Hungarian astronomer Attila Dezsi. This is a cascade of 6 stars next to Gaia DR3 350283586905833600.
- One is a "Starry Path" made up of stars of the IAU constellation Perseus. This was posted on *Cloudy Nights* by American astronomer Dale Smith in February 2024. Starting at HIP 13965 it runs through HIP 13713, HIP 13635, HIP 13512, HIP 13339, and HIP 13181 to HIP 13155.
- One is a "Starry Path" made up of stars of the IAU constellations Andromeda and Perseus. This was posted on *Cloudy Nights* by American astronomer Dale Smith in February 2024. Starting at Theta (θ) Persei it runs through HIP 12453, HIP 11997, HIP 11785, 66 Andromedae, 65 Andromedae, and 64 Andromedae, to 63 Andromedae.

Caskels:

This Selk'nam star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. Caskels is a man-eating giant defeated by their mythical shaman Kwányip (see below).

Caph Cassiopeia Cascade:

This **telescopic** asterism is a cascade of stars in the IAU constellation Cassiopeia and is Ennis 23 on the observing list of Canadian astronomer Charles Ennis. Starting at the double star Beta (β) Cassiopeiae (Caph) it then runs through three double stars in a row: HIP 876A, HIP 848, and HIP 940, then runs through HIP 874, and 902, ending at a group of five stars in the shape of a "W" including HIP 1023, 951, and 857. NOTE: The three double stars (but not Caph) at one end of the cascade are Corder 34 on the observing list of Jeffrey Corder. Corder notes these three doubles in a row but doesn't mention that Caph is also a double, making it four in a row. Size 95' X 15'

Casper the Friendly Ghost Nebula:

This asterism is the reflection nebula Messier 78 in the IAU constellation Orion. It was discovered by French astronomer Pierre Méchain in 1780 and included in Charles Messier's catalogue. In the 1864 General Catalogue it is GC 1267, and in John Herschel's catalogue it is h 368. It has been named this recently as to someone it resembled the main character in Famous Studios animated cartoon series *Casper the Friendly Ghost* (1945 – 1959). It is also known as the Bogeyman Nebula.

Cassiopeia:

The "W" asterism of this constellation is very easy to spot in the sky and the stars of this constellation show up in 316 of the asterisms of the world's sky cultures and is the way this constellation is depicted on IAU charts.

The IAU constellation Cassiopeia (IAU abbreviation Cas) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and is one of the 48 original constellations listed by Ptolemy (100 – 170), which he listed as "Κασσιέπεια" ("Kassiepeia") in his *Almagest* (see Queen Kassiepeia below). Teucros uses the name Eileithyia. Cassiopeia is the Latin version of the original Greek name. It is named for the wife of King Cepheus of Ethiopia, who became another of Ptolemy's constellations (see Cepheus, below). It is also known as the "Queen's W". Variations include "Cassiepia" (as listed by 1st century Roman author Gaius Julius Hyginus), "Cassiope", and "Cushiopeia" (as described by English painter Edwin Landseer, who described her as the "Queen of Cush").

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts Cassiopeia seated parallel to the tropics, on the equinoctial colure, when she should be resting on the Arctic circle as in the myth she was suspended in the sky upside down as a punishment for her pride.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Cassiopeia as a crowned woman seated on some sort of throne facing to our right with a wand or stick in her upraised left hand.

The globe of the 2nd century Farnese Atlas depicts this constellation as a female seated in a chair with her arms raised (Stevenson 1921).

This constellation appears as "Cassiepeia", a paranatellonta of the third decan of Aries and of Virgo as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k).

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Casiepia".

Cassiopeia appears in the Leiden *Aratea* (816) as a crowned woman in long robes facing us seated in a chair, holding her arms out slightly bent to form a "W" shape.

This constellation appears as "Cassiepia" in editions of the 8th century *Revised Aratus Latinus*:

- In two editions (St Gall 250, St Gall 902) she is wearing a crown and seated on a throne with no back,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) she is wearing a dome-shaped crown and has a halo.

The Paris BN, 12117, Paris BN lat 8663, Los Angeles, Getty Ludwig XII 5, and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Cassiopeia with a cloak over her head.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Cassepia", "Caiepia", and "Sasepia", the latter term translating as "Sage". The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depict Cassiopeia seated on a throne made of sticks. In the Padua 27 and Venice VIII 22 editions she is wearing a cloak draped over her left shoulder and has exposed her right breast and navel. The Dijon 448 manuscript of *De signis caeli* depicts Cassiopeia on a circular throne and does not expose her breast. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Cassiopeia seated on a throne with a tall, curved back, wearing a pointed or Phrygian cap. The Montecassino 3 manuscript of *De signis caeli* depicts no back on Cassiopeia's throne.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Cassiopeia as viewed from the earth and the sky as are all of the constellations in this book. She is depicted as a female in ankle-length robes seated on a

throne. She is wearing earrings, a tikka, a necklace, and bracelets. On one page the throne is turned to our right and on the other page it is turned to our left. She is sitting on the side of the throne so that she is facing us on both pages. Her arm next to the back of the throne is holding one of the uprights of the back of the throne and her other arms is gesturing palm upwards.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad depicts Cassiopeia as a woman seated in a chair facing to our left looking over her left shoulder at Cepheus and gesturing towards him with her left hand.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Hunt 212 (1171) depicts Cassiopeia seated on a throne with her left leg crossed over her right leg. She is gesturing out to her side with her left hand and has her right hand raised in a manner that makes it look as if it is tied to the top of the back of her throne. It is shown overlapping a camel representing Camelopardalis.

The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) depicts "Cassiopeia" as a well dressed woman with her arms stretched out to either side.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Cassiopiea as a crowned woman seated on a throne. The throne is turned to our left, partially showing its back, and Cassiopeia is looking sideways towards us waving with her right hand and holding the back of her throne with her left hand.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Cassiopeia as a crowned queen seated on a throne turned slightly to our left. Her right hand is raised as if in greeting and her left arm is wound around one of the uprights of the throne. It is labelled "dhāt al-kursī" ("the seated woman").

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Cassiopeia as a female seated on a throne which is turned to our right. She is wearing a crown and calf length robes. She is holding the back of the throne with her right hand and gesturing with her left hand.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Cassiopeia" as a nude figure crouching in front of a throne. They have their back to us and are slightly turned to our left, so it is impossible to determine the gender of this figure. The figure is holding a feather in their left hand and their right hand is raised skyward.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Cassiopeia as a nude figure striding to our left in front of a throne. The figure is holding a feather in their left hand and has their right hand raised above their head. It is not labelled and is poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Cassiopeia as a tiny featurless figure sitting on a throne. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Cassiopeia as a female seated on a throne turned partly to our right. She is holding her right hand up over her head and gesturing to one side with her left hand.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Cassiopeia as a female seated in a simple chair. She has

ankle length robes but her right breast is exposed. Her left hand is held skyward and her right hand is extended out to her side, palm forward, revealing a wound in her palm which is dripping blood.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts "Cassiepia" as a robed female seated on a wide throne with her arms outstretched.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Cassiopeia as a woman nude from the waist up seated on a throne facing us with arms outstretched.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts a woodcut of Cassiopeia seated on a bench with two forked branches and a pole forming a back with her arms outstretched and tied to these uprights. She is wearing an ankle length garment, but her breasts are exposed.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Cassiopeia" as a nude woman seated sideways (facing to our left) on a throne who looks in a hand mirror in her left hand and has her right hand tied to an ornament at the centre of the back of the throne.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Cassiopeia as a nude female seated on a throne. She is holding a feather aloft in her left hand and her right hand is on her right knee. It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts this reversed, with her throne turned to our right and holding the feather in her right hand.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts Cassiopeia as a crowned nude female seated in a throne which is turned to face to our left, holding a feather in her left hand and with her right hand raised as if in greeting.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Cassiopeia as a nude female seated on a throne with a canopy which is turned to our left. Her right hand is raised skyward, and she is holding a feather in her left hand.

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515, 1534, and 1535 (Dekker & Lippincott, 1999) depict Cassiopeia seated on a very tall throne with a sickle in one hand and a spiked crown on her head. In the 1515 gores she is labelled "Cassiopeia" but in the 1534 and 1535 gores she is named "CASSIEPEA". Celestial globe gores (1517) of Schöner depicts "Cassiopeia" as a crowned female seated on a throne that is turned far to our left so that we can see the back of it. He is holding what could be either a feather or a sickle in her left hand and her right hand is gesturing towards the sky. A celestial globe (1522) of Schöner depicts "Cassiopeia" as a woman seated on a throne turned to face to our left. In her left hand she is holding a feather or frond, and her right hand is touching the canopy of her throne over her head.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Cassiopeia in the same manner as Dürer et al.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Cassiopeia" as a woman seated on a throne as viewed from her left side: Details are hard to make out due to damage to the globe, but it appears that she is turned to face away from us with her right arm raised over her head.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Cassiopeia" as a woman on a throne as viewed from the left side. She is turned to face away from us, holding a frond in her left hand and having her right arm raised over her head.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Di Cassiepia". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Cassiopea".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Cassiopeia as a nude female standing in front of a throne which is turned slightly to our left. She is in left profile, with her left leg raised as if about to step onto something. Her left arm is pointing at something ahead of her. Her right arm is concealed.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Cassiopea" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss German artist Jost Amman (1539 – 1591) depicts "Cassiopeia" as a female seated on a throne with her left hand pointing skyward and a feather raised in her right hand.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a nude female seated in a chair. She is pointing skyward with her right hand and seems to be holding something out in her left hand.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius does not depict Cassiopeia on this chart.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Cassiopeia" as a crowned female in a long robe seated on a throne. She is facing to our left, looking over her right shoulder and gesturing upwards with her right hand.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Cassiepea" as a female in a long robe wearing a dome shaped hat with a six pointed star on top. She is seated on a throne and has her arms spread wide.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Cassiopeia as a queen seated on a throne.

Cassiopeia is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a woman seated on a chair with her right hand over her head and holding aloft a plume in her left hand. Bayer lists the following names for this constellation: "Cassiepea, Cassiopea, Cathedra Mollis, Mulier Sedis, Seliquastri, Seliquastrum, Siliquastrum, Sella, Solijm, Sedes regalis, Habens palmam delibutam, Canis, vel Cerua".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Cassiepeae" and depicts it as a woman seated on a chair.

Johannes Kepler's *Stella Nova in Pede Serpentarii* (1606) lists this constellation as "Cassiopeja".

Cassiopeia is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cassiopea" and is depicted as a crowned woman in a long robe holding her arms high with a feather in her left hand.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Casiopeya" as a short haired woman seated on a couch. She is naked but has drapery over her lap.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Cassiopeia" for this constellation.

"Cassiopeia" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a crowned female in a long robe seated on a throne with her arms raised high, holding a feather in her left hand.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Cassiopeia" as a female in full-length robes seated on a throne which faces to our left. She is holding a leafy branch in her right hand and is waving a cloth over her head with her left hand.

Cassiopeia is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as seated on a throne with her left leg crossed over her left, with her left arm raised.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum,* depicts "Cassiopeia" as a female seated on a throne on a plinth. She has drapery around her that leaves her breasts bare. She is holding a strip of drapery from her headdress over her head in her left hand and a frond or feather in her right hand.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Andromeda seated on a gold throne wearing purple robes: She has both hands raised above her head.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Cassiopeia" as a female wearing a crown seated on a throne holding a streaming cloth aloft in her left hand with her right hand raised to head height.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Cassiopeia" as a female seated on a throne with her arms raised.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Cassiopee” and “Cassiopeia” and depicts her as a female crowned with a diadem seated on a throne. She is holding up a frond in her right hand and is holding up the shoulder strap of her garment in her left hand.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Cassiopeia as a female seated on a throne with her arms raised and a frond in her left hand.

Cassiopeia is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: She is depicted sitting on a throne, holding her tresses in her right hand and holding a frond aloft in her left hand.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Cassiopeia” as a woman seated on a through holding aloft a feather in her left hand and a piece of cloth in her right hand.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Cassiopeia as a female seated on a throne with her arms raised above her shoulders.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Cassiopeia as a female seated on a throne. He is wearing calf length robes and a conical hat. She is holding aloft a feather or frond in her left hand and is holding her right hand over her head as if she is about to remove her hat.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Cassiopée” as a female seated on a canopied throne with her right hand touching her head and her left hand holding a feather.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Cassiopeia” as a seated female holding a feather in her rith hand and holding her left arm in an arc over her head.

Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists this constellation as “Cassiopeja” in the text but “Cassiopiea” on the charts. It depicts her as a female seated on a chair with her arms raised to form the “W” of this constellation.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Cassiopea” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Cassiopée” on a northern sky chart as standing beside a throne as if she has just stood up and is turning away from us to our right: She is holding a frond of some sort in her right hand. In the same atlas in a close-up chart she is depicted as seated on a throne holding both arms aloft as if flexing her biceps and is holding a piece of cloth in her right hand and her braids in her left hand: She is wearing a robe which exposes her left breast. In the 1778 edition she is depicted seated on a throne wearing a robe which exposes her left breast. She has both arms raised, her right hand holding her tresses.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts

"Cassiopeia" as a female seated on a throne, naked from the waist up, holding some drapery over her head with her left hand and a feather aloft in her right hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Cassiopeia" as a seated woman with her left arm over her head and her right hand holding aloft a feather.

"Cassiopeia" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a robed female sitting on a throne with her left hand over her head and her raised left hand holding a frond.

American uranographer William Croswell (1760 – 1834) depicts Cassiopeia on his *Mercator Map of the Starry Heavens* in 1810 as a woman seated a throne, her breasts exposed, with her right hand touching her head and her left hand holding a feather aloft.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Cassiopeia" and depicts her as seated on a throne holding a branch aloft in her left hand.

Scottish astronomer Alexander Jamieson (1782 – 1850) listed Cassiopeia in his Celestial Atlas in 1822. She is depicted as a female seated on a throne wearing a robe which exposes her left breast. She has both arms raised, her right hand holding part of the robe and the left hand looks as if it is holding a brush that she is using to brush her hair. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts Cassiopeia in a similar manner.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Cassiopeia" as a woman seated on a throne, with her breasts bared, and her arms raised above her head.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Cassiopeia" as a seated female facing to our left gesturing to her left with her left hand.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cassiopeia" as a female seated on a throne holding her arms up to make a "W" shape.

Cassiopeia is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. She is depicted as seated in a chair, nude except for a drapery that runs over her right shoulder and over her right leg. She is wearing sandals and holding a frond in her raised left hand.

"Cassiopeia" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): She is depicted as a female in a long robe seated on a throne with her arms raised high.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Cassiopeia" and describes it as "a queen seated on her throne".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) listed "Cassiopeia, The Lady in the Chair" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation simply as "Cassiopeia".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cassiopeia" in his *Star Atlas* (1893).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Cassiopeia" and does not describe it.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Cassiopeia" as "the starred Ethiop queen".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Cassiopeia in his book *The Stars - A New Way to See Them* (1952) by extending one end of the "W" of Cassiopeia by running a line from Epsilon (ε) Cassiopeiae through 48 Cassiopeiae to 50 Cassiopeiae.

Cassiopeia in Cassiopeia:

This telescopic asterism is made up of stars of the IAU constellation Cassiopeia: HD1863, 1825, 1821, Gaia DR3 419538250936734208, and Gaia DR3 41972612980958336. It was posted by "jrazz" on Cloudy Nights in October 2022.

Cassiopeia Salt and Pepper Cluster:

See Salt and Pepper, below.

Cassiopeia's Volcano:

This **telescopic** asterism is made up of stars of the IAU constellation Cassiopeia. It was posted on *Cloudy Nights* by American astronomer "Fiske" in February 2022. The "V" shape of the volcano is defined by HIP 43, HIP 118116, HIP 117775, HIP 117830, HIP 118090, HIP 124, and HIP 418. The "lava flow" is starts at SH 2-169 and SH 2-168 and runs down to WZ Cassiopeiae and HIP 181. The Widow's Web Cluster (NGC 7790) and open cluster NGC 7788 resemble ash clouds on one side of this "volcano".

Cast Away Children:

This Salish asterism "Esʔsḱʷlelt" is the Hyades cluster and the Pleiades cluster in the IAU constellation Taurus (Pete 2023). Each star represents a character:

- Snc̓le ("Coyote") is Alpha (α) Tauri (Aldebaran),
- Theta (θ) 1 and 2 Tauri (Hyadum II and III) are a pair of dancing head lice,
- Badger's wife is Delta (δ) 1 Tauri,
- Badger's children are Delta (δ) 2 and 3 Tauri and Epsilon (ε) Tauri,
- Coyote's favorite child is Gamma (γ) Tauri,
- Coyote's other "cast away" children are the Pleiades cluster.

Castaway Cluster:

This **telescopic** asterism is the open cluster NGC 6520 in the IAU constellation Sagittarius, which was discovered by English astronomer William Herschel in 1785 who listed it as "VII 7". It is GC 4358 in the *General Catalogue* of 1864. This is also known as the Dead Man's Chest (see below) and the Cosmic Dandelion (see Dandelion, below).

Castle of Arianrhod:

This Welsh asterism "Caer Arianrhod" is the IAU constellation Corona Borealis and is also known as the Castle of the Silver Circle. R. H. Allen lists this in his *Star Names* in 1899. Victorian folklorist Marie Trevelyan (1852 – 1922) listed it as the "Circle of Arianrhod" and "Caer Arianrhod" in her *Folk-lore and Folk-stories of Wales* (1909). Lady Charlotte Guest (1812 – 1895) also lists Caer Arianrod as a name for this constellation in her translation of the *Mabinogion*.

Castle of Gwydion:

This Welsh asterism is made up of the stars of the IAU constellation Draco (Freer 2004). NOTE: Trevelyan, Marie. *Folk-Lore and Folk-Stories of Wales* (1909) lists "Caer Gwydion" and "Gwydion's Circle" names for the Milky Way.

Castle of the Silver Circle:

See Castle Arianrhod, above.

Castle with Rampart:

This Korean asterism "Seongbyeog-i Issneun Seong" (성벽이 있는 성) is a hexagon of stars in the IAU constellation Capricornus: Iota (ι), Theta (θ), Eta (η), Chi (χ), Phi (ϕ), and 29 Capricorni.

Castor:

This Greek and Roman star is the sextuple star system Alpha (α) Geminorum in the IAU constellation Gemini. Castor is one of the twin sons of Zeus and Leda in Greek and Roman mythology:

- Dante Alighieri (1265 – 1321) and the Italians call it "Castore".
- Pliny the Elder (23 – 79 C.E.) called it "Castores" in his *Naturalis Historia*.
- *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists "Castore".
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Castor al Apollo".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as Castor.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Castor".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Castore" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Castor" for this star.
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists "Castor".
- American uranographer William Croswell (1760 – 1834) lists "Castor" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Castor" in his *Celestial Atlas* in 1822.
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Castor".

- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Castor".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Castor".
- This is listed as "Castor" in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English astronomers Crossley, Gledhill, and Wilson list "Castor" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Castor".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Castor".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Castor".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Castor".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Castor".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Castor" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Castor" for this star.
- "Lelum" is the Lithuanian name for Alpha (α) Geminorum (Castor) in the IAU constellation Gemini.
- The IAU Working Group on Star Names chose Castor as the name for the star Alpha (α) Geminorum Aa.

Cat:

This Greek lunar mansion is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as "a Greek interpretation of the Sumerian AL.LUL": This would make it stars in the IAU constellation Cancer.

This Egyptian asterism is one of the paranatellonta of the second decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). Mosenkis describes this as "Perseus' sickle, or less Auriga, a half of Triangulum".

A sitting cat appears alongside the Greek asterism Ram (see below) on the Daressy Zodiac of the Roman Imperial Period.

In 1870 English astronomer Richard A. Proctor proposed naming IAU constellation Canis Minor "Felis" ("the cat") and Canis Major "the dog" as he thought that these abbreviated titles would take up less space on celestial charts. In *A New Star Atlas* (1887) Proctor drops this idea and lists Canis Minor as an official constellation "recognized in the catalogue of the British Association".

Another "cat" asterism was "Felis", created by French astronomer Jérôme Lalande in 1799, who wrote: "I am very fond of cats. I will let this figure scratch on the chart. The starry sky has worried me quite enough in my life, so that now I can have my joke with it." Variations of the name include "Faelis". This asterism was made up of stars between the IAU constellations Antlia and Hydra. It first appeared in German astronomer Johann Ehlert Bode's *Uranographia sive Astronum Descriptio* in 1801, in Bode's Die

Gestirne as “Katze”, in Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) as “Katze” and Lalande’s *Bibliographie Astronomique* in 1805 and on Secchi’s planisphere in 1878 as “Gatto”. Scottish uranographer Alexander Jamieson (1782 – 1850) listed Felis in his *Celestial Atlas* in 1822. Felis is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. The central star of Felis is Mu (μ) Hydrae:

- The cat’s “head” is four 8th to 9th magnitude stars including HIP 51060,
- The “body” is a rough oval of 9th magnitude stars on the opposite side of Mu (μ) Hydrae plus the star HIP 51185, and
- From HIP 51185 a “tail” runs out through HIP 51148 and three other 8th to 9th magnitude stars.

This IAU star “Felis” is the star HIP 48615 (HD 85951) in the IAU constellation Hydra. The IAU approved the name “Felis” for HIP 48615 as it was once in the now obsolete constellation Felis (see above).

This **telescopic** asterism is in the IAU constellations Cassiopeia and is Ennis 31 on the observing list of Canadian astronomer Charles Ennis. The “head” is the triangle of stars HIP 11067, 10743, and 10681. The “neck” is the stars HIP 10629 and HD 13560. The “front leg” is HIP 10780 and 10893. The “back leg” is HIP 9765, the double star HIP 9720A, 53 Cassiopeiae, and HIP 9635. The cat’s curving “back” is HIP 10388, 9997, 9690, and 52 Cassiopeiae. The cat’s “tail” is the line between the double stars HIP 9312 and HIP 8626. Size 150’ X 80”. NOTE: John Raymond lists 52 and 53 Cassiopeiae as his asterism “52-53 CAS” and Jeffrey Corder lists these two stars as Corder 317.

Cat Scratch:

This **telescopic** asterism NGC 5907 is a spiral galaxy in the IAU constellation Draco. It is viewed edge-on with a spiraling tidal stream of stars. It was discovered in 1788 by English astronomer William Herschel who listed it as “II 759”. John Herschel listed it as h 1917 and it became GC 4087 in his *General Catalogue* of 1864. NOTE: Lord Rosse thought he was looking at two objects separated by the dust lane, and created the name NGC 5907, but this was later discovered not to be a separate object. It is GC 4086 in the *General Catalogue* of 1864. NGC 5906 (GC 4086) now refers to the fainter part of the galaxy west of the dust lane, which was recorded by George Johnstone Stoney in 1850. It is also known as the Splinter Galaxy (see below), the Enveloped of Draco (see below) and the Knife Edge Galaxy (see above).

Cat Stars:

This Celtic (Gaulish) asterism “Catosđirai” is the Hyades cluster in the IAU constellation Taurus (Boutet 2017). It was also known as “Cat Palug” (“defective cat”) or “Cattos Pallucos” (“customary cat”).

Catalpa Brightness:

This Chinese Chenzhuo xing guan “Ziming” is the star Lambda (λ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden West Wall.

Caterpillar Jaguar:

This Barasana asterism “Iya Yai” is the IAU constellation Scorpius. Hugh-Jones (2006) writes that some Barasana add “parts of Lupus and Libra… as feet”. It is described by some as a jaguar with a snake for a tail. Caterpillar Jaguar is also known as “Anya Haku” (see Father of All Snakes, below).

Caterpillar Nebula:

This **telescopic** asterism is the dark nebula Barnard 168 (LDN 1055) in the IAU constellation Cygnus. Size 100'X 20'. René Merting describes it on the *Faint Fuzzies* website: "The dark nebula starts faintly in the west and then pulls east as a dark well-defined tube… south of the nebula a prominent star chain pulls from SW to NE and ends near Cr 470." NOTE: This is next to IC 5146, the Cocoon Nebula (see below). It is Lorenzin 12 on Tom Lorenzin's list and listed in Gary Seronik's *Binocular Highlights* and in Steve Coe's *Best of Barnard's Dark Nebulae*. It is also known as the Asphalt Path (see above), and the Dark Cigar (see below).

Catherine:

This German asterism "Catherine" or "Saint Catherine" is the IAU constellation Aquila and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Catharina Al Aquila cum Antinous". Edward Sherburne lists it as "Saint Katherine" in his Sphere of Marcus Manilius in 1675 and John Hill lists it in his *Urania* in 1754 as "Katherine".

Cat's Cradle of the Children:

This Hawaiian asterism "Ka Hei-Hei o Na Keiki" is the seven brightest stars of the IAU constellation Orion: It is a new Hawaiian name as any original name has been lost. It was also known as "Ku'uku'u" ("spider") or "Po" ("night").

Cat's Eye:

There are three **telescopic** "Cat's Eye" asterisms:

- One is the planetary nebula NGC 6543 (Caldwell 6) in the IAU constellation Draco. It was discovered by English astronomer William Herschel in 1786 who listed it as IV 37". It is GC 4373 in the *General Catalogue* of 1864. English amateur astronomer William Huggins (1824 – 1910) made the first spectroscopic investigation of a planetary nebula on this nebula. It is also known as the Sunflower Nebula or the Snail Nebula. Size 0.3' X 0.3.
- One is the planetary nebula NGC 3242 (Caldwell 59) in the IAU constellation Hydra. It was discovered in 1785 by English astronomer William Herschel who listed it as "IV 27". John Herschel included it in his catalogue as h 3248 and later as GC 2102 in his *General Catalogue* of 1864. American astronomer Tom Lorenzin gave it this name. It is also known as the Ghost of Jupiter due to its similar size and appearance to the planet when viewed in a telescope eyepiece. It is also known as the Eye Nebula.
- One is Messier 94 (NGC 4736) is a spiral galaxy in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1781. It is listed in the 1864 General Catalogue as GC 3258 and in John Herschel's catalogue as h 1456. It is also known as the Croc's Eye Galaxy.

Cat's Eyes:

This asterism is the stars Lambda (λ) and Upsilon (υ) Scorpii in the IAU constellation Scorpius. It was given this name by American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941). Rey lists it his book *The Stars - A New Way to See Them* (1952).

Cat's Head:

This Egyptian asterism is one of the paranatellonta of the first decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). Mosenkis describes this as "Perseus or less Arcturus". Arcturus is in Boötes in a different part of the sky, so I assume that it is made up of stars of the IAU constellation Perseus.

Cat's Paw Nebula:

This **telescopic** asterism is emission nebula NGC 6334 in the IAU constellation Scorpius. It was discovered in 1837 by English astronomer John Herschel who listed it as h 3678 and later as GC 4288 in his *General Catalogue* of 1864.

Cat's Paw of Lynx:

This **telescopic** asterism "Aelúropus Lýncis" is the peculiar ring galaxy NGC 2445 (Arp 143) in the IAU constellation Lynx which is interacting with NGC 2444 (GC 5392). It was discovered by Édouard Stephan in 1877 and later became GC 5393 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "looks as if it is physically touching the cat's paw at the northern edge". It is also known as the "Genie in a Bottle".

Cattle Corral:

The stars of this Mapuche asterism are unidentified at present.

Cattle Fires:

This Dinka asterism is the IAU constellation Canis Major: The Dinka believed them to be cattle fires of people who tended livestock on the plains.

Cattle Herd:

This Maasai asterism is the Pleiades cluster in the IAU constellation Taurus.

Cattle Master:

The Uppsala Archaeoastronomical Project proposed the IAU constellation Orion for this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne's Tribe in Tacoma, Washington in November 2023.

Cattle of Athamantos Helles:

This Latin asterism "Pecus Athamantidos Helles" is the IAU constellation Aries.

Cattle Pen:

This Babylonian asterism "É.TÙR" or "tarbasu" is listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified.

Cattle Thief:

This Zulu star "iNtshola" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Slotegraaf 2013).

Cattleman:

This Arabic star "al-Baqqār" (البقار) is Beta (β) Boötis in the IAU constellation Boötes:

- This was later latinized to "Nekkar" or "Nakkar".
- John Hill gives the name "Neckar" in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Nikkar, a corruption from al bakkár, the herdsman" as well as "Nekkar,… from al-nakkár, the digger" and attributes this to the Egyptian astronomer Ibn Yunis (Abū ibn 'Abd al-Rahmān ibn Ahmad ibn Yūnus al-Safafī, 950 – 1009).
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Nekkar".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Nekkar".
- The IAU approved the name Nekkar for Beta (β) Boötis.

Cauldron of Cerridwen:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Cauliflower:

This **telescopic** asterism "three-lobe nebula" is the HII region and open cluster Messier 20 (NGC 6514) in the IAU constellation Sagittarius. It was listed by French astronomer Charles Messier in 1764, but American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* that it was "probably first seen by Le Gentil in 1747": This would be French astronomer Guillaume Le Gentil (1725 – 1792). It is listed in the General Catalogue of 1864 as GC 4355 and John Herschel listed it elsewhere as h 1991 and 3718. South African astronomer Richard Ford (2010) describes this as having a "cauliflower shape". This is more commonly known as the Trifid Nebula (see below).

Cautel:

This asterism is Ptolemy's asterism Argo's Ship (see Argo's Ship, above) as listed by Dutch uranographer Hugo Grotius (1583 – 1645), who admitted "Hoc quid sit nescio" ("I don't know what this is"). Cautel is an obsolete term, meaning deceit or trickery, which doesn't seem to fit here.

Cavalier:

This German star is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by German astronomer Johann Bayer (1572-1625) and by R. H. Allen in his *Star Names* in 1899.

Cavalier's Hat:

This **telescopic** asterism is in the IAU constellation Pegasus and is Ennis 84 on the observing list of Canadian astronomer Charles Ennis. Size 45' X 10'. The "brim" starts at SAO 90170 and runs through HIP 108679, HIP 108618, and HIP 108548 to HD 208799. The top of the hat is a curve from HIP 108618, through SAO 90161 and Gaia DR3 1782689780376695552 to HIP 108548. A "feather" in the hat is formed by the triangle of stars SAO 90161, Gaia DR3 1782645486378315648 and Gaia DR3 1782632120440092416. This asterism includes stars of Corder 4555.

Cavalry of Emperor:

This large Korean asterism “Hwangje-ui Gibyeong” (황제의 기병) is made up of stars of the IAU constellations Centaurus, Circinus, Lupus, and Crux:

- The central feature is a pentagon of the stars Gamma (γ), Epsilon (ε), Upsilon (υ) 1 and 2, Mu (μ), Iota (ι), and Eta (η) Centauri,
- From Gamma (γ) Centauri a line runs off through Sigma (σ), and Delta (δ) Centauri to the IAU constellation Crux, which forms the end of the line,
- From Epsilon (ε) Centauri a line runs to Nu (ν) Centauri, where it splits:
- One line runs to HIP 70264A where it splits to Mu (μ) 1 Crucis in one direction and Beta (β) Circini in the opposite direction, and
- One line runs down through Zeta (ζ) and Kappa (κ) 1 Lupi to Mu (μ) Lupi.

Cave Nebula:

There are two **telescopic** “cave” asterisms:

- One is the HII region SH 2-155 (C 9, LBN 529) in the IAU constellation Cepheus. This cloud has a rectangular dark spot on one side resembling a cave. This name was coined by English astronomy educator Patrick Moore (1923 – 2012), who included it in his *Caldwell Catalogue* as Caldwell 9.
- This is also an alternative name for the Wolf’s Cave Nebula (see below).

Cave of Chickens:

This Raivavae asterism “Anamoa” is the Pleiades cluster in the IAU constellation Taurus (Edwards 2015).

Cavern of the Flounder:

This Māori asterism “Te Rua-Patiki” is the Coal Sack Nebula (see Coal Sack Nebula below).

Caverns of Mist:

This Polynesian asterism from the Tuamotu archipelago is the dust lanes of the Milky Way near the galactic bulge near the IAU constellation Scorpius.

Cayrel’s Star:

This **telescopic** star is an ultra-metal-poor halo star BD-16 251 in the IAU constellation Cetus (magnitude 11.6). It is named after French astronomer Roger Cayrel (1925 – 2021).

Cebalrai:

See Shepherd’s Dog, below.

Cecrops:

This Greek asterism “Cecrops” is the IAU constellation Aquarius:

- Johann Bayer’s *Uranometria* (1603) lists “Cecrops” for Aquarius.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Cecrops”.
- “Cecrops” is listed by John Hill in his *Urania* in 1754. Hill translates this as “urn”, but Cecrops I and II are rulers of Athens in Greek mythology who are both related in myths regarding the God of the Sea, Poseidon.

Cedron:

This asterism is the IAU constellation Eridanus as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675, in John Hill's *Urania* in 1754, and as listed by German astronomer Wilhelm Schickard (1592 – 1635). Cedron is a stream David crossed and is mentioned in 2 Samuel 15:23.

Ceginus:

Ceginus is the star Phi (ϕ) Boötis in the IAU constellation Boötes:

- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as "Cegnius"
- German astronomer Johann Bayer (1572-1625) listed it as "Thegius" but also gives this as an alternate name for the constellation and elsewhere lists "Ceginus" as a name for Gamma (γ) Boötis.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists "Arabice Theguius".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Thegius".
- R.H. Allen lists "Ceginus", "Seginus", "Chegninus", and "Cheguius" as former names of the constellation Boötes in his *Star Names* in 1899.
- Other variations include "Chegnius", "Chegninus", and "Cheguinus". These names are believed to be Latin mistranslations of an Arabic rendering of the name of the constellation Boötes in Ptolemy's *Almagest* (2nd century). Compare this to Seginus, below, which is the name for the star Gamma (γ) Boötis. NOTE: Ceginus, Chegnius, Chegninus, and Cheguinus have been used by some, including Johann Bayer for the IAU constellation Cepheus.

Ceibo:

This **telescopic** Uruguayan star "Ceibo" is HIP 37284 (HD 63454) in the IAU constellation Chamaeleon (magnitude 9.36). It was given this name in the IAU NameExoWorlds campaign. The Ceibo is a tree native to Uruguay. It has an exoplanet named Ibirapitá: This is a tree, also known as the Artigas tree, named for a national hero.

Celaeno:

See Dark One, below.

Celebration Gate:

This Chinese Chenzhuo xing guan "Qingmen" is the star Iota (ι) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Celebration of Sky:

This Korean asterism "Haneul-ui Chugha" (하늘의 축하) is a line of stars with another line "crossing the T" at the end in the IAU constellation Taurus:

- The line of stars starts at HIP 21670 and runs through 88, 90, and 79 Tauri, ending at 73 Tauri. Two lines branch off from 73 Tauri to form the "T":
- One to Rho (ρ) Tauri, and
- One to 57 Tauri.

Celeris:

This Latin asterism is the IAU constellation Equuleus. Celeris was the brother of the winged horse Pegasus, given by the God Mercury to Castor.

Celestial Arsenal:

There are two Chinese Chenzhuo xing guans named “Tianku” (天库):

- One is the star HIP 69038 in the IAU constellation Boötes. It represents generals and military affairs.
- One is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. It is part of their xing guan Five Chariots.

Celestial Balance:

This Chinese star “Tianquan” from the Three Kingdoms to the Ming Dynasty is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Tianquan” is the star Delta (δ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Celestial Barn:

This Chinese Chenzhuo xing guan “Tiancang” is the star Theta (θ) Aurigae in the IAU constellation Auriga. It is part of their xing guan Five Chariots.

Celestial Beam:

This Chinese star “Tianliang” is Tau (τ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

Celestial Bed:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is two intersecting bent lines of three stars in the IAU constellation Draco:

- The first bent line starts at HIP 72664, runs to a bend at HIP 71876A and ends at HIP 68184.
- The second bent line starts at HIP 73507, runs to a bend at HIP 71040, and ends at the determinative star, HIP 70952.

This Chinese xing guan “Tiānchuáng” (天床) is made up of stars in the IAU constellation Ursa Minor: 6 Ursae Minoris and HIP 69373, 74605, 73199, 77277 and 79414.

This Chinese Chenzhuo xing guan “Tiānchuáng” is a zig-zagging line of stars in the IAU constellation Draco and Ursa Major: Starting at HIP 71111 it runs through HIP 71040, HIP 65728,10 Draconis, HIP 62402, and 8 Draconis to 9 Draconis.

Celestial Boat:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of star in the IAU constellation Perseus: One end starts at Lambda (λ) Persei and runs through b Persei, Mu (μ) Persei, 48 Persei, Delta (δ) Persei, Psi (ψ) Persei, Alpha (α) Persei (Mirfak – determinative star), and Gamma (γ) Persei, ending at Eta (η) Persei.

This Chinese xing guan “Tiānchuán” (天船) is a curving line of stars in the IAU constellation Perseus: HIP 19949 and 20156, Mu (μ) Persei, 48 Persei, Delta (δ) Persei, Psi (ψ) Persei, Alpha (α) Persei (Mirfak), Gamma (γ) Persei, and Eta (η) Persei. They call the star Lambda (λ) Persei inside of this curve “Stored Water”.

This Chinese Chenzhuo xing guan “Tiānchuán” is a curved line of stars in the IAU constellation Perseus: Starting at HIP 19949 it runs through HIP 20070, Mu (μ) Persei, 48 Persei, Delta (δ) Persei, Psi (ψ) Persei, Alpha (α) Persei (Mirfak), and Gamma (γ) Persei to HIP 14382.

Celestial Cereals:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a pentagon of stars in the IAU constellation Vela: Gamma (γ) Velorum, w Velorum, e Velorum, b Velorum, and c Velorum (determinative star).

This Chinese Chenzhuo xing guan is a kite shaped asterism made up of the stars of the IAU constellations Carina and Vela. Four stars form a “diamond” or “kite” shape: Delta (δ) Velorum, Kappa (κ) Velorum, HIP 46701, and Iota (ι) Carinae. From Delta (δ) Velorum a line runs out to Omicron (ο) Velorum to form a “tail”.

Celestial Cock:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Sagittarius: 57 and 55 Sagittarii (the latter being the determinative star).

This Chinese xing guan “Tiānjī” (天鸡) is a line of two stars in the IAU constellation Sagittarius: 55 and 56 Sagitarii.

This Chinese Chenzhuo xing guan “Tiānjī” is a line of two stars in the IAU constellation Sagittarius: 61 and 55 Sagittarii.

Celestial Collaborators:

This Chinese star “ Tiantong” is Phi (φ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

Celestial Comma:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. It was given this name by American astronomer Tom Lorenzin in his *1000+ The Amateur Astronomer’s Field Guide to Deep Sky Observing*. This is also known as the Antennae Galaxies (see above), the Ring Tail Galaxy (see below), the Snorter (see below), the “Little Shrimp”, the “Doughnut with a Bite Taken Out of It” (see below) and the Mosquito Larvae (see below). It is Arp 244 in Arp’s *Atlas of Peculiar Galaxies*. American astronomer Steve Coe (1949 – 2018) also used this name.

Celestial Conclave:

This Chinese xing guan “Tiān'ē” (天阿) is the star 62 Arietis in the IAU constellation Aries. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tiān'ē” is the star HIP 20842 in the IAU constellation Taurus.

Celestial Discipline:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellations Corona Borealis and Hercules: The line starts at the star f Herculis and runs through Theta (θ) Herculis, HIP 85382, 72 Herculis, 59 Herculis, Epsilon (ε) Herculis, Zeta (ζ) Herculis, and Nu (ν) 1 and 2 Coronae Borealis, ending at the determinative star, Xi (ξ) Coronae Borealis. Kemp et al (2022) describe this as a "prison".

This Chinese xing guan "Tiānjì" (天纪) is a "W" shaped group of stars in the IAU constellations Corona Borealis and Hercules: Theta (θ), Epsilon (ε), Zeta (ζ), and 61 Herculis, and Xi (ξ) Coronae Borealis and HIP 86178.

This Chinese Chenzhuo xing guan "Tiānjì" is a zig-zagging line of stars in the IAU constellations Corona Borealis, Hercules, and Lyra: Starting at Xi (ξ) Coronae Borealis it runs through Nu (ν) 1 & 2 Coronae Borealis, Zeta (ζ) Herculis, Epsilon (ε) Herculis, 59 Herculis, 68 Herculis, Theta (θ) Herculis, and Kappa (κ) Lyrae to Mu (μ) Lyrae.

Celestial Dog:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of stars with a "fork" at one end in the IAU constellations Monoceros and Puppis:

- The curving line stars at KQ Puppis (next to Messier 47) and runs through 140 Puppis (the determinative star), 4 Puppis, and 5 Puppis, ending at Alpha (α) Monocerotis.
- From Alpha (α) Monocerotis two lines run out:
    - One to the star HIP 37394,and
    - One to the star HIP 36640.

This Chinese xing guan "Tiāngǒu" (天狗) is a bent line of stars in the IAU constellations Pyxis and Vela: Delta (δ), Gamma (γ), Alpha (α), and Beta (β) Pyxidis, and HIP 43603, 43325, 42884, and 42312.

This Chinese Chenzhuo xing guan "Tiāngǒu" is made up of stars of the IAU constellation Monoceros: From 27 Monocerotis, three lines run out:

- One runs to Zeta (ζ) Monocerotis,
- One runs to 28 Monocerotis, and
- One runs through HIP 38474, HIP 37901, and 25 Monocerotis to HIP 36388.

Celestial Drumstick:

This Chinese xing guan "Tiānfú" (天桴) is a line of stars in the IAU constellation Aquila: 58, 62, Eta (η), and Theta (θ) Aquilae. It is close to their xing guan "Drum at the River" (see below).

This Chinese Chenzhuo xing guan Tianfu (天桴) is a bent line of three stars in the IAU constellation Aquila: HIP 100541, Tau (τ) Aquilae, and Phi (φ) Aquilae. The Celestial Drumstick was originally located near the Drum at the River which coincided with its astrological meaning. Over time, it was gradually moved downward, and its connection with Drum at the River gradually weakened.

Celestial Earth God's Temple:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellation Puppis: One end starts at c Puppis and runs through n Puppis, E Puppis, D Puppis, and x Puppis, ending at v Puppis (the determinative star).

This Chinese xing guan “Tiānshè” (天社) is a bent line of stars in the IAU constellation Vela: The line of stars starts at Gamma (γ) Velorum and runs through b, Delta (δ), and Kappa (κ) Velorum ending at N Velorum.

This Chinese Chenzhuo xing guan “Tiānshè” is made up of stars of the IAU constellation Puppis. Two stars form a central line: HIP 37752 and HIP 38455.

- From HIP 37752 two lines go out to Pi (π) Puppis and HIP 37096, and
- From HIP 38455 two lines go out to Zeta (ζ) Puppis and HIP 38414

Celestial Emperor:

This Chinese star was a pole star listed during the Shang Dynasty (1600 – 1027 B.C.E.). Alpha (α) Ursae Minoris (Polaris) was NOT the pole star at that time (due to precession). Possible stars proposed for this pole star include i Draconis, 42 Draconis, or 184 Draconis, or Beta (β) Ursae Minoris (Kochab), but it is possible that this was something carried over from as early as 3000 B.C.E., so it is difficult to pin down the exact star.

Celestial Farmland (in Horn Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Virgo: 84 Virginis and Omicron (o) Virginis (the determinative star).

This Chinese xing guan “Tiāntián” (天田) is a line of two stars in the IAU constellation Virgo: Tau (τ) and Omicron (o) Virginis.

This Chinese Chenzhuo xing guan is a line of two stars in the IAU constellations Virgo: 84 Virginis and Omicron (o) Virginis.

Celestial Farmland (in Ox Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Capricorn, each of which has two lines of stars running off from it in opposite directions:

- The line of three stars is HIP 102094, 101384, and 4 Capricorni (the determinative star).
- From HIP 102094 two lines run out:
    - One to the star HIP 101997, and
    - One to the star HIP 103092
- From HIP 101384 two lines run out:
    - One to the star HIP 101090, and
    - One to the star HIP 100738.
- From the star 4 Capricorni, two lines run out:
    - One to the star Sigma (σ) Capricorni, and
    - One to the star HIP 99825.

This Chinese xing guan “Tiāntián” (天田) is a quadrilateral of stars in the IAU constellations Piscis Austrinus and Capricornus: 24, Psi (ψ), and Omega (ω) Capricorni and 3 Piscis Austrini.

This Chinese Chenzhuo xing guan “Tiāntián” is a lattice of stars in the IAU constellations Capricornus, Microscopium, and Sagittarius: The centre line is the stars HIP 102094, HIP 101384, and 4 Capricorni. From HIP 102094 lines run out to HIP 101997 and HIP 102092. From HIP 101384 lines run out to HIP 100738 and 101090. From 4 Capricorni lines run out to Sigma (σ) Capricorni and HIP 99825.

Celestial Flail:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Capricorn, each of which has two lines of stars running off from it in opposite directions:

- The line of three stars is HIP 102094, 101384, and 4 Capricorni (the determinative star).
- From HIP 102094 two lines run out:
    - One to the star HIP 101997, and
    - One to the star HIP 103092
- From HIP 101384 two lines run out:
    - One to the star HIP 101090, and
    - One to the star HIP 100738.
- From the star 4 Capricorni, two lines run out:
    - One to the star Sigma (σ) Capricorni, and
    - One to the star HIP 99825.

This Chinese Chenzhuo xing guan “Tiānbàng” is a bent line of five stars in the IAU constellations Draco and Hercules: Iota (ι) Herculis, Gamma (γ) Herculis, Beta (β) Herculis (Kornephoros), Nu (ν) 1 Draconis, and Xi (ξ) Draconis.

This Chinese xing guan “Tiānbàng” (天棓) is made up of stars of the IAU constellations Draco and Hercules:

- The “handle” is a line running between Gamma (γ) Draconis and 85 Herculis.
- A curve of stars forming the “flail” runs from Gamma (γ) Draconis to Beta (β) Draconis (Rastaban), 25 Draconis, and Xi (ξ) Draconis.

This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Celestial Foodstuff:

This Chinese xing guan “Tiānlǐn” (天廩) is a line of four stars in the IAU constellation Taurus: 5, 4, Xi (ξ), and Omicron (ο) Tauri. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tiānlǐn” is a line of four stars in the IAU constellation Taurus: Omicron (ο) Tauri, Xi (ξ) Tauri, 4 Tauri, and 5 Tauri.

Celestial Ford:

This Chinese xing guan “Tiānjīn” (天津) is an oval of stars at one end of the IAU constellation Cygnus:

- One side starts at Delta (δ) Cygni (the determinative star) and runs down through Omicron (ο) 1 and 2 Cygni, Alpha (α) Cygni (Deneb), Nu (ν) Cygni, Tau (τ) Cygni, and Upsilon (υ) Cygni, ending at Zeta (ζ) Cygni, and
- The other side runs from Zeta (ζ) Cygni through Epsilon (ε) and Gamma (γ) Cygni back to Delta (δ) Cygni.

This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tiānjīn Zēng” is an oval of stars in the IAU constellation Cygnus: From Delta (δ) Cygni it runs around through Gamma (γ) Cygni, Epsilon (ε) Cygni, Zeta (ζ) Cygni, Upsilon (υ) Cygni, Tau (τ) Cygni, Nu (ν) Cygni, Alpha (α) Cygni (Deneb), and Omicron (ο) 1 & 2 Cygni.

Celestial Gate:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Virgo: 73 Virginis and 61 Virginis (the determinative star).

This Chinese star Tiānguān (天關) is Zeta (ζ) Tauri in the IAU constellation Tauri. The IAU approved the name Tianguan for the star Zeta (ζ) Tauri A.

This Chinese xing guan "Tiānmén" (天門) is a line of two stars in the IAU constellation Virgo: 53 and 69 Virginis.

Celestial Great One:

This Chinese xing guan "Tiānyǐ" (太乙) is the star 10 Draconis in the IAU constellation Draco. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. NOTE. The IAU approved the name Tianyi for the star 7 Draconis and Taiyi for the star 8 Draconis.

This Chinese Chenzhuo xing guan "Tiānyǐ" is the star Kappa (κ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden West Wall.

Celestial High Terrace:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Taurus: 97 Tauri (the determinative star), HIP 22176, 96 Tauri and HIP 23043.

There are two Chinese xing guans called ""Tiāngāo" (天高)" from the Three Kingdoms to the Ming Dynasty:

- One is the star Alpha (α) Tauri (Aldebaran). It is also known as Side General (see below).
- One is a diamond of four stars in the IAU constellation Taurus: Iota (ι), Eta (η), 97, and 107 Tauri.

There are two Chinese Chenzhuo xing guans called "Tiangao" in the IAU constellation Taurus:

- One is the star Alpha (α) Tauri (Aldebaran). It is part of their xing guan "Net".
- One is an angular "box" of the stars Tau (τ) Tauri, HIP 21604, 97 Tauri, and Iota (ι) Tauri.

Celestial Hook:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of stars in the IAU constellation Cepheus: It stars at the star Gamma (γ) Cephei, 33 Cephei, 31 Cephei, 24 Cephei, 11 Cephei, Beta (β) Cephei (Alderamin, the determinative star), to a bend at HIP 100261, ending at HIP 101134.

This hook-shaped Chinese xing guan "Tiāngōu" (天钩) is made up of stars of the IAU constellation Cepheus: It starts at Omicron (o) Cephei then runs down through HIP 113864, Iota (ι) Cephei, 26 Cephei, Xi (ξ) Cephei, Alpha (α) Cephei (Alderamin), and Eta (η) Cephei and then curves around through Theta (θ) Cephei, HIP 100357, 99731, and 100933, and ends at 4 Cephei.

This Chinese Chenzhuo xing guan "Tiāngōu" is a "hooked" line of stars in the IAU constellations Cepheus and Cygnus: From 63 Cygni it runs through Xi (ξ) Cygni, 68 Cygni, Rho (ρ) Cygni, Pi (π) 2 & 1 Cygni, Mu (μ) Cephei, and Nu (ν) Cephei to HIP 108317.

Celestial Horse:

Four stars forming part of the Chinese xing guan Wang Linag (see below) from the Three Kingdoms to the Ming Dynasty bear the name “Tiansi”:

- Zeta (ζ) Cassiopeiae,
- 18 Cassiopeiae,
- Eta (η) Cassiopeiae, and
- Gamma (γ) Cassiopeiae

Celestial Jellyfish:

See Jellyfish, below.

Celestial Keyhole:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a circle of stars in the IAU constellations Ophiuchus and Sagittarius: 4 Sagittarii (the determinative star), 1 Sagittarii, 70 Sagittarii, HIP 89678, HIP 88839, HIP 88012, HIP 87836, and 63 Ophiuchi.

This Chinese xing guan “Tiānyuè” (天籥) is a circle of stars in the IAU constellation Ophiuchus and Sagittarius: 2 Sagitarii, and 51, 52, 58, and 63 Ophiuchi, and HIP 87099.

This Chinese Chenzhuo xing guan “Tiānyuè” is a circle of stars in the IAU constellations Ophiuchus and Sagittarius: HIP 88839, HIP 89678, 70 Sagittarii, 1 Sagittarii, 4 Sagittarii, 63 Ophiuchi, HIP 87836, and HIP 88012.

Celestial King:

This Chinese star “Tianwang” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Heart (see below).

This Chinese Chenzhuo xing guan “Tianwang” is the star Alpha (α) Scorpii (Acrab) in the IAU constellation Scorpius. It is also known as “Great Star”.

Celestial Kitchen:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is two bent intersecting lines of three stars in the IAU constellation Draco:

- The first line is the stars HIP 91315, Delta (δ) Draconis (the determinative star), and Rho (ρ) Draconis, and
- The second line is the stars 42 Draconis, 58 Draconis, and Epsilon (ε) Draconis.

This Chinese xing guan “Tiānchú” (天厨) is a curve of stars in the IAU constellation Draco: Delta (δ), Sigma (σ), Epsilon (ε), Rho (ρ), 64, and Eta (η) Draconis.

This Chinese Chenzhuo xing guan “Tiānchú” is made up of stars of the IAU constellation Draco: This is a “box” of the stars Pi (π) Draconis, Rho (ρ) Draconis, Epsilon (ε) Draconis, Tau (τ) Draconis, Upsilon (υ) Draconis, and Delta (δ) Draconis.

Celestial Lance:

This Chinese xing guan “Gěnghé” (梗河) is a line of three stars in the IAU constellation Boötes: Sigma (σ), Rho (ρ), and Epsilon (ε) Boötis (the determinative star). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Gěnghé” is a line of three stars in the IAU constellation Boötes: Epsilon (ε) Boötis, Sigma (σ) Boötis, and Rho (ρ) Boötis.

Celestial Meadows:

This Chinese xing guan “Tiānyuàn” (天苑) is a curving line of stars in the IAU constellations Cetus and Eridanus: The line starts at the determinative star, Gamma (γ) Eridani and runs through 26 Eridani, Delta (δ) Eridani, Epsilon (ε) Eridani, Zeta (ζ) Eridani, Eta (η) Eridani, 89 Ceti, Tau (τ) 1, 2, 3, 4, 5, 6, 7, and 8 Eridani, ending at Tau (τ) 9 Eridani. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is a large “U” shaped asterism made up of stars of the IAU constellations Cetus and Eridanus: Starting at HIP 19398 it runs through Gamma (γ) Eridani, Pi (π) Eridani, Delta (δ) Eridani, Epsilon (ε) Eridani, Zeta (ζ) Eridani, Eta (η) Eridani, Pi (π) Ceti, and Tau (τ) 1,2,3,4, 5,6 & 8 and 9 Eridani.

Celestial Milk:

This Chinese xing guan “Tiānrǔ” (天乳) is the star Mu (μ) Serpentis in the IAU constellation Serpens. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tianru” is the star 110 Virginis in the IAU constellation Virgo.

Celestial Money:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Aquarius: 49 Aquarii, 47 Aquarii (the determinative star), 41 Aquarii, and HIP 109509, 109199, 109375, 109737, 109990, and 110746.

This Chinese xing guan “Tiānqián” (天钱) is a pentagon of stars in the IAU constellation Piscis Austrinus: Theta (θ), Iota (ι), Mu (μ), Tau (τ), and 13 Piscis Austrini.

This Chinese Chenzhuo xing guan “Tiānqián” is a bent oval of stars in the IAU constellation Aquarius. It runs from 69 Aquarii through HIP 112021, HIP 111066, 50 Aquarii, 53 Aquarii, 47 Aquarii, 49 Aquarii, HIP 111515, and 68 Aquarii.

Celestial Official:

This Chinese star “Tianfu” is Zeta (ζ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

This Chinese Chenzhuo xing guan “Tianfu” is the star Zeta (ζ) Sagittarii in the IAU constellation Sagittarius.

Celestial Orchard:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellation Eridanus: The line starts at the star Upsilon (υ) 1 Eridani (the determinative star) and runs through Upsilon (υ) 2, 3 and 4 Eridani, f, g, h, Gamma (γ), e, Theta (θ) 1 Eridani, and HIP 12486, ending at s Eridani.

This Chinese xing guan “Tiānyuán” (天园) is a jagged line of stars in the IAU constellations Eridanus and Phoenix. It starts at one end with Upsilon (υ) 1, 2, 3 and 4 Eridani, then runs through g, f, Theta (θ), s, Kappa (κ), Phi (φ), and Chi (χ) Eridani, ending at the star Delta (δ) Phoenicis.

This Chinese Chenzhuo xing guan is a long bending line of stars in the IAU constellation Eridanus: Starting at Nu (ν) 1,2, 3, & 4 Eridani, it runs through HIP 17797, HIP 17874, HIP 17351, Gamma (γ) Eridani, HIP 16310, 82 Eridani, Theta (θ) 1 Eridani, and Iota (ι) Eridani to HIP 12413.

Celestial Pass:

This Chinese xing guan “Tiānguān” (天关) is the star Zeta (ζ) Tauri in the IAU constellation Taurus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tianguan” is the star Zeta (ζ) Tauri in the IAU constellation Taurus.

Celestial Pier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curved line of stars in the IAU constellation Auriga: 16 Aurigae, 19 Aurigae (the determinative star), Phi (φ) Aurigae, and HIP 25580, ending at HIP 25475.

This Chinese xing guan “Tiānhuáng” (天潢) is made up of stars in the IAU constellation Auriga. The central star is 19 Aurigae. From this, four lines go out to the stars Mu (μ), Sigma (σ), Phi (φ) and 14 Aurigae.

Celestial Pigsty:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Cetus and Pisces: Starting at the determinative star, 20 Ceti, the line runs through 25, 39, and 42 Ceti, f and e Piscium, and HIP 3992.

This Chinese xing guan “Tiānhùn” (天溷) is made up of four stars in the IAU constellation Cetus: Phi (φ) 1 and 3, 21, and 18 Ceti.

This Chinese Chenzhuo xing guan “Tiānhùn” is a loop of stars in the IAU constellations Cetus and Pisces: From 89 Piscium it runs through 80 Piscium, HIP 3765, 20 Ceti, 25 Ceti, 37 Ceti, and 39 Ceti.

Celestial Pillar:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent quadrilateral of stars in the IAU constellation Draco: HIP 102599 (the determinative star), HIP 104756, 76 Draconis, 75 Draconis, and 74 Draconis.

This Chinese xing guan “Tiānzhù” (天柱）is a curve of stars in the IAU constellation Draco: 76, 77, 69, 59, and 41 Draconis.

This Chinese Chenzhuo xing guan “Tiānzhù” is a “cross” of stars in the IAU constellation Draco: Starting at the star 19 Draconis it runs to HIP 78893, HIP 80161, 15 Draconis and across to 18 Draconis.

Celestial Pivot:

This Chinese star “Tianshu” was a pole star listed during the Shang Dynasty (1600 – 1027 B.C.E.). Alpha (α) Ursae Minoris (Polaris) was NOT the pole star at that time (due to precession). Possible stars proposed for this pole star include i Draconis, 42 Draconis, or 184 Draconis, or Beta (β) Ursae Minoris

(Kochab), but it is possible that this was something carried over from as early as 3000 B.C.E., so it is difficult to pin down the exact star.

In the Three Kingdoms to Ming Dynasty period this name was given to two stars:

- The star Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major, and
- The star HIP 62572A in the IAU constellation Ursa Minor.

There are two Chinese Chenzhuo xing guans called “Tianshu”:

- One is the star Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.
- One is the star HIP 65595 in the IAU constellation Ursa Minor. It is part of their xing guan “Northern Pole”. It is also known as “Ancient Star”.

Celestial Premier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellations Hydra and Sextans: Gamma (γ) Sextantis (the determinative star), 6 Sextantis, and 33 Hydrae.

This Chinese xing guan “Tiānxiàng” (天相) is a small triangle of stars in the IAU constellation Sextans: Epsilon (ε), 17, and 18 Sextantis.

This Chinese star “Tianxiang” is Lambda (λ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

There are two Chinese Chenzhuo xing guans called “Tianxiang”:

- One is the star Lambda (λ) Sagittarii in the IAU constellation Sagittarius.
- One is a triangle of stars in the IAU constellations Hydra and Sextans: Gamma (γ) Sextantis, 33 Hydrae, and 6 Sextantis.

Celestial Prison:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Ursa Major: Starting at the determinative star 37 Ursae Majoris, it runs around through 36 Ursae Majoris, HIP 52136, 44 Ursae Majoris, 43 Ursae Majoris, and 39 Ursae Majoris.

This Chinese xing guan “Tiānláo” (天牢) is made up of stars in the IAU constellation Ursa Major: Omega (ω), 47, 49, 56, 57, and 58 Ursae Majoris.

This Chinese Chenzhuo xing guan is an oval of stars in the IAU constellation Ursa Major: 36 Ursae Majoris, HIP 52136, 44 Ursae Majoris, 43 Ursae Majoris, 39 Ursae Majoris, and 37 Ursae Majoris.

Celestial Quadriga:

This Mithraic asterism is made up of the stars of the IAU constellations Draco and Ursa Minor (Reza Assasi 2013). The center of the asterism is the smaller asterism Swastika (see below) which becomes Mithra’s quadriga. At each of the four ends of the swastika are a “horse”:

- The first horse’s “head” is the triangle of stars 47 Draconis, 45 Draconis, and 39 Draconis, with the “neck” running from 39 Draconis to Xi (ξ) Draconis (Grumium), the “body” a line from Xi (ξ)

Draconis to Gamma (γ) Ursae Minoris (Pherkad), and the "horse's hooves" being the stars 24 Draconis and Beta (β) Draconis (Rastaban).

- The second horse's "head" is the triangle of stars Chi (χ) Draconis, Phi (ϕ) Draconis, and Psi (ψ) 1 Draconis, with the "neck" running from Phi (ϕ) Draconis to Upsilon (υ) Draconis, the "body" a line from Upsilon (υ) Draconis to Tau (τ) Draconis, and the horse's "hooves" are Epsilon (ε) Draconis and Delta (δ) Draconis (Altais).
- The third horse's "head" is a triangle of the stars 3, 4 and 5 Ursae Minoris, with the "neck" running from 5 Ursae Minoris to Beta (β) Ursae Minoris (Kochab), and the "body" being a line from Kochab to Zeta (ζ) Ursae Minoris and the "horse's hooves" being the stars Gamma (γ) Ursae Minoris (Pherkad) and Eta (η) Ursae Minoris.
- The final horse's "head" is the triangle of stars HIP 76957, 78286, 78542, with the "neck" between 78542 and HIP 78180, the "horse's body" being a line from HIP 78180 to Iota (ι) Draconis (Edasich) and the "horse's hooves" are the stars Theta (θ) Draconis and HIP 77277.

Celestial Ramparts:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a ragged oval of stars in the IAU constellations Grus and Piscis Austrinus: Gamma (γ) Gruis, HIP 108294, HIP 108681, HIP 109289, Mu (μ) Piscis Austrini, Tau (τ) Piscis Austrini, Eta (η) Piscis Austrini, HIP 106913, HIP 106564, 7 Piscis Austrini, HIP 106907, and HIP 107019.

This Chinese xing guan "Tiānlěichéng" (天垒城) is a ragged spiral of stars in the IAU constellations Aquarius and Capricornus. It starts at one end at Xi (ξ) Aquarii, then runs through 46, 47, Lambda (λ), and 50 Capricorni, 18 Aquarii, 29 Capricorni, 9, 8, Nu (ν), 14, and 17 Aquarii, and ends at 19 Aquarii.

This Chinese Chenzhuo xing guan "Tiānlěichéng" is a bent oval of stars in the IAU constellations Aquarius, Capricornus, and Piscis Austrinus: It runs from Zeta (ζ) Capricorni through 8 Piscis Austrinus, Eta (η) Piscis Austrinus, Lambda (λ) Piscis Austrinus, HIP 109737, 41 Aquarii, 35 Aquarii, HIP 108784, HIP 107901, Kappa (κ) Capricorni, Epsilon (ε) Capricorni, 37 Capricorni, and 36 Capricorni.

Celestial River:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of four stars in the IAU constellation Ophiuchus: c Ophiuchi, b Ophiuchi, Theta (θ) Ophiuchi (the determinative star), and 36 Ophiuchi.

This Chinese xing guan "Tiānjiāng" (天江) is a line of three stars in the IAU constellation Ophiuchus: 44, Theta (θ), and 36 Ophiuchi.

Celestial Roach:

This Italian asterism "Celeste Lasca" (the Rutilus or Roach fish) is the IAU constellation Pisces as listed by Dante Alighieri and in R. H. Allen's *Star Names* in 1899.

Celestial Rotating Jade:

This Chinese star "Tianxuan" from the Three Kingdoms to the Ming Dynasty is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Lucun" is the star Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Celestial Secret:

This Chinese star “Tianji” is Sigma (σ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

This Chinese Chenzhuo xing guan “Tianji” is the star Sigma (σ) Sagittarii in the IAU constellation Sagittarius.

Celestial Shining Pearl:

This Chinese star “Tianji” from the Three Kingdoms to the Ming Dynasty is Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Tianji” is the star Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Celestial Sisters:

This Shaawanwaki asterism is the IAU constellation Corona Borealis. These celestial sisters descend to Earth every night to dance. R. H. Allen lists this in his *Star Names* in 1899. The star Alpha (α) Coronae Borealis (Alphecca) is the wife of their hunter White Hawk (see below).

Celestial Slander:

This Chinese xing guan “Tiānchán” (天谗) is the star 42 Persei in the IAU constellation Perseus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tiānchán” is the star Eta (η) Persei in the IAU constellation Perseus.

Celestial Snow Angel:

This **telescopic** asterism is HII region is SH 2-106 in the IAU constellation Cygnus.

Celestial Spear:

This tiny Chinese xing guan “Tiānqiāng” (天枪) is a triangle of stars in the IAU constellation Boötes: Theta (θ), Iota (ι), and Kappa (κ) Boötis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Tiānqiāng” is a triangle of stars in the IAU constellation Boötes: Theta (θ) Boötis, 17 Boötis, and Iota (ι) Boötis.

Celestial Spokes:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Libra: 39 Librae (the determinative star) and 42 Librae.

This Chinese xing guan “Tiānfú” (天辐) is a line of two stars in the IAU constellation Libra: 39 and 40 Librae.

This Chinese Chenzhuo xing guan “Tiānfú” is a line of two stars in the IAU constellation Scorpius: 1 and 2 Scorpii.

Celestial Spring:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars with four lines running out of the oval in the IAU constellations Sagittarius and Telescopium:

- The oval is the stars HIP 98032, 97749, 97067, 96234, 95823, and 96721.
- From HIP 98032 a line runs to HIP 98512,
- From HIP 97749 a line runs out to the determinative star, Theta (θ) 1 Sagittarii,
- From HIP 96234 a line runs out to HIP 94986, and
- From HIP 95823 a line runs out to Beta (β) 1 and 2 Sagittarii (Rukbat).

This Chinese xing guan "Tiānyuān" (天渊) is a line of two stars in the IAU constellation Sagittarius: Alpha (α) Sagittarii (Rukbat) and the double binary star system Beta (β) 1 and 2 Sagitarii (Arkab).

This Chinese Chenzhuo xing guan "Tiānyuān" is a rough oval of stars with four lines radiating from it in the IAU constellation Sagittarius: The oval is made up of the stars Iota (ι) Sagittarii, HIP 97749, HIP 97067, HIP 96234, HIP 95823, and HIP 96178. The four radiating lines are:

- Iota (ι) Sagittarii to HIP 98512,
- HIP 97749 to Theta (θ) Sagittarii,
- HIP 96234 to HIP 94986, and
- HIP 95823 to Beta (β) 1 & 2 Sagittarii (Arkab).

Celestial Stable:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellations Andromeda and Cassiopeia: Starting at the determinative star 22 Andromedae it runs around through HIP 2225, HIP 2900, 20 Cassiopeiae, 22 Cassiopeiae, Xi (ξ) Cassiopeiae, HIP 1921A, HIP 1415, and HIP 967.

This Chinese xing guan "Tiānjiù" (天厩) is a triangle of stars in the IAU constellation Andromeda: Rho (ρ), Sigma (σ), and Theta (θ) Andromedae.

This Chinese Chenzhuo xing guan is an oval of stars in the IAU constellations Andromeda and Cassiopeia: Xi (ξ) Cassiopeiae, HIP 1921, HIP 1415, HIP 967, 22 Andromedae, HIP 2225, HIP 2900, Pi (π) Cassiopeiae, HIP 3478, and 22 Cassiopeiae.

Celestial Street:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Taurus: Kappa (κ) 1 and 2 Tauri (the determinative star) and Upsilon (υ) Tauri.

This Chinese xing guan "Tiānjiē" (天节) is a line of two stars in the IAU constellation Taurus: Kappa (κ) and Omega (ω) Tauri.

This Chinese Chenzhuo xing guan is a line of two stars in the IAU constellation Taurus: Upsilon (υ) Tauri and Kappa (κ) 1 Tauri.

Celestial Tally:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellation Taurus:

- At one end is a quadrilateral of stars starting at the determinative star c Tauri and running around through d Tauri, HIP 22044, and HIP 22157.

- From d Tauri a line runs out through r Tauri, Mu (μ) Tauri, and HIP 18975, ending at Nu (ν) Tauri.

This Chinese xing guan "Tiānjié" (天节) is roughly a "Z" shape in the IAU constellation Taurus. From Rho (ρ) Tauri, the line goes through Eta (η) Tauri to a bend at 57 Tauri, then through 79 Tauri to a curve starting at 90 Tauri, and then through 93 and 88 Tauri, ending at 66 Tauri.

This Chinese Chenzhuo xing guan "Tiānjié" is a bending line of stars in the IAU constellation Eridanus: It runs from 39 Eridani through Omicron (ο) 1 & 2 Eridani, HIP 19996, Xi (ξ) Eridani, Nu (ν) Eridani, and 51 Eridani to HIP 21718 where it splits into two lines:

- One running to Mu (μ) Eridani, and
- One running to 45 Eridani.

Celestial Temple:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of stars that forms a large "C" shaped enclosure made up of stars in the IAU constellations Antlia, Pyxis and Vela: Starting at the determinative star Theta (θ) Pyxidis it runs around through Kappa (κ) Pyxidis, Gamma (γ) Pyxidis, Alpha (α) Pyxidis, Beta (β) Pyxidis, k Velorum, HIP 45754, Epsilon (ε) Pyxidis, Lambda (λ) Pyxidis, Zeta (ζ) Antliae, Epsilon (ε) Antliae, HIP 48219, Theta (θ) Antliae, and HIP 46578.

This Chinese Chenzhuo xing guan is a closed loop of stars resembling a large letter "C" in the IAU constellations Antlia, Pyxis, and Vela: Starting at Lambda (λ) Velorum, it runs around through HIP 44511, HIP 47175, HIP 48374, Psi (ψ) Velorum, Epsilon (ε) Antliae, Alpha (α) Pyxidis, Beta (β) Pyxidis, HIP 40943, HIP 40706, HIP 40326, HIP 40096, HIP 42570, HIP 43023, HIP 42884, and HIP 44191.

Celestial Wine Cup:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Gemini: Delta (δ) Geminorum (the determinative star), 56 Geminorum, and 63 Geminorum.

This Chinese xing guan "Tiānzūn" (天樽) is a triangle of stars in the IAU constellation Gemini: Omega (ω), Delta (δ), and 57 Geminorum.

This Chinese Chenzhuo xing guan "Tiānzūn" is a bent line of three stars in the IAU constellations Auriga and Gemini: 28 Geminorum, 53 Aurigae, and 49 Aurigae.

Celestial Wolf:

This Chinese xing guan "Tiānláng" (天狼) is the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. It was also known as "Lang" ("wolf").

Celestial Yin Force:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars in the IAU constellation Aries. From a central star, Tau (τ) 2 Arietis, four lines run out:

- One to 65 Arietis,
- One to Tau (τ) 1 Arietis
- One to Zeta (ζ) Arietis, and

- One to the determinative star, Delta (δ) Arietis.

This Chinese xing guan "Tiānyīn" (天阴) is five stars in the IAU constellation Aries: Tau (τ) 1 and 2, Zeta (ζ), Delta (δ), and 66 Arietis.

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Taurus: From the central star HIP 19261 four lines run out:

- One to HIP 18170
- One to HIP 18717
- One to HIP 19284, and
- One through HIP 19529 to HIP 19641.

Celtic:

This Latin asterism "Celticus" is the IAU constellation Hercules and relates to forms of that hero worshipped in early Celtic territories.

Celtic of Ursa Major:

This **telescopic** asterism "Célticus Úrsae Majóris" is the spiral galaxy NGC 3631 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "I 226". It became GC 2379 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this as it "shows some resemblance to ancient Celtic patterns on coins and jewels".

Ceneus:

This Dutch asterism appeared on a globe created by the Dutch uranographer Willem Jansz Blaeu (1571 – 1638) in the place of the IAU constellations Chamaeleon and Musca. It is possibly a reference to the Lapith Caeneus.

Censer:

This Arabic asterism "Almabkhara" (المبخرة), latinized to "Al Mijmarah" or "Al Mugamrah" is the IAU constellation Ara:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed this constellation as "Almegramith".
- German poet Philipp von Zesen (1619 – 1689) lists this constellation as "Almugamra".
- Robert Hues lists "Almugamra" in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne lists it as "Almegrameth" in *The Sphere of Marcus Manilius* in 1675 as does John Hill's *Urania* in 1754.

This Latin asterism "Thuribulum", "Turribulum", or "Turibulum" is the IAU constellation Ara:

- A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts "Thuribulum" as a three-legged vase with flames rising from it.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Lar, sive Thuribulum, sev Ara" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Lar sieu Thuribulum, vel ara" as a cubical altar with burning sticks on top.
- The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) lists this constellation as "Thuribulum" and depicts it as an hourglass shaped altar with flames rising from it.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Thuribulum" as an alternate name for Ara.
- Johann Bayer's *Uranometria* (1603) lists "Thuribulum".
- The *Tabulae Rudolpinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Thuribulum" for this constellation.
- Robert Hues lists "Thuribulum" in his *A Learned Treatise of Globes* in 1659. English astronomer Edmond Halley lists "Thuribulum" in his *Catalogus Stellarum Australium* in 1679.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Ara al Thuribulum".

The Leyden Manuscript shows Ara as a tripod censer with incense burning.

This French asterism "Encensoir" is the IAU constellation Ara.

NOTE: R. H. Allen writes in his *Star Names* in 1899 that Censer is a "Euphratian" name given to the IAU constellation Libra. This could be Akkadian, Assyrian, or even Seleucid.

Centaur:

This Greek asterism "Κένταυρος" ("Kentaurus") is the IAU constellation Centaurus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described by Ptolemy (c.100 – c.170) in his *Almagest.* It is made up of stars of the IAU constellations Centaurus and Crux:

- The "head" is a triangle of the stars 1, 2, 3 and 4 Centauri.
- The "body" runs from Iota (ι) Centauri through HIP 65373, Gamma (γ) Centauri, and E Centauri to the base of the "tail" at Delta (δ) Centauri, then through Rho (ρ) Centauri, F Centauri, Epsilon (ε) Centauri, Zeta (ζ) Centauri, Upsilon (υ) 1 Centauri, and Phi (φ) Centauri to the other shoulder at Theta (θ) Centauri.
- One "arm" runs from Iota (ι) Centauri to n Centauri (HIP 62896).
- The other "arm" runs from Theta (θ) Centauri to an "elbow" at Chi (χ) Centauri and through Eta (η) Centauri to a "hand" at Kappa (κ) Centauri.
- The "tail" is the line between Delta (δ) Centauri and A Centauri.
- Two "rear legs" are lines running out from F Centauri:
- One runs through Gamma (γ) Crucis to Beta (β) Crucis (Mimosa), and
- One runs through Delta (δ) Crucis to Alpha (α) 1 Crucis (Acrux).
- Two "front legs" are lines running out from Epsilon (ε) Centauri to Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar).

NOTE: John Hill lists the name "Pher" as "one of the old Greek names" of the IAU constellation Centaurus in his *Urania* in 1754.

This Arabic asterism "Alqantur" (القنطور) or "Qanturūs" is the IAU constellation Centaurus. "Qanturūs" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Assyrian asterism “EN.TE.NA.MASH.LUM” is the IAU constellation Centaurus.

Centaur Beast:

This Latin asterism “Bestia Centauri” is the IAU constellation Lupus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671): Lupus is right next to the IAU constellation Centaurus so could be seen as associated with the centaur.

Centaur’s Altar:

This Greek asterism “Ara Centauri” is the IAU constellation Ara (which is nearby the IAU constellation Centaurus).

Centaur’s Crown:

This Greek asterism is the IAU constellation Corona Australis as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.).

Centaurus:

The stars Alpha (α) Centauri (Rigil Kentaurus, Toliman, or Bungula- 3rd brightest star in the sky) and Beta (β) Centauri (Hadar- 11th brightest star in the sky) are the Southern Pointers or the Pointers (which is the Hawaiian name for them) leading from the Southern Cross to the southern horizon and thus helping to distinguish Crux from the False Cross (see False Cross, below). This constellation also contains the 54th brightest star (Theta (θ) Centauri, Menkent) and 63rd brightest star (Gamma (γ) Centauri, Muhlifain). The stars of this constellation show up in 377 asterisms of the sky cultures of the world.

The IAU constellation Centaurus (IAU abbreviation Cen) is now at a high southern latitude, but at the beginning of recorded history it was an equatorial asterism. It first appeared as a Babylonian bison-man “MUL.GUD.ALIM” (see Bison Man, below). The current name is the latinized Centaurus from the original Greek “Κένταυρος” or “Kéntavros”, named to honor Chiron, the centaur who was the tutor of the mythical hero Hercules. Another Greek name for it is “Ἱππότα Φήρ” or “Ippóta Fír” (“horseman beast”). Ptolemy (c.100 – c.170) lists it as Kentaurus in his *Almagest* (see Centaur, above). Eratosthenes (d.194 B.C.E.) named it “Χείρων” or “Cheíron”. The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Centaurus as a centaur riding to our right.

This constellation appears in editions of the *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) he is shown as a centaur walking to the right holding an animal by its heels in one hand and having another suspended from a stick over his shoulder,
- In several editions (Dresden DC 183, Paris BN 12597, St Gall 250, St Gall 902) his back is towards us,
- In the Prague IX C 6 edition he faces us.
- In the Gottweig 7 and Paris BN n.a. 1614 editions he is wearing an animal skin,
- In the Prague IX C 6 edition he wears a Phrygian cap,
- In the Vat Reg lat 1324 edition he is a hybrid centaur/satyr.

This constellation appears in the *Leiden Aratea* (816).

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Centaurus holding a dead rabbit by its heels in his outstretched left hand and a spear decorated with foliage in his right hand. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* also depict Centaurus holding this rabbit, but in his right hand: In his left hand he is holding a thyrsus. The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Centaurus holding a trident.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Centaurus on one page as a clean-shaven centaur walking to our right. He is wearing a tunic, holding a leafy branch in his right hand, and his holding the left rear foot of Lupus in his left hand. On the other page he is riding to our left, holding the branch in his left hand, and holding Lupus with his right hand.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Centaurus, ferter habere bestiam" ("A centaur, to bear a beast"). The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depict Centaurus as a centaur holding Bestia or Lupus in his left hand so that its feet stick upwards. He has a plant resting on his left shoulder. The Dijon 448 manuscript of *De signis caeli ("of the signs of heaven*") depicts him with a second animal on his rump. The Paris BN 5239 manuscript shows him with a lion. The Klosterneuberg 685, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict a rabbit and a sword in Centaurus' right hand and a purse hung from his left elbow and he is accompanied by a dog. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Centaurus with a stick over his left shoulder with a dead hare hanging from it. The Durham Hunter 100 manuscript of *De signis caeli* depicts Centaurus with a dead animal on his outstretched left arm and a flag under that arm. The Montecassino 3 manuscript of *De signis caeli* depicts him carrying a rabbit and a purse in his right hand and a stick with a dead animal tied to it rests on his left shoulder.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Centaurus as a centaur galloping to our right. He is wearing a crown and tunic. He is holding three leaves in his right hand and his left hand is holding the rear leg of Lupus.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Centaurus as a centaur wearing a stacked conical hat.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Centaurus as a Centaur facing to our right. He is wearing a red hat and has a red garment around his "human waist" which has a cape spread out across his horse's back. He is holding some sort of bloody straight weapon in his right hand (possibly a sword) and is holding the left rear leg of Lupus in his left hand.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Centaurus as a centaur walking to our left. He is dressed in a Medieval hat and tunic. He is holding a branch with three leaves in his left hand and holding on to the right rear leg of Lupus with his right hand.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Centaurus" as a centaur with a shield on his right arm. He is using a spear to stab Lupus in the mouth.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Centaurus as a centaur trotting to our right. He is brandishing a spear with which he is spearing Lupus in the mouth. It is not labelled and poorly drawn. A square figure behind the centaur's right arm may represent a shield.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts only the head and shoulders of Centaurus: The rest of the constellation is off the edge of the astrolabe. It is not labelled.

The Paris manuscript of al-Sufi's *Book of Fixed Stars* (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg's library (c 1430 – 1440) depicts Centaurus as a centaur holding the rear right leg of Lupus in his left hand and holding three leaves in his right hand. Centaurus is shown wearing a tunic and a turban.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Centaurus as a crowned centaur galloping to our right. He is wearing a lion's skin and has a rabbit perched on his right shoulder. The tip of a spear is showing over his left shoulder, and his right arm is outstretched with what appears to be a dead rabbit in his right palm.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Centaurus as a centaur galloping to our right. In his right hand he is carrying a small animal and he has a spear resting on his left shoulder which he is holding with his left hand. This spear has spitted Lupus.

Centaurus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a centaur riding to our left spearing Lupus.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This is labeled "Centaurus" and "Phyllirides" and depicts a centaur with a tunic walking to our right. He has a spear slung over his left shoulder with a dead rabbit strung just below the spear tip, a canteen over his right forearm, and an upside-down goat in his right hand.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "CENTAVRVS AVT CHYRON" as a centaur with long curly hair who is using a spear to attack Lupus.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Centaurus as a centaur galloping to our left, holding a spear with which he is spearing Lupus. It is not labelled.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Centaurus as a bearded centaur spearing Lupus.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts "Centaurus" as a centaur brandishing a spear on which is impaled the asterism "Fera" (see Beast, above). The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Centaurus and Fera in the same manner as Dürer et al but labels this constellation with the abbreviated title "CENTAV".

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Centaurus" as a male centaur galloping to our right., wielding a spear with which he is spearing Lupus in the mouth.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Centaurus as a centaur trotting to our right. The centaur's upper body is turned slightly away from us and he is spearing Lupus.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Centaurus" as a centaur galloping to our right spearing Lupus.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Centauro". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

Welsh mathematician and physician Robert Recorde (1512 – 1558: inventor of the = sign) listed it as "Centaure Chiron".

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Centaur".

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Centaurus as a male centaur galloping to our right, spearing Lupus.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Centaurus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Centaurus" as a centaur spearing Lupus.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Centaurus: as a centaur trotting to our right. He is brandishing a spear on his left side and has a spiky shield on his right upper arm. Lupus does not appear in his illustration: He appears at the end of that spear in a separate illustration.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "le Centaure" as a centaur charging to our left with a spear with what appears to be a wreath around it. He is spearing "le Loup" (Lupus).

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Centaurus" as a clean-shaven centaur spearing Lupus with a spear.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Centaurus" as a centaur walking to our right spearing Lupus.

Flemish cartographer Jodocus Hondius (1563 – 1612) included it on his globe in 1598. This constellation appears in a 10th century copy of the Leiden *Aratea* (Boulogne-sur-Mer, Bibliotèque municipal MS 188) but is missing from the 9th century edition.

Centaurus was depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a centaur spearing Lupus.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Centaurus" as a bearded centaur in a tunic. He is riding to our right with a spear over his left shoulder to which is tied a rabbit he has killed. In his hands he is holding a dead goat which is lying on its back. Over his right forearm is draped a canteen.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Centaurus as a centaur spearing Lupus.

Centaurus is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

Centaurus is listed in Dutch navigator Frederick de Houtman's catalogue of fixed stars (1603).

Johann Bayer (1572 – 1625) depicts it in his *Uranometria* in 1603 as a bearded centaur holding a spear wound with ivy: This centaur is stabbing Lupus the wolf. Some sort of canteen is draped on a chain over the centaur's left wrist. Bayer lists these names for Centaurus: "Centaurus, Pholos, Chiron, Phillyrides, Semifer, Minotaurus, Albeze, Asmeat". NOTE: Bayer also lists "Centaurus" as an alternative name for Sagittarius.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Centaurus" as a young male centaur armed with a leafy spear who is spearing Lupus and gives the alternate name "Phyllirides".

Centaurus is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and labelled "Centaury" and depicted as a centaur spearing Lupus, riding to our left.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Centaurus" and "Chiron" for this constellation. On a later page it is listed as "Centauro".

"Centaurus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a centaur riding to our left spearing Lupus.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Centaurus" as a centaur galloping to our right using a spear to stab Lupus.

Centaurus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: He is depicted as a centaur spearing Lupus, which is labelled both "Lupus" and "Fera". The label on the chart of the northern sky lists "Centaurus" followed by "Chiron".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Centaurus as a centaur who has speared Lupus with a lance bearing a triangular banner.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Centaurus" but you can only see his head above the edge of the planisphere.

Centaurus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted on his charts as a centaur spearing Lupus with a spear which is sprouting leaves.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Centaurus” as a centaur riding to our right, brandishing a spear which he is using to spear Lupus.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Κένταυρος” and “Centaurus”. There is also a French label, but this has faded and is unintelligible. It depicts Centaurus as a centaur galloping to our right. A blanket is draped over the back of his horse body. He is spearing Lupus with a spear covered in leafy branches.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Centaurus Phyllirides” as a centaur spearing Lupus. Phyllirides is a name for this constellation from the *Poeticon Astronomicon*.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Centaurus as a centaur with a shield on his left arm and a lance in his right hand with which he is spearing Lupus.

Centaurus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: He is depicted as a centaur brandishing a spear with which he is stabbing Lupus.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Centaurus” as a centaur riding to our left spearing a wolf (Lupus).

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Centaurus” as a centaur riding to the left spearing a wolf (“Lupus”).

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Centaurus as a centaur galloping to our left. He is spearing Lupus with a spear covered in leaves.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Centaure” as a centaur spearing Lupus with a spear from which leaves are sprouting.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Centaurus as a centaur spearing Lupus.

English astronomer John Hill lists “Chiron” as a name for Centaurus in his *Urania* in 1754.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “le Centaure” as a centaur with a round shield on his left arm and a spear in his right hand who is spearing Lupus.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Centaurus” as a centaur riding to our right spearing a wolf (Lupus).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Centaure” as a centaur moving to our left with a shield on his left arm and brandishing a spear in his right hand with which he is spearing Lupus.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Centaur" in the text and "Centaur" on the charts, depicting it as a centaur riding to our left brandishing a spear with which he is spearing Lupus.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Centauro" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Centaurus" as a centaur galloping to our right spearing a wolf (Lupus).

"Centaurus" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801): It is depicted as a centaur with a shield on his left arm spearing Lupus. He is riding to our left.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Centaurus" as a centaur spearing Lupus: The spear has a banner on it and he is holding the spear with both hands.

American uranographer William Croswell (1760 – 1834) depicts "Centaurus the Centaur" on his *Mercator Map of the Starry Heavens* in 1810 as a Centaur spearing Lupus. Centaurus has the spear in his left hand and a shield with a spiked boss on his right arm.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Centaurus in his *Celestial Atlas* in 1822: He is depicted as a bearded centaur brandishing a spear and carrying a shield bearing the images of a branch and a two handled amphora. Centaurus is stabbing Lupus.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Centaur" and depicts it as a centaur armed with a spear.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "the Centaur" as a centaur spearing Lupus.

"Centaurus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Centaurus" as a centaur riding to our right with a shield on his right arm and a spear in his left hand with which he is spearing a wolf (Lupus).

"Centaurus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a Centaur with a spear.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its charts as "Centaur".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Centaurus, the Centaur" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Centaurus” in his *Star Atlas* (1893) and describes it as “The Centaur”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Centaurus” and describes it as a “Centaur”.

R. H. Allen lists an Arabic name as “Al Kentaurus” in his *Star Names* in 1899.

The standard IAU chart depicts Centaurus this way:

- A winding line of stars starts at his “head” Theta (θ) Centauri and runs down to “shoulders” at Nu (ν) and Mu (μ) Centauri, then through a “body” of Upsilon (υ) 1, Zeta (ζ), Gamma (γ), and Sigma (σ) Centauri to Delta (δ) Centauri,
- The “back leg” runs from Delta (δ) Centauri through A Centauri to Lambda (λ) Centauri,
- The “front leg” runs from Zeta (ζ) Centauri through Epsilon (ε) Centauri and Beta (β) Centauri (Hadar) to Alpha (α) Centauri (Rigil Kentaurus),
- One “arm” runs from Nu (ν) Centauri through d Centauri to Iota (ι) Centauri, and
- One “arm” runs from Mu (μ) Centauri through Eta (η) Centauri to Kappa (κ) Centauri.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Centaurus in his book *The Stars - A New Way to See Them* (1952):

- His “head” is a five sided figure running from Phi (ϕ) Centauri through Chi (χ) Centauri, HIP 70300, Psi (ψ) Centauri, Theta (θ) Centauri, to Nu (ν) Centauri,
- His “upper body is a roughly triangular shape formed by Nu (ν), Mu (μ), Zeta (ζ), Upsilon (υ) 1 and 2, and Phi (ϕ) Centauri,
- His “lower body” is the triangle of stars Zeta (ζ), Gamma (γ), and Epsilon (ε) Centauri,
- His “front legs” run from Epsilon (ε) Centauri to “feet” at Alpha (α) Centauri (Rigil Centaurus) and Beta (β) Centauri (Hadar),
- His “hind legs” start at a line from Gamma (γ) Centauri to Sigma (σ) Centauri and then split into two lines:
    - One runs through Rho (ρ) Centauri to Lambda (λ) Centauri, and
    - One runs through Delta (δ) Centauri to Pi (π) Centauri,
- His right arm runs from Phi (ϕ) Centauri through Eta (η) Centauri to an “elbow” at Kappa (κ) Centauri and then through b Centauri to c1 Centauri, and
- His left arm runs from Nu (ν) Centauri through d Centauri to an “elbow” at Iota (ι) Centauri and then to a “wrist” at I Centauri from which three lines to g, k, and h Centauri form “fingers”.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Centaurus in *their Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- The “body” is a six-sided figure made up of the stars Epsilon (ε) Centauri, Zeta (ζ) Centauri, Eta (η) Centauri, Theta (θ) Centauri, Iota (ι) Centauri, and Gamma (γ) Centauri,
- A “front leg” runs from Epsilon (ε) Centauri through Beta (β) Centauri (Hadar) to Alpha (α) Centauri (Rigil Kentaurus), and
- A “back leg” runs from Gamma (γ) Centauri through Sigma (σ) Centauri, Delta (δ) Centauri, and Pi (π) Centauri to Lambda (λ) Centauri.

Sky and Telescope Magazine, founded in 1941, depicts Centaurus in their magazine and publications like this:

- His "head" and "upper torso" is a bent triangle of the stars Zeta (ζ), Upsilon (υ) 1, Phi (ϕ), Chi (χ), Psi (ψ), Theta (θ), Nu (ν), and Mu (μ) Centauri,
- His "horse body" is the triangle of stars Zeta (ζ), Gamma (γ), and Epsilon (ε) Centauri,
- His "front leg" is a line from Epsilon (ε) Centauri to Beta (β) Centauri (Hadar) and Alpha (α) Centauri (Rigil Kentaurus),
- His "back legs" are two lines running from Gamma (γ) and Sigma (σ) Centauri:
    - One runs through Rho (ρ) Centauri to Omicron (ο) 1 Centauri, and
    - One runs through Delta (δ) Centauri to Pi (π) Centauri,
- One arm runs from Nu (ν) Centauri through d Centauri and Iota (ι) Centauri to l Centauri, and
- One arm runs from Phi (ϕ) Centauri through Eta (η) Centauri to Kappa (κ) Centauri.

This Kaykavian asterism "Cújzeki" is their name for the IAU constellation Centaurus.

Centaurus Chain:

This **telescopic** asterism is a group of galaxies including spiral galaxy NGC 4650 and polar-ring lenticular galaxy NGC 4650A in the IAU constellation Centaurus. John Herschel listed NGC 4650 as h 3413 and later as GC 3183 in his *General Catalogue* of 1864.

Centaurus Cluster:

This **telescopic** asterism A3526 is a cluster of hundreds of galaxies in the IAU constellation Centaurus. The main subgroup contains NGC 4696. Another is centered on NGC 4709.

Center:

This Persian star "Miyan" is Alpha (α) Leonis (Regulus) in the is the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

Center of the Heavens:

This Japanese star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. This name comes from the ceiling art in the Takamatsu Zuka Kofun tomb.

Center of the Sky:

This Desana asterism is centered on the star Epsilon (ε) Orionis (Alnilam), the middle star of the belt of Orion. It is surrounded by a hexagon of the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini, Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Alpha (α) Carinae (Canopus) in the IAU constellation Carina, Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus, and Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

This K'iche' star "Hurakan" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. Hurakan is a K'iche' God.

Center of the Universe:

This Italian asterism is the belt of Orion in the IAU constellation Orion.

Centipede:

This Mayan asterism “Ch’apat” from the *Chilam Balam* book of Kaua is the IAU constellation Scorpius.

This Rapanui star “Veri Hariu” (‘stunning worm”) is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Edwards and Edwards 2010, Edwards 2016).

Central Fire of Náhookǫs:

This Diné star “Náhookǫs Bikǫ’” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Childrey 2008). It is part of their three-part asterism Náhookǫs (see below), the other parts being “Náhookǫs Bi’ką” (see Male Revolving One, below) and “Náhookǫs Bi’áád” (see Female Revolving One, below). The Female Revolving One and the Male Revolving One circle this Hearth Fire.

Central Point of Centaurus:

This **telescopic** asterism “Centrósus Centaúri” is the Seyfert galaxy IC 4329 in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because it is surrounded by other galaxies in the center of the Abell 3574 cluster

Central Spirit:

This Taíno star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It represents the mythical figure Anacacuya, brother-in-law of the mythical hero Guahayona. It has also been translated (Flaquer 2020) as “El Lucero del Centro” (“Star of the Center”). The Taíno hero Guahayona took his brother-in-law Anacacuya by the feet and threw him into the sea, thus Ursa Minor represents Anacacuya being twirled around by Guahayona.

Cenuke:

This Selk’nam star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. Cenuke was a mythical xo’on (shaman).

Cenuke’s Robe:

This Selk’nam asterism is the IAU constellation Boötes. Cenuke was a mythical xo’on (shaman) and this is his fur robe. Since in Selk’nam culture Cenuke (represented by the star Procyon) is not in the same part of the sky as Boötes, they believe that he placed his robe there to trick people into believing where he is.

Cepheus:

None of the stars of this constellation are brighter than 2nd magnitude, but they do appear in 206 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Cep) was first mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and is listed as “Κηφεύς”(“Kepheus”) in Ptolemy’s *Almagest* (2nd century). It is named for the mythical King of Ethiopia who was married to Cassiopeia (see Kepheus, below). Variations of the name found in medieval documents and charts include the Greek term “Κηφεῦς” (“Kifefs”), latinized to “Kekeus”, “Keikaus”, “Keiphus”, and “Kikans” (these four listed by John Hill in his *Urania* in 1754), “Kikaus”, “Caicans”, “Ceichius”, “Chiphus”, “Canaus”, “Ḳifaūs”, “Ḳikaūs”, “Kankaus”, “Fikaus”, “Fifaus”, “Ficares”, “Phicares” (by John Chilmead in the 1800s and Robert Hues in the 1600s), and “Phicarus”.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a standing man in a toga wearing some sort of crown or helmet with his arms raised skyward.

The globe of the 2nd century Farnese Atlas depicts this constellation as a standing man in a toga wearing some sort of crown or helmet with his arms raised skyward (Stevenson 1921).

Cepheus is depicted in the Leiden *Aratea* (816) as a white bearded male facing us with his arms outstretched. He is wearing a thigh length robe, hose, sandals, and a purple cape, and has a conical hat on his head (Katzenstein & Savage-Smith, 1988).

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Cepheus in a short tunic.

This constellation appears as "Ceopheus" in editions of the 8th century *Revised Aratus Latinus*:

- Several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) show him standing with arms outstretched and a cape over his shoulders,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) he is shown with a halo,
- In the Vat Reg lat 1324 edition he is seated on a throne.

Cepheus was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) as "Qīqāwūs" and "al-Multaheb".

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Cepheus as a bearded male kneeling on his left knee. He is wearing knee-length robes and a qalansowa ṭawīla (tall conical hat). His left hand is gesturing with his palm upwards, and his right arm is by his side.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Cepheus", "Ceppheus", and "Zepheus".(see Sage, below). The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depict Cepheus in a long tunic, wearing a sword. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Germanicus Aberyswyth 735C, Hyginus Leiden 8° 15, and Zwettl 296 manuscripts of *De signis caeli* depict Cepheus in a mitre-like hat with fluttering ribbons. The Montecassino 3 manuscript of *De signis caeli* depicts Cepheus without this hat.

The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) describes Cepheus as a crowned king with a sword in his belt.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Cepheus as a male kneeling on his left knee, turned to our left, and waving at us with his right hand. His left arm is extended behind him.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Cepheus as a male wearing a qalansuwa prayer cap.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Cepheus as a male turned slightly to our right who is about to kneel on his right knee. He is dressed in calf length robes and wearing a qalansowa ṭawīla (tall conical hat). He is gesturing to his left with his left hand and his right arm is stretched out behind him.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Cepheus” as a male kneeling on his right knee, his body turned away from us. He is dressed in Medieval tunic, tights, and a pointy hat. His left fist is raised and his right hand is extended outwards.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Cepheus as a figure kneeling on its right knee as viewed from behind. It is not labelled and is poorly drawn. It has a pointed hat on its head and some sort of tunic. Its left hand is gesturing skyward and its right arm is extended out to its side.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Cepheus as a figure with a pointed hat. It is not labelled and being rather small, has little detail.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Cepheus as a figure in ankle length robes with his right hand holding a Sceptre. His head is no longer visible.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Cepheus as a male dressed in Medieval knee length robes, pants, shoes, and a conical cap with ear flaps. He has a long sword sheathed on his left hip. Both of his hands are raised out to his sides and beneath each hand a large fern is growing up to just below his hands.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Cepheus as a man walking holding his arms out on either side at shoulder height. He is dressed in a tunic, pants, a cap, and boots and has a sword at his hip.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts Cepheus as a man walking holding his arms out on either side at shoulder height. He is dressed in a tunic, pants, a cap, and boots and has a sword at his hip.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Cepheus” as a crowned king wearing red and blue Medieval garments and a Toki style hat as viewed from the rear. He is holding a sceptre in his right hand and pointing at the sky with his left hand. He has a sword in his belt.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Cepheus as a nude figure who appears to be seated on a throne behind Cassiopeia. The artist appears to have drawn breasts on his figure, making its gender indeterminate. The figure is unlabelled and is holding his right hand aloft. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Cepheus as a nude figure viewed from behind, running to our left. His right hand is raised skyward. It is difficult to make out any other details as this figure is in the fold between the pages.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Cepheus” as a nude bearded male as viewed from behind. He is wearing a pointed Toki cap and has both of his hands raised to shoulder height, palms forward.

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515 list “Cepheus”, but those from 1534 and 1535 list “CEPHEVS” (Dekker & Lippincott, 1999). Celestial globe gores (1517) of Schöner depict “Cepheus” as a male in Medieval clothing wearing what looks like a Tudor Nobles style cap. He is running to our left with his arms outstretched with empty hands. A celestial globe (1522) of Schöner depicts “Cepheus” as a nude male crouching with his back to us. He is only wearing a Toki style cap and has both of his hands raised to either side.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius lists “CEPHEVS” and depicts it as a nude bearded male as viewed from behind. He is wearing a pointed Toki cap and has both of his hands raised to shoulder height, palms forward.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “CEPHEVS: as a nude crowned male walking away from us with both his hands raised.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts CEPHEVS in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Cepheus” as a male facing away from us. He is wearing a thigh length tunic, pants and shoes and a hat on his head. His arms are outstretched to either side.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Di Cefeo”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Cepheus”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Cepheus as a nude male with his back to us, kneeling on his right knee. He is wearing a pointed Toki hat. Both his hands are raised to his sides, palms forward.

A celestial globe atop a planetary clock modified by Oronce Fine in 1553 (the “Paris Globe”) lists “CEPHEVS” (Dekker & Lippincott, 1999).

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists “Cepheus” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Cepheus” as a male in thigh length tunic and tall boots and a pointed hat. He is walking with both arms raised.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a male in a long robe, gesturing aloft with his right hand.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Cepheus” as a male in full length robes wearing a Medieval floppy hat. His arms are extended out to his sides.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Cepheus" as a male viewed from the rear, wearing a full-length robe and what appears to be a sort of Egyptian crown. He has partially turned to his left, pointing with his left hand at Cassiopeia. His left arm is bent out to his right, with his right hand concealed behind the body of Draco.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Cepheus" as a crowned male in long robes holding a sceptre.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "CEPHEVS" as a bearded male wearing a pointy cap and long sleeved thigh length tunic and cape with his arms spread and looking to his right.

Cepheus is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer Johann Bayer depicted it in his *Uranometria* in 1603 as a "Soldier" walking away from us wearing a helmet, and Roman style armour and a cape: His left hand is raised and his right hand is on his hip. Bayer lists the following names for this constellation: "Cepheus, Dominus Solis, Flammiger, Incensus Sonans, Iasides, Phicares, Cheichius, Cancaus, Cheguius, Ceginus".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Cepheus" as a male in a long robe facing away from us with a sceptre raised in his right hand and his left hand on his left hip. Blaeu lists the alternate names "Phicares" and "Cheichius".

"Cepheus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who lists the alternate names "Cheichius" and "Caucaus".

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Zepheo" as a bearded male kneeling on his right knee with his back to us. He is wearing a soft conical hat and some sort of kilt.

Cepheus is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

"Cepheus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a crowned male walking with his left hand on his hip and holding a wand aloft in his right hand.

Gores for a celestial globe Bibliothèque Nationale de France, Department Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Cepheus" as a male in full length robes, a turban, and a crown facing away from us to our left. He is holding a sceptre in his left hand

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Cepheus as a male walking away from us in calf length robes and a cape and wearing a conical crown on his head. His left arm is extended out with his left hand holding a sceptre. His right hand is behind his back.

Cepheus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: He is depicted as a man with a blue and gold long cape and some sort of turban walking to our left, holding a staff in his left hand and with his right arm raised.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1665) and in his *Catalogus Stellarum Fixarum* (1690) depicts “Cepheus” as a male in a short sleeved long tunic, sandals, and a turban with a crown with a long tassel on top. He is facing away from us, holding up a corner of his drapery with his right hand and holding aloft a sceptre in his left hand.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Cepheus as a man with a pointed cap, blue cloak, and gold boots striding away from us with his left hand on his hip and holding aloft a gold staff in his right hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Cepheus” as a male in a tunic, pants, boots, and a pointy cap holding a scepter in his right hand.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Cepheus” as a male in a tunic and crown viewed from behind with a scepter in his left hand and his right hand waving.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Cephée”, “Cepheus”, and “Κηφεύς” and depicts it as a bearded male in Roman armour with a spiky turban walking to our left. He has a sceptre cradled in his right arm and is holding up his cape in his left hand.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Cepheus” as a male facing away from us, dressed in ankle length robes, his head turned to the left. He is wearing a crown, holding a wand with a trefoil tip in his left hand, and a length of cloth aloft in his right hand.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Cepheus as a crowned male facing away from us wearing blue drapery around his waist, pointing to the left with his left hand and holding a golden wand in his right hand.

Cepheus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: He is depicted as a seated crowned king, holding a wand aloft in his left hand and some of his drapery aloft in his right hand.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Cepheus” as a male facing away from us, dressed in ankle length robes, holding a wand with a trefoil tip in his right hand and some sort of cloth in his left hand.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts Cepheus as a male standing facing away from us, his head turned to the right. He is wearing ankle length robes, boots, and a turban with a crown on top. In his right hand he holds a scepter, and in his left hand he holds aloft what appears to be a folded flag.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Cepheus as a male striding to our right. He is wearing knee high sandals, and a knee length tunic with a cape and has a conical hat on his head. His right hand is on his hip and he is gesturing upwards with his left hand.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Cephée” wearing a crown and robes as viewed from behind, kneeling on his left knee, with his right hand on his hip and a wand raised in his left hand.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Cepheus” as a male in long robes facing away from us. He has a turban and a crown on his head. In his left hand he holds a wand with a trefoil tip, and in his right hand he holds aloft a length of cloth.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Cephée” as a male seated facing us wearing a crown in a chart of the northern hemisphere: He is naked from the waist up and has his right arm extended out to one side and his left hand holding what appears to be a quill pen. Later in this atlas a close up chart depicts him as a crowned king holding a wand with a trefoil tip aloft in his left hand and a piece of cloth in his right hand: He is depicted this way in the 1778 edition as well.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Cepheus” and depicts him as a crowned king striding to our right wearing a billowing cape and carrying a staff of office in his right hand. Bode‘s *Vorstellung Der Gestirne* (1782) lists this constellation as “Cepheus” and depicts him in the same manner.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Cefeo” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Cephus” as a bearded male facing away from us in tunic, pants, and boots, wearing a turban topped with a crown: He is holding some of his drapery up with his right hand and a scepter in his left hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Cepheus” as a male in ankle length robes viewed from behind. He is wearing a crown, holding aloft a trefoil tipped wand in his left hand, and holding a length of cloth in his right hand.

American uranographer William Croswell (1760 – 1834) depicts “Cepheus” on his *Mercator Map of the Starry Heavens* in 1810 as a bearded male with a turban topped with a crown holding aloft a piece of cloth in his right hand and a scepter in his left hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Cepheus it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): He depicts him as a seated crowned king, holding a wand aloft in his left hand and some of his drapery aloft in his right hand.

American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) depicts Cepheus as a seated bearded male wearing a crown and a toga, with his raised right hand holding up part of his toga and his raised left hand holding up a wand.

“Cepheus” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a male in a knee length robe viewed from the front. He is looking over his left shoulder with his left hand open in front of him and his right hand raised to shoulder level.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Cepheus” as a male in long robes and a crown holding aloft a trefoil want in one hand: As “Cepheus” is placed over the figure’s head, it is difficult to tell if he is facing toward us or away from us.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cepheus" as a crowned king holding aloft one end of his drapery in his right hand and holding a scepter in his left hand.

Cepheus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. He is depicted as a crowned, bearded king holding a trefoil scepter aloft in his left hand. He is seated and wearing a toga like garment and sandals.

"Cepheus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877). He is depicted as a bearded male in a long robe facing us, his arms spread wide, looking to his left: This looks very like a Biblical prophet.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Cepheus" as "a king in regal state, with a crown of stars on his head, while he holds in his hand a scepter which is extended toward his wife, Cassiopiea".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Cepheus, the Monarch" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation simply as "Cepheus".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cepheus" in his *Star Atlas* (1893).

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Cepheus".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Cepheus" and does not describe it.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Cepheus" as the "mythological Ethiopian monarch".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows Cepheus as a rectangle of Alpha (α) Cephei (Alderamin), Zeta (ζ) Cephei, Iota (ι) Cephei, and Beta (β) Cephei (Alphirk) attached to a triangle of the last two stars plus Gamma (γ) Cephei: This looks to me rather like the silhouette of an old sagging garden shed. Rey has altered the line between Alderamin and Zeta (ζ) Cephei to include Mu (μ), Epsilon (ε), and Delta (δ) Cephei and has added two more lines: One from Alderamin through Eta (η) Cephei to Theta (θ) Cephei, and one from Zeta (ζ) Cephei to Nu (ν) Cephei: This looks to me like a garden shed that has been hit by a tree. *Sky and Telescope Magazine*, founded in 1941, depicts Cepheus in the same manner in their magazine and publications.

Cepheus' Daughter:

This Latin asterism "Cepheis" is the IAU constellation Andromeda.

Cepheus in Cepheus:

This telescopic asterism is made up of the stars of the IAU constellation Cepheus. This was posted by American astronomer Fiske Miles on *Cloudy Nights* in October 2022. The corner stars are HIP 108226A, HIP 108603, HIP 108829, HIP 108364, and HD 208657.

Cerberus:

There are two "Cerberus" asterisms:

- One Greek asterism is the IAU constellation Canis Major as listed by Hesiod and Mosenkis in his *Mycenaean Oecumene* (date n/k). Cerberus was the three headed dog who guarded Hades. This is related to their asterism Orthrus (see below): Orthrus was the brother of Cerberus.
- One Polish asterism is made up of the stars of the IAU constellation Hercules and was created by the Polish astronomer Johannes Hevelius in 1687 for his *Firmamentum Sobiescianum*: In his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, it is depicted as a three headed serpent in his left hand.
- Greek myth has Cerberus the three-headed dog guarding the entrance to Hades, and Hercules capturing him as one of his twelve labors. This asterism is made up of stars of the IAU constellation Hercules surrounding Omicron (o) Herculis, including 93, 95, 96, 102 and 109 Herculis:
    - The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Ramus Cerberus" as an apple branch with three serpents twining through it in the hand of Hercules.
    - The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts a three headed snake in the right hand of Hercules labelled "Cerberus".
    - John Hill lists Cerberus as a constellation in his *Urania* in 1754.
    - The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists "le Rameau et Cerbere" ("the twig and Cerberus") and depicts this as an apple branch with two serpents entwined in the branches being held by Hercules.
    - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "Cerberus u Zureig" and depicts it as a branch with three serpents twining through it.
    - Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Cerberus et Ramus Pomifer" in his *Celestial Atlas* in 1822.
    - French astronomer Camille Flammarion (1842 – 1925) insists in his *Astronomie Populaire* that this constellation was on the sphere of Eudoxos.
    - The French call it "Cerbère" or combine it with the asterism Ramus Pomifer (see Apple Branch, above) as "Rameau et Cerbère" or "Cerberus et Ramus".
    - "Cerberus et Ramus" is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Hercules" as "a warrior clad in the skin of the Nemean lion, holding a club in his right hand and the dog Cerberus in his left".

Cerberus of Hercules:

This **telescopic** asterism "Cérberus Hérculis" is the barred spiral galaxy NGC 6050 (Arp 272) in the IAU constellation Hercules. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this multiheaded monster could be named after Cerberus, one of the mythical creatures hunted by Hercules”. NGC 6050 is interacting with IC 1179. NOTE: IC 1179 was recorded by American astronomer Lewis Swift (1820 – 1913).

Cereal Measure Regulation:

This Korean asterism “Ggogmul Cheugjeong Gyujeong” (곡물 측정 규정) is a “dipper” of stars in the IAU constellations Hercules and Ophiuchus: Kappa (κ) and Iota (ι) Ophiuchi, and Iota (ι), 46, and 45 Herculis. Note: This asterism shares stars with the Chinese xing guan “Dipper for Solids” (see below).

Ceremonial Fish Scale:

This Wardaman star “Yagalal” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Cairns and Harney 2003).

Ceremonial Headband:

This Wardaman asterism is a line of two stars in the IAU constellation Musca: Alpha (α) and Beta (β) Muscae. This is next to their asterism Two Armbands (see below).

Ceres:

This Latin asterism “Ceres” or “Ceres Splendifera Dea” (“Ceres, the bright Goddess”) is the IAU constellation Virgo. Ceres is a Goddess of agriculture, grain crops, fertility, and motherhood:

- in Johann Bayer’s *Uranometria* (1603) lists “Ceres” as an alternate name for Virgo.
- “Ceres” appears as a name for Virgo on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- “Ceres” appears as a name for this constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- John Hill lists “Ceres” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Ceres”.
- “Ceres” is listed in R. H. Allen’s *Star Names* in 1899.

Cernunnos:

This Celtic (Gaulish) asterism is the IAU constellation Ophiuchus (Boutet 2017) as depicted on the Gundestrup Cauldron. In *The Myth of the Year*, Benigni, Carter and Ua Cuinn connect the IAU constellation Ophiuchus with this Celtic horned God of nature (2001).

Cerucion:

This “Greek” name for the IAU constellation Corona Australis is listed by John Hill in his *Urania* in 1754. Hill does not translate it or list a source.

Cervantes:

This Spanish star “Cervantes” is Mu (μ) Arae in the IAU constellation Ara. It is named for Miguel de Cervantes Saavedra, author of *El Ingenioso Hidalgo Don Quixote de la Mancha* (Don Quixote) and received this name from the IAU in 2015. This has four exoplanets named for characters in this novel: Quijote, Dulcinea, Rocinante, and Sancho.

Ceteus:

This Greek asterism is the Kneeler (see below) as described by Ptolemy (c.100 – c.170) which is the IAU constellation Hercules. Ceteus appears in Greek mythology as an Arcadian prince who was one of the 50 sons of King Lycaon. Johann Bayer's *Uranometria* (1603) lists "Cetheus". The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Ceteus" as an alternate name for Hercules. "Ceteus" is listed by John Hill in his *Urania* in 1754. Variations include Caeteus and Cetheus.

Cetus:

The brightest star in this constellation is the 2nd magnitude Beta (β) Ceti (Diphda) which is only 51st on the list of 90 brightest stars, but its stars appear in 241 of the asterisms in this handbook.

The IAU constellation Cetus (IAU abbreviation Cet) is one of the 48 original constellations Ptolemy (c.100 – c.170) listed in the *Almagest* and was associated by the ancient Greeks with the sea monster that was slain by the mythical hero Perseus. It is located in the middle of a number of constellations associated with the sea: Eridanus, Pisces, Piscis Austrinus, and Aquarius. Ptolemy (100 – 170) called it "Κῆτος" ("Kitos"- see Sea Monster, below).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a whale-like creature with a dorsal fin.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Cetus as a creature whose front half resembles a horned goat and whose back half is segmented with a whale's tail.

This constellation appears as "Coetus" in the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821). It also appears as "Coetus" in editions of the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) he is depicted as a dog-faced monster with a curled tail, facing right,
- In the Paris BN n.a. 1614 manuscript he is facing left with a curled snout and horns,
- In the Vat Reg lat 1324 and Munich 560 manuscripts Cetus appears as a fish.

Cetus appears in the Leiden *Aratea* (816) with the front half resembling a wolf and the back end a fish (Katzenstein & Savage-Smith, 1988).

The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Cetus looking back and up. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Cetus as a pointy nosed creature, possibly a crocodile.

This constellation was listed as "Qītus" by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Cetus as a sea monster whose front half is a bearded jackal and whose rear half is a whale's tail. He is shown in right and left profile.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts this as a monster whose front half is a sort of bearded lion and whose rear half is a whale's tail.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts Cetus as a horned sea monster swimming to our right.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Cetus" and "Coetus". The Oxford Laud 644 and Venice VIII 22 manuscripts of *De signis caeli* depict Cetus with a head resembling an aardvark and long ears. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Cetus as a beaked, clawed sea monster with a long horn on his head. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Cetus with a snake's head and flippers. The Durham Hunter 100 manuscript of *De signis caeli* depicts Cetus as a fish. The Montecassino 3 manuscript of *De signis caeli* depicts Cetus with a dog's head.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Cetus as a sea monster with a dragon-like head, a collar, clawed front legs, and the tail of a whale.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Cetus as a reptilian sea-monster.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Cetus as a monster whose rear half is whale and whose front half is a monster having a head with ears and a large mouth and front legs with claws. The artist has clothed the green monster in a red garment.

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Cetus as a sea monster with sharp teeth swimming to our right.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Cetus as a monster with a dragon's head, clawed front legs, and the tail of a whale.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Cetus" as a whale swimming to our right.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Cetus as a large fish with a collar swimming to our right. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Cetus as a creature whose front half resembles a snarling wolf and whose rear is a whale's tail. It is facing towards our right and is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts only the snarling head of Cetus, the rest of the constellation being off the edge of the vault.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Cetus as a sea monster with what appears to be a lion's head, front legs with hooves, and a rear end of a serpent.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Cetus as a winged dragon with a long curling tail facing to our right.

"Cetus" appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a whale like sea monster facing to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Cetus Magnus aut Pistrix” as a whale.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Cetus as a monster whose front half appears to be a dog and whose back half is a whale. It is not labelled and is facing to our right. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts it in a similar fashion but reversed, facing to our left.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Cetus as a large rotund fish with teeth.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius lists this as “CETVS” and depicts Cetus as a large fish with a head resembling a dog’s head with ears.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Cetus” as a dragon headed sea monster swimming to our right.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Cetus as a whale swimming to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts “CETVS” in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Cetus” as a whale with teeth swimming to our right.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Ceto, o ver Balena”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Whale”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Cetus as a sea monster swimming to our left with a ribbon wrapped around its neck. It has a whale’s rear end. It’s head is hard to make out, but appears to be a dragon’s head with ears.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Cetus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Cetus” as a sea monster.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Cetus” as a sea monster swimming to our right.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “la Baleine” as a large fish swimming to our left.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Cetus” as a sea monster swimming to our right. Its back end is a whale’s tail and the front end looks like a bear

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels this constellation “Pistris” (“fish”) and depicts it as a sort of half wolf, half fish.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Cetus” as a sort of whale swimming to our right.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Cetus as a whale-like sea monster swimming to our right.

Cetus is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a sea dragon. Bayer lists these names for this constellation: “Cetus, Cete, Draco Leo ursus marinus, Bellua, Monstrum marinum, Balena, Pistrix, Orphus, Orphas, Elkaitos, Elketos”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Cetus” as a sea monster swimming to our right with “Balena” listed as an alternate name.

“Cetus” and “Balena” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a sea monster swimming to our left.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Cete” for this constellation.

“Cetus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a whale like sea monster swimming to our left.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Cetus Ballena” as a whale with teeth swimming to our right.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts just the head of Cetus at the lower edge of the dome. It is a dragon like head.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Cetus” and “Balena”.

A Latin name listed by Edward Sherburne in his *Spheres of Marcus Manilius* in 1675 is “Cete”.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Cetus” as a whale.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this constellation “Cetus” with the subtitle “Balena” and depicts it as a half whale half lion creature.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Cetus” as a sea monster with a long tongue and pointed nose facing to our right.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Balena Cetus Pistrix ireo Marinus" and depicts it as a whale.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Cetus" as a whale with teeth.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Cetus" as a see monster with clawed front legs.

Cetus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a sea monster with large teeth, front clawed paws, and a whale's tail.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Cetus" as a sea monster with a curved tusk, clawed front legs, and a whale's tail.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Cetus Balena" and depicts it with the front end of a lion and the back end of a whale.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Cetus as a sea monster with a dragon head, clawed front legs, and a whale tail, swimming to our left.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "La Baleine" as a sea monster resembling a whale.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Cetus" as a sea monster facing to our right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "La Baleine" ("the whale") as a sea monster with large teeth, front clawed paws, and a whale's tail, as does the 1778 edition.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Wallfisch" and depicts it as a monster with the front half resembling a lion and the back half a whale. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Wallfisch" and depicts it the same way.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Balena" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Cetus Balena" as a whale with teeth.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Cetus" as a sea monster facing to our right.

Cetus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Walvisch" and depicted as a sea monster.

American uranographer William Croswell (1760 – 1834) depicts "Cetus the Whale" on his *Mercator Map of the Starry Heavens* in 1810 as a whale with teeth.

"Cetus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a dragon headed sea monster, whose head is tilted to one side.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Cetus in his *Celestial Atlas* in 1822: It is depicted as a monster with a single horn over its nose, clawed front feet and a whale's body.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Cetus" as a whale like monster with clawed front fins: It is facing to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cetus" as a whale like monster with front flippers.

Cetus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. This constellation is depicted as a whale with a dog-like bearded face and clawed front legs.

"Cetus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It its depicted as a sea monster with a lion's head.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Cetus, the Whale".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) labels this constellation "Cetus, the whale,… a huge sea monster".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Cetus, The Sea Monster" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cetus" in his *Star Atlas* (1893) and describes it as "The Whale".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Cetus" and describes it as a "Whale".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Cetus" as "the Whale".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Cetus in his book *The Stars - A New Way to See Them* (1952), turning the "whale" 180 degrees:

- Its "tail" is an oval of the stars Alpha (α) Ceti (Menkar), Lambda (λ) Ceti, Mu (μ) Ceti, Xi (ξ) Ceti, and Gamma (γ) Ceti, with a line from this last star going to Delta (δ) Ceti,
- Its "body" is the bent oval of stars Delta (δ) Ceti, Omicron (ο) Ceti, Zeta (ζ) Ceti, Theta (θ) Ceti, Iota (ι) Ceti, Beta (β) Ceti (Diphda), and Upsilon (υ) Ceti.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Cetus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- His "head" is the oval of stars Gamma (γ) Ceti, Alpha (α) Ceti (Menkar), Lambda (λ) Ceti, Mu (μ) Ceti, Xi (ξ) 2 Ceti, and Nu (ν) Ceti,

- The “body” is a line running from Gamma (γ) Ceti through Delta (δ), 75, Omicron (ο), Zeta (ζ), and Theta (θ) Ceti to Eta (η) Ceti,
- The “tail” is the triangle of stars Eta (η) Ceti, Iota (ι) Ceti, and Beta (β) Ceti (Deneb Kaitos), and
- An “arm” runs from Zeta (ζ) Ceti through Tau (τ) Ceti to Upsilon (υ) Ceti.

Sky and Telescope Magazine, founded in 1941, depicts Cetus in their magazine and publications like this:

- Its “head” is a pentagon of the stars Alpha (α) Ceti (Menkar), Lambda (λ) Ceti, Mu (μ) Ceti, Xi (ξ) 2 Ceti, Nu (ν) Ceti, and Gamma (γ) Ceti,
- From Gamma (γ) Ceti a line runs through Delta (δ) Ceti and Omicron (ο) Ceti to Zeta (ζ) Ceti,
- Its “body” is a six-sided figure of the stars Zeta (ζ) Ceti, Theta (θ) Ceti, Eta (η) Ceti, Iota (ι) Ceti, Beta (β) Ceti (Deneb Kaitos) and Tau (τ) Ceti.

Arabic astronomers translated the Greek name to “al Ketus”, which resulted in the names “Elketos”, “Elkaitos”, and “Elkaitus”. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Elketos”. “Elketos” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Cetus A:

This **telescopic** asterism is the barred spiral galaxy Messier 77 (NGC 1068) in the IAU constellation Cetus. This was discovered by French astronomer Pierre Méchain in 1780 and listed by his colleague Charles Messier. William Herschel described it as a “star cluster” and his son John Herschel did also, including it on his list as h 262. It was listed in John Herschel’s 1864 *General Catalogue* as GC 600. It is also known as the “Fiery-Spirited of Cetus” (see above) and the Squid Galaxy (see below).

Chaff:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star HIP 88550 in the IAU constellation Sagittarius.

This Chinese xing guan “Kāng” (糠) is the star 45 Ophiuchi in the IAU constellation Ophiuchus.

This Chinese Chenzhuo xing guan “Kang” is the star HIP 88550 in the IAU constellation Sagittarius.

Chain Link of Andromeda:

This **telescopic** asterism “Désmus Andrómedae” is the intermediate spiral galaxy IC 1525 in the IAU constellation Andromeda. It was discovered by American astronomer Lewis Swift in 1887, who recorded it in his list “IX”. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “located exactly on the spot where Hevelius in his Uranographia star atlas drew the chain”.

Chained Broach Nebula:

This **telescopic** asterism is the HII region NGC 2467 (SH 2-311, RCW 16, LBN 1065, Cr 164, Ced 103) in the IAU constellation Puppis, which was discovered by English astronomer William Herschel in 1784 who listed it as “IV 22” in his catalogue. It is GC 1589 in the *General Catalogue* of 1864. This is also known as the “Skull and Crossbones” (see below), the “Death’s Head Nebula” (see below), and the “Mandrill Nebula” (see below).

Chained of Grus:

This **telescopic** asterism "Catenátus Grúis" is the barred spiral galaxy IC 5201 in the IAU constellation Grus. It was discovered by Joseph Lunt in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "at its western side, this galaxy has a long and thin interspaced spiral arm, like a chain of bright luminous spots".

Chained Sea Calf:

This Latin asterism "Vitulus Marinus Catenatus" is the IAU constellation Andromeda and appears in Bayer's *Uranometria* in 1603 as a chained seal. "Vitulus Marinus" is given as an "Arabic" name for Andromeda in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. John Hill gives it the Latin name "Phoca" or "Phoce" ("sea calf" or "seal") in his *Urania* in 1754. Hill describes this as "one of the Arabian constellations", which means it is a variation of their asterism "al-mar'ah al-musalsalah" (see Chained Woman, below).

Chained Woman:

This Arabic asterism "al-mar'ah al-musalsalah" (المرأة المسلسلة), later latinized to "Merga", "Marrha", or "El Mara al Musalsela" is the star 38 Boötis in the IAU constellation Boötes:

- "al-Mara' al-Musalsala" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Merga".
- Dorn (1829) lists this as "chain", explaining that this is "probably mis-written for the Chained Lady" and describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- John Chilmead lists the name "Alamara Almasulsala" in his *Learned Treatise on Globes* in 1889, which was a translation of early Latin works by English geographer and mathematician Robert Hues: Hues listed it in 1659 as "Almara Almasulsela".
- In his *Star Names* in 1899, R. H. Allen suggested that "Marrha" is derived from the Latin "Marra" ("hoe" or "rake") and that this name was used by the Roman Poet Decimus Junius Juvenalis (Juvenal) and Roman writer Lucius Junius Columella.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Merga" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this star as "Merga, or corn fork, of Bayer".
- The IAU approved the name Merga for 38 Boötis. Compare this to Shackled Woman, below.

This Latin asterism "Mulier Cathenata" is the IAU constellation Andromeda. This name is listed in Johann Bayer's *Uranometria* (1603). This name is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. This name is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Chair:

This Arabic asterism "Dal al Cursa" is the IAU constellation Cassiopeia as listed in John Hill's *Urania* in 1754. He describes it as "only a translation of the old Greek name".

The Latin name “Cathedra” is given for the IAU constellation Cassiopeia by John Hill in his *Urania* in 1754.

There are two **telescopic** “chair” asterisms:

- One is Sánta 82, listed in 2007 by Hungarian astronomer Sánta Gábor is 11 – 13th magnitude stars in the IAU constellation Orion. Gábor describes it as “nice, pretty bright, chair-like asterism.”
- One is in the IAU constellation Cassiopeia and is Corder 202 on the observing list of American astronomer Jeffrey Corder. Corder describes it as “a loose group of five 8th and 9th magnitude stars.” This includes HIP 5839 and 5696. To me, it looks like a recliner chair. Size 30’ X 20’.

Chair of Eiddionydd:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Chair of Teyrnon:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Ch’akana:

This Inca asterism “Ch’akana” or “Chacana” is the IAU constellation Crux (Gamarra & Gamarra 2009). It represents the principal grains in the Inca diet, with the star Alpha (α) Crucis (Acrux) called “Saramanqa” (“Pot of Maize”) and Beta (β) Crucis (Mimosa) called “Qoqamanqa” (“Pot of Qoqa”).

Chalawan:

This Thai star is 47 Ursae Majoris in the IAU constellation Ursa Major and was given this name by the IAU in 2015. Chalawan is a mythological crocodile from a Thai folktale. It has two exoplanets named Taphao Thong and Taphao Kaew.

Chaldean Fish:

This Dutch asterism with the Greek name “Χελιδόνιας ἰχθύς” (“Chelidónias ichthýs”) is the triangle of stars Phi (ϕ), Upsilon (υ), and Sigma (σ) Piscium in the IAU constellation Pisces, forming the northern “fish”. This was listed in R. H. Allen’s *Star Names* in 1899. Allen writes that “A scholiast on Aratus, commented on by Grotius, said that the Chaldeans called the northernmost fish [this name]”, this being the Dutch lawyer and astronomer Hugo Grotius (1583 – 1645).

Chalice:

This Austrian asterism is made up of stars of the IAU constellation Orion and was created by Anton Maria Schryrleus (1604 – 1660), the maker of the lenses for Kepler’s telescope. R. H. Allen lists this in his *Star Names* in 1899 but does not describe the precise stars.

Chalk Line:

This **telescopic** asterism is Renou 37 in the asterism list of French astronomer and author Alexandre Renou. This is in the IAU constellation Ophiuchus. René Merting lists it on the *Faint Fuzzies* website. The line starts at HIP 89283 and runs through a line of 8^{th} – 10^{th} magnitude stars. It is 15' long.

Cham:

This asterism is the IAU constellation Taurus as listed by John Hill in his *Urania* in 1754. Hill describes this as being the name of an Egyptian character, but Cham is actually the son of Noah in Hebrew legends.

Chamaeleon:

None of the stars of this constellation are brighter than 4^{th} magnitude and only show up in 12 asterisms in this handbook.

The IAU constellation Chamaeleon (IAU abbreviation Cha) was created by Flemish astronomer Petrus Plancius in 1597 based on the observations of the Dutch navigators Pieter Dirkszoon Keyser (1540 – 1596) and Frederick de Houtman (1571 – 1627). De Houtman called it "Het Chamel joen". Dutch historian Paulus Merula (1558 – 1607) called it "Chamaeleon", as did Flemish cartographer Jodocus Hondius (1563 – 1612), and Dutch uranographer Willem Blaeu (1571 – 1638). It was depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a chameleon.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists "Chamaeleon" and depicts it as a chameleon.

German uranographer Johannes Bayer (1572 – 1603) depicts "Chameleon" in his *Uranometria* in 1603 as a chameleon.

"Chamaeleon" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Chamaeleon" for this constellation.

"Chamaeleon" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a chameleon.

Gores for a celestial globe Bibliothèque Nationale de France, Department Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Chamelion" as a chameleon.

"Chameleon" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Cameleon" and depicts it as what looks like a worm with a rounded head.

English astronomer Edmund Halley's chart of 1678 depicts "Chamaeleon" as a chameleon.

Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Chamaeleon" as a chameleon walking to our left.

Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Chamaeleon" as a chameleon and Hevelius shows it as a line of three stars: Alpha (α), Gamma (γ), and Beta (β) Chamaeleontis.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Chamaeleon" as a chameleon.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Chamaeleon as a green lizard.

Chamaeleon is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Chamaeleon" as a chameleon.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Chamæleon" as a chameleon.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts "Chamaeleon" as a lizard with a curly tail.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Chamaeleon as a lizard with a curly tail.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "la Cameleon" as a chameleon.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Cameleon" as a chameleon.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Camelion" as a chameleon.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Cameleon" as a lizard, as does the 1778 edition.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Chamaleon" as a chameleon.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Chamelion" as a chameleon walking to our left.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Chamaeleon in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "The Camelian" as a chameleon.

"Chamaeleon" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Chameleon” as a lizard.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Chamaeleon, the Chameleon” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Chamaeleon” and describes it as a “Chamaeleon” and incorrectly attributes it to Bayer.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the in his book *The Stars - A New Way to See Them* (1952). The IAU standard asterism is simply a line of three stars: Beta (β) Chamaeleontis, Gamma (γ) Chamaeleontis, and Alpha (α) Chamaeleontis. Rey creates a rectangle of the stars Gamma (γ), Delta (δ) 2, Beta (β), and Epsilon (ε) Chamaeleontis with a line running from Gamma (γ) Chamaeleontis to “eyes” of Alpha (α) and Theta (θ) Chamaeleontis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Chamaeleon in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, as a diamond shape made up of Theta (θ), Delta (δ) 2, Beta (β), Gamma (γ), and Alpha (α) Chamaeleontis.

Sky and Telescope Magazine, founded in 1941, depicts Chamaeleon in their magazine and publications like this:

- One end is a quadrilateral of the stars Gamma (γ), Delta (δ) 2, Beta (β), and Epsilon (ε) Chamaeleontis, and
- From Gamma (γ) Chamaeleontis a line runs out to Alpha (α) Chamaeleontis.

French astronomers call it “Caméléon” and Italian astronomers “Camaleonte”.

Chamber:

This is the Japanese sei shuku or lunar station moon station “Soi Boshi”, sometimes translated as “breasts”. It is a line of four stars in the IAU constellation Scorpius: Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Eta (η) Scorpii, and Rho (ρ) Scorpii.

Chamber of Horrors:

This is an alternate name for the Ant Nebula (see Ant, below).

Chamberlain:

This Korean asterism “Sijong” (시종) is a line of two stars in the IAU constellation Lupus: Chi (χ) and Xi (ξ) 2 Lupi.

Champagne Flute and Fizz:

This Canadian **telescopic** asterism is in the IAU constellation Andromeda and was listed by Calgary Centre member Roland Deschesne. The base of the “champagne flute” is Beta (β) Andromedae (Mirach) and the “flute” is formed by the triangle of stars Mu (μ), Nu (ν), and 32 Andromedae. The “fizz” is the Andromeda Galaxy, Messier 31. Size 470’ X 140’.

Champion:

This Xhosa star “iQhawe”, “iQhawa”, or “iNgqaqhawuli” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Slotegraaf 2013, Lock and Slotegraaf 2022). Some expand this into an asterism including the star Beta (β) Canis Majoris (Mirzam). This star and uCanzibe (see Shining Brightly, below) are seen by some as suitors, though it is not clear whose affections they are seeking.

This asterism is the IAU constellation Perseus as listed by Robert Burnham in his Burnham’s Celestial Handbook in 1978. Burnham describes this as a classical Greek name.

Chamukuy:

See Small Bird, below.

Chanal's Variable Star:

This **telescopic** star is a suspected variable star NSV 2229 (V1118) in the IAU constellation Orion.

Chandelier:

This **telescopic** asterism is the globular cluster NGC 6723 in the IAU constellation Corona Australis. It was discovered by Scottish astronomer James Dunlop in 1827. John Herschel listed it as h 3770 and later as GC 4450 in the *General Catalogue* of 1864. It is also known as the Soccer Ball (see below) and the Candelabra (see above).

Changing Room (Vassal of Tail):

This Chinese xing guan “Shéngōng” (神宫(附尾宿)) is the star Zeta (ζ) 2 Scorpii in the IAU constellation Scorpius.

Chángshā (Vassal of Chariot):

This Chinese xing guan “Chángshā” (长沙(附轸宿)) is the double star Zeta (ζ) Corvi in the IAU constellation Corvus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Channel:

This Persian lunar station “Khatsar” is the stars Beta (β) Aquarii (Sadalsuud), Delta (δ) Aquarii, and Kappa (κ) Aquarii in the IAU constellation Aquarius as listed by R. H. Allen in his *Star Names*.

This Sogdian lunar station “Shawshat” is the stars Beta (β) Aquarii (Sadalsuud), Delta (δ) Aquarii, and Kappa (κ) Aquarii in the IAU constellation Aquarius as listed by R. H. Allen in his *Star Names*.

This Khorasmian lunar station “Mashtawand” is the stars Beta (β) Aquarii (Sadalsuud), Delta (δ) Aquarii, and Kappa (κ) Aquarii in the IAU constellation Aquarius as listed by R. H. Allen in his *Star Names*.

Channel-billed Cuckoo:

This Kamilaroi star “Murgu” is Alpha (α) Pavonis in the IAU constellation Pavo as listed by William Ridley in 1875, who called it a “night cuckoo”.

Chaophraya:

This **telescopic** Thai star is WASP 50 in the IAU constellation Eridanus (magnitude 11.44). This name was proposed to the IAU for their NameExoWorlds campaign in 2019. It is named after the Chao Phraya River. It has an exoplanet named Maeping, which is one of the tributaries of this river.

Chaotic of Canes Venatici:

This **telescopic** asterism "Chaódes Cánum Venaticórum" is the spiral galaxy NGC 4242 in the IAU constellation Canes Venatici. It was discovered in 1788 by William Herschel who listed it as "III 725". It became GC 2830 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of "the disordered structure of this wild looking galaxy with its short fragmented arms".

Chaple's Arc:

This **telescopic** asterism is also known as the Fairy Ring. It was named for American astronomer and author Glenn Chaple. This asterism is in a busy field of stars: The challenge is to spot the arc of stars, all of which are doubles. Four bright double stars in the IAU constellation Cygnus form the northwest curve of the ring, including HIP 98848 and 98773A. Some fainter double stars complete the circle. This is a few degrees south of Gamma (γ) Cygni (Sadr) in Cygnus and 1.6 degrees west of NGC 6888 (the Crescent Nebula). This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011. Jeffrey Corder lists it as Corder 4040. Size 20'.

Chara:

See Joy, below.

Charcoal Lined of Virgo:

This **telescopic** asterism "Carbolineáta Vírginis" is the spiral galaxy NGC 4772 in the IAU constellation Virgo. It was discovered in 1784 by English astronomer William Herschel who listed it as "II 24". It became GC 3285 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "conspicuous dark belt".

Chariot:

This Chinese xiù (lunar mansion) "Zhěnxiù" (轸宿) is a quadrilateral of stars in the IAU constellation Corvus: Gamma (γ) Corvi, Delta (δ) Corvi, Beta (β) Corvi (Kraz), Alpha (α) Corvi (Alchiba), and Epsilon (ε) Corvi. In one corner you find their minor asterisms Left Linchpin (see below) and Right Linchpin (see below). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Zhen" was associated to matters concerning the Jingzhou territory. It appears in the Tang Dynasty (618 – 907 C.E.) as "Zhěn" (轸) and was compared to the Vedic nakshatra Hasta (Kotyk 2017, see Hand, below).

This Chinese Chenzhuo xing guan "Zhěnxiù" is a box of four stars in the IAU constellation Corvus: Beta (β) Corvi (Kraz), Delta (δ) Corvi, Gamma (γ) Corvi, and Epsilon (ε) Corvi. From three corners lines run out:

- From Gamma (γ) Corvi a line runs into the middle of this "box" to the star Zeta (ζ) Corvi, called "Chansha",
- From Delta (δ) Corvi a line runs out to Eta (η) Corvi, called "Zuoxia" ("Left Linchpin (Adjunct to Chariot"), and

- From Epsilon (ε) Corvi a line runs out to 3 Corvi, called "Youxia" ("Right Linchpin, Adjunct to Chariot".

This Babylonian asterism "MUL.GIS.GIGIR" from the *Astrological Reports to the Kings* is listed by Parpola in *Letters from Assyrian and Babylonian Scholars* in 1993 as an unidentified asterism. Anthony Hope lists it as "GIGIR (GISH.GIGIR)" or "narkabtu" in his *A Guide to Ancient Near Eastern Astronomy* in 1996 as an unidentified asterism. However, Herman Hunger in his *Astronomical Diaries and Related Texts from Babylonia* in 1988 lists two stars which are in the IAU constellation Taurus that are part of a chariot: "SUR GIGIR sa SI" (see Northern of the Chariot below) and "SUR GIGIR sa ULU" (see Southern of the Chariot below). I'm listing this in Taurus.

This Assyrian asterism "Narkabtu" (Parpola 1993) from the Astrological Reports to the Kings is stars in the IAU constellation Taurus.

This Sumerian asterism "mul ĝišgigir" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is stars in the IAU constellation Taurus.

Akkadian asterism "dEn-[me-šár]-ra" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is stars in the IAU constellation Taurus.

This Greek asterism "Σάτιλλα" ("Sátilla") is the Pleiades cluster in the IAU constellation Taurus as listed by 6th century Greek grammarian Hesychius of Alexandria and by R. H. Allen in his *Star Names* in 1899.

This Greek asterism is the Big Dipper Asterism in the IAU constellation Ursa Major (see Big Dipper, above) as listed by Greek poet Anacreon (c. 5th century B.C.E.) and as listed in R. H. Allen's *Star Names* in 1899. Anacreon called it both a chariot and a bear.

This Arabic asterism "Mercab" is the asterism Argo's Ship (see above) as listed in John Hill's *Urania* in 1754. Hill translates this name as "chariot".

There are two Latin asterisms called "Currus":

- One is the IAU constellation Delphinus. "Currus" is listed in Johann Bayer's *Uranometria* (1603). This name is attributed to the Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) in John Hill's *Urania* in 1754.
- One is the Big Dipper asterism in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

There are two Belarussian "chariot" asterisms:

- One, "Kolesnitsa", is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper below). They also call it "Pavozachka" (see Small Cart, below).
- One, "Kaliansnitsa", is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009).

This Seima-Turbino asterism is the IAU constellation Ursa Minor (Polyakova 2009).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists the name "Chariot" for the Little Dipper asterism.

Chariot Cross Board:

This is the Japanese sei shuku or lunar station “Mitsusake Boshi”, sometimes translated as “strings of Koto”, and is made up of stars of the IAU constellation Corvus. It is a quadrilateral of stars: Beta (β) Corvi (Kraz), Delta (δ) Corvi, Epsilon (ε) Corvi, and Gamma (γ) Corvi.

Chariot of Elias:

This asterism is the Big Dipper asterism in the IAU constellation Ursa Major as listed in Edward Sherburne’s Sphere of Marcus Manilius in 1675, attributing it to German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658). It is later listed John Hill’s *Urania* in 1754, but Hill doesn’t identify his source. Elias is a variation of the name of the Hebrew prophet Elijah.

Chariot of Emperor:

This Korean lunar mansion “Jin” is a quadrilateral of stars in the IAU constellation Corvus: Beta (β) Corvi (Kraz), Delta (δ) Corvi, Gamma (γ) Corvi, and Epsilon (ε) Corvi. Three small asterisms, each a line of two stars, are connected to two of the corners of this asterism: “Royal” (see below), “Sand for Life” (see below), and “Lord” (see below).

Chariot of the Sea:

This Latin asterism “Currus Maris” is Ptolemy’s asterism Argo’s Ship (see above).

Chariot Yoke:

This “Euphratian” asterism “Sugi” is the stars Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed by R. H. Allen in his *Star Names* in 1899. Bartel van der Waerden lists “SHU-GI” as a Babylonian name for “Perseus and norther part of Taurus” in his *Birth of Astronomy* in 1974.

Chariots and Cavalry:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Lupus: Zeta (ζ) Lupi (the determinative star), HIP 74006, and b Lupi.

This Chinese xing guan “Chēqí” (车骑) is a bent line of stars in the IAU constellation Lupus: Sigma (σ), Rho (ρ), and Zeta (ζ) Lupi. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Chēqí” is a triangle of stars in the IAU constellation Norma: Eta (η) Normae, HIP 77678, and HIP 76935.

Chariots and Cavalry General:

This Chinese xing guan “Qízhènjiāngjūn” (骑阵将军) is the star Kappa (κ) 1 Lupi in the IAU constellation Lupus.

This Chinese Chenzhuo xing guan “Qízhènjiāngjūn” is the star HIP 78323 in the IAU constellation Lupus.

Charioteer:

This Greek asterism “‘Ηνίοχος” or “Heniochus” is Ptolemy’s version of the IAU constellation Auriga which appeared in his *Almagest* (2nd century). Greek names for this constellation relating to charioteers include “Ἁρμελάτης” (“Armelátis”, “Armelates”, “Harmelates”, or “Hamiclates”), “Διφρηλάτης”

(“Difrilátis” or “Diphrelates”), “Ἱππηλάτης” (“Ippilátis” or “Ippelates”), “Pelethronius”, “Threthon”, “Hippolytus”, and “Ἐλάσιππος” (“Elásippos” or “Elasippos”):

- *Dele Stelle Fisse* (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De l’inuentor del Carro, o vero Auriga” (“the true Charioteer, Auriga”). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Auriga, qui et Heniochus, sev Erichtonius” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- In the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch the alternative name “Heniochus” is listed.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Aeritonio” (“Erichthonius”), “Agitator”, “Auriga”, and “Heniochus” and depicts him as a nude bearded male viewed from behind kneeling on his left knee with a got sitting on his left shoulder.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Auriga”, “Heniochus”, and “Ericthonius” for this constellation.
- John Hill lists “Armelates” and “Harmelates” as names for this asterism in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Heniochus”.

Ptolemy’s charioteer includes stars from the IAU constellations Auriga and Taurus:

- From the “head” at Delta (δ) Aurigae a line runs to the base of his “neck” at Omicron (ο) Aurigae,
- His “shoulders” are the stars Alpha (α) Aurigae (Capella) and Beta (β) Aurigae (Menkalinan),
- His “cloak” is anchored at the “shoulder” stars Alpha (α) and Beta (β) Aurigae and its lower corners are the stars HIP 22453 and Chi (χ) Aurigae,
- One “arm” runs from Beta (β) Aurigae to an “elbow” at Nu (ν) Aurigae to a “hand” at Theta (θ) Aurigae,
- The other “arm” runs from Alpha (α) Aurigae to an “elbow” at Epsilon (ε) Aurigae to a “hand” at the stars Eta (η) and Zeta (ζ) Aurigae, and
- The “legs” run from the “hips” at star Sigma (σ) Aurigae:
    - One goes out to Iota (ι) Aurigae, and
    - The other goes out to Beta (β) Tauri.

This Vedic asterism is the IAU constellation Auriga. They call the star Alpha (α) Aurigae (Capella) “Bramha-hrdaya”.

This Korean asterism “Chalo Naleuda” (차로 나르다) is a line of stars with a loop at the end in the IAU constellations Cygnus and Lacerta. The loop is the four stars HIP 107235 and 72, 74, and 79 Cygni. From HIP 107235 a line runs out through HIP 109102 and 2 Lacertae, ending at 5 Lacertae.

This Romanian asterism “Vizitiul” is the IAU constellation Auriga (Ottescu 2009).

Charles’ Heart:

This English star with the Latin name “Cor Caroli” is Alpha (α) Canum Venaticorum in the IAU constellation Canes Venatici. It was named in 1660 by Sir Charles Scarborough, physician to Charles II of

England, although it is unclear whether it was meant to commemorate that king or his father, Charles I, who was executed during the civil war in 1649. It is also known as "Regis Martyris", which is certainly a reference to Charles I:

- Edward Sherburne lists it as "Cor Caroli" in his *Sphere of Marcus Manilius* in 1675.
- English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Cor Caroli" as a heart topped with a crown.
- A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Cor Car" as a heart topped with a crown.
- A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Cor Caroli as a heart topped with a crown.
- A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Cor Caroli" as a heart topped with a crown.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts this as a star in a heart topped with a crown on the collar of one of the two dogs of Canes Venatici and has a tiny label which reads "le Cœur de Charles".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Das herz Carlo II".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Cuor di Carlo" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- American uranographer William Croswell (1760 – 1834) depicts "Cor Caroli Charles's Heart" on his *Mercator Map of the Starry Heavens* in 1810 as a heart topped with the English crown.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Cor Caroli" it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822). These depict the star inside a heart shape topped with a crown.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Cor Caroli" and his *Bedford Catalogue* in 1844 writes that "Cor Caroli [was named] by Halley, at the suggestions of Sir. C. Scarborough, after a worthless man's heart. The popular story, or rather the vulgar one, runs, - how Scarborough, the court physician, gazed upon a star the very evening before the return of King Charles II to London, the which, as in duty bound, appeared more visible and refulgent than heretofore; so the said star… was thereupon extra-constellated within a sort of Valentine figure of a heart, with a royal crown upon it; and so the monarch, it would seem, buy this extraction, remained heartless".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Cor Caroli".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cor Caroli" as a heart topped with a crown.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Cor Caroli".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Cor Caroli".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cor Caroli" in his *Star Atlas* (1893).
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Cor Caroli" for this star.

- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Cor Caroli" for this star and claims that it is "named in honor of Charles II'.
- The IAU approved the name Cor Caroli for the star Alpha (α) 2 Canum Venaticorum Aa.
- NOTE: French astronomers listed it as "Coeur de Charles", Italian astronomers as "Cuor di Carlo", and German astronomers as "Herz Karls".

Charioteer of Libra:

This **telescopic** asterism "Auríga Líbrae" is the spiral galaxy NGC 5917 (Arp 254) in the IAU constellation Libra. It was discovered in 1835 by John Herschel who listed it as h 3602 and later as GC 4095 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 5917 and its southern companion MCG-01-39-003 bring to mind a charioteer and his horse, the long tidal bridge being the reins". See "Mare of Libra", below.

Charles' Oak:

This English asterism "Robur Carolinum" was created by the English astronomer Edmond Halley in 1679 in reference to the Royal Oak where his patron Charles II was said to have hidden from Oliver Cromwell's troops. Halley listed "Robur Carolinum" in his *Catalogus Stellarum Australium* in 1679. It was made up of stars between the IAU constellations Centaurus and Carina, extending into half of Vela. It included the stars Beta (β) Carinae (Miaplacidus) and Eta (η) Carinae, the Eta Carina Nebula (NGC 3372), and the "Southern Pleiades", open cluster IC 2602 (see Southern Pleiades, below). French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) strongly objected to it as he felt these stars were the best stars of the constellation Argo Navis (see Ship of Argo, below).

English astronomer Edmund Halley's chart of 1678 depicts "Robur Carolinum" as an oak tree. Halley renamed Beta (β) Carinae (Miaplacidus) to "Alpha Roboris" ("alpha oak") or "Royal Oak".

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Robur Caroli" as and oak tree. Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Robur Caroli" as an oak tree. The central star is Theta (θ) Carinae with three lines running out:

- One to Beta (β) Carinae (Miaplacidus),
- One to Gamma (γ) Muscae, and
- One to Mu (μ) Velorum.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Robur Carolinum" on his charts as a tree.

German astronomer Johann Elert Bode (1747 – 1826) restored Robur Carolinum on his charts and American uranographer Elijah Burritt (1794 – 1838) showed it on his charts.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts "Robur Carolim" as an oak tree between Centaurus and Carina.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Robur Carolinum as an oak next to Argo Navis.

English astronomer John Flamsteed listed “Robur Carolinum” in his *Atlas Coelestis* in 1729.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Chéne de Charle” as an oak tree as does the 1778 edition.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Robur” as an oak tree.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Robur Caroli” as an oak tree.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Robur Car” as an oak tree.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Carls Eiche” on his chart and depicts it as a oak tree.

American uranographer William Croswell (1760 – 1834) depicts “Robur Carolinum the Royal Oak” on his *Mercator Map of the Starry Heavens* in 1810 as an oak tree.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “Robur Carolinum, King Charles’ Oak” as an oak tree.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Robur Caroli” as an oak tree.

Charles’ Wain:

This Brythonic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above). Its name was derived from the older Saxon “Carlswæn”, which in turn was probably derived from the Germanic “Churlswagen” and related to the Norse **“**Karlvagn” (see Men’s Wagon, below):

- English linguist John Minsheu (1560 – 1627) lists “Charles Waine”.
- English alchemist and translator Richard Eden (c. 1520 —1576) called it “Charles Wayne”.
- King James I (1566 – 1625) called it “charlewaine”.
- Elizabethan poet Sir John Davies called it ”Charles his waine”.
- In 1630 English poet John Taylor called it “Charles his cart (which we by custome call Charles his wane)”.
- Shakespeare and Tennyson both used “Charles’ Wain”.
- Variations include “Charles’s Waine”, “Carles-Wæn”, “Carleswagn”, “Cherlemaynes-wayne”, “Charlmons wayn”, “carle wen-sterre”, “Carwaynesterre”, “Charel-wayn”, “Charlewayn”, “Charle wane”, “Charles Waine”, “Carol's Wain(e)”, “Charlemagne’s Wane”, “Charlemagne’s Wain”, “Charle-waine”, and “Charl-maigne Wain”.
- American uranographer William Croswell (1760 – 1834) depicts the Big Dipper asterism on his *Mercator Map of the Starry Heavens* in 1810 and labels it “Septentrio Charles’s Wain:.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Charles’ Wain”.

- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists "Charles' Wain" as an alternate name for the Big Dipper asterism "from a fancied resemblance to a wagon drawn by three horses tandem".
- R. H. Allen dismisses any connection between "men's wagon" and "Charles' wain" in his *Star Names* in 1899 and claims that the connection between Charlemagne and this asterism "appears to arise out of the verbal association of the star-name Arcturus with Arturus or Arthur, and the legendary association of Arthur and Charlemagne; so that what was originally the wain of Arcturus or Boötes ('Boötes' golden wain,' Pope) became at length the wain of Carl or Charlemagne".

This Gaelic asterism "A' Chrainn-arain" or "An Crann-arain" is the IAU constellation Ursa Major. R. H. Allen lists the name "Crann" and "Crannarain" in his *Star Names* in 1899.

Charming of Cetus:

This **telescopic** asterism "Amoénus Céti" is the barred spiral galaxy NGC 157 in the IAU constellation Cetus. It was discovered in 1783 by English astronomer William Herschel who listed it as II 3. It is GC 78 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this as they thought it "would be a charming place to live in".

Charnabon:

This Greek asterism is the IAU constellation Ophiuchus. In Greek myth Charnabon was king of the Getae. Charnabon received Triptolemus as a guest, then conspired to kill him, but instead killed one of the dragons that drew his chariot. Demeter rescued Triptolemus and placed Charnabon in the sky as this constellation. John Hill lists this constellation as "Carnabos" in his *Urania* in 1754.

Charon:

This Greek star is possibly Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed by the 8th century B.C.E. poet Homer (Mosenkis, date N/K). Charon is the person who ferries the dead across the river Acheron (later the Styx) into Hades.

Chaste One of Cetus:

This **telescopic** asterism "Cásta Céti" is the edge on spiral galaxy NGC 799 in the IAU constellation Cetus. This is located beside the spiral galaxy NGC 800. These were discovered by Lewis A. Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is smaller than NGC 800 (which they labelled "male") and as there appears to be no interaction between them.

Checkmark:

There are fifteen **telescopic** "checkmark" asterisms:

- One, Ennis 2, is in the IAU constellation Cygnus, and is on the list of Canadian astronomer Charles Ennis. The top end of the long line of the checkmark is the star HIP 104007 and the double star HIP 104103, then runs west through Gaia DR3 2163606169276981632, SAO 50434, Gaia DR3 2162852862051225856, And Gaia DR3 2162852552813578752, to Gaia DR3

2164351019694229248. From this last star a shorter line stars runs at right angles through Gaia DR3 2164354215146593280 to Gaia Dre 2164356001853851008. Nearby is another **telescopic** asterism, the Horseshoe (see below). Size 28' X 8'.

- One is Corder 4260 in the IAU constellation Vulpecula and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 20'. This includes the stars T, 32, 31, 30, and 28 Vulpeculae.
- One is in the IAU constellation Taurus and is Ennis 45 on the observing list of Canadian astronomer Charles Ennis. This runs from the double stars HIP 27218 through HIP 27191, and HD 247180 to HIP 27129, and then across to 27183. Size 50' X 15'. This is Corder 918 on Jeffrey Corder's list, which he describes as "a wide 'V'".
- One is in the IAU constellation Gemini and is Ennis 48 on the observing list of Canadian astronomer Charles Ennis. Size 35' X 20'. This runs from HIP 38231, through HD 63282, the double star HIP 38144, to HIP 38101, and across to the double star HIP 38055A. This includes stars from Corder 1429 on Jeffrey Corder's list.
- One is in the IAU constellation Ursa Major and is Ennis 50 on the observing list of Canadian astronomer Charles Ennis. Size 17' X 4'. This is four 7^{th} – 8^{th} magnitude stars starting at HIP 44925 and running through HD 77994 to HD 78448 and across to HIP 45147. Jeffrey Corder lists this as Corder 1770 and describes it as "a line of four pretty faint stars".
- One is in the IAU constellation Hydra and is Corder 2089 on the observing list of American astronomer Jeffrey Corder. Size 55' X 35'. This includes five 7^{th} – 8^{th} magnitude stars including HIP 53153, 53099, and the double star HIP 53226.
- One is in the IAU constellation Virgo and is Corder 2507 on the observing list of American astronomer Jeffrey Corder. Size 75' X 35'. This is eight 7^{th} – 8^{th} magnitude stars including HIP 66007, 66147, and 66218, and the double stars HIP 65697 and 65911A.
- One is in the IAU constellation Scorpius and is Corder 3199 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is eight 7^{th} – 8^{th} magnitude stars including HIP 83498 and 83330.
- One is in the IAU constellation Pavo and is Ennis 81 on the observing list of Canadian astronomer Charles Ennis. Size 10'. This is six 7^{th} – 11^{th} magnitude stars: HD 166318, double star HIP 89416, HIP 89398, Gaia DR3 6436941394314296704, Gaia DR3 6436983832888879104, and Gaia DR3 6436983283133088256. This is Corder 3511 on Jeffrey Corder's list: Corder describes it as an "asterism of two multiple stars… a double… at the north end, and a triple star… at the southern end."
- One is in the IAU constellation Indus and is Corder 4240 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is seven 9^{th} – 11^{th} magnitude stars including HIP 102550.
- One is in the IAU constellation Vulpecula and is Corder 4410 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is twelve 8^{th} – 9^{th} magnitude stars including HIP 105791. Corder describes this as an "L" or "Checkmark" shape.
- One is in the IAU constellation Pegasus and is Corder 4620 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 10^{th} magnitude stars.
- One is in the IAU constellation Pegasus and is Corder 4700 on the observing list of American astronomer Jeffrey Corder. Size 75' X 25'. This is seven 6^{th} – 8^{th} magnitude stars including HIP 111108, 111233, 111296, and 111437.

- One is in the IAU constellation Phoenix and is Corder 4913 on the observing list of American astronomer Jeffrey Corder. Size 75' X 40'. This is six 8th magnitude stars including HIP 116137, 116013, and 115940.
- One, the Checkmark Nebula, the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel's General Catalogue of 1864 as GC 4403. It is also known as the Omega Nebula, Swan Nebula, Lobster Nebula, and Horseshoe Nebula. American astronomer Tom Lorenzin refers to it as the "Check-mark".

Cheerio Nebula:

This **telescopic** asterism the Cheerio or the Ghostly Cheerio is the planetary nebula NGC 6337 in the IAU constellation Scorpius. It was discovered by English astronomer John Herschel in 1847. It is GC 4290 in the *General Catalogue* of 1864. It is called this as it resembles the Cheerios brand of breakfast cereal that came out in 1945.

Cheeseburger Nebula:

This **telescopic** asterism is planetary nebula NGC 7026 in the IAU Cygnus. It is also known as Burnham's Nebula after the American astronomer Sherburne Wesley Burnham (1838 – 1921), who discovered it in 1894. Size 0.4' X 0.1'. This name was posted on the *Deep Sky Forum* in July 2014 by American astronomer Dragan Nikin.

Chelidonias:

John Hill lists this name for "one of the two fish" in the IAU constellation Pisces in his *Urania* in 1754, going on to describe it as "the northern fish". This would be the triangle of stars Upsilon (υ), Sigma (σ), and Phi (ϕ) Piscium.

Chematy:

This ancient Egyptian asterism is a diamond of stars in the IAU constellations Vela and Carina: Delta (δ) and Kappa (κ) Velorum and Epsilon (ε) and Iota (ι) Carinae.

Chenti Irti:

This Egyptian Dendera asterism is made up of stars in the IAU constellations Centaurus, Circinus, Lupus, and Triangulum Australe (Hoffmann 2017). The central star is Alpha (α) Centauri (Rigil Kentaurus) and three lines run off to the stars Alpha (α) Lupi, Alpha (α) Circini, and Beta (β) Trianguli Australis. Chenti Irti or Mechenti-Irti was an ancient Egyptian falcon deity of Chem or Letopolis. The meaning of "Chenti Irti" is uncertain but may be "sharp sighted one".

Cherrypickus:

This American asterism is the IAU constellation Ursa Minor and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Chertan:

See Two Small Ribs, below.

Cheshire Cat:

See Smiley Face below.

Chest of the Old Man:

This Babylonian star "GABA.SHU.GI" is listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is possibly Delta (δ) Persei in the IAU constellation Perseus and is part of their asterism Old Man (see below).

Chevremont's Star:

This is a variable star in in the globular cluster Messier 2 in the IAU constellation Aquarius.

Chevron:

This **telescopic** asterism in the IAU constellation Canis Major is Nagler 1 on American astronomer and optics expert David Nagler's list. It is made up of 7th to 10th magnitude stars beside the galaxy NGC 2217, running from HIP 30461 at one end through HIP 30390 to the apex at HIP 30288 and then through IT Canis Majoris and HIP 30203 to HIP 30066.

Chi:

See Whip, below.

Chi of Draco:

This **telescopic** asterism "Chiástus Dracónis" is the edge-on spiral galaxy NGC 5965 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as II 762". It became GC 4115 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the central region of this edge-on galaxy shows a remarkable crosslike figure, resembling the Greek letter Chi (χ)".

Chiao Yao:

This Chinese star was mentioned in the *Huai Nan Tze* (2nd century B.C.E.). It was circumpolar then and was probably the star Gamma (γ) Boötis (Seginus).

Chickadee:

This Mi'kmaq star "Jiji'kes" is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major. It is part of their asterism Muin and the Seven Hunters (see below).

Chicken Head:.

This **telescopic** asterism is HII region IC 2872 in the IAU constellation Centaurus. It was discovered by American astronomer Royal Harwood Frost

Chicklet:

See Little Joe (from Kokomo) below.

Chicks:

This is the Belarussian name for the Pleiades cluster in the IAU constellation Taurus. Compare this to the asterism Hen and Her Chicks (see below).

This Ibibio asterism is the Pleiades cluster in the IAU constellation Taurus. It is part of their asterism Mother Hen and Her Chicks (see below).

This French asterism “Poussinière” is the Pleiades cluster in the IAU constellation Taurus as listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 and in R. H. Allen’s *Star Names* in 1899.

This Italian asterism “Pulsiniere” or “Gallinelle” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed this as “Gallinella”.

Chief Goddess of Perseus:

This **telescopic** asterism “Archidaémonis Pérsei” is the elliptical galaxy NGC 1129 in the IAU constellation Perseus. It was discovered in 1786 by William Herschel who listed it as “II 602”. It became GC 616 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They describe naming it thus: “…the first part .ρχι- (archi-) of the name, meaning chief, leader. The second part, daemonis (female of daemon) points to the fact that this galaxy is located not far from Beta Persei, the so-called Demon Star (Algol). The Greek word δα&μων (daimòn, latinized daemon) is also a name for a divine power, especially a light emitting god”.

Chief Frigate Bird:

This Hawaiian asterism “‘Iwakeli’i” or “‘Iwa Keli’I” is the “W” asterism of the IAU constellation Cassiopeia (see W below). The ‘iwa is the chief frigate bird or man of war bird which flies out to fish in the morning and returns to the islands in the evening, giving navigators a clue to nearby land.

Chief in Charge:

This Skidi (Pawnee) star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It is part of their asterism Council of Stars (see below).

Chief Judge:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Draco: HIP 77277 (the determinative star), HIP 76196, and HIP 75974.

This Chinese xing guan “Dàlǐ” (大理) is the star CO Camelopardalis in the IAU constellation Camelopardalis.

This Chinese Chenzhuo xing guan “Dàlǐ” is a line of two stars in the IAU constellation Ursa Minor: HIP 69373 and HIP 68537.

Chief of Farming:

This Korean asterism “Nong-eob Chaeg-imja” (농업 책임자) in the IAU constellations Pyxis and Vela is a quadrilateral of stars with a line going off one corner. The quadrilateral is made up of the stars Alpha (α) and Zeta (ζ) Pyxidis, and e, d, and Psi (ψ) Velorum. From Alpha (α) Pyxidis a line runs out to Gamma (γ) Pyxidis.

Chief of the Southern Heavens:

This Hawaiian star Ke Ali'I Kona i ka Lewa is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Chief of the Night:

This A:shiwi asterism stretches across most of the sky observable from Zuni Pueblo, but the stars and constellations involved have not yet been identified. Compare this to the Dene asterism Tailed Man (see below).

Chief Whose Altar is Made of Bones:

This Hawaiian star "Kalanikauleleiaiwi" is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus. This is the name of a famous ancestral Mō'iwahine.

Chief's Eyes:

This Hawaiian asterism "Makali'i'" ("chief's eyes" or "little eyes" or "little stars") is the Pleiades cluster in the IAU constellation Taurus. It got this name as Makali'i was the ho'okele ("navigator-steersman") for the famous voyageur Hawai'iloa.

This Tongan asterism" Mataliki" ("chief's eyes", "little eyes", "little stars") is the Pleiades cluster in the IAU constellation Taurus.

This Māori asterism "Matariki" ("chief's eyes", "small face" or "small eyes"), also known as "Tātai o Matariki", "Ao-Kai", "Hoko-kumara" or "Huihui o Matariki" ("the assembly of Matariki") is the Pleiades cluster in the IAU constellation Taurus. The helical rising of Matariki signaled the Māori New Year. Their names for the stars in Matariki are: Waiti, Waitā, Tupu-a-nuku, Tupu-a-rangi, and Ururangi.

This Anutan asterism "Matariki" ("small face" or "small eyes"), is the Pleiades cluster in the IAU constellation Taurus.

This Rapanui asterism "Matariki" ("small face" or "small eyes"), is the Pleiades cluster in the IAU constellation Taurus (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

This Tahitian asterism "Matari'i" is the Pleiades cluster in the IAU constellation Taurus (Edwards 2015).

This Samoan asterism "Matāli'i" is the Pleiades cluster in the IAU constellation Taurus (Fitisemanu 2022). Fitisemanu translates this as "Face of Li'i" and associates it with their demigod Li'i. This is related to the legend of a Tanifā (see Sea Monster, below) pursuing a canoe paddled by Li'i. The acronychal rising of Matāli'i signaled the beginning of the new year (Vāipālolo season) and ushered in the festivities of the first fruits (Talomua) during the lunar months of Taumafamua and Toetaumafa.

This Kiribati asterism "Matiriki" or "Mætirki" is listed by Trussel and Groves (1978) as "three stars in Eagle", which would be the IAU constellation Aquila. NOTE: All the other cultures in Oceania give this name to the Pleiades cluster in the IAU constellation Taurus.

Chief's Fishline:

This Hawaiian star line **"**Manaiakalani" is also known as "Ka Makau Nui O Maui" ("The Big Fishhook of Maui") as it represents the Demigod Maui's fishhook. It starts with the three stars of what the Hawaiians call the Navigator's Triangle (which Western astronomers call the Summer Triangle, see below):

- Hawaiki: Alpha (α) Cygni (Deneb),

- Keoe: Alpha (α) Lyrae (Vega), and
- Humu: Alpha (α) Aquilae (Altair).

These three stars represent the Polynesian Triangle: Hawaiki (Hawai'i), Rapanui (Easter Island), and Aotearoa (New Zealand). The northern pointer connects Hawaiki (Deneb) and Momonapikowalu (Gamma (γ) Cygni (Sadr)). The southern pointer in the fishhook is created when you connect Mili'opu (Delta (δ) Scorpii (Dschubba)) with Kahe (Pi (π) Scorpii) at the top of the "hook".

Chieftain's Star:

There are two Vedic asterisms with the name "Tishya", "Tishia", "Tisya", "Tishiga", "Tistrija", "Tishrija", or "Tistar":

- One is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and is listed in the Vedas (Holberg 2007). Compare this to the Persian asterism Tishtar, the Iranian asterism Tishtrya, and the Zoroastrian Tistrya (below). Ivanković translates this as "Three-star" and lists it as "Tisyà" as appearing in the *Atharveda* and "Tisyàh" as appearing in the *Taittirīya Brāhmana*. Ivanković writes that his translation indicates that "it was more probably intended to denote the characteristic 3 stars in the belt of Orion".
- One is Gamma (γ), Delta (δ), and Theta (θ) Cancri in the IAU constellation Cancer (Ivanković 2021).

Child:

This **telescopic** Kulin star "Bubup" is HIP 26380 (HD 38283) in the IAU constellation Mensa (magnitude 6.7). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Yanyan, which is their word for "boy".

This Greek lunar mansion is possibly the stars of the IAU constellation Scutum and is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

Children Carrying Fur:

This Inuit (Igloolik) asterism is the sword of Orion in the IAU constellation Orion. This represents children carrying fur clothing to their fathers, the Runners (the belt of Orion, see Runners, below).

Child's Dreaming Face:

This **telescopic** asterism "Träumendes Kindergesicht" or "child's dreaming face" Hay-Merting 7 in the IAU constellation Vulpecula. This was discovered in 2017 by German astronomer René Merting and listed in Robert Zebahl's *Faint Fuzzies* website. Its size is 110' X 110'. Zebahl describes it as "a long, curved line of stars forms the silhouette of a child's face, and two groups of stars within glow slightly nebulous in binoculars like two closed eyes". Merting describes the arc of stars as measuring "a good 1.8° and forms the contour of the face- a short one closes northeast of the chain star arch, which could represent a lock of hair... the chin area in particular is beautifully shaped." The arc of the face includes HIP 99487, 99400, 99361, 99183, 99018, 98714, and 98699. The "lock of hair" starts at HIP 99487 and runs through HIP 99402A. The "left eye" includes HIP 99261 and the "right eye" includes HIP 99017 and 98992

Chillwiri:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Chimera:

This Greek lunar mansion is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as "some constellation near Perseus = Bellerophon". Bellerophon (see above) is a name given to the constellation Pegasus by the ancient Greeks.

Chimo:

This "Syrian" asterism is the Pleiades cluster in the IAU constellation Taurus as listed in John Hill's *Urania* in 1754.

Chinese Dragon Nebula:

This **telescopic** asterism is the HII region is NGC 6559 (LBN 28, Ced 154f, ESO 521-40) in the IAU constellation Sagittarius. It was discovered in 1847 by English astronomer John Herschel who listed it as h 1996 and h 3733 and later as GC 4384 in the *General Catalogue* of 1864. NOTE: Alongside this is the emission nebula IC 4685 (Ced 154c) which is also given this name.

Chinese Hat:

This **telescopic** asterism is the open cluster IC 2488 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1752. It ended up on the Index Catalogue after being recorded by American astronomer Solon Irving Bailey (1854 – 1931). It is located 30 arcminutes west of N Velorum, a 3rd magnitude star located near the False Cross asterism (see False Cross above). South African astronomer Magda Streicher (2011) described it as a "typical Chinese hat". It is also known as the Hoopskirt (see below), Milk Can (see below), and Strings of Pearl (see below).

Chinese Kite:

See Kite below.

Chingcharoibi:

This Meitei star "Chingcharoibi" is Gamma (γ) Geminorum (Alhena) in the IAU constellation Gemini.

Chirka:

This Arabic asterism is the IAU constellation Lyra as it appears on the Dresden globe of 1288, depicting what R. H. Allen describes in his *Star Names* in 1899 as "a circular vessel with a flat bottom and two handles".

Chiron:

This Greek asterism "Χείρων" or "Cheíron", also known as "Chiron" and "Chyron", is their asterism Centaur (see above) as listed by Eratosthenes (d.194 B.C.E.). This is the name of the centaur that was the tutor of Hercules:

- Johann Bayer's *Uranometria* (1603) lists "Chiron" as a name for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Chiron" as a name for Centaurus.

- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Chiron" as an alternate name for Centaurus.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Centaurus" and "Chiron" for this constellation.

Chiron's Daughter:

This French asterism with the Latin name "Chironis Filia" is the IAU constellation Taurus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). R. H. Allen lists it in his *Star Names* in 1899 and lists its derivation as "unintelligible". In Greek myth Chiron had three daughters, but it isn't clear which one Lalande is referring to here.

Chitralekha:

This Vedic star "Chitralekhā" is Delta (δ) Orionis (Mintaka) in the belt of Orion in the IAU constellation Orion.

Chow:

This Chinese star is Beta (β) Serpentis in the IAU constellation Serpens. It is their star "Zhōu" or "Tiānshìyòuyuán V" in their asterism Heavenly Market Right Wall (see below). R. H. Allen lists it in his *Star Names* in 1899. It is listed on Stellarium, but not approved by the IAU.

Christ Child's Manger:

This German asterism "Praesepe Infantis Christi" is the open cluster Messier 44 (NGC 2632), found in the IAU constellation Cancer (see Beehive, below). This astersim is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Christmas Sieve:

This Estonian asterism is the side by side open clusters known as the Double Cluster (NGC 869 and 884) in the IAU constellation Perseus (Kuperjanov 2006). It is from the island of Saaremaa.

Christmas Star:

This Estonian star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Kuperjanov 2006).

Christmas Stars:

This Estonian asterism is the stars Alpha (α) Aurigae (Capella), Zeta (ζ) Aurigae, Eta (η) Aurigae, and Epsilon (ε) Aurigae in the IAU constellation Auriga (Kuperjanov 2006). Compare this to the Kids (see below).

Christmas Tree:

There are thirteen telescopic "Christmas tree" asterisms:

- One, the "Christmas Tree Cluster", is the open cluster Melotte 49, which is found within the emission nebula and open cluster NGC 2264 (the Cone Nebula) in Monoceros. It was discovered by English astronomer William Herschel in 1784. It was given this name by American amateur astronomer and poet Leland S. Copeland (1886 – 1973). Inside the Christmas Tree Cluster is a smaller cluster of stars with a pinwheel shape known as the

Snowflake Cluster. This is O'Meara 35 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), which lists the names "Cone Nebula", "Fox Fur Nebula" and "Christmas Tree Cluster". Astrophotographer Michael Clow named it the "Grinchy Christmas Tree" or simply the "Cosmic Grinch" in the 2024 December 22 article "Astro-photographer Reveals a Cosmic Grinch in a Holiday-Themed Star Cluster".

- One is Charlie Brown's Christmas Tree, the open cluster NGC 2367 in the IAU constellation Canis Major, which was discovered by English astronomer William Herschel in 1785 who listed it as "VIII 27". It is GC 1516 in the *General Catalogue* of 1864. This is a reference to the character Charlie Brown in Charles M. Schultz's comic strip *Peanuts*, which premiered in 1950.
- One is made up of seven stars including the star HIP 102042 in the IAU constellation Aquarius.
- One is Sánta 97, listed in 2007 by Hungarian astronomer Sánta Gábor. This is 9 – 15th magnitude stars in the IAU constellation Monoceros. Gábor describes it as "very nice, Christmas tree form.
- One is the "Bent Christmas Tree" in the IAU constellation Perseus which is Corder 478 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder describes this as a "wedge-shaped star group that contains at least 12 faint stars surrounding a single 6th magnitude star [HIP 14264]". Size 25' X 15'.
- One is in the IAU constellation Andromeda and is Corder 349 on the observing list of American astronomer Jeffrey Corder. Size 60'. This includes HIP 10610 (as the star at the top of the tree), HIP 10544, and HIP 10519.
- One is in the IAU constellation Canis Major and is Corder 1059 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 6th – 9th magnitude stars and includes HIP 29854 and the double star HIP 29888A.
- One is in the IAU constellation Centaurus and is Corder 2234 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is a wedge shape of seven 9th – 11th magnitude stars. Corder simply lists it as a "tree", but I have put it in this category as it resembles the others in this category.
- One is in the IAU constellation Crux and is Corder 2357 on the observing list of American astronomer Jeffrey Corder. Size 30'. This includes HIP 60947, 60949, and 60781.
- One is emission nebula NGC 2024 (SH 2-277, LBN 953, Ced 55p) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 28" in his catalogue. It is GC 1227 in the *General Catalogue* of 1864. Size 30' X 30'. It is also known as the Maple Leaf (see below), the Tank Tracks (see below), the Oak Leaf (see below) and the "Flame Nebula" (see below). This particular name is attributed to Donald J. Ware by the DOCdb database.
- One is the open cluster NGC 2516 (Caldwell 96) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as "Lac II 3". It is GC 1619 in the *General Catalogue* of 1864. South African astronomer Carol Botha (2007) described this as "like a Xmas tree with lights on the tips of the branches". It is also known as the Diamond, the Southern Beehive, and the Sprinter.
- One is the Hyades cluster (Caldwell 41, Collinder 50, Melotte 25, see below) in the IAU constellation Taurus. South African astronomer Andre de la Porte (2012) described it as a Christmas Tree.

- One is made up of stars of the IAU constellation Monoceros: HD 47939, 47917, 47898, 47899, 47842, and Gaia DR3 3002689603180197120. It was posted by Spanish astronomer "Takuan" on *Cloudy Nights* in January 2025.

Christmas Tree Galaxy Cluster:

This **telescopic** asterism is the galaxy cluster MACS J0416.1-2403 in the IAU constellation Eridanus. This name appeared in the 2023 article *NASA's Webb, Hubble Combine to Create Most Colorful View of Universe* in November 2023.

Christ's Ass:

This asterism is the IAU constellation Pegasus as listed in R. H. Allen's *Star Names* in 1899. Allen only identifies the source as "pious people" who saw this as the ass on which Christ rode as he entered Jerusalem.

Christ's Cross:

This German asterism is the IAU constellation Triangulum Australe and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.Edward Sherburne lists it as "Signum Tau, sive Imago crucis" ("The sign of the Tau, or the image of the cross") and attributes this to Schiller and elsewhere describes this as the IAU constellation Triangulum. "Christ's Cross" later appears as a name for Triangulum Australe in John Hill's *Urania* in 1754.

This German asterism "Christi Crux" is the IAU constellation Cygnus as listed by German astronomer Wilhelm Schickard (1592 – 1635). "Crux Christis" is an alternate name for this constellation listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists this as "Cross of Christ" in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Christi crux".

Christ's Seamless Coat:

This Austrian asterism is made up of stars of the IAU constellation Orion and was created by Anton Maria Schryrleus (1604 – 1660), the maker of the lenses for Kepler's telescope. R. H. Allen lists this in his *Star Names* in 1899 but does not describe the precise stars. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 attributes this to "padre de Rheita" which is another name for Schryrleus and describes it as Alpha (α) Orionis (Betelgeuse), Lambda (λ) Orionis, Delta (δ) Orionis, and Kappa (κ) Orionis.

Christ's Tomb:

This German asterism "Sepulchrum Christi" or "Holy Sepulchre" is the IAU constellation Andromeda and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures: Schiller depicts this as a stone sepulchre with a cloth draped over the near side and a tall pole with a cross at the top bearing a fluttering banner. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Sepulchrum XPI vel Andromeda". It later appears in Edward

Sherburne's Sphere of Marcus Manilius in 1675 as "Sepulchre of Christ" and later in John Hill's *Urania* in 1754 as "Sepulchre". *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Sepulchre" as an asterism created from the stars of Andromeda, but does not identify the source.

Christ's Two Fishes:

This German asterism "Duo Piscisuli Christi" is the IAU constellation Pisces as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Chrulius:

This "Coptic" star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in John Hill's *Urania* in 1754.

Chrysaor:

This Greek star "Chrysaor" ("golden sword") is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by Hesiod (Mosenkis, date n/k). Chrysaor was the brother of the winged horse Pegasus. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Chrysaor".

Chrysomallus:

This Greek asterism is the IAU constellation Aries. Chrysomallus is the name of the golden flying ram that rescued Phrixus in Greek mythology. Johann Bayer's *Uranometria* (1603) lists "Chrysomallus" for this constellation.

This Latin asterism "Chrysovellus" is the IAU constellation Aries. This is the Latin name for Chrysomallus, the golden flying ram that rescued Phrixus in Greek mythology.

Chrysophris:

This Latin asterism is the IAU constellation Dorado as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. Chrysophris is a variety of snapper.

Chǔ:

This Chinese star "Chǔ" from the 3 Kingdoms and Ming Dynasty Period is the star Epsilon (ε) Ophiuchi in the IAU constellation Ophiuchus and is part of their xing guan Heavenly Market West Wall (see below).

Chumak's wagon.

This Ukrainian asterism "Viz Chumaka" (віз чумака) is the Big Dipper asterism in the IAU constellation Ursa Major. The Chumak people were a merchant class in the Ukraine.

Chun Huo:

This Chinese asterism "Chun Huo" from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Leo (Kotyk 2017).

Chun Shou:

This Chinese asterism “Chun Shou” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Cancer (Kotyk 2017).

Chun Wei:

This Chinese asterism “Chun Wei” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Virgo (Kotyk 2017).

Chungshennubi:

This Meitei asterism “Chungshennubi” is the IAU constellation Cancer.

Church:

This asterism is made up of the stars of the IAU constellation Aries by German astronomer Erhard Weigel (1625 – 99) produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. Weigel depicts Aries as a lamb lying down facing to our right looking back over its right shoulder, with a tall pole topped with a cross and a two tailed red triangular banner leaning across the ram’s right shoulder.

This Lithuanian asterism “Bažnyčia” is the Great Square of Pegasus asterism in the IAU constellations Andromeda and Pegasus.

This **telescopic** asterism Kernya 58 was listed by Hungarian astronomer Gábor János Kernya in 2014 and is a group of stars in the IAU constellation Ophiuchus. Kernya describes it as a “slightly triangular church. Its main star is 10th magnitude.”

Chushee:

This “Persian” asterism is the IAU constellation Virgo as listed in John Hill’s *Urania* in 1754.

Cicada:

This Swazi star “Lweti” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Slotegraaf 2013).

Cicada of Hydra:

There are two **telescopic** “Cicada of Hydra” asterisms:

- One is the asterism “Téttix Hýdrae” which is the barred spiral galaxy NGC 2713 in the IAU constellation Hydra. It was discovered by Albert Marth in 1864. This became GC 5442 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name in reference to “the three foreground stars on the face of this galaxy”.
- One is the asterism “Cicáda Hýdrae” which is the barred spiral galaxy NGC 2815 in the IAU constellation Hydra. It was discovered in 1784 by William Herschel who listed it as “III 242”. It became GC 1799 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Cicero’s Quadruped:

This Latin asterism “Quadrupes Ciceroni” is the IAU constellation Lupus.

- Johann Bayer’s *Uranometria* (1603) lists this constellation as “Ciceroni Quadrupes”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Quadrupes Ciceroni”.

Cicero’s Yoke:

One, “Iugum Ciceroni” is the IAU constellation Libra. Johann Bayer’s *Uranometria* (1603) lists “Iugum Ciceroni”. “Iugum Ciceroni” is listed in The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638)

Cigar Galaxy:

There are three **telescopic** asterisms by this name:

- One is Messier 82 (NGC 3034), an edge-on starburst galaxy in the IAU constellation Ursa Major. It was discovered in 1774 by German astronomer Johann Elert Bode. French astronomer Pierre Méchain observed it and reported it to his supervisor, French astronomer Charles Messier, in 1779. It is listed in the *General Catalogue* of 1864 as GC 1950. William Herschel listed it as IV 79. It is also known as the “Exploding Cigar of Ursa Major” (see below).
- One is NGC 4945 (Caldwell 83), a galaxy in the IAU constellation Centaurus, which was discovered by Scottish astronomer James Dunlop in 1827. This is listed as GC 3386 in John Herschel’s *General Catalogue* of 1864. This is also known as the Tweezers (see below) and the Golden Coin (see below).
- One, “Sigárum Úrsae Majóris” (“cigar of Ursa Major”), is the lenticular galaxy NGC 5422 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as “I 230”. It became GC 3749 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Cillas:

This Greek asterism is the IAU constellation Auriga. Cillas was the chariot driver of Oenomaus in Greek mythology.

Cinerary Urn:

This Greek asterism “Κάλπη” (“Kálpi”) is the IAU constellation Crater.

Circinus:

None of the stars of this constellation are brighter than 3rd magnitude and only show up in 20 asterisms in this handbook.

The IAU constellation Circinus (IAU abbreviation Cir) was created by French astronomer Abbé Nicolas Louis de Lacaille in 1763. He originally called it “Le Compas” (“the compass”) and it is so labeled on his *Planisphère des Étoiles Ausralea* (1756) which depicts a drafting compass. However, de Lacaille changed the name to the current Latin name later.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Compas” as a map compass.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "See Compass".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Circinus in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Circinus the Compass" as a compass.

"Circinus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Circinus" as a compass.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Circinus, The Compass" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Circinus" and describes it as a "Pair of Compasses".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., describes this as "Circinus (Compasses)".

The standard IAU charts depict Circinus as a narrow "V" of the stars Gamma (γ), Alpha (α), and Beta (β) Circini.

French astronomers call it "Compas", German astronomers call it "Zirkel", and Italian astronomers call it "Compasso".

Circinus Galaxy:

This **telescopic** asterism is the galaxy PGC 50779 (ESO 97-13) in the IAU constellation Circinus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as ""Círcinus Círcini" {"Compasses of Circinus").

Circle Constellation:

This Celtic (Gaulish) asterism "Cantli prinnios" ("circle constellation" or "cycle setting") is the IAU constellation Libra (Boutet 2001, 2014, 2017) and appears in the Coligny Calendar.

Circle Dance:

This Quechua asterism from Sonqo, "Khaswa Coyllur", is an unidentified spiral group of stars (Urton 1981).

Circle Dances:

This Tukano asterism "Circulo de Dança" is made up of stars in the IAU constellation Orion (Cardoso 2007): The belt of Orion plus the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix). The Tukano also call it "Sioyahpu" (see Adze Handle above) or "Cabo do Enxó" (literally – "instrument to carve wood").

Circle Maker of Ursa Major:

This **telescopic** asterism "Circulans Úrsae Majóris" is the spiral galaxy NGC 3898 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "I 228". It became GC 2564 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "multiple tightly wound spiral arms".

Circle of Arianrhod:

This Welsh asterism is the IAU constellation Corona Borealis and is also known as the Castle of the Silver Circle and Caer Arianrhod. Victorian folklorist Marie Trevelyan (1852 – 1922) listed it as the "Circle of Arianrhod" and "Caer Arianrhod" in her *Folk-lore and Folk-stories of Wales* (1909).

Circle of Don:

This Welsh asterism "Llys Don" ("circle of Don" or "court of Don") is the IAU constellation Cassiopeia as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). Lady Charlotte Guest (1812 – 1895) also lists this name in her translation of the *Mabinogion*. This name is listed in R. H. Allen's *Star Names* in 1899. Freer (2004) lists this as the "Palace of Don".

Circle of Grizhulas:

This Lithuanian asterism "Grižułas -Arctos", "Gryžulio Rats", "Gryzdo Rat(a)s", "Grįžo ratas", "Grįžulio ratas", "Grižoratas'Manege", "Gryzdas", "Grįžulas", "Gręzu", or "Grįžulys" is the IAU constellation Ursa Major.

Circled of Eridanus:

This **telescopic** asterism "Circumscriptus Erídani" is the spiral galaxy NGC 1357 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as "II 290". It became GC726 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "the arms of this spiral galaxy form well-defined arcs around the nucleus".

Circlers:

There are two asterisms with the Latin name "Circitores":

- One is a group of stars in the IAU constellation Ursa Minor: Alpha (α) Ursae Minoris (Polaris), Beta (β) Ursae Minoris (Kochab), Gamma (γ) 1 and 2 Ursae Minoris, Delta (δ) Ursae Minoris, and Epsilon (ε) Ursae Minoris. This is listed in R. H. Allen's *Star Names* in 1899. It is called this as these stars circle the north celestial pole.
- One is the star Epsilon (ε) Ursae Minoris in the IAU constellation Ursa Minor. This is a name that was proposed to the IAU for this star but has not yet been approved.

Circlet:

This Western asterism "Circlet" or "Circlet of Pisces" is the circle of stars forming the western "fish" of the constellation Pisces: Gamma (γ), Kappa (κ), Lambda (λ), TX, Iota (ι), and Theta (θ) Piscium. Robert Burnham lists "Circlet of Pisces" in his *Burnham's Celestial Handbook* in 1978. The Norwegians call this the "Diademet" ("Diadem"). This is listed as Corder 4908 on Jeffrey Corder's list.

This **telescopic** asterism is in the IAU constellation Cepheus and is Corder 4660 on the observing list of American astronomer Jeffrey Corder. Size 70'. This is nine 7^{th} – 10^{th} magnitude stars including HIP 110706, 110634, and 110410.

Circlet of 'Uvea:

This Tongan asterism, "Ae e'Uvea", "Ao-o-Uvea" or "Kaukupenga" (see below), also known as "cloud of 'Uvea" (see below), is their name for the IAU constellation Corona Borealis.

Circling of Fornax:

This **telescopic** asterism "Circúitus Fornácis" is the spiral galaxy NGC 1425 in the IAU constellation Fornax. It was discovered in 1790 by William Herschel who listed it as "II 852". It became GC 764 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Circular Celestial Granary:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty, despite the name, isn't circular, but a bending line of stars ending in a quadrilateral of stars in the IAU constellations Aries and Cetus:

- The line stars at Omicron (ο) Ceti and runs through 70, 75, 84, Delta (δ), Gamma (γ), Nu (ν), and Alpha (α) Ceti (Menkar – the determinative star), and Lambda (λ) Ceti, ending at Mu (Ceti).
- The quadrilateral of stars is Mu (μ) Ceti, Xi (ξ) 1 and 2 Ceti, and Xi (ξ) Arietis.

This Chinese xing guan "Tiānqūn" (天囷) is made up of stars in the IAU constellation Cetus. One curved line runs from Alpha (α) Ceti (Menkar) through Kappa (κ) Ceti, Lambda (λ) Ceti, Mu (μ) Ceti and HIP 11603A to a bend at Xi (ξ) 1 Ceti. Here it starts another curve running through Xi (ξ) 2, Nu (ν), Gamma (γ), Delta (δ), 75, 70, and 63 Ceti, ending at 66 Ceti.

This Chinese Chenzhuo xing guan "Tiānqūn" is a bent line of stars in the IAU constellations Aries and Cetus: Starting at Alpha (α) Ceti (Menkar) the line runs through Lambda (λ) Ceti, Mu (μ) Ceti, Xi (ξ) Arietis, Xi (ξ) 1 & 2 Ceti, Gamma (γ) Ceti, Delta (δ) Ceti, 75 Ceti, 70 Ceti, and 69 Ceti to HIP 10723.

Circular Mark:

This Arabic asterism is the stars Phi (φ) 1 and 2 Orionis in the IAU constellation Orion and is part of the "head" of their asterism Al Jawza' (see above).

Circumvallated of Columba:

This **telescopic** asterism "Circumvallátus Colúmbae" is the barred spiral galaxy NGC 1808 in the IAU constellation Columba. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as 2740 and later as GC 1021 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Circumvallated of Eridanus:

This **telescopic** asterism "Vallátus Erídani" is the barred spiral galaxy NGC 1358 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as "III 446". It became GC 727 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "the arms of this spiral galaxy form well-defined arcs around the nucleus".

Circus:

This asterism “Cirhara” is the IAU constellation Lyra. This name is listed in Johann Bayer’s *Uranometria* (1603).

Cirrus Nebula:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as “V 15”. It is GC 4600 in the *General Catalogue* of 1864. This is also known as the West Veil Nebula, Filamentary Nebula, Lacework Nebula, Witch’s Broom Nebula, and Pickering’s Triangular Nebula.

Citadelle

This **telescopic** Haitian star is HIP 1547 (HD 1502) in the IAU constellation Pisces (magnitude 8.35). It was given this name in the IAU NameExoWorlds campaign. It is named after Citadelle Laferrière, a mountaintop fortress and UNESCO World Heritage Site. It has an exoplanet named Indépendance, which is a reference to the Haitian Declaration of Independence on 1 January 1804, when it became the first independent black republic.

Cithara:

This Greek asterism “Κιθάρα” (“Kithára”), later latinized to “Cithara” or “Cythara” is the IAU constellation Lyra. This name is now the Greek name for guitar, but when this name was applied to this constellation it referred to a seven-string professional lyre. An older Greek name for this constellation and this instrument is “Φόρμιγξ” (“Fórminx”). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Cythara”. Compare this to Fidicula (below).

This German asterism “Citharae” was created from the stars of the IAU constellation Lyra by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. On Weigel’s chart this asterism is labeled “Anglia” representing England and is depicted as a cithara, which resembles a Welsh harp.

The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Cithara” as an alternate name for Lyra.

City of Refuge:

This Hawaiian star “Pu’uhonua” is Gamma (γ) Orionis (Saiph) in the IAU constellation Orion. It is a new name for this star and is a rhyming pun as it compares the Arabic name for the star, “Saiph”, with the English word “safe”.

City State:

This Coptic lunar mansion “πολις” or “Polis” is the star Mu (μ) Sagittarii in the IAU constellation Sagittarius and was listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as

“Civitas”. R. H. Allen translates this as “foal” in his *Star Names* in 1899. The IAU approved the name Polis for the star Mu (μ) Sagittarii Aa in 2017.

Civil Engineer:

This Korean asterism “Tomog Gisa” (토목 기사) is a line of two stars in the IAU constellation Pisces: 64 and 47 Piscium.

Clair Obscur of Leo Minor:

This **telescopic** asterism “Clarobscúrus Leónis Minóris” is the spiral galaxy NGC 3294 in the IAU constellation Leo Minor. It was discovered in 1787 by English astronomer William Herschel who listed it as “I 164”. It became GC 2145 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They translate this due to the “bright arms and dark dust lanes.”

Clamshell Nebula:

This **telescopic** asterism is HII region Sh 2-119 in the IAU constellation Cygnus.

Claw:

This Arabic star “’az-Zubānā” (“claw”, “dart”, “sting” -الزّبانى) is Alpha (α) Cancri in the IAU constellation Cancer and later latinized to “Acubens”. Compare this to “Claws”, below.

This **telescopic** asterism NGC 247 (Caldwell 62) is an intermediate spiral galaxy in the IAU constellation Cetus, which was discovered in 1847 by English astronomer John Herschel. This is listed as GC 132 in the 1846 *General Catalogue*. It is also known as the Needle’s Eye Galaxy (see below) and the Black Bottomed Galaxy (see above).

Claw of Virgo:

This **telescopic** asterism “Ónyx Vírginis” is the barred spiral galaxy NGC 4731 in the IAU constellation Virgo. William Herschel listed this as “I 41”. John Herschel listed it as h 1452 and later as GC 3254 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Clawed of Hydra:

This **telescopic** asterism “Onychóphora Hýdrae” is the intermediate spiral galaxy NGC 3054 in the IAU constellation Hydra. It was discovered in 1859 by Christian Heinrich Friedrich Peters. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the “many curved arms of this galaxy [having] the appearance of extending claws”.

Clawless:

This Sogdian and Khorasmian lunar station “Bighanwand” is the stars Delta (δ) Scorpii, Beta (β) Scorpii (Acrab), and Pi (π) Scorpii in the IAU constellation Scorpius and is listed in R. H. Allen’s *Star Names* in 1899.

Claws:

This Greek asterism “Χηλαί” (“Chilaí”)is the IAU constellation Libra as described in Aratus’ poem *Phaenomena* (270 B.C.E.) and later described in Ptolemy’s *Almagest* (2nd century): Latin translations of Ptolemy often call it “forficis” (“shears”). This was not a set of scales, but the claws of a scorpion. Ptolemy’s asterism consisted of two quadrilaterals:

- “βόρειος” (“vóreios” – “north” or “northern”): Theta (θ) Librae, Beta (β) Librae (Zubeneschamali), Delta (δ) Librae, and Gamma (γ) Librae.
- “νότιος” (“nótios” – “south” or “southern”): Iota (ι) 1 Librae, Alpha (α) Librae (Zubenelgenubi), Mu (μ) Librae, and Nu (ν) Librae.

This became the Latin “Chelae” and the name “Chelis” shows up in the 1551 edition of the Latin *Almagest*.

- The globe of the 2nd century Farnese Atlas depicts the claws of Scorpius holding scales.
- Eratosthenes (d.194 B.C.E.) included these stars as part of “Σκορπίος” (“Skorpíos”) but alluded to Chilaí, as did Hipparchus (190 – 120 B.C.E.).
- The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) mentions “Chelae” but never illustrates it as part of Scorpius.
- “Claws” appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus and is separate from Scorpius.
- It was depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as scales with the title “Libra” and the subtitle “Chelae”.
- The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels this asterism “Chelae” and depicts it as a set of loose scales.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Chelae” as an alternate name for Libra.
- Johann Bayer’s *Uranometria* (1603) lists “Chelae” as a name for Libra.

This Greek star “Γραψαῖος” (“Grapsaíos”), later latinized to “Graffias or “Grafias” is Xi (χ) Scorpii in the IAU constellation Scorpius:

- Graffias is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as Xi (ξ) Librae: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- American uranographer Elijah Burritt (1794 – 1838) assigned the name Graffias to Xi (ξ) Librae in his atlas of 1835 but changed it to Beta (β) Scorpii in his 1856 edition.
- The *Century Dictionary* of 1889 lists it as “Grassias”.
- The IAU approved the name Graffias for Xi (χ) Scorpii.
- NOTE: This name earlier was applied to Beta (β) Scorpii (Hafez 2010).

There are several Arabic asterisms named “claws”:

- One is the Arabic and Bedouin manzil “Al-Zubānā” (الزبانى), or “ʾAz-Zubānā” (ٱلزُّبَانَى). This is in the IAU constellation Libra and is the stars Alpha (α) 1 and 2 Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali):
    - This was later latinized to “Al Zubanah” or “Al-Zubana”.
    - An Arabic variation of this is “Al Zubānatain” (“two claws”).

  - "Al-Zubānayn" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) as a name for Libra in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - This was later latinized to "Azubene" in the 1515 edition of the *Almagest*.
  - Dorn (1829) lists this as "Al-Zubenen" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
  - German astronomer Johann Bayer (1572-1625) listed it as "Acubene" and "Azubene" in his *Uranometria* (1603).
  - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al zubáná, the claws or pincers, and corrupted to Zuban al bravi for Zubán al aktrab" which is Smuth confusing this with the Arabic asterism Claws of the Scorpion (see below).
  - W. Brennand lists this as "Al-Zubana" in his *Hindu Astronomy* in 1896.
- One is the Arabic and Bedouin (Najran, Saudi Arabia) asterism "al-Aẓfār" (الاظفار). This is a group of stars in the IAU constellation Gemini: Iota (ι) Geminorum, Upsilon (υ) Geminorum, Delta (δ) Geminorum, Kappa (κ) Geminorum, Zeta (ζ) Geminorum and Lambda (λ) Geminorum which are part of their asterism Lion (see above).
- One is the Arabic star "al-zubānayā", latinized to "Zubanah". This is Alpha (α) Cancri in the IAU constellation Cancer:
  - This was further "latinized" to "Açubens" or "Acubens" and appears as "Acubenae" in the 15th century *Alfonsine Tables*.
  - Johann Bayer's *Uranometria* (1603) lists "Acubene" and "Azubene" for this star.
  - The IAU approved the name Acubens for Alpha (α) Cancri Aa.

This Yemeni manzil "Zubānān" is the stars Alpha (α) 1 and 2 Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Claws of the Scorpion:

This Arabic star "Zuban al-ʿAqrab" (زبانى العقرب) is Gamma (γ) Librae in the IAU constellation Libra:

- This was later latinized to "Zubenelhakrabi", "Zuben Elakrab", "Zuben Elakribi", "Zuban al Kravi", and "Zuben Acrabi".
- German astronomer Johann Bayer (1572-1625) listed it as "Zuben Hakrabi". The name Zuben Hakrabi has been used by some for the star Nu (ν) Librae.
- Italian astronomer Giovanni Batista Riccioli (1598 – 1671) lists it as "Vaznegenubi", which is a combination of the Arabic name "Wazn" (see Weight, below) and the name of this star.
- In this *Urania* in 1754, John Hill lists the name "Akatrab" for Libra, which is probably a corruption of this name and lists this under the Latin name "Chelæ Scorpionis" ("claws of a Scorpion").
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Zubenhakrabi".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al zubáná, the claws or pincers, and corrupted to Zuban al bravi for Zubán al aktrab" which is Smyth confusing this with the Arabic asterism Claws (see above).
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Zuben el Akrab" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Zuben el Akrab": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Zuben Hakrabi."
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Zuben el Hakrabi".
- The IAU approved the name Zubenelhakrabi for the star Gamma (γ) Librae A.
- NOTE: American uranographer Elijah Burritt (1794 – 1838) assigned the name "Zubenhakrabi" to Eta (η) Librae.

Claws of Al Jawza:

This Bedouin (Qasseem region of Saudi Arabia) asterism "Zawābin al-Ǧawzā" (زوابن الجوزا) or "al-Zibban" (الزبَّن) is made up of stars in the IAU constellation Orion: Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis, Beta (β) Orionis (Rigel), and Kappa (κ) Orionis. See Giant, below.

Claws of the Wolf:

This Arabic asterism "aẓfār al-dhiʾb" or "Al Aṭhfār al Dhīb", later latinized to "Adfar Aldib" is the stars Omega (ω) and 27 Draconis in the IAU constellation Draco as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449):

- This is depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283) as "the wolf" (Dorn 1829).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Adhfár al dhib, the jackal's claws".

Clean and Chaste:

This Chinese star "Lianzhen" from the Three Kingdoms to the Ming Dynasty is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major.

Cleanser of Waters:

This Vedic star "Agastya" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Bhagwath 2019). It was associated to their sage Agastya and appeared in the *Parasaratantra* and the *Rig Veda*.

Clear Sighting:

This Wardaman star "Larawag" is Epsilon (ε) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003). The IAU approved the name Larawag for Epsilon (ε) Scorpii.

Clenched Forearm:

There are two Arabic asterisms by this name:

- One is the Arabic star "adh-Dhirāʿu l-Maqbūḍah" (الذّراع المقبوضة), translated as "clenched arm" or "folded arm". This is Zeta (ζ) Geminorum in the IAU constellation Gemini:
    - This was later Latinized to "Mekbuda".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Mekbuda, rom al makbúdah, contracted, or rather mut-a-kabbidah, a culminating star".
    - The IAU approved the name Mekbuda for the star Zeta (ζ) Geminorum Aa.

- One is the Arabic asterism “adh-dhira’a al-maqbuda” (الذراعة المقبوضة). This is Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Minor. This is part of their asterism Lion (see below).

Cleonaeus:

This asterism is the IAU constellation Leo. It is named for Cleonae, the town near where Hercules killed the Nemean lion. Johann Bayer’s *Uranometria* (1603) lists “Cleonaeus” as an alternate name for Leo. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Cleonaeus” as an alternate name for Leo. Compare this to Star of Cleonaeus (below).

Cleopatra’s Eye:

There are two **telescopic** “Cleopatra’s eye” asterisms:

- One is planetary nebula NGC 1535 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as “IV 26” in his catalogue. It is GC 826 in the *General Catalogue* of 1864. Astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this name and makes it O’Meara 22. It is also known as the “Celestial Jellyfish” and the “Ghost of Neptune Nebula”.
- One, “Cleopatras Auge” or “Cleopatra’s Eye”, is Hay-Merting 8 in the IAU constellation Sagittarius. Christopher Hay claims this as his discovery in 2012 on *Cloudy Nights* in February 2022 and his associate Robert Zebahl lists it on his *Faint Fuzzies* webpage. Its size is 160’ X 70’. Zebahl describes it as “a curved line of 15 stars up to 9m5 wraps around the [open] cluster Messier 25 so that it looks like the eyeliner of Cleopatra’s right eye. Messier 25 forms the actual eye in it”. This arc of stars starts at HIP 91527 and runs through HIP 91276, 91143, 90950, and 90806 to 90687. René Merting notes that the “brow just fits into the 7° field of view”. Jeffrey Corder lists this as Corder 3602 and describes it as a “very large arc”.

Clepsydra:

This asterism is the IAU constellation Orion as listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844. Compare this to Hourglass, below. NOTE: A clepsydra is an ancient Greek water clock.

Clepsydra Terrace:

This Chinese xing guan “Jiàntái” (渐台) is a quadrilateral of stars in the IAU constellation Lyra: Gamma (γ) Lyrae, Beta (β) Lyrae (Sheliak), Delta (δ) 1 and 2 Lyrae, and Iota (ι) Lyrae. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Jiàntái” is a “box” of four stars in the IAU constellation Lyra: Delta (δ) 1 & 2 Lyrae, Beta (β) Lyrae (Sheliak), Gamma (γ) Lyrae, and Iota (ι) Lyrae.

Climber:

This Vedic asterism is the Hyades cluster in the IAU constellation Taurus. Their name for the star Alpha (α) Tauri (Aldebaran) is Rohini (“red one”), and this is one of their Nakshatra (see Red One below).

Climbing Serpent:

This Korean asterism “Deungban Baem” (등반 뱀) is made up of stars in the IAU constellations Andromeda and Cassiopeia:

- The central star is 3 Andromedae, from which one line goes up to the serpent’s “head” through HIP 114924 and Sigma (σ), Rho (ρ), and Tau (τ) Cassiopeiae, ending at the four stars of the “head”: HIP 115990, 113561, 114622 and 1 Cassiopeiae,
- From 3 Andromedae three lines run out in the other direction:
    - One line to star HIP 113288,
    - One line to star HIP 113327, and
    - A line through the stars 7, 8, Lambda (λ), Kappa (κ), and Iota (ι) Andromedae to the “tip of the tail” at star Omicron (ο) Andromedae.

Climbing to the Heavens:

This Hawaiian star “Pi’ilani” is Gamma (γ) Pegasi in the IAU constellation Pegasus.

Clinging Star:

See Embracer, below.

Cloister of Hori:

This German asterism is the IAU constellation Gemini as listed by German astronomer Athanasius Kircher (1602 – 1680).

Close Pack:

This Celtic (Welsh) asterism “Y Tŵr Tewdws” (“close pack (of dogs)”) is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Close to Alpha of Grus:

This **telescopic** asterism “Parálpha Grúis” is the lenticular galaxy NGC 7213 in the IAU constellation Grus. This was discovered in 1834 by John Herschel who listed it as h 3924 and later as GC 4757 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is located only 15’ from the 1.7 magnitude star Alpha (α) Gruis.

Close to Iota Centauri:

This **telescopic** asterism “Parajóta Centaúri” is the lenticular galaxy NGC 5102 in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy forms a physical pair with [the spiral galaxy] NGC 5091. The elliptical galaxy seems to be gently touched or kissed by the partner”. It was discovered by English astronomer John Herschel in 1835 who listed it as h 3492. It is GC 3504 in the *General Catalogue* of 1864. It is called this as it is located next to the star Iota (ι) Centauri. It is also known as “Iota’s Ghost” (see below). This is O’Meara 70 in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Close to Lambda Hydrae:

This **telescopic** asterism “Paralámbdus Hýdrae” is the barred spiral galaxy NGC 3145 in the IAU constellation Hydra. It was discovered in 1786 by William Herschel who listed it as “III 518”. It became GC 2043 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to it being close to the 3.6 magnitude star Lambda (λ) Hydrae.

Closed Wings Eagle:

This Bedouin (Hayel region) asterism “al-Nasr al-Mkattaf” (النسر المكتف) is the stars Alpha (α) Lyrae (Vega), Epsilon (ε) 1 Lyrae and Zeta (ζ) Lyrae in the IAU constellation Lyra.

Cloth (thrown over the Giant’s Arm):

This Latin asterism “Mantile” is the stars Omicron (ο) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis and 6 Orionis in the IAU constellation Orion and was listed by Dutch uranographer Hugo Grotius (1583 – 1645). Compare this to Gauntlet, below.

Clotho of Draco:

This **telescopic** asterism “Clótho Dracónis” is the edge-on spiral galaxy NGC 5985 in the IAU constellation Draco. It was discovered in 1788 by William Herschel and listed as “II 766”. It became GC 4131 and GC 4133 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “the easternmost member… of a beautiful trio, which is reminiscent of the three Fates (Greek Moirai).” Clotho (“spinner”) was one of those three Fates. This is part of the NGC 5982 Cluster which is also known as the Dragon Slayer Group.

Cloud:

This Persian lunar station “Avra-k” is the stars Epsilon (ε), Gamma (γ), Delta (δ), Eta (η), and Theta (θ) Cancri in the IAU constellation Cancer.

Cloud and Rain:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is four stars in the IAU constellation Pisces: Kappa (κ) Piscium (the determinative star), 14 Piscium, XZ Piscium, and Lambda (λ) Piscium.

This Chinese xing guan “Yúnyǔ” (云雨) is four stars in the IAU constellation Pisces: Kappa (κ), Lambda (λ), 12, and 21 Piscium.

This Chinese Chenzhuo xing guan is a bent line of four stars in the IAU constellation Pisces: Gamma (γ) Piscium, 8 Piscium, Lambda (λ) Piscium, and 19 Piscium.

Cloud Bearing of Leo:

This **telescopic** asterism “Nephelóphorus Leónis” is the flocculent intermediate spiral galaxy NGC 3521 in the IAU constellation Leo. It was discovered by William Herschel in 1784 who listed it as “I 13” in his catalogue. It is GC 2301 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it this

due to its “remarkable giant halo”. It is also known as the “Bubble Galaxy” (see above). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as O’Meara 56 without a name.

Cloud in Cancer:

This asterism is the open cluster Messier 44 (NGC 2632) in the IAU constellation Cancer as described by the Welsh explorer Thomas James (1593 - 1635)on 31 January 1632: “I could see the Cloud in Cancer full of small Starres”.

Cloud Man:

This is an alternate Upper Tanana name, “H’oh dindeh”, for their asterism “Yihdaa” (see Traveler, below (Cannon 2021)).

Cloud of Hydra:

This **telescopic** asterism “Nimbus Hýdrae” is the Magellanic spiral galaxy NGC 3109 in the IAU constellation Hydra. It was discovered in 1835 by John Herschel who listed it as h 3211 and later as GC 2003 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its “dim amorphous appearance”.

Cloud of ‘Uvea:

This Tongan asterism, “Ae e’Uvea” also known as “Circlet of ‘Uvea” (see above), is their name for the IAU constellation Corona Borealis.

Cloud Sculpting Star Cluster:

This **telescopic** asterism is NGC 6823 (SH 2-86, LBN 135, Cr 405) in the IAU constellation Vulpecula. William Herschel listed it as “VII 18”. John Herschel listed it as h 2049 and later as GC 4512 in his *General Catalogue* of 1864. It is also known as “ET’s Finger”.

Clouds of Antlia:

This **telescopic** asterism is the nebulosity surrounding the star HD 85493 in the IAU constellation Antlia.

Cloudy:

This Greek asterism “νεφελοειδής συστροφή” (“nefeloeidís systrofí”) or “ἀμόρφωτοι” (“amórfotoi”- “amorphous”) is the IAU constellation Coma Berenices. The Latin *Almagest* of 1551 describes this as “Convolutio nubilosa quae cincinnus vocatur” (“The cloudy cloud which is called curly”)

This German asterism “Nubilum” is open cluster Messier 44 in the IAU constellation Cancer as listed by German astronomer Johann Bayer (1572-1625). Compare this to Sherburne’s “Cloudy Star” (below).

Cloudy Ones which Follow the Sting:

“Stella nebulosa quae sequitur aculeum Scorpionis” (“the cloudy ones which follow the sting”) is the open cluster Messier 6 (NGC 6405) in the IAU constellation Scorpius as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449). This was identified by a star cluster by Abbe Louis de Lacaille in 1752 who listed it as Lac III 12. It is GC 4318 in the *General Catalogue* of 1864. The 1551 edition of the Almagest calls it “Girus ille nebulosus” (“foggy nebula”).

Cloudy Star:

This asterism is open cluster Messier 44 in the IAU constellation Cancer as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675. Compare this to Bayer's "Nubilum" (see Cloudy, above).

Clown Face Nebula:

This asterism is the planetary nebula NGC 2392 (Caldwell 39) in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1787 who listed it as "IV 45" in his catalogue. It is listed as GC 1532 in the *General Catalogue* of 1864. Size 0.9' X 0.9'. NOTE: Western astronomers previously also called this the Eskimo Nebula, but as the term Eskimo is offensive to the Inuit, I'm not listing it here under that name. Some people are now calling it the Parka Nebula. This is now listed on the Deep Sky Forum as the "Inuit Nebula" (see below).

Club:

This Greek star "Cujam", "Caiam", "Cajam", or "Kajam" is Omega (ω) Herculis in the IAU constellation Hercules. Pliny the Elder (24 – 79) listed this "club" as a separate asterism in his *Naturalis Historia*. Variations include "Gaiam", "Gujam", and "Guyam":

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Gujam" in his *Celestial Atlas* in 1822.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Cajam".
- This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Gajam": The author is unknown, but it is based on Jamieson's *Celestial Atlas.*
- The IAU Working Group on Star Names approved Cujam as a name for Omega (ω) Herculis A in 2017.

This Latin star "Clava" is Mu (μ) Boötis in the IAU constellation Boötes.

There are two **telescopic** "Club" asterisms:

- One is open cluster NGC 7082 in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1788 who listed it as "VII 52". It is GC 4673 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a club 30 arcminutes long.
- One is NGC 4559 (Caldwell 36), an intermediate spiral galaxy with a weak inner ring structure in the IAU constellation Coma Berenices. This was discovered by English astronomer William Herschel in 1785 who listed it as "I 92". It is GC 3101 in the *General Catalogue* of 1864. This is also known as the Koi Fish (see below). British astronomer Rev. Thomas Webb (1807 – 1885) describes this in the 5th edition of his Celestial Objects for Common Telescopes as "according to John Herschel, club-shaped".

Club of Eaglehawk:

This Kokatha and Ngalea asterism "Jurding" or "Dhurding" is the Pointer stars in the IAU constellation Centaurus (see Pointers below) as listed by Leaman and Hamacher (2014). The two stars are:

- "Maalu": Alpha (α) Centauri (Rigil Kentaurus), and
- "Kanyala": Beta (β) Centauri (Hadar).

Club of Hercules:

This **telescopic** asterism "Fústis Hérculis" is the barred spiral galaxy NGC 6045 in the IAU constellation Hercules. It was discovered by Lewis Swift in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it appears to be plunging into NGC 6040B (PGC 56942).

Cluck Hen:

This Norse asterism is the Pleiades cluster in the IAU constellation Taurus.

Clucking Hen:

This German asterism "Gluckhenne" is the Pleiades cluster in the IAU constellation Taurus. English Admiral Henry William Smyth lists "gluck-henne" in his *Bedford Catalogue* in 1844. R. H. Allen lists it as "Gluck Henne" in his *Star Names* in 1899.

Cluster:

This Gaelic asterism "Griograran", "Grigirean", or "Grioglachan" is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen lists it as "Griglean" in his *Star Names* in 1899. Allen also lists this as a name for Ursa Major, but the Gaelic name is actually "An Crann-arain".

Cluster of Flies:

This Elvish asterism "Itseloktë" is the Pleiades cluster in the IAU constellation Taurus in the Qenya language. It appears in the works of J. R. R. Tolkien (1892 – 1973).

Cluster of Makali'i:

This Hawaiian asterism "Na-Huihui-o-Makali'i", also known simply as "Makali'i'" ("chief's eyes" or "little eyes" or "little stars") is the Pleiades cluster in the IAU constellation Taurus.

Cluster of the Shield of Sobieski:

This **telescopic** asterism "Amas de l'Ecu Sobieski" ("Cluster of the Shield of Sobieski").is the open cluster Messier 11 (NGC 6705) in the IAU constellation Scutum. It was discovered by German astronomer Gottfried Kirch in 1681. It is listed in John Herschel's General Catalogue of 1864 as GC 4437. It is also known as the Wild Duck Cluster (see below), the July Salt and Pepper Cluster, and the Scutum Salt and Pepper Cluster (see Salt and Pepper, below).

Coachman:

This French asterism "Cocher" is the IAU constellation Auriga.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Cocchiere" ("coachman") in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

This Romanian asterism "Surugiul" is the IAU constellation Auriga (Ottescu 2009).

Coal Car Cluster:

This **telescopic** asterism is open cluster NGC 1981 in the IAU constellation Orion. It was discovered by English astronomer John Herschel in 1827 becoming h 362 on his list and GC 1184 in the *General Catalogue* of 1864. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists "Coal

Car" as one of its names and makes it O'Meara 28. It is also known as the Crocodile Cluster (see Crocodile, below).

Coal Sack Cluster:

This *telescopic* asterism is the open cluster NGC 4609 (Caldwell 98) in the IAU constellation Crux. This was discovered by English astronomer John Herschel in 1847 who listed it as "h 3407". It is GC 3145 in the *General Catalogue* of 1864. It is also known as the Bow Tie (see above).

Coal Sack Nebula:

This dark nebula, Caldwell 99, is next to the IAU constellation Crux, the Southern Cross (see Southern Cross below) and appears in 60 of the asterisms of the world's sky cultures. It was first reported by Spanish explorer and navigator Vicente Yáñez Pinzón in 1499 and named "il Canopo fosco" ("the dark Canopus") by Italian merchant and navigator Amerigo Vespucci (1454 – 1512). Other names include "Macula Magellani" ("Magellan's Spot"), Southern Coal Sack Nebula, and "Black Magellanic Cloud". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Coalsack (Southern Coalsack)".

Coalman Nebula:

This **telescopic** asterism is dark nebula is LDN 810 in the IAU constellation Vulpecula. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024).

Coals of the Fire:

This Inca asterism "Kotu Sankha" is the Hyades cluster in the IAU constellation Taurus (Gamarra & Gamarra 2009). The star Alpha (α) Tauri (Aldebaran) is the fire and the stars around it are the coals.

Coat Button Nebula:

See Fetus Nebula, below.

Coat Hanger:

The most well-known "coat hanger" asterism is Collinder 399 in the IAU constellation Vulpecula and is known as Brocchi's Cluster (see above) and Al Sufi's Cluster (see above). The name cannot predate 1830, as this when "clothes hangers" first appeared. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), doesn't name it, but describes this cluster as being "About half-way from Albireo to the two stars ζ and ε in Aquila" and describes it as "a curious little group, consisting of six or seven stars in a straight row, with a garland of other stars hanging from the center." This is Corder 3852 on American astronomer Jeffrey Corder's list. Its size is 100' X 40' and these are the stars involved:

- The "hanger" is a line of six stars: (7 Vulpeculae, HIP 95700, 95584, 95487, 95340 and 95291), and
- Four stars form the "hook": 4 and 5 Vulpeculae, and HIP 95582 and 95432.

NOTE: Brocchi's Cluster, the Coat Hanger, is typically listed as a telescopic asterism by Western amateur astronomers. However, it was first discovered by the Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) and so it definitely *can* be seen with the unaided eye in a dark sky.

There are two **telescopic** "coat hanger" asterisms:

- One "mini coat hanger" can be found in the IAU constellation Ursa Minor between the stars HIP 80272 and 80902. A line of five stars between magnitude 9.1 and 10.3 form the "hanger" and three stars between magnitude 10.5 and 10.8 form the "hook". Its size is 17' X 9'. This was discovered by American astronomer Tom Whiting, President of the Erie County Mobile Observer's Group. It is Harrington 22 on American astronomer and author Phil Harrington's list. Jeffrey Corder lists it as Corder 3067.
- One is Cseh 16 listed by Hungarian astronomer Viktor Cseh which is a group of six 10^{th} – 11^{th} magnitude stars in the IAU constellation Hydrus. Cseh describes this as forming "a similar shape as the Vállfa ("hanger") cluster, although a star is missing from the longitudinal axis, the similarity is striking in the DSS images."

Coatimundi:

This Kogi asterism "Uká" or "Uxa" is the Pleiades cluster in the IAU constellation Taurus.

Cobra:

This Kolam asterism "Nagun" is the IAU constellation Scorpius (Vahia 2014).

This asterism is the IAU constellation Scorpius as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

There are two **telescopic** "cobra" asterisms:

- One is NGC 2442 and NGC 2443, a single intermediate spiral galaxy in the IAU constellation Volans. It is also known as the Meathook Galaxy (see below), an "S" (see below), or the Cobra and Mouse (see below). NGC 2442 and 2443 are two parts of the same galaxy: John Louis Emil Dreyer (1852 – 1926) assumed it was two separate objects from William Herschel's earlier observations that this was a "double nebula". It is entered in the General Catalogue of 1864 as GC 1568 and 1569. English astronomer John Herschel, William's son, confirmed that it was a single "nebula" in December 1834 and entered it in his catalogue as h 3097. It is also known as "Sigmoídes Volántis" ("S-shaped").
- One is in the IAU constellations Boötes and Corona Borealis and is Corder 2868 on the observing list of American astronomer Jeffrey Corder. Size 275' X 90'. The cobra's "head" includes Nu (ν) 1 and 2 Boötis, Phi (ϕ) Boötis, HIP 75896, 75894, 75908, and the double stars HIP 76382A and 76035. The "body" includes Mu (μ) Coronae Borealis, HIP 76366, Zeta (ζ) 1 and 2 Coronae Borealis, HIP 76006, 75928, and Mu (μ) 1 Boötis.

Cobra and Mouse:

This **telescopic** asterism is NGC 2442 and NGC 2443, a single intermediate spiral galaxy in the IAU constellation Volans. It is also known as the Meathook Galaxy (see below), the "S" (see below) or Cobra Galaxy (see above). NGC 2442 and 2443 are two parts of the same galaxy: John Louis Emil Dreyer (1852 – 1926) assumed it was two separate objects from William Herschel's earlier observations that this was a "double nebula". It is entered in the General Catalogue of 1864 as GC 1568 and 1569. English astronomer John Herschel, William's son, confirmed that it was a single "nebula" in December 1834.

Cobweb Cluster:

This **telescopic** asterism is the Coma Berenices Cluster, Melotte 111.

Cocibolca:

This **telescopic** Nicaraguan star is HIP 3479 (HD 4208) in the IAU constellation Sculptor (magnitude 7.79). This name was given to this star in the IAU NameExoWorlds campaign. It is named after a lake in Nicaragua. It has an exoplanet named Xolotlan, which is the Nahuas name of their second largest lake.

Cock:

This Greek asterism "Alector" appears in John Hill's *Urania* in 1754: Hill describes it as made up of stars of "the Ship", which would be Ptolemy's asterism Argo's Ship (see above). Hill does not identify the ethnicity of this asterism, only calling it a "constellation formed by some persons". Compare this to Gallus (see Rooster, below).

Cock of Telescopium:

There are two **telescopic** "Cock of Telescopium" asterisms:

- One, "Aléctor Telescópii", is the galaxy IC 4837 in the IAU constellation Telescopium.
- One, "Gallus Telescópii", is the galaxy IC 4839 in the IAU constellation Telescopium.

These were discovered by DeLisle Stewart in 1901. These names appear in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called them this because "the pair of galaxies IC 4837 and IC 4839 call to mind a pair of cocks in a cock fight".

Cockatoos:

This Gunditjmara asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). They see these as cockatoo ancestors being chased by a male crow or raven, represented by the star Canopus.

Cock's Foot:

This French asterism "Ἀλετροπόδιον" ("Aletropódion") is the IAU constellation Orion as listed by French Jesuit theologian Denis Pétau (also known as Petavius- 1583 – 1652). This was translated by German astronomer Christian Ludwig Ideler (1776 – 1846) as "Cock's Foot", and by Robert Brown as "foot turning wanderer".

Cockscomb of Horologium:

This **telescopic** asterism "Cristátus Horológii" is the intermediate spiral galaxy NGC 1494 in the IAU constellation Horologium. It was discovered in 1834 by John Herschel who listed it as 2601 in his catalogue and later as GC 796 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to its "the many spiral arms at the east side of this galaxy [which] give it the appearance of a…cockscomb".

Coconut Shell:

This Kiribati star "Binobino" or "ana Binobino Nei Kama" is a group of stars in the IAU constellation Centaurus (Trussel and Groves 1978).

Coconut Tree:

This Filipino (Mayayaw Ifugao) asterism “Salokah” is the IAU constellation Scorpius (Masong 2017).

This Sama asterism “Niyu Niyu” or “Saloka” (Ambrosio 2008) is the IAU constellation Scorpius (Santos et al 2019).

Cocoon:

This Latin star “Tegmine”, “Tegmen”, or “Tegmini” is Zeta (ζ) Cancri in the IAU constellation Cancer. On Wikipedia they translate this as “Shell of the Crab”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Tegmine”. Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Tegmine” it in his *Celestial Atlas* in 1822. This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Tegmine”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. The IAU approved the name Tegmine for the star Zeta (ζ) 1 Cancri A.

There are two **telescopic** “cocoon” asterisms:

- One is the nebula IC 5146 (Caldwell 19, SH 2-125, LBN 424, Cr 470, Ced 198) in the IAU constellation Cygnus. This was discovered by German astronomer Max Wolf at the Heidelberg Observatory in the late 19th century. This is also listed as Sh2-125. NOTE: This is next to the Caterpillar Nebula (see Caterpillar, above) and is sometimes referred to as the Cocoon Cluster.
- One is NGC 4490, a barred spiral galaxy, which is interacting with the smaller galaxy NGC 4485 in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1778 who listed it as “I 198”. It is GC 3042 in the *General Catalogue* of 1864. It is listed as the “Cocoon Galaxy” in *Burnham’s Celestial Handbook* by American astronomer Sherburne Wesley Burnham (1838 – 1921). It is also known as the Rhinoceros and its Infant (see below).

Coddington’s Nebula:

This **telescopic** asterism is the dwarf spiral galaxy IC 2574 in the IAU constellation Ursa Major. This was discovered by American astronomer Edwin Foster Coddington in 1898. It is an outlying member of the M 81 Group. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Coddingtónius Úrsae Majóris” (“Coddington’s of Ursa Major”).

Coffee:

This **telescopic** Ethiopian star “Buna” is HIP 12191 (HD 16175) in the IAU constellation Andromeda (magnitude 7.28). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Abol, which refers to the first of three rounds of coffee in the traditional Ethiopian coffee ceremony.

Coffee Bean Nebula:

This **telescopic** asterism is HII region is RCW 98 in the IAU constellation Norma.

Coffin:

This asterism from the Saguaro Astronomy Club asterism database is made up of stars of the IAU constellation Ophiuchus: Delta (δ) Ophiuchi, Zeta (ζ) Ophiuchi, Eta (η) Ophiuchi, Gamma (γ) Ophiuchi, Alpha (α) Ophiuchi (Rasalhague), Kappa (κ) Ophiuchi, and Lambda (λ) Ophiuchi.

Coffin Nebula:

See Crescent Nebula (below).

Coffin Star:

This Thai asterism “Dao Loong” is four stars in the IAU constellation Gemini (Nitiyanant 2015): Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Gamma (γ) Geminorum, and Mu (μ) Geminorum.

Cōha Fruit:

This Barasana asterism is unidentified stars in the area of the IAU constellation Corvus (Hugh-Jones 2006). This is the fruit of the Mauritia gracilis, a type of palm.

Coica:

This Andean star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga and was important to shepherds. Compare this to the Quechua star Colça (below).

Coil:

This **telescopic** asterism is the open cluster Messier 50 in the IAU constellation Monoceros. It was recorded by French astronomer and mathematician Giovanni Domenico Cassini before 1711 and independently discovered by Charles Messier in 1772. It is also known as the Heart Shaped Cluster.

Coiled Thong:

This Chinese xing guan “Guànsuǒ” (贯索) is the IAU constellation Corona Borealis: the determinative star is Alpha (α) Coronae Borealis (Alphecca). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is an oval of stars of the IAU constellation Corona Borealis: Alpha (α) Coronae Borealis (Alphecca), Gamma (γ) Coronae Borealis, Delta (δ) Coronae Borealis, Epsilon (ε) Coronae Borealis, Iota (ι) Coronae Borealis, Rho (ρ) Coronae Borealis, Pi (π) Coronae Borealis, Theta (θ) Coronae Borealis, and Beta (β) Coronae Borealis (Nusakan).

Coin of Pavo:

This **telescopic** asterism “Númmus Pavónis” is the barred spiral galaxy IC 5092 in the IAU constellation Pavo. It was discovered by Royal Harwood Frost in 1903. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Colça:

This Quechua star “Colça” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Compare this to the Andean star Coica (above).

Cold:

This Greek asterism “Ἀθαλπής” or “Athalpís” is the IAU constellation Capricornus. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed the name “Athalpis” for this constellation.

This Latin asterism “Gelidus” is the IAU constellation Capricornus. Johann Bayer’s *Uranometria* (1603) lists the name “Gelidus” for Capricornus.

This Latin asterism “Frigidus” is the IAU constellation Aquarius and is listed in R. H. Allen’s *Star Names* in 1899. Allen attributes it to the 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil).

This Arabic star “Al Bard” is Beta (α) Virginis (Zavijava) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Cold of Autumn Settling Down on Land and Water:

This Māori asterism “Te Kohi a Autahi” is made up of stars of the obsolete asterism Argo’s Ship (Robertson et al 2016, see Argo’s Ship, above). Autahi is the star Canopus (see Autahi, above).

Collarbone:

This Latin asterism “Jugulum” is Delta (δ) Cancri (Asellus Borealis) and Gamma (γ) Cancri (Asellus Australis) in the IAU constellation Cancer.

Collarbones:

This Inuit asterism “Quturjuuk” is made up of stars of the IAU constellations Gemini and Auriga (MacDonald 1998). Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) are the pair of stars that form one end of the “collarbones” and the pair Alpha (α) Aurigae (Capella) and Beta (β) Aurigae (Menkalinan) form the other end. Its rising indicated that their asterism “Aagjuuk” (see Two Sunbeams below) would soon rise. This asterism was used by the Inuit as a navigational aid when moving across featureless terrain.

Collision of Taurus:

This **telescopic** asterism “Injéctio Taúri” is the lenticular galaxy NGC 1409 in the IAU constellation Taurus. It was discovered in 1785 by William Herschel who listed it as “III 263”. This became GC 753 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to long dust lane between NGC 1410 (GC 754) and the Seyfert galaxy NGC 1409.

Colored Contacts Nebula:

See Spirograph Nebula, below.

Colossal Cosmic Eye:

This **telescopic** asterism NGC 1350 is a spiral galaxy in the IAU constellation Fornax, which was discovered by Scottish astronomer James Dunlop in 1828. It is GC 721 in the *General Catalogue* of 1864. It is also known as the “Cow Eye of Fornax” (see below) and the “Cosmic Eye Galaxy” (see below).

Colossus:

This “Euphratian” star “Lamash” is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Columba:

None of the stars of this constellation are brighter than 3rd magnitude and show up in 51 of the asterisms in this handbook.

The IAU constellation Columba (IAU abbreviation Col) appeared as field stars under Canis Major in Ptolemy's *Almagest*. It was first depicted as a separate asterism by Flemish astronomer Petrus Plancius in 1592. Plancius called it "Columba Noachi" ("Noah's dove"). Plancius' *Orbis terrarium typus de integro multis in locis emedatus* (1594) depicts it as a dove in flight.

Plancius' contemporary, Dutch navigator Frederick de Houtman (1571 – 1627), called it "De Dyve med den Okijftack" ("the dove with the olive branch") and German astronomer Jakob Bartsch (1600 – 1633) called it "Columba Hohae".

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Columba as a dove in flight to our right with an olive branch in its beak.

Later German astronomer Johannes Bayer (1572-1625) listed it in his *Uranometria* (1603) as "Columba Noachi" and depicts Columba as a dove with a branch in its beak.

This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Columba Nohae".

"Columba" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a dove flying to our left with an olive branch in its beak.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Columba" as a dove flying to our right with an olive branch in its beak.

Edward Sherburne lists this constellation in his *Sphere of Marcus Manilius* in 1675.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Coma Berenices is listed by Polish astronomer Johannes Hevelius in his *Catalogus Stellarum Fixarum* in 1690 and is depicted as a dove with an olive branch in its mouth.

John Hill lists this name in his *Urania* in 1754. French architect and uranographer Augustin Royer published it in 1679 and claimed to have created it, but Plancius clearly created it first.

American uranographer William Croswell (1760 – 1834) depicts "Columba Noachi Noah's Dove" on his *Mercator Map of the Starry Heavens* in 1810 as a dove in flight with an olive branch in its mouth.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Columba Noe" and depicts it as a dark bird flying with a branch in its beak.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Columba" as a bird in flight, but the front end of this bird is concealed beyond the edge of the planisphere.

"Columba Noachi" is listed English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679. Halley later shortened the name to "Columba".

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Columba" as a flying dove with a branch in its beak.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Columba Nöe" and depicts it as a flying dove with a branch in its beak.

This constellation is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: some charts list "Columba" and one "Columba Noachi".

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Columba" as a dove flying to our left with a branch in its beak.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Columba Noachi" and depicts it as a bird in flight.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "la Columbe" as a dove in flight with a leafy twig in his beak.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "La Colombe" as a dove with an olive branch in its mouth.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Columba Noachi" as a dove in flight with a branch in its beak.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "la Colombe" as a dove with a branch in its beak, as does the 1778 edition.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Colomba" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Columba" as a dove with an olive branch in its beak.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Columba Noachi" as a dove in flight with a twig in its mouth.

Columba is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Duif" ("pigeon") and depicted as a pigeon in flight.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Taube" ("dove") and depicts it flying carrying a branch in its beak. Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Die Taube" in the text and "Taube" on the charts and depicts it as a dove flying with a branch in its beak .

"Columba" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a dove flying to our left with a branch in its beak.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this constellation as "Columba Noachi" and erroneously has Royer giving this name to the IAU constellation Corvus, as Corvus is also known as Noah's Rave (see above).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Columba Noachi" as a dove in flight.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Columba Noachi" as a dove flying to our left.

"Columba" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a dove flying to our left with an olive branch in its beak.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on the charts as the "Dove".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Columba, Noah's Dove" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Columba" in his *Star Atlas* (1893) and describes it as "The Dove".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Columba" and describes it as a "Dove".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Columba", gives its "original form" as "Columba Noachi" and describes it as "The Dove".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists this constellation as "Columba (Dove)".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Columba in his book *The Stars - A New Way to See Them* (1952). Standard IAU charts depict Columba nowadays as three short lines of stars emerging from the central star Beta (β) Columbae (Wazn):

- One runs through Alpha (α) Columbae (Phact) to Epsilon (ε) Columbae,
- One runs through Kappa (κ) Columbae to Delta (δ) Columbae, and
- One runs to Eta (η) Columbae.

Wazn is still the central star in Rey's version of this constellation, but one line from Wazn to a bend at double star Alpha (α) Columbae ending at Epsilon (ε) Columbae becomes the dove's "head", one triangle made up of Wazn, Eta (η) Columbae and Gamma (γ) Columbae forms the dove's "wing", and another triangle consisting of Gamma (γ) Columbae, Delta (δ) Columbae, and Kappa (κ) Columbae the dove's "tail".

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Columba in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as three star lines radiating from the central star Beta (β) Columbae:

- One runs to Eta (η) Columbae,
- One runs through Gamma (γ) Columbae to Delta (δ) Columbae, and
- One runs through Alpha (α) Columbae (Phact) to Epsilon (ε) Columbae.

Sky and Telescope Magazine, founded in 1941, depicts Columba in their magazine and publications in the same manner as Hlad et al.

French astronomers have called it “Colombe de Noé” and German astronomers “Taube” (“dove”).

Coma Berenices:

None of the stars in this constellation are brighter than 4th magnitude, but its stars show up in 168 of the asterisms listed in this handbook.

The IAU constellation Coma Berenices (IAU abbreviation Com) is the only IAU constellation named for a historic figure. Conon of Samos, court astronomer to Egyptian King Ptolemy III Euergetes in the 3rd century B.C.E., named it for the king’s consort Berenice II. Berenice vowed to sacrifice her hair if Ptolemy III returned safely from battle during the Third Syrian War. Greek myths tell us that the Goddess Aphrodite placed Berenice’s hair in the sky. The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Coma Berenices as a lock of hair (Bullinger 1882, Seiss 1882).

Ptolemy only listed this asterism as “the Lock” (of hair) in Leo. Coma Berenices and Antinous (see above) were the first post-Ptolemaic constellations to appear on a globe. Eratosthenes (d.194 B.C.E.) called it “Ariadne’s Hair” and “Πλόκαμος Βερενίκης Ἑυεργέτιδος” (“Plókamos Vereníkis Evergétidos”), which later became “Βόστρυκος Βερενίκης” (“Vóstrychos Vereníkis”), “Plokamos Berenikēs” or “Bostrukhon Berenikēs”, and 1st century Roman author Gaius Julius Hyginus called it “Βερενίκης πλόκαμος” (“Vereníkis plókamos”). Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 wrote that another ancient Greek name for this constellations was “Colus” (“distaff”). These Greek names became the current name when translated into Latin. Pliny the Elder (24 – 79) called it “Berenices Crinem” (“Berenice’s Hair”).

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r does not depict Corona Berenices nor does the mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) labels this the “Lock of Hair”: This appears to have been the first graphical representation of this constellation (Dekker 2010).

In 1536 German astronomer Petrus Apianus called it “Crines Berenices” (“Berenice’s locks”).

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Berenice’s Hair”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Coma Berenices as a females long hair, viewed from behind.

Dutch uranographer and cartographer Gerardus Mercator (1512 – 1594) called it “Cincinnus”, “Caesaries”, “πλόκαμος”, “Berenicis Crinis” and “Trica” (see Tresses, below) on his globes.”

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Berenices Crinis” as a pile of long hair.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Coma Berenices" as a woman's long hair as viewed from behind.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Coma Berenices" as a woman's long hair as viewed from behind.

Coma Berenices is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer Johannes Bayer (1572-1625) called it "Coma" ("hair"), "Spiracum Manipulus seu Crines" ("Bunch of Spikes or hair") and depicted in in his *Uranometria* in 1603 as a bound sheaf of wheat.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Coma Berenices" as a woman's long hair as viewed from behind.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Coma Berenices" for this constellation.

"Coma Berenices" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a woman's long hair as viewed from behind.

"Coma Berenices" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a woman's long hair as viewed from behind.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Coma Berenices" as a woman's long hair as viewed from behind.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Coma Berenices as a woman's long hair as viewed from behind.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Coma Berenices and is depicted as a woman's long hair as viewed from behind the woman's head: She has a blue coronet on her head.

English astronomer John Flamsteed (1646 – 1719) gave it the plural name "Comae Berenices".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Coma Berenices as a woman's head with long hair viewed from behind.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts Coma Berenices as a woman's long hair as viewed from behind: This woman is wearing a circlet.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Coma Berenices" as a woman's long hair as viewed from behind her head: She is wearing a circlet.

Coma Berenices is listed by Polish astronomer Johannes Hevelius in his in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum,* and is depicted as a woman's long hair as viewed from behind.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “La Chevelure de Berenices”, “Coma Berenices”, and “OMH ΒΕΡΕΝΙΚΗΣ” and depicts it as a woman’s long hair as viewed from behind. A ribbon is wound through her hair.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts this constellation as a woman’s long hair as viewed from behind.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Chevelure de Berenice” as a woman’s long hair as viewed from behind.

This constellation is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729 as “Comae Berenices”: This is depicted as a woman’s long hair as viewed from behind the woman’s head.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Coma Berenices” as a woman’s long hair as viewed from behind the woman’s head.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Coma Berenices” as a woman’s long hair as viewed from behind.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “La Chevelure de Bérénice” as a woman’s long hair as viewed from behind, as does the 1778 edition.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Coma Berenices” as a woman’s long hair as viewed from behind the woman’s head: This woman is wearing a circlet.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Berenices” and depicted it as a woman’s long hair viewed from behind her head. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”das Haupthaar der Berenice“ and depicts it as a woman’s long hair as viewed from behind.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Berenice” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

American uranographer William Croswell (1760 – 1834) depicts “Coma Berenices Berenice’s Hair” on his *Mercator Map of the Starry Heavens* in 1810 as a woman’s long hair as viewed from behind the woman’s head.

“Coma Berenices” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a woman’s long hair as viewed from behind.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Coma Berenices” as a woman’s long hair as viewed from behind the woman’s head.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Coma Berenices" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822). This is depicted as a woman's long hair as viewed from behind the woman's head.

Coma Berenices is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. It is depicted as a woman's long hair as viewed from behind the woman's head.

"Coma Berenices" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): This is depicted as a woman's long hair as viewed from behind.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Coma Berenices, Berenice's Hair" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Berenices' Hair".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Coma Berenices" in his *Star Atlas* (1893) and describes it as "The Hair of Berenice".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Coma Berenices" and describes it as "Berenice's Hair", incorrectly attributing it to Tycho Brahe.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Coma Berenices".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists this constellation as "Coma Berenices (Berenice's Hair)".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Coma Berenices in his book *The Stars - A New Way to See Them* (1952). This constellation is depicted on standard IAU charts as a right angle of three stars: Alpha (α) Comae Berenices (Diadem), Beta (β) Comae Berenices, and Gamma (γ) Comae Berenices. Rey creates what looks more like a flail, with the handle the line between Alpha (α) Comae Berenices (Diadem) and Beta (β) Comae Berenices and having multiple lines from Beta (β) Comae Berenices running to stars in the Coma Berenices Cluster.

Sky and Telescope Magazine, founded in 1941, depicts Coma Berenices in their magazine and publications in the same manner as the standard IAU charts.

Coma Pinwheel Galaxy:

This **telescopic** asterism is Messier 99 (NGC 4254), a grand design spiral galaxy in the IAU constellation Coma Berenices. French astronomer Pierre Méchain discovered it in March 1781. It is listed in the General Catalogue of 1864 as GC 2838 and in John Herschel's catalogue as h 1173. Dreyer lists it in the New General Catalogue of 1888 as "3 branched spiral". It is also known as St. Catherine's Wheel (see below) and the Virgo Cluster Pinwheel (see below).

Combination Roof:

This Danish **telescopic** asterism is made up of stars in the IAU constellation Aquarius. It was created Claus Agerskov, a Danish astronomer on *Cloudy Nights*, in May 2022. The stars are 86, 88, 89, 98, 99,

and 101 Aquarii, which Agerskov describes as “the shape of the roof of an old Pizza Hut restaurant”, which is known as a “Combination Roof”.

Comet Komorowski:

This **telescopic** asterism NGC 404 is a field galaxy in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1784, who recorded it as “II 221”. It is listed as GC 218 in the 1864 *General Catalogue*. It is located within 7arcminutes of Beta (β) Andromedae (Mirach), making it a difficult object to observe, which is why it is known as “Mirach’s Ghost”. Size 3.5’ XX 3.5’. This was named by Polish astronomer Artur Komorowski. It is also known as the Lost Pearl (see above) and “Mirach’s Ghost”. This was named by Polish astronomer Artur Komorowski.

Comet Like of Lupus:

This **telescopic** asterism “Cometoïdes Lúpi” is the edge-on galaxy ESO 274-1 (PGC 54392) in the IAU constellation Lupus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “two outer spiral arms of this galaxy form a pseudoring, i.e. a ring that is not completely closed”.

Comet Nebula:

This **telescopic** asterism is planetary nebula NGC 1360 in the IAU constellation Fornax. It was discovered by American astronomer Lewis Swift (1820 – 1913) in 1857 and recorded in 1868 by the German astronomer Friedrich August Theodor Winnecke: They were both comet hunters so that’s how it got this name. It is listed in the General Catalogue of 1864 as GC 5315. It is O’Meara 16 on astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007). It is also known as the Robin’s Egg Nebula (see below).

Comet of Piscis Austrinus:

This **telescopic** asterism “Cométa Píscis Austríni” is the lenticular galaxy NGC 7135 in the IAU constellation Piscis Austrinus. This was discovered in 1834 by John Herschel who listed it as h 3891 and later as GC 4704 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the long tidal arm extending in [the] northeastern direction make it look like a comet”.

Coming Dawn Stars:

This Ininew (Cree) asterism, “Petapu Achak” is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila (Buck 2016). Gamma Aquilae rises first, followed by Altair.

This Anishinaabe asterism “Beedabun Anung” is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila (Lee et al 2014). Gamma Aquilae rises first, followed by Altair.

For both the Ininew and the Anishinaabe, the Coming Dawn Stars are the children of the Morning Star (Venus). They rise before her, in the false dawn, and are aligned one above the other so that they point to where she will appear.

Comma of Eridanus:

This **telescopic** asterism “Sicilículus Erídani” is the irregular galaxy NGC 1427A in the IAU constellation Eridanus. It was listed as 2579 by John Herschel and became GC 766 in the General Catalogue of 1864.

NOTE: American astronomer Lewis Swift observed this galaxy in 1896 and classified it as IC 1983. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to a square of foreground stars at the southeast side of this galaxy.

Command:

This Chinese star “Ling” from the Three Kingdoms to the Ming Dynasty is Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese star “Ling” is Zeta (ζ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, below.

This Chinese Chenzhuo xing guan “Ling” is the star Zeta (ζ) Sagittarii in the IAU constellation Sagittarius.

Commodity Market:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Ophiuchus: 20 Ophiuchi (the determinative star) and HIP 82979.

This Chinese xing guan “Chēsì” (车肆) is a line of two stars in the IAU constellation Ophiuchus: Upsilon (υ) and 20 Ophiuchi.

This Chinese Chenzhuo xing guan “Chēsì” is two stars in the IAU constellations Ophiuchus and Serpens: 30 Ophiuchi and Nu (ν) Serpentis.

Common People:

This Chinese star “Shuren” from the 3 Kingdoms and Ming Dynasty Period is Xi (ξ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Steps (see below).

Companion:

This Latin asterism “Amasius” is the IAU constellation Orion.

Companion of Dorado:

This **telescopic** asterism “Comitáta Dorádus” is the edge-on lenticular galaxy NGC 1596 in the IAU constellation Dorado. It was discovered in 1834 by English astronomer John Herschel who listed it as 2648 in his catalogue and later as GC 864 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is accompanied by the irregular galaxy NGC 1602 (GC 870).

Companions of Denebola:

This asterism is the stars around Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed by R. H. Allen in his *Star Names* in 1899.

Company of Maidens:

This Lapita asterism “Togo nis amu” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen identifies the culture involved as “Solomon Islanders”.

Compass:

This German asterism “Zirkel” is the IAU constellation Circinus.

This French asterism “Compas” is the IAU constellation Circinus.

This Italian asterism “Compasso” is the IAU constellation Circinus.

Compasses of Circinus:

This **telescopic** asterism “Círcinus Círcini” is the galaxy PGC 50779 (ESO 97-13) in the IAU constellation Circinus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Complete Horse:

This Arabic asterism “Al Amasch” is the IAU constellation Pegasus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986):

- The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts this as a complete horse in profile.
- The Doha manuscript (1125) of al-Sufi’s *Book of Fixed Stars* depicts this as a horse in profile facing Andromeda. The horse is saddled and harnessed.
- Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283) called it “Al Faras al Tamm”. This is a reference to those referring to Pegasus as a “half horse” (see Pegasus, below).
- The Paris manuscript of al-Sufi’s *Book of Fixed Stars* (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg’s library (c 1430 – 1440) depicts this as a complete horse in profile.
- The Princeton University Library manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Garrett 2259 Y (1607) depicts this as a complete horse in profile.
- R. H. Allen lists it in his *Star Names* in 1899 and describes it as the space between the eastern “wing” of the IAU constellation Cygnus, the “chest of Pegasus”, the IAU constellation Equuleus, and the “tail” of the IAU constellation Lacerta. Allen says that this appears in the *Sternnamen* of German astronomer Christian Ludwig Ideler (1776 – 1846) and that he had not found references to it elsewhere.

Comprising a Hundred Physicians:

This Vedic nakshatra (lunar mansion) “Shatabhisha” or “Satabhishak” (“comprising 100 physicians” or “100 healers”) is the star Gamma (γ) Aquarii (Sadachbia) in the IAU constellation Aquarius. It is listed as “Satabhisaj” in the *Atharvaveda* and *Taittiriya Samhita* and “Satabhisak” in the *Taittiriya Brahmana* (Ivanković 2021) . Ivanković relates it to the storm god God Indra and in the *Taittiriya Brahmana* to Varuna, their God of oceans. Ivankovic notes that some texts list the star Lambda (λ) Aquarii for this asterism. Compare to Hundred Cures (below). W. Brennand lists this as “Satabhisha” in his *Hindu Astronomy* in 1896 and translates this as “a circular jewel”. Bhagwath (2019) lists its symbols as either an empty circle, flowers, or stars.

This Myanmar nekkhat (lunar mansion) “Thattabeiksha” (သတ္တဘိသျှ) is the star Gamma (γ) Aquarii (Sadachbia) in the IAU constellation Aquarius.

Concealed Arm:

This Coptic lunar mansion “Upeurtherian” is made up of stars in the IAU constellations Aquarius and Pisces and was listed by W.B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as “Brachium absconditum” (“hidden arm”).

Concealer of al Thurayya:

This Arabic star “Mughammid al Thurayya” or “Muliammir al Thurayya” is Alpha (α) Persei (Mirfak) in the IAU constellation Perseus as listed by R. H. Allen in his *Star Names* in 1899. Allen writes that it is “alluded to” by translator Giuseppe Simone Assemani (1687 – 1768) as being on the Borgian Globe of 1225. Al Thurayyah (see above) is the Pleiades cluster in the IAU constellation Taurus.

Concealment:

See Hair on the Tail, below.

Conceiving of Boötes:

This **telescopic** asterism “Concéptus Boótis” is the spiral galaxy NGC 5614 (Arp 178) in the IAU constellation Boötes. William Herschel listed this as “II 420”. John Herschel listed this as h 1804 and later as GC 3880 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “A small galaxy NGC 5615 [GC 3883] is seen on the rim, or even inside the larger galaxy NGC 5614. The large plume that is extending in northwestern direction is provoked by the tidal effects that are caused by the proximity of both systems. This interesting configuration is metaphorically interpreted as a process of conception.”

Conception of Perseus:

This **telescopic** asterism “Concéptio Pérsei” is the Seyfert galaxy NGC 1275 (Caldwell 24) in the IAU constellation Perseus. It was discovered by Prussian astronomer Heinrich d’Arrest and became GC 675 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it the name “Mucronátus” (“Having a sharp point”) as it “looks like an arrowhead”. It is also known as “Perseus A” (see below).

Concordant of Ursa Major:

This **telescopic** asterism “Cóncors Úrsae Majóris” is the interacting galaxy NGC 3690 (Arp 299) in the IAU constellation Ursa Major. It was discovered in 1790 by William Herschel who listed it as “I 247”. It became GC 2425 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this due to it “strongly interacting with its close neighbour IC 694”. NOTE: IC 694 was discovered by English astronomer William Parsons, 3rd Earl of Rosse and also observed by American astronomer Lewis Swift.

Concordia:

This Greek asterism “Concordia” is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. Concordia was the Greek Goddess of agreement in marriage and society.

Condor:

This Quechua (Misminay) asterism is made up of stars of the IAU constellations Canis Majoris, Hydra, Monoceros, and Pyxis (Urton 1981):

- The “head” is Delta (δ), Epsilon (ε), and Eta (η) Canis Majoris,
- One “wing” is Alpha (α) Monocerotis,
- One “wing” is Alpha (α) Pyxidis, Beta (β) Pyxidis, and Gamma (γ) Pyxidis, and
- The “tail” is Alpha (α) Hydrae (Alphard).

This Quechua asterism “Mallku” is the Coal Sack Nebula (Ciancia 2018).

This **telescopic** asterism NGC 6872 is a large barred spiral galaxy in the IAU constellation Pavo. It was discovered by English astronomer John Herschel in June 1835, listing it as h 3816. It is GC 4549 in the *General Catalogue* of 1864. It is the largest known spiral galaxy and is interacting with the lenticular galaxy IC 4970. It is also known as the “Giant of Pavo” (see below).

Condor, Vulture, and Falcon:

This Moche asterism is the belt of Orion in the IAU constellation Orion.

Cone Nebula:

This **telescopic** asterism is HII region NGC 2264 (SH 2-273, LBN 911, Cr 112, Mel 49, Ced 84b) in the IAU constellation Monoceros. It was discovered by English astronomer William Herschel in 1785, who listed it as “V 27” and “VII 5” in his catalogue. It is GC 1440 in the *General Catalogue* of 1864. This is O’Meara 35 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007), which lists the names “Cone Nebula”, “Fox Fur Nebula” and “Christmas Tree Cluster”. It contains the Christmas Tree Cluster (see above).

Conepatus:

The stars of this Kogi asterism “Wása” are currently unidentified (Kelley & Milone 2011). A Conepatus is a high-nosed skunk.

Confederates of Seth:

This Egyptian asterism is the stars of the IAU constellation Sagittarius as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003). Seth or Set is the brother of Osiris and is a God of war, chaos, storms, and pestilence.

Confused of Coma Berenices:

This **telescopic** asterism “Confúsulus Cómae Bereníces” is the barred spiral galaxy NGC 4561 in the IAU constellation Coma Berenices. This was discovered in 1784 by English astronomer William Herschel who listed it as “II 407”. It became GC 3104 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the small size and irregular shape of this Magellanic type galaxy”.

Conical Shell:

This Kiribati star “Baraitoa” or “B’aráitoa” is currently unidentified (Trussel and Groves 1978).

Conjoined Whales:

This **telescopic** asterism "Conjuncta Céti" is the galaxies NGC 34, NGC 17 and Mrk 938 in the IAU constellation Cetus. It was discovered by Frank Muller and Lewis Smith in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has these galaxies are merging.

Conjunction of a Hundred Circles:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Connected of Eridanus:

This **telescopic** asterism "Sýmphytus Erídani" is the interacting galaxies NGC 1516 A and 1524 in the IAU constellation Eridanus. NGC 1516 was discovered in 1786 by William Herschel who recorded it as one object, "III 499". Ormond Stone later discovered that it was two galaxies and listed it as NGC 1524 and 1525. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to their interaction.

Connector:

This asterism involves stars in three IAU constellations: Boötes, Leo, and Virgo. It was created by Samantha Jewett and Shannon Dales of the RASC for the 2023 General Assembly. This is a triangle of the stars Alpha (α) Boötis (Arcturus), Alpha (α) Virginis (Spica), and Beta (β) Leonis (Denebola), with Epsilon (ε) Virginis (Vindemiatrix) in the middle, all of these being double stars. The name relates to the theme of the conference: Connect.

Conqueror:

This Arabic asterism "Al Najīd" or "Al Najidh" is Gamma (γ) Orionis in the IAU constellation Orion as listed by Persian astronomer Zakariyya' al-Qazwini (1203 – 1283):

- This star was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as "al-Nājid" and "al-Mirzam" (Hafez 2010). Sufi writes that some astronomers use this name for Beta (β) Orionis (Rigel).
- Persian astronomer Ulugh Beg Mirza (1394 – 1449) called it "Al Murzim al Najīd" ("the herald conqueror").
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al-nájid", translating this as "subduer", and adds his version of Ulugh beg Mirza's name, "Al Mirzam al Najīd", translating this as "the conquering lion".
- R. H. Allen translates this last name as "the roaring conqueror" in his *Star Names* in 1899 and includes the stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) in this asterism.

Conspiracy of Sky:

This Korean asterism "Haneul-ui Eummo" (하늘의 음모) is four lines of stars radiating away from the star 66 Tauri in the IAU constellation Taurus:

- One line goes to HIP 19799,
- One line goes to 47 Tauri,
- One line goes to Mu (μ) Tauri, and

- One line goes to 46 Tauri.

Constant Mau:

This Hawaiian star “Hoku-Mau” (“constant Mau” or “always Mau”) is Beta (β) Ursae Minoris (Kochab). This is a new Hawaiian name, dating to the 1970s, as the old name for this star was lost. This star is also known as “Holopuni” (“to sail around” or “to circle”). It was named in honor of Mau Piailug, the Satawalese navigator that assisted the Polynesian Voyaging Society to recover their use of stellar navigation.

Constellation of the King:

This Babylonian asterism “Kakkab Sar” is the stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Eta (η) Orionis, and Lambda (λ) Orionis in the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899.

Constellations:

This Hebrew asterism “Məzārîm” (מזרים) may be the IAU constellations Ursa Major and Ursa Minor, or it could be a synonym for the Hebrew word “mazzalot” (“constellations”), in which case it probably refers to the planets or the constellations of the zodiac. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Mazzaroth” as a name for Alpha (α) Canis Majoris (Sirius).

Containing Five of Antlia:

This **telescopic** asterism “Quinárius Ántliae” is the spiral galaxy IC 2537 in the IAU constellation Antlia. It was discovered by Lewis Swift in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the five outer arms”.

Coolabah Tree:

This Euahlayi asterism “Mullyan” is the IAU constellation Crux (Clarke 2014, Fuller et al 2014) and represents the Gulabaa (Coolabah) tree. Compare to the Kamilaroi asterism “Minggah” (see Spirit Tree, below) or the Ngiyampaa or Weilwan asterism “Nguu” (see Tea Tree, below).

Coolamon:

This Aranda and Arrernte asterism is the IAU constellation Corona Australis (Kemp et al 2022). A coolamon is a multi-purpose shallow vessel used by people indigenous to Australia.

Cooling Tower:

This **telescopic** asterism is open cluster Messier 29 in the IAU constellation Cygnus. It was discovered by French astronomer Charles Messier in 1764. It is listed in John Herschel’s General Catalogue of 1864 as GC 4576. Some call it this as it has two parallel lines of three stars curving inwards towards each other, resembling the side profile of a hyperboloid natural draft cooling tower. These sort of cooling towers were first patented by Dutch engineers in 1918, so although I do not know who first gave it this name, it couldn’t be earlier than that. It is also known as the Little Sisters.

Copeland’s Eyes:

See Eyes (below).

Copeland’s Golden Worm:

This **telescopic** asterism is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as "VI 27" in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. Size 12' X 12'. This was its name in the 19th century, referring to English astronomer Ralph Copeland (1837 – 1905), and it later became known as the Great Bird Cluster (see below) and Hagrid's Dragon (see below).

Copeland's of Leo:

This **telescopic** asterism "Copelandínus Leónis" is the spiral galaxy NGC 3753 in the IAU constellation Leo. It was discovered by Ralph Copeland in 1874. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). This is the brightest galaxy in Copeland's Septet (see below).

Copeland's Septet:

This **telescopic** asterism is a group of seven galaxies in the IAU constellation Leo: NGC 3748, 3754, 3750, 3751, 3745, 3753, and 3746. It was named for the English astronomer Ralph Copeland, assistant to Lawrence Parsons at Birr Castle in 1874 discovered these within 7' in the 72" Leviathan reflector. It is also listed as Hickson 57 and Arp 320.

Copernicus:

This IAU star is Rho (ρ) 1 Cancri (55 Cancri A) in the IAU constellation Cancer, named by the IAU in honor of the German astronomer Nicolaus Copernicus. It has 5 exoplanets:

- "Galileo", named for the Italian astronomer Galileo Galilei.
- "Brahe", named for the Danish astronomer Tycho Brahe,
- "Lipperhey", after the Dutch lens maker Hans Lipperhey,
- "Janssen", after the Dutch astronomer Zacharias Janssen, and
- "Harriot", after the English astronomer Thomas Harriot.

Copiously Flowing of Sagittarius:

This **telescopic** asterism "Multíflua Sagittárii" is the spiral galaxy NGC 6902 in the IAU constellation Sagittarius. It was discovered in 1836 by John Herschel who listed it as h 3827 and later as GC 4569 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the many spiral arms and star forming HII regions in this galaxy".

Copulating of Cetus:

This **telescopic** asterism "Coítus Céti" is the spiral galaxy NGC 191 (Arp 127) in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as II 479. It is GC 95 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name "NGC 191 and its smaller companion IC 1562 interact with each other like copulating animals".

Copulating Paramecia of Lepus:

This **telescopic** asterism "Cópulans Léporis" is the barred spiral galaxy NGC 1738 in the IAU constellation Lepus. It was discovered by American astronomer Ormond Stone in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its "this pair of interacting galaxies NGC 1738 and 1739 looks like copulating paramecia".

Cor Caroli:

See Charles' Heart, above.

Coral of Hydra:

This **telescopic** asterism "Corállium Hýdrae" is the barred spiral galaxy Messier 83 (NGC 5236) in the IAU constellation Hydra. French astronomer Charles Messier added it to his catalogue in 1781, but it was first observed by French astronomer Nicolas Louis de Lacaille in February 1752 who listed it as Lac I6. It is GC 3606 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "its many bright reddish HII regions [which makes it look] like a giant spiral-shaped coral reef.". It is also known as the Thousand Ruby Galaxy, the Southern Pinwheel, and "El Molinillo Austral" ("the Southern Grinder").

Cord:

This Coptic lunar mansion "Kutôn" or "Kuton" is the star Delta (δ) Piscium ("Kuton I") and Zeta (ζ) A & B Piscium ("Kuton II and III") in the IAU constellation Pisces. R. H. Allen describes this as Upsilon (υ), Phi (ϕ), and Chi (χ) Piscium in his *Star Names* in 1899 and attributes this description to "Brown", which is probably Robert Brown in his *Researches Into the Origin of the Primitive Constellations of the Greeks, Phoenicians and Babylonians* (1899). W. B. Yeats listed it as "Kutôn" in *A Vision* in 1917, basing this on Athanasius Kircher's listing in his *Lingua Aegyptiaca Restituta* in 1636, giving the Latin names "Piscis" ("fish", as it is the triangle that forms one of the "fishes" that are part of this constellation) and "Venter Caeti, sive Piscis" ("belly of a fish").

This Khorasmian lunar station "Zidadh" is the stars Delta (δ) Piscium and Zeta (ζ) A and B Piscium in the IAU constellation Pisces and is listed in R. H. Allen's *Star Names* in 1899.

This Sogdian lunar station "Riwand" is the stars Delta (δ) Piscium and Zeta (ζ) A & B Piscium in the IAU constellation Pisces and is listed in R. H. Allen's *Star Names* in 1899.

This Persian lunar station "Kaht" is the stars Delta (δ) Piscium and Zeta (ζ) A & B Piscium in the IAU constellation Pisces and is listed in R. H. Allen's *Star Names* in 1899.

Cork Nebula:

This **telescopic** asterism is the planetary nebula Messier 76 (NGC 651), discovered by French astronomer Pierre Méchain in 1780 and included in Charles Messier's catalogue. It is in the IAU constellation Perseus and was first recognized as a planetary nebula in 1918 by American astronomer Heber Doust Curtis. It is also known as the Butterfly Nebula, the Little Dumbbell Nebula, and the Barbell Nebula.

Cork Tree:

This Lacandón asterism is the IAU constellation Crux. It represents the Ceiba tree (Ochromoa lagopus).

Corn, Beans, and Squash:

This K'iche (Yucatán) asterism is the belt of Orion in the IAU constellation Orion (Sokol 2022).

Corn Mother:

This Quechua asterism "Mamazara" or "Saramama" is the IAU constellation Crux.

Corner Star:

This Mayan star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus, which they believed marked the southern corner of the night sky at the end of the dry season.

This K'iche' star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Milbrath 1999).

Cornerstone:

This Norwegian asterism "Hjørnesteinen" ("cornerstone") or "Sluttsteinen" ("capstone") is in the IAU constellation Hercules. The four central stars in the IAU constellation Hercules form a wedge-shaped quadrilateral resembling the keystone of an arch: Epsilon (ε) Herculis, Zeta (ζ) Herculis, Eta (η) Herculis, and Pi (π) Herculis. Compare this to Keystone, below.

Cornucopia:

This **telescopic** asterism is in the IAU constellation Pisces and is Ennis 25 on the observing list of Canadian astronomer Charles Ennis. Size 70' X 32':

- The "mouth" of the cornucopia is a line of three stars: HIP 635, the eclipsing binary star HIP 664, and HIP 700.
- A curving arc of stars forms the "body" of the cornucopia, including HIP 803, the double star HIP 931A, HIP 906, HIP 1033, and HIP 1192, with the "tip" being the double star HIP 1153.

Corolla:

This asterism is the IAU constellation Corona Australis. English astronomer Richard Anthony Proctor gave the name "Corolla, The Wreath (for Corona Australis") in 1873 as he believed that shortening the name would make more room on astronomical charts. "Corolla" appears in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

Corona:

This is the IAU constellation Corona Borealis as listed in editions of the *Revised Aratus Latinus* (8th century).

This German asterism "Krona" is the IAU constellation Corona Borealis as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This **telescopic** asterism is in the IAU constellation Virgo and was listed as Corder 2408 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. Size 60'. This is an arc of eight stars starting at 33 Virginis and including HIP 62375, 62489, and 62597.

Corona Australis:

None of the stars of this constellation are brighter than 4th magnitude, but this constellation is easy to spot, and its stars show up in 78 of the sky cultures of the world listed in this handbook.

This IAU constellation (IAU abbreviation CrA), “the southern crown”, was first recorded in Seleucid sky lore as MA.GUR (see Bark, below). Ptolemy (c.100 – c.170) listed it as “Στέφανος Νότιος” or “Stéfanos Nótios” (see Southern Crown, below) in his *Almagest*. The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a circle.

This constellation appears in a 10th century copy of the Leiden *Aratea* (Boulogne-sur-Mer, Bibliotèque municipal MS 188) but is missing from the 9th century edition.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Corona Australis as a teardrop shaped formation of stars.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Corona Australis as a curve of stars within a teardrop shape.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) lists Corona Australis.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts “Corona Meridionalis” as an open crown.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Corona Australis as a tear drop shaped formation of stars with a rope forming a border around it.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Corona Australis as a crown but does not label it, but ff.170v – 171r depicts it as a crown with the label “Corona”.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Corona Australis as a crown with flower decorations. It is unlabelled.

This constellation appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a crown with the abbreviated label “Corona Merid.”

The *Germanicus Aratea* with scholia Strozziana (c. 1475) omits Corona Australis.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Corona Meridionalis vel Australe Serum” as an open crown.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Corona Australis as a closed horseshoe shape which is not labelled.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts this constellation as a crown with the abbreviated title “Corona Meri”.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts this as a crown and lists it as “Corona Meridionalis” (“southern crown”).

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Corona” as a crown. NOTE: Schöner uses “Corona” for both Corona Australis and Corona Borealis on these gores.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and labels this “Corona Meridionalis” and depicts in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Coronameridionalis” as a golden crown with fleur de lis decorations.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De la Corona Australe”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Southern Crown”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Corona Australis as a crown with fleur de lis points.

The *Globus Coelestis* chart (1584) of Swiss German artist Jost Amman (1539 – 1591) labels this with the abbreviated “Corona Meridi” and depicts it as a crown.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius labels this “Corona A” on this chart and depicts it as a crown.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Corona Austrina, quae et Rota Ixionis” as a jeweled crown.

Flemish cartographer Jodocus Hondius (Joost de Hondt 1563 – 1612) includes “Corona Aust” on his globe in 1598 on which he depicts it as a starry ring and on his *Hemelglobe* (1600) and depicts it as a crown.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Corona Austrina; Quae et Rota” (“the Eastern Crown or the Wheel”) in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “la Corona Australe” as a crown.

German uranographer Johann Bayer (1572 – 1625) depicts this constellation as a laurel wreath in his *Uranometria* in 1603. Bayer lists these names for this constellation: “Corona Meridionalis, Corona Austrina, Corona Notia, Coelulum, Parvum Coelum, Rota Ixionis, Caduceus”.

Corona Australis is omitted from Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Corona Meridionalis”, “Corona Notia”, and “Corona Austrina” for this constellation.

Dutch navigator Frederick de Houtman's catalogue of fixed stars (1603) lists this constellation as "De Zuyder Croon" ("southern crown").

"Corona Australis" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a crown.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Corona Australis" for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) labels this constellation with the abbreviated "Corona Aust" and depicts it as a crown.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Corona Austr" as a crown.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Corona Aust" and is depicted as a laurel wreath.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Corona Australis" as a crown.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Corona Australis as a golden crown.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Corona Australis" as a crown.

Edward Sherburne listed it as "Coronae Australis Asterismus" ("Southern Crown Asterism") and "Corona Secunda" ("second crown") in his *Sphere of Marcus Manilius* in 1675.

German astronomer Erhard Weigel (1625 – 99) produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. On this chart he depicts this constellation as a golden circlet or ring of beads: The label appears to read "Buren" but is partially unintelligible.

Corona Australis is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Coronne Aus", "Corona Aus" and depicts it as a wreath with ribbons.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Rota Ixionis al Corona Austral" and depicts it as a laurel wreath.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Corona" and depicts it as a golden crown.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Corona Aust" as a crown.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Corona Australe as a crown.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Corona Australis as an ivy wreath.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts this constellation as a laurel wreath.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels this constellation with the abbreviated "La Couronne Meridion" and depicts it as a laurel wreath.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Corona Aust" as a single triangle.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "la Couronne Australe" as a crown in its southern hemisphere chart but in a later closeup chart depicts it as a laurel wreath.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer labels this constellation with the abbreviated label "Corona Aust." And depicts it as a crown.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) labels this constellation "Sūdl Krone" on his chart and depicts it as a crown partially tucked behind Sagittarius.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Corona Aust" as a crown.

Corona Australis is depicted as a crown in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) but is not labelled.

American uranographer William Croswell (1760 – 1834) depicts "Corona Australis the Southern Crown" on his *Mercator Map of the Starry Heavens* in 1810 as a crown.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation as "Carona Australis" in his *Celestial Atlas* in 1822: It is depicted as a laurel wreath.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) simply as "Corona": He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Corona Aust" as a laurel wreath.

Corona Australis is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: This is influenced by Jamieson's *Celestial Atlas*. *Urania's Mirror* depicts it as a laurel wreath.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Corona Australis" and describes it as the "Southern Crown".

This constellation briefly had its name changed by the IAU in 1932 to “Corona Austrina” (“Eastern crown”), but this was repealed in 1955.

Other adjectives attached to Corona for this constellation include “Meridiana” (“southern border”), “Meridionalis” (“southernmost”), and the Greek “Notia” (“southerly”). the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Corona Meridionalis” as an alternate name.

French astronomers call it “Couronne Australe”, German astronomers “Südliche Krone”, and Italian astronomers “Corona Australe”.

Corona Australis is depicted on standard IAU charts as a curve of stars starting at HIP 92953 and running through Zeta (ζ) Coronae Australis, Delta (δ) Coronae Australis, Beta (β) Coronae Australis, Alpha (α) Coronae Australis (Meridiana), Gamma (γ) Coronae Australis, Epsilon (ε) Coronae Australis, HIP 92866, and Lambda (λ) Coronae Australis to HIP 90887.

Sky and Telescope Magazine, founded in 1941, depicts Corona Australis in their magazine and publications as the line of stars Theta (θ) Coronae Australis, Delta (δ) Coronae Australis, Beta (β) Coronae Australis, Alpha (α) Coronae Australis (Meridiana), and Gamma (γ) Coronae Australis.

Corona Borealis:

The brightest star of this constellation is Alpha (α) Coronae Borealis (Alphecca) at magnitude 2.2, which is the 66th brightest star on the list of 90 brightest stars and its stars appear in 173 asterisms.

This small IAU constellation (IAU abbreviation CrB) was first mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and was described by Hipparchus (190 – 120 B.C.E.) in his star catalogue (Gysembergh et al 2022). It is one of the 48 original constellations listed by Ptolemy (c.100 – c.170) in his *Almagest*, who called it “Στέφανος” (“Stéfanos “-“crown” or “wreath”)- see below. Later they added “πρῶτος” (“prótos”) or “βόρειος” (“vóreios”) to differentiate it from Corona Australis. Greek mythology describes this as a crown given by the God Dionysus to Ariadne, while Latin myths describe it as a crown worn by the God Bacchus. The Mesopotamians associated it with their Goddess Nanaya, and it has also been associated with the Goddess Aphaia in Aegina and the Cretan Goddess Britomartis.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a circle.

The globe of the 2nd century Farnese Atlas depicts this constellation as a laurel wreath (Stevenson 1921).

“Corona Borealis” is depicted in the Leiden *Aratea* (816) as laurel wreath (Katzenstein & Savage-Smith, 1988).

This constellation appears in editions of the 8th century *Revised Aratus Latinus*:

- It is depicted as having a “D” shape in several editions (St Gall 250, St Gall 902, Ps Bede DSC, Montecassino 3), where it has a “D” shape,
- Two editions (Gottweig 7 (146), Siena L. IV. 25) depict it as a wreath,
- In the Munich 560 edition it is shown as a crown,
- In the Paris BN 12957 edition the crown is being held by an unidentified figure,
- In the Vat Reg lat 1324 edition it is depicted as a crowned king.

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) simply lists the name "Corona".

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Corona Borealis as a wreath. The Los Angeles, Getty Ludwig XII, 5 manuscript of the *De ordine ac positione stellarum in signis* depicts a circlet with a cross.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Corona vero" and "Corona". The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict a circlet with ribbons. The Vat lat 643 and Zwettl 296 manuscripts incorrectly place this constellation between Serpentarius and Scorpius. The Laon 422 manuscript of *De signis caeli* depicts what looks like a torque and the Rouen 26 manuscript of *De signis caeli* depicts what looks like a dog's collar with a ring attached. The Montecassino 3 manuscript of *De signis caeli* depicts nine ovals arranged in a "D" shape. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts a leafy wreath.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Corona Borealis as its curve of stars within a circle.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Corona Borealis as a double circle.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Corona Borealis as the curve of its stars within a decorated circular border.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Corona Borealis as an upside-down crown: That is, the curving stars of this constellation are shown as jewels in the top of the crown rather that as the bottom of the crown as on most other charts. The artist has squeezed a label inside the crown, but it is illegible.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Corona Borealis as an unlabelled circle of stars.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r omits Corona Borealis.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Corona Borealis as a perfect circle of stars with ribbons attached at the top.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Corona Borealis as a round crown viewed from above with a wavy ribbon attached to one side, as does the *Germanicus Aratea* with scholia Strozziana (c. 1475).

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Corona" as a crown with three fleur de lis ornaments.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Corona Borealis" as an open crown.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Corona Borealis as a horseshoe shape that doesn't look much like a crown. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Corona" as a crown.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius, lists this constellation as "Corona" and depicts it as a crown.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Corona" as a crown. NOTE: Schöner uses "Corona" for both Corona Australis and Corona Borealis on these gores.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts this constellation as a crown.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Corona Borealis as an open crown.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Corona" as a golden crown.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Northern Crown".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Corona Borealis as a crown.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Corona Borea" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Corona" as a crown.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a crown with six points. There is no room for a label.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Corona Borealis as a female's long hair as viewed from behind: The female is wearing a crown. A tear in the page makes it difficult to read the label which starts with a "C" and appears to end "… arius". This looks very similar to how charts of this period depict Coma Berenices, apart from the crown.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Corona Gnosia" as a crown.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Corona” as a laurel wreath.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Corona” as a crown.

German astronomer Johann Bayer (1572 – 1625) depicts it in his *Uranometria* in 1603 as a laurel wreath with a ribbon and lists these names: “Corona, Corona Borea, Corona Septentrionalis, Corona Vulcani, Corona Thesei, Corona Ariadnae, Minois, Acliluschemali, Malphelcarre”.

“Corona Borea” (“crown of the north”) appears in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

“Corona Borealis” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as a crown.

“Corona Gnosia” and “Corona Septentrionalis” (“northern crown”) are listed as names for Corona Borealis in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and he depicts it as a laurel wreath.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Corona Boreal” and “Ariadna Constelacion (Ariadne’s Constellation)” and depicts it as a jewelled crown with eight points.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Corona Borea” for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) lists “Corona Sept”, an abbreviation of “Corona Septentrionalis”, and depicts it as a laurel wreath.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Corona” as a crown.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Corona Borealis as an open crown.

Robert Hues lists this constellation as “Corona Borea” in his *A Learned Treatise of Globes* in 1659.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Corona”.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) lists this constellation with the abbreviated label “Corona Bor.” And depicts it as a crown.

This constellation appears as “Corona Septentrionalis” (“corona north”) in Edward Sherburne’s Sphere of Marcus Manilius in 1675.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Corona Borealis” as a crown.

English uranographer John Seller's *A coelestiall planisphere* (1678) gives this the abbreviated label "Corona Sep" and depicts it as a crown.

Corona Borealis appears on four pages of Polish astronomer Johannes Hevelius' *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum.* In each case it is depicted as a crown with fleur de lis decorations, but one is labelled "Corona Septen", two are simply labelled "Corona" and one is labelled "Corona Borealis".

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Cóuronne Boreale" and depicts it as a ring decorated with leaves and ribbons.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Corona Septentrionales" and depicts it as a golden crown.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts Corona Borealis as a crown.

This constellation is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as "Corona".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 labels this constellation "Corona" and depicts it as a jeweled crown in the left hand of Boötes.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Corona Borealis" as a crown with fleur de lis decorations.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Corona Borealis as a flowery wreath.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels this constellation "La Couronne Septentrionale" and depicts it as a laurel wreath.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, does not label Corona Borealis, but depicts it as a crown.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "La Couronne" as a crown decorated with six fleur de lis.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Corona Boreale" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer labels this constellation with the abbreviated "Corona Serpent" and depicts it as a crown.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Krone". Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists "die nördliche Krone" in the text and "Nordliche Krone" in the charts, which depict a crown with ten points.

American uranographer William Croswell (1760 – 1834) depicts “Corona Borealis the Northern Crown” on his *Mercator Map of the Starry Heavens* in 1810 as a crown.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Courone” as a crown, as does the 1778 edition.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Corona Borealis in his *Celestial Atlas* and in his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) which depicts this as a crown.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a laurel wreath. However, Argelander has labelled it “Corona Corealis” (“royal crown”) not Corona Borealis.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Corona Borealis” as a crown.

Corona Borealis is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. It is depicted as a crown with the stars as gems.

Corona Borealis is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877) simply as “Corona”: It is depicted as a laurel wreath.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as “Corona Borealis… six stars arranged in a semicircular form”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “the Northern Crown”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Corona Borealis” in his *Star Atlas* (1893) and describes it as “The Northern Crown”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Corona Borealis” and describes it as the “Northern Crown”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Corona Borealis”.

Standard IAU charts depict Corona Borealis as the curving line of the stars Iota (ι) Coronae Borealis, Epsilon (ε) Coronae Borealis, Delta (δ) Coronae Borealis, Gamma (γ) Coronae Borealis, Alpha (α) Coronae Borealis (Alphecca), Beta (β) Coronae Borealis, and Theta (θ) Coronae Borealis.

The French call it “Couronne Boréale” and the Italians “Corona”.

Corona Sagittarii:

See Golden Crown of Sagittarius, below.

Corona Ursa Major:

This **telescopic** asterism is made up of stars of the IAU constellation Ursa Major. It was posted on *Cloudy Nights* by "idahoeng" in June 2022. It is a curve of stars starting at 36 Ursae Majoris and running through 37, 39, 43 and 44 Ursae Majoris.

Coronet:

This Persian asterism "Aveçr" is the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Coronet Cluster:

This **telescopic** asterism is the variable reflection/emission nebula NGC 6729 (Caldwell 68) in the IAU constellation Corona Australis. It was discovered by German astronomer Johann Friedrich Julius Schmidt in 1861. It is GC 5937 in the *General Catalogue* of 1864.

Corpse:

This Babylonian asterism from the MUL.APIN tablets "Pagru" ("corpse" or "dead man") is made up of the stars of the IAU constellations Equuleus, Aquila, and Delphinus. One end is a triangle of stars: Alpha (α) Equuleus (Kitalpha), Delta (δ) Equuleus, and Kappa (κ) Delphini. From Kappa Delphini a hook of stars runs through HIP 100541, 69 Aquilae and 70 Aquilae, ending at Iota (ι) Aquilae. This is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mull u.us" (Koch-Westenholz 1995). This asterism appears in later Seleucid sky lore. Some suggest that the Babylonian asterism "Eagle" (see above) is carrying the corpse.

This Egyptian Dendera asterism is made up of stars of the IAU constellation Delphinus (Hoffmann 2017) but is shown on Stellarium as made up of stars of Pegasus, Vulpecula, and Equuleus. It is clearly influenced by the Babylonian asterism Pagru (see Corpse above) except that the Babylonian asterism is a dead man and this is a dead animal.

This Kolam asterism "Murda" is the IAU constellation Leo (Vahia 2014).

This Gond asterism is the IAU constellation Leo (Vahia 2014).

Corpse Bundle:

This Barasana asterism "Masa Hoti" (the body of Star Woman, killed by wasps) is the IAU constellation Delphinus (Hugh-Jones 2006). She fell to Earth, was resurrected, and married a mortal who accompanied her into the sky, only to be killed by a snake in the sky.

Corpse Stars:

This Banjar asterism is the sword of Orion in the IAU constellation Orion.

Corvus:

The four brightest stars of this constellation are 2nd and 3rd magnitude, and its stars appear in 107 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Crv) appeared as "Aribu" or "MUL.UGA.MUSHEN" in the Babylonian MUL.APIN tablets (see Raven below). The Greeks adopted it around 500 B.C.E. and Ptolemy (c.100 – c.170) lists it as Κόραξ (see Raven, below) in his *Almagest*. This relates to a Greek myth of a raven which is sent for a cup of water, loiters at a fig tree, then returns with a water snake (the constellation Hydra), and is punished by being placed in the sky.

Corvus appears in the 8th century *Revised Aratus Latinus*:

- Many editions place Corvus at the tail of the constellation Hydra,
- In two editions (St Gall 250, St Gall 902) the crow is pecking the snake's tail.

Corvus appears in the Leiden *Aratea* (816) as a raven standing on the tail of Hydra (Katzenstein & Savage-Smith, 1988).

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Corvus on one page as a raven standing with wings spread in both right and left profile.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Corvus as a raven perched on Hydra's tail.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) lists Corvus.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Corvus as a raven standing on the back of Hydra near the serpent's tail.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Corvus as a Raven with wings raised facing to our left. On another page it depicts Hydra with the stars of Corvus near its tail, but does not illustrate the raven.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Corvus" as a raven standing on the tail of Hydra.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Corvus as a raven standing on the tail of Hydra. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Corvus as standing on the tail of Hydra. It is not labelled.

The Paris manuscript of al-Sufi's Book of Fixed Stars (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg's library (c 1430 – 1440) depicts Corvus as a raven standing on the tail of Hydra.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Corvus as a raven standing on the tail of Hydra.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Corvus as a raven standing on the tail of Hydra.

Corvus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a raven standing on Hydra's tail facing toward Hydra's head.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "CORV(VS) APPOLLINE(VS)" as a raven perched on the tail of Hydra.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Corvus as a raven on Hydra's tail. It is not labelled and is partially obscured by the crease between the pages.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Corvus as a raven pecking on Hydra’s back.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts “Corvus” as standing pecking on the back of Hydrus, facing towards the front of Hydrus.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Corvus” as a raven standing on the tail of Hydra.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Corvus as a raven facing to our left pecking on Hydra’s tail.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Corvus as a crow on the back of Hydra (but NOT Crater).

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Corvus in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Corvus” as a crow on the tail of Hydra.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Corvo”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Crow”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Corvus as a raven standing on the tail of Hydra and pecking the serpent.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Corvus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Corvus” as a raven pecking at Hydra’s back near its tail.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Corvus” as a raven walking to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “Corbeau” as a raven standing on the tail of Hydra.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Corvus” as a raven perched on the tail of Hydra pecking on its back. It is facing towards the head of Hydra.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Corvus” as a raven perched on the back of Hydra near its tail, facing forward.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) “Corvus” as a raven pecking at the back of Hydra. NOTE: As with most illustrations, Corvus is shown at the tail end of Hydra, but is facing towards Hydra’s rear, where most other illustrations have it facing forward.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Corvus as a raven standing on the tail of Hydra.

Corvus is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1603) depicts this constellation in his *Uranometria* in 1603 as a crow walking with its wings raised. Bayer lists these names for Corvus: “Corvus, Ales Phoebi, Algorab, Gorab”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Corvus” as a raven standing on the tail of Hydra.

“Corvus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a raven standing on the tail of Hydra.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Corvus” for this constellation.

“Corvus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a raven standing on Hydra’s tail.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Corvus” as a raven standing on the tail of Hydra, pecking on it.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Corvus Corax”: It is depicted as a raven on Hydra’s tail.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Corvus as a raven pecking at Hydra’s back.

English astronomer Edmund Halley’s chart of 1678 depicts Corvus as a raven pecking at Hydra’s back.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Corvus” as a raven pecking at Hydra’s back.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Corvus” as a raven standing on Hydra’s tail facing towards Hydra’s head with wings outstretched.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Κόραξ”, “Le Corbeau”, and “Corvus” and depicts it as a raven standing on the tail of Hydra.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Corvus as a raven pecking at the back of Hydra.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Corvus al Phoeba Avis"("raven or Phoebe Bird") as a raven pecking at Hydra's back.

Corvus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a raven standing on Hydra's back, facing forward.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Corvus standing on the tail of Hydra.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Corvus as a raven pecking on Hydra's back.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Corvus as a raven standing on Hydra's back near the tail.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Corbeau" as a raven pecking on Hydra's back.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Corvus" as a raven standing on the tail of Hydra.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Corbeau" ("the crow") as a raven standing on Hydra's back, facing forward.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Corvo" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Corvus" as a crow flying above Hydra's tail.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Rabe" and depicts it as a raven standing on Hydra's back. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Rabe" in the text and "Rabe" on the charts, depicting it as a raven standing on Hydra's back.

Corvus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Raaf" ("raven"): It is depicted as a raven standing on the tail of Hydra.

American uranographer William Croswell (1760 – 1834) depicts "Corvus the Crow" on his *Mercator Map of the Starry Heavens* in 1810 as a crow pecking at Hydra's back.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Corvus it in his *Celestial Atlas* in 1822: It is depicted as a raven standing on Hydra's back, facing foward.

"Corvus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a raven standing on the tail of Hydra.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Corvus" as a crow standing on Hydra's tail, facing to our left.

Corvus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: It is depicted as a crow standing on Hydra's back, facing forward.

"Corvus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a raven standing on Hydra's tail.

Rev. Thomas William Webb describes it in the third edition of his *Celestial Objects for Common Telescopes* in 1873 as "an appendage to Hydra".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Corvus, the Crow".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Corvus" on some of its charts and as the "Crow" on others.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Corvus, The Crow" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Corvus" in his *Star Atlas* (1893) and describes it as "The Crow".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Corvus" and describes it as the "Crow".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Corvus: The Raven".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Corvus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows us a quadrilateral of the stars Beta (β) Corvi (Kraz), Delta (δ) Corvi, Gamma (γ) Corvi, and Epsilon (ε) Corvi, with a line running out of this last star to Alpha (α) Corvi (Alchiba). Rey's version shrinks the quadrilateral to form a "body" of the stars Delta (δ) Corvi, Gamma (γ) Corvi, Epsilon (ε) Corvi and the double star Zeta (ζ) Corvi. A short line from Delta (δ) Corvi to Eta (η) Corvi becomes the "beak", a line from Zeta (ζ) Corvi to Beta (β) Corvi its "leg" and a line from Epsilon (ε) Corvi to Alpha (α) Corvi (Alchiba) the "tail".

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as it is shown on IAU charts except that they omit the line from Epsilon (ε) to Alpha (α) Corvi.

Cosmic Ballet:

This **telescopic** asterism is the interacting spiral galaxies IC 2163 and NGC 2207 in the IAU constellation Canis Major. These were discovered by American astronomer Herbert Alonzo Howe (1858 – 1926). This name was posted by American astronomer Jimi Lowrey on the *Deep Sky Forum* in January 2013.

Cosmic Bat Nebula:

There are two **telescopic** Cosmic Bat asterisms:

- One is the reflection nebula NGC 1788 (vdB 33, LBN 916, Ced40) in the IAU constellation Orion. This was discovered by English astronomer William Herschel in 1786 who listed it as "V 32" in his

catalogue. It is GC 1005 in the *General Catalogue* of 1864. It is also known as the Fox Face Nebula. Size 5’ X 3’.

- One is the dark nebula LDN 43 in the IAU constellation Ophiuchus. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024). This dark cloud is partially blocking light from the nearby reflection nebula LDN 7. This was listed under this name on the NASA Facebook page with a photo by Cristi Agapi.

Cosmic Brain:

This **telescopic** asterism is the emission nebula NGC 6888 (Caldwell 27) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1792 and listed as “IV 72”. It is GC 4561 in the *General Catalogue* of 1864. It was given this name by American astrophotographer Clint Shimer, who posted his SHORGB image of this nebula on the ZWO Astrophotography Facebook page 5 August 2025. Size 20’ X 10’. It is also known as the “Crescent Nebula”.

Cosmic Cliffs:

This **telescopic** asterism is part of the open cluster NGC 3324 in the northwest corner of NGC 3372, the Eta Carina Nebula complex in the IAU constellation Carina. It was photographed by the James Webb Space Telescope in 2022.

Cosmic Dancer:

This Indian asterism “Nataraja” from the *Rigveda* is the IAU constellation Orion plus the Hyades cluster in the IAU constellation Taurus and some stars in the IAU constellations Lepus and Monoceros (Bhagwath 2019). This four-armed dancer, mentioned in the *Rigveda*, is described this way:

- The dancer’s “head” is the stars around Lambda (λ) Orionis,
- The dancer’s “right shoulder” is Alpha (α) Orionis (Betelgeuse) and has two “arms:
    - One runs to an “elbow” at Epsilon (ε) Monocerotis then to a “hand” at 15 and 17 Monocerotis,
    - One runs to an “elbow” Omega (ω) Orionis and a hand at 56 Orionis,
- The dancer’s “left shoulder” is Gamma (γ) Orionis (Bellatrix)and has two arms:
    - One runs out to an “elbow” at Pi (π) 5 Orionis and runs up through Pi (π) 4, 3 and 2 Orionis to a hand holding a “torch” which is the Hyades cluster,
    - One crosses in front of the dancer’s body through 32 Orionis, and Omega (ω) Orionis to a “hand” at HIP 28413,
- The belt of Orion is the dancer’s jeweled belt,
- The dancer’s “left leg” starts at a “hip” at Eta (η) Orionis and ends at a “foot” of the stars Beta (β) and Gamma (γ) Monocerotis.
- The dancer’s “right leg” runs from Zeta (ζ) Orionis (Alnitak) to a “knee” at Kappa (κ) Orionis (Saiph) to a “foot” of the stars Lambda (λ) and Kappa (κ) Leporis.

Cosmic Eye Galaxy:

This **telescopic** asterism NGC 1350 is a spiral galaxy in the IAU constellation Fornax. It was discovered by Scottish astronomer James Dunlop in 1828. It is GC 721 in the *General Catalogue* of 1864. It is also known as the “Cow Eye of Fornax” (see below) and the “Colossal Cosmic Eye” (see above).

Cosmic Fireplace:

This **telescopic** asterism is the HII region Sh2-126 in the IAU constellation Lacerta. It is also known as the Great Lacerta Nebula. It was listed by this name on Astrobin by astronomer Jon Gascoyne.

Cosmic Question Mark:

See Question Mark, below.

Cosmic Rosebud:

This **telescopic** asterism is the reflection nebula NGC 7129 (vdB 146, LBN 497, Cr 441, Ced 196) in the IAU constellation Cepheus. It was discovered in 1794 by English astronomer William Herschel who listed it as "IV 75". It is GC 4702 in the *General Catalogue* of 1864. It has two lobes, a large one resembling a "rose bud" and a smaller one beside it resembles the foliage at the base of the "bud". It is also known as the "Small Cluster Nebula" (see below) and the "Cosmic Rose".

Cosmic Sailor:

This **telescopic** asterism is the HII region SH 2-63 (LBN 86) in the IAU constellation Sagittarius. This name appeared on the *Astrophotography* page of Facebook in a photo by Polish astrophotographer *Cmk Photo* on 23 August 2025. It is also known as the "Eagle Ray" or the "Dark Dust Nebula".

Cosmic Tornado:

This **telescopic** asterism is the protostar Herbig Haro 49/50 in the IAU constellation Chamaeleon. It was first observed by NASA's Spitzer Space Telescope in 2006, and the scientists involved named it the "Cosmic Tornado". Herbig-Haro objects are outflows produced by jets launched from a nearby, forming star.

Cosmic X:

Manilius (1st century) mentions in his *Astronomica* a heavenly gate that stands at the intersections of the Milky Way and the Zodiac. Plato (427 – 348 B.C.E.) also mentions this in his *Timaeus* as a heavenly or cosmic "X". Latura (2013) has identified this from their descriptions as where the zodiacal light intersects the Milky Way.

Cosmological Temple:

This Chinese star "Mintang" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Heart (see below).

Cosmos Redshift 7:

This **telescopic** asterism is a high-redshift Lyman-alpha emitter galaxy in the IAU constellation Sextans. It was discovered in 2015 by a team led by Portuguese astrophysicist David Sobral using the VLT at the European Southern Observatory.

Cot:

This Kolam asterism "Mandater" or "Saptarshi" is a quadrangle of stars in the IAU constellation Ursa Major: Alpha (α) Ursae Majoris (Dubhe), Beta (β) Ursae Majoris (Mirak), Gamma (γ) Ursae Majoris, and Delta (δ) Ursae Majoris (Vahia 2014, Bhagwath 2019). Compare this to the Banjara asterism Cot of the Dead (see below) or the Gond asterism Old Woman's Cot (see below).

Costco Carportus:

This American asterism is male up of stars of the IAU constellation Cepheus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Cot of the Dead:

This Banjara asterism "Jamakhat" or "Saptarshi" is the Big Dipper asterism in the IAU constellation Ursa Major (Vahia et al 2014). Compare this to the Banjara asterism Cot (see above) or the Gond asterism Old Woman's Cot (see below).

Cotton Candy Nebula:

This **telescopic** asterism is protoplanetary nebula IRAS 17150-3224 is in the IAU constellation Ara. It was discovered by the IRAS satellite in 1982. It is a challenge to view as it is only 16" long and dim. Senior Astronomy editor Michael E. Bakich described it in Astronomy in May 2010 and recommended using a 16" telescope.

Cottus of Sculptor:

This **telescopic** asterism "Cóttus Sculptóris" is the intermediate spiral galaxy IC 5332 in the IAU constellation Sculptor. This was first recorded by American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Cottus is one of the three hekatoncheires, the hundred-armed giants from Greek cosmogony.

Cougar:

This Skidi asterism is the IAU constellation Auriga.

Couigahaegjek:

This Sami asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Lundmark 1982).

Council of Chiefs:

This Skidi (Pawnee) asterism is the IAU constellation Corona Borealis and a star from the IAU constellation Ursa Minor (Krupp 1983, Kemp et al 2022). They saw this as the smoke hole over a fireplace, the fire surrounded by a meeting of chiefs, with Alpha (α) Ursae Minoris (Polaris) as the chief in charge of the meeting. The smoke from the fire carried their messages to the Gods. The central star, Theta (θ) Coronae Borealis is seen as an errand man (see below) or a servant cooking (see below).

Couple:

This Tibetan khyim (zodiac constellation) "Kh'rig" or "Trik" is the IAU constellation Gemini (Johnson-Groh 2013).

This Egyptian Dendera asterism is the IAU constellation Gemini (Hoffmann 2017). It is depicted as a man and a woman.

Court Historian:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Taishi" is 15 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism "Wénchāng" (文昌) - see Administrative Centre, above.

This Chinese star “Taishi” from the Three Kingdoms to the Ming Dynasty is Kappa (κ) Geminorum in the IAU constellation Gemini and is part of their xing guan Five Feudal Kings (see below)

Court Lady:

This Korean lunar mansion “Yeo” is a quadrilateral of stars in the IAU constellation Aquarius: 3, 5, Epsilon (ε) and Mu (μ) Aquarii. Their asterism “Storage for Lady” (see below) is nearby.

Cousins:

This Inuit asterism “Qangiammaariik” is the Orion Nebula, Messier 42 (NGC 1976, SH 2-281, LBN 974, Ced 55d) in the IAU constellation Orion, one of two nebulae visible to the unaided eye in the Northern hemisphere (MacDonald 1998).

Counterpoising of Virgo:

This **telescopic** asterism “Antírrhopus Vírginis” is the barred lenticular galaxy NGC 4550 in the IAU constellation Virgo. William Herschel listed this as “I 36”. John Herschel listed it as h 1343 and later as GC 3095 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the remarkable fact that this system consists of two counterrotating stellar populations (Vera Rubin et. al, 1992)”.

Cover:

This Arabic asterism is a bent line of three stars in the IAU constellation Virgo: Iota (ι), Kappa (κ), and Lambda (λ) Virginis:

- Dorn (1829) lists this as “Covering or Carpet” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al ghafr, the covering”: This name actually refers to another Arabic asterism, Hair on the Tail (see below).

Cover for Emperor:

This Korean asterism “Hwangjeleul Wihan Deopgae” (황제를 위한 덮개) in the IAU constellation Cepheus is a shallow “D” shaped group of stars resembling a canopy. A straight line between the stars Beta (β) Cephei and Gamma (γ) Cephei form the bottom edge of this “canopy”. Between these two stars a curve goes out through 11, 24, 31, and Eta (η) Cephei.

Cover of House:

This Korean asterism “Jib-ui Deopgae” (집의 덮개) is a line of two stars in the IAU constellation Aquarius: Theta (θ) and 31 Aquarii.

Cow:

This ancient Egyptian asterism “Kenemet” or “Kenmet” is depicted on the ceiling of the Temple of Hathor at Dendera as a cow in a boat with a star between its horns, which is believed to be Alpha (α) Canis Majoris (Sirius) is the IAU constellation Canis Major (Bomhard 2009). Kenemet (“the darkness”) is one of the forty two judges that judged the soul of the dead in the Hall of Truth (Le Vye 2022).

This Japanese sei shuku or lunar station “Inami Boshi” is a line of stars in the IAU constellation Capricornus with 6 Capricorni at one end, Beta (β) Capricorni (Dabih) in the middle, and the stars Rho (ρ) and Eta (η) Capricorni at the end. It is often depicted as a standing human figure with a horned cow head (Kotyk 2018).

Cow Eye of Fornax:

This **telescopic** asterism “Boópis Fornácis” is the elliptical galaxy NGC 1350 in the IAU constellation Fornax. It was discovered by Scottish astronomer James Dunlop in 1828. It is GC 721 in the *General Catalogue* of 1864.. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Colossal Cosmic Eye (see above) and the Cosmic Eye Galaxy (see above).

Cow Herd:

The Uppsala Archaeoastronomical Project proposed the Pleiades cluster in the IAU constellation Taurus for this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne’s Tribe in Tacoma, Washington in November 2023.

Cow Leading Man:

This Korean lunar mansion “Wuu” in the IAU constellation Capricornus rather resembles a fish: In one direction from the star Beta (β) Capricorni (Dabih) you have a shallow oval of stars: Eta (η), Omicron (ο), and Rho (ρ) Capricorni. In the other direction from Beta (β) Capricorni you have two lines of stars forming a “tail”, with the end stars being the optical double star Alpha (α) 1 and 2 Capricorni (Algedi) and Nu (ν) Capricorni.

Cowboy:

This Chinese star “Qianniuxing” from the Three Kingdoms to the Ming Dynasty is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and is part of their asterism Drum at the River (see above).

Cowboy Boot (and Flying Bootlaces):

This asterism from the asterism list of the American astronomer John Davis is made up of 4^{th} – 5^{th} magnitude stars in the IAU constellation Vulpecula:

- The “boot” is the stars 16, 17, 14, 12, and 13 Vulpeculae with the “toe” of the boot being 10 Vulpeculae.
- The “flying bootlaces” is a wavy line of stars starting at HIP 99853 and running through HIP 99951, 99824A, 19 Vulpeculae, 23 Vulpeculae and 21 Vulpeculae.

Cowboy on a Bucking Bronco:

This **telescopic** asterism is also known as the Bucking Horse or the Theta Delphinus Group in the IAU constellation Delphinus:

- The “head” of the horse is a triangle of 7^{th} magnitude stars including HIP 101967 and 101943,
- The “saddle” is Theta (θ) Delphini,
- The rear “hoof” is HIP 101816, and
- A “tail” of 9^{th} to 10^{th} magnitude stars runs out from HIP 101848.

Cowboy’s Star:

This Italian star “Este`la du Vache´” or “S˘ te´ra di Vache´e” is Alpha (α) Lyrae (Vega). This star marked the workdays of a vache´ (cowboy) in the wintertime: They got up in the morning when it rose and went to bed in the evening when it set.

Cowherd:

This German asterism “Pastor Boum” is the IAU constellation Boötes as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Cows:

This asterism “al Baqar” is the Magellanic Clouds as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars*, explaining that his was a name used by the “inhabitants of Tihama”, which would be the coastal plain of Arabia.

Coyote:

This Yokuts star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Coyote Star:

This Diné star “Ma’ii Bizǫ” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Childrey 2008). When Coyote flung stars across the sky, he placed a single bright one low down in the south where it would only briefly rise.

This Ininew star is Delta (δ) Ursae Minoris in the IAU constellation Ursa Minor (Buck 2016). It is part of their asterism “Atima Atchakosuk” (see Dog Stars below).

This Pawnee star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. NOTE: Some Pawnee tribes see this as the Wolf Star (see below).

Coyote, Wolves, and Bears:

See Wolf Brothers, below.

Coyote’s Arrow:

See Arrow, above.

Coyote’s Daughters:

This Paiute asterism is the Pleiades cluster in the IAU constellation Taurus (Gillard 2021). The star Eta (η) Tauri (Alcyone) is Coyote’s most beautiful daughter, who is a guide to the spirit world.

Coyote’s Eyeball:

This Xwlemi star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. One day while Coyote was juggling his eyeballs, one flew too high and became this star.

Crab:

This Greek asterism “Καρκίνος” or “Karkínos” is the IAU constellation Cancer as originally described in Ptolemy’s *Almagest* (2nd century). The 15th century *Alfonsine Tables* list the name “Carcinus”. Ptolemy (c.100 – c.170) described the “crab” as follows:

- The “body” is a quadrilateral of the stars Gamma (γ) Cancri, Eta (η) Cancri, Theta (θ) Cancri, and Delta (δ) Cancri.

- From each of the corners a line goes out to the following stars to form "legs": Mu (μ) Cancri, Beta (β) Cancri (Tarf), Alpha (α) Cancri (Acubens), and Iota (ι) Cancri.

NOTE: This Greek asterism appears next to a Scarab on the *Daressy Zodiac* of the Roman Imperial Period.

This Arabic asterism "Saltieun" (سلطعون) is the IAU constellation Cancer.

This Egyptian Dendera asterism is the IAU constellation Cancer (Hoffmann 2017).

This Arabic star "al-saraṭān', later latinized to "Sertan" and "Sertain", is Alpha (α) Cancri in the IAU constellation Cancer:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Alsartan" and "Asartan".
- Johann Bayer's *Uranometria* (1603) lists "Alsaran" and "Asartan".
- "Alsartan vel Assartano" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a name for this star.
- Robert Hues lists "Alsartan" as a name for the constellation Cancer in his *A Learned Treatise of Globes* in 1659.
- Cancer is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as a crayfish and is labelled "Cancer Alsartan".
- This star is listed as "Alsertan", a name for the constellation Cancer, in John Hill's *Urania* in 1754: The Arabic name for Cancer is "Saltieun", but the Hebrew name for this constellation is Sartan, so this may have influenced Hill's listing.
- German astronomer Johann Elert Bode (1747 – 1826) lists it as "Ez Zaban".
- "Sertan" appears in Giuseppe Piazzi's *Palermo Catalogue* of 1814 as a name for Alpha (α) Cancri.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al sertán, the crab".

This Hebrew asterism "Sartan" or "Sarton" is the IAU constellation Cancer as listed in their list of constellations of the zodiac (mazzaroth) in their Talmud and is related to their month Tammuz.

This Babylonian asterism "MULAL.LUL" (Hunger 1992), "AL.LU" (Anthony 1996), "AL.LUL" (Bartel van der Waerden 1974), or "MUL.AL.LU" from the MUL.APIN tablets. It is listed as "mul al.lul" in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995). Boutet (2014) lists it as "Al.Lil". It is made up of stars in the IAU constellations Cancer and Gemini:

- The "body" is a quadrilateral of four stars: Delta (δ), Gamma (γ), Eta (η), and Theta (θ) Cancri. The open cluster Messier 44 is in the middle of this quadrilateral, and
- A line goes out from each of these corner stars to form "legs", and the stars at the end of these are: Beta (β) Cancri (Tarf), 65 Cancri, 48 Cancri, and Kappa (κ) Geminorum.

This Babylonian ziqpu "mulAL.LUL" from cuneiform text AO 6478 (Schaumberger 1952) is open cluster Messier 44 (see Beehive, above) in the IAU constellation Cancer.

This Babylonian and Sumerian star "al-lul" in the star catalogue BM 78161 (Liechty 1988) is the star Epsilon (ε) Cancri in the IAU constellation Cancer. In 2019 Leitz listed the star Epsilon (ε) Cancri as the 20th ziqpu in this tablet. Some translators have this as "crayfish" rather than "crab".

The Akkadian name for this asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.), is “Alluttu” (Hunger 1992, Anthony 1996).

This Seleucid asterism as “NAGAR” or “A.MES” (“waters”). from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Cancer (Foxvog 1993).

The Latin name “Carcinus” for the IAU constellation Cancer is listed by John Hill in his *Urania* in 1754.

The “Syrian” name “Sartóno” for the IAU constellation Cancer is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. R. H. Allen lists this as a Syrian name in his *Star Names* in 1899 and suggests that the Chaldeans also used it.

The “Persian” name “Chercjengh” for the IAU constellation Cancer is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 and by R. H. Allen in his *Star Names* in 1899. Allen also gives the name “Kalakang”.

This Turkish asterism “Yengeç” is the IAU constellation Cancer. The names “Lenkutch”, “Lenkitch”, “Yenkutch”, “Yenkitch”, “Yilenkutch”, and “Yilenkitch” are listed as Turkish names for this constellation by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 and “Lenkutch” by R. H. Allen in his *Star Names* in 1899. John Hill lists “Lenkutch”, “Yenkutek”, “Yenkitek”, and “Yilenkutek” in his *Urania* in 1754.

This German asterism “Kraba” is the IAU constellation Cancer as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Kogi asterism “Huso”, “Husso”, or “Crucero” is the IAU constellation Cancer.

This German asterism “der Krebs” is the IAU constellation Cancer. German astronomer Johann Bayer (1572-1625) listed it as “die Krippe”. “Der Krebs” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This Italian asterism “Granchio” is the IAU constellation Cancer.

This Saxon asterism “Crabba” is the IAU constellation Cancer.

This Seri asterism “ZAAMTH” or “Jaiba” is the stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), and the belt of Orion.

The stars of this Sama asterism “Mamahi Kagang” have not yet been identified (Ambrosio 2008).

This Tupi asterism “Guanham-y” is the IAU constellation Leo (De Freita Mourão 2009). This is the lagostim crab.

This Anindilyakwa (Groote Island, Australia) asterism “Unwala” is the stars Delta (δ), Epsilon (ε), Eta (η), Rho (ρ), and Sigma (σ) Hydrae in the IAU constellation Hydra (Clarke 2009). Unwala is a crab ancestor.

This Arawak asterism is the IAU constellation Corona Borealis (Kemp et al 2022).

This Kiribati star “Te Waro” or “Waro” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Trussel and Groves 1978). NOTE: the Kiribati called a group of stars around Canopus “Banga n waro” (see above). or “Na nu ware” (see above).

This Estonian asterism "Vähk" is the IAU constellation Cancer and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

This Carib asterism "Kusayuman" or "Kusa" represents the crab (Coragyps atratus). Its present location is unknown (Magaña, and Jara, 1982).

A **telescopic** crab asterism is the planetary nebula Messier 1 (NGC 1952, SH 2-244, LBN 833, Ced 53, SNR G184.6-05.8) in the IAU constellation Taurus. This was discovered by English astronomer John Bevis in 1731 and later added to French astronomer Charles Messier's catalogue. Taurus. The supernova that created this planetary nebula was recorded by Chinese astronomers in 1054. It was listed in the General Catalogue of 1864 as GC 1157. It got its name "crab nebula" from English astronomer William Parsons, 3rd Earl of Rosse, who observed it in 1842 with a 91 cm (36 inch) telescope and produced a drawing that looked like a crab. Size 8' X 4':

- English astronomer John Herschel listed this as h 357.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the "Crab Nebula".
- William Denning's *Telescopic Work for Starlight Evenings* (1891) lists it as the "Crab Nebula" and as the "Great Crab Nebula".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Crab Nebula".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists this as the "Nebula in Taurus" in his *Star Atlas* (1893) but mentions Lord Rosse's describing it as a "crab (crab-nebula".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as the "Famous Crab Nebula of Lord Rosse".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this as the "Crab Nebula".

Crab, Asses, and Crib:

This Greek asterism "Καρκίνος,Ὄνοι, καί Φάτνη" or "Karkínos, Ónoi, kaí Fátni" is the IAU constellation Cancer as described by Eratosthenes (d.194 B.C.E.). A variation is "Ὀπισθοβάμων" or "Opisthovámon".

Crab Cluster:

This **telescopic** asterism is the open cluster NGC 7789 in the IAU constellation Cassiopeia. It was in 1783 by English astronomer Caroline Herschel. John Herschel listed it as ""VI 30". John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864. It is also known as Caroline's Rose, the White Rose, the Star Mist Cluster, Herschel's Spiral Cluster, the Ghost Cluster, and the Screaming Skull Cluster.

Crab Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Cancer as "Xiè shén" (蟹神) or "crab deity" (Kotyk 2017).

Crab Globular Cluster:

Another **telescopic** "crab" asterism is the globular cluster Messier 4 (NGC 6121) in the IAU constellation Scorpius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745 and

included in Charles Messier's catalogue in 1764. The 1864 *General Catalogue* lists it as GC 4138. It is also known as the "Eye of the Scorpion" (see below).

Crab (Jumping Off a Rock):

This **telescopic** asterism is the open cluster Messier 52 (NGC 7654) in the IAU constellation Cassiopeia. It was discovered by French astronomer Charles Messier in 1774. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4957. It was given this name by American astronomer Wayne Schmidt, who describes it as a small crab jumping off a rock. This is also known as the Cassiopeia Salt and Pepper Cluster (see above), October Salt and Pepper Cluster (see below), Flying Bird (see below), and the Scorpion (see below).

Crab of Grus:

This **telescopic** asterism "Cáncer Grúis" is the barred spiral galaxy NGC 7424 in the IAU constellation Grus. This was discovered by John Herschel in 1847. It is GC 4867 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy resembles a giant crab". It is also known as the "Grand Design Galaxy" (see below).

Crab of Hercules:

This **telescopic** asterism "Cárcinus Hérculis" is the lenticular galaxy IC 1222 (Arp 73) in the IAU constellation Hercules. It was discovered by French astronomer Édouard Stephan in 1883. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "its two split spiral arms, looking like claws of a crab".

Crab of Ursa Major:

This **telescopic** asterism "Carcinódes Úrsae Majóris" is the spiral galaxy NGC 5585 in the IAU constellation Ursa Major. William Herschel listed this as "I 235". John Herschel listed it as h 1790 and later as GC 3856 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Crab's Claws:

This is the globular cluster Messier 53 (NGC 5024) in the IAU constellation Coma Berenices. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 writes that "Sir John Herschel, with Mr. Baily, …[observed] curved appendages of stars, like the short claws of a crab running out from the main body". It is listed in the General Catalogue of 1864 as GC 3453 and in John Herschel's catalogue as h 1558. Walter Scott Houston describes it in exactly the same words. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply refers to this as a "Coma Berenices Cluster".

Crackerjack Cluster:

This **telescopic** asterism is the globular cluster Messier 22 (NGC 6656) in the IAU constellation Sagittarius. It was discovered by German amateur astronomer Abraham Ihle in 1665 and included in Charles Messier's catalogue in 1764. It is GC 4424 in the *General Catalogue* of 1864. Although I do not know who assigned this name to this globular cluster, the name could not have appeared before 1896, which was when the name for this American caramel-coated popcorn was registered.

Cradle:

This Tiwa asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Crane:

This Ojibwe asterism "Ajijiaak" is the IAU constellation Cygnus (Lee et all 2014). They also call it the "Skeleton Bird" (see below).

This Chinese xing guan "Hè" (鶴) is seven lines of stars radiating out from the central star Beta (β) Gruis in the IAU constellations Grus and Tucana:

- One line goes out to Alpha (α) Gruis (Alnair),
- One goes out to Iota (ι) Gruis,
- One goes out to Theta (θ) Gruis,
- One goes out through Rho (ρ) Gruis to Nu (ν) Gruis,
- One goes out through Delta (δ) 1 and 2 Gruis to Mu (μ) 1 and 2 Gruis,
- One goes out through Epsilon (ε) Gruis to Eta (η) Gruis, and
- The last line goes out through Zeta (ζ) Gruis to Gamma (γ) Tucanae.

This Greek asterism "Gergnus" is the IAU constellation Grus as listed in John Hill's *Urania* in 1754. The modern Greek word for crane is γερανός (geranós).

This Lithuanian asterism "Kranas" is the IAU constellation Virgo.

This French asterism "la Grue" is the IAU constellation Grus.

This Germans asterism "der Kranich" is the IAU constellation Grus.

This Italian asterism "la Gru" is the IAU constellation Grus.

This English asterism is the IAU constellation Grus as described by Robert Hues in his *A Learned Treatise of Globes* in 1659.

Crane with a Snake:

This German asterism "Grus vel Ciciona cum Serpente" ("a crane (swan) or a crane with a snake") is the IAU constellations Ophiuchus and Serpens. Johann Bayer's *Uranometria* (1603) lists the name "Mauris Grus" ("Mauris Crane"). The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Grus vel Ciciona cum Serpente" and claims this to be an Arabic asterism.

Crane's Nest:

This Hungarian asterism "Darvak buqqya" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism depicts this as behind the three-star formation which is their asterism Leader of Cranes (see below). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Crank Stars:

This Estonian asterism is the "W" asterism in the IAU constellation Cassiopeia (Kuperjanov 2006).

On the Estonian island of Saarema this asterism is three stars in the IAU constellation Taurus (Kuperjanov 2006): Alpha (α) Tauri (Aldebaran), Beta (β) Tauri (Elnath), and Zeta (ζ) Tauri.

Crater:

None of the stars of this constellation are brighter than 4th magnitude but show up in 79 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Crt) was possibly incorporated with the stars of the Babylonian asterism "Aribu" or "MUL.UGA.MUSHEN" in the MUL.APIN tablets (see Raven below). Greek myths refer to a raven who brings a cup and a snake to the God Apollo. Apollo finds the cup empty and throws the raven, cup, and snake into the sky where they become stars (the IAU constellations Corvus, Crater, and Hydra). Aratus (315 – 240 B.C.E) mentions this asterism in his poem *Phaenomena* (270 B.C.E.) and Ptolemy (c.100 – c.170) describes it as "Κρατὴρ" ("Krater", a special wine mixing vessel which resembles an amphora or vase) in his *Almagest*. Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) gives it the Latin name "Cratera", later corrupted to "Creter". Ptolemy only describes one star at the foot of the vessel, Alpha (α) Crateris, and two handles, Eta (η) and Theta (θ) Crateris.

Crater appears in the Leiden *Aratea* (816) as a two-handled cup on the back of Hydra.

Kauffmann's translation of the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in 1888 lists "sive Urna" ("or an urn"). NOTE: Urna is also used as a name for the asterism Water Jar (see below).

This constellation appears in editions of the 8th century *Revised Aratus Latinus*: In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Crater is on the back of the constellation Hydra.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Crater as a drinking cup with no handles in left and right profile on one page.

The 11th century *De signis caeli ("of the signs of heaven*") lists Hydra as "Serpens" ("snake") with Corvus and Urna on its back. The Klosterneuberg 685, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict this asterism as a bucket.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts the stars of Crater, but does not mark or label it.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Crater as a drinking cup with no handles on Hydra's back.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Crater as a cup.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Crater as a cup with no handles on the back of Hydra.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Crater as a drinking cup with no handles. On another page Hydra is shown with the stars of Crater alongside, but on this page the cup is not illustrated.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts Crater as a wooden bucket with two handles on the back of Hydra. The label is hard to make out but the first word might be “Vas…” which means “Vessel”.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Crater as a wooden bucket with two handles on the back of Hydra. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Crater as a drinking cup with no handles on the back of Hydra. It is not labelled.

The Paris manuscript of al-Sufi’s Book of Fixed Stars (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg’s library (c 1430 – 1440) depicts Crater as a cup with no handles on the back of Hydra.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Crater as a two-handled cup on the back of Hydra.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Ara as a vase with handles on the back of Hydra.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Crater as a vase with no handles on the back of Hydra.

Crater appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a two handled cup on the back of Hydra. NOTE: This has the rather unusual feature of flames rising from the top of the vase.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “VAS [VE]L CRATER” as a wooden bucket with two handles.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Crater as a drinking cup with no handles on the back of Hydra. It is not labelled.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Crater as a wooden bucket with two handles on Hydra’s back.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts “Crater” as a one handled cup on the back of Hydrus.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depict “Urnus” as a two handled wooden bucket.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “Crater” as a two-handled cup on Hydra’s back.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Crater in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Crater” as a sort of teapot.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De la tazza, o ver

vaso" ("from the cup, or from the vase"). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Cup".

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Crater as a drinking cup with no handles on the back of Hydra.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Crater" as a two handled cup on the back of Hydra.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Crater siue patera" ("Crater or Bowl") as a two handled vessel.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a two handled cup on the back of Hydra.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Crater" as a two handled cup on the back of Hydra.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Crater" as a two handled cup on the back of Hydra.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Crater" as a two handled vessel on Hydra's back.

"Crater" is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a two-handled cup on Hydra's back.

Crater is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a squat amphora with two handles. Bayer lists these names for this constellation: "Crater, Cratera, Urna, Patera, Calix, Poculum, Elkis".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Crater" as a two handled vessel on the back of Hydra. It also lists the name "Urna".

"Crater" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a vase on the back of Hydra.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Crater" for this constellation.

"Crater" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a two-handled vessel on Hydra's back.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Crater Vas" as a two handled cup on the back of Hydra.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Crater” and “Vas” (“vessel”): It is depicted as a cup on Hydra’s back.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Crater as a two-handled cup on Hydra’s back.

English astronomer Edmund Halley’s chart of 1678 depicts Crater as a two-handled cup.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Crater” as a two-handled cup.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Crater” as a two handled cup on Hydra’s back.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “La Coupe”, “Crater” and “Κρατὴρ” and depicts it as a vase with two dragon handles.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Crater vel Vas” (“a bowl or vessel”) as a two handled vessel, the handles resembling birds and the base a pair of human figures having the cup on their shoulders.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Crater as a two-handled vase on the back of Hydra.

Crater is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a two handled crater on Hydra’s back.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Crater” as a two handled cup on the back of Hydra.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Crater” as a two handled vase.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Crater as a bowl with two handles on Hydra’s back.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Crater as a two handled vase on the back of Hydra.

John Hill lists “Calpe” as a name for this constellation in his *Urania* in 1754. Dorn (1829) lists the Arabic name “Flaggon”.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Coupe” as a wine cup with no handles.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Crater” as a two handled cup on the back of Hydra.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Coupe” as a vase with two handles on Hydra’s back, as does the 1778 edition.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Idra e Coppa" ("Hydra and cup") in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Crater" as a two handled cup on Hydra's back.

Crater is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Beeker" ("beaker"): It is depicted as a two-handled vessel on the back of Hydra.

American uranographer William Croswell (1760 – 1834) depicts "Crater the Cup" on his *Mercator Map of the Starry Heavens* in 1810 as a two-handled cup.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Crater in his *Celestial Atlas* in 1822: It is depicted as a vase with two handles on Hydra's back.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Becher" and depicts it as a two handled cup. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Becher" in the text and "Becher" on the charts and depicts it as a two handled cup.

"Crater" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a two-handled vessel.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Crater" as a wine cup.

Crater is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: It is depicted as a two handled crater on Hydra's back.

"Crater" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a two-handled vessel on Hydra's back.

Rev. Thomas William Webb describes it in the third edition of his *Celestial Objects for Common Telescopes* in 1873 as "an appendage to Hydra".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Crater" on some of its charts and "Cup" on others.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Crater, the Cup" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Crateris, the Cup".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Crater" in his *Star Atlas* (1893) and describes it as "The Cup".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Crater" and describes it as a "Cup".

Standard IAU charts depict Crater as a "cup" shape with two interconnected parts:

- The “base” is a quadrilateral of the stars Delta (δ) Crateris, Alpha (α) Crateris (Alkes), Beta (β) Crateris (Al Sharasif), and Gamma (γ) Crateris, and Delta (δ) Crateris.
- The “cup” is a pentagonal shape of the stars Gamma (γ), Zeta (ζ), Eta (η), Theta (θ), Epsilon (ε), and Delta (δ) Crateris.

Sky and Telescope Magazine, founded in 1941, depicts Crater in their magazine and as does the IAU except that they do not connect the stars Eta (η) and Theta (θ) Crateris.

Alternate names that show up in medieval manuscripts include “Cratera” and “Calpe”.

Craver:

This French asterism is the IAU constellation Dorado as listed by French astronomer Camille Flammarion (1842 – 1925) in his *Astronomie Populaire*. Compare this to Golden Fish, below.

Crawler:

This Latin asterism “Repertrix” is the IAU constellation Cygnus as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

Crayfish:

This Greek lunar mansion is stars in the IAU constellation Cancer and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This French asterism “l'Écrevisse” is the IAU constellation Cancer.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts the IAU constellation Cancer as a crayfish.

This Arabic asterism is the IAU constellation Cancer as described by Persian astronomer Abu Ma’shar (Albumasar- 787 – 886).

This Romanian asterism “Rac de Râu” or “Racul” is the IAU constellation Cancer (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This German asterism “Flusskrebs” is the IAU constellation Cancer.

This Wardaman star “Galin” or “Jalin” is Epsilon (ε) Tauri in the IAU constellation Taurus (Cairns and Harney 2003) and one of the stars in their asterism “Little Fishes” (see below).

This Barasana asterism “Rasikamu” is the IAU constellation Leo. Hugh-Jones (2006) describes it as “part of Leo”.

This asterism is the IAU constellation Cancer as depicted in the *Introductio in Astronomiam* (1489) a translation by Erhard Ratdolt of an earlier work by Persian astronomer Abu Ma’shar (Albumasar- 787 – 886).

Creation Dog:

This Wardaman asterism “Mudborongo” is the IAU constellation Leo (Cairns 1999).

Creation of Fire:

This Palawa star “Pumpermehowlle” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Gantevoort et al 2016).

This Paredarerme star “Puckarnepenner” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Gantevoort 2015).

This Nuenone star “Pyelebay” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Gantevoort 2015).

Creation of the Sky:

This Micronesian asterism from the Marshall Islands is made up of the stars of the IAU constellations Auriga, Scorpius, and Taurus. The star Alpha (α) Scorpii (Antares) represents Dümur, the oldest son of the mother of the stars, Ligedaner, who is the star Alpha (α) Aurigae (Capella). Her youngest son is the Pleiades cluster in the IAU constellation Taurus. Her youngest son won a canoe race against Dümur and became King of the Stars (see below).

Creepers:

This Latin asterism “Ramphestes” is the IAU constellation Tucana as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

Crescent Nebula:

There are two **telescopic** “Crescent Nebula” asterisms:

- One is the emission nebula NGC 6888 (Caldwell 27) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1792 and listed as “IV 72”. It is GC 4561 in the *General Catalogue* of 1864. Size 20’ X 10’. It is also known as the “Cosmic Brain”.
- One is planetary nebula NGC 6445 in the IAU constellation Sagittarius, discovered by William Herschel in 1784 who listed it as “II 586”. It is GC 4333 in the *General Catalogue* of 1864. It is also known as the Box Nebula (see above), the Coffin Nebula, or the Little Gem Nebula (see below).

Crest of a Helmet of Ursa Major:

This **telescopic** asterism “Crísta Úrsae Majóris” is the barred spiral galaxy NGC 3359 in the IAU constellation Ursa Major. It was discovered in 1793 by William Herschel who listed it as “V 52”. It became GC 2189 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “It brings to mind a Roman helmet with a… plume”

Crested of Dorado:

This **telescopic** asterism “Lophéphora Dorádus” is the barred spiral galaxy NGC 1672 in the IAU constellation Dorado. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed this as 2665 and later as GC 912 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as to them the northern arm of the galaxy appeared to be a crest.

Crested of Libra:

This **telescopic** asterism “Eúlophus Líbrae” is the intermediate spiral galaxy NGC 5861 in the IAU constellation Libra. William Herschel listed this as “II 192”. It became GC 4055 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard

Bodifee and Michel Berger (2010): They called it this because of the "expanded, tangled aspect of the spiral arm at the northern side of this galaxy".

Crested Parrot:

This Kamilaroi star "Gurie" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (William Ridley 1875).

Cretan Crown:

This Latin asterism "Corona Creta" is the IAU constellation Corona Borealis.

Crinoid:

This **telescopic** asterism in the IAU constellation Auriga is Corder 886 on the observing list of American astronomer Jeffrey Corder. Size 55'. Corder describes this as "7 stars in a 'crinoid' or 'lambda' shape" of 6^{th} – 9^{th} magnitude including HIP 26417, 26315, 26267, and 26075. I'm listing this under "crinoid" as I believe this is a better description. NOTE: A crinoid is a fossil of a marine animal which appeared in the Middle Cambrian having an array of branching arms attached to a globe-shaped, cup like body.

Criss Cross Nebula:

This telescopic asterism is in the IAU constellation Eridanus. It was described in *The "Criss-Cross" Nebula": and interaction of the Orion-Eridanus Bubble with a small interstellar cloud*, Astronomy and Physics, 324, 1165-1169, (C. Zanin and R. Weinberger, 1997). American astronomer Victor van Wulfen describes it in the *Deep Sky Forum* as "11 minutes of arc west-southwest of the GO mag. 7.5 star SAO 131003".

Crocodile:

This ancient Egyptian asterism "Saq" is made up of stars of the IAU constellations Hercules, Lyra, and Serpens and is depicted on the ceiling of the tomb of Seti I and the Ramesside tombs (Krupp 1983). The body is a long, irregular quadrilateral with four stars at the corners: 103 Herculis, Kappa (κ) Lyrae, and Kappa (κ) Serpentis and 21 Serpentis. It is depicted as being on the back of their asterism "Reret" (see Hippopotamus, below).

Another ancient Egyptian "crocodile" asterism "Sek" or "Hetep Redwy" ("lying on his feet") is an epithet of the Egyptian God Sobek who manifests as a crocodile or a man with a crocodile head. It is made up of the stars of the IAU constellations Hydra, Cancer, and Crateris:

- One side of this irregular figure runs from Xi (ξ) Hydrae through three stars to Alpha (α) Hydrae (Alphard) and then through another star to end at Beta (β) Cancri (Tarf),
- From Beta (β) Cancri it runs back through a bent line of stars to Delta (δ) Crateris, and
- The final side runs from Delta (δ) Crateris through Gamma (γ) Crateris to end back at Xi (ξ) Hydrae.

It has also been suggested that this Egyptian asterism is the IAU constellation Ursa Major (Berio 2014). It has been pointed out that the Big Dipper does have a long "tail" like a crocodile. This would be an elongated oval of stars, starting at one end with Omicron (ο) Ursae Majoris and running through Upsilon (υ) Ursae Majoris, Beta (β) Ursae Majoris (Merak), Gamma (γ) Ursae Majoris, Eta (η) Ursae Majoris, Zeta (ζ) Ursae Majoris, Epsilon (ε) Ursae Majoris, Delta (δ) Ursae Majoris, Alpha (α) Ursae Majoris (Dubhe), and 23 Ursae Majoris. The 6^{th} nome (district) of Upper Egypt "iḳr", whose emblem

was the crocodile, celebrated the Birth of Sobek ("sbk") the crocodile God when Eta (η) Ursae Majoris (Alkaid) was at its lowest culmination. The heliacal rising of the star Omicron (o) Ursae Majoris (Muscida, Latin for "muzzle") is related to their "Day of the cutting out of the tongue of Sobek".

There is also an Egyptian asterism by this name which is one of the paranatellonta of the decans of Pisces as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is described by Mosenkis as "may be Cetus or less Telescopium". As Telescopium is in a different part of the sky and as Cetus rises with Pisces, it is probably the stars of Cetus.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts a figure consisting of the front halves of two crocodiles connected to each other at the waist (Bullinger 1882, Seiss 1882).

This Hebrew asterism "Tannīm" is the IAU constellation Draco.

This Aramaic asterism "Tannīn" is the IAU constellation Draco.

This Egyptian asterism "Tanem" is the IAU constellation Draco. R. H. Allen lists this in his *Star Names* in 1899.

This Celtic (Gaulish) asterism "Riuri Prinnios" is the IAU constellation Capricornus and appears in the Coligny Calendar (Boutet 2014).

There are two Vedic crocodile asterisms:

- One is the IAU constellation Capricornus.
- One, "Sisumara", is 14 stars in the IAU constellations Draco and Ursa Minor with the star Dhruva (Alpha (α) Ursae Minoris (Polaris), see Immovable, above) as the tip of the tail as listed in the *Taittiriya Aranyaka* (Leitz 2019).

This Lacandón asterism "El Lagarto" is the Little Dipper asterism in the IAU constellation Ursa Minor (Milbrath 1999).

There are two **telescopic** "crocodile" asterisms:

- One is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius, also known as the False Comet, the Northern Jewel Box, and The Table of Scorpius. It is located a half a degree north of Zeta (ζ) Scorpii. It was discovered by Giovanni Battista Hodierna before 1654, who called it Luminosae (Italian for "bright"). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. The cluster forms the "head" of the "crocodile", with stars running north from Zeta (ζ) Scorpii and NGC 6231 to a point roughly halfway to Mu (μ) Scorpii. The "tail" is formed by two clusters: Collinder 316 and Trumpler 24. It was Magda Streicher who came up with the name "Crocodile Cluster" for this asterism. NOTE: Streicher also noted that this cluster "resembles the body of a fly".
- One is open cluster NGC 1981 in the IAU constellation Orion. It was discovered by English astronomer John Herschel in 1827 becoming h 362 on his list and GC 1184 in the *General Catalogue* of 1864. Its eastern star is the "nose" and western star the "tail" and the two groups of three stars in the middle its "legs". Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) states "some people say it looks like an alligator" and makes it O'Meara 28.

Crocodile in the Sky:

This Wardaman asterism “Wariga” is the dark nebulosity located near the Coal Sack Nebula (Cairns 1999). This “Black Spaces Crocodile” is there to catch those who do not obey the laws. The Black Spaces are the dust clouds in the Milky Way. Compare this to Crocodiles in the Sky (see below).

Crocodiles in the Sky:

This Kamilaroi/Euahlayi asterism “Garriya” is dark nebulosity located under the belly of their asterism “Gawarrgay” (see Emu, below) in the Milky Way (Fuller et al 2014): It forms two “crocodiles” looking away from the Emu. NOTE: crocodiles are only found in northern Australia. In southern Australia this asterism is described as the Kangaroo (see below). Compare this to Crocodile in the Sky (above).

Croc’s Eye:

This **telescopic** asterism, Messier 94 (NGC 4736) is a spiral galaxy in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1781. It is listed in the 1864 General Catalogue as GC 3258 and in John Herschel’s catalogue as h 1456. It is also known as the Cat’s Eye Galaxy.

Crom Cruach:

This Celtic (Irish) asterism may be the IAU constellation Hercules (Mosenkis, N/K date). Crom Cruach, whose name “Crom” (“bent, crooked, stooped’) Cruach (“pile, heap, mound, stack”) was likely a fertility God. He is also depicted as a gold figure surrounded by twelve stone figures, which suggests a solar connection. Later Christian writers depict him as a bloody God of sacrifice defeated by St. Patrick.

Crook:

This Mesopotamian asterism “Gam” (Bartel van der Waerden 1974), “GÀM” (Anthony 1996), or “Gamlu” (Anthony 1996) is made up of stars in the IAU constellations Auriga and Taurus: Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), Theta (θ) Aurigae (Mahasim), Beta (β) Tauri (Elnath) and Alpha (α) Tauri (Aldebaran). It has also been interpreted as “Scimitar” and “Throwing Stick”. R. H. Allen lists this as “Gam the Scimitar” from the “Tablet of the Thirty Stars” in his *Star Names* in 1899 and cites “Brown” who wrote that it “stretches from Okda of the Fishes to Hamal of Aries”. This is probably Robert Brown in his *Researches Into the Origin of the Primitive Constellations of the Greeks, Phoenicians and Babylonians* (1899). Boutet (2014) lists it as “Gamlu” and translates this as “sickle, sword, or harpé”.

This Babylonian ziqpu “mulGAM” or “Gamli” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Aurigae (Cappella) in the IAU constellation Auriga.

This Babylonian asterism from the MUL.APIN tablets, “MU.ZUBI”, “MUL.GAM”, “GAM”, or “d GAM” (Hunger 1992) listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “dGAM” and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul gam” (Koch-Westenholz 1995) is a triangle of stars in the IAU constellation Auriga: Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), and Theta (θ) Aurigae (Bartel van der Waerden 1974). This appears in later Seleucid sky lore.

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “Gamlu” (Hunger 1992) is a triangle of stars in the IAU constellation Auriga: Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), and Theta (θ) Aurigae.

This Persian asterism “Gumlu” from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is a triangle of stars in the IAU constellation Auriga: Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), and Theta (θ) Aurigae (Boll 1918). Ernst Weidner lists it as “gam” in his *Fixsterne* in 1971.

This Seleucid asterism is a triangle of stars in the IAU constellation Auriga: Alpha (α) Aurigae (Capella), Beta (β) Aurigae (Menkalinan), and Theta (θ) Aurigae.

This proposed Egyptian asterism “ḥḳ꜀-ʿnḏw” from the Old Kingdom (3100 B.C.E.) is related to their nome (district) of that name and is made up of stars of the IAU constellation Centaurus (Berio 2014).

Crook of the Goat:

This Seleucid star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Crook of Uz:

This Babylonian and Sumerian ziqpu from the star catalogue BM 78161 (5^{th} – 7^{th} century B.C.E.) is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra and is the 7^{th} ziqpu on that list (Liechty 1988, Leitz 2019).

Crooked Big Cart:

This Latvian asterism “Lielie Greizie Rati” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Crooked Billet:

This asterism is listed by Australian astronomer Francis Abbott (1799 – 1883) as a vacant space of irregular shape amongst the stars of what would be the Eta Carinae Nebula (NGC 3372) and is listed in R. H. Allen’s *Star Names* in 1899.

Crooked Cart:

This Italian (Piedmont and Ligurian Alps) asterism “u Car Gars” or “u Mantenay” is the IAU constellation Ursa Major.

Crooked Clawed:

This Coptic asterism “Khambalia” is the stars Iota (ι), Kappa (κ), and Lambda (λ) Virginis in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Crooked Running Water:

This Chinese xing guan “Shuǐweǐ” (水委) is a triangle of stars in the IAU constellation Phoenix: Alpha (α) Phoenicis (Ankaa), Zeta (ζ) Phoenicis, and Eta (η) Phoenicis.

Crooked Serpent:

This Latin asterism “Coluber Tortuosus” is the IAU constellation Draco as listed in John Hill’s *Urania* in 1754.

This Hebrew asterism “Nabash Barih” is the IAU constellation Draco as listed by John Hill in his *Urania* in 1754.

Crookedness of Talons:

This Coptic star “Khambaliya” or “Kambalia” is Lambda (λ) Virginis in the IAU constellation Virgo. It is part of a Coptic lunar station “χαμβαλια” (“Khambalia”). In *Star Names* in 1899, R.H Allen gives the derivation as being from the Greek word “γαμψωλή” or “gampsôlê”, which Liddell and Scott identify as a variant of “γαμψότης” or “gampsotês”. The IAU approved the name Khambalia for the star Lambda (λ) Virginis A in 2017.

Cross:

This Chinese xing guan “Shízìjià” (十字架) is the IAU constellation Crux.

The French edition of John Flamsteed’s work, the *Atlas Céleste,* which was revised in 1778, lists “Croisade” as a name for Crux.

This Northern Andean asterism “Antonio Quinatoa” is a cross of stars in the IAU constellations Canis Major, Canis Minor, and Orion (Quinatoa 2018). These are the first stars to appear at dusk: Alpha (α) Canis Majoris (Sirius), Alpha (α) Canis Minoris (Procyon), Beta (β) Orionis (Rigel), and Alpha (α) Orionis (Betelgeuse).

This Macedonian asterism “Krst” is a cross laying in “the Priest’s Straw” (“Popova Slama” or “Popovʌ Slʌmʌ” - their name for the Milky Way). It is also known as the Small Cross or Priest’s Small Cross. This is a cross formed by four stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Delta (δ) Delphini, and Gamma (γ) Delphini (Cenev 2004 & 2104).

This Italian (Piedmont and Ligurian Alps) asterism “Crusiero” is the Northern Cross asterism in the IAU constellation Cygnus.

There are two Belarussian asterism “Крыж” (“Kryž” or “Kryzhe”):

- One is the Northern Cross asterism in the IAU constellation Cygnus.
- One, Kryzhe”, is the constellation Orion (Avilin 2009). It is also known as “Kigachi ragachy” (see Shaft of a Plough, below), “Kosy” (see Scythes, below), “Matawila” (see Wheel, below), “Traiko” (see Three Times, below), “Karomyselko” (see Small Yoke, below), “Grabli” (see Rake, below), “Kastsy” (see Mowers, below), “Try Karali” (see Three Kings, below), “Kasar” (see Mower, below), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, below), “Tri Siostry” (see Three Sisters, below), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Asilki” (see above), “Lisa” (see Fox, below), and “Trohkutnaia” (see With Three Corners, below).

This Sotho and Tswana asterism “Sefapano” is the IAU constellation Crux. This seems to be a relatively modern name.

R.H. Allen in his *Star-Names* in 1899 describes a cross made up of the stars of the IAU constellation Andromeda, although it more closely resembles an “L” shape as described:

- The upright is the stars Beta (β) Andromedae (Mirach), Gamma (γ) Andromedae, and Delta (δ) Andromedae, and
- The transverse is the stars Alpha (α) Andromedae (Alpheratz) and Kappa (κ) Andromedae.

This Lithuanian asterism “Kryžius” is the IAU constellation Cygnus.

There are six **telescopic** “cross” asterisms:

- One is Sánta 51 from the list of Hungarian astronomer Gabor Sánta, which is a cross of six 8 – 10th magnitude stars in the IAU constellation Pegasus including HIP 184, 185, and 190A. Its size is 14'.
- One is Sánta 78, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a group of 8th – 13th magnitude stars in the IAU constellation Eridanus. Gábor describes it as "cross-like, round".
- One is the "Cross of Draco" in the IAU constellation Draco and is on John Raymond's list of asterisms. Jeffrey Corder lists it as Corder 3536 and calls it the "Sword" (see below). The cross is made up of 8th – 9th magnitude stars and includes HIP 89943 and 89981.
- One is in the IAU constellation Centaurus and is Corder 2744 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is six 7th – 9th magnitude stars including HIP 73145, 73082, 73123, and the doubles star HIP 73195A.
- One is in the IAU constellation Cygnus and is Corder 4076 on the observing list of American astronomer Jeffrey Corder. Size 120' X 70'. This is eight 6th – 8th magnitude stars including HIP 99818, 99955, 99662, 99294, and the double stars HIP 100097A and 98946.
- One is in the IAU constellation Pegasus and is Corder 4846 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is eight 8th – 9th magnitude stars including HIP 114764 and 114723.

Cross Bar of the Well:

This Arabic asterism "Al ʻArḳuwah" is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus as listed by Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283):

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al kereb, the joining of the two cross bars of wood placed diagonally over the well, to which the bucket rope is fastened".
- R. H. Allen in his *Star Names* in 1899 lists "Al ʻArkuwah".

Cross in a Cross:

This **telescopic** asterism is the open cluster NGC 6830, found in the IAU constellation Vulpecula. This was discovered by English astronomer William Herschel in 1785 who listed it as "VII 9". It is GC 4516 in the *General Catalogue* of 1864. It is also known as the Poodle (see below). Dutch astronomer Michael Geldorp (1999) describes it as "a cross in a cross". South African astronomer Magda Streicher describes it both as a "distinctive cross shape" and in 2006 as a "letter 'X'".

Cross-Like:

This Kaykavian asterism "Krížeki" is the Northern Cross asterism in the IAU constellation Cygnus.

This Chakavian asterism "Križevâli" is the Northern Cross asterism in the IAU constellation Cygnus.

Cross of Fire:

This Palawan asterism "Urapane Lopatin" is the IAU constellation Crux. This is related to their asterisms "Stingray" (see below) and "Two Men and Two Women" (see below).

Cross of God the Father:

This Quechua asterism “Papa Dios Cruz” is made up of stars in the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Pi (π) Scorpii, and Sigma (σ) Scorpii (Urton 1981).

Cross of Jesus:

This Melkite and Nestorian asterism is the IAU constellation Delphinus as listed by R. H. Allen in his *Star Names* in 1899.

Cross of May:

This Ch’orti’ asterism is the IAU constellation Crux (Milbrath 1999).

This Inca asterism “Laja Haykuna” is the False Cross asterism made up of stars of the IAU constellations Carina and Vela (Gamarra & Gamarra 2009): Delta (δ) Velorum (Alsephina), Kappa (κ) Velorum (Markab), Epsilon (ε) Carinae (Avior) and Iota (ι) Carinae (Aspidiske).

Cross of St. Constantine:

This Sardinian asterism “issa rugs de Santu Antinu” (“Cross of St. Constantine) is the Northern Cross asterism in the IAU constellation Cygnus (Putzolu 2019). This represents the cross that appeared in a dream to the emperor Constantine before the battle of the Milvian Bridge, fought against Maxentius in 312 C.E.

Cross of St. Helena:

This German asterism “Crux cum S. Helena” is the IAU constellation Cygnus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Crux XPI cum S. Helena Al Cygnus”. It later appears in Edward Sherburne’s Sphere of Marcus Manilius and later in John Hill’s *Urania* in 1754.

Cross of the Devil:

This Ikoots asterism “Krus Nimeeč” is the False Cross asterism (see below) of stars of the IAU constellations Vela and Carina: Delta (δ) Velorum (Alsephina), Kappa (κ) Velorum (Markeb), Epsilon (ε) Carinae (Avior), and Iota (ι) Carinae (Aspidiske).

Cross of the Passion:

The stars of this Quechua asterism from Lucre are unidentified at present (Urton 1981).

Cross of the Swan:

This French asterism “la Croix du Cigne” is the Northern Cross asterism (see below) in the IAU constellation Cygnus. This appears in the French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719).

Cross One Another:

This Zulu asterism “iMpambano” or “ImPhambano” (“a group of things together”) or “iNgulube” is the belt of Orion in the IAU constellation Orion (Holbrook and Baleisis 2007).

Cross Star:

This Tzeltal asterism is the IAU constellation Orion (Milbrath 1999).

This Yucatec (of Quintana Roo) asterism “Cruz Ek” is the IAU constellation Crux (Milbrath 1999). They also call it the “cross rising over Jerusalem” or the “cross which tops the tower over Jerusalem”.

This Hungarian asterism is the IAU constellation Cygnus.

Cross Stars:

This Ikoots asterism “Krus Okas” is the Southern Cross asterism in the IAU constellation Crux.

This Tzotzil (of Zinacantán) asterism “Krus K’anal” is the IAU constellation Crux (Milbrath 1999). They identify two star crosses on either side of this as “Thieves’ Crosses” (see below).

This Spanish asterism “Cruzero Estrellas” is the IAU constellation Crux (Urton 1980).

Cross Stars of the North:

This Ikoots asterism “Krus Okas am Kalïy” is the Little Dipper asterism of the IAU constellation Ursa Minor (see Little Dipper below).

Crossbeam for Heo:

This Korean asterism “Heoleul Wihan Daedeulbo” (허를 위한 대들보) is a line of four stars in the IAU constellation Aquarius: 38 and Rho (ρ) Aquarii and HIP 110009 and 110532.

Crossbow:

This asterism is made up of stars of the IAU constellation Cepheus. Delta (δ) Cephei is the “shoulder stock”, Epsilon (ε) Cephei, Zeta (ζ) Cephei, and Lambda (λ) Cephei form the “bow arms” and 14 Cephei the “bolt tip”. Size 240’. This is Lorenzin 6 on Tom Lorenzin’s list. Bruno Alessi lists it on his BDCC 7.6 list and Jeffrey Corder lists it as Corder 4619. It is in the Saguaro Astronomy Club asterism database.

Crossing:

This Zulu asterism “Impanbana” is the belt of Orion in the IAU constellation Orion (Holt and Slotegraaf 2022). It’s rising marked the beginning of cultivation. It is also seen as dogs or wild hogs.

Crossing Shi’ra:

See Southern Shi’ra, below.

Crosswise of Centaurus:

This **telescopic** asterism “Cársia Centaúri” is the lenticular galaxy NGC 5124 in the IAU constellation Centaurus. It was discovered in 1834 by John Herschel who listed it as h 3499 and later as GC 3521 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this “refers to the half right angle between the long axes of this galaxy and its companion NGC 5126”.

Crotus:

This Greek asterism is the IAU constellation Sagittarius and is listed in John Hill’s *Urania* in 1754. Krotos or Crotus was the son of Pan in Greek mythology.

Crow:

This French asterism “Corbeau” is the IAU constellation Corvus.

This Italian asterism “Corvo” is the IAU constellation Corvus.

This asterism is the IAU constellation Corvus as listed in John Hill’s *Urania* in 1754. Hill clearly identifies it as Ptolemy’s asterism “Κόραξ” (see Raven, below). Later he gives it the name “Gorab” and “Algorab” (both Arabic names for Raven, see below), describing these names as applying to the entire constellation and not just Delta (δ) Corvi.

This Boorong asterism “War” is in the IAU constellation Carina (Stanbridge 1857, Morieson 1999, and Hamacher and Frew 2010). This is a male crow (Australian raven, Corvus coronoides). The middle of the curve of stars that form the “wings’ is the star Alpha (α) Carinae (Canopus). One wing is the stars N Carinae and HIP 32402. The other wing is HIP 29990 and 30104. War was the first to bring down fire from space (tyrille) and give it to the Boorong.

This Wotjobaluk asterism “War” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Hamacher 2011).

This Koori and Pirt-Kopan-noot star “Waa” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Dawson 1900, Matthews 1904, Clarke 2009, Hamacher 2011).

This Gunditjmara star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Clarke 2009). They see it as chasing seven young women who are cockatoo ancestors (see Cockatoos, above).

Crow Children:

This Kokatha and Ngalea asterism “Nyumbu” or “Mamu” is the IAU constellation Delphinus (Leaman, Hamacher, and Carter 2016).

Crow Mother:

This Kokatha and Ngalea star “Kangga Ngoonji” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Leaman and Hamacher 2014, Leaman, Hamacher, and Carter 2016).

Crow Star:

This Thai asterism “Dao Ka” is made up of stars in the IAU constellation Gemini (Nitiyanant 2015): Delta (δ) Geminorum, Zeta (ζ) Geminorum, Lambda (λ) Geminorum, and Epsilon (ε) Geminorum.

Crowbar Galaxy:

This **telescopic** asterism is NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as “I 176” and “I 177”. The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Hockey Stick Galaxies (see below), the Hook (see below), the Fishhook (see below), the letter “S” (see below), and the Hummingbird (see below). NOTE: It was originally thought that these were two galaxies merging. However, it is now believed that this is one tidally distorted galaxy interacting (in radio wavelengths) with NGC 4631. Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists the names “Crowbar Galaxy”, “Fish Hook Galaxy”, and “Hockey Stick Galaxy”.

Crowd of Young Women:

This Bangala asterism “lingondo nsamba” is the Pleiades Cluster in the IAU constellation Taurus (Holbrook 2020).

Crowded of Centaurus:

This **telescopic** asterism “Stipátus Centaúri” is the elliptical galaxy IC 4296 in the IAU constellation Centaurus. It was discovered by American astronomer Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because it is surrounded by other galaxies in the center of the Abell 3565 cluster

Crown:

This Greek asterism “Στέφανος” (“Stéfanos”) is the IAU constellation Corona Borealis as it was described by Ptolemy (c.100 – c.170) in his *Almagest*. It is also listed as a Greek lunar mansion in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as “Corona Borealis or Australis”.

This Arabic asterism “’iiklil” or “Iklil”, latinized to “Iclil” or “Al Iclil”, is the IAU constellation Corona Borealis:

- Corona Borealis was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) as “al-Iklīl al-Shamālī” and “al-Fakka”.
- Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed this constellation as “’iiklil” or “Iklil”.
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “Iklil shamāli” and the Hebrew name “nezer sefoni” for Alpha (α) Coronae Borealis (Alphecca).
- Johann Bayer’s *Uranometria* (1603) lists “Acliluschemali” and attributes it to Albumasar.
- “Iclil” and “Al Iclil” are listed in John Hill’s *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Iklil al Jebhah, the crown of the brow”.
- R. H. Allen writes in his *Star Names* in 1899 that the earlier Arabic name was “Al Iklil al Shamāliyyah”, which got latinized to “Acliluschemali” and “Aclushemali”.
- W. Brennand lists this as “Au-Iclil, the Northern Crown” in his *Hindu Astronomy* in 1896.
- Compare this to their manzil Crown of the Forehead (below).

This asterism “Comis” was made up of the stars of the IAU constellations Lupus and Centaurus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It depicts a jeweled crown.

There are two Belarussian asterisms called “Karona”:

- One is the IAU constellation Corona Borealis. This is supposed to be the crown of Jesus.
- The other, also known as “Litwa” (see Gem, below) or “Blizniuki” (see Twins, below) is the IAU constellation Gemini. The stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) symbolized the Great Lithuanian Princedom and the Polish Kingdom.

This English asterism “Corona” is the IAU constellation Corona Borealis. English astronomer Richard Anthony Proctor gave the name “Corona, the Northern Crown” in 1873 as he believed that shortening the name would make more room on astronomical charts. “Corona” is listed in Proctor’s *A New Star Atlas* (1887) as an official constellation “recognized in the catalogue of the British Association”.

This Arabic and Persian asterism "Al Tāj" ('the crown" or "the tiara") is the stars Omicron (o) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis in the IAU constellation Orion:

- "Tāj al-Jauzā'" ("crown of al-Jauzā'" is a curve of the stars Pi (π) 1, 2, 3, 4, 5, and 6 Orionis in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Al Tāj" according to the 16th century Arabic astronomer Al Tizini is the stars Omicron (o) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis .
- "Al Tāj" is listed in R. H. Allen's *Star Names* in 1899.

This Coptic lunar station "Stephani" is the stars Delta (δ) Scorpii, Beta (β) Scorpii (Acrab), and Pi (π) Scorpii in the IAU constellation Scorpius as listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as "Corona". R. H. Allen listed it in his *Star Names* in 1899.

This asterism is the IAU constellation Lyra as represented on two Islamicate celestial globes, described by Savage-Smith and Belloli (pg. 144-46 & fig. 55 https://repository.si.edu/handle/10088/2445).

This Filipino (Mayayaw Ifugao) asterism "Nahiki'hig" or "Ni'pugot" is the IAU constellation Corona Australis (Masong 2017).

There are two Belarussian asterisms named "Korona", "Koruna", or "Koronka":

- One is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009, 2018).
- One is the IAU constellation Gemini (Avilin 2009).

There are four **telescopic** "crown" asterisms:

- One is in the IAU constellation Ursa Major, 2 degrees west of Beta (β) Ursae Majoris (Merak). It is an oval of 9th magnitude stars resembling a small crown or tiara with the "jewel" being the 7th magnitude star HIP 53036 and the "crown" including HIP 53061 and 53042.
- One is Vastagh 11, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Andromeda. Its apparent diameter is 22'. Vastagh describes it as "Six bright stars draw a circular arc that is not completely closed… In the center of the resulting crown, or letter 'C', a few faint stars can be seen in a group. The [asterism] contains a total of 17 stars."
- One is in the IAU constellation Hydra and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 1750. Size80' X 45'. It is also known as the Flower Vase (see below). Corder describes this as a "pretty rich collection of at least 16 stars between magnitudes 7.5 and 9.5… elongated north/south, although most of the stars are in a curving chain that is nearly "S" shaped. The double star HIP 44584A is near the center. The "base" of the vase or crown is HP 44476 and 44316. The top of the vase or crown is HIP 44622 and 44594.
- One is in the IAU constellation Sagittarius and is Corder 3977 on the observing list of American astronomer Jeffrey Corder. Size 25'.

Crown Jewel:

This Latin star "Gemma Coronae" is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis. R. H. Allen suggests in his *Star Names* in 1899 that this may have come from the 1st century B.C.E. Roman poet Ovid's asterism Nine Precious Stones (see below). "Gemma seu margarita

Coronae" ("the jewel or pearl of the crown") is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Gemma". Compare this to "Gem", below.

Crown of Al-Jawza:

See Hair Braids of Al-Jawza, below.

Crown of Anu:

This Babylonian asterism "AGA dA-nim" (Anthony 1996) is not clearly identified. Anu is related to the IAU constellation Taurus, and it has been suggested by Berio (2014) that this asterism is Corona Australis as it resembles the curved horns of a bull. Taurus rises as Corona Australis sets (Berio 2014)

Crown of Cassiopeia:

This **telescopic** asterism is made up of stars of the IAU constellation Cassiopeia. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes the star Zeta (ζ) Cassiopeiae as the Cassiopeia's head and describes "a singular and brilliant array of stars near it in a broken half circle, which may suggest the notion of a crown". This appears to be the stars HIP 2854, HIP 2782, HIP 2697, HD 232222, HIP 2795, and HIP 2890.

Crown of Cressa:

This Latin asterism "Corona Cressa" is the IAU constellation Corona Borealis.

Crown of Dapi'chi:

This Toba asterism "Nolo'pa" is stars near the Pleiades cluster in the IAU constellation Taurus (Gómez 2011) and is related to their asterism Dapi'chi (see below).

Crown of Esther:

This German asterism is the IAU constellation Corona Borealis as described by German poet Philipp von Zesen (1619 – 1689), who described it as the crown of Ahasuersus, the Biblical King of Persia, placed on Esther's head.

Crown of Firmiana:

This Austrian asterism "Corona Firmiana" is the IAU constellation Corona Borealis and was created in 1730 to honor the Archbishop of Salzburg in the atlas *Mercurii Philosophicii Firmamentum Descriptionem et Cum Globi Artificialis Coelestis* by Benedictine Monk Corinianus Thomas, a professor of mathematics and theology at the university there. The constellation resembles the stag's antlers that are on the coat of arms of this family.

Crown of Guossia:

This asterism "Corona Guossia" is in the IAU constellation Cygnus and is listed in Edward Sherburne's Sphere of Marcus Manilius in 1675 as being "in the beak and tail of the swan". It is not mentioned elsewhere in Sherburne's text. "Corona Gnosia" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. I believe that this is a reference to NGC 7000, the North America Nebula, a 4th magnitude HII region which is located next to the star Alpha (α) Cygni (Deneb).

Crown of the Forehead:

This Arabic and Bedouin manzil "Al-Ikleel", "ʾAl-Iklīl" (ٱلْإِكْلِيل), or "ʾAl-Iklīlu ʾl-Jab'hah" (ٱلْإِكْلِيلُ ٱلْجَبْهَة), or "Iklīl al Jabhah" (إكليل الجبهة), translated as "ornamented headband", "diadem", or "crown of the forehead", is in the IAU constellation Scorpius and is the stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii (Dschubba), and Pi (π) Scorpii:

- Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) listed it as the stars Theta (θ), Kappa (κ) and 42 Librae (Hafez 2010).
- This was later latinized to "Iklil" or "Iolil".
- Dorn lists this as the "Diadem" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists the name "Alielil" for Beta (β) Scorpii (Dekker 2000).
- The IAU identifies the stars of this asterism as Rho (ρ) Scorpii, Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Pi (π) Scorpii, and possibly Nu (ν) Scorpii.
- Dorn (1829) attributes the addition of the star Nu (ν) Scorpii to Ulugh Beg Mirza (1394 – 1449).
- Robert Hues (1659) lists it as "Alachil Algenubi".
- German poet Philip von Zesen (1619 – 1689) as "Aladil Algenubi".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) as "Elkeil Elgenubi
- John Chilmead (1899) list it as "Alachil Algenubi"
- The IAU approved the name Iklil for Rho (ρ) Scorpii Aa.
- NOTE: This asterism is the IAU constellation Aquila as listed in John Hill's *Urania* in 1754 to which he assigns the name "Alkale": He describes it as "one of the Arabic names of that constellation, and it signifies torment". The Arabic name for Aquila is "Alnasr". However, this does seem to match the Arabic asterism Crown of the Forehead, so this is probably where Hill got this name. Compare this to Crown (above).

This Yemeni manzil "Iklīl" is the stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii in the IAU constellation Scorpius (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Crown of Gnosida:

This Latin asterism "Corona Gnosida" or "Gnossis" is the IAU constellation Corona Borealis. This is a reference to Ariadne's birthplace of Gnosos. Compare this to Gnosia Star of Corona (below). "Corona Gnosia" is listed as a name for Corona Borealis on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

"Corona Gnosia" and "Corona Septentrionalis" ("northern crown") are listed as names for Corona Borealis in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and he depicts it as a laurel wreath.

Crown of Heaven:

This Akkadian star "Dayan Esiru" ("prospering judge" or "crown of heaven") is Alpha (α) Draconis (Thuban) in the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899.

This Latin asterism “Diadema Coeli” is the IAU constellation Corona Borealis.

Crown of Sagittarius:

See Golden Crown of Sagittarius, below.

Crown of the Scorpion:

This Arabic star “iklīl al-ʿaqrab” or “Iklīl al ʿAḳrab” is Delta (δ) Scorpii (Dschubba) in the IAU constellation Scorpius:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Aakràb genubi”.
- This was later latinized to “Iclarkrau” in the *Palermo Catalogue* of Giuseppe Piazzi (1786 – 1846).

Crown of Thorns:

This German asterism is the IAU constellation Corona Borealis and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 labels it “Corona XPI Sps”. German poet Philipp von Zesen (1619 – 1689) also listed this name for this constellation. Edward Sherburne lists it as “Saviour’s Crown of Thorns” in his *Sphere of Marcus Manilius* in 1675. It later appears as “Crown of Thorns” in John Hill’s *Urania* in 1754.

Crown of Vulcan:

This Latin asterism is the IAU constellation Corona Borealis. Johann Bayer’s *Uranometria* (1603) lists “Corona Vulcani” as a name for Corona Borealis. “Corona Vulcani” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who attributes it to “the ancients”.

Crown Prince:

This name was earlier given by the Chinese to a pole star listed during the Shang Dynasty (1600 – 1027 B.C.E.). Alpha (α) Ursae Minoris (Polaris) was NOT the pole star at that time (due to precession). Possible stars proposed for this pole star include i Draconis, 42 Draconis, or 184 Draconis, or Beta (β) Ursae Minoris (Kochab), but it is possible that this was something carried over from as early as 3000 B.C.E., so it is difficult to pin down the exact star.

There are three stars from the Three Kingdoms to the Ming Dynasty era with this name “Tàizǐ” (太子):

- One is the star Sigma (σ) Scorpii in the IAU constellation Scorpius and is part of their xing guan Heart (see below).
- One is the star 93 Leo in the IAU constellation Leo. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.
- One is the star Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor.

There are three Chinese Chenzhuo xing guans called “Tàizǐ”:

- One is the star Sigma (σ) Scorpii in the IAU constellation Scorpius.
- One is the star 93 Leonis in the IAU constellation Leo.

- One is the star Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor. It is part of their xing guan “Northern Pole”.

This Japanese star is the star Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor. This name comes from the ceiling art in the Takamatsu Zuka Kofun tomb.

Crown Without Honour:

This Latin asterism “Corona sine Honore” is the IAU constellation Corona Australis as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.), who got this from an interpretation of the Aratus’ *Phaenomena* (c. 270 B.C.E.).

Crowned Bull’s Head:

This asterism was made up of stars of the IAU constellation Carina by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This is labeled with a word beginning with the letter “M” but the rest of the label is unintelligible in the JPEG of this chart that I was examining. It is depicted as a bull’s head facing us with a very large gold ring in its nose and a gold crown on its head.

Crowned Face:

This **telescopic** asterism is the star cloud NGC 6682 in the IAU constellation Scutum and is Ennis 88 in the asterism list of Canadian astronomer Charles Ennis, who discovered it in July 2025. English astronomer John Herschel first recorded it in 1827. The cloud forms a face in right profile with an “eye” a dark patch by the star HIP 91337 and a “nose” a triangular mass of stars by the star HIP 91386. The bottom of the “ear” is the star HIP 91598 with the top being HIP 172316: The “ear” is a cloud of stars between them and extending slightly beyond them. The “crown” is the oval of stars starting at HD 172202 and running around through Gaia DR 3 4256965601505260160, Gaia DR3 4256868844485573620, HIP 91215, HD 171687, HIP 91272, SAO 142434, and Gaia DR3 4256960378824538880. Size 50’.

Crowned of Ursa Major:

This **telescopic** asterism “Coronáta Úrsae Majóris” is the barred lenticular galaxy NGC 3945 in the IAU constellation Ursa Major. It was discovered in 1790 by William Herschel who listed it as “I 251”. It became GC 2602 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “the beautiful outer ring”.

Crowned with Dust of Virgo:

This **telescopic** asterism “Pulvericoronáta Virginis” is the lenticular galaxy NGC 4429 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 65”. It became GC 2987 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the “small dusty ring around the nucleus”.

Crow's Neck:

This Persian star "únuq al-ghuraab" or "Unuk al Ghyrab" (عنق ألغراب), latinized to "Al Unuḳ al Ghurāb" is Beta (β) Aquilae in the IAU constellation Aquila as listed in the 17th century *Calendarium* of Al Achsasi al Mouakket.

This Latin star "Collum Corvi" is Beta (β) Aquilae in the IAU constellation Aquila.

Crow's Nest:

This **telescopic** asterism is the open cluster NGC 1647 in the IAU constellation Taurus. It was discovered by William Herschel in 1784 who listed it as "VIII 8" in his catalogue. It is GC 896 in the *General Catalogue* of 1864. It is O'Meara 25 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the Pirate Moon (see below). South African astronomer Auke Slotegraaf (2018) lists it under the name "Crow's Nest Cluster".

Croziers:

This English asterism is four stars in the IAU constellation Centaurus: Epsilon (ε), Zeta (ζ), Nu (ν), and Xi (ξ) 2 Centauri. English astronomer Edmond Halley (1656 – 1742) listed these as the four "Dictis a nautis Croziers" ('croziers as remarked by the sailors") according to R. H. Allen in his *Star Names* in 1899.

This French asterism is the IAU constellation Crux. When the Jesuit mathematician Guy Tachard (1651 – 1712) went to the Cape of Good Hope in 1685 and set up a temporary observatory, he used the name "the Crozier" in reference to this constellation (Moore 1994)

Crucifix Cluster:

This **telescopic** asterism is the globular cluster Messier 107 (NGC 6171) in the IAU constellation Ophiuchus. It was discovered by French astronomer Pierre Méchain in 1782, then independently by English astronomer William Herschel in 1792. John Herschel listed it in his 1864 *General Catalogue* as GC 4211 and in his other catalogue as h 3637, but it was RASC astronomer Helen Sawyer Hogg that added it to the modern catalogue in 1947.

Cruciform Cluster:

This **telescopic** asterism is the open cluster Melotte 49, which is found within the emission nebula and open cluster NGC 2264 (the Cone Nebula) in Monoceros. It was discovered by English astronomer William Herschel in 1784 who listed it as "V 27" and "VII 5" in his catalogue. It is GC 1440 in the *General Catalogue* of 1864. It was given this name in *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns. It is also known as the Christmas Tree Cluster.

Crumbs of Camelopardalis:

This **telescopic** asterism "Micárium Camelopardális" is the intermediate spiral galaxy NGC 2403 (Caldwell 7) in the IAU constellation Camelopardalis. It was discovered in 1788 by William Herschel who listed it as "V 44". It became GC 1541 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the "mixture of HII regions with this galaxy…[which] look like an accumulation of light speckles".

Crusade:

This Chinese star “Fa” from the Three Kingdoms to the Ming Dynasty is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Fa” is the star Delta (δ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Crustacean:

This Myanmar asterism “Pucwan Tārā” (ပုဇွန် တာရာ) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above).

Crux:

These stars appear in 298 of the asterisms of the sky cultures of the world.

This is the IAU constellation Crux (IAU abbreviation Cru). Ptolemy (c.100 – c.170) included the stars of Crux in the IAU constellation Centaurus, but Pliny the Elder (24 – 79) recognized it as the asterism “θρόνος καισάριος” (“Thronos Caesaris” or “Caesar’s Throne”) in honour of the emperor Augustus in his *Naturalis Historia*. Venetian navigator Alvise Cadamosto made note of the stars of the Southern Cross in 1455, but the first accurate record of them is believed to be that of Portuguese navigator João Faras in 1500, who called it “The Guards” (“Las Guardas” or “Os Guarsas”- see below).

Italian explorer Antonio Pigafetta (1480 – 1531), one of Magellan’s companions, called this constellation “El Crucero”.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Crux as a crucifix.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Crux as a crucifix, but it is not labelled on this chart.

English uranographer Emery Molyneux (d. 1598), and Flemish uranographer Petrus Plancius (1522 – 1662) placed Crux on their globes of the sky in 1592, creating Crux from the stars in the hind legs of Ptolemy’s constellation Centaurus.

Flemish cartographer Jodocus Hondius (1563 – 1612) included Crux on his globe in 1598, labelling it “Cruzero”.

Dutch navigator Frederick de Houtman’s catalogue of fixed stars (1603) lists this constellation as “De Cruzeiro”.

Crux was included in Bayer’s *Uranometria* (1603) and in the same year Dutch navigator Frederick de Houtman (1571 – 1627) first catalogued it separately from Centaurus.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “El Crusero Hispanis” as a cross.

“Crux” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who also gives the Spanish name “Cruzero”.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this “Cruzero” and “Pedes Se Tauris” and depicts it as a crucifix.

Robert Hues listed this constellation as “Crusiers” in his *A Learned Treatise of Globes* in 1659 and also gave the Spanish name “Crusero”.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Cruzero”.

“Crusiers” and “Crosers” are listed by Rear Admiral Sir. John Narborough (1640 - 1688).

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this constellation “El Crusero”.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, and his *Firmamentum Sobiescianum sive Uranographia* (1690) lists “Crux” and depicts it as a cross.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation “Crux Hisp Crucero”.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Crux but does not label it.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Crux” as a crucifix.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Crux as a crucifix.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “le Croix du Sud” as a crucifix.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Cruzero” as a crucifix.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Crucero” as a crucifix.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Croizade” as a crucifix on the southern hemisphere chart and on a later closeup chart as “la Croix du Sud”.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Creutz” on some charts and “Sūdl Creutz” on others and depicts it as a crucifix.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Crucero” as a cross.

Crux is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Tkruis”: It is depicted as a cross.

American uranographer William Croswell (1760 – 1834) depicts “Crux the Cross” on his *Mercator Map of the Starry Heavens* in 1810 as a cross.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Crux the Cross" as a cross.

"Crux" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Crux" as a crucifix.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on their charts as "Southern Cross".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Crux, The Cross" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Crux" and describes it as the "Cross".

"Crusero" is listed by John Chilmead in 1899 "Crosiers" (by English astronomer Edmund Halley (1656 – 1742)), "Cruzero" (by Portuguese naturalist Cristoval d'Acosta).

In his *Star Names* in 1899, R. H. Allen cites English alchemist and translator Richard Eden (c.1520 – 1576) as naming them the "Cross Stars".

German astronomers call it "Kreuz" and the Italians "Cruce". and the French now call it "Croix", but an earlier French name "Crossiers" ("crossers") has been applied to this constellation,Standard IAU charts depict Crux as a cross made up of the stars Alpha (α) 1 Crucis (Acrux), Beta (β) Crucis (Mimosa), Gamma (γ) Crucis, and Delta (δ) Crucis.

In the 4th millennium B.C.E. Crux would have been visible in northern latitudes but by 400 C.E. they would not have risen above the horizon for most of Europe.

Cryer:

The IAU constellation Boötes has been described with the Latin asterisms "Clamator" ("cryer"), "Clamans" ("crying"), and "Plorans" ("weeping"). This was because some early translators thought the name of this constellation was derived from the old Greek word "Βοητής" or "Voitís" ("clamourous"), transcribed as "Boetes", and believed this to refer to the shouts of a herdsman to his oxen:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Clamator" and "Vociferator" as alternate names for Boötes.
- Johann Bayer's *Uranometria* (1603) lists "Clamator", "Vociferator", and "Plorans" as alternate names for this constellation.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "clamans clamator" ("crying cryer") for Boötes.
- Robert Hues lists it as "Clamator" and "Vociferator" in his *A Learned Treatise of Globes* in 1659
- "Clamator" and "Vociferator" are listed by English Admiral Henry William Smyth in his *Bedford Catalogue* in 1844. Smyth also lists "Plorans". Variations include Loud Weeper. Compare this to Shouter, below.

This Polish asterism "Przyczck" is the IAU constellation Boötes.

Crying:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Capricornus: Zeta (ζ) Capricorni (the determinative star) and b Capricorni.

This Chinese xing guan "Kū" (哭) is a line of two stars in the IAU constellation Aquarius: Epsilon (ε) and Mu (μ) Aquarii.

This Chinese Chenzhuo xing guan "Kū" is a line of two stars in the IAU constellation Capricornus: Delta (δ) and Gamma (γ) Capricorni.

Crying Children:

This Salish asterism is the Pleiades cluster in the IAU constellation Taurus.

Crystal Ball Nebula:

This **telescopic** asterism is planetary nebula NGC 1514 in the IAU constellation Taurus. It was discovered by English astronomer William Herschel in 1790 who listed it in his catalogue as "IV 69". It is GC 810 in the *General Catalogue* of 1864. David Knisely of the Prairie Astronomy Club wrote "I like to call NGC 1514 'the Crystal Ball Nebula' as it reminds me of one". It is also known as the Pansy Nebula. RASC member Frankie Sowa posted on Facebook 2023 December 23 that it "looks like a monkey's face". Size 2.2' X 2.2'.

Crystals:

This Thai star "Kaewkosin" is the red dwarf star GJ 3470 in the IAU constellation Cancer. Kaewkosin (แก้วโกสินทร์) refers to the crystals of the Hindu deity Indra. It received this name in the IAU's NameExoWorlds competition in 2022. It is It has an exoplanet GJ 3470b, "Phailinsiam" (ไพลินสยาม), which is the Thai term for the blue "Siamese Sapphire", alluding to the detection of Rayleigh scattering in the planet's atmosphere suggestive of blue skies.

Cú Chulainn:

This Celtic (Irish) asterism is the IAU constellation Canis Major (Mosenkis, N/K date). Cú Chulainn was a warrior hero whose name means "hound of Culann". Cú Chulainn was invited to Culann's feast, but Culann forgot and left his guard dog out. Cú Chulainn arrived and had to slay Culann's hound in self-defense and offered to take over the task of guarding Culann's holding in reparation, which is how he got this name.

In *The Myth of the Year*, Benigni, Carter and Ua Cuinn (2003) connect the Irish Celtic warrior hero to the IAU constellation Orion. The three stars of Orion's belt are heads of his enemies, and his hounds (Canis Major and Canis Minor) are accompanying him. This asterism is also found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015).

Cú Chulainn and Ferdiad Forever Friends:

This Irish asterism is the IAU constellation Gemini. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). Ferdiad was a warrior of Connacht in the Ulster Cycle of Irish mythology.

Cú Roí:

This Celtic (Irish) asterism is the IAU constellation Canis Minor (Mosenkis, date N/K). Cú Roí, whose name means 'hound of the plain/field" who appears in several Irish texts and is depicted as a challenger of Cú Chulainn. Compare this to Hound, below.

Cube:

This Estonian asterism "Kubel" is made up of stars of the IAU constellation Cepheus: Alpha () Cephei (Alderamin), Zeta () Cephei, Iota () Cephei, and Beta () Cephei (Alfirk). It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.

Cubeccos:

This Celtic (Gaulish) star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Boutet 2017).

Cubit of the Nile:

This Coptic lunar mansion "Pi-Mahi" is the stars Gamma (γ) and Delta (δ) Cancri in the IAU constellation Cancer. Compare this to the Arabic and Bedouin manzil "Al-Nuthrah (see Tip of the Nose of the Lion, below).W. B. Yeats listed it in *A Vision* in 1917, taking this from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, where it was described as "cubitus Leonis" ("Leo's elbows") and "cubutis (Nili)" ("elbow of the Nile"). Compare this to Elbow of the Nile, below.

Cucumber of Ursa Major:

This **telescopic** asterism "Cúcumis Úrsae Majóris" is the edge-on barred spiral galaxy NGC 4010 in the IAU constellation Ursa Major. It was discovered in 1830 by John Herschel who listed it as h 1040 and later as GC 2651 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Cudgel Bearer:

This Greek asterism "Κορυνήτης" ("Korynítis") or "Κορυνηφόρος" ("Korynifóros"), which translates as "club bearer" or "cudgel bearer" is the IAU constellation Hercules:

- Variations include "Korneforos" and "Korenephoros".
- American uranographer Elijah Burritt (1794 – 1838) listed it as "Kornephorus".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Korneforos" for Beta (β) Herculis.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Beta (β) Herculis as "Korneforus".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Kornephoros" for this star.
- The IAU approved the name Kornephoros for the star Beta (β) Herculis Aa.

This Latin asterism "Clavator" or "Claviger" is the IAU constellation Hercules as listed by Edward Sherburne in his *Sphere of Marcus Manlius* in 1675.

Cudgels:

This Bulgarian asterism is a five-sided figure in the IAU constellation Orion. It starts at Nu (ν) Orionis and runs around through Xi (ξ) Orionis, 69 Orionis, Chi (χ) 2 and Chi (χ) 1 Orionis. This is also known as Orion's Cudgel (see below), Grandmother's Cudgels (see below) and the Bent Stick (see above).

Cujam:

See Club, above.

Cultivation Area:

This Inca asterism "Chacra" is the IAU constellation Orion (Gamarra & Gamarra 2009). Bucur (2022) lists it as "farm".

Cumaros:

This Celtic (Gaulish) star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Boutet 2017).

Cumulative Corpse Gas:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty located inside their lunar mansion Ghosts (see below) is the Beehive Cluster, Messier 44 (see Beehive, above). It later became Cumulative Corpses (see below).

Cumulative Corpses:

This Chinese xing guan "Jīshī" (积尸), located inside their lunar mansion Ghosts (see below) is the Beehive Cluster, Messier 44 (see Beehive, above). In earlier Chinese sky lore it was known as Cumulative Corpse Gas (see above).

This Chinese Chenzhuo xing guan "Jishi" is the open cluster Messier 44 (NGC 2632) in the IAU constellation Cancer. It is inside their xing guan Cabin Ghosts.

Cup:

This Arabic star "al-Ka's" (الكأس) or "Al Kās", later latinized to "Alkes", is Alpha (α) Crateris in the IAU constellation Crater":

- Other variations include "Alkis", "Alker", or "Alhas" and "Alhes" (in the 15th century *Alfonsine Tables*- Kunitzsch 1986).
- Johann Bayer's *Uranometria* (1603) lists "Alhes", "Alkes", and "Alches".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Elkes", "Alches", and "Alkaso".
- Robert Hues lists it as "Elkis" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists it in his *Urania* in 1754 as "Alkas".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alkes".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Alkes…the shallow basin".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alkes".

- In his *Star Names* in 1899, R. H. Allen translates it as “shallow basin” and states that it was originally a name for the entire constellation but goes on to say that it is “generally applied to the star α”.
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list “Alkes” for this star.
- The IAU approved the name Alkes for the star Alpha (α) Crateris.

This Hebrew asterism “כוס”, listed in medieval manuscripts as “Kus” or “Kos” or “Cyathus”, is the IAU constellation Crater. John Hill lists it as “Kos” and “Kus” in his *Urania* in 1754 but translates it as “glass”. R. H. Allen lists it as “Cōs” in his *Star Names* in 1899.

This French asterism “Coupe” is the IAU constellation Crater.

This Latin asterism “Calix” or “Poculum” (“cup”) or “Scyphus” (“the cup”) is the IAU constellation Crater. The Romans made this the cup of Apollo, Bacchus, Hercules, Achilles, Dido, Demophoön, and Medea.

- Johann Bayer’s *Uranometria* (1603) lists “Calix” and “Poculum”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Calix” and “Poculum” as alternate names for Crater.

This English asterism is the IAU constellation Crater as listed in John Hill’s *Urania* in 1754.

This German asterism “Becher” is the IAU constellation Crater as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Belarussian asterism “Chasha” is the IAU constellation Ursa Major (Avilin 2009).

This Estonian asterism “Karjus” is the IAU constellation Boötes and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

This asterism is the IAU constellation Capricorn as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

There are two **telescopic** “Cup” asterisms:

- One is Sánta 94, listed in 2007 by Hungarian astronomer Sánta Gábor, is a curve of 9th – 13th magnitude stars in the IAU constellation Taurus. Gábor describes it as “nice cup form asterism.
- One is “Cýathus Cassiopéiae” (“Cup of Cassiopeia”), the interacting galaxies PGC 3183 in the IAU constellation Cassiopeia. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Cup and Spoon:

This **telescopic** asterism is Vastagh 9, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cygnus. Its apparent diameter is 38’. Vastagh describes this as “Eight bright stars pattern a cup shape. Next to the cup is a small spoon, courtesy of three bright stars… a total of almost 50 stars are visible. The sugar in the cup must have spilled… A single red star is visible on the left wall of the cup. his could mean the sample, on drinking suitability.” NOTE: Vastagh observed this on his birthday in 2009, 20 July.

Cup Bearer:

This French asterism "Pocillator" is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Cup of Christ's Passion:

This German asterism is the IAU constellation Crater as described by German poet Philipp von Zesen (1619 – 1689).

Cupped Hand:

This K'iche' asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Milbrath 1999).

Cupunika:

This Vedic star from the *Taittiriya Brahmana* is 19 Tauri (Taygeta) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, below).NOTE: Leitz listed 7 Vedic names of stars in Krttika and then a corresponding list of only 6 modern names. I'm making an educated guess that this last star on his list is Taygeta.

Curassow Bird:

This Carib asterism "Wokoyuman" or "Woko" is made up of stars of the IAU constellation Crux. The southern cross asterism represents a Paui bird resting in a tree (Magaña, and Jara, 1982).

Curl of Cetus:

This **telescopic** asterism "Cincínnus Céti" is the barred spiral galaxy NGC 945 in the IAU constellation Cetus. It was discovered in 1785 by William Herschel who listed it as "II 487". It became GC 547 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its "gracefully curved arms".

Curls:

This Latin star "Cirros" or "Cirrus" ("curls" or "forelock") is Alpha (α) Cancri (Acubens) in the IAU constellation Cancer as listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*. This suggests a connection with the Arabic asterism Lion (see below) as this is situated where that part of their asterism would be.

Curls of Lynx:

This **telescopic** asterism "Cirrátus Lýncis" is the barred spiral galaxy NGC 2543 (IC 2232) in the IAU constellation Lynx. This was discovered in 1788 by William Herschel who listed it as "II 719" and appeared as GC 1633 in the General Catalogue of 1864, subsequently being catalogued as NGC 2543. French astronomer Stéphane Javelle observed it in 1896 and catalogued it as IC 2232. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its "low surface brightness and faint absolute magnitude".

Curly One of Virgo:

This **telescopic** asterism “Cincinnáta Vírginis” is the interacting spiral galaxy NGC 5300 in the IAU constellation Virgo. William Herschel listed this as “II 533”. John Herschel listed this as h 1669 and later as GC 3655 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the many curled spiral arms at the eastern side”.

Cursa:

See Footstool of Al-Jawza, below.

Curve:

This Suku Bali asterism “Bengkongor” is the IAU constellation Aries.

Curved:

This Latin asterism “Curvus” is the IAU constellation Delphinus as described by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.). German astronomer Johann Bayer (1572-1625) listed the name “Currus” (“chariot”), but this is believed to be a typographical error, because Bayer also explained “Ciceroni ob gibbum in dorso” (“Cicero because of the hump in the back”).

This Kiribati star “Rabi” is an unidentified star in the IAU constellation Auriga (Trussel and Groves 1978).

Curved Array:

This Chinese xing guan “Gōuchén” (勾陈) is a line of stars in the IAU constellation Ursa Minor. The line roughly forms the shape of a question mark or a “dipper” with the dipper at the Polaris end of Ursa Minor: HIP 113116, 2 Ursae Minoris, Alpha (α) Ursae Minoris (Polaris), Delta (δ) Ursae Minoris, Epsilon (ε) Ursae Minoris, and Zeta (ζ) Ursae Minoris. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Gōuchén” is a hooked line of stars in the IAU constellations Cepheus and Ursa Minor: Starting at Zeta (ζ) Ursa Minoris it runs through Epsilon (ε) Ursae Minoris, Delta (δ) Ursae Minoris, Alpha (α) Ursae Minoris (Polaris), and HIP 16489 to HIP 4283.

Curved Arrow:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is an arrow with a curved shaft found in the constellation Coma Berenices 1.5 degrees south of the star 35 Comae Berenices. Three stars (HIP 62769, 62724 and 62783A) form the triangular arrowhead and the curving line of stars that form the “shaft” include the stars HIP 62904, 63043, and 63068. Size 120’ X 70’.

Curved Knife:

This **telescopic** asterism is the cluster Berkeley 82 in the IAU constellation Aquila. Size 4’ X 4’. René Merting describes it on the *Faint Fuzzies* website: “At 40X… the brightest members form a crooked line, which with a little imagination resembles a curved knife.”

Curved of Capricornus:

This **telescopic** asterism “Curvátus Capricórni” is the grand design spiral galaxy NGC 6907 in the IAU constellation Capricornus. It was discovered by English astronomer William Herschel in July 1784 who listed it as “III 141”. It is GC 4573 in the *General Catalogue* of 1864. This name appears in *The Catalogue*

of One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the S-shaped curve of this galaxy".

Curved of Virgo:

This **telescopic** asterism "Scólius Vírginis" is the barred spiral galaxy NGC 4241 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as "III 480". It became GC 2829 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the lack of active star formation. NOTE: This was also observed by German astronomer Arnold Schwassmann in 1899 and entered in the Index Catalogue as IC 3115.

Curved Staff of Cancer:

This **telescopic** asterism "Lítuus Cáncri" is the spiral galaxy IC 2421 in the IAU constellation Puppis. It was discovered by Stéphane Javelle in 1896. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the elegant widening spiral arms have almost exactly the form of the mathematical lituus curve, a kind of Archimedean spiral".

Curving Cascade:

There are seven "curving cascade" asterisms:

- One is in the IAU constellation Leo Minor and is Corder 2061 on the observing list of American astronomer Jeffrey Corder. Size 480'. This starts at 44 Leonis Minoris and runs through 43, 42, RX, and 37 Leonis Minoris, ending at 33 Leonis Minoris.
- This asterism is in the IAU constellation Lupus and is Corder 2890 on the observing list of American astronomer Jeffrey Corder. Size 420' X 240'. This is eight stars including d, e, g, k1, Lambda (λ), Pi (π) and Epsilon (ε) Lupi and HIP 76397.
- This asterism One is in the IAU constellation Ophiuchus and is Corder 3261 on the observing list of American astronomer Jeffrey Corder. Size 240' X 40'. This is 36, 44, 51, and Theta (θ) Ophiuchi.
- One is in the IAU constellation Vulpecula and is Corder 4231 on the observing list of American astronomer Jeffrey Corder. Size 420' X 90'. This is 28, 29, 30, 31, and 32 Vulpeculae.
- One is in the IAU constellation Capricornus and is Corder 4419 on the observing list of American astronomer Jeffrey Corder. Size 125' X 25'. This is five 3rd – 5th magnitude stars including 33, 35, 36, and Zeta (ζ) Capricorni and HIP 105853.
- One is in the IAU constellation Aquarius and is Corder 4898 on the observing list of American astronomer Jeffrey Corder. Size 140' X 30'. This is four 3rd – 6th magnitude stars including 98, 99, 100, and 101 Aquarii.

There are 296 **telescopic** "curving cascade" asterisms:

- One is the open cluster NGC 1790 in the IAU constellation Auriga. René Merting describes it on the Faint Fuzzies website: "A star trail leads westwards from a medium-bright star, it is slightly curved towards the north - the brightness increases slightly towards the northwest - overall it is hardly noticeable".

- One is Sánta 146, listed in 2009 by Hungarian astronomer Sánta Gábor, which is described by Gábor as "a dense curve of stars, 9 – 13 [magnitude] along NNW – SSW… at the W end of Sánta 6". This is in the IAU constellation Gemini and includes the star HD 252102.
- One is Sánta 71, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "tiny curve of 10 – 11 [stars]" in the IAU constellation Canis Major. Hungarian astronomer Gábor János Kernya lists this as Kernya 33. This includes Gaia DR3 3044491901400313600, Gaia DR3 3044491248568251904, Gaia DR3 3044489702376965376, and Gaia DR3 3044474618451871872.
- One is Sánta 139, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "nice curve" in the IAU constellation Libra. Includes Gaia DR3 4418422527447054208, HIP 74106, Gaia DR3 4418425001348218112, HD 134135.
- One is Sánta 135, listed in 2008 by Hungarian astronomer Sánta Gábor, which is described by Gábor as an "arc of 6 stars, 7 – 10 [magnitude]" in the IAU constellation Aquarius: HD 220605, HD 220533, HIP 115526, HIP 115505.
- One is Cseh 4, listed in the asterism list of Hungarian astronomer Viktor Cseh, which is in the IAU constellation Ursa Major. It is described as "a small cascade formed by 9 – 10 magnitude stars, approximately 30 arcminutes long: Gaia DR3 1709526008921904384, SAO 2721, SAO 2725, SAO 2729, Gaia DR3 1710287416422819020 8, Gaia DR3 1710292231087898240.
- One is Cseh 24, listed in the asterism list of Hungarian astronomer Viktor Cseh, which is in the IAU constellation Mensa. Cseh describes it as "loosely arc shaped group of stars. Although it has only 5 members, it is very striking, clearly visible." This is HD 59398, HD 59553, HD 59796, and Gaia DR3 5211488376093233408.
- One is Cseh 47, listed in the asterism list of Hungarian astronomer Viktor Cseh, which is an arc of five stars of 10^{th} – 14^{th} magnitude in the IAU constellation Microscopium. Includes Gaia DR3 6799033907899397248.
- One is Kernya 19, listed by Hungarian astronomer Gábor János Kernya, which is a line of 8.5 – 11.5 magnitude stars in the IAU constellation Sextans: HD 47588, HD 84061, HD 84062, HD 84080, HIP 47630.
- One is a chain of stars in the IAU constellation Pegasus and is Corder 15 on the observing list of Jeffrey Corder. It is a curving arc of ten stars, magnitudes 6.5 to 10, with HIP 258 and HIP 324 at the north end and HIP 503 and the double star HIP 451 at the other. Size 90'X 25'.
- One is a chain of stars in the IAU constellation Pegasus and is Corder 32 on the observing list of Jeffrey Corder. This is an arc of six stars, magnitudes 7 to 9.5. This starts at HIP 836 at one end and HIP 860 is close to the other end.
- One is in the IAU constellation Cetus and is Corder 359 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This line of five stars includes HIP 10723, 10664, 10600, and 10631.
- One is in the IAU constellation Cassiopeia and is Corder 432 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is an arc of stars of magnitude 7.5 to 8.5 including the double star HIP 12972A at one end as well as HIP 13022 and 13151.
- One is in the IAU constellation Camelopardalis and is Corder 558 on the observing list of American astronomer Jeffrey Corder. Size 60'. Corder describes this as "a deep art of 9 stars, magnitudes 7 to 9." This includes HIP 17083, 17075, 17008, and 16749.

- One is in the IAU constellation Auriga and is Corder 803 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. Corder describes it as an "arc of five almost equal stars that are 10th magnitude." These are Gaia DR3 201293336075636480, 201290656016062464, 201102708244994176, 201101505654167808 and 201100818459429504.
- One is in the IAU constellation Taurus and is Corder 808 on the observing list of American astronomer Jeffrey Corder. Size 80' X 60'. Corder describes this as "an arc of 8 taint stars of 9th and 10th magnitude. The brightest star is at the southern end of the arc, which has a major axis pointing north-south. There is a triangle of three 10th magnitude stars at the north end." The triangle of stars is HIP 23606, HD 32461, and HIP 23645
- One is in the IAU constellation Auriga and is Corder 818 on the observing list of American astronomer Jeffrey Corder. Size 50' X 25'. This includes HIP 24738, Rho (ρ) Aurigae, HIP 25143, the double star HIP 24902A, HIP 24771, Lambda (λ) Aurigae, and Mu (μ) Aurigae.
- One is in the IAU constellation Orion and is Corder 819 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is a curved group of 8th – 9th magnitude stars including HIP 24330.
- One is in the IAU constellation Auriga and is Corder 821 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is a chain of stars of 7th – 10th magnitude including HIP 24662 and 24388.
- One is in the IAU constellation Orion and is Corder 926 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is five 8th magnitude stars including HIP 27216 and the double star HIP 27258A.
- One is in the IAU constellation Orion and is Corder 952 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is an arc of seven stars between magnitude 6.5 and 10, including HIP 27839 and 27751.
- One is in the IAU constellation Orion and is Corder 957 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is five stars between magnitude 7.5 and 9, including HIP 27919.
- One is in the IAU constellation Auriga and is Corder 971 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is five stars between magnitude 7 – 9 including HIP 28354, 28131 and 28152.
- One is in the IAU constellation Auriga and is Corder 972 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six stars between magnitude 8.5 to 11: HD 39658, HD 233183, Gaia DR3 2644838155063683 84, Gaia DR3 2644848119387797 76, Gaia DR3 2644880073942927 36, and Gaia DR3 2644992086697832 96.
- One is in the IAU constellation Orion and is Corder 980 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five stars between magnitude 7.5 to 9 including HIP 28398, 28414, and 28337.
- One is in the IAU constellation Orion and is Corder 1023 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is an arc of four 8th magnitude stars including HIP 29253.
- One is in the IAU constellation Orion and is Corder 1047 on the observing list of American astronomer Jeffrey Corder. Size 65' X 25'. This is an arc of seven stars between 5th – 8th magnitude starting at the double star 71 Orionis and including HIP 29775, 29856, with the double star HIP 29731 at the other end. NOTE: Corder describes this as five stars, but I count seven.

- One is in the IAU constellation Orion and is Corder 1051 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is an arc of eight stars of magnitude 8.5 to 10 including the double star HIP 29770A.
- One is in the IAU constellation Lynx and is Corder 1080 on the observing list of American astronomer Jeffrey Corder. Size 70' X 20'. This is a chain of stars between 4^{th} – 7^{th} magnitude including 1, 2, and 4 Lyncis, and HIP 30491, 30458, and 30275.
- One is in the IAU constellation Monoceros and is Corder 1090 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is an arc of four 6^{th} – 7^{th} magnitude stars including HIP 30602, 30552, and 30492.
- One is in the IAU constellation Auriga and is Corder 1138 on the observing list of American astronomer Jeffrey Corder. Size 30'. Corder describes this as a "faint, curving chain of seven stars of magnitude 9 to 10." This is HIP 31484, Gaia DR3 965476045046260992, HD 46357, HD 46398, HD 46551, and HD 31684
- One is in the IAU constellation Gemini and is Corder 1241 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is seven stars between 7^{th} – 8^{th} magnitude including HIP 33855, 33893, 33921, and 34061.
- One is in the IAU constellation Gemini and is Corder 1411 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is six stars of 8^{th} – 9^{th} magnitude including the double star HIP 37769.
- One is in the IAU constellation Gemini and is Corder 1478 on the observing list of American astronomer Jeffrey Corder. Size 25'. Ten stars between magnitudes 8.5 and 10 including HIP 38992, 39058, and 39096.
- One is in the IAU constellation Lynx and is Corder 1570 on the observing list of American astronomer Jeffrey Corder. Size 90' X 20'. This is an arc of four 5^{th} – 6^{th} magnitude stars including HIP 41152, 40878, 40677, and 40599.
- One is in the IAU constellation Hydra and is Corder 1589 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four stars between 8^{th} - 9^{th} magnitude: HD 70595, SAO 116701, HD 70666, and Gaia DR3 3093002972886494464.
- One is in the IAU constellation Ursa Major and is Corder 1610 on the observing list of American astronomer Jeffrey Corder. Size 55' X 20'. This is a chain of six 8^{th} – 9^{th} magnitude stars: HIP 41180, HD 70663, HD 70877, SAO 14561, HD 70823, and HD 70625.
- One is in the IAU constellation Cancer and is Corder 1717 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five stars starting at the double star 57 Cancri and includes HIP 43732, 43616, and 43549.
- One is in the IAU constellation Ursa Major and is Corder 1754 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is seven 7^{th} – 9^{th} magnitude stars including HIP 44830, HIP 44744, and the double star HIP 44727.
- One is in the IAU constellation Leo Minor and is Corder 1860 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is HIP 46749 and 9, 10, and 11 Leonis Minoris.
- One is in the IAU constellation Leo and is Corder 1872 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is seven 7.5 – 9.5 magnitude stars including HIP 47323 and 46938.

- One is in the IAU constellation Camelopardalis and is Corder 1902 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is five 7th – 8th magnitude stars including HIP 48154 and 48236.
- One is in the IAU constellation Ursa Major and is Corder 1914 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 7th – 9th magnitude stars including HIP 48314 and the double star HIP 48271.
- One is in the IAU constellation Ursa Major and is Corder 1935 on the observing list of American astronomer Jeffrey Corder. Size 65' X 20'. This is six 5th – 9th magnitude stars including HIP 49408, 49437, 49452, 49415, and the double stars HIP 49253 and 49224A.
- One is in the IAU constellation Ursa Major and is Corder 1941 on the observing list of American astronomer Jeffrey Corder. Size 50' X 25'. This is seven 8th – 11th magnitude stars including HIP 49263 and 49197.
- One is in the IAU constellation Leo Minor and is Corder 1956 on the observing list of American astronomer Jeffrey Corder. Size 55' X 30'. This is eight 7th – 10th magnitude stars including HIP 49680.
- One is in the IAU constellation Leo Minor and is Corder 1983 on the observing list of American astronomer Jeffrey Corder. Size 20 X 10'. This is four 8th – 9th magnitude stars including HIP 89054 and 50374.
- One is in the IAU constellation Leo and is Corder 2032 on the observing list of American astronomer Jeffrey Corder. Size 90' X 30'. This is seven 7th – 9th magnitude stars including HIP 51663, 51562, 51550, 51513, 51377, and the double star HIP 51591A.
- One is in the IAU constellation Ursa Major and is Corder 2037 on the observing list of American astronomer Jeffrey Corder. Size 80' X 30'. This includes 32, 35, and 38 Ursae Majoris and HIP 50933, 52577, 52338, 52425, 53275, and 54038.
- One is in the IAU constellation Ursa Major and Leo Minor and on the observing list of American astronomer John Raymond, who calls it "46-46". It is Corder 2091 on the observing list of American astronomer Jeffrey Corder. Size 90' X 45'. This includes the stars 46 Ursae Majoris, 47 Leonis Minoris, HIP 53305, and Omicron (o) Leonis Minoris (46 Leonis Minoris).
- One is in the IAU constellation Ursa Major and is Corder 2154 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 8th – 9th magnitude stars including HIP 54964.
- One is in the IAU constellation Leo and is Corder 2159 on the observing list of American astronomer Jeffrey Corder. Size 90' X 35'. This is five stars including the double star Eta (η) Leonis, HIP 55033, 55029, 55167, and 55209.
- One is in the IAU constellation Leo and is Corder 2172 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 9th magnitude stars including HIP 55496.
- One is in the IAU constellation Draco and is Corder 2200 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is five 8th – 9th magnitude stars including HIP 56298 and 56349.
- One is in the IAU constellation Leo and is Corder 2265 on the observing list of American astronomer Jeffrey Corder. Size 75' X 45'. This is six 7th – 8th magnitude stars including HIP 58359, 58221, 58069, 57932, 57941, and the double star HIP 58006.
- One is in the IAU constellation Ursa Major and is Corder 2272 on the observing list of American astronomer Jeffrey Corder. Size 55' X 25'. This is an arc of five 6th – 8th magnitude stars including HIP 58003, 58193, 58287, 58277, and the double star HIP 58261A.

- One is in the IAU constellation Ursa Major and is Corder 2279 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 5th -9th magnitude stars including HIP 58698 and the double stars HIP 58648A, HIP 58708, and 67 Ursae Majoris.
- One is in the IAU constellation Ursa Major and is Corder 2293 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 9th – 10th magnitude stars including HIP 59020 and 58994.
- One is in the IAU constellation Tucana and is Corder 20 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 8th magnitude stars including HIP 407, 372, 409, and 558.
- One is in the IAU constellation Phoenix and is Corder 49 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30', This is six 8th – 10th magnitude stars including HIP 1331, 1728, 2017, 2184, and the double stars HIP 724, 1072, and 2237A.
- One is in the IAU constellation Tucana and is Corder 90 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is four 8th – 9th magnitude stars including HIP 1764 and 2013, and the double stars HIP 1876 and 2111.
- One is in the IAU constellation Tucana and Hydrus and is Corder 149 on the observing list of American astronomer Jeffrey Corder. Size 65' X 25'. This is four stars including Lambda (λ) Hydri, HIP 4062, 4157, and 4291. NOTE: Corder lists Lambda (λ) Hydri as "Gamma Tucana".
- One is in the IAU constellation Hydrus and is Corder 164 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 11th magnitude stars including the double star HIP 4638A.
- One is in the IAU constellation Octans and is Corder 268 on the observing list of American astronomer Jeffrey Corder. Size 65' X 25'. This is six 6th – 9th magnitude stars including HIP 8291 and 7637 and the double stars HIP 7601 and HIP 8018A.
- One is in the IAU constellation Hydrus and is Corder 281 on the observing list of American astronomer Jeffrey Corder. Size 60'. This is nine mostly 8th – 9th magnitude stars including Tau (τ) 2 Hydri (6th magnitude), HIP 7958, and 8419.
- One is in the IAU constellation Phoenix and is Corder 342 on the observing list of American astronomer Jeffrey Corder. Size 70' X 25'. This is seven 6th – 8th magnitude stars including HIP 10254, 10278, 10205, 10133, 10018, and 9970.
- One is in the IAU constellation Fornax and is Corder 413 on the observing list of American astronomer Jeffrey Corder. Size 120' X 45'. This is an arc of five stars including HIP 12435, HIP 11979, the double star HIP 11917, and Iota (ι) 1 and 2 Fornacis.
- One is in the IAU constellation Fornax and is Corder 474 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 8th – 10th magnitude stars including HIP 14122, and 14100.
- One is in the IAU constellation Eridanus and is Corder 602 on the observing list of American astronomer Jeffrey Corder. Size 180' X 40'. This is Tau (τ) 6, 7, 8, and 9 Eridani.
- One is in the IAU constellation Eridanus and is Corder 637 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 7th – 8th magnitude stars and one 9th magnitude star including HIP 19360, 19375, 19421, and the double star HIP 19414.
- One is in the IAU constellation Eridanus and is Corder 652 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is four 6th – 8th magnitude stars including HIP 19856, 19839, 19820, and 19752.

- One is in the IAU constellation Eridanus and is Corder 675 on the observing list of American astronomer Jeffrey Corder. Size 60' X 35'. This is six 8th – 9th magnitude stars including HIP 20524, 20398, 20289, and the double star HIP 20613.
- One is in the IAU constellation Caelum and is Corder 689 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 8th – 10th magnitude stars including HIP 20929.
- One is in the IAU constellation Reticulum and is Corder 697 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is four 8th magnitude stars including HIP 21184 and 21150.
- One is in the IAU constellation Caelum and is Corder 746 on the observing list of American astronomer Jeffrey Corder. Size 75' X 25'. This is ten 6th – 10th magnitude stars including HIP 22674, 22430, 22437, 22397, and the double stars HIP 22551, 22411A, 22389, and 22488.
- One is in the IAU constellation Lepus and is Corder 778 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 8th magnitude stars including HIP 23237.
- One is in the IAU constellation Orion and is Corder 795 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is seven 7th – 9th magnitude stars ending at the reflection nebula NGC 1788. This includes HIP 23819, 23745, and 23661.
- One is in the IAU constellation Lepus and is Corder 988 on the observing list of American astronomer Jeffrey Corder. Size 4'. This is four 8th – 9th magnitude stars: Gaia DR3 2998862100122114432, HD 40659, HD 40619, and Gaia DR3 2998854708480814208.
- One is in the IAU constellation Columba and is Corder 999 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 28635 and 28611.
- One is in the IAU constellation Orion and is Corder 1024 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is four 8th – 9th magnitude stars including HIP 29253.
- One is in the IAU constellation Canis Major and is Corder 1064 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is nine 9th – 10th magnitude stars including HIP 29819.
- One is in the IAU constellations Canis Major and Columba and is Corder 1065 on the observing list of American astronomer Jeffrey Corder. Size 350' X 90'. This includes HIP 31688, HIP 31362, Lambda (λ) Canis Majoris, Delta (δ) Columbae, HIP 30143, HIP 30059, and Kappa (κ) Columbae.
- One is in the IAU constellation Monoceros and is Corder 1213 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 8th magnitude stars including HIP 33395, 33405, 33381, and 33361.
- One is in the IAU constellation Monoceros and is Corder 1219 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 9th magnitude stars including HIP 33602.
- One is in the IAU constellation Canis Major and is Corder 1293 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is eight 8th – 9th magnitude stars including HIP 34989.
- One is in the IAU constellation Puppis and is Corder 1296 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is six 4th – 9th magnitude stars including HIP 35096, 34958, and 34921 and the double star HIP 35020.
- One is in the IAU constellation Puppis and is Corder 1307 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 7th – 10th magnitude stars including HIP 35114, 35147, 35376, and the double star HIP 35090.

- One is in the IAU constellation Monoceros and is Corder 1315 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is eight 7th – 9th magnitude stars including HIP 35561, 35642, and 35707 and the double star HIP 35594A.
- One is in the IAU constellation Mensa and is Corder 1321 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 10th magnitude stars in a short curve: Gaia DR3 5211488376093233408, HD 59796, HD 59553, and HD 59398.
- One is in the IAU constellation Canis Major and is Corder 1337 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 8th magnitude stars including HIP 36101 and the double star HIP 35997A.
- One is in the IAU constellation Puppis and is Corder 1423 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 7th – 9th magnitude stars including HIP 37907 and the double star HIP 37954A.
- One is in the IAU constellation Puppis and is Corder 1430 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 3rd – 9th magnitude stars including the double star Xi (ξ) Puppis, 188 Puppis, and HIP 38134.
- One is in the IAU constellation Puppis and is Corder 1439 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 5th – 8th magnitude stars including 9 Puppis, HIP 38436, and the double star HIP 38493.
- One is in the IAU constellation Puppis and is Corder 1444 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is five 7th – 10th magnitude stars including HIP 38652, 38629, and the double star HIP 38395A.
- One is in the IAU constellation Volans and is Corder 1473 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 38809.
- One is in the IAU constellation Hydra and is Corder 1539 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven 7th – 9th magnitude stars including HIP 40281 and 40468 and the double star HIP 40419.
- One is in the IAU constellation Puppis and is Corder 1542 on the observing list of American astronomer Jeffrey Corder. Size 60-' X 30'. This is five 6th – 7th magnitude stars including HIP 40307, 40344, 40485, and 40639, and the double star HIP 40407.
- One is in the IAU constellation Puppis and is Corder 1590 on the observing list of American astronomer Jeffrey Corder. Size 140' X 45'. This is five 5th – 6th magnitude stars including 22 Puppis, HIP 41395, 41255, 40822, and the double star HIP 40693.
- One is in the IAU constellation Carina and is Corder 1602 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 6th – 7th magnitude stars including HIP 41223 and the double stars HIP 41285, 41266A, and 41147.
- One is in the IAU constellation Puppis and is Corder 1608 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is five 7th – 9th magnitude stars including HIP 41354.
- One is in the IAU constellation Puppis and is Corder 1616 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is five 8th magnitude stars including HIP 41498.
- One is in the IAU constellation Hydra and is Corder 1643 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 8th – 9th magnitude stars including HIP 42013 and the double star HIP 42037A.

- One is in the IAU constellation Hydra and is Corder 1653 on the observing list of American astronomer Jeffrey Corder. Size 70' X 35'. This is eight 6th – 8th magnitude stars including HIP 42510, 42495, 42122, 42065, 41939, and 41980 and the double stars 42406A and 42302.
- One is in the IAU constellation Vela and is Corder 1688 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 9th magnitude stars including HIP 43057, 43011, and the double star HIP 43037A.
- One is in the IAU constellation Vela and is Corder 1746 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is ten 7th – 9th magnitude stars including HIP 43938, 44317, 44461, and the double stars HIP 44181A, 44634A, and 44618A.
- One is in the IAU constellation Hydra and is Corder 1811 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 9th magnitude stars including HIP 46090.
- One is in the IAU constellation Vela and is Corder 1812 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is four 6th – 7th magnitude stars including HIP 46204 and the double star HIP 46067.
- One is in the IAU constellation Carina and is Corder 1848 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 9th magnitude stars including HIP 46600 and the double stars HIP 46678A and 46778.
- One is in the IAU constellation Hydra and is Corder 1854 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is nine 6th – 9th magnitude stars including HIP 46717, 46869, and the double star HIP 46801.
- One is in the IAU constellation Sextans and is Corder 1891 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is six 9th – 10th magnitude stars including HIP 47630, 47588, and 47516.
- One is in the IAU constellation Hydra and is Corder 1896 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 10th magnitude stars including HIP 47596.
- One is in the IAU constellation Hydra and is Corder 1917 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is twelve 7th – 10th magnitude stars in a curving line: HD 84785, SAO 178004, Gaia DR3 5660301012435538432, HD 85060, HD 85224, HD 85276, HD 85262, SAO 178057, SAO 178056, HIP 48180, HD 84973, HD 84786.
- One is in the IAU constellation Carina and is Corder 1961 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is an arc of eight 7th – 9th magnitude stars including HIP 49934, 49907, 49723, 49662, 49607, and the double star HIP 49644.
- One is in the IAU constellation Hydra and is Corder 1962 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is four stars including HIP 49774, 49802, and the double stars Lambda (λ) Hydrae and HIP 49809.
- One is in the IAU constellation Carina and is Corder 1970 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 6th – 9th magnitude stars including HIP 49833, 49875, 50020, and the double star HIP 50018A.
- One is in the IAU constellation Sextans and is Corder 1985 on the observing list of American astronomer Jeffrey Corder. Size 110' X 20'. This is eight 8th – 9th magnitude stars including HIP 50466, 50354, 50291, 50275, 50322, and 50343.
- One is in the IAU constellation Sextans and is Corder 1991 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is five 8th – 9th magnitude stars including HIP 50534 and 50515.

- One is in the IAU constellation Sextans and is Corder 1995 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is four 6th – 7th magnitude stars forming a pair of binocular doubles including HIP 50692, 50658, 50554, and 50552.
- One is in the IAU constellation Carina and is Corder 2007 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 7th – 8th magnitude stars including HIP 50919 and 50843.
- One is in the IAU constellation Antlia and is Corder 2010 on the observing list of American astronomer Jeffrey Corder. Size 20' X 15'. This is six 8th – 10th magnitude stars including HIP 50492 and 50510.
- One is in the IAU constellation Carina and is Corder 2063 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 8th – 9th magnitude stars: HD 93059, Gaia DR3 5232821684824141056, Gaia DR3 5232821100708520320, HD 92967, HD 92897.
- One is in the IAU constellation Vela and is Corder 2095 on the observing list of American astronomer Jeffrey Corder. Size 90' X 25'. This is about eighteen 7th – 10th magnitude stars including HIP 53638, 53542, 53343, 53244, 52927, 52855, and 52740 and the double star HIP 53782A.
- One is in the IAU constellation Vela and is Corder 2099 on the observing list of American astronomer Jeffrey Corder. Size 80' X 40'. This is six 4th – 7th magnitude stars including HIP 53773, 53605, 53356, 52924, 52710, 52694, and 52709 and the double star HIP 53379.
- One is in the IAU constellation Vela and is Corder 2106 on the observing list of American astronomer Jeffrey Corder. Size 50' X 25'. This is five 6th – 8th magnitude stars including HIP 53784, 53729, and 53762, and the double star HIP 53777A.
- One is in the IAU constellation Crater and is Corder 2141 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 7th – 8th magnitude stars including HIP 54737 and 54739.
- One is in the IAU constellation Chamaeleon and is Corder 2150 on the observing list of American astronomer Jeffrey Corder. Size 20' X 15'. This is four 8th – 10th magnitude stars including HIP 54852.
- One is in the IAU constellation Carina and is Corder 2163 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is four 6th – 7th magnitude stars including HIP 55046 and HIP 54931 and the double star HIP 55140.
- One is in the IAU constellation Centaurus and is Corder 2176 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is six 7th – 8th magnitude stars including HIP 55400, 55336, 55238, and the double star HIP 55518.
- One is in the IAU constellation Chamaeleon and is Corder 2247 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 8th – 10th magnitude stars including HIP 57505 and 57374.
- One is in the IAU constellation Hydra and is Corder 2280 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 7th – 9th magnitude stars including HIP 58601.
- One is in the IAU constellation Octans and is Corder 2283 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 10th magnitude stars including HIP 59059.

- One is in the IAU constellation Corvus and is Corder 2330 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 5th – 8th magnitude stars including HIP 60209, and the double stars Zeta (ζ) Corvi and HIP 60157A.
- One is in the IAU constellation Musca and is Corder 2334 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is about fifteen 6th – 8th magnitude stars including HIP 59985, 60183, 60601, 60339, 60570, 60394, and 60165, and the double star HIP 59898.
- One is in the IAU constellation Hydra and is Corder 2349 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is seven 8th – 10th magnitude stars: HD 108390, HD 108338, Gaia DR3 3469670569656457216, SAO 203464, Gaia DR3 3469714275243659392, SAO 203451, HD 107970.
- One is in the IAU constellation Hydra and is Corder 2369 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is five 6th – 8th magnitude stars including HIP 61337, 61211, 61172, and 61159.
- One is in the IAU constellation Crux and is Corder 2404 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is five 4th – 8th magnitude stars including HIP 62058 and the double stars HIP 62026 and 62327.
- One is in the IAU constellation Virgo and is Corder 2409 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. The is four 7th – 8th magnitude stars including HIP 62551, 62458, 62383, and the double star HIP 62304.
- One is in the IAU constellation Hydra and is Corder 2411 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 6th – 9th magnitude stars including HIP 62447, 62448, and the double star HIP 62471B.
- One is in the IAU constellation Corvus and is Corder 2415 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is five 9th – 10th magnitude stars: HD 111400, Gaia DR3 3509506636141300864, SAO 157522, Gaia DR3 3503501309788475904, Gaia DR3 3503494815797907840.
- One is in the IAU constellation Crux and is Corder 2432 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 4th – 7th magnitude stars including HIP 62861, 63145, and 63230, and the double stars HIP 63117 and Mu (μ) 1 and 2 Crucis.
- One is in the IAU constellation Hydra and is Corder 2435 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 10th – 11th magnitude stars: Includes SAO 181293 and Gaia DR3 6187318449120674304.
- One is in the IAU constellation Hydra and is Corder 2441 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is six 6th – 9th magnitude stars including HIP 63538, and 63673, and the double star HIP 63738B.
- One is in the IAU constellation Centaurus and is Corder 2458 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is six 4th – 7th magnitude stars including HIP 64565, 64580, and the double stars HIP 64583, 64478A, 64425, and 64033A.
- One is in the IAU constellation Centaurus and is Corder 2469 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is four 7th – 8th magnitude stars including HIP 64699 and 64585 and the double star HIP 64791A.
- One is in the IAU constellation Centaurus and is Corder 2469 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is four 5th – 8th magnitude stars including Iota (ι) 1 and 2 Muscae and HIP 64972.

- One is in the IAU constellation Virgo and is Corder 2530 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is seven 8th – 10th magnitude stars including HIP 66858, 66708, and the double star HIP 66476A.
- One is in the IAU constellation Centaurus and is Corder 2565 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 6th magnitude stars including HIP 67851 and 67648 and the double stars HIP 67819A and 67244.
- One is in the IAU constellation Centaurus and is Corder 2574 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is six 7th – 8th magnitude stars including HIP 67956, 67913, and 68054, and the double stars HIP 68101, 67919, and 68162.
- One is in the IAU constellation Virgo and is Corder 2595 on the observing list of American astronomer Jeffrey Corder. Size 60' X 40'. This is nine 6th – 9th magnitude stars including HIP 68707, 68783, 68731, and 68680.
- One is in the IAU constellation Centaurus and is Corder 2607 on the observing list of American astronomer Jeffrey Corder. Size 7'. This is six 8th – 10th magnitude stars including HIP 69224 and the double star HIP 69220.
- One is in the IAU constellation Boötes and is Corder 2618 on the observing list of American astronomer Jeffrey Corder. Size 80' X 25'. This is eight 6th – 9th magnitude stars including HIP 69891, 69876, 69735, 69580, 69534, and 69520, and the double star HIP 69666A.
- One is in the IAU constellation Boötes and is Corder 2632 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is four 6th – 8th magnitude stars including HIP 69888, 69955, 70029, and 70135.
- One is in the IAU constellation Centaurus and is Corder 2635 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is six 8th – 9th magnitude stars including HIP 70126, 70257, and 70307.
- One is in the IAU constellation Virgo and is Corder 2649 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 9th – 11th magnitude stars: HD 126497,.Gaia DR3 3654233496279055136, HD 126534, Gaia DR3 3654228445397558400.
- One is in the IAU constellation Libra and is Corder 2653 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is ten 9th – 10th magnitude stars including HIP 70889 and 70598.
- One is in the IAU constellation Lupus and is Corder 2659 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7th – 8th magnitude stars including HIP 70918 and the double star HIP 70976A.
- One is in the IAU constellation Draco and is Corder 2667 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is four 6th – 8th magnitude stars including HIP 70952 and 71267.
- One is in the IAU constellation Boötes and is Corder 2683 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is four 8th magnitude stars including HIP 71612, 71472, and 71468.
- One is in the IAU constellation Virgo and is Corder 2684 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 9th – 10th magnitude stars: HIP 71438, Gaia DR3 1171262462365591424, Gaia DR3 1171066233899673856, SAO 120561, HIP 71483, Gaia DR3 11710426, SAO 120577.

- One is in the IAU constellation Hydra and is Corder 2698 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 9th magnitude stars including HIP 71871.
- One is in the IAU constellation Hydra and is Corder 2711 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is five 7th – 9th magnitude stars including HIP 72353 and 72278.
- One is in the IAU constellation Libra and is Corder 2716 on the observing list of American astronomer Jeffrey Corder. Size 90' X 15'. This is five 6th – 7th magnitude stars including HIP 72731, 72650, 72553, 72442, and 72373 and the double star HIP 72347.
- One is in the IAU constellation Hydra and is Corder 2736 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 6th – 9th magnitude stars including HIP 72883, 72930, and 72962.
- One is in the IAU constellation Libra and is listed as Corder 2750 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 7th – 9th magnitude stars including Delta (δ) Librae and HIP 73571, 73587, and 73565.
- One is in the IAU constellation Libra and is Corder 2753 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 10th magnitude stars including HIP 73349 and 73356.
- One is in the IAU constellation Circinus and is Corder 2771 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is seven 7th – 8th magnitude stars including HIP 73769, 73755, 73728, and 73785.
- One is in the IAU constellation Lupus and is Corder 2790 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 8th – 9th magnitude stars including HIP 74389 and 74414 and the double star HIP 74469A.
- One is in the IAU constellation Libra and is Corder 2800 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 9th – 11th magnitude stars including the double star HIP 74586.
- One is in the IAU constellation Serpens and is Corder 2809 on the observing list of American astronomer Jeffrey Corder. Size 125' X 50'. This is five 5th – 7th magnitude stars including 4 & 6 Serpentis, HIP 75293, and the double stars HIP 74702 and 74895A.
- One is in the IAU constellation Libra and is Corder 2818 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 8th – 9th magnitude stars including HIP 75075 and 75028.
- One is in the IAU constellation Libra and is Corder 2842 on the observing list of American astronomer Jeffrey Corder. Size 75'. This is eight 8th – 9th magnitude stars including HIP 75892, 75789, 75739, 75629, 75474, 75325, 75131, and 75158.
- One is in the IAU constellation Libra and is Corder 2899 on the observing list of American astronomer Jeffrey Corder. Size 100' X 25'. This is sixteen 5th – 9th magnitude stars including 42 Librae, HIP 76614, 76666, 76834, 76969, and 77077, and the double stars HIP 76532 and 77399A.
- One is in the IAU constellation Triangulum Australe and is Corder 2901 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 8th – 10th magnitude stars including HIP 76755, 77039, and the double star HIP 76919A.

- One is in the IAU constellation Serpens and is Corder 2906 on the observing list of American astronomer Jeffrey Corder. Size 45' X 35'. This is six 7^{th} – 10^{th} magnitude stars including HIP 76883, 76964, 76959, and 76965.
- One is in the IAU constellation Ursa Minor and is Corder 2910 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is five 7^{th} – 8^{th} magnitude stars including HIP 77013.
- One is in the IAU constellation Scorpius and is Corder 2930 on the observing list of American astronomer Jeffrey Corder. Size 65' X 25'. This is ten 7^{th} – 10^{th} magnitude stars including HIP 77457, 77664, and the double star HIP 77729.
- One is in the IAU constellation Lupus and is Corder 2946 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is six 7^{th} – 9^{th} magnitude stars including HIP 78118, and 78020, and the double star HIP 78142A.
- One is in the IAU constellation Corona Borealis and is Corder 2956 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 4^{th} – 8^{th} magnitude stars including HIP 78989, HIP 78234 and the double star Epsilon (ε) Coronae Borealis.
- One is in the IAU constellation Draco and is Corder 2961 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 7^{th} – 8^{th} magnitude stars including HIP 78492, 78461, and 78548.
- One is in the IAU constellation Norma and is Corder 2985 on the observing list of American astronomer Jeffrey Corder. Size 60'. This is four 6^{th} – 7^{th} magnitude stars including HIP 78803 and the double star HIP 79133.
- One is in the IAU constellation Triangulum Australe and is Corder 2990 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 6^{th} – 8^{th} magnitude stars including HIP 79251, 79208, 79079, and 78951, and the double star HIP 78978.
- One is in the IAU constellation Scorpius and is Corder 2994 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7^{th} – 8^{th} magnitude stars including the double star HIP 79169.
- One is in the IAU constellation Scorpius and is Corder 3016 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 8^{th} – 9^{th} magnitude stars including HIP 79687 and the double star HIP 79696.
- One is in the IAU constellation Hercules and is Corder 3055 on the observing list of American astronomer Jeffrey Corder. Size 100' X 25'. This is twelve 8^{th} – 9^{th} magnitude stars including HIP 80814, 80684, 80657, 80543, 80555, 80348, and 80317.
- One is in the IAU constellation Ophiuchus and is Corder 3103 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7^{th} – 8^{th} magnitude stars including HIP 81809 and 81742.
- One is in the IAU constellation Ara and is Corder 3110 on the observing list of American astronomer Jeffrey Corder. Size 90' X 30'. This is four 5^{th} – 8^{th} magnitude stars including HIP 81850, 82110, and 82171, and the double star HIP 81937A.
- One is in the IAU constellation Hercules and is Corder 3118 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is seven 8^{th} – 10^{th} magnitude stars including HIP 82043, and 82053.

- One is in the IAU constellation Scorpius and is Corder 3148 on the observing list of American astronomer Jeffrey Corder. Size 80' X 45'. This is five 6th – 7th magnitude stars including HIP 82829, 92650, and the double stars HIP 82560 and 82740B.
- One is in the IAU constellation Hercules and is Corder 3172 on the observing list of American astronomer Jeffrey Corder. Size 90' X 20'. This is nine 7th – 9th magnitude stars including HIP 83213, 83170, 83115, 83108, 83212, and the double star HIP 83260.
- One is in the IAU constellation Apus and is Corder 3183 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is five 9th magnitude stars: Gaia DR3 5777272767414445312, HD 151711, HD 151992, HD 152302, Gaia DR3 5777633269789281664, HD 152494.
- One is in the IAU constellation Ara and is Corder 3192 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 6th – 8th magnitude stars including HIP 83323 and the double stars HIP 83174 and 83268A.
- One is in the IAU constellation Ophiuchus and is Corder 3196 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 8th magnitude stars including HIP 83540 and 83461.
- One is in the IAU constellation Ophiuchus and is Corder 3206 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 9th – 11th magnitude stars.
- One is in the IAU constellation Serpens and is Corder 3244 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is four 6th – 9th magnitude stars including HIP 84647, 84675, and 84649.
- One is in the IAU constellation Ophiuchus and is Corder 3258 on the observing list of American astronomer Jeffrey Corder. Size 100' X 30'. This is seven 3rd – 9th magnitude stars including 32 Scorpii, Theta (θ) Ophiuchi, HIP 84907, and HIP 85071.
- One is in the IAU constellation Ophiuchus and is Corder 3308 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is nine 6th – 10th magnitude stars including 52 Ophiuchi.
- One is in the IAU constellation Ara and is Corder 3310 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 6th – 10th magnitude stars including HIP 85968 and 85975.
- One is in the IAU constellation Draco and is Corder 3326 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 8th – 9th magnitude stars including HIP 86469.
- One is in the IAU constellation Apus and is Corder 3333 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 7th – 10th magnitude stars including HIP 86381.
- One is in the IAU constellation Sagittarius and is Corder 3387 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 8th – 9th magnitude stars including HIP 87429 and 87455.
- One is in the IAU constellation Apus and is Corder 3407 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is four 8th – 9th magnitude stars including HIP 87772 and 87758.
- One is in the IAU constellation Hercules and is Corder 3429 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is nine 5th – 10th magnitude stars including 96 Herculis, HIP 88391, 88131, 87934, 87896, and 87825 and the double star HIP 88313.

- One is in the IAU constellation Hercules and is Corder 3462 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is ten 6th – 10th magnitude stars including HIP 88590, 88689, and 88766 and the double stars HIP 88772 and 88778.
- One is in the IAU constellation Sagittarius and is Corder 3472 on the observing list of American astronomer Jeffrey Corder. Size 7'. This is five 9th – 10th magnitude stars including HIP 88805.
- One is in the IAU constellation Lyra and is Corder 3519 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is four 7th magnitude stars including HIP 89654 and the double star HIP 89603A.
- One is in the IAU constellation Draco and is Corder 3526 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 9th magnitude stars including HIP 89857 and 89730.
- One is in the IAU constellation Sagittarius and is Corder 3543 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is eight 7th – 9th magnitude stars including HIP 90184, and the double star HIP 90128A.
- One is in the IAU constellation Sagittarius and is Corder 3565 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is eight 7th – 10th magnitude stars including the double star HIP 90513.
- One is in the IAU constellation Draco and is Corder 3570 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is ten 7th – 10th magnitude stars including HIP 90423, 90527, and 90495.
- One is in the IAU constellation Corona Australis and is Corder 3587 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is six 5th – 8th magnitude stars including HIP 90842, 90782, 90674, and 90597.
- One is in the IAU constellation Hercules and is Corder 3610 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is twelve 7th – 9th magnitude stars including HIP 91518, 91377, 91313, 91390, and the double star HIP 91408.
- One is in the IAU constellation Pavo and is Corder 3618 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is four 7th – 8th magnitude stars including HIP 91565, 91512, 91464, and 91516.
- One is in the IAU constellation Scutum and is Corder 3634 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 8th – 9th magnitude stars including HIP 91867.
- One is in the IAU constellation Serpens and is Corder 3641 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 8th magnitude stars including HIP 91850 and the double star HIP 91893A.
- One is in the IAU constellation Telescopium and is Corder 3686 on the observing list of American astronomer Jeffrey Corder. Size 60' X 45'. This is ten 6th – 8th magnitude stars including HIP 92799 and 92678.
- One is in the IAU constellation Sagittarius and is Corder 3720 on the observing list of American astronomer Jeffrey Corder. Size 2'. This is five 10th – 11th magnitude stars: Gaia DR3 6731114841275915648, Gaia DR3 6731114978714868096, Gaia DR3 6731115287952489088, HD 175649, Gaia DR3 6731103944934365824.
- One is in the IAU constellation Vulpecula and is Corder 3724 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 7th – 9th magnitude stars including HIP 93150 and the double star HIP 93127.

- One is in the IAU constellation Aquila and is Corder 3746 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is five 6th – 8th magnitude stars including HIP 93671, 93645, 93586, 93566, and the double star HIP 93601A.
- One is in the IAU constellation Sagittarius and is Corder 3748 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is five 6th – 9th magnitude stars including HIP 93077 and the double stars HIP 93543, 93537A, 93224, and 92950.
- One is in the IAU constellation Corona Australis and is Corder 3758 on the observing list of American astronomer Jeffrey Corder. Size 90' X 20'. This is seven 4th – 9th magnitude stars including Alpha (α) Coronae Australis (Meridiana), HIP 93874, 93858, 93552, and the double star HIP 93625A.
- One is in the IAU constellation Sagittarius and is Corder 3768 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is four 7th – 9th magnitude stars including HIP 94122 and the double star 94041.
- One is in the IAU constellation Draco and is Corder 3803 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is five 7th – 8th magnitude stars including HIP 94508 and 94775.
- One is in the IAU constellation Lyra and is Corder 3823 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is four 6th – 8th magnitude stars including the double stars HIP 94981 and 94932.
- One is in the IAU constellation Aquila and is Corder 3827 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 6th – 8th magnitude stars including 23 and 24 Aquilae and HIP 94793, 94785, and the double star HIP 94883.
- One is in the IAU constellation Sagittarius and is Corder 3829 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is four 9th magnitude stars: HD 181031, HD 180978, 180952, 180925.
- One is in the IAU constellation Cygnus and is Corder 3846 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is ten 8th – 9th magnitude stars: Gaia DR3 2025969303717478912, Gaia DR3 2025970089669922048, HD 338254, Gaia DR3 2025947897598966528, Gaia DR3 2025947450922386944, Gaia DR3 2025948069397684352, HD 338521, Gaia DR3 2025990361915544192, Gaia DR3 2026000261842879616, HIP 95330, HIP 95400.
- One is in the IAU constellation Aquila and is Corder 3866 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 5th – 10th magnitude stars including 35 Aquilae.
- One is in the IAU constellation Sagittarius and is Corder 3870 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is six 8th – 9th magnitude stars including HIP 95991 and 95941.
- One is in the IAU constellation Draco and is Corder 3893 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is five stars including Sigma (σ) Draconis, HIP 95988 and 96350.
- One is in the IAU constellation Aquila and is Corder 3902 on the observing list of American astronomer Jeffrey Corder. Size 120' X 60'. This is a chain of 4th – 10th magnitude stars including Iota (ι) Aquilae, HIP 96535, 96604, and the double stars HIP 96379 and 96193.

- One is in the IAU constellation Draco and is Corder 3947 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th – 9th magnitude stars including HIP 97399. NOTE: Corder lists this same asterism elsewhere as Corder 3953.
- One is in the IAU constellation Cygnus and is Corder 3991 on the observing list of American astronomer Jeffrey Corder. Size 150' X 20'. This is four 5th – 6th magnitude stars including HIP 98044, and 98073 and the double stars HIP 97892 and 23 Cygni.
- One is in the IAU constellation Telescopium and is Corder 4009 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is nine 7th – 9th magnitude stars including HIP 98048, 98112, 98327, and 98317 and the double star HIP 98196A.
- One is in the IAU constellation Pavo and is Corder 4010 on the observing list of American astronomer Jeffrey Corder. Size 6'. This asterism is seven 10th – 11th magnitude stars: HD 187790, HD 187455, HIP 97952, HD 187443, HD 188163, Gaia DR3 6427280058657173504, Gaia DR3 6427306275138645376.
- One is in the IAU constellation Cygnus and is Corder 4023 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 5th – 9th magnitude stars including 25 Cygni and HP 98563.
- One is in the IAU constellation Sagittarius and is Corder 4025 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is six 7th – 9th magnitude stars including HIP 98479 and 98521.
- One is in the IAU constellation Aquila and is Corder 4060 on the observing list of American astronomer Jeffrey Corder. Size 130' X 25'. This is Theta (θ), 62, 64, and 66 Aquilae.
- One is in the IAU constellation Cygnus and is Corder 4068 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is six 7th – 9th magnitude stars including HIP 99414 and 99561.
- One is in the IAU constellation Octans and is Corder 4090 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 9th magnitude stars including HIP 99219 and the double star HIP 99959A.
- One is in the IAU constellation Aquila and is Corder 4095 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 9th – 10th magnitude stars including HIP 99797.
- One is in the IAU constellation Aquila and is Corder 4099 on the observing list of American astronomer Jeffrey Corder. Size 15': HD 192689, Gaia Dr3 4250888428897980928, Gaia DR3 4250888635056274048, SAO 125623, HIP 99860.
- One is in the IAU constellation Aquila and is Corder 4100 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is eight 7th – 10th magnitude stars including HIP 99894 and the double star HIP 99867A.
- One is in the IAU constellation Cygnus and is Corder 4129 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is four 6th – 10th magnitude stars including HIP 100434, 100501, and 100548.
- One is in the IAU constellation Delphinus and is Corder 4130 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is five 7th – 8th magnitude stars including HIP 100500 and 100381 and the double star HIP 100397A.
- One is in the IAU constellation Draco and is Corder 4134 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 5th – 10th magnitude stars including HIP 100553, 100059 and the double stars HIP 100357 and 99832.

- One is in the IAU constellation Sagittarius and is Corder 4150 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 6^{th} – 8^{th} magnitude stars, descending in magnitude from one end to the other: HIP 100764, HD 194027, HIP 100604, HD 193885, HD 194064.
- One is in the IAU constellation Telescopium and is Corder 4152 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is eight 8^{th} – 10^{th} magnitude stars including HIP 100627 and 100752.
- One is in the IAU constellation Delphinus and is Corder 4153 on the observing list of American astronomer Jeffrey Corder. Size 65' X 25'. This is four 6^{th} – 7^{th} magnitude stars including HIP 101114, 100969, and 100797.
- One is in the IAU constellation Delphinus and is Corder 4176 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is four 7^{th} magnitude stars including HIP 101371, 101290, and 101219.
- One is in the IAU constellation Indus and is Corder 4223 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 9^{th} – 11^{th} magnitude stars including HIP 102064.
- One is in the IAU constellation Cygnus and is Corder 4262 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 9^{th} – 10^{th} magnitude stars: Gaia DR3 1870104150260339200, Gaia DR3 1870103394346059264, Gaia DR3 1870103256907096960, Gaia DR3 1870079686125492224, Gaia DR3 1870079376887875200.
- One is in the IAU constellation Equuleus and is Corder 4318 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is six 7^{th} – 10^{th} magnitude stars including 104325 and 104274.
- One is in the IAU constellation Cepheus and is Corder 4339 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is five 9^{th} magnitude stars including HIP 104736.
- One is in the IAU constellation Cepheus and is Corder 4348 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is five 6^{th} – 9^{th} magnitude stars including HIP 104886, 104900, and the double star HIP 104778A.
- One is in the IAU constellation Microscopium and is Corder 4375 on the observing list of American astronomer Jeffrey Corder. Size 55' X 25'. This is six 6^{th} – 9^{th} magnitude stars including HIP 105090, 105086, 105198, 105260, and the double star HIP 105289A.
- One is in the IAU constellation Cygnus and is Corder 4376 on the observing list of American astronomer Jeffrey Corder. Size 90' X 50'. This is twelve 4^{th} – 9^{th} magnitude stars including Sigma (σ) Cygni, HIP 105116, 105264, 105561, and 105573.
- One is in the IAU constellation Pavo and is Corder 4385 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is ten 8^{th} – 11^{th} magnitude stars including HIP 105509 and 105191.
- One is in the IAU constellation Cygnus and is Corder 4399 on the observing list of American astronomer Jeffrey Corder. Size 90' X 30'. This is ten 5^{th} – 8^{th} magnitude stars including HIP 105722, 105497, and 105282 and the double stars HIP 105866, 105733, 105540A, and 105290.
- One is in the IAU constellation Cygnus and is Corder 4409 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8^{th} – 11^{th} magnitude stars including HIP 105741 and 105709.

- One is in the IAU constellation Octans and is Corder 4420 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is four 7th magnitude stars including HIP 105511, 106259, 106474 and the double star HIP 104997A.
- One is in the IAU constellation Grus and is Corder 4437 on the observing list of American astronomer Jeffrey Corder. Size 170' X 40'. This is eight 7th magnitude stars including HIP 106056, 106123, 106098, 106116, and the double star HIP 106203A.
- One is in the IAU constellation Piscis Austrinus and is Corder 4458 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is twelve 7th – 10th magnitude stars including HIP 106490, 106576, 106180, and the double star HIP 106438.
- One is in the IAU constellation Cepheus and is Corder 4459 on the observing list of American astronomer Jeffrey Corder. Size 75' X 15'. This is seven 7th – 8th magnitude stars including HIP 107334 and the double star HIP 105644A.
- One is in the IAU constellation Cygnus and is Corder 4464 on the observing list of American astronomer Jeffrey Corder. Size 75' x 15'. This is four 3rd – 6th magnitude stars including Rho (ρ) Cygni, HIP 106507, 106420, and 106642.
- One is in the IAU constellation Pegasus and is Corder 4469 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is five 10th magnitude stars: Gaia DR3 1741724313587804032, Gaia DR3 1741722423802211072, SAO 107276, Gaia DR3 1742380923892087040, Gaia DR3 1742375293191018368.
- One is in the IAU constellation Cepheus and is Corder 4484 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is nine 9th magnitude stars including HIP 107192 and 106869.
- One is in the IAU constellation Capricornus and is Corder 4494 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 6th – 9th magnitude stars including HIP 107304 and the double star HIP 107238.
- One is in the IAU constellation Aquarius and is Corder 4518 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 7th – 8th magnitude stars including HIP 107895, 107886, and 107816.
- One is in the IAU constellation Octans and is Corder 4521 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is seven 9th – 11th magnitude stars including the double star HIP 108162A.
- One is in the IAU constellation Cepheus and is Corder 4540 on the observing list of American astronomer Jeffrey Corder. Size 80' X 25'. This is six 7th – 9th magnitude stars including HIP 108027, 108151, 108387, and the double star HIP 208411.
- One is in the IAU constellation Cepheus and is Corder 4567 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th magnitude stars including HIP 108897 and the double star HIP 108902A.
- One is in the IAU constellation Piscis Austrinus and is Corder 4584 on the observing list of American astronomer Jeffrey Corder. Size 55' X 40'. This is six 7th – 8th magnitude stars including HIP 109116, 109189, and 109230.
- One is in the IAU constellation Cepheus and is Corder 4588 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 7th – 9th magnitude stars including HIP 109295, 109311 and the double star HIP 109254A.

- One is in the IAU constellation Aquarius and is Corder 4592 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is eight 7^{th} – 10^{th} magnitude stars including the double star HIP 109378.
- One is in the IAU constellation Lacerta and is Corder 4611 on the observing list of American astronomer Jeffrey Corder. Size 55' X 35'. This is six 7^{th} – 8^{th} magnitude stars including HIP 109503, 109706, 109727 and the double star HIP 109829A.
- One is in the IAU constellation Cepheus and is Corder 4626 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is five 8^{th} – 9^{th} magnitude stars: HD 212350, HD 212236, HD 212349, SAO 10300, HIP 109575.
- One is in the IAU constellation Aquarius and is Corder 4649 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 9^{th} – 10^{th} magnitude stars: HD 212011, HD 211895, HD 211874, SAO 191076, HD 211939.
- One is in the IAU constellation Pegasus and is Corder 4652 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is six 8^{th} – 9^{th} magnitude stars including HIP 110559.
- One is in the IAU constellation Tucana and is Corder 4656 on the observing list of American astronomer Jeffrey Corder. Size 90' X 30'. This is four 5^{th} – 8^{th} magnitude stars including HIP 110311 and 110649 and the double stars HIP 109955 and 110842A.
- One is in the IAU constellation Pegasus and is Corder 4670 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is six 7^{th} – 9^{th} magnitude stars including HIP 110809.
- One is in the IAU constellation Pegasus and is Corder 4678 on the observing list of American astronomer Jeffrey Corder. Size 75' X 45'. This is five 5^{th} – 7^{th} magnitude stars including HIP 111124 and the double stars 34, 35, and 37 Pegasi.
- One is in the IAU constellation Pegasus and is Corder 4690 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 7^{th} – 9^{th} magnitude stars including HIP 111177.
- One is in the IAU constellation Grus and is Corder 4693 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is 6^{th} – 9^{th} magnitude stars including the double star HIP 111143.
- One is in the IAU constellation Cepheus and is Corder 4742 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is eight 8^{th} – 10^{th} magnitude stars including HIP 112036.
- One is in the IAU constellation Pegasus and is Corder 4757 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 9^{th} – 10^{th} magnitude stars: SAO 127743, HIP 112435, Gaia DR3 2716343373344100960, SAO 127765, HD 215912, HD 215930, HIP 112659.
- One is in the IAU constellation Piscis Austrinus and is Corder 4803 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is six 6^{th} – 9^{th} magnitude stars including HIP 113593, 113562, 113570, 113623, and 113574.
- One is in the IAU constellation Cepheus and is Corder 4825 on the observing list of American astronomer Jeffrey Corder. Size 70' X 25'. This is twelve 6^{th} – 9^{th} magnitude stars including HIP 114307, 114070, 113947, 113793, 113249, and 113218, and the double stars HIP 113907A, 113461A, 113306A, and 113301.
- One is in the IAU constellation Grus and is Corder 4828 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 5^{th} – 8^{th} magnitude stars including Nu (v) Gruis and HIP 114127, and 113997.

- One is in the IAU constellation Tucana and is Corder 4844 on the observing list of American astronomer Jeffrey Corder. Size 7'. This is six 10th magnitude stars including the double star HIP 114582A.
- One is in the IAU constellation Cepheus and is Corder 4864 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 7th – 8th magnitude stars including HIP 114816, 114990, and 115047, and the double star HIP 114898A.
- One is in the IAU constellation Pegasus and is Corder 4866 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 8th – 10th magnitude stars including HIP 115032 and 115100.
- One is in the IAU constellation Aquarius and is Corder 4885 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 7th – 8th magnitude stars including HIP 115526 and the double star HIP 115505.
- One is in the IAU constellation Sculptor and is Corder 4888 on the observing list of American astronomer Jeffrey Corder. Size 60' X 15'. This is four 7th magnitude stars including HIP 115796, 115681, and the double star HIP 115518A.
- One is in the IAU constellation Sculptor and is Corder 4892 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is six 9th – 10th magnitude stars including HIP 115794, 115676, and 115659.
- One is in the IAU constellation Pegasus and is Corder 4904 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 7th – 8th magnitude stars including HIP 116005, 115921, and 115896.
- One is in the IAU constellation Pegasus and is Corder 4905 on the observing list of American astronomer Jeffrey Corder. Size 75' X 40'. This is seven 8th – 9th magnitude stars including HIP 115847 and the double star HIP 116067A.
- One is in the IAU constellation Pegasus and is Corder 4951 on the observing list of American astronomer Jeffrey Corder. Size 20' X 5'. This is four 8th – 9th magnitude stars including HIP 116809 and the double star HIP 116880A.
- One is in the IAU constellation Cassiopeia and is Corder 4959 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th magnitude stars including HIP 116969.
- One is in the IAU constellation Andromeda and is Corder 4977 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 8th – 9th magnitude stars including HIP 117620 and the double stars HIP 117695A and 117565A.
- One is made up of stars of the IAU constellation Taurus. It is Dezsi 13 on the list of Hungarian astronomer Attila Dezsi. It is the five stars HD 23823, HD 23852, HD 17892, HIP 17928, and Gaia DR3 64117853073517440.

Custom:

This Arabic star "Al Araph'" (العرف) is Beta (β) Virginis in the IAU constellation Virgo:

- This was later latinized to "Alaraph" in the of the *Alfonsine Tables*.
- The 1515 edition of the *Alfonsine Tables* lists this as Epsilon (ε) Virginis.
- German astronomer Johann Bayer (1572-1625) lists "Alacast", "Alcalst", "Alaraph", and "Almucedie" as names for Epsilon (ε) Virginis.
- Compare this to their manzil Unarmed High One, below.

This Hebrew asterism "Shiboleth" is the IAU constellation Virgo as listed in John Hill's *Urania* in 1754. Shibboleth is the Hebrew term for "custom". Compare this to the Arabic asterism Alaraph.

Customary Cat:

This Celtic (Gaulish) asterism "Cattos Pallucos" is the Hyades cluster in the IAU constellation Taurus (Boutet 2017). It was also known as "Cat Palug" ("defective cat") or "Catosđirai" ("cat stars").

Cut Short Hand:

There are three Arabic asterisms with the name "al-Kaff al-Jadhmā'" (الكف الجذماء):

- One, listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449) and 16th century Arabic astronomer Al Tizini is the star Gamma (γ) Ceti in the IAU constellation Cetus.
    - "al-Kaff al-Jadhmā" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - This was later latinized to "Kaffaljidhma", "Al Kaff al Jidhmah", "Kafalgidma", or "Alkaffaljidhina".
    - It is found on the Borgian globe of 1225.
    - The IAU approved the name Kaffaljidhma for the star Gamma (γ) Ceti A.
    - NOTE: Catholic librarian Giuseppe Simone Assemani (1687 - 1768) interpreted the listing on the Borgian globe as the constellation Eridanus and called it "Al Kaff Algeria".
- One is the stars Delta (δ), Mu (μ), and Xi (ξ) 1 and 2 Ceti in the IAU constellation Cetus:
    - This was later latinized to Al Kaff al Jidmah I, II, III & IV. This is one version of the "hand" of Al Thurayya (see Little Abundant One, below). It is called this as it is at the end of a shorter "arm" than the other one in that asterism. Compare this to another version of this asterism, Leprous Hand (see below).
    - NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Kaff-al-jidhmà, the maimed hand" and indicates that it was used for both of the "Cut Short Hand" asterisms listed above.
- One, "kaff al-jadmā'" is Alpha (α) Ceti (Menkar) in the IAU constellation Cetus as it appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

Cutter:

This Akkadian asterism is from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is "Zuqaqipu" (Hunger 1992, Parpola 1993), "Zuqaqīpu" or "Zuqaqipu" is the IAU constellation Scorpius.

This Persian asterism "Zuqaqipu" from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Scorpius (Boll 1918).

Cutters:

This Vedic nakshatra (lunar mansion) "Kṛttikā" (Sanskrit: कृत्तिका) , "Krittika", "Kritika", "Kṛttikās" (Ivanković 2021), or "Kārtikā" (literally "the cutters") is the Pleiades cluster in the IAU constellation Taurus (Vahia 2014). Ivanković (2021) lists it as "Kṛttikā" and translates this as "skinny", associating it to the God Agni. Ivankovic also lists the variation "Krttikah" as appearing in the *Taittirīya Brāhmana*. The six Krittikas raised the Hindu God Kārttisa, son of Shiva. It is associated with the God Agni ("fire").

NOTE: R. H. Allen in his *Star Names* in 1899 translates this as “General of the Celestial Armies” and lists the names “Krittikā”, “Karteek”, or “Kartiguey”. In the *Atharveda* and on the nakshatra list of the scholars Varahamihir and Parasara it appears as “Krttika” (Leitz 2019). W. Brennand lists this as “Critica” in his *Hindu Astronomy* in 1896 and translates this as “a razor”. Bhagwath (2019) lists the symbols associated with this nakshatra as a knife or spear.

This Javanese asterism “Krrtika”, “Kartika” or “Ketika”, is the Pleiades cluster in the IAU constellation Taurus.

This Myanmar nekkhat (lunar mansion) “Kyattika” (ကြတ္တိကာ) is the Pleiades cluster in the IAU constellation Taurus.

This Tibetan gyukar (lunar house) “Mindruk” or “Smin Drug” is the Pleiades cluster in the IAU constellation Taurus (Johnson-Groh 2013).

Cybele:

This Greek asterism “Cybele” is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. Cybele was a Greek Mother Goddess.

Cyclogon of Virgo:

This **telescopic** asterism “Cyclogónum Vírginis” is the barred spiral galaxy NGC 4902 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “I 69”. It became GC 3358 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the southern arms of this spiral galaxy are well rounded”. It comes from the Greek word kyklogonios, meaning “round and angular”.

Cyclopes:

This Greek asterism is the IAU constellation Corona Australis as listed by Hesiod (Mosenkis, date n/k). The Cyclopes were monsters exiled to Tartarus by Uranus. This is related to their asterisms Hundred Handed (see below) and Campe (see above).

Cyclops of Aquarius:

This **telescopic** asterism “Cýclops Aquárii” is the spiral galaxy NGC 7606 in the IAU constellation Aquarius. This was discovered in 1785 by William Herschel who listed it as “I 104”. John Herschel listed it as h 2228 and h 3982 and later as GC 4933 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the dark spot at the northwestern side makes this giant galaxy look like a cyclops”.

Cygnus:

The stars of this constellation show up in the skies of 382 asterisms of the sky cultures of the world.

The IAU constellation Cygnus (IAU abbreviation Cyg) was one of Ptolemy’s 48 original constellations and in his *Almagest* (2nd century) was called ’΄Ορνις (“Órnis”- see “Hen” see below).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a large bird in flight, resembling a swan.

The globe of the 2nd century Farnese Atlas depicts this constellation as a swan in flight as viewed from above (Stevenson 1921).

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Cygnus" and "Cignus".

Cygnus appears in the Leiden *Aratea* (816) as a swan in flight to our right (Katzenstein & Savage-Smith, 1988).

Cygnus appears in the 8th century *Revised Aratus Latinus*:

- In two editions (St Gall 250, St Gall 902) this looks more like a long-legged stork or heron walking to the right,
- In several editions (Paris BN 12597, Gottweig 7 (146), Siena L. IV. 25) Cygnus is standing to the right with extended wings,
- In the Dresden DC 183 and Vat Reg lat 1324 editions Cygnus is shown as a long-necked swan standing to the right
- In the Cologne 83 II edition Cygnus is moving to the left,
- In the Prague IX C 6 edition Cygnus is shown in a heraldic form.

The 9th century Berlin 130, Madrid 3307, Paris BN 8663 and Los Angeles Getty Ludwig XII 5, and Monza F.9/176 manuscripts of the *De ordine ac positione stellarum in signis* depict Cygnus facing to the front with its head turned to the right, while the Vat lat 645 manuscript shows Cygnus in profile with alongside a decorative heart. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Cygnus set against a coloured square background. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Cygnus in flight. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Cygnus flying to the right.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Cignus" and "Cygnus". The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depict Cygnus standing as if about to take flight to the left. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Cygnus standing to the right biting its breast: The two Paris manuscripts Cygnus is raising his right foot, but in the Zwettl and Klosterneuberg manuscripts he does not.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Cygnus as a swan in flight as viewed from below.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Cygnus as a swan in flight as viewed from below.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Cygnus as a hen in flight as viewed from below and labels it "sūrat al-dajāja" ("picture of the chicken").

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Cygnus as a hen in flight as viewed from below.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Cygnus as a bird in flight as viewed from below. It is not labelled and the drawing is poor.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Cygnus as a swan in flight as viewed from below. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Cygnus as a swan standing on a rock. The swan is facing to our right with neck arched and wings raised as if in annoyance.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Cygnus as a swan facing to our right with wings raised as if about to take flight.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. It lists both "Olor" (see Smell below) and "Cygnus" and depicts it as a swan standing with neck arched and wings raised as if in annoyance.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Olor aut Gallina" as a swan in flight as viewed from above.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Cygnus as a swan in flight as viewed from below. It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts it in the same fashion.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Gallina" as a swan in flight as viewed from above.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists this constellation as "AVIS" and depicts it as a swan in flight as viewed from below.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Cygnus as a swan standing with its wings outstretched.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Cygnus" as a swan in flight to our left as viewed from below.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Cigno". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Swan" and "Bird".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Cygnus as a swan in flight as viewed from below.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Cygnus” as a swan in flight as viewed from below.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Cigne” as a swan in flight as viewed from above.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Cygnus: as an eagle in flight as viewed from below.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Cygnus” as a swan taking flight to our right.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Cygnus” as a swan in flight as viewed from below.

German uranographer Johann Bayer (1572 – 1625) depicts this as a flying swan as viewed from below in his *Uranometria* in 1603. Bayer lists these names for this constellation: “Cygnus, Olor seu Auis, Ouidio Miluius, Gallina, Vultur Cadens, Myrtilus, Ledae Adulter, Hirezem, Arided, Degige vel Adegige, Digegi, Adigegi vel Adigege, Rosa, redolens Lilium”.

“Cygnus: is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a swan in flight as viewed from below.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Cisne” and “Galina” and depicts it as a swan in flight.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) list the names “Cygnus” and “Olor” for this constellation.

“Cygnus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a swan in flight as viewed from below.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Cygnus” as a swan in flight as viewed from below.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Cygnus as a swan in flight as viewed from below.

Cygnus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: It is depicted as a swan in flight as viewed from below.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Cygnus” as a swan in flight as viewed from below.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Cygnus as a swan in flight as viewed from below.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Cygnus” as a swan in flight viewed from below.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Cygnus” as a swan in flight as viewed from below.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Cyngne”, “Cygnus”, and “κύκνος” and depict it as a swan in flight as viewed from below.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Cygnus” as a swan in flight.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Cygnus as a swan in flight as viewed from below.

Cygnus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: This is depicted as a swan in flight as viewed from below.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Cygnus” as a swan in flight as viewed from below.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Cygnus” as a swan in flight as viewed from below.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Cygnus as a swan in flight as viewed from below.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Cygnus as a swan in flight as viewed from below.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Cigne” as a swan in flight as viewed from below.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Cygnus” as a swan in flight as viewed from above.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Cigne” as a swan in flight as viewed from below, as does the 1778 edition. It also appears on French charts as “Cygne”.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Der Schwan” and depicts it as a swan in flight as viewed from below.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Cigno” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Cygnus” as a swan in flight as viewed from below.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Cygnus” as a swan in flight as viewed from below.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Schwan" and depicts it as a swan in flight as viewed from below.

American uranographer William Croswell (1760 – 1834) depicts "Cygnus the Swan" on his *Mercator Map of the Starry Heavens* in 1810 as a swan in flight as viewed from below.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Cygnus in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Cygnus the Swan" as a swan in flight.

"Cygnus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and is depicted as a swan in flight as viewed from below.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Cygnus" as a swan in flight as viewed from below.

Cygnus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. Cygnus is depicted in *Urania's Mirror* as a flying swan viewed from below.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Cygnus" as a swan in flight as viewed from below.

"Cygnus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a swan in flight as viewed from below.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Cygnus, the swan".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Cygnus, The Swan" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Cygnus, the Swan".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Cygnus" in his *Star Atlas* (1893) and describes it as "The Swan".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Cygnus" and describes it as a "Swan".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Cygnus… the Swan".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Cygnus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows Cygnus as the Northern Cross asterism (see below). Rey adds lines connecting the tips of the "wings", Zeta (ζ) Cygni and Kappa (κ) Cygni, with Alpha (α) Cygni (Deneb) in the "tail". Lines from Deneb to Xi (ξ) Cygni and from Nu (ν) Cygni through Sigma (σ) Cygni to Tau (τ) Cygni have been added to form the "legs".

Sky and Telescope Magazine, founded in 1941, depicts Cygnus in their magazine and publications like this:

- The "head" and "neck" is a line from Beta (β) 1 Cygni (Albireo) to Gamma (γ) Cygni,
- The body and wings are formed by to interconnected pentagonal shapes:
    - One runs from Gamma (γ) Cygni through Delta (δ) Cygni to a "wing tip" at Iota (ι) Cygni then through Omicron (ο) 2 Cygni to Alpha (α) Cygni (Deneb) with a line running from Iota (ι) Cygni to Kappa (κ) Cygni at the "wing tip",
    - One runs from Gamma (γ) Cygni through Epsilon (ε) Cygni to a "wing tip" at Zeta (ζ) Cygni then through Nu (ν) Cygni to Alpha (α) Cygni (Deneb).

Italian astronomers call this constellation "Cigno", and the Spanish "Cisne".

Cygnus A:

This **telescopic** asterism is the galaxy PGC 63932 (3C 405, Cygnus A) in the IAU constellation Cygnus. It is also known as "Reber's of Cygnus" (see below).

Cygnus Box:

This **telescopic** asterism is in the IAU constellation Cygnus and is Leiter 7 on astronomer Frank Leiter's asterism list. This is made up of five stars, the brightest being magnitude 9.5, and is only2 arcseconds in size, so you'll need higher magnification to see it. Its size is 2' X 0.6'.

Cygnus Loop:

See Veil Nebula (below).

Cygnus Star Cloud:

This **telescopic** asterism is Sharpless SH 2-101 (LBN 168, Ced 173) in the IAU constellation Cygnus. Size 16' X 9'. It is also known as the Tulip Nebula.

Cyllarus:

This Latin asterism is the IAU constellation Equuleus. Cyllarus was the brother of Pegasus, given by the Goddess Juno to Pollux.

Cyllenius:

This Greek asterism is the IAU constellation Perseus. Johann Bayer's *Uranometria* (1603) lists "Cyllenius" for this constellation. R. H. Allen's *Star Names* in 1899 lists "Cyllenius" for this constellation. Cyllenius is a surname of the God Hermes.

Cylon Spaceship of Ophiuchus:

This **telescopic** asterism "Cylónia Ophiúchi" is the irregular galaxy NGC 6240 in the IAU constellation Ophiuchus. It was discovered by Édouard Stephan in 1871. It became GC 5833 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because to them it looked like "a Cyclon basestar spaceship as figuring in the well-known sf television series Battlestar Galactica".

Cymbal:

This German asterism “Azzango” was created from the stars of the IAU constellation Lyra by Wilhelm Schickard (1592 - 1635) according to Italian translator Giuseppe Simone Assemani (1687 – 1768). Compare this to Lyre, below.

Czar’s Cross:

This Belarussian asterism “Tsarou Krest” is the IAU constellation Cygnus (Avilin 2009). They also call it “Petrova Palka” (“Peter’s Stick”).

D:

There are three **telescopic** letter “D” asterisms:

- One is the open cluster NGC 1513 in the IAU constellation Perseus. This was discovered by English astronomer William Herschel in 1790 who listed it in his catalogue as “VII 60”. It is GC 809 in the *General Catalogue* of 1864. English Admiral Henry William Smyth described it as “in the form of a letter ‘D’” in his *Bedford Catalogue* in 1844. It is also known as the Knight’s Badge.
- One from *Pattern Asterisms* by American astronomer John A. Chiravalle is made up of eight stars in the IAU constellation Eridanus (including HIP 17017, 17079, and 17132), 6 degrees north of the Letter “F” asterism (see below). This is listed on American astronomer Jeffrey Corder’s list as Corder 565 and on Brazilian astronomer Bruno Alessi’s BDCC 7.6 catalogue. Size 45’.
- One, David’s D, is in the IAU constellation Triangulum, Collinder 21. It is made up of thirteen stars, the brightest being HIP 8545A. It is on the asterism list of English astronomer David Ratledge. Robert Zebahl lists it on his Faint Fuzzies site as a “semi circle”.

Da Huo:

This Chinese asterism “Da Huo” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Scorpius (Kotyk 2017).

Da Liang:

This Chinese asterism “Da Liang” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Taurus (Kotyk 2017).

Dabih:

See Auspice of the Slaughterer, above.

Dabih Major:

This star is Beta (β) 1 Capricorni in the IAU constellation Capricornus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this star.

Dabih Minor:

This star is Beta (β) 2 Capricorni in the IAU constellation Capricornus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this star.

Daddy of Boötes:

This **telescopic** asterism "Patérculus Boótis" is the starburst galaxy NGC 5930 (Arp 90) in the IAU constellation Boötes. William Herschel listed this as "II 651". John Herschel listed it as h 1925 and later as GC 4104 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this rather small galaxy is accompanied by an even smaller one [the Seyfert galaxy NGC 5929], like a daddy strolling with his child".

Dagger:

This German star "Pugio" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by German astronomer Johann Bayer (1572-1625).

There are two **telescopic** "Dagger" asterisms:

- One is in the IAU constellation Corona Borealis and is Corder 2817 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is eight 5^{th} – 12^{th} magnitude stars including Omicron (o) Coronae Borealis, HIP 75060, 75005, and 74944. Corder describes this as forming "the shape of a 'Dagger' or 'Angel'".
- One is the Seyfert II galaxy IC 2461 in the IAU constellation Lynx. This was discovered in April 1900 by French astronomer Steven Javelle. This name was posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in February 2022.

Dagger of Leo:

This **telescopic** asterism "Púgio Leónis" is the spiral galaxy NGC 3495 in the IAU constellation Leo. It was discovered in 1786 by William Herschel who listed it as III 498". It became GC 2279 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Dagon:

This Syrian name "Dāgōn" is given for the IAU constellation Cetus in John Hill's *Urania* in 1754. Dagan or Dagon is an ancient Syrian God of prosperity. R. H. Allen associates it with Pisces in his *Star Names* in 1899.

This asterism is the IAU constellation Pisces as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17^{th} century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a mermaid with a male figure in the palm of her left hand and a bent stick in her right hand and also gives the name "Ichthion" (see Ichthion, below). The stars of Pisces did not appear in any ancient Egyptian asterism and its stars appeared in the Seleucid asterisms "Tails" (see below) and "Swallow" (see below). Brennan attributes this name for this constellation to the 5^{th} century Roman author Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennand writes that Pisces was associated with "Nephlis, the Greek Venus". Of course, Venus is a Roman Goddess: The Greeks called her Aphrodite. The ancient Egyptians had several Goddesses associated with love, but the only Egyptian Goddess with a name similar to this was Nephthys, who was a funerary Goddess of grief and unrelated to Venus. Dāgōn

or Dagan was an ancient Syrian God of prosperity which the associated with the IAU constellation Cetus, not Pisces (see above).

Dalim:

See Ostrich, below.

Dam:

This English star is Theta (θ) Eridani in the IAU constellation Eridanus as listed in R. H. Allen's *Star Names* in 1899. Allen attributes it to English orientalist Thomas Hyde (1636 – 1703).

Damu:

This Chaldean asterism "mul da-mu" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified. Damu was a Mesopotamian God of vegetation, later a God of healing.

Dance:

This Kiribati star "Batere" or "Nei Batere" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Trussel and Groves 1978).

Dance of the Widows:

This Sardinian asterism "Su Ballu de sas Fiudas" is the IAU constellation Corona Borealis (Putzolu 2019).

Dancer:

There are two Arabic asterisms with this name:

- One is the star "'ar-Rāqiṣ", "Ar-Raaqis", or "Ar-Raaqiss" (الراقص) which is translated as "dancer" or as "trotting camel" is the star Mu (μ) Draconis:
  - This was later latinized to . "Arrakis", "Alrakis", or "Errakis".
  - It appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
  - American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "El Rakis".
  - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al rákis, the trotter" as well as "El rákis, the dancer or leaper".
  - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "er Rakis": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
  - The IAU approved the name Alrakis for Mu (μ) Draconis A.
- One "Al-rāqes" is the IAU constellation Hercules as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Latin asterism "Saltator" is the IAU constellation Hercules. Johann Bayer's *Uranometria* (1603) lists "Saltator". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Saltator.

This Ainu Nociw ("asterism") "Upopo Keta" (ウポポ ケタ) is the Big Dipper asterism in the IAU constellation Ursa Major. This represents a dancing bearded male: His head is Beta (β) Ursae Majoris (Merak), his right elbow Alpha (α) Ursae Majoris (Dubhe), and his left elbow Gamma (γ) Ursae Majoris.

The line of stars Delta (δ) Ursae Majoris, Epsilon (ε) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Eta (η) Ursae Majoris is his body down to his feet at Eta (η) Ursae Majoris.

Dancers:

This Iroquois asterism is the Pleiades cluster in the IAU constellation Taurus.

This Greek asterism "Choreutae" ("dancers" as listed in the *Scolia Basileensia* and by Hyginus), "Circenes" ("circuses" as listed in the *Aratus Latinus*), or by the Latin name "Saltatores", is a group of stars in the IAU constellation Ursa Minor: Alpha (α) Ursae Minoris (Polaris), Beta (β) Ursae Minoris (Kochab), Gamma (γ) 1 and 2 Ursae Minoris, Delta (δ) Ursae Minoris, and Epsilon (ε) Ursae Minoris. This is listed in Robert Hues' *A Learned Treatise of Globes* in 1659 and in R. H. Allen's *Star Names* in 1899. Compare this to Players, below.

Dancing:

This **telescopic** Trinidad and Tobago star "Dingolay" ("dance", "twist", or "turn") is HIP 54158 (HD 96063) in the IAU constellation Leo (magnitude 8.25). It was given the name Dingolay in the IAU NameExoWorlds campaign. It has an exoplanet named Ramajay ("sing" or "make music").

Dancing Girl of Canes Venatici:

This **telescopic** asterism "Orchéstris Cánum Venaticórum" is the barred spiral galaxy NGC 4145 in the IAU constellation Canes Venatici. William Herschel listed this as "I 169". John Herschel listed it as h 1105 and later as GC 2750 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Dancing Girl of Centaurus:

This **telescopic** asterism "Saltátrix Centaúri" is the intermediate spiral galaxy NGC 4947 in the IAU constellation Centaurus. It was discovered by John Herschel in 1834 who listed it in his *General Catalogue* of 1864 as GC 3388. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "elegant whirling spiral arms". NOTE: Lewis Swift observed this in 1898 and entered it in the Index Catalogue as IC 3974.

Dancing Master of Andromeda:

This **telescopic** asterism "Chorodidáscalus Andrómedae" is the interacting galaxy UGC 1810 (Arp 273) in the IAU constellation Andromeda. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Galactic Trainwreck".

Dancing One of Pegasus:

This **telescopic** asterism "Orchésis Pégasi" is the interacting galaxies UGC 12914 and UGC 12915 in the IAU constellation Pegasus. It was discovered by A. G. Wilson in the 1950s. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "UGC 12914 and its companion UGC 12915 form a dancing pair". It is also known as the "Taffy Galaxies" (see below).

Dancing Pair of Pegasus:

This **telescopic** asterism "Orchésis Pégasi" is the interacting galaxies UGC 12914 and UGC 12915 in the IAU constellation Pegasus. It was discovered by A. G. Wilson in the 1950s. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "UGC 12914 and its companion UGC 12915 form a dancing pair". It is also known as the "Taffy Galaxies" (see below).

Dancing Woman of Eridanus:

This **telescopic** asterism "Baccibállum Erídani" is the elliptical galaxy NGC 1395 in the IAU constellation Eridanus. It was discovered in 1784 by William Herschel who listed it as "I 58". It became GC 746 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They explain their name thus: Bacciballum is a hapax (a once-only non-recurring word) in ancient literature. It was once used by Petronius, indicating a lovely charming woman. The word is derived from bac(c)a, a berry, and ballare, to dance. The name emphasizes the beautiful round form of this galaxy."

Dandedare Pila:

This Kolam asterism is a spiral of stars believed to be the "tail" of the IAU constellation Scorpius (Vahia 2014).

Dandelion:

There are three **telescopic** "dandelion" asterisms:

- One is Vastagh 22, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 1° 50'. Vastagh describes it as a "'Dandelion' with a broken stem, with a long stem. His head is already small and thin. Cassiopeia must be bored: it was a toy, now it lies discarded on the velvet of the sky meadow. The number of its members is ~60, and its total brightness is high. Cascade type [asterism] that ends in a grouping… Appears with Berkeley 61 NY. Its surroundings are also interwoven with star trails. Towards the DRC, the head of the dandelion connects to another cascade of rare but bright members."
- One is the Cosmic Dandelion, NGC 6520 in the IAU constellation Sagittarius, which was initially discovered by English astronomer William Herschel in 1785 who listed it as "VII 7". It is GC 4358 in the *General Catalogue* of 1864. This is also known as the Dead Man's Chest (see below) and the Castaway Cluster (see above).
- One is nebulosity surrounding Wolf-Rayet star WR 134 in the IAU constellation Cygnus. This open cluster discovered by British astronomer John Herschel in 1828. Canadian astrophotographer Oleg Bouevitch, taking an SHO image of this cluster 17 August 2025, discovered a round nebula, likely a supernova remnant, in this cluster. His daughter named it "Dandelion" Size 35'.

Dandelion Puffball:

See Glowing Eye nebula, below.

Danger:

This Chinese star “Wei” from the Three Kingdoms to the Ming Dynasty is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major.

Daniela Alejandra Ayala:

The location of this Northern Andes asterism is uncertain but is in the center of the sky at nightfall of the female equinox (Quinatoa 2018).

Daniel’s Lion:

This asterism is the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899. Allen attributed it to people “who figured Biblical characters throughout the heavens in place of the old mythology” but did not name a specific culture. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 attributes it to “Stower’s celebrated manuscript Almanac of 1386”.

Danu:

This Celtic (Irish) asterism may be the IAU constellation Aquarius. Danu was a mother-Earth Goddess who appears in various forms in Celtic mythology (Mosenkis, date N/K).

This Myanmar yathi (zodiac constellation) “Danu” (ဓနု) is the IAU constellation Sagittarius.

Dapi’chi:

This Toba asterism “Dapi’chi” is the Pleiades cluster in the IAU constellation Taurus (Gómez 2011). The meaning of this depends on the Toba community involved: The Tobas from Tartagal and Monte Caramelo see it as a “high Uranus God”, another community sees it as a big bonfire, another as some boys, and yet another as some carob flour spilled on the ground around a mortar. Many other Tobas identify it as an old man who is seen as being in charge of frost and cold.

Dark Camel:

This Arabic star is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major. It is also known as The Oryx.

Dark Canopus:

“Il Canopo Fosco” is the name given to the Coal Sack Nebula (see Coal Sack Nebula above) by the by Italian merchant and navigator Amerigo Vespucci.

Dark Cigar:

This **telescopic** asterism “Dunkelzigarre” (“Dark Cigar”) is the dark nebula Barnard 168 in the IAU constellation Cygnus. Size 100’X 20’. René Merting describes it on the *Faint Fuzzies* website: “The dark nebula starts faintly in the west and then pulls east as a dark well-defined tube… south of the nebula a prominent star chain pulls from SW to NE and ends near Cr 470.” It is also known as the Caterpillar Nebula (see above) and the Asphalt Path (see above).

Dark Doodad:

This asterism is a dark nebula near the globular cluster NGC 4372 (Caldwell 108) in the IAU constellation Musca. It was discovered by James Dunlop and became h 3390 in John Herschel’s catalogue and later GC

2927 in the *General Catalogue* of 1864. It was named by American amateur astronomer and author Dennis di Ciccio in 1986.

Dark Dust Nebula:

This **telescopic** asterism is the HII region SH 2-63 (LBN 86) in the IAU constellation Sagittarius. This name appeared on the *Astrophotography* page of Facebook in a photo by Polish astrophotographer *Cmk Photo* on 23 August 2025. It is also known as the "Eagle Ray" or the "Cosmic Sailor".

Dark Green:

This Arabic star "al-akhdar" is from the rain star calendar of Qushayr (Adams 2016). The identity of this star is uncertain, but it must have set in the west after the Two Vultures (see below) and before the Cross Bar of the Well (see above).

Dark Horse Nebula:

This **telescopic** asterism is dark nebula the Dark Horse, Great Dark Horse, or the Prancing Horse is in the IAU constellation Ophiuchus. This contains the Pipe Nebula (see below).

Dark One:

This Greek star "Celaeno" or "Celeno" is 16 Tauri in the Pleiades cluster in the IAU constellation Taurus. This is the name of one of the Pleiades sisters and the daughter of the Titan Atlas and this star is part of the Pleiades cluster:

- Scottish uranographer Alexander Jamieson (1782 – 1850) list it as "Celino" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Celino": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Celaeno" for this star.
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Celieno".
- The IAU approved the name Celaeno for 16 Tauri.

Dark Rift:

See Great Rift, below.

Dark River:

See Great Rift, below.

Dark River Clouds:

See Ophiuchus Nebula, below.

Dark Shark Nebula:

This **telescopic** asterism is dark nebula is LDN 1235 in the IAU constellation Cepheus. It is also known as the Shark Nebula (see below). LDN 1235 is the spot in the "shark's head". vdB 149 and 150 are two blue reflection nebula on either side of the "shark's neck". Spiral galaxy PGC 67671 appears behind the "dorsal fin".

Dark Skin:

This Mapuche asterism is a dark nebula in the Milky Way.

Dark Whale:

This **telescopic** asterism "Tenebrosus Céti" is the spiral galaxy NGC 45 in the IAU constellation Cetus. It was discovered by John Herschel in 1835. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has a low surface brightness.

Dark Wolf Nebula:

This **telescopic** asterism is dark nebula is Barnard 228 in the IAU constellation Lupus.

Darkening:

This Celtic (Gaulish) asterism "Dumanni Prinnios" ("arborescence/darkening/tree structure of darkening") is the IAU constellation Sagittarius and appears in the Coligny calendar (Boutet 2001, 2017). Compare to their asterism Month of Fumigations Guiding Star (below).

Darkness:

This Arabic star "al-Dhulaīm" is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus:

- "al-Dhulaīm" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Edward Sherburne lists it as "Al Dalim" in his Sphere of Marcus Manilius in 1675 which he translates as "Agger" ("embankment").
- Italian astronomer Giuseppe Piazzi gave it the latinized name "Dalim" in his Palermo Catalogue in 1803.
- English Admiral Henry William Smyth's Bedford Catalogue in 1844 lists "Dhalim" but incorrectly translates it as "the ostrich" and attributes this to "Bedawi Arabs": The Arabic star Ostrich ("al Thalim" is Alpha (α) Piscis Austrini (Fomalhaut).

This **telescopic** Bengali star "Timir" is HIP 80687 (HD 148427) in the IAU constellation Ophiuchus (magnitude 6.89). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Tondra, which means "nap".

Darkness Stars:

This Yucatec asterism "Ekel Ek" may be the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above) and represents a starry ball court.

Dart:

This **telescopic** asterism is the open cluster NGC 6400 in the IAU constellation Scorpius. It was discovered in 1826 by the Scottish astronomer James Dunlop who listed it as 'Dunlop 568". John Herschel listed it as h 3696 and later as GC 4313 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a dart 8 arcminutes long.

This Latin asterism "Jaculum" ("dart" or "javelin") is the IAU constellation Sagitta. The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Jaculum" as a name for Sagitta. John Hill

lists it simply as “Dart” in his *Urania* in 1754. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Jaculum”.

Darth Vader’s Starfighter:

This **telescopic** asterism is the galaxy NGC 936 in the IAU constellation Cetus. This was discovered by English astronomer William Herschel in 1785, who listed it as IV 23. It is listed as GC 544 in the General Catalogue of 1864. Stephen James O’Meara gave it this name in 2011 in his *Deep-Sky Companions*. It is also known as Darth Vader’s Galaxy. It is also known as the “Dish of Cetus” (see below).

Darts:

This Hawaiian asterism “Na Kao” is the belt of Orion in the IAU constellation Orion.

Date Clusters:

This Arabic asterism is a line of stars with three more branching off of it in the IAU constellations Centaurus, Crucis, and Hydra: The line starts at Xi (ξ) Hydrae and runs through HIP 57443 to HIP 57803, where two lines branch off:

- One line runs through Gamma (γ) Centauri, Epsilon (ε) Centauri, Beta (β) Centauri (Al-Muqil) and ends at Alpha (α) 1 Centauri (Rigil Kentaurus).
- One line runs to Delta (δ) Centauri and then splits again into two lines:
    - One line runs through Gamma (γ) Crucis to Beta (β) Crucis (Mimosa), and
    - One line runs through Delta (δ) and Epsilon (ε) Crucis to Alpha (α) Crucis (Acrux).

Date Palm Fruit:

This Persian asterism “Ihlilagji” is the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899.

This Latin asterism “Myrobalanum” is the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899. Allen notes that English orientalist Thomas Hyde (1636 – 1703) called it “Myrobalanaris”, describing it as a geometrical figure and that German astronomer Christian Ludwig Ideler (1776 – 1846) described it as consisting of stars in the IAU constellations Camelopardalis and Ursa Minor: Alpha (α) Ursae Minoris (Polaris), Delta (δ) Ursae Minoris, Epsilon (ε) Ursae Minoris, Zeta (ζ) Ursae Minoris, Eta (η) Ursae Minoris, Gamma (γ) Ursae Minoris, Beta (β) Ursae Minoris (Kochab), a Ursae Minoris, and b Ursae Minoris plus “stars in the head of Camelopardalis”.

Daughter of Minos:

This Italian asterism “la Figliuola di Minoi” is the IAU constellation Corona Borealis as described by Italian poet Dante Alighieri (1265 – 1321).

Daughter of the Elder:

See Bier of Lazarus, above.

Daughter of Ursa:

This French asterism “Filia Ursae” is the IAU constellation Ursa Major as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Daughters of Na'sh:

This Bedouin asterism "Banāt Naʿš" (بنات نعش) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above). These seven daughters are carrying the bier of their father, the Arabic hero Al Na'ash, who was killed by Al-Jady or al-Ǧady (Polaris). It is related to their asterism Two Guards (see below):

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Benat na'sch" and "Serir benat na'sch, throne of Benat na'sch".
- R. H. Allen writes in his *Star Names* in 1899 that the star Mizar is seen as holding an infant daughter (the star Alcor). Compare this to Daughters of the Bier, below.

This Arabic asterism "Bani Na'sh" is the Big Dipper asterism in the IAU constellation Ursa Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Daughters of the Bier:

There are two Arabic versions of this asterism:

- One, "Banāt un-Naʿash" (بنات النعش) is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major:
    - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the name "ha-me'ir mi-benot".
    - This appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - German uranographer Johannes Stöffler's Constance Celestial Globe (1493) lists this star as "Bennetnatz".
    - This was later latinized to "Benetnash", "Benetnasch" and the "Benenas", "Benethasch", and "Beneath As" by John Chilmead (1899) and German orientalist Jakob Christmann (Christmannus- 1554 – 1613).
    - The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists "Bemaziz" for this star.
    - Johann Bayer's *Uranometria* (1603) lists the names "Benenaim", "Benenatz", and "Benetnasch" for this star.
    - Gores for a celestial globe Bibliothèque Nationale de France, Department Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this star "Beneth As".
    - Robert Hues lists it as "Beneth As", "Benethasch", and "Benenas" in his *A Learned Treatise of Globes* in 1659 and translates this as "filium ursa" which means "bear's son".
    - This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Benet Aa".
    - German astronomer Johann Bayer (1572-1625) listed "Benenaim", "Bennenatz", "Benetenasch" and Benenacx".
    - The 1521 edition of the *Alfonsine Tables* lists "Bennenazc" (Kunitzsch 1986)
    - Italian astronomer Giovanni Batista Riccioli (1598 – 1671) lists "Benat Elnanschi", "Beninax", "Benenath", and "Benenatz".

- Dorn (1829) lists this as “Benat-nash” and attributes it to Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists the name “Benena” (Dekkker 2000).
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “Benenaz” (Dekker 2000).
- American uranographer William Croswell (1760 – 1834) lists this star as “Benetnasch” on his *Mercator Map of the Starry Heavens* in 1810.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) as Benetnasch”. Compare this to Daughters of the Lesser Bier, below, and Daughters of Na’sh, above.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Benetnasch” in his *Celestial Atlas* in 1822.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists this star as “Benetnatsch”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as “Benetnasch”.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as “Benetnasch”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Benetnasch”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Benetnasch”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Benetnasch”.
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list “Benetnasch” for this star.

- One is the asterism “Banāt Naʿesh al-Kubra” (“great daughters of the bier or coffin”) or “Banāt Naʿash al Ḳubrā” and is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars.* Compare this to Daughters of Na’sh, above.

This asterism was listed by German astronomer Petrus Apianus in 1533 in his *Horoscopion Apiani General*. It represents three female figures in front of a seated woman and is made up of stars between the IAU constellations Draco and Ursa Minor. The three women stretch between Alpha (α) Ursae Minoris (Polaris) and Zeta (ζ) Ursae Minoris. The “head” of the seated woman is the “bucket” of the Little Dipper and the “chair” she is seated on is the tail end of the constellation Draco. Although no translations of Persian astronomer 'Abd al-Rahman al-Sufi’s *Book of Fixed* stars were available to him at that time in history, it appears that Apianus was influenced by the *Book of Fixed Stars* in creating this asterism as this asterism earlier appeared in Arab sky lore (see Daughters of Na’sh and Daughters of the Bier, above).

John Hill lists the Latin name “Feretrum Majus” (“the bier”) in his *Urania* in 1754.

Daughters of the Lesser Bier:

This Arabic asterism “Banāt al Naʿash al Ṣughrā” is the IAU constellation Ursa Minor. Compare this to Daughters of the Bier, above.

Daughters of the Night:

This Ayt Xebbac asterism “Tintsḍiṣ” (Arabic “Ettṛeyya”) is the Pleiades cluster in the IAU constellation Taurus (Souag 2019).

Daughters of the Sky God:

This Nama asterism includes the Pleiades cluster in the IAU constellation Taurus, Alpha (α) Tauri (Aldebaran) in the Hyades cluster in the IAU constellation Taurus, and the IAU constellation Orion. Aldebaran was the husband of the daughters of the sky god: The Pleiades were the daughters of the Dawn or Sky God Tsui Goab. When the husband shot his arrow (Orion’s sword) at three zebras (the belt of Orion) it fell short. He didn’t recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching in ambush.

The San (Ju/Wasi) asterism is identical to the Nasa asterism above.

Daughters of the Tabernacle:

This Italian asterism “Filiae Tabernaculi” ” is the Pleiades cluster in the IAU constellation Taurus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671) and by R. H. Allen in his *Star Names* in 1899.

Dauntless of Cetus:

This **telescopic** asterism “Intrépida Céti” is the interacting galaxies NGC 1141 and 1143 (Arp 118) in the IAU constellation Cetus. These were discovered by German astronomer Albert Marth in 1864. They became GC 5287 and GC 5288 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

DAVe:

This asterism consists of stars from three different IAU constellations: Alpha (α) Cygni (Deneb- 19th brightest star) in the IAU constellation Cygnus, Alpha (α) Aquilae (Altair- 12th brightest star) in the IAU constellation Aquila, and Alpha (α) Lyrae (Vega- 5th brightest star) in the IAU constellation Lyra. The Halifax Centre of the RASC calls this “DAVe” (“Deneb, Altair, Vega”), a name attributed to Chris Young (Dave Chapman 2023).

David:

This German asterism “David” or “King David” is the IAU constellation Perseus as listed by German astronomer Wilhelm Schickard (1592 – 1635), who described it as “David with the head of Goliath”. “David” is listed as an alternate name for this constellation in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Rex David”. English Admiral Henry William Smyth lists Davic in his *Bedford Catalogue* in 1844, as does R. H. Allen in his *Star Names* in 1899: Both Smyth and Allen list Schickard and Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?) as having used this name. Edward Sherburne lists “David with the Head of Goliath” in his Sphere of Marcus Manilius in 1675 and attributes it to Schickard. John Hill lists both Schickard and German uranographer

Julius Schiller as the source in his *Urania* in 1754. Stevenson (1921) writes that "King David" appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627).

This German asterism "Saint David" is the IAU constellation Canis Major as listed by German uranographer Julius Schiller (c. 1580 – 1627). This appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

This Italian asterism is the IAU constellation Lyra as depicted on the 1710 globe of Italian monk and uranographer Amantius Moroncelli (Stevenson 1921).

David with the Head of Goliath:

This asterism "Davides cum Capite Goliathi" is an alternate name for the IAU constellation Perseus and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

David's Chariot:

This French asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Ottescu 2009). The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Chariot de David" for this constellation.

David's Crown:

This German asterism is the IAU constellation Corona Australis as listed in Edward Sherburne's Sphere of Marcus Manilius in 1675 and in John Hill's *Urania* in 1754. Both attribute it to "Hartsdorf" or "Harsdorfius", which would be German poet, jurist and translator Georg Philipp Harsdörffer (1607 – 1658). NOTE: "Corona Regis Davidis" is listed as an alternate name for Corona Borealis in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

David's Harp:

This German asterism is the IAU constellation Lyra as listed in John Hill's *Urania* in 1754. He attributes it to German astronomer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists it in his Sphere of Marcus Manilius in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as the "harp of David".

David's Wife:

This asterism "Davidis Uxorem" is the IAU constellation Andromeda and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Dawn:

This Estonian star "Koit" is XO-4 in the IAU constellation Lynx. This has an exoplanet named Hāmarik, which is their word for "dusk".

Dawn Heart's Child:

This /Xam star "Kó-G!nuin-Tára" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Dechend 1975, Alcock 2014). It is the child of Dawn's Heart (Venus). Dechend lists it as the child of Jupiter. See Dawn's Heart in Volume 5.

Dawn Star:

This Dëne Suhne star “yełká tthél” is unidentified at present (Cannon 2021).

Dawn’s Great Stars:

This Romanian asterism is made up of stars in the IAU constellations Canis Major, Orion, and Taurus (Ottescu 2009). This is Alpha (α) Tauri (Aldebaran), the belt of Orion, and Alpha (α) Canis Majoris (Sirius).

Day Star:

This Norse star “Dagstjarna” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Persson 2022). This name, “Dagstjerne”, is still used in parts of Norway. Its rising in late winter and early spring indicated the return of the Sun. There is an old Swedish Christmas song which is sung when Arcturus is rising:

“There is no sign of dawn, Even if it seems to be, It is the shining star, Promising the day to come”

This Saxon star “Tagstern” is Alpha (α) Boötes (Arcturus) in the IAU constellation Boötes as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). Reuter (1934) listed it as “Tag Stern”, coming from the Old High German “tagasterno”.

This Icelandic star “Morgun Stjarna” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by Bender in 2020 and Cleasby and Vigusson in 1874.

De Mairan’s Nebula:

This **telescopic** asterism is HII region de Mairan’s Nebula or Mairan’s Nebula is Messier 43 (NGC 1982) in the IAU constellation Orion. It is named for French astronomer Jean-Jacques Dortous de Mairan, who discovered it before 1731. It is GC 1185 in the *General Catalogue* of 1864.

Dead:

This Estonian star “Surnu” is Zeta (ζ) Tauri in the IAU constellation Taurus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006). This is related to the Estonian mythical entity “Liiva Annus” or “Surm” which represents death.

Dead Horse:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. This is made up of stars of the IAU constellation Cygnus. The central star is HIP 102431, from which three lines of stars emerge:

- One runs through HIP 101164 to 26 Cygni,
- One runs to 33 Cygni, and
- One runs to HIP 103598.

Dead Man’s Chest:

This **telescopic** asterism is the open cluster NGC 6520 in the IAU constellation Sagittarius, which was discovered by English astronomer William Herschel in 1785 who listed it as “VII 7”. It is GC 4358 in the *General Catalogue* of 1864. This is a reference to the fictional song “*Fifteen Men on the Dead Man’s Chest*” from Robert Louis Stevenson’s 1883 novel *Treasure Island*, later expanded in Young E. Allison’s 1891 poem *Derelict*. Dead Chest is the name of one of the British Virgin Islands near Deadman’s Bay which Stevenson found in a book of island names by Charles Kingsley, who was writing in 1871. Although I do not know who assigned this name to this open cluster, it can’t predate Stevenson’s

novel. This is also known as the Cosmic Dandelion (see Dandelion, above), and the Castaway Cluster (see above).

Deaf:

This Weilwan star “Wumba” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Death:

This is the Mayan asterism “Kimi”, a triangle of stars in the IAU constellations Leo and Hydra: Xi (ξ) and 43 Leonis and Iota (ι) Hydrae.

Death Star:

This Akkadian asterism “Mulu Bat” is Iota (ι) Virginis in the IAU constellation Virgo as listed by German orientalist Fritz Hommel (1854 – 1936) and R. H. Allen in his *Star Names* in 1899.

Death’s Head Nebula:

This **telescopic** asterism is the HII region NGC 2467 (SH 2-311, RCW 16, LBN 1065, Cr 164, Ced 103) in the IAU constellation Puppis. This was discovered by English astronomer William Herschel in 1784 who listed it as “IV 22” in his catalogue. It is GC 1589 in the *General Catalogue* of 1864. This is O’Meara 39 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007), where the names “Skull and Crossbones Nebula” and “Mandrill Nebula” are listed. On 2025 February 19, Denis Mainville listed it on the RASC Facebook page as the “Death’s Head Nebula”. It is also known as the Chained Broach Nebula (see above).

Deborah:

This German asterism is the IAU constellation Cassiopeia as listed in R. H. Allen’s *Star Names* in 1899, meant to depict Deborah sitting in judgement under a palm tree in Mount Ephraim.

Decacord:

This Latin asterism “Decachordum” is the IAU constellation Lyra. This was a ten stringed lyre.

Decayed Mortar:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Grus: Mu (μ) 2 Gruis (the determinative star), Alpha (α) Gruis, Beta (β) Gruis, and Rho (ρ) Gruis.

This Chinese xing guan “Bàijiù” (败臼) is a quadrilateral of stars in the IAU constellations Grus and Piscis Austrinus: Gamma (γ) and 19 Piscis Austrini and Gamma (γ) and Lambda (λ) Gruis. It is attached to the larger xing guan “Materials for Making Tents” (see below).

This Chinese Chenzhuo xing guan “Bàijiù” is a curved line of four stars in the IAU constellation Piscis Austrinus: Epsilon (ε) Piscis Austrinus, Beta (β) Piscis Austrinus, Nu (ν) Piscis Austrinus, and Iota (ι) Piscis Austrinus.

Deceptive of Virgo:

This **telescopic** asterism “Ludificátrix Vírginis” is the elliptical galaxy NGC 5576 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “I 146”. It became GC 3851 in the

General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the redshift values of NGC 5576 and its northern neighbour NGC 5577 [GC 3855] differ less than the redshift values of NGC 5576 and the southern companion NGC 5574, it seems that NGC 5576 and NGC 5577 are the true couple, notwithstanding the larger apparent distance. However, close inspection of high quality pictures show that there is a physical connection between NGC 5576 and NGC 5574 [I 145, GC 3850]; so it is to be concluded that they form a real couple. Hence, NGC 5576 is an enigmatic partner, deceiving the honest observer."

Decorated With a Star of Leo:

This **telescopic** asterism "Astridecórus Leónis" is the spiral galaxy NGC 3338 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "II 77". It became GC 2175 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to a foreground star.

Deep Beginning:

This Dagon asterism "To Polo" is the IAU constellation Canis Major. They viewed these stars as eight seeds created by their creator God Amma, and these represented the eight brightest stars in Canis Major. The star Beta (β) Canis Majoris (Mirzam) was the first to rise.

Deep Space in a Reef:

This Kiribati star "Mataro" is currently unidentified (Trussel and Groves 1978).

Deeply Cut of Virgo:

This **telescopic** asterism "Incisus Vírginis" is the barred spiral galaxy NGC 5020 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 129". It became GC 3450 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the large, sharp-edged empty region at the western side of this galaxy".

Deer:

This Egyptian asterism is one of the paranatellonta of the decans of Pisces as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Camelopardalis.

This asterism "Cerua" is the IAU constellation Cassiopeia. This name is listed in Johann Bayer's *Uranometria* (1603) and attributed to Arab sources and the bishop Synesius (373 – 414 C.E.).

This Indian asterism "Mriga", described in the *Rigveda*, is the IAU constellation Orion. The acronical rising of Orion (or specifically the "deer's head" or "śīrṣa") corresponded to the Vedic month "Mārgaśīrṣa" (Ivanković 2021). R. H. Allen lists it as "Mrigaçiras" in his *Star Names* in 1899 (see Deer's Head, below). The deer is pursuing the roe "Rohini" (see Red One, below) that is the star Alpha (α) Tauri (Aldebaran). In this version of the story, Prajapati (an aspect of Brahman) takes the form of a male deer to pursue Rohini, who is his daughter Ushas in the form of a female deer. Prajapati's good twin Rudra is a hunter pursuing them (see Rudra, below). The stars of the belt of the IAU constellation Orion represent three other Gods:

- Agni (“fire”): the God Rudra, who is another aspect of Prajapati (see Rudra, below) is Zeta (ζ) Orionis (Alnitak),
- Soma (“moon” or “celestial drink”) is Epsilon (ε) Orionis (Alnilam), and
- Vishnu is the star Delta (δ) Orionis (Mintaka).

This Greek lunar mansion is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as “Sextans, Crater, or Coma Berenices”.

This Kolam asterism “Mekam” is made up of stars between the IAU constellations Centaurus and Hydra (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

This Banjara asterism “Halni”, “Halini”, or “Harini” is the IAU constellation Orion (Vahia et al 2014).

This Tupi Guarani asterism, “Veado” is made up of the stars of the IAU constellations Carina, Crux, Musca, and Vela:

- The “tail and hind quarters” is the IAU constellation Crux,
- The “head” is an oval of stars: Lambda (λ), d, e, Gamma (γ), B, A, C, D, and c Velorum,
- The “ears” are lines that run up from Lambda (λ) Velorum to the stars Psi (ψ) and k Velorum,
- The “neck” is the triangle of stars Kappa (κ) and Delta (δ) Velorum and Iota (ι) Carinae, and
- The “feet” are the stars Beta (β) Carinae (Miaplacidus) and I Carinae, and Gamma (γ) and Delta (δ) Muscae.

NOTE: The hindquarters of Veado overlaps the “head” of their asterism “White Ostrich” (see below).

This asterism “Cervus” is the IAU constellation Monoceros and was given this name by English astronomer Richard A. Proctor in 1870 as he believed that shortening the name would make more room on astronomical charts. Proctor’s *A New Star Atlas* (1887) lists it under the original name “Monoceros”.

This Lithuanian asterism “Elnias” is the IAU constellation Scorpius (Vairkünas 1999).

This Ikoots asterism “Šikwïw” is five stars in the IAU constellation Sagittarius.

This Tepehuán asterism is the belt of Orion in the IAU constellation Orion.

This Skidi Pawnee asterism is the belt and sword of Orion in the IAU constellation Orion.

This Mayan asterism is made up of the stars of the IAU constellation Sagittarius and is mentioned in the Paris Codex. The K’iche name for Scorpius is “under the deer’s leg”, which suggests this asterism, although it is uncertain exactly which stars where involved (Sokol 2022).

This early Celtic (Gaulish) asterism “Sidos” is made up of stars of the IAU constellations Virgo and Libra (Boutet 2017). Compare this to their asterism Fawn (see below) and Livestock (see below).

This Carib asterism “Awoyoyuman” or “Awoyo” represents the deer (Cervidae). Its present location is unknown (Magaña, and Jara, 1982).

Deer and Arrow:

This Kazakh, Kyrgyz, Tibetan, Tuvan, Altai, Khakas, Teleut, Telengit, Tofalar, Buryat, and Mongol asterism is the belt and sword of the IAU constellation Orion (Berezkin 2005). The three stars of the belt are a

deer (or antelope in some versions) and the “sword” an arrow (in later versions a bullet) shot at the animal.

This Mohave, Kumeyaay, Cocopah, Seri, Ivilyuqaletem, Payómkawichum, Kuupangaxwichem, Western Apache, Mescalero, Lipan, Southern Ute asterism is the IAU constellation Orion (Berezkin 2005). The stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) are the hunters, the sword of Orion their arrow, and the belt of Orion a single animal.

Deer Horn:

This Sardinian asterism “su corru 'e chervu” is the IAU constellation Perseus (Putzolu 2019).

Deer Horns:

This Palikur asterism “Gituw” is the “tail” of the IAU constellation Scorpius (Green and Green 2011). This deer is being hunted by their asterism Two Jaguars (see below).

Deer Hunter:

There are two Vedic asterisms with the name “Mrgavyadha” or “Mrigavyadha”:

- One is the IAU constellation Canis Minor.
- One is the star Alpha (α) Canis Majoris (Sirius). R. H. Allen lists this as “Mrigavyadha” in his *Star Names* in 1899 and translates this as “hunter” and Holberg (2007) also lists this translation. Compare this to “Lubdhaka” (see Deer Slayer, below).

Deer Lick Group:

This **telescopic** asterism is a group of galaxies in the IAU constellation Pegasus. It is centered on the spiral galaxy NGC 7331 (Caldwell 30), with four other galaxies around it:

- Lenticular galaxies NGC 7335 and 7336,
- Barred spiral galaxy NGC 7337, and
- Elliptical galaxy NGC 7340.

Deer Sisters:

This Paiute asterism is the Pleiades cluster in the IAU constellation Taurus. The Deer Sisters play with the Grizzly sisters (see below) which is the IAU constellation Aries.

Deer Skull:

This **telescopic** asterism is the open cluster NGC 2527 in the IAU constellation Puppis. It was discovered by English astronomer William Herschel in 1784 who listed it as “VIII 30” in his catalogue. It is GC 1624 in the *General Catalogue of 1864*. It was given this name by American astronomer Wayne Schmidt, who describes it as a wedge-shaped deer skull.

Deer Slayer:

This Vedic star “Lubdahka” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). This was discovered by English astronomer William Herschel in 1785. It is part of their asterism Deer Hunter (see above). W. Brennand lists it as “Lubdaca” in his *Hindu Astronomy* in 1896.

Deer’s Head:

This Vedic nakshatra (lunar mansion) "Mrigashira" ("Mṛgaśiraṣa", "Mārgaśīrṣa", "Mṛgaśira", Devanagari: मृगशीर्ष, Tamil: மிருகசீரிடம், Sinhalese: Muwasirasa, Kannada: ಮೃಗಶಿರ, Malayalam: മകയിരം), from the 4th to 3rd millennium B.C.E., also known as "Agrahayani" or "āgrahāyaṇī", is in the IAU constellation Orion and is the stars Lambda (λ) and Phi (ϕ) 1 & 2 Orionis (Bhagwath 2019). The maharshi Parasara lists it as Lambda (λ) and Phi (ϕ) 1 & 2 Orionis (Leitz 2019). It is related to the deity Chandra or Soma who challenged Prajipati for Rohini (see Red One, above). It appears in the *Atharveda* and on the nakshatra list of the scholar Varahamihir as "Mrigasira" (Leitz 2019). Leitz unfortunately describes it as "the star Orion" or the star "Orionis", indicating he doesn't understand that this is a suffix which could be applied to any star in Orion. The acronical rising of the "deer's head" corresponded to the Vedic month "Mārgaśīrṣa". R. H. Allen lists it as "Mrigaçiras" in his *Star Names* in 1899 and translates it as "deer". Ivanković notes that some Indian lexicographers list this under the feminine form "Mrgaśira" and "Mrgaśirsa" and that it is also known as "Invakās" (see Lords, below). Ivanković associates this asterism with the lunar God Soma. W. Brennand lists this as "Mrigasiras" in his *Hindu Astronomy* in 1896 and translates this as "head of an antelope".

This Myanmar nekkhat (lunar mansion) "Migathi" (မိဂသီ) is in the IAU constellation Orion and is the stars Lambda (λ) and Phi (ϕ) Orionis.

This Tibetan gyukar (lunar house) "Mgo" or "Go" is in the IAU constellation Orion and is the star Lambda (λ) Orionis (Johnson-Groh 2013).

Defective Cat:

This Celtic (Gaulish) asterism "Cat Palug" is the Hyades cluster in the IAU constellation Taurus (Boutet 2017). It was also known as "Catosđirai" ("cat stars") or "Cattos Pallucos" ("customary cat").

Defective Star:

This Latin asterism "Defectum Sidus" is the IAU constellation Hercules. It relates to this constellation's original Greek name, which meant "kneeler" but was often given names meaning "falling down" (see Kneeler, below). A variation of this was "Effigies defecta labore" ("portrait of defective wear").

Deformed of Aries:

This **telescopic** asterism "Distórtus Aríetis" is the barred galaxy IC 196 (Arp 290) in the IAU constellation Aries. It was discovered by American astronomer Lewis Swift in 1889, who recorded it in his list IX. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy is seriously deformed by its close neighbour."

Deformed of Cetus:

This **telescopic** asterism "Defórmis Céti" is the barred spiral galaxy NGC 337 in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "fragmented and deformed spiral arms".

Deibui:

This Mabuiag asterism is the Large Magellanic Cloud.

Deified Judge of Disaster:

This Chinese star from the Three Kingdoms to the Ming Dynasty “Sizhong” is Theta (θ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism “Wénchāng” (文昌) - see Administrative Centre, above.

This Chinese Chenzhuo xing guan “Sizhong” is the star Nu (ν) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan “Administrative Centre”.

Deified Judge of Disaster and Good Fortune:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Equuleus: Gamma (γ) Equulei (the determinative star) and Delta (δ) Equulei.

This Chinese xing guan “Sīwēi” (司危) is a line of two stars in the IAU constellation Equuleus: Beta (β) and 9 Equulei.

This Chinese Chenzhuo xing guan “Sīwēi” is a line of two stars in the IAU constellation Pegasus: 1 and 5 Pegasi.

Deified Judge of Life:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellations Pegasus and Aquarius: d Aquarii (the determinate star) and 11 Pegasi.

This Chinese star from the Three Kingdoms to the Ming Dynasty “Siming” is 15 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism “Wénchāng” (文昌) - see Administrative Centre, above.

This Chinese xing guan “Sīmìng” (司命) is a line of two stars in the IAU constellation Aquarius: 24 and 26 Aquarii.

This Chinese Chenzhuo xing guan “Simming” is a line of two stars in the IAU constellation Equuleus: Beta (β) Equulei and 3 Equulei.

Deified Judge of Rank:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Pegasus: 4 Pegasi (the determinate star) and 7 Pegasi.

This Chinese xing guan “Sīlù” (司禄) is a line of two stars in the IAU constellation Aquarius: 25 and 27 Aquarii.

This Chinese star from the Three Kingdoms to the Ming Dynasty “Silu” is Theta (θ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism “Wénchāng” (文昌) - see Administrative Centre, above.

This Chinese Chenzhuo xing guan “Silu” is a line of two stars in the IAU constellation Equuleus: Delta (δ) Equulei and Gamma (γ) Equulei.

Deified Judge of Right and Wrong:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Pegasus: 9 Pegasi (the determinate star) and 13 Pegasi.

This Chinese xing guan “Sīfēi” (司非) is a line of two stars in the IAU constellation Equuleus: Gamma (γ) and Delta (δ) Equulei.

This Chinese Chenzhuo xing guan “Sīfēi” is a line of two stars in the IAU constellation Pegasus: 2 and 12 Pegasi.

Deity in Charge of Monsters:

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty called “Siguai”:

- One is 15 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism “Wénchāng” (文昌）- see Administrative Centre, above.
- One is made up of four stars in the IAU constellations Gemini, Orion, and Taurus: 136 and 139 Tauri, 1 Geminorum, and Chi (χ) 2 Orionis (the determinate star).

This Chinese xing guan “Sīguài” (司怪) is made up of four stars in the IAU constellations Gemini, Orion, and Taurus: 139 Tauri, 1 Geminorum, and Chi (χ) 1 and 2 Orionis.

There are two Chinese Chenzhuo xing guans by this name:

- One, “Siguan” is the star Theta (θ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan “Administrative Centre”.
- One is a line of four stars in the IAU constellations Gemini, Orion, and Taurus: 136 Tauri, 139 Tauri, 1 Geminorum, and Chi (χ) 1 & 2 Orionis.

Deity of Two Birds:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Gemini as “Shuāng niǎo zhī shén” (雙鳥之神) or “deity of two birds” (Kotyk 2017).

Deleter:

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “MUL.KA.MUS.I.KU.E” (Hunger 1992) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul ka.mus.i.nag.a” or “mul ka.mus.i.gu” (Koch-Westenholz 1995) is part of the IAU constellation Andromeda.

This Chaldean asterism “mul.ka.mus.i.gu” from the Great Star List (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is part of the IAU constellation Andromeda.

This Akkadian asterism “Pasittu” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Andromeda.

This Persian (Achaemenid, 539 – 331 B.C.E.) asterism “ka-mus-ni-ku-e” as listed by Ernst Weidner’s *Fixsterne* in 1971 is Alpha (α) Cassiopeiae (Shedar) in the IAU constellation Cassiopeia.

Delicate Natured of Boötes:

This **telescopic** asterism “Leptóphyes Boótis” is the barred spiral galaxy NGC 5754 (Arp 297) in the IAU constellation Boötes. It was discovered in 1787 by William Herchel who listed it as “III 687”. It became GC 3992 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the thin, delicate aspect of the long outer arm and the gentle way it seems to touch its companion NGC 5752”. NOTE: NGC 5752 was first recorded by astronomer William Parsons, 3rd Earl of Rosse.

Delicate of Cetus:

This **telescopic** asterism "Ténuis Céti" is the barred spiral galaxy NGC 1073 in the IAU constellation Cetus. This was discovered by William Herschel, who listed it as "III 455". It became GC 602 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of the "delicate structure of arms and central bar".

Delicate of Virgo:

This **telescopic** asterism "Téner Vírginis" is the spiral galaxy NGC 4939 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as II 561. John Herschel listed it in his catalogue as 3458. It is 3381 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the delicate aspect of the thin arms of this galaxy".

Delle Caustiche:

This asterism is the open cluster Messier 24 (NGC 6603) in the IAU constellation Sagittarius, otherwise known as the Small Sagittarius Star Cloud. It was discovered by French astronomer Charles Messier in 1764. Irish astronomer Agnes Mary Clerke (1842 – 1907) gave it this name when describing it as "visible to the naked eye as a dim cloudlet near Mu Sagittarii and named by Fr. Secchi as 'Delle Caustiche' from the peculiar arrangement of its stars in rays, arches, caustic curves and intertwined spirals." Delle Caustiche is an Italian lace pattern of six-sided stars in three arcs. John Herschel's *General Catalogue* of 1864 lists this as GC 4397.

Delphin:

See Dolphin, below.

Delphinus:

None of the stars of this constellation are brighter than 3rd magnitude, but its stars do appear in 141 of the asterisms listed in this handbook.

This IAU constellation "the dolphin" (IAU abbreviation Del) was one of Ptolemy's 48 original constellations and is related to the Greek myths about the God Poseidon and Amphitrite. Ptolemy (c.100 – c.170) listed it as "Δελφίς" ("Delfis" or "Delphis") in his *Almagest* (see Dolphin, below). The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a dolphin.

Delphinus is one of the paranatellonta of the decans of Gemini as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). French astronomers call it "Dauphin", the Italians "Delfino", and the Germans "Delphin".

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts this constellation as a classical dolphin.

The globe of the 2nd century Farnese Atlas depicts this constellation as a dolphin (Stevenson 1921).

"Delphinus" appears in the Leiden *Aratea* (816) as a classical dolphin swimming to our left.

This constellation appears in editions of the 8th century *Revised Aratus Latinus*:

- In the St Gall 250 and St Gall 902 editions Delphinus is shown with a dog-like face and pointed ears,
- In the Paris BN 12597 and Dresden DC 183 it is shown as a dolphin with a curvy body,
- In the Prague IX C 6 version it is depicted as a dolphin with an odd concertina-like body,
- In the Cologne 83 II edition it is a curvy fish swimming left with a beard and a fin on its head.

The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Delphinus with a very large horn on top of its head. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts two horns in the mouth of Delphinus. The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts a single horn in the mouth of Delphinus.

The 11th century *De signis caeli (“of the signs of heaven*”) lists “Delphinus” and “Delfinus”. The Oxford Laud 644, Padua 27, and Venice VIII 22 manuscripts of *De signis caeli* depict Delphinus with a horn on his head, swimming to the left. The Dijon 448 manuscript of *De signis caeli (“of the signs of heaven*”) depicts Delphinus with an odd facial structure. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict a classical dolphin. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Delphinus with a Pharaonic beard. The Durham Hunter 100 manuscript of *De signis caeli* depicts Delphinus as a fish. The Montecassino 3 manuscript of *De signis caeli* depicts Delphinus with a dog’s face.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Delphinus as a large fish.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Delphinus as a dolphin.

English author Geoffrey Chaucer (c.1340s – 1400) named it “Delphyn” in his *Hous of Fame* and others of that era “Dolphyne”.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Delphin” as a classical dolphin.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Delphinus as some sort of fish. It is poorly drawn and not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Delphinus as a curving fish. It is not labelled.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Delphin” as a dolphin with a pointed snout.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Delphinus as a fish with teeth swimming to our left.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Delphin” as a classical dolphin with sharp teeth.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Delphinus as a fish swimming to our right. It is not labelled. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts it in the same fashion.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Delphin” as a classical dolphin.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists Delphinus and depicts it as a classical dolphin.

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515 list “Delphinus” and from 1534 and 1535 “DELPHINUS” (Dekker & Lippincott, 1999).

Celestial globe gores (1517) of Johann Schöner (1477 – 1547) depicts “Delphinus” as a classical dolphin.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “DELPHINVS” as a classical dolphin.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Delphinus in the same manner as Dürer et al.

The celestial globe depicted in Hans Holbein’s *Double Portrait of Jean de Dinteville, the Bailly of Troyes, and Georges de Selve, Bishop of Lavaux* (more commonly known as “*The Ambassadors*”) from 1533 lists the abbreviated “DEL” (Dekker & Lippincott, 1999).

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) labels this asterism “Delphin” and depicts it as a fish.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Delfino”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Dolphin”.Fequuleus

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Delphinus as a classical dolphin.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Delphinus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss German artist Jost Amman (1539 – 1591) depicts “Delphin” as a classical dolphin.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Delphinus” as a classical dolphin.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Delfin” as a classical dolphin.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Delphinus” as a classical dolphin.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Delphin” as a dolphin.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Delphin” as a classical dolphin.

Delphinus is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German Uranographer Johann Bayer (1572 – 1603) depicts it in his *Uranometria* in 1603 as a classical dolphin. Bayer lists these names for Delphinus: “Delphinus, Delphin, Amphitrites, Vector Arionis, Smon nautis, Hermippus, Musicum Signum, Currus”.

“Delphinus” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as a classical dolphin facing to our right.

“Delphinus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a classical dolphin.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) depicts “Delphinus” as a classical dolphin facing to our right.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Delphinus” for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts “Delphin” as a classical dolphin.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Delphinus” as a classical dolphin.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Delphinus as a classical dolphin.

Robert Hues lists this constellation’s “Arabic” name as “Aldelphin” in his *A Learned Treatise of Globes* in 1659.

Delphinus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as a classical dolphin.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Delphinus as a classical dolphin.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Delphinus” as a classical dolphin.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Delphinus” as a classical dolphin.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Delphinus” as a classical dolphin facing to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Delphinus as a classical dolphin.

Delphinus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a classical dolphin.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Delphinus as a classical dolphin.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Delphinus" as a classical dolphin.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Delphinus as a classical dolphin.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Delphinus as a classical dolphin.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Delfin" as a classical dolphin.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Delphinus" as a classical dolphin.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Dauphin" ("the dolphin") as a classical dolphin, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der Delphin" and depicts it as a classical dolphin facing to our left.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Delphinus" as a classical dolphin.

American uranographer William Croswell (1760 – 1834) depicts "Delphinus the Dolphin" on his *Mercator Map of the Starry Heavens* in 1810 as a classical dolphin.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists "Delphin" for this constellation and depicts it as a classical dolphin.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Delphinus in his *Celestial Atlas* in 1822: It is depicted as a classical dolphin. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) labels it "Delphin".

"Delphinus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicts it as a classical dolphin.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Delphinus" as a classical dolphin.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Delphinus" as a classical dolphin.

Delphinus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Delphinus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a dolphin.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Delphinus, the Dolphin".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Delphinus" in his *Star Atlas* (1893) and describes it as "The Dolphin".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this on its charts as the "Dolphin".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Delphinus" and describes it as a "Dolphin".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Delphinus… the Dolphin".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Delphinus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows this constellation as a quadrilateral of the stars Beta (β) Delphini (Rotanev), Delta (δ) Delphini, Gamma (γ) 2 Delphini, and Alpha (α) Delphini (Sualocin) with a single line running from Rotanev to Epsilon (ε) Delphini. Rey's version expands this to a "body" bounded by the stars Iota (ι) Delphini, Theta (θ) Delphini, Delta (δ) Delphini, Gamma (γ) 2 Delphini, Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev) and Eta (η) Delphini. A triangle of the stars Iota (ι) Delphini, Epsilon (ε) Delphini, and Kappa (κ) Delphini forms the "tail".

Delphinus Minor:

See Mini Delphinus, below.

Delta:

This Greek asterism "Δελτωτόν" ("Deltoton") is the original name for the IAU constellation Triangulum as it resembled their upper-case letter Delta (Δ). Roman astronomers later Latinized this to Deltotum:

- "Deltoton" appears in editions of the 8th century *Revised Aratus Latinus*: In the Cologne 83 II edition it is depicted as two concentric triangles.
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "quem Graeci deltoton vocant" ("whom the Greeks call deltoton").
- The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict the triangle of Deltoton on the head of Aries Mc Gurk, Patrick (1966).

- The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Deltoton as a single triangle.
- The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists “Deltoton” and depicts it as a single triangle.
- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists “Deltonon” as a single triangle.
- The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al lists Deltoton and depicts in the same manner as Dürer et al.
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Deltoton” as a single triangle.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists “Trianulum, sive Deltoton” for this constellation in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Deltoton” as a single triangle.
- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Triangulum siue Deltoton” (“Triangulum or Delta”) as a single triangle.
- The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Deltoton” as a single triangle.
- Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Deltonton” for this constellation.
- “Deltoton” is listed as a name for the IAU constellation Triangulum in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Deltoton o Triangulo” and depicts it as a single triangle.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) list the names “Triangulus” and “Deltoton” for this constellation.
- John Hill lists “Deltoton” as a name for this constellation in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Deltoton” as a name for Triangulum.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists “Deltoton” as a alternate name for this constellation.

This Arabic asterism “al-Dāl” is the Hyades cluster in the IAU constellation Taurus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Kauffmann’s translation of the *De ordine ac positione stellarum in signis* in 1888 lists “quem Graeci eltoton vocant” (“whom the Greeks call eltoton”).

There are two **telescopic** “delta” asterisms:

- One is in the IAU constellation Canis Minor and is listed as Corder 1368 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John

Raymond. It resembles the Greek letter Delta (δ). It includes the stars Delta (δ) 2 and 3 Canis Minoris, HIP 36879, 36882, and 36869. Size 30'.

- One is in the IAU constellation Ursa Minor and is on the observing lists of John A. Chiravalle. Jeffrey Corder lists it as Corder 3351. It resembles the Greek letter Delta (Δ). This consists of the four stars Delta (δ) Ursae Minoris, 24 Ursae Minoris, HIP 89465 and HIP 87663.

Deltas:

This **telescopic** asterism is made up of stars of the IAU constellation Taurus: Delta (δ) 1, 2, and 3 Tauri. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels these the "Deltas".

Deltoton:

See Delta, above.

Deltotum:

See Delta, above.

Demeter:

This Greek asterism "Demeter" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Demeter is a Greek Goddess of agriculture and the mother of Persephone, who is also identified with this constellation (see Persephone, below).

Demeter of Cetus:

This **telescopic** asterism "Deméter Céti" is the lenticular galaxy NGC 545 (Arp 308) in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as "II 448". It became GC 322 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). This galaxy is near NGC 547, which they named "Persephone of Cetus".

Dementor Nebula:

This **telescopic** asterism is the HII region LBN 420 in the IAU constellation Lacerta. American astrophotographer Jeff Lesperance listed it by this name on the *Astrophotography* Facebook page on Facebook on 26 August 2025. This is also known as the Galileo's Finger (see below).

Demon:

This Babylonian asterism from the MUL.APIN tablets "Ukadua" or "Udkadua" is made up of stars from the IAU constellations Andromeda, Cepheus, Cygnus, Lacerta, and Vulpecula:

- One "heel" is Lambda (λ) Andromedae and the other Zeta (ζ) Cephei,
- Its five-sided "body" is made up of the star Alpha (α) Cygni (Deneb- which they call "the breast of Ukadua"), Gamma (γ) Cygni, Epsilon (ε) Cygni, Rho (ρ) Cygni, and 1 Lacertae,
- One "arm" runs from Epsilon (ε) Cygni to Zeta (ζ) Cygni,
- The other "arm" arcs over the demon's "upper body" from Gamma (γ) Cygni to Zeta (ζ) Cygni to 15 Vulpeculae, and
- From 15 Vulpeculae two lines of stars to 39 and 41 Cygni form "pincers".

This Persian asterism “UT.KA.DU.A” from the list of Lumasi Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is made up of stars of the IAU constellations Cygnus and Lacerta (Jeremias 1929).

This Sumerian asterism “Humbaba” or “Huwawa” is made up of the stars of the IAU constellations Cygnus and Cepheus. It is part of the story about Gilgameš of Uruk.

This “Hebrew” asterism “Daemon” is the IAU constellation Sagitta. “Daemon” is listed by German astronomer Johann Bayer (1572-1625) in his Uranometria (1603). In his *Urania* (1754), John Hill cites German astronomer Athanasius Kircher (1602 – 1680) as identifying this as a Hebrew name for this constellation. R. H. Allen’s *Star Names* in 1899 lists “Daemon” for this constellation.

This star “Demon” or “Demon Star” is Beta (β) Persei (Algol) in the IAU constellation Perseus:

- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this star as “Algol, the Ghoul, or Demon Star”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) calls this the “Demon Star”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., refers to this star as the “Demon Star” or the “Winking Demon Star”.
- Robert Burnham lists this in his *Burnham’s Celestial Handbook* in 1978. This German asterism

Deneb:

See Tail of the Hen, below.

Deneb Algedi:

See Tail of the Goat, below.

Deneb Kaitos Schemali:

See Northern Tail of the Sea Monster, below.

Denebola:

See Tail of the Lion, below.

Denevýr:

This Kaykavian asterism is the IAU constellation Hydra.

Dentist’s Chair:

This **telescopic** asterism PGC 49560 is a galaxy in the IAU constellation Hydra.

Deprived:

This Māori asterism “Pipiri” is the IAU constellation Aries.

This Polynesian asterism “Pipiri” is the IAU constellation Scorpius.

This Rapanui asterism “Pipiri” is the stars Lambda (λ) Scorpii (Shaula) and Upsilon (υ) Scorpii (Lesath) in the IAU constellation Scorpius (Edwards and Edwards 2016, Edwards et al 2018). Compare this to the Tahitian and Cook Islands asterism Pipiri and Rehua (see below).

Derceto:

This Latin asterism is the IAU constellation Cetus as listed in John Hill's *Urania* in 1754. The Greeks called the Syrian fertility Goddess Atargatis by the name "Derketo" (see below) and the Romans "Derceto".

This Latin asterism "Derceto" or "Syrorum Dea" ("Syrian Goddess") is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Allen attributes this to "classical Latin writers". "Syrorum Dea" is listed as an alternate name for Virgo on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Derketo:

This Syrian asterism "Derketo" or "Derke" is made up of stars of the IAU constellation Pisces. Eratosthenes (d.194 B.C.E.) wrote that it was named for this Syrian fertility Goddess in his time, although he used the Greek name "Derketo" for this Goddess: The Syrian name is Atargatis ("Ἀτάργατις"). Later Latinizations include "Dea Syria" ("Syrian Goddess"), "Dii Dyrii" ("the gods of the Syrians"), "Deasura", "Dercis", "Dercetis", "Dercete", "Proles Dercia" ("child of Dercia"), and "Phacetis". 4th century Roman writer Postumius Rufius Festus Avienius called it "Bambycii Hierapolitani" which relates to the name of the city Bambyce where Atargatis was worshipped, later known as Hierapolis. Johann Bayer's *Uranometria* (1603) lists the variants "Proles Dercia", "Derce", "Derceto", "Dercetis", "Phacetis", and "Dea Syria".

Dervish's Platter:

This Persian asterism "Kāsah Darwishān" is the IAU constellation Corona Borealis. Compare this to Dish of the Poor People, below.

Desanaus:

This asterism "Desanaus", "Desanes", "Dosanes", or Dorsanes" is the IAU constellation Hercules and is listed in R. H. Allen's *Star Names* in 1899. Allen identifies it as a Hindu name.

Desert Birds:

This Arabic asterism "Al Ṣuradain" is the stars Alpha (α) Sagittarii (Rukbat) and Beta (β) 1 and 2 Sagittarii (Arkab Prior and Arkab Posterior) as listed by Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) and in R. H. Allen's *Star Names* in 1899.

Desert Garden:

See Two Lines, below.

Deserter of Ursa Major:

This **telescopic** asterism "Tránsfuga Úrsae Majóris" is the spiral galaxy NGC 4157 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "I 208". It became GC 2761 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this because "this galaxy is situated exactly on the border between the constellations of Canes Venatici and Ursa Major, the eastern part of it lying in the former, the western part in the latter".

Deserving to be Seen of Virgo:

This **telescopic** asterism "Conspicábilis Vírginis" is the lenticular galaxy NGC 5122 in the IAU constellation Virgo. It was discovered by American astronomer Lewis Swift in 1887. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is "difficult to observe because of the proximity of Spica." It is also known as Swift's Polar Ring.

Desirous of Aries:

This **telescopic** asterism "Cúpidus Aríetis" is the interacting galaxy IC 1801 (Arp 276) in the IAU constellation Aries. It was first recorded by French astronomer Stéphane Javelle (1864 – 1917). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called its interaction with its partner NGC 935 as "avid, desiring grasping". They named NGC 935 "Avid of Aries" (see above).

Desk of Woman:

This Korean asterism "Yeojaui Chaegsang" (여자의 책상) is a bent line of three stars in the IAU constellation Hercules: Rho (ρ), 69, and Eta (η) Herculis.

Destroyed of Reticulum:

This **telescopic** asterism "Ruinósus Retículi" is the irregular field galaxy NGC 1313 in the IAU constellation Reticulum. It was discovered by Scottish astronomer James Dunlop in September 1826. It is listed in the *General Catalogue* of 1864 at GC 695. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "two strong arms spring from the ends of the bar of this galaxy". It is also known as the Topsy Turvy Galaxy (see below).

Deucalion:

This Greek asterism is the IAU constellation Aquarius Deucalion was the son of Prometheus in Greek mythology:

- Johann Bayer's *Uranometria* (1603) lists "Deucalion" as a name for Aquarius.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Deucalion".
- "Deucalion" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Edward Sherburne's *Sphere of Marcus Manilius* in 1675 lists Deucalion.
- Deucalion is listed in John Hill's *Urania* in 1754.

Devil's Chariot:

This Romanian asterism "Carul Dracului" is the IAU constellation Perseus (Ottescu 2009). Romanian legend describes this as the chariot the Devil will use to take sinners to Hell.

Devil's Head Nebula:

This **telescopic** asterism is the emission nebula and open cluster NGC 7822 (Sh 2-171) in the IAU constellation Cepheus. John Herschel listed this as h 2302 and later as GC 5051 in his *General Catalogue* of 1864. It is also known as the Question Mark (see below).

Devil's Mask:

This telescopic asterism is a triplet of galaxies in the IAU constellation Pavo:

- The intermediate spiral galaxy NGC 6769, forming one "eye" of the mask,
- The barred spiral galaxy NGC 6770, forming the other "eye" of the mask, and
- The edge-on barred lenticular galaxy NGC 6771, forming the "mouth".

These were discovered by John Herschel in 1836

Devil's Tower:

This **telescopic** asterism is the emission nebula RCW 85 in the IAU constellation Centaurus, between Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar).

Devilus Dustia:

This American asterism is made up of stars of the IAU constellation Lacerta and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Devoted Virgin:

This asterism "Virgo Deuota" is the IAU constellation Andromeda. This name is listed in Johann Bayer's *Uranometria* (1603).

Devourer of the Sacrifice:

This Hindu star "Hutabuj" is Beta (β) Tauri in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

Devouring of Centaurus:

This **telescopic** asterism "Vórax Centaúri" is the lenticular galaxy NGC 5128 (Caldwell 77, Arp 153) in the IAU constellation Centaurus. This was discovered by Scottish astronomer James Dunlop in 1827 who listed it as h 3501. It is GC 3525 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this spectacular system is generally interpreted as a lenticular galaxy devouring a dust-rich spiral galaxy". It is also known as the "Hamburger" (see below). As a prominent radio source, it is known as Centaurus A.

Devout Virgin:

This Latin asterism "Virgo Devota" is the IAU constellation Andromeda and was given this name by the popular Roman general Caesar Germanicus (15 B.C.E. – 19 C.E.). "Virgo Devota" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a name for Andromeda. This is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Dhanus:

This Vedic rashi "Dhanus" as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022), "Dhanu", or "Dhanasu" is the IAU constellation Sagittarius. W. Brennan lists it as "Dhanus" in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists it as "Dhannus" and writes that it represents the energy of the God Anshuman.

This Tamil zodiac asterism "Dhamsu" is the IAU constellation Sagittarius.

Dhogay Ii:

This Mabuiag star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Dhruvam:

This Vedic star "Dhruvam" or "Druvaloka" is Alpha (α) Draconis (Thuban) listed in the Ramayana (Bhagwath 2019). Bhagwath notes that this refers to when Thuban was the pole star c 2800 B.C.E. Dhruva is the son of Uttānapāda.

Dhungagil:

This Dharug asterism is the belt of Orion in the IAU constellation Orion as listed by Collins in 1798 and Mathews in 1903.

Diabolo Nebula:

This asterism is the planetary nebula Messier 27 (NGC 6853) in the IAU constellation Vulpecula. It was discovered by French astronomer Charles Messier in 1764. It was listed in John Herschel's General Catalogue of 1864 as GC 4532. It is also known as the Dumbbell Nebula (see below), the Double Headed Shot (see below) and the Apple Core Nebula (see above). The name diabolo is a reference to a juggling or circus yo-yo prop called a diabolo, which is spun with two batons or wands. It was derived from an hourglass-shaped Chinese yo-yo dating back to the Ming Dynasty, and first reported to Europeans by missionary Father Amiot in 1782. Belgian engineer Gustave Philippart developed the modern diabolo in the early twentieth century. Although I do not know who assigned this name to this planetary nebula, whose shape certainly resembles a diabolo, the name cannot predate Amiot's report and probably does not predate the beginning of the twentieth century.

Diadem:

This Greek star "diadēma" is Alpha (α) Comae Berenices in the IAU constellation Coma Berenices. The name obviously relates to the name of the constellation. The IAU Working Group on Star names approved the name Diadem for the star Alpha (α) Comae Berenices A.

Diadem is an alternate translation of the Arabic asterism Crown of the Forehead (see above).

This Norwegian asterism "Diademet" is the circle of stars forming the western "fish" of the constellation Pisces: Gamma (γ), Kappa (κ), Lambda (λ), TX, Iota (ι), and Theta (θ) Piscium. Compare this to the Circlet asterism (see above).

Diadem of Crater:

This **telescopic** asterism "Diadúmenus Cratéris" is the lenticular galaxy NGC 3497 in the IAU constellation Crater. It was discovered in 1790 by William Herschel who listed it as III 824. It became GC 2281 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as the dust lanes look like the headband "in the famous sculpture by Polykleitos of an athlete attaching a band around his forehead." NOTE: This galaxy also appears in the NGC catalogue as NGC 3525, NGC 3528, and IC 2624.

Diadem of Pegasus:

This **telescopic** asterism "Diadéma Pégasi" is the elliptical galaxy NGC 7742 in the IAU constellation Pegasus. This was discovered by William Herschel in 1784 who listed it as "II 255". It is GC 5005 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the beautiful bright ring in the central region". This is also known as the "Fried Egg" (see below).

Diadem of Solomon:

This was a name given to the IAU constellation Corona Australis by the 17th-century German uranographer Julius Schiller (c. 1580 – 1627). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Diadema Salomon Vel Corona Australis".

Diagonal Cross of Pisces:

This **telescopic** asterism "Decussátus Píscium" is the polar ring galaxy NGC 660 in the IAU constellation Pisces. William Herschel listed this as "II 253" in his catalogue. This became GC 390 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The dark lanes of this galaxy resemble a Saint Andrew's cross or crux decussata.

Dial of Horologium:

This **telescopic** asterism "Diális Horológii" is the barred spiral galaxy NGC 1433 in the IAU constellation Horologium. It was discovered by James Dunlop in 1826. This became GC 767 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to a square of foreground stars at the southeast side of this galaxy.

Diameter of Lepus:

This **telescopic** asterism "Diametráta Léporis" is the barred spiral galaxy NGC 1730 (IC 2113) in the IAU constellation Lepus. It was discovered by American astronomer Francis Leavenworth in 1885. Edward Barnard observed it in the 1890s and added it to the Index Catalogue as IC 2113. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its "narrowly wound spiral arms".

Diametrical of Virgo:

This **telescopic** asterism "Diamétricus Vírginis" is the barred spiral galaxy IC 1067 in the IAU constellation Virgo. It was discovered by French astronomer Stéphane Javelle in 1891. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the bar which divides the inner circle in two equal parts."

Diamond:

This **telescopic** Malay star "Intan" is HIP 15578 (HD 20868) in the IAU constellation Fornax (magnitude 9.94). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Balduri ("opal").

There are fourteen **telescopic** "diamonds":

- One is the Virgo Diamond, which is found in the IAU constellation Virgo 2.2 degrees west northwest of the star Gamma (γ) Virginis (Porrima). Its size is 1' X 1'. This asterism was listed by astronomer Noah Brosch (Tel Aviv University) in *Monthly Notices of the Royal Astronomical Society* on December 1, 1991. American astronomer Tom Lorenzin lists it as Lorenzin 20.
- One, also known as the Southern Beehive, the Christmas Tree, and the Sprinter, is the open cluster NGC 2516 (Caldwell 96) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as "Lac II 3". It is GC 1619 in the *General Catalogue* of 1864.
- One is the Diamond Cluster, which is found in the IAU constellation Delphinus. It is a triangle of 7^{th} magnitude stars (including the stars HIP 101967 and HIP 101943) plus the 6^{th} magnitude star Theta (θ) Delphini.
- One is the planetary nebula NGC 3242 (Caldwell 59) in the IAU constellation Hydra. It was discovered in 1785 by English astronomer William Herschel who listed it as "IV 27". John Herschel included it in his catalogue as h 3248 and later as GC 2102 in his *General Catalogue* of 1864. It is also known as the Ghost of Jupiter due to its similar size and appearance to the planet when viewed in a telescope eyepiece. It is also known as the Eye Nebula.
- One is Cseh 33 listed by Hungarian astronomer Viktor Cseh which is in the IAU constellation Pictor. Cseh describes it as a "15' X 10' regular diamond shaped group of stars. One of the members is TYC 8080-594 at magnitude 8.3."
- One is "Chi 1, 2, 3" in the IAU constellation Fornax. This is listed as Corder 539 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. It has this name as it includes Chi (χ) 1, 2, and 3 Fornacis. The other stars in this "diamond" are HIP 16289 and 16167. Size 45' X 30'.
- One is Corder 2119 in the IAU constellation Ursa Major and is listed on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25'. This is the stars 51 Ursae Majoris, HIP 54210, 54235, and 54178A.
- One is Corder 4085 in the IAU constellation Pavo and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 4'. This includes HIP 99626.
- One is in the IAU constellation Andromeda and is Corder 402 on the observing list of American astronomer Jeffrey Corder. Corder describes it as "a small, diamond-shaped group of 5 faint stars of 9^{th} and 10^{th} magnitude." Size 10'.
- One is in the IAU constellation Ursa Major and is Corder 1960 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8^{th} – 9^{th} magnitude stars including HIP 49731, 49661, and 49629.
- One is in the IAU constellation Sculptor and is Corder 220 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is six 6^{th} – 10^{th} magnitude stars including HIP 6477 and the double star HIP 6478.

- One is in the IAU constellation Cetus and is Corder 352 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 10545, 10511, and 10502.
- One is in the IAU constellation Pictor and is Corder 739 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 10th magnitude stars including HIP 22323 and the double star HIP 22359A.
- One is in the IAU constellation Hydra and is Corder 1932 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th magnitude stars.
- One is in the IAU constellation Vela and is Corder 2029 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is four 6th – 9th magnitude stars including HIP 51387, 51412, and the double star HIP 51379A.

Diamond Cross:

This Western asterism is made up of four stars: Beta (β) Carinae (Miaplacidus), Upsilon (υ) Carinae, Theta (θ) Carinae, and Omega (ω) Carinae in the IAU constellation Carina. It appears on the SAC database and is Corder 1936 on Jeffrey Corder's list. Size 10° X 6°.

Diamond Head:

This asterism is a small diamond of stars in the IAU constellations Draco and Hercules. Gamma (γ) Draconis (Eltanin), Xi (ξ) Draconis (Grumium), Beta (β) Draconis (Rastaban), and Iota (ι) Herculis. It is also known as the Lozenge.

Diamond of Virgo:

This English asterism is made up of four stars of the IAU constellations Boötes, Canes Venatici, Cygnus, and Virgo: Alpha (α) Virginis (Spica), Alpha (α) Cygni (Denebola), Alpha (α) Boötis (Arcturus), and Alpha (α) Canum Venaticorum (Cor Caroli). This name appears in *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886). It also appears in *The Facts on File Dictionary of Astronomy, 2nd edition*, 1985.

Diamond Ring:

See Ring, below.

Diamond Ring Nebula:

See Ring, below.

Diamond Starburst:

This **telescopic** asterism is the open cluster Messier 37 (NGC 2099) in the IAU constellation Auriga. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654 and listed by French astronomer Charles Messier in 1764. The 1864 General Catalogue lists it as GC 1295. John Herschel listed it as h 369. It was given this name by American astronomer Charles Edward Barns (1862 – 1937) in his *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931): 19th century English astronomer William Parsons, 3rd Earl of Rosse, listed this name in his observation notes and described it as a "virtual cloud of glittering stars", describing one of a magnitude 9.5 red giant in this cluster as "like a ruby on a field of diamonds". English astronomer William Henry Smyth (1788 – 1865) described it as "a magnificent object, the whole field being strewed as it were with sparkling gold-dust". It is also known as the "Cartwheel" (see above), and the "Skull" (see below).

Diana:

This Latin asterism "Diana" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Diana was the Roman equivalent of the Greek Goddess Artemis.

Diana's Count:

There are two Latin asterisms with the name "Dianae Comes":

- One is the IAU constellation Orion.
- One is the IAU constellation Ursa Major.

Diana's Star:

This Latin asterism "Dianae Sidus" is the IAU constellation Sagittarius as listed in R. H. Allen's *Star Names* in 1899.

Diaphragm:

This German star with the Greek name "Υπόζωμα" ("Ypózoma") is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major as listed by German astronomer Johann Bayer (1572-1625).

Digger:

This asterism "Pastinator" ("digger" or "trencher") is the IAU constellation Boötes as listed in R. H. Allen's *Star Names*. Allen attributes this name to English orientalist Thomas Hyde (1636 – 1703) and describes it as the "rendering of a supposed Arabic title".

Digging Stars:

Several African peoples call the Pleiades cluster in the IAU constellation Taurus "the digging stars" as their appearance marks the beginning of their agricultural season. Here are the peoples along with their name for this cluster:

- The Xhosa: "Eyesilimela" or "isiLimela" (Slotegraaf 2013, Holt and Slotegraaf 2022))
- San, Ndebele, and Zulu: "IsiLimela" (Hold and Slotegraaf 2022)),
- Nyabungu, Nyae Nyae !Kung: "Kelemera" (Slotegraaf 2013),
- Nyasa: "Lemila" (Slotegraaf),
- Sotho, Tswana: "Selemela" (Slotegraaf 2013),
- Tlôkwa: "Selemela se setsehali",
- Tswana: "Shirimela" (Slotegraaf 2013),
- Tsonga: "shirimelo" ("one which announces the tilling season"),
- Venda":"Tshilimela", "Tshilimo" (Slotegraaf 2013),
- Tabwa: "Bulimina", and
- Kiswahili: who call them the "digging stars" or the "ploughing stars" (Slotegraaf 2013).

Digging Stick:

This Asháninka asterism is the dark nebula Barnard 44 near the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Urton 2016). This digging stick is used to pry open the Beehive (see above).

This /Xam star is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Dechend 1975, Alcock 2014). They also call it “stone of the digging stick”. Dechend lists it as “stone of the tombstone” and “stone of the star grave”.

This !Kung star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. It is also known as the Ant Egg Star (see Bush Food, above).

This Anmatyerre asterism “Anem” is the Hyades cluster in the IAU constellation Taurus (Clarke 2014).

Dignity:

This Babylonian asterism from the MUL.APIN tablets “Bastum”, “BAL.TÉSH.A” or “kakkab balti” (Anthony 1996) also known as “the vizier of the God Tispak”, is the IAU constellation Corona Borealis. This appears in later Seleucid sky lore.

Dignity of King:

This Korean asterism “Gaak” is a cross of four stars in the IAU constellation Virgo: Alpha (α) Virginis (Spica), Zeta (ζ), 74, and 66 Virginis.

Dilmun:

This Bahrainian star “Dilmun” is the F6V type star WASP-121 in the IAU constellation Puppis (magnitude 10.4). It received this name in the IAU’s NameExoWorlds competition in 2022. Dilmun was the Sumerian name of an ancient civilization in the eastern Arabian Peninsula. It has an exoplanet WASP-121b, “Tylos” (Τύλος), which is the ancient Greek name for the Bahrain island.

Dim One of Lynx:

This **telescopic** asterism “Sublústris Lýncis” is the spiral galaxy NGC 2541 in the IAU constellation Lynx. William Herschel listed this as “VII 11”. It became GC 1630 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its “low surface brightness and faint absolute magnitude”.

Dimmer of the Two Calves:

This Arabic star “’akhfā al-farqadayn” (أخفى الفرقدين) or “Alifā‘ al Farḳadain”, later latinized to “Akfa Farkadain” is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their asterism Two Calves (see below). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Anpha al Pherkadein”.

Dindima:

This Wiradjuri asterism is the Pleiades cluster in the IAU constellation Taurus (Mathews 1904, Grant & Rudder 2010). Variations include “Malanydyang” and “Gibirgin”.

Dingo Father:

This Kokatha or Ngalea star “Babba” is either Beta (β) Tauri (Elnath) or the star Zeta (ζ) Tauri.

Dingo Mother:

This Kokatha or Ngalea star “Ngurunya” is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Leaman, Hamacher, and Carter 2016).

Dingo Puppies:

This Kokatha and Ngalea asterism, also known as "Mingarri's Dogs", is a row of stars in the IAU constellation Orion. The line starts at Pi (π) 1, 2, 3, 4, and 5 Orionis, Omicron (ο) 2 Orionis, and 6, 11, and 15 Orionis. These are puppies deployed before Nyeeruna (see Hunter of the Seven Mingarri Sisters, below) to stop his advances on the Seven Mingarri Sisters (see Seven Young Sisters, below). One dog, "Babba", is the father of the puppies (Hamacher 2017).

Dingolay:

See Dancing, below.

Dining Table:

This Macedonian asterism "Sofra" ("circular dining table") is the IAU constellation Corona Borealis (Cenev 2004).

Dinosaur:

This **telescopic** asterism from the asterism list of the American astronomer John Davis is basically an expansion of the **telescopic** asterism Sweat of Ophiuchi (see below) made up of the stars of the IAU constellations Hercules and Ophiuchus:

- The "head" is the stars around HIP 84036 and 60 Herculis.
- The "neck" is the double star 33/34 Ophiuchi and 32 Ophiuchi,
- The "body" is an oval of stars between 32 Ophiuchi and HIP 82372, and
- The "tail" runs from HIP 82372 through HIP 82028 to 81707.

Dionysus' Altar:

This Greek asterism "Thymele" is the IAU constellation Ara.

Dioscuri:

This Greek asterism "Dioscuri" is the IAU constellation Gemini. Johann Bayer's *Uranometria* (1603) lists "Ledaeiiuuenes Dioscuri". John Hill's *Urania* n 1754 lists this name. The ancient Greeks called Castor and Pollux the Dioscuri, which means sons of Zeus.

Diota:

This asterism "Diota" ("two handled wine jar") is the IAU constellation Aquarius as listed by R. H. Allen in his *Star Names* in 1899. Allen writes that Julius Caesar's foe Vercingetorix used this symbol on his "stateres" (a type of coin).

Diotima of Virgo:

This **telescopic** asterism "Diotíma Vírginis" is the grand design spiral galaxy NGC 5364 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "II 534". John Herschel listed it as h 1705 but later it became GC 3704 and GC 3705 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named this for "Diotima, the priestess of Mantinea who taught Socrates about the theory of love, as narrated in the *Symposium* by Plato".

Diphda:

See Second Frog, below.

Diphrelates:

This Greek asterism "Diphrelates" is the IAU constellation Auriga as listed in John Hill's *Urania* in 1754.

Dipper:

This Chinese xiù (lunar mansion) "Dǒuxiù" (斗宿) is a "dipper" in the IAU constellation Sagittarius. The "bowl" is the stars Zeta (ζ), Tau (τ), Sigma (σ) and Phi (ϕ) Sagittarii (the determinative star). The "handle" runs from Phi (ϕ) through Lambda (λ) to Mu (μ) Sagittarii. Each has been assigned a name:

- Mu (μ) Sagittarii: "Qisha" ("Seven Assistants") or "Jiang" ("General"),
- Lambda (λ) Sagittarii: "Tianxiang" ("Celestial Premier") or "Yin" ("Stamp"),
- Phi (ϕ) Sagittarii: "Tiantong" ("Celestial Collaborators") or "Fu" ("Blessing"),
- Sigma (σ) Sagittarii: "Tianji" ("Celestial Secret") or "Shan" ("Kindness"),
- Tau (τ) Sagittarii: "Tianliang" ("Celestial Beam") or "Yin" ("Shade") and
- Zeta (ζ) Sagittarii: "Tianfu" ("Celestial Official") or "Ling" ("{Command").

In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Jiang and Hu territories. This xiù appears in the Tang Dynasty (618 – 907 C. E.) as "Dǒu" (斗) and was compared to the Vedic nakshatra Uttara Ashadha (Kotyk 2017, see Second of the Asadha, below). This xing guan is sometimes referred to as "Nan Dou" ("southern dipper"). Compare to the 3 Kingdoms/Ming Dynasty xiù Dipper for Liquids (below).

This Japanese sei shuku or lunar station "Hikitsu Boshi" ("dipper" or "measure") is a quadrilateral of stars in the IAU constellation Sagittarius: Phi (ϕ), Zeta (ζ), Sigma (σ), and Tau (τ) Sagittarii.

R.H. Allen describes a dipper made up of the stars of the IAU constellations Andromeda and Pegasus in his *Star Names* in 1899. The "handle" is Gamma (γ) Andromedae and Beta (β) Andromedae (Mirach) and the Great Square of Pegasus (see Great Square below) is the dipper, but doesn't identify the culture involved.

This asterism is in the IAU constellation Cassiopeia and is Corder 272 on the observing list of American astronomer Jeffrey Corder. The dipper bowl is 40, 42, 48, and 50 Cassiopeiae. The handle is the stars 31, Phi (ϕ) 43, and Omega (ω) Cassiopeiae. Size 300' X 90'.

This asterism is in the IAU constellation Orion and is Corder 770 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 320' X 90'. The "handle" is 15 and 11 Orionis. The "bowl" is the double star HIP 23161 and Omicron (o) 1 and 2 Orionis.

There are two **telescopic** "Dipper" asterisms:

- One is in the IAU constellation Carina and is Corder 1387 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is eight 7^{th} – 8^{th} magnitude stars. The "dipper bowl" is five stars including HIP 36860, 36833, 37063, and the double star HIP 37013A. The handle is three stars including HIP 37186.
- One is in the IAU constellation Carina and is Corder 2109 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is six 7^{th} – 8^{th} magnitude stars.

Dipper Bowl:

This **telescopic** asterism is found in the Pleiades Cluster in the constellation Taurus:

- Four stars form the "bowl": Eta (η) Tauri (Alcyone), 23 Tauri (Merope), 17 Tauri (Electra) and 19 Tauri (Taygeta), and
- One star forms the "handle": 27 Tauri (Atlas).

Dipper for Liquids:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellations Hercules and Ophiuchus: 25 and Kappa (κ) Ophiuchi, and 43 and 47 Herculis. Note: This xing guan shares stars with the Korean asterism "Cereal Measure Regulation" (see above). It was later known as Dipper for Solids (see below).

This Chinese xiù (lunar mansion) "Dǒu" (斗) or "Dǒuxiù" is a bent line of stars in the IAU constellation Hercules and Serpens: Omega (ω), 13, 29, and 33 Herculis, and 49 Serpentis. Compare to the xiù Dipper (above).

This Chinese Chenzhuo xing guan "Dǒuxiù" is stars in the IAU constellations Hercules and Ophiuchus: The "handle" of the dipper is two stars: 45 and 47 Herculis. The "dipper" is 47 Herculis, 43 Herculis, Iota (ι) Ophiuchi, and Kappa (κ) Ophiuchi.

Dipper for Solids:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars from the IAU constellations Hercules and Ophiuchus: Sigma (σ) Ophiuchi, U Ophiuchi, 16 Ophiuchi (the determinative star), and m Herculis.

This Chinese xing guan "Hú" (斛) is a quadrilateral of stars in the IAU constellations Hercules and Ophiuchus: 25 and Kappa (κ) Ophiuchi, and 43 and 47 Herculis. Note: This xing guan shares stars with the Korean asterism "Cereal Measure Regulation" (see above). In the 3 Kingdoms to the Ming Dynasty era, it was known as Dipper for Liquids (see above).

This Chinese Chenzhuo xing guan "Hú" is a curved line of four stars in the IAU constellations Hercules and Ophiuchus: Sigma (σ) Ophiuchi, HIP 83601, 21 Ophiuchi, and 28 Herculis.

Direction:

This Arabic star "Qibla" (قِبْلَة), later latinized to "Qiblah" or "Al Kiblah" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It was used to locate the direction to the Kaaba in Mecca. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al Kiblah".

Direction Star:

This Okinawan star "niinufabushi"(ニーヌファブシ) is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. This is derived from the older older 子の方星 or ne = no fau boshi (1st earthly.branch = GEN.IANI direction GEN\star| 'the North Star').

dIš-tar MUL.MEŠ:

This Akkadian asterism "dIš-tar MUL.MEŠ" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mul dnin-si-an-na.

Discordant of Canes Venatici:

This **telescopic** asterism "Discors Cánum Venaticórum" is the dwarf barred irregular galaxy NGC 4228 (4214) in the IAU constellation Canes Venatici. It was discovered in 1785 by English astronomer William Herschel who listed it as "I 95". It was subsequently listed twice in the General Catalogue of 1864 as GC 2804 and GC 2818. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the tumultuous star formation activity at one side of the central region." Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 59.

Discordant Quasar:

This American **telescopic** asterism the quasar [HB89]0156+187 in the IAU constellation Aries. It is located near the core of ARP 78. This name was posted on the *Deep Sky Forum* in November 2014 by Mark Friedman.

Discus of Eridanus:

This **telescopic** asterism "Discus Erídani" is the spiral galaxy NGC 1386 in the IAU constellation Eridanus. It was discovered by Johan Friedrich Julius Schmidt in 1865. This became GC 5321 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Disease:

This Inca asterism "Oncoy" or "Onqoy" is the Pleiades cluster in the IAU constellation Taurus (Gamarra & Gamarra 2009). They also called it "Colla" or "Qollqa" (see Storehouse, below), "Larilla", "Fur", and "Pugllairuuaico".

Dish Cluster:

This **telescopic** asterism is the open cluster NGC 2539 in the IAU constellation Puppis. It was discovered by English astronomer William Herschel in 1785 who listed it as "VII 11" in his catalogue. It is GC 1630 in the *General Catalogue* of 1864. A "rim" of brighter stars forms an oval around the cluster, giving the impression of a "dish". Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 41.

Dish of Cetus:

This **telescopic** asterism "Catínus Céti" is the spiral galaxy NGC 615 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as "II 282". It became GC 363 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Dish of the Poor People:

This Bedouin asterism "as qaṣʿat al-masākīn" (قصعة المساكين), later latinized to "Ḳasʿat al Sālik", and "Ḳasʿat al Masākīn", is the IAU constellation Corona Borealis. Compare this to Bowl of the Poor, above.

Disk of Virgo:

This **telescopic** asterism "Discoídes Vírginis" is the spiral galaxy NGC 4380 in the IAU constellation Virgo. It was discovered in 1826 by John Herschel who listed it as h 1241 and later as GC 2944 in his *General*

Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Disk Thrower of Pegasus:

This **telescopic** asterism "Discobolus Pégasi" is the barred lenticular galaxy NGC 7753 (Arp 86) in the IAU constellation Pegasus. William Herschel listed this as "II 213". John Herschel listed it as h 2268 and later as GC 5011 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the spiral galaxy NGC 7753 is connected to the disk-like galaxy NGC 7752 [GC6226] by its long arm" which reminded them of "the famous sculpture of a disk throwing athlete by Myron".

Disorder Outside of Tucana:

This **telescopic** asterism "Exotaráche Túcanae" is the barred spiral galaxy NGC 7329 in the IAU constellation Tucana. This was discovered in 1835 by John Herschel who listed it as h 3951 and later as GC 4814 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the inner structure of this galaxy is well-ordered with a bar and an inner ring, while outside the ring, a complex structure of multiple fragments of overlapping spiral arms is prevalent."

Disordered of Eridanus:

This **telescopic** asterism "Incónditus Erídani" is the unbarred spiral galaxy NGC 1337 in the IAU constellation Eridanus. It was discovered by American astronomer Lewis Smith in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "looks like an ancient Roman shield in oblique view".

Disordered of Hydra:

This **telescopic** asterism "Tarachódes Hýdrae" is the barred spiral galaxy IC 2995 in the IAU constellation Hydra. It was discovered by Lewis Swift in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the rather disordered shape of this late type galaxy".

Disordered of Virgo:

This **telescopic** asterism "Atáctus Vírginis" is the spiral galaxy UGC 8041 in the IAU constellation Virgo. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it this because of "the disordered state of the disk of this very late type galaxy".

Dispersed Fire:

This K'iche' asterism is the IAU constellation Orion (Milbrath 1999).

Dissembling Anger of Hydra:

This **telescopic** asterism "Crypsíchola Hýdrae" is the elliptical galaxy NGC 2986 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as "II 311". It became GC 1913 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its bright center "hiding the violent activity that is probably taking place in its core".

Dissolved of Ursa Major:

This **telescopic** asterism "Solútus Úrsae Majóris" is the intermediate spiral galaxy NGC 2805 in the IAU constellation Ursa Major. It was discovered in 1791 by William Herschel who listed it as "III 878". It became GC 1790 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "very dissolved appearance".

Distaff:

This Latin asterism "Colus" or "Fila et Stamina" ("Distaff, Thread, and Woof") is Alpha (α) Virginis (Spica) in the IAU constellation Virgo. Compare this to Ear of Grain, below.

This Greek asterism "Colus" is the IAU constellation Coma Berenices as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

Distant Bird of Tucana:

This **telescopic** asterism "Teleórnis Tucánae" is the galaxy ESO 148-2 in the IAU constellation Tucana. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this galaxy resembles a flying bird.

Distant Neighbour of Sextans:

This **telescopic** asterism "Televicínus Sextántis" is the irregular galaxy UGC 5373 (Sextans B) in the IAU constellation Sextans. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "UGC 5373 is one of the most distant members of the Local Group." The earliest known reference to this galaxy is from a 1954 paper by Edison Pettit in the *Astrophysical Journal*, where it was listed as the "Wilson Dwarf".

Distinguished Premier:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Guixiang" is Phi (ϕ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism "Wénchāng" (文昌) - see Administrative Centre, above.

Distorted of Ursa Major:

This **telescopic** asterism "Diástrophus Úrsae Majóris" is the Magellanic spiral galaxy NGC 3998 in the IAU constellation Ursa Major. It was discovered by Prussian astronomer Heinrich d'Arrest in 1864. John Herschel listed it as JG 1031 and later as GC 2637 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its tidal distortion.

District Driver:

This Hungarian asterism "Okörz hajtó" is the IAU constellation Boötes. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as men with staffs and whips herding steer

Disturbed of Coma Berenices:

This **telescopic** asterism "Turbátus Cómae Bereníces" is the lenticular galaxy NGC 4382 (Messier 85) in the IAU constellation Coma Berenices. It was discovered by Pierre Méchain in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "this galaxy is seriously disturbed in its outer envelope".

Disturber of Coma Berenices:

This **telescopic** asterism "Turbátor Cómae Bereníces" is the barred spiral galaxy NGC 4394 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "II 55". It became GC 2957 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it is a close companion of NGC 4382 (see Disturbed of Coma Berenices, above).

Diti:

This Vedic star is Beta (α) Geminorum (Castor) in the IAU constellation Gemini.

Diverse:

This Greek asterism "ποικίλος" or "poikílos" is the IAU constellation Canis Major as described by Aratus (315 – 240 B.C.E), who was describing the variability of the magnitudes of its stars.

Divider:

This Kazakh asterism "Urker" is the Pleiades cluster in the IAU constellation Taurus. The Turkic and Mongol peoples used the rising and setting of the Pleiades to divide their year. Some sources spell this "Yrker" and translate it "scared" (Jaambayeva 2019) and relates it to a myth describing seven girls who flee into the sky to avoid seven thieves".

Divine Lion:

See Lion, below.

Diving Tower:

This **telescopic** asterism is Hay-Merting 6 in the IAU constellation Cepheus. This was discovered by German astronomers Christopher Hay and René Merting in 2106 and listed in Robert Zebahl's *Faint Fuzzies* website. Its size is 10' X 5'. Zebahl describes it thus: "Approximately 10' north of the cluster King 10 is an orange star of 9th magnitude, which is interpreted as the leading edge of the 5 m board on a diving tower. Between this star and King 10 a prominent triple chain of 10 [magnitude] bright stars forms the 3 m board. King 10 is the splashing water directly after a jump".

Diwo:

See Sun, below

Diya:

This **telescopic** Mauritian star is WASP 72 in the IAU constellation Fornax (magnitude 10.96). It was given this name in the IAU NameExoWorlds campaign. A Diya is an oil lamp used for special occasions,

including Diwali. It has an exoplanet named Cuptor: This is a thermally insulated baking or drying chamber.

Djurt-djurt:

This Kulin Nations star "Djurt-djurt" is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Massola 1968, Hamacher 2011).

dLAMMA:

This Babylonian star "dLAMMA" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

DNA Strand:

This **telescopic** asterism is a twisting helix of stars in the IAU constellation Aquarius starting with the star Psi (ψ) Aquarii and running down to 98 Aquarii.

Dnoces:

This star is Iota (ι) Ursae Majoris in the IAU constellation Ursa Major. This is the word "second" spelled backwards, and is a name given to this star by American astronaut Gus Grissom as it was his nickname for fellow astronaut Edward H. White. It is believed that Grissom was influenced by the stars Sualocin and Rotanev (see below) which were reversed Latinized names of Giuseppe Piazzi's assistant Nicolo Cacciatore and decided to name some other stars in this area with reversed names.

Doctor:

This Chinese star "Boshi" from the Three Kingdoms to the Ming Dynasty is Upsilon (υ) Geminorum in the IAU constellation Gemini and is part of their xing guan Five Feudal Kings (see below).

Dodonides:

This Greek asterism is the Pleiades cluster in the IAU constellation Taurus as listed by as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k). The Pleiades were also known as the Atlantides (see below).

Dofida:

See Our Star, below.

Dog:

This Greek asterism "Κύων" ("Kýon") or "Kuon" is the IAU constellation Canis Major as it appeared in Homer's *Iliad and Odyssey* (8th century B.C.E.) and in Hesiod's poem *Works and Days* (late 8th century B.C.E.). It was mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and described in Ptolemy's *Almagest* (2nd century):

- The "body" of the dog starts at the "mouth", Alpha (α) Canis Majoris (Sirius) and then runs around the "head" through the stars 11 Canis Majoris, to the "tip of the ear" at Theta (θ) Canis Majoris, then down along the back through Gamma (γ) Canis Majoris and Tau (τ) Canis Majoris to the "tip of the tail" at Eta (η) Canis Majoris. The lower "body" runs from here through Omega (ω), Sigma (σ), Omicron (ο) 1 Canis Majoris, and 19 Canis Majoris to 20 Canis Majoris.

- One “front leg” is a line from 17 Canis Majoris to a “knee” at Xi (ξ) 1 and 2 Canis Majoris and a “foot” at HIP 29843.
- The other “front leg” is a line that runs from 15 Canis Majoris through Nu (ν) 2 Canis Majoris to a “foot” at Beta (β) Canis Majoris and then back through Nu (ν) 3 Canis Majoris to HIP 33077.
- The “back leg” starts at Omicron (ο) 2 Canis Majoris, runs to a bend at Omicron (ο) 1 Canis Majoris, then another bend at HIP 31870, then to a “foot” at Zeta (ζ) Canis Majoris, then back to a bend at Kappa (κ) Canis Majoris, then through Epsilon (ε) Canis Majoris to Delta (δ) Canis Majoris.

NOTE: Ptolemy (c.100 – c.170) used “Kýon” to refer to both this asterism and to just the star Sirius. Sirius was listed as “al-Kalb” (“the dog”) by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This asterism “Canis” is the IAU constellation Cassiopeia. This name is listed in Johann Bayer’s *Uranometria* (1603) and attributed to Arab sources.

This is listed as a Greek lunar mansion made up of stars of the IAU constellation Canis Major or Canis Minor and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). A dog or jackal appears alongside the Greek asterism Bull (see above) in the *Daressy Zodiac* of the Roman Imperial Period. It also appears as a paranatellonta of the decans of Sagittarius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k).

This Babylonian asterism “ur-gi” is made up of stars of the IAU constellation Hercules. The “body” is the oval of stars Beta (β) Herculis (Rasalgethi), Zeta (ζ) Herculis, Eta (η) Herculis, HIP 83947, 67 Herculis, Epsilon (ε) Herculis, and 51 Herculis. Several lines run out:

- A “tail” (“kun mul ur gi”) listed in the *Great Star List* (Kock-Westenholz 1995) runs from Rasalgethi to Gamma (γ) Herculis,
- One “leg” runs from Epsilon (ε) Herculis to Delta (δ) Herculis, and
- One “leg” runs from 67 Herculis to Mu (μ) Herculis.
- NOTE: The “dog’s head” (“mul sag ur.gi” or “mul.min”) is listed in the *Great Star List* (Koch-Westenholz 1995) but the precise stars are uncertain.

This Sumerian asterism “mulur-gir” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “ur-gi” (above).

This Akkadian asterism “kal-bi” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “ur-gi” (above).

This Seleucid asterism is identical to the Babylonian asterism “ur-gi” (above).

This Arabic star “al-Kalb” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Hebrew star “kelev gadol”.is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major:

- “Kelev gadol” is listed on the star list of Abraham Bar Hiyya in 1104 (Goldstein 1985). Goldstein believes that “ha-kelev” (“the dog”) “seems to be related to a Latin miscopying of orionis as canis (…Kunitzsch 1966)”.

- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-'abur kalb" and the Hebrew name "kelev gadol".

This Quechua asterism "Perro" or "Perrito" is dark nebulosity in the Milky Way (Ciancia 2018).

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Sagittarius: 52 Sagittarii (the determinative star) and Chi (χ) 1 Sagittarii.

This Chinese xing guan "Gǒu" (狗) is a line of two stars in the IAU constellation Sagittarius: 52 and 48 Sagittarii. Their xing guan "Territory of Dog" (see below) is nearby.

This Chinese Chenzhuo xing guan "Gǒu" is the two stars HIP 93134 and 93667 in the IAU constellation Sagittarius.

This Korean asterism "Gae" (개) is a line of two stars in the IAU constellation Sagittarius: HIP 93667 and 93134.

This English asterism "Canis, the Dog" is the IAU constellation Canis Major. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more room on astronomical charts. "Canis" is listed in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

In his *Urania* in 1754 John Hill lists the Latin name "Canis" for the star Pi (π) Cephei in the IAU constellation Cepheus. Hill is influenced here by the Arabic asterism Shepherd and the Sheep (see below): This star is their Shepherd Dog or Northern Shepherd Dog. Hill incorrectly claims in his explanation that a nearby star in this constellation is "psti, signifying a shepherd". This Arabic star, now called Cebalrai, is in the IAU constellation Ophiuchus and is nowhere near Cepheus. In the Shepherd and the Sheep, the "shepherd" is the star Gamma (γ) Cephei.

The Evenk, Udege and Oroch in eastern Siberia see the three stars of the handle of the Big Dipper asterism in the IAU constellation Ursa Major as hunters (see Hunters, below) and the star 80 Ursae Majoris (Alcor) as the hunter's dog (Berezkin 2005).

This Pawnee star is 80 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Two Stretchers, with Medicine Man, Wife, Errand Man, and Dog (see below).

This Salish, Chinookan, Lenape, Iroquois, and Meshkwahkihaki star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major (Berezkin 2005).

This Romanian asterism "Câinele" is the IAU constellation Canis Major (Ottescu 2009). It is also known as the Mastiff (see below).

There are four **telescopic** "dog" asterisms:

- Davis' Dog is a **telescopic** asterism found in the IAU constellation Taurus. Size 210' X 150'. Omega (ω) Tauri forms the nose, 51, 53 and 56 Tauri the "head and ears", and Kappa (κ) 1 & 2 Tauri are the dog's "backside" with Mu (μ) Tauri and 72 Tauri for the "tail". This was created by c. 2003 by American astronomer John Davis in Massachusetts. Davis passed away in 2018 at 86 years of age. This is Harrington 16 on the list of Astronomer and author Phil Harrington. NOTE: These stars were known to the ancient Arabs as the dogs of Al Dabaran, Alkalbain. René Merting describes it on the *Faint Fuzzies* website as "Geist der Hyaden" ("spirit of the Hyades").

- One is Ennis 21 on the observing list of Canadian astronomer Charles Ennis and is in the IAU constellation Andromeda. Size 150' X 110':
  - The double star HIP 365A is the dog's "Nose",
  - The dog's "head" is a quadrilateral of HIP 365A HIP 300, HIP 30, and HIP 137
  - The tip of the dog's "ear" is HIP 254.
  - The dog's "back" is the star HIP 118071 and a line of 8^{th} – 9^{th} magnitude stars running to one side of it.
  - The dog's "front leg" runs from HIP 118083 through HIP 118099 to a "foot" at HIP 118251 and 118269.
  - The dog's "rear leg" runs from the double star HIP 117646B to the double star HIP 117769.
  - The dog's "tail" runs through HIP 117672 to a curve of four stars forming the "tip" including the double star HIP 117565A, HIP 117620, and the double star HIP 117695A.
- One is in the IAU constellation Eridanus and is Ennis 65 on the observing list of Canadian astronomer Charles Ennis. Size 30' X 12'. The dog's "head" is a ring of 7^{th} – 12^{th} magnitude stars (Ennis 64) including HIP 22301 and Gaia DR# 3187668003459498368. The dog's "back" is HIP 22369 (7^{th} magnitude). The "front paw" is 9.05 magnitude star HD 20536. The "back leg" is HD 30664 and HD 30665. The "body" is a scattering of 10^{th} – 12^{th} magnitude stars.
  - One is the Double Cluster, NGC 869 and NGC 884 (C 14) in the IAU constellation Perseus. A "leash" is formed by the line of stars Chi (χ) Persei, 8 Persei, HIP 10690, HD 13744, and HIP 10379. This was posted on *Cloudy Nights* by American astronomer Fiske Miles in October 2023. Fiske describes this as a "person walking a dog – the dog being the Double Cluster".

Dog and Stick:

This **telescopic** asterism is from *Pattern Asterisms: A New Way to Chart the Stars* by John A. Chiravalle. It is in the IAU constellation Draco and resembles the head of a dog with jaws open to grab a stick. This includes stars of Corder 3303 and 3306. Size 100':

- The dog's "nose" is the star Omega (ω) Draconis,
- The dog's "head" is roughly a heart shape that runs around through DZ Draconis, 27 Draconis, HIP 85483, HIP 85678, to a 8.4 magnitude star and then back to the nose, and
- The "stick" is the line of stars HIP 85742, 86184, 86481, 86775, and 87237.

Dog Bone:

This **telescopic** asterism is in the IAU constellation Pisces and Corder 47 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 30'. Corder describes it as being oriented north-south and "contains about 12 stars, magnitudes 9.5 to 10.5." It includes the stars HIP 1130 and 1095A.

Dog Chasing Cariboo:

This Northern Tutchone star "Tlin hudzi nana" is unidentified at present (Cannon 2021).

Dog Face:

This Blackfoot star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Dog Following Mountain Sheep:

This Seri, Osage, and Tonono O'odham asterism is the IAU constellation Canis Major.

Dog Head:

The Egyptian decan "Isu" is a dog-headed man covered in wrappings from chest to heels, made up of stars of the IAU constellation Aquarius. Variations include "Epikhnaus". It has been depicted as a masked man with a flask in his right hand and a needle in his left.

Dog of Al Dabaran:

This Arabic asterism "Kalb al Dabarān" is stars in the IAU constellation Taurus as listed by Iranian scholar and astronomer Abu Rayhan Muhammad ibn al-Biruni (973 – c.1050). R. H. Allen lists this in his *Star Names* in 1899 and describes it as "the comparatively vacant space westward towards the Pleiades", though he does note that Al Biruni mentions "Kappa and Upsilon". However, another Arabic asterism is placed here: "al-kalbān" or "two dogs (of Al Dabaran)", see Two Dogs, below: This is the stars Kappa (κ) 1 and 2, Upsilon (υ), Phi (ϕ), and Chi (χ) Tauri in the IAU constellation Taurus (Alkalbain I, II, III, IV, & V) and is associated with their asterism Camel Herder (see above). I'm listing under the location for Kappa (κ) Tauri (Alkalbain III) since this is clearly a variation of Two Dogs and Kappa is clearly indicated. Compare this to Davis' Dog (see above).

Dog of the God Gula:

The Babylonian asterism "Kalbu" or "Kal-bu"from the MUL.APIN tablets, which later appears in Seleucid sky lore, is the dog of the God Gula:

- The "body" is made up of the "Keystone" of the IAU constellation Hercules (see Keystone below) extending out to a backside at Beta (β) Herculis (Kornephoros), and
- The dog's "feet" are Delta (δ) and Mu (μ) Herculis and the end of the "tail" is Gamma (γ) Herculis.

Compare to the Babylonian asterism "Kakab-lik-u" (see Dog Star, below).

Dog of the Giant:

This Arabic asterism "Al Kalb al Jabbār" is the IAU constellation Canis Major as listed by the Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050).

This Persian asterism "Kelbo Gavoro" is the IAU constellation Canis Major.

Dog of the Wild:

This asterism "Auensrae Canis Iatrans" is the IAU constellation Boötes. This name is listed in Johann Bayer's *Uranometria* (1603).

Dog of Tobias:

This star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. "Canis Tobias" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. "Dog of Tobias" is listed as a name for Canis Major in R. H. Allen's *Star Names* in 1899. Allen attributes it to Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?), "who imagined Biblical significance in every starry group".

This star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed by German poet Philipp von Zesen (1619 – 1689) and German uranographer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675.

Dog of Typhon:

This is the IAU constellation Ursa Major as listed by French philologist Jean-François Champollion (1790 – 1832). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 writes "my intelligent friend, Professor Leemans, says 'Ursa Major, quae secundum Champollionem dicebatur Canis Typhonis'" ("Ursa Major, which according to Champollion was called the Dog of Typhon").

Dog Pack:

This Sami asterism "Rougot" ("dog pack") or "Miese-cora" ("calf pack") is the Pleiades cluster in the IAU constellation Taurus (Lundmark 1982).

Dog Sister:

This Tse'khene star is possibly Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Cannon 2021).

Dog Star:

This Babylonian star "Kakab-lik-u" or "the star of the dog" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). Compare to their asterism "Kalbu" (see Dog of the God Gula, above).

This Greek star "Κύων ἀστήρ" ("Kýon astír"), "Αστροκύων" ("Astrokýon") is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. This name was in used before the 7th century B.C.E. when Hesiod named it "Seirios" (see Glowing, below). The ancient Greeks though that dogs were affected by the annual heliacal rising of Sirius, indicated by their panting, which led to them calling Sirius the "Gaper" (see below). The earliest mention of Sirius as a dog star is in Homer's *Iliad* (8th century B.C.E.), where Homer called it "midsummer's purest flaming star", "a baleful summer star", and "Orion's dog" (Holberg 2007). The heliacal rising of Sirius marked the arrival of the heat of late summer to the Greeks. Hesiod wrote of this in his poem *Works and Days*, Aratus (315 – 240 B.C.E) wrote of this in his *Phaenomena*, and Hippocrates warned of the effects of Sirius. This ultimately led to the Roman expression "dies caniculares" ("days of the dog star"), which is the origin of the expression " dog days of summer".

- This star appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Dog Star".
- Johann Bayer's *Uranometria* (1603) lists this star as "Canis" ("Dog").
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as "Sirius" and as the "Dog Star".
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) refers to this star as the "Dog Star".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists Sirius as the "Dog Star".

There are two Lithuanian stars by this name:

- One, “Szunis zwayzdie“ is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.
- One, “Šuva žvaigždė” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This Icelandic star “Hunda Stjarna” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Cleasby and Vigfusson 1874).

Dog Stars:

This Ininew asterism “Atima Atchakosuk” is the Little Dipper asterism in the IAU constellation Ursa Minor (Buck 2016). They call the star Alpha (α) Ursae Minoris (Polaris) “Keewatin Anung” (see Going Home Star, below) and some describe this as the anchor for a leash for the “dog”, which is the “handle” of the Little Dipper, while the “dipper” is the “dog”. One version of the story (Buck 202) has the brothers Wolf, Coyote, and Fox holding a council and deciding to send pups to mankind so that they may have dogs:

- Polaris is the Wolf Star (see below),
- Delta (δ) Ursae Minoris is the Coyote Star, and
- Epsilon (ε) Ursae Minoris is the Fox Star.

Another version of this Ininew asterism “Ahtimah Atchakosuk” is made up of the stars of the IAU constellations Camelopardalis and Ursa Minor. The triangle of Camelopardalis is the “head” and the stars of Ursa Minor the hind quarters.

This Cherokee asterism is the stars Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. They viewed them as guardian dogs at either end of the Path of Souls (Milky Way).

Dog Tooth of Time:

This Arabic star “nab al-dahr” is Beta (β) Leonis (Denebola) in the IAU constellation Leo. This is a nickname for their manzil Al-Sarfah (see Weather Change, below).

Dog Who Courts Someone:

This Tsilhqot’in asterism “Lhìn Nìts’én Nánàyídásh” may be cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)).

Dogs:

This Greek and Minoan asterism is the IAU constellations Canis Major and Canis Minor. Lithuanian archaeologist Marija Gimbutas (1996) identified the IAU constellation Orion as the Greek huntress Goddess Artemis and her Minoan equivalent A-ti-me-te, accompanied by her two hunting dogs represented by the IAU constellations Canis Major and Canis Minor. Gimbutas has also associated these constellations with Hecate (see Hecate’s Dogs, below).

This Inuit asterism “Qimmiitt” is the Hyades cluster in the IAU constellation Taurus (MacDonald 1998). The star Alpha (α) Tauri (Aldebaran) is called “Nanurjuk” (see Spirit of a Polar Bear, below) by the Inuit. The bear Nanuk chased the dogs off the edge of the world where they became stars.

This Inuit (Greenlandic) asterism “Qillugtussat” (‘baying dogs”) is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen lists this as “Killukturset” in his *Star Names* in 1899 and translates it as “dogs baiting a bear”, and attributes it to Norse missionary Hans Egede, who was in Greenland between 1721 – 1734.

This Celtic (Gaulish) asterism “Cunes” is the IAU constellations Canis Major and Canis Minor (Boutet 2017).

This Mocoví asterism is the Pointer Stars Alpha (α) Centauri (Rigil Centaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers below). They are chasing their asterism “Mañic” (see Rhea, below).

This Portuguese asterism “Cães” is the IAU constellation Canis Major.

Dogs Are Chasing:

There are two versions of this Gwich’in asterism “Łąjj Ch’ihiił’oh” (Cannon 2021):

- One is the Little Dipper asterism in the IAU constellation Ursa Minor,
- One is the Pleiades cluster in the IAU constellation Taurus.

Dog’s Head:

This asterism is made up of the stars of the IAU constellations Centaurus and Crux by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. The label on his chart appears to read “Œsingia” and depicts a bust of a dog’s head facing to our right with a golden cross (Crux) on its ear.

This Lithuanian asterism “Šunio galva” is currently unidentified.

Dog’s Star:

This German star “Hunds Sterm” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch

Dogs Strung Together:

This Gwich’in asterism “L’énatlla” or “Łaii Atł’yaa” is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Dog’s Tail:

This Greek asterism “Κυνοσούρα” (“Kynosoúra”) is the name that the Greek poet Aratus (315 – 240 B.C.E) used for the IAU constellation Ursa Minor in his *Phaenomena* in 270 B.C.E., which became latinized to “Cynosura”, with the Roman poet Ovid (b. 43 B.C.E.) and the Roman general Germanicus (15 B.C.E. – 19 C.E.) later calling it “Cynosuris”. There are several interpretations of this, as Cynosura was the name of a nymph given a place in the sky by Zeus:

- The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists “Cynosura” and “Cinosura” as names for Ursa Minor.
- *Dele Stelle Fisse* (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542, lists “Cinosura”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

- This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Cynosura” and “Ursa Minor”.
- Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Cynosura” as a name for Ursa Minor.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Cynosura” as an alternate name for Ursa Minor.
- Johann Bayer’s *Uranometria* (1603) lists “Cynosura” for Ursa Minor and “Cynosuris” for Ursa Major.
- English poet John Milton (1608 – 1674) calls it “Tyrian Cynosure” and “Cynosure” in his *L’Allegro*. Other variations include “Cinosura” which appeared in the 17th and 18th centuries.
- “Cynosurae” and “Cynosura” are listed as names for the IAU constellation Ursa Minor in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists both “Ursa Minor” and “Cynosura” for this constellation.
- In a collection of Marian poetry published by Nicolaus Lucensis (Niccolo Barotti de Lucca) in 1655, Polaris is called “Cynosura seu Mariana Stella Polaris” (“Cynosure, or the Marian Pole Star”).
- Robert Hues lists this as “dog” in his *A Learned Treatise of Globes* in 1659 and attributes this name to the 6th century B.C.E. mathematician Thales.
- Edward Sherburne lists “Cynosura” as “the bright one in the Shoulder” in his *Sphere of Marcus Manilius* in 1675.
- Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists the star Polaris as “Cynosura“.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) calls Alpha (α) Ursa Minoris (Polaris) “Cynosura vel Alruccaba”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists Alpha (α) Ursae Minoris as “Cynosura” and describes it as a “dog’s tail”.
- Robert Brown in his *Researches Into the Origin of the Primitive Constellations of the Greeks, Phoenicians and Babylonians* (1899) wrote: “in the case of some Kretan coin-types, Ursa Maj. is represented as a Cow, hence Boôtês as 'the Herdsman', and Ursa Min. as a Dog ('Chienne' cf. Kynosoura, Kynoupês), a Zeus-suckler."
- R. H. Allen notes in his *Star Names* in 1899 that the name “Κυνόσουρις” (“Kynósouris”) was occasionally assigned to Ursa Major and that by his time “Cynosure” was only used in reference to Polaris.

This Latin asterism “Canis Cauda” is the Little Dipper asterism in the IAU constellation Ursa Minor as listed in the 11th century *De signis caeli (“of the signs of heaven*”) and in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

This asterism is the Pointer stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus as listed by R. H. Allen in his *Star Names* in 1899, which he describes as “Cynosura of the Southern Hemisphere”.

Dok:

This Wotjobaluk, Mara, and Moporr asterism is Alpha (α) Crucis (Acrux) in the IAU constellation Crux (Clarke 2009). She is the mother of the twins Bram-bram-bult (see above) which are the Pointer stars. Hamacher (2011) lists the Wotjobaluk asterism as Delta (δ) Crucis.

Dolphin:

This Greek asterism "Δελφίς" ("Delfís") is the IAU constellation Delphinus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as described in Ptolemy's *Almagest* (2nd century). It is a five-sided figure attached to a triangle:

- The triangle is the stars Epsilon (ε), Kappa (κ) and Iota (ι) Delphini.
- The five-sided figure is the stars Epsilon (ε) Delphini, Eta (η) Delphini, Zeta (ζ) Delphini, Alpha (α) Delphini (Sualocin), Gamma (γ) Delphini, Delta (δ) Delphini, and Theta (θ) Delphini with the star Beta (β) Delphini (Rotanev) inside.

This Vedic asterism "Shisumara" or "Śhiśumāra" is the circumpolar constellations, Draco, Lyra, Cygnus, Cepheus, Ursa Minor, and Ursa Major, also known as Kundalini-cakra (Bhagwath 2019). It is specifically associated with the IAU constellation Draco and the God Vishnu. Bhagwath notes that this is referred to as a crocodile in the Śivapurāna which he relates to the crocodile cults in Gujarat and Bastar.

This Arabic asterism "Aldalafayn" (الدلفين) is the IAU constellation Delphinus.

This Hawaiian asterism "Nai'a" ("dolphin" or "porpoise") is the IAU constellation Delphinus.

This asterism "Delphin" is the IAU constellation Delphinus. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more room on astronomical charts. However "Delphinus" is the name that appears in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

Dolphin Head Nebula:

This **telescopic** asterism is the emission nebula SH 2 – 308 (RCW 11, LBN 1052) in the IAU constellation Canis Major. It surrounds the star EZ Canis Majoris. NOTE: Stellarium lists two names, one being "Dolphin Head" and the other being "Dolphin", this second name being more commonly used for SH 2-188 (see below).

Dolphin Nebula:

This **telescopic** asterism is planetary nebula Sh 2-188 in the IAU constellation Cassiopeia. It is listed under this name as well as the names "Shrimp Nebula" and "Prawn Nebula" on RASC member Ron Brecher's *Astro Doc* website.

Dolphin's Diamonds:

This **telescopic** asterism is found in the IAU constellation Delphinus, consisting of thirteen magnitude 8 – 11 stars with the spiral galaxy NGC 7205 on one side. The name Dolphin's Diamonds is of course a reference to the name of the constellation. It is also known as the Toadstool (French 1, see Toadstool, below) and is Harrington 27 on the asterism list of American astronomer Phil Harrington.

Dolphin's Tail:

This Arabic star "Danab ad-Dulfīn" (ذنب الدلفين), shortened to "al Dulfīm" (ذيل الدلفين) is Epsilon (ε) Delphini in the IAU constellation Delphinus:

- "Dhanab al-Dulfin" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Deneb Dulfim,", "Aldufin" or "Al Dhanab".
- Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Delfin" , although it makes it a name of Gamma (γ) Delphini (Dekker 2000).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "dhanab al-dulfīn".
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Delfin"
- The IAU has approved the name Aldufin for Epsilon (ε) Delphini.

Dombay:

This Russian star is HAT-P-3 in the IAU constellation Ursa Major and was given this name in the IAU NameExoWorlds campaign. It was named after the Dombay resort region in the North Caucasus. It has an exoplanet named Teberda, which is the name of a mountain river in that region.

Dome Like Tent:

This Arabic asterism is an oval of stars in the IAU constellation Corona Australis: Starting at Alpha (α) Coronae Australis (Meridiana) it runs through Beta (β) Coronae Australis, Delta (δ) Coronae Australis, Zeta (ζ) Coronae Australis, Eta (η) Coronae Australis, HIP 91494, Theta (θ) Coronae Australis, HIP 90759, HIP 90887, Lambda (λ) Coronae Australis, Epsilon (ε) Coronae Australis, and Gamma (γ) Coronae Australis.

Domesticated Animals:

This Latin asterism "Pecudes" is listed in John Hill's *Urania* in 1754 as "a cluster of stars upon the hands of Cepheus" and gives it the Arabic name "Al Agh'nam, Sheep". This is clearly a reference to the Arabic asterism Flock of Sheep (see below), which is the stars Kappa (κ) and Pi (π) Cephei in the IAU constellation Cepheus (I and II Al Aghnam). This is probably also influenced by the Arabic asterism Shepherd and the Sheep (see below) and Apianus' asterism Shepherd, Dogs, and Sheep (see below).

Dōnghǎi:

This Chinese star "Dōnghǎi" from the 3 Kingdoms and Ming Dynasty Period is the star Eta (η) Serpentis in the IAU constellation Serpens and is and is part of their xing guan Heavenly Market East Wall (see below).

Dongou:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Antlia and Vela and consists of a line of three stars with a "fork: at one end:

- The line of stars consists of I Velorum, Iota (ι) Antliae, and HIP 50888.
- From HIP 50888 two lines run out:
    - One goes to the star q Velorum (the determinative star), and
    - One goes to the star n Antliae.

This Chinese Chenzhuo xing guan is a bent line of five stars in the IAU constellations Centaurus and Vela: Mu (μ) Velorum, HIP 54746, Pi (π) Centauri, Delta (δ) Centauri, and HIP 57803.

Donkey:

This asterism "Asina" is the IAU constellation Hydra. This name is listed in Johann Bayer's *Uranometria* (1603).

This Latin star "Asinus" is Gamma (γ) Cancri in the IAU constellation Cancer as listed in the Basil 1551 edition of the *Almagest*. Compare this to Donkeys, below.

A donkey or ass appears next to the Greek asterism Lion (see below) on the *Daressy Zodiac* of the Roman Imperial Period (Mosenkis, date n/k).

Donkey Colts:

This Latin asterism "Aselli" ("little asses" or "donkey colts") or "Asini" ("ass") is made up of three stars in the IAU constellation Boötes:

- Theta (θ) Boötis: Asellus Primus ("first donkey colt")
- Iota (ι) Boötis: Asellus Secundus ("second donkey colt"), and
- Kappa (κ) Boötis: Asellus Tertius ("third donkey colt").

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Asini".

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* list "Aselli" and depict a square manger.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Due asini".

Johann Bayer's *Uranometria* (1603) lists "Asellus Primus" for Theta (θ) Boötis, "Asellus Secundus" for Iota (ι) Boötis, and "Asellus Tertius" for Kappa (κ) Boötis.

This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Aselli".

Edward Sherburne lists this as "Aselli" in his *Sphere of Marcus Manilius* in 1675. Compare this to "Two Asses", below.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Aselli" as Gamma (γ) and Delta (δ) Cancri.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), refers to Delta (δ) and Gamma (γ) Cancri as "the Aselli, or the Ass's Colts".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) mentions this asterism as "three small stars in the left hand of Boötes… near Benetnasch" but does not name it.

Donkeys:

This Greek asterism "Ὄνοι" or "Ónoi" is the stars (Delta (δ) Cancri (Asellus Borealis- "northern donkey colt") and Gamma (γ) Cancri (Asellus Australis- "southern donkey colt") in the IAU constellation Cancer.

It is part of their asterism “Praesepe” (“manger”) or “Asselli and Praesepe” (see Manger, below) which includes the open cluster Messier 44 (see Beehive, above). The ancient Greeks saw it as a manger from which two donkeys are eating. Aselli is Latin for “little asses” or “little donkey colts” and Asellus is Latin for “ass”.

Door Bolt:

This Chinese xing guan “Jiànbì” (键闭) is the star 14 Scorpii in the IAU constellation Scorpius and is related to their nearby xing guan “Room” (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Jianbi” is the star 14 Scorpii in the IAU constellation Scorpius.

Door Lock and Key:

This Korean asterism “Do-eologgwa Yeolsoe” (도어록과 열쇠) is a line of two stars in the IAU constellation Scorpius: Omega (ω) 1 and 2 Scorpii and Beta (β) 1 Scorpii (Acrab). This asterism is attached to the longer asterism “Royal Hall” (see below) at Beta (β) 1 Scorpii.

Doradinal Pole:

“Polus Doradinalis” This is the name given to the IAU constellation Dorado by German poet Philipp von Zesen (1619 – 1689) as its “head”, the stars Beta (β) Doradus, Delta (δ) Doradus, and HIP 27890, mark the south pole of the ecliptic.

Dorado:

Although none of its stars of this constellation are brighter than 3rd magnitude, they do show up in 116 asterisms in this handbook, principally because the Large Magellanic Cloud is located here.

This IAU constellation (IAU abbreviation Dor), “the swordfish”, was named with the Spanish word for “golden” (“Piscis auratus”) and was one of twelve constellations identified by the Flemish astronomer Petrus Plancius (1552 - 1622) based on the observations of Dutch navigator and uranographer Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627). De Houtman called it “Den Dorado” (“the Dorado”). Dutch historian Paulus Merula (1558 – 1607) listed the Latin names “Dorado” and “Aurata” (“golden”), as well as “Zee Braesum” (“sea bream”) and “Vleigende Visch”, the latter being a name for Volans (see below).

A celestial globe (late 1597) of Flemish astronomer Petrus Plancius published by Amsterdam cartographer Jodocus Hondius the Elder depicts “Dorado”.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Dorado” as a fish.

German uranographer Johann Bayer (1572 – 1625) depicts “Dorado” in his *Uranometria* of 1603 as a fish.

German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe’s catalogue, in 1627, listed this constellation as “Dorado” and “Xiphias”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Dorado” as a fish swimming to our right.

"Dorado" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as well as the alternate names "Xiphias" and "Gladius" and the local name "Schwert Fisch".

"Dorado" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a fish swimming to our left.

Dorado is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Edward Sherburne lists "Dorado", "Piscis Auratus" and "Chrysophris" (a variety of snapper) in his *Sphere of Marcus Manilius* in 1675.

English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 lists this constellation as "Dorado" and "Xiphias".

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, labels this fish "Dorado" on one chart page and "Xiphias" on another.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "La Dorade" and "Dorado" and depicts it as a fish with its face pointing toward celestial south.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Dorado al Xiphias" and depicts it as a fish.

This is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as "Dorado".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Xiphias" as a fish.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Dorado Xiphias" as a fish.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Dorado as a fish.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Dorado as a fish.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) labels this "Dorade" and depicts a fish.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Xiphias" as a fish.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "la Dorade" as a fish, as does the 1778 edition.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Dorado" as a fish.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Xiphias” as a fish.

American uranographer William Croswell (1760 – 1834) depicts “Dorado Xiphias the Swordfish” on his *Mercator Map of the Starry Heavens* in 1810 as a swordfish.

“Dorado” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Doradot in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “Dorado the Swordfish” as a swordfish.

The French call it “Dorade” but French astronomer Camille Flammarion (1842 – 1925) called it “Doradus” in his *Astronomie Populaire*.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its charts as “Dorade”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Dorado, The Sword-Fish” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Dorado” and describes it as a “Sword Fish”, incorrectly attributing it to Bayer.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Dorado in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart depicts this constellation as the triangle of stars Beta (β) Doradus, Delta (δ) Doradus, and HIP 27890, with a line running from Beta (β) Doradus through Alpha (α) Doradus to Gamma (γ) Doradus. Rey adds the star Zeta (ζ) Doradus to create an additional line connecting Beta (β) and Alpha (α) Doradus to create a “body”.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Dorado in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of stars running from Delta (δ) Doradus through Beta (β) Doradus and Alpha (α) Doradus to Gamma (γ) Doradus.

Sky and Telescope Magazine, founded in 1941, depicts Dorado in their magazine and publications like this:

- Its “tail” is the triangle of stars Delta (δ) Doradus, HIP 27890, and Beta (β) Doradus,
- Its “body” is the triangle of stars Beta (β) Doradus, Zeta (ζ) Doradus, and Alpha (α) Doradus, and
- Its “sword” is a line from Alpha (α) Doradus to Gamma (γ) Doradus.

Dormouse:

This **telescopic** asterism is the open cluster NGC 7510 in the IAU constellation Cepheus, which was discovered by English astronomer William Herschel in 1784. It is also known as the Arrowhead (see above). The main stars of the cluster are the body with a line of four 11^{th} – 12^{th} magnitude stars forming a “tail”.

Doró botó:

This Karajá asterism is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009). Doró botó is a hunter chasing "A-onidurarú" (see Tapir, below).

Dostár kellöse:

This Hungarian asterism "Dostár kellöse" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts this asterism as two people stretched out on the ground looking at something. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Dotted of Horologium:

This **telescopic** asterism "Punctatus Horológii" is the spiral galaxy IC 1933 in the IAU constellation Horologium. It was discovered by American astronomer DeLisle Stewart in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the HII regions of this galaxy provide it with a dotted appearance".

Double Barbed of Antlia:

This **telescopic** asterism "Bihamátus Ántliae" is the barred spiral galaxy NGC 3347 in the IAU constellation Antila. John Herschel listed it as h 3291 and later as GC 2181 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Double Bubble Nebula:

See Peanut Nebula, below.

Double Cluster:

This asterism is two open clusters side by side in the IAU constellation Perseus: NGC 869 and 884. The Greek astronomer Hipparchus (190 – 120 B.C.E.) noted them in 130 B.C.E., describing them as a "νεφελοειδής" ("nefeloeidís": "cloudy spot" or "nebular"). Ptolemy (c.100 – c.170) called it "συστροφή" ("systrofí": "dense mass" or "twisted") and it appeared in Abd al-Rahman al-Sufi's *Book of Fixed Stars* in 964. S. Raab described them in the Meddelanden Fran Lunds Astronomiska Observatorium Series II, 28, 1, as forming a "double cluster in Perseus".

- German astronomer Johann Bayer (1572-1625) described them as h Persei and Chi (χ) Persei in his *Uranometria* in 1603.
- Sherburne Wesley Burnham (1838 – 1921) listed it as the Double Cluster in *Burnham's Celestial Handbook.*
- It was English astronomer William Herschel who first recognized them as open clusters in the and listed NGC 869 and NGC 884 as VI 33 and VI 34in his catalogue.
- John Herschel lists NGC 869 as h 207 and NGC 884 as h 212.
- The 1864 General Catalogue lists NGC 869 as GC 512.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) mentions "a beautiful star cluster visible to the naked eye" between Perseus and Cassiopeia which is probably this asterism but does not name it.

- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), calls this the "Great Cluster" and describes it as "a double swarm of stars".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Double Cluster" and the "Sword Handle".
- NOTE: NGC 869 is also referred to as the h Persei Cluster or Caldwell 14, and NGC 884 as the Chi Persei Cluster.

Double Dark Nebula:

See Barnard's E, above.

Double-Double:

This asterism is the side-by-side double stars Epsilon (ε) 1 Lyrae and Epsilon (ε) 2 Lyrae. English Admiral Henry William Smyth describes this as a "double-double" in his *Bedford Catalogue* in 1844. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes these as a "quadruple". R. H. Allen listed them as "celebrated" in his *Star Names* in 1899. English astronomer William Herschel discovered them. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as a "Double Double".

Double-Double and a Doughnut:

This Canadian **telescopic** asterism is in the IAU constellation Lyra. Canadians will be familiar with the Tim Hortons Double Double, which is two shots of cream and two shots of sugar in their original brewed coffee. RASC Halifax member Tony Schellinck noted that the double double asterism (see above) is next to Messier 57 (NGC 6720), the Ring Nebula, so he calls this the "double double and a doughnut". M 57 and Epsilon (ε) 1 and 2 Lyrae are 6° 46' apart.

Double Hair of Leo:

This **telescopic** asterism "Diplóthrix Leónis" is the intermediate spiral galaxy NGC 3626 (Messier 65) in the IAU constellation Leo. It was discovered by Charles Messier in 1780. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Double-Headed Eagle:

This asterism "Aquila Biceps" was made up of the stars of the IAU constellation Orion by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents the coat of arms of the Austro-Hungarian empire and is depicted as a double headed eagle topped with a crown holding a sword in his left claws and a sceptre in his right claws. It is listed as a "Two Headed Eagle" in R. H. Allen's *Star Names* in 1899.

Double-Headed Shot:

This **telescopic** asterism is the planetary nebula M 27 (NGC 6853), discovered by French astronomer Charles Messier in 1764 in the IAU constellation Vulpecula. It is GC 4532 in the *General Catalogue* of 1864. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "the double-headed shot". It is also known as the Dumbbell (see below), the Diabolo Nebula (see above) and the Apple Core Nebula (see above). NOTE: A double-headed shot, sometimes known as an "angel", was a cannon

projectile with two balls or half balls connected with a bar, which was used to slash through the rigging and sails of enemy ships.

Double Falcons:

This proposed Egyptian asterism nṯrwi̯ from the Old Kingdom (3100 B.C.E.) is the name of the 5th nome (district) of Upper Egypt, also known as "two gods" and represented by the IAU constellation Gemini (Berio 2014). The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts a bird-like figure with a crocodile head and an extra pair of wings above Orion and next to Gemini (Bullinger 1882, Seiss 1882).

Double Horse:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is made up of the stars of the IAU constellation Aquila:

- The "body" is a triangle of the stars Theta (θ) Aquilae, 71 Aquilae and Phi (ϕ) Aquilae,
- The "front leg" runs from Theta (θ) Aquilae to Eta (η) Aquilae, and
- The "back leg" runs from Phi (ϕ) Aquilae to Gamma (γ) Aquilae.

Double Little Wing of Aries:

This **telescopic** asterism "Diptérium Aríetis" is the barred spiral galaxy IC 167 (Arp 31) in the IAU constellation Aries. It was discovered by French astronomer Guillaume Bigourdan in 1891. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "its long straight tail looks like a little sword, just as the leaf of the well-known gladiolus flower". They also described it as "a smaller copy of NGC 1365" (see Two Wings of Fornax, below).

Double Man:

This Anutan asterism "Te Rua Tangata" is the Pointer Stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers below). These stars form the "handle" of Te Rakau Tapu ("the Net"- see below).

Double Mane of Virgo:

This **telescopic** asterism "Bícomis Vírginis" is the intermediate spiral galaxy NGC 4079 in the IAU constellation Virgo. It was discovered in 1828 by John Herschel who listed it as h 1077 and later as GC 2703 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "the to long curly arms extending from this 'grand design' galaxy like graceful manes".

Double Mint Cluster:

This asterism is the open cluster NGC 2343 in the IAU constellation Monoceros. It was discovered by English astronomer William Herschel in 1785 who listed it as "VIII 33" in his catalogue. It is GC 1498 in the *General Catalogue* of 1864. The Double Mint trademark belongs to the Wrigley Company, which created this brand in 1914, so the name cannot predate this.

Double of Cetus:

This **telescopic** asterism "Dúplex Céti" is the dumbbell galaxy NGC 1128 in the IAU constellation Cetus. It was discovered by American astronomer Lewis Swift in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its twin nuclei.

Double of Coma Berenices:

This **telescopic** asterism "Diplásia Cómae Bereníces" is the barred lenticular galaxy NGC 4245 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel in who listed it as "I 74". It became GC 2832 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of "the double rings of this galaxy: a nuclear one and an inner one".

Double Ring of Coma Berenices:

This **telescopic** asterism "Bianuláta Cómae Bereníces" is the barred spiral galaxy NGC 4274 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "I 75". It became GC 2851 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "both spiral arms of this galaxy nearly overlap and form an almost perfect ring. A fainter outer ring can also be seen".

Double Star Curve:

This **telescopic** asterism is the open cluster Elosser 3 in the IAU constellation Orion. René Merting describes it on the Faint Fuzzies website: "At 29x, a very flat, gently curved double star curve extends from north to south through the surrounding area - towards the south, the stars become brighter and the distances larger, the brightest star is 72 Ori - the pattern is formed by seven stars, or nine if you include the two faint companions along the line." The line of stars is HIP 29637, 72 Orionis, HIP 29694, HD 43096, and HIP 29665.

Double Triangle:

This **telescopic** asterism in the Hyades star cluster in the IAU constellation Taurus contains six stars that form a double triangle. This was listed by Troy Stratton of the Salt Lake Astronomical Society.

Double V:

This telescopic asterism is the open cluster NGC 6716 in the IAU constellation Sagittarius, discovered by English astronomer John Herschel in 1830. It is GC 4443 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a double-v of geese.

Double Wedge:

This **telescopic** asterism is the open cluster NGC 2232 in the IAU constellation Monoceros. This was discovered by English astronomer William Herschel who listed it as "VIII 25" in his catalogue. It is GC 1415 in the *General Catalogue* of 1864. This open cluster forms a double wedge shape.

Doubled of Virgo:

This **telescopic** asterism "Gemináta Vírginis" is the barred spiral galaxy NGC 4999 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "II 537". It became GC

3432 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the spiral arms of this galaxy show remarkable double lanes in some places [which] brings to mind the so-called geminations of the Mars canals".

Doubling of Iota of Grus:

This **telescopic** asterism "Jotacísmus Grúis" is the barred spiral galaxy NGC 7496 in the IAU constellation Grus. This was discovered in 1834 by John Herschel who listed it as h 3973 and later as GC 4897 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "has the shape of the Greek letter iota (ι). By coincidence the star Iota (ι) Gruis is situated only two degrees south of the galaxy."

Doubtful Two Headed of Cetus:

This **telescopic** asterism "Ánceps Céti" is the lenticular galaxy IC 1575 (Arp 231) in the IAU constellation Cetus. It was discovered by American astronomer Lewis Swift in 1896. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because some sources describe it as a galaxy with a concentric ring while others see it as a pair of intersecting galaxies.

Doubting Thomas:

This asterism is the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899. Allen attributed it to people "who figured Biblical characters throughout the heavens in place of the old mythology" but did not name a specific culture or uranographer.

Doughnut (Cut in Half):

This **telescopic** asterism is planetary nebula NGC 2371-2 in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1785, who described it as "Two. Sp-nf, distance 1', chevelure mixed. Both faint, small, equal, having a nucleus". Herschel listed it as "II 316 and II 317" in his catalogue. It is GC 1519 and 1520 in the *General Catalogue* of 1864. It seemed to English astronomer John Louis Emil Dreyer (1852 – 1926) to be two objects and so was entered as NGC 2371 and 2372 in the *New General Catalogue* in 1888. It is actually a single planetary nebula. It is also known as the Double Bubble Nebula, the Ant Nebula, the Figure Eight, the Mini Dumbbell, or the Gemini Nebula. Size 1' X 1'. American astronomer Ken Reeves of the Saguaro Astronomy Club described it in the SACNEWS On-line, February 1997, as "a donut cut in half with the two bright spots being the cut ends of the donut".

Doughnut with a Bite Taken Out of It:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as "IV 28.1" and "IV 28.2". They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. It was given this name by American astronomer John Sanford in his 1989 *Observing the Constellations.* This is also known as the Antennae Galaxies (see above), the Ring Tail Galaxy (see below), the Snorter (see below), the "Little Shrimp", and the Mosquito Larvae (see below). It is Arp 244 in Arp's *Atlas of Peculiar Galaxies.*

Dove:

This Arabic star "(al-)Fākhitah" (فاخثة) is Alpha (α) Columbae in the IAU constellation Columba and is related to the original name of this constellation (see Columba, above):

- This name was later latinized to "Phact", "Phaet", "Phakt", or "Phad".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Phaet".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Phact".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Phakt" and "Phact" but his 14th edition (1959) onlylists this star as "Phakt".
- The IAU approved the name Phact for Alpha (α) Columbae.

This German asterism "Taube" is the IAU constellation Columba.

This Banjara asterism "Kamedi" is stars of the IAU constellation Taurus (Vahia 2014). It was used as an indicator of the rainy season.

This Quechua asterism from Yucay, "Urpi", is the Coal Sack Nebula (Urton 1981).

Dove with the Olive Branch:

This asterism "De Dyve med den Okijftack" is the name Dutch navigator Frederick de Houtman (1571 – 1627) gave to the IAU constellation Columba (see Columba, above) and which influenced the name this constellation acquired.

Downward Bend:

This Bedouin asterism is the stars Xi (ξ) Geminorum and Gamma (γ) Geminorum in the IAU constellation Gemini. NOTE: Dorn (1829) translates this as "a mark burnt in on the Camel's neck" and describes it as "the pair [of stars] in the foot of the second Twin": This would be these two stars. There are two versions of the Arabic asterism Mark on the Horse's Hide (see below), none of which involve the stars of Gemini, but one of which involves the nearby constellation Orion.

Dowsing Rod:

This **telescopic** asterism Ferrero 31 is in the IAU constellation Centaurus near HIP 54467.

Draco:

Draco's brightest star, Gamma (γ) Draconis (Eltanin) is only number 69 on the list of brightest stars, but its stars appear in 329 of the asterisms in this handbook. From the 4th to the 2nd millennium B.C.E. Alpha (α) Draconis (Thuban) was the northern pole star. The French call this constellation "Dragon", the Germans "Drache", and the Italians "Dragone".

This IAU constellation (IAU abbreviation Dra), known to Eratosthenes (d.194 B.C.E.) and described by Hipparchus (190 – 120 B.C.E.) in his *Star Catalogue* as"Ὄφις" or "Ophis" ("serpent") was first mentioned in Aratus (240 – 315 B.C.E.) in his poem *Phaenomena* (Gysembergh et al 2022). It was one of the 48 original constellations of Ptolemy (100 – 170), which he adopted from a list created by Eudoxus of Cnidus (4th century B.C.E.). The modern name comes from another old Greek name for this constellation: "Δράκων" ("Drákon"). Greek myths have the Goddess Athena or the hero Hercules slaying this serpent and casting it into the sky.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts Draco as a snake winding between Ursa Major and Ursa Minor but does not place its head under the foot of Hercules (who is supposed to be crushing it).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Draco as a snake winding between Ursa Major and Ursa Minor

The globe of the 2nd century Farnese Atlas depicts this constellation as a snake (Stevenson 1921).

Draco is depicted in the Leiden *Aratea* (816) as a snake winding between Ursa Major and Ursa Minor (Katzenstein & Savage-Smith, 1988).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In two editions (St Gall 250, St Gall 902) Draco is depicted as a dragon with long ears,
- In the Paris BN 12957 the snake's head is shown from above while all other editions show this head in profile,
- In the Paris BN n.a. 1614 edition Draco is shown with four curves.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Draco with four bends and with a comb and beard. In the Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* the comb and beard are omitted.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Draco as a serpent with a dragon's head and two coils.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Draco, qui continent utrosque Arcturos" ("Draco, which contains both Arcturus"). The Oxford Laud 644 and Padua 27 manuscripts of *De signis caeli* depict Draco as a flat snake slithering to the left, while the Venice VIII 22 manuscript shows him as a two-legged dragon with bird-like feet. The Rouen 26 manuscript of *De signis caeli* depicts a winged dragon with a cock's comb. The Klosterneuberg 685, and Zwettl 296 manuscripts of *De signis caeli* depict Draco as a dragon with two feet and a small pair of wings and an arrow shaped tongue.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Draco as a dragon headed serpent with two coils circling celestial north.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Draco as a horned serpent with one coil and labels it "sūrat al-tinnīn" ("picture of the dragon").

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Draco" as a dragon headed serpent with four coils.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscripts CLM 14583, ff.70v-71r and 71v-72r both depict Draco as a dragon headed serpent with two coils. It is not labelled as these charts seem to be intended to illustrate primarily the asterisms of the zodiac.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Draco as a serpent with two coils, but is not labelled.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Draco as a dragon headed serpent with three coils as does the German Bayerische Staatsbibliothek Clm 826 manuscript and the Czech Památnik Národního Písemnictiví Strahoviensis D.A. II. 13 manuscript.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Draco as a dragon headed serpent.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Draco as a serpent completely circling Ursa Major with its forward half and Ursa Major with its lower half, its tail completely closing the loop around Ursa Major.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Draco as a serpent winding between Ursa Major and Ursa Minor.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Draco as a serpent winding between Ursa Major and Ursa Minor.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Draco" as a dragon headed serpent winding between Ursa Major and Ursa Minor.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Draco" as a serpent.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Draco as a serpent with a coil around celestial north. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Draco" as a dragon-headed serpent with four coils.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Draco as a dragon headed serpent with pointed ears and two coils.

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515 list "Draco" and from 1535 list "DRACO" (Dekker & Lippincott, 1999). Celestial globe gores (1517) of Schöner depicts "Draco" as a dragon headed serpent with three coils, as does his 1522 globe.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists Draco and depicts it as a dragon headed serpent with pointed ears with four coils.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Draco" as a dragon headed serpent with pointed ears and three coils.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Draco in the same manner as Dürer et al.

The celestial globe depicted in Hans Holbein's *Double Portrait of Jean de Dinteville, the Bailly of Troyes, and Georges de Selve, Bishop of Lavaux* (more commonly known as "*The Ambassadors*") from 1533 lists "DRACO" (Dekker & Lippincott, 1999).

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Draco" as a dragon-headed serpent with four coils.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Drage". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Dragon".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Draco as a dragon-headed serpent with four coils.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists "Draco" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

German astronomer Johann Bayer (1572 – 1625) depicts Draco in his *Uranometria* in 1603 as a dragon-headed serpent with four coils and lists the following names: "Drakon, Draco, Serpens, Anguis, Hesperidum Custos, Palmes Emeritus, Coluber Arborem Conscendens, Python, Monstrum Germanico, Azophi Arabi, Quinque Dromedarii, Douque Lupi, Aben, Taben, Etabin, In Mappa Turcica, Etanin."

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Draco" as a dragon-headed snake with no coils.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a dragon-headed serpent with no coils.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Draco" as a serpent with no coils slithering around the north celestial pole and between Ursa Major and Ursa Minor.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Draco" as a dragon headed serpent with no coils.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Draco" as a dragon-headed serpent with no coils.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Draco" as a dragon-headed winged serpent with one coil.

Draco is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Draco" as a dragon-headed serpent with four coils and lists the alternate name "Serpens".

"Draco" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a dragon-headed serpent with no coils. Batsch lists the alternative names "Serpens", "Anguis", "Atanin sue Attanins", "Draco Infernalis", and "der Drach" ("the dragon").

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Dragon" as a serpent in an "S" shaped form with no loops.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Draco" as a serpent with one coil.

Draco is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as a winged dragon headed serpent.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) depicts "Draco" as a serpent with a bird's beak and four coils.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists "Draco" for this constellation.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Draco as a dragon headed serpent with three coils.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Draco as a dragon headed serpent with two coils.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Draco" as a dragon-headed serpent with one coil.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Draco" as a dragon-headed serpent with one coil.

Draco is listed by Polish astronomer Johannes Hevelius in his *Catalogus Stellarum Fixarum* in 1690 and is depicted as a dragon-headed serpent with four coils.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Draco" as a serpent with two coils.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Draco as a dragon-headed serpent with three coils.

Draco is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: This is depicted as a dragon-headed serpent with three coils.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Draco as a serpent with three coils.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts Draco as a dragon-headed serpent with four coils.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Draco as a dragon-headed serpent with three coils.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Dragon" as a dragon-headed serpent with three coils.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Draco" as a serpent with two coils.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Dragon" as a dragon headed serpent with one coil on one chart and with three coils on a close-up chart later on in the atlas.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der nordliche Drache" in the text and as "Drache" on the charts, where it is depicted as a dragon-headed serpent with three coils.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Dragone" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Draco" as a dragon headed serpent with wings and one coil.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Draco" as a dragon headed serpent with three coils.

American uranographer William Croswell (1760 – 1834) depicts Draco on his *Mercator Map of the Starry Heavens* in 1810 as a dragon headed serpent.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Draco in his *Celestial Atlas* and in his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a dragon with six looped coils.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Draco the Dragon" as a dragon-headed serpent with six coils.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict Draco as a serpent facing to our right with three coils.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Draco" as a dragon-headed serpent with four coils.

Draco is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. This is depicted as a dragon with six looped coils.

"Draco" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a dragon-headed serpent with three coils.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this constellation as "Le Dragon" and depicts it as a dragon-headed serpent.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Drache".

"Draco" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a dragon headed serpent with four coils.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Draco, The Dragon" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Draco, the Dragon".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Draco" in his *Star Atlas* (1893) and describes it as "The Dragon".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Draco" and describes it as a "Dragon".

This Hungarian asterism "Sárkány" is the IAU constellation Draco. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a four-legged dragon.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Draco".

This constellation is often referred to as "Draco inter Arctos" ("the dragon between the bears").

Standard IAU charts depict Draco this way:

- Its "head" is the quadrilateral of stars Xi (ξ) Draconis, Nu (ν) 2 Draconis, Beta (β) Draconis (Rastaban), and Gamma (γ) Draconis,
- Its "body" is the winding line of the stars starting at Xi (ξ) Draconis and running through Delta (δ) Draconis, Epsilon (ε) Draconis, Tau (τ) Draconis, Chi (χ) Draconis, Zeta (ζ) Draconis, Eta (η) Draconis, Theta (θ) Draconis, Iota (ι) Draconis, Alpha (α) Draconis (Thuban), and Kappa (κ) Draconis to Lambda (λ) Draconis.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Draco in his book *The Stars - A New Way to See Them* (1952). Rey added two lines representing "feet":

- One from Delta (δ) Draconis to Epsilon (ε) Draconis, and
- One from Phi (ϕ) Draconis to Chi (χ) Draconis.

Sky and Telescope Magazine, founded in 1941, depicts Draco in their magazine and publications in the same manner as Reyersbach.

The Angkor Wat temple in Cambodia has a central causeway dating to the Megalithic Era which is patterned on the IAU constellation Draco, according to Hancock and Faiia in *Heaven's Mirror*.

In Arabic astronomy, the IAU constellation Draco was divided into three parts:

- The main body: "ar-Ruba'" (الْرُّبَع), later latinized to "Alawaid",
- The Dancer: Arrakis (see Dancer, above), and

- The Wolf's Nails: Azfar Adib (see Wolf's Nails, below).

Draco Dagger:

This **telescopic** asterism "Maas 2" from the asterism list of American astronomer Steve Maas is in the IAU constellation Draco. Its size is 38'X 16'. The brightest star is HD 169305 (magnitude 5.02). This is listed on the SOCO (Sentinel of the Caprock Observatory) list.

Draco Trio:

This **telescopic** asterism is the spiral galaxy NGC 5985, the elliptical galaxy NGC 5982, and the edge on spiral galaxy NGC 5981 in the IAU constellation Draco. These are part of the NGC 5982 cluster. This is also known as the Dragon Slayer Group.

Dracula Cluster:

This asterism is the open cluster NGC 5617 in the IAU constellation Centaurus. It was discovered by Scottish astronomer James Dunlop in 1826. It is GC 3885 in the *General Catalogue* of 1864. The name is probably a reference to the character in Bram Stoker's novel *Dracula*, published in 1897. Although I do not know who assigned this name to this open cluster, it can't predate Stoker's novel.

Dragon:

This Greek asterism "Δράκων" ("Drákon") is the IAU constellation Draco as it appeared in *Phaenomena* by Aratus in 270 B.C.E. and as described in Ptolemy's *Almagest* (2nd century). It is more complex than the modern IAU constellation Draco:

- The "head" of is the stars Beta (β) Draconis (Rastaban), Gamma (γ) Draconis, 46 Draconis, Omicron (ο) Draconis, 39 Draconis, Xi (ξ) Draconis, and 25 Draconis, with a line running out from this last star to Mu (μ) Draconis.
- The "neck" is the stars Omicron (ο) Draconis, 58 Draconis, Rho (ρ) Draconis, Epsilon (ε) Draconis, and Delta (δ) Draconis,
- The "upper body" is the stars Sigma (σ) Draconis, Tau (τ) Draconis, Chi (χ) Draconis, and Upsilon (υ) Draconis,
- The "lower body" is the stars Chi (χ) Draconis, Psi (ψ) 1 and 2 Draconis, Zeta (ζ) Draconis, and Phi (φ) Draconis,
- The "tail" runs from Zeta (ζ) Draconis through Eta (η) Draconis, Theta (θ) Draconis, Iota (ι) Draconis, Alpha (α) Draconis (Thuban), and Kappa (κ) Draconis to Lambda (λ) Draconis.

This Hungarian asterism "Sárkány" is the IAU constellation Draco. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a four-legged dragon.

This Greek lunar mansion is stars in the IAU constellation Cetus and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). It appears in the Tabula Bianchini.

This Arabic asterism "Taniyn" (تنين) or "at-tinnīn" (التنين) which translates as "dragon" or "great serpent" is the IAU constellation Draco according to some sources but is used for Gamma (γ) Draconis in others:

- "al-Tinnīn" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010).

- It was later latinized to “Al-Tinnin”, “Altannin”, “Eltanin”, “Eltinnin”, “Ettanin”, “Etamin”, “Etannin”, “Etanim”, “Etamin”, “Aben”, “Taben”, “Raseltinnin”, and “Etabin”:
- German Johann Bayer (1572-1625) listed “Aben”, “Taben”, “Etabin“ and“Etanin“ and attributes this to “In Mappa Turcica“ (“on Turkish maps”). He also lists the name “Etanin” for Gamma (γ) Draconis.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed “Ras Eltanim” and “Abeen vel Taeben”,
- French linguist Guillaume Postel (1510 – 1581) listed “Daban”.
- This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Atanin seu Attanins” and “der Drach”.
- Robert Hues lists it as “Alanin” and “Aben” in his *A Learned Treatise of Globes* in 1659.
- John Hill lists “Tanin” as a “Hebrew” name in his *Urania* in 1754.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists ”Etanin”.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists “Etanin”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists Gamma (γ) Draconis as “Etanin” in his *Celestial Atlas* in 1822.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists Gamma (γ) Draconis as “Etanin”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Etamin” and “Etanin” for this star, but his 14th edition (1959) only lists Gamma (γ) Draconis as “Etanin”.

This American asterism “Draka” is the IAU constellation Draco and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

English Admiral Henry William Smyth’s Prolegomena of 1844 lists “Etamin” for the star Gamma (γ) Draconis and his *Bedford Catalogue* in 1844 lists “tinnin”.

This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Etamin”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

The IAU approved the name Eltanin for Gamma (γ) Draconis (see Dragon’s Head, below).

This Persian asterism “Azhdeha” is the IAU constellation Draco: See Man Eating Serpent, below. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “azhdehá”. R. H. Allen lists “Azhdehā” in his *Star Names* in 1899: Allen writes that this was later latinized to “Hastheher”.

This Gaulish asterism “Ambis” is the IAU constellation Draco (Boutet 2001).

This German asterism “Drache” is the IAU constellation Draco as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Romanian asterism “Balaur” or “Balaurul” (“dragon” or “golden serpent”) is the IAU constellation Draco (Ottescu 2009, Lite, Lodina, and Ignat 2018). It’s head is “Capul Baluruli” (“Balaur’s head”).

There are five **telescopic** “Dragon” asterisms:

- One, “Wieger’s Dragon”, is in the IAU constellation Canes Venatici. It was discovered by German astronomer Andreas Wieger in 2018. It is located about 1 degree north of the galaxy Messier 94.

The “head” is a diamond of stars including HIP 62594, 62545, 62490, and 62634. From HIP 626334 a wavy line of stars forms the “body”, including HIP 62748, 62802, and a line of 9th magnitude stars. Size 120’ X 20’. This asterism is listed by Robert Zebahl on his *Faint Fuzzies* website.

- One is HII region Messier 8 (NGC 6533) in the IAU constellation Sagittarius. It was discovered by Italian astronomer Giovanni Hodierna before 1654. It is GC 4368 in the *General Catalogue* of 1864. It is also known as the Lagoon Nebula (see below), and Hourglass.
- One is NGC 1499 (SH 2-220, LBN 756, PGC 3517568, Ced 26) in the IAU constellation Perseus. It is also known as the California Nebula (see above).
- One, “Dráco Vírginis” (“Dragon of Virgo”) is the face-on field barred spiral galaxy NGC 5068 in the IAU constellation Virgo. William Herschel listed this as “II 312”. It became GC 3482 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “with a little bit of fantasy the figure of a winged dragon, as depicted in medieval style, is recognizable”.
- One is the dust clouds vdB126, LDN772, and LDN781 in the IAU constellation Vulpecula. The “neck and head” is LDN 781, the “body” is vdB126 with the “tail end” being LDN 772. Size 2° X 1°. This is Ennis 93 on the observing list of Canadian astronomer Charles Ennis.

Dragon Ascendant:

This Chinese Chenzhuo xing guan “Longdeng” is the star Zeta (ζ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Dragon-Headed Fish:

This Tibetan khyim (zodiac constellation) “Chusrin” or “Chusin” is the IAU constellation Capricornus (Johnson-Groh 2013).

This asterism is the IAU constellation Cetus and was depicted this way by German uranographer Johann Bayer (1572-1625).

Dragon Lizard:

This **telescopic** asterism is Vastagh 4, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Gemini. Its size is 27.5’ X 15.5’. Vastagh describes it as “a dragon-lizard, which flies with extended wings, and its long tail coils up behind it.” NOTE: At the time Vastagh viewed it, the comet Lulin was “right in front of the primeval beast's beak”. Vastagh gives the alternative description of a “mouse cartoon character” (see Mouse, below). This includes the star TYC 1356-00393-1.

Dragon of Hell:

This German asterism “Draco Infernus” is the IAU constellation Draco as listed by German uranographer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675.

Dragon of Lesbos:

This Latin asterism “Draco Lesbius” is the IAU constellation Serpens.

Dragon of the Tiber:

This Latin asterism “Draco Tiberinus” is the IAU constellation Serpens.

Dragon Slayer Group:

See Draco Trio (above).

Dragon Star:

This large Chinese xing guan "Long Xing" (龍星) appears in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.) and is made up of stars of the IAU constellations Sagittarius, Scorpius, Libra, and Virgo:

- The "tail" is the quadrilateral of stars Eta (η), Epsilon (ε), Delta (δ), and Gamma (γ) Sagittarii,
- The body extends through Scorpius and Libra, with the asterism Heart Star (see below) as the dragon's heart,
- Delta (δ) and Zeta (ζ) Virginis are the "neck", and
- The tips of the "horns" are Alpha (α) Virginis (Spica) and Gamma (γ) Virginis.

Dragonfly:

This Finnish asterism "Sudenkorento" ("dragonfly") or "Taivaan korento" (Dragonfly of the sky) is the Belt of Orion asterism in the IAU constellation Orion.

There are two **telescopic** "dragonfly" asterisms:

- One is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1787, who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. It is also known as the Owl Cluster, Kachina Doll Cluster, the Skiing Cluster, Massed Jewels, and the E.T. Cluster. Two bright stars (HIP 6229 & Phi (ϕ) Cassiopeiae) are the eyes.
- One is the open cluster Messier 36 (NGC 1960) in the IAU constellation Auriga. It was discovered by Giovanni Battista Hodierna before 1654. It is listed in the 1864 General Catalogue as GC 1166 and in John Herschel's catalogue as h 2866. in the IAU constellation Auriga. This is the name assigned to it by American astronomer Wayne Schmidt. It is also known as the Pinwheel Cluster.

Dragon's Egg:

This **telescopic** asterism is the HII region NGC 6164 in the IAU constellation Norma. John Herschel listed this as h 3633 and later as GC 4206 in the *General Catalogue* of 1864.

Dragon's Eyes:

This asterism is the stars Beta (β) Draconis (Rastaban) and Gamma (γ) Draconis in the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899.

Dragon's Head:

This Arabic star "Al Rās al Tinnīn" is Gamma (γ) Draconis in the IAU constellation Draco as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449). "Taniyn" (تنين) or "at-tinnīn" (التنين) translates as "dragon" or "great serpent" (see Dragon, above):

- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels the four stars Beta (β) Draconis (Rastaban), Gamma (γ) Draconis, Xi (ξ) Draconis, and Nu (ν) 2 Draconis "Tête du Dragon".

- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "den Kopf des Drachen".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "rás el tannin, the dragon's head": Compare this to "Raʿas uth-Thuʿabān" (see "Head of the Snake" below).
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Eltanin" for this star.
- The IAU approved the name Eltanin for Gamma (γ) Draconis.

Dragon's Heart Nebula:

This **telescopic** asterism is supernova remnant RCW 114 in the IAU constellation Ara.

Dragons of Ara:

This **telescopic** asterism "the Dragons of Ara" or the "Fighting Dragons of Ara" is emission nebula NGC 6188 in the IAU constellation Ara. John Herschel listed this as h 3640 and later as GC 4223 in the *General Catalogue* of 1864. It is also known as the Rim Nebula.

Drain of the Well:

This Romanian asterism or "Jgheabul Puţului" is the IAU constellation Andromeda (Ottescu 2009). It is part of their larger asterism "Well with a Drain" (see below).

Drawer Up of the Night:

This Sotho star "Kgogamashego" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holbrook and Baleisis 2007, Slotegraaf 2013). Compare this to the Tswana star "Kgogamasigo" (see Pulling Out the Dawn, below).

Drawing:

This Babylonian asterism "MUL.u.-sur-ti" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Gemini.

This Akkadian asterism "Usurtu" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Gemini.

Dreever:

This Palawan star is Epsilon (ε) Canis Majoris in the IAU constellation Canis Major. This is a name from the journals of the missionary George Augustus Robinson in 1837.

Dreyer's Nebula:

This **telescopic** asterism is HII region is IC 2169 (LBN 903, Ced 78) in the IAU constellation Monoceros. It was discovered by American astronomer Edward Emerson Barnard (1857 – 1923) in 1894. It is named for English astronomer John Louis Emil Dreyer (1852 – 1926).

Dreyer's Object:

This **telescopic** asterism is NGC 7538 (SH 2-158, LBN 542, Ced 209) in the IAU constellation Cepheus. This was discovered in 1787 by English astronomer William Herschel. This name was posted on the *Deep Sky Forum* in January 2023 by American astronomer Dragan Nikin. It is also known as the Brain Nebula (see above), and the Northern Lagoon Nebula (see below).

Dried Red Willow:

This Dakota/Lakota/Nakota asterism "Cansasa Pusyapi" or "Chanshasha Ipusye", is made up of the stars of the IAU constellations Aries and Triangulum. This is a five-sided asterism with the corner stars being Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), Alpha (α) Trianguli, Beta (β) Trianguli, and Gamma (γ) Trianguli.

Drill:

This asterism "Terebellum" was created by Scottish mathematician Michael Scot in 1225. It is described as located between the IAU constellations Sagittarius and Virgo, which would mean it involved the stars of the IAU constellations Scorpius and Libra (or Capricornus according to German astronomer Christian Ludwig Ideler (1776 – 1846)). A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts it as having two stars for a handle and three for the drill, but it is uncertain which stars these would be. It is also known as Auger (see above), Neper (see Below) and Borer, and French astronomer Camille Flammarion (1842 – 1925) listed the names "Neper" and Foret ("Forest"). Terebellum is a Latin word that can describe a drill or auger, but also a snail: Compare this to Snail, below, which is in the same part of the sky.

Drill Gun:

This **telescopic** asterism is in the IAU constellation Hercules and is on the observing lists of John A. Chiravalle. Jeffrey Corder lists it as Corder 3556/3557. The "base" of the "drill" is the pair of stars HIP 90398 and 90377. The "body" of the "drill" is a triangular group of 8^{th} – 9^{th} magnitude stars including HIP 90361 and 90288A. A short time of 9^{th} – 10^{th} magnitude stars is the "drill".

Drinker of Water:

This Latin asterism "Hauritor Aquae" is the IAU constellation Aquarius and is listed in the 1515 edition of the *Almagest* and in R. H. Allen's *Star Names* in 1899.

Drinking Gourd:

This asterism refers to the hollowed-out gourd used by American slaves (and other rural Americans) as a water dipper. It was incorporated into a song, *Follow the Drinking Gourd*, which encoded directions for fleeing slaves to make their way north to Canada. It is a code name for the Big Dipper asterism in the IAU constellation Ursa Major. The song was originally published in 1928 and the author, H. B. Parks, claimed that an Underground Railroad operative known as Peg Leg Joe moved from plantation to plantation teaching people this song marking an escape route.

Drinking Ostriches:

This Arabic asterism "al Naʿāma al Wārida" (النعامة الواردة) or "an-na'am al-warid", later latinized to "Awal al Warida", listed in the *Calendarium* of Arabic astronomer al Achsasi al Mouakket in 1650, is made up of stars in the IAU constellation Sagittarius: Gamma (γ), Delta (δ), Epsilon (ε), and Eta (η) Sagittarii. It is also known as "Going Ostriches" or "Ostriches Drinking at the River". The "river" that they are drinking from is the Milky Way:

- Edward Sherburne lists this as "Al Naâm Al Wârid" and translates it as "the ostrich returning from the water" in his Sphere of Marcus Manilius in 1675.

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al na'ám máridah… the ostriches going out to water" and elsewhere in this text as "Min al na'aim al Wáridah", describing it as camels not ostriches.
- W. Brennand lists this as "Al-Warida" in his *Hindu Astronomy* in 1896.

Driver:

This Arabic star "sāīḳ" or "Saik" is Zeta (ζ) Ophiuchi in the IAU constellation Ophiuchus.

This Latin asterism "Aurigator" ("driver") or "Aurigator cursus retinens habenas" ("driver holding reins"), is the IAU constellation Auriga. These appear in tables and editions of the Almagest down to the 16th century. Compare this to Holding the Reins, below. Johann Bayer's *Uranometria* (1603) lists this as "Agitator Currus", "Retinens Habenas", and "Aurigator".

This Lithuanian asterism "Vežėjas" is the IAU constellation Auriga.

Driver of the Seven Brothers:

This Sardinian star "Su Trubadore de sos Sette Frades" is the star Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Putzolu 2019).

Driver of the Sticks:

This Sardinian asterism "de su trubadore de sos bacheddos" is the IAU constellation Canis Major (Putzolu 2019).

Driver's Hands:

This Latin star "Aurigae Manus" is Beta (β) Tauri (Elnath) in the IAU constellation Taurus (which was once also called Gamma (γ) Aurigae which makes it part of Auriga "the charioteer"). This name was given to it by 1st century Roman architect Vitruvius.

Driver of Al Thurayya:

This Bedouin star "Sāïḳ al Thurayya" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed by R. H. Allen's *Star Names* in 1899. Allen lists the "synonymous" Arabic names "Tāli al Najm" and "Hādī al Najm" without providing precise translations: These are the Arabic asterisms Follower of the Star (see below) and Urger of the Star (see below).

Droemerdeenne:

This Palawa star "Droemerdeenne" or "Dromerdene" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Gantevoort et al 2016) and represents one of the brothers in their asterism Star Brothers (see below). Compare to the Nuenone star Dromerdene (below).

Dromerdene:

This Nuenone star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Gantevoort 2015). Compare this to the Palawa star Droemerdeenne (see above).

Drop of Virgo:

This **telescopic** asterism "Gútta Vírginis" is the elliptical galaxy NGC 4621 (Messier 59) in the IAU constellation Virgo. It was discovered by Charles Messier in 1779. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Drum:

This Japanese asterism "Tsuzumi" is the IAU constellation Orion.

This Latin asterism "Tympanum" ("drum" or "tambourine") is the IAU constellation Lyra.

Drum at the River:

This Chinese xing guan "Hégǔ" (河鼓) which first appeared in the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Aquila, each having a name:

- Beta (β) Aquilae (Alshain): "Zuojiangjun" ("Left General"),
- Alpha (α) Aquilae (Altair), the determinative star: "Dajiangjun" ("Great General"), and
- Gamma (γ) Aquilae: "Youjiangjun" ("Right General").

Their xing guan Celestial Drumstick (see above) is nearby. This is identical to the Korean asterism "Drum of River" (see below).

This Chinese Chenzhuo xing guan Hegu (河鼓) is a line of three stars in the IAU constellation Aquila: Gamma (γ) Aquilae, Alpha (α) Aquilae (Altair), and Beta (β) Aquilae. The Celestial Drumstick was originally located near the Drum at the River and this position is in line with its astrological meaning.

Drum of River:

This Korean asterism "JangGun" or "Gang-ui Bug" (강의 북) is identical to the Chinese xing guan "Drum at the River" (see above), but unlike this Chinese xing guan, it has a roughly parallel asterism next to it: "Drumstick of Sky" (see below).

Drumstick of Sky:

This Korean asterism "Haneul-ui Bugchae" (하늘의 북채) is a line of three stars in the IAU constellation Aquila: Xi (ξ), Tau (τ), and Omicron (ο) Aquilae. It is right next to the Korean asterism "Drum of River" (see above).

Drunken Lizard:

This **telescopic** asterism is the open cluster NGC 7209 in the IAU constellation Lacerta. It was discovered by William Herschel in 1787 who listed it as "VII 53". It is GC 4755 in the *General Catalogue* of 1864. It is also known as the Lizard Cluster or Star Lizard Cluster and contains 150 9th to 15th magnitude stars.

Dry Season:

The Quechua and Guaraní both view the rising and setting of the Pleiades cluster as indicators of their dry season.

Dry Season Thieves' Cross:

This K'iche' asterism is made up of stars of the IAU constellation Sagittarius with Delta (δ) Sagittarii in the middle and the end stars being Epsilon (ε), Sigma (σ), Lambda (λ) and Gamma (γ) Sagittarii (Milbrath 1999). They also had a Rainy Season Thieves' Cross (see below).

dsar-urdsar-gaz:

This Babylonian and Sumerian asterism "dsar-urdsar-gaz" listed in the BM 78161 tablets (Liechty 1988) is Lambda (λ) and Nu (ν) Scorpii in the IAU constellation Scorpius.

Dschubba:

See Forehead of the Scorpion, below.

dŠul-pa-è-a:

This Akkadian asterism "dŠul-pa-è-a" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mulud-al-tar.

Dthanes:

This Euahlayi asterism is possibly the Hyades cluster in the IAU constellation Taurus. It represents boys following the Seven Young Women (see below). Compare this to Uninitiated Boys, below.

Dubhe:

See Back of the Bear, above.

Duck:

This Kalapalo (Mato Grosso) asterism "Kofongo" is made up of the stars of the IAU constellations Carina, Canis Minor, and Gemini. The "body" is the stars Alpha (α) Carinae (Canopus) and Alpha (α) Canis Minoris (Procyon) with the "hands" being the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux). They used it to mark the arrival of the rainy season.

This Egyptian Dendera asterism is the IAU constellation Aquila (Hoffmann 2017). It is depicted as a small dark bird, possibly a duck.

There are two **telescopic** "Duck" asterisms:

- One is in the IAU constellation Canis Major and is Ennis 69 on the observing list of Canadian astronomer Charles Ennis. Size 75' X 30'. The "head" of the duck is an oval of 8^{th} – 9^{th} magnitude stars including HIP 32031, HD 48483, HD 48575, the double star HIP 32102, and HD 48378. 9^{th} magnitude star HD 48183 forms the "neck". The "body" is an oval of ten 8^{th} – 10^{th} magnitude stars: SAO 172149, HD 48184, HD 48130, HD 48020, HD 47869, HD 47849, Gaia DR3 2923629425743157760, SAO 172123, and SAO 172141. The "tail" is 10^{th} – 11^{th} magnitude stars SAO 172090 and Gaia DR3 2923727174899408128. The duck's "foot" is the triangle of 8^{th} – 9^{th} magnitude stars: HIP 31762, SAO 172076 and HD 47741. NOTE: The duck's back is the chain listed as Corder 1147 on Jeffrey Corder's list.
- One is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764 and R. H. Allen in his *Star Names* in 1899. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4402. American astronomer Tom Lorenzin gives "Duck" as one of its names and attributes this to "Tectron's Tom Clark". It is also known as the Horseshoe Nebula, the Checkmark Nebula, "2", the Omega Nebula, the Swan Nebula, the Goose, and the Lobster Nebula.

Duck Head Nebula:

See Thor's Helmet, below.

Duck Hunters:

This Wsanec asterism "PIOTEL" is the Belt of Orion asterism in the IAU constellation Orion.

Duck Nebula:

See Thor's Helmet, below.

Duck Nest:

To the Siberian peoples the Pleiades cluster in the IAU constellation Taurus is a bird's nest, with various species of bird associated with it (Svjatskij 2007). The most common is the Duck Nest.

Duid:

This Kalina star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus. It is part of their asterism Twins (see below).

Duma:

This Vedic star from the *Taittiriya Brahmana* is 20 Tauri (Maia) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, above).

Dumbbell:

This **telescopic** asterism is the planetary nebula Messier 27 (NGC 6853) in the IAU constellation Vulpecula. It was discovered by French astronomer Charles Messier in 1764:

- It is also known as the Diabolo Nebula (see above), the Double-Headed Shot (see above), the Manubrian Nebula (see below), and the Apple Core Nebula (see above).
- English astronomer William Parsons, 3rd Earl of Rosse, who observed it in 1842 with a 91 cm (36 inch) telescope drew its shape.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as the "dumb-bell nebula".
- John Herschel's General Catalogue of 1864 lists this as GC 4532 and describes it as the "Dumbbell".
- It is listed as the "Dumb Bell Nebula" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the "Dumb-bell Nebula".
- William Denning's *Telescopic Work for Starlight Evenings* (1891) lists this as the "Dumb-bell Nebula".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists it as "Rosse's 'Dumb-bell Nebula'" in his *Star Atlas* (1893).
- American astronomer Solon Irving Bailey (1854 – 1931) described it in 1908 as the "well known Dumb-bell Nebula".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns describes it as the "Dumb-bell".

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this as the "Dumb-bell Nebula".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Dumbbell Nebula".

DUMU.USH.É.MAH

This Babylonian star "DUMU.USH.É.MAH" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is possibly the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Dümur:

This Micronesian (Marshall Islands) star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Creation of the Sky (see above). Dümur was the son of Ligedaner the mother of the stars (see Ligedaner, below). Her other son is the Pleiades cluster who became the King of the Stars (see King of the Stars, below).

Dumuzi:

This Sumerian asterism is the IAU constellation Orion. This is a character in an ancient myth about the priest Adapa of Eridu and his encounter with the Gods Ningišzida or Gišzida and Dumuzi. This is listed in the Neo-Babylonian (Chaldean) *Great Star List* (636 – 539 B.C.E.) as "mul dumu.[zi]" and "ddumu.zi" (Koch-Westenholz 1995).

Dun Bull:

This Celtic (Gaulish) asterism "Donnotaruos" is the IAU constellation Taurus (Boutet 2017).

Dungdung Malgun:

This Wardaman star is Iota (ι) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Duplicates:

This Greek asterism "Didypoi" is the IAU constellation Gemini as listed in John Hill's *Urania* in 1754.

Durga:

This Hindu asterism is the IAU constellation Virgo (Bhagwath 2019). Durga ("the Inaccessible") is an aspect of the Hindu Mother Goddess Mahadevi associated with protection, strength, motherhood, destruction, and wars. Bhagwath notes that in Eastern India they celebrate the nine-day long Durga Puja during the Sun transit in Virgo to celebrate the nine avatars of the Goddess Durga (Shailputri, Brahmacharini, Chandraghanta, Khushmanda, Skandamata, Kaalratri, Kaatyayani, Mahagauri, and Siddhidatri).

Durin's Crown:

This Dwarvish asterism of seven stars is from the works of J. R. R. Tolkien (1892 – 1973). There is no definite asterism associated with this: As the constellation was a miraculous event, it is possible that they were only a vision: the seven stars Durin saw in Mirrormere. Some suggest that it is Corona Borealis (which has seven stars and does resemble a crown), some say it is part of the IAU constellation Auriga ('which has seven stars in a ring, with Eta (η) Aurigae (Haedus) beside Zeta (ζ) Aurigae (Saclateni) as a "jewel") and others Ursa Major (which has seven stars but does not resemble a

crown). I'm going with Corona Borealis as it most closely resembles Durin's Crown as depicted on the doors of Durin at Moria in Tolkien's works.

Dushiza:

This "Persian" asterism is the IAU constellation Virgo as listed in John Hill's *Urania* in 1754.

Dust Angel Nebula:

This **telescopic** asterism is the integrated flux nebula Mandel-Wilson 2 in the IAU constellation Ursa Major. It is also known as the Angel Nebula.

Dust Cloud of Lynx:

This **telescopic** asterism "Coniórtus Lýncis" is NGC 2683, a field spiral galaxy in the IAU constellation Lynx. It was discovered by English astronomer William Herschel in February 1788 who listed it as "I 200" in his catalogue. It is GC 1713 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "UFO" (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 47, but does not list a name.

Dust Devil:

This **telescopic** asterism is NGC 4753, a lenticular galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in February 1784 who listed it as "I 16". It is GC 3273 in the *General Catalogue* of 1864. It is noted for the distinct dust lanes around its nucleus. It is also known as "Who Scribbled on My Galaxy?".

Dust Egg of Indus:

This **telescopic** asterism "Cónis Índi" is the lenticular galaxy NGC 7049 in the IAU constellation Indus. It was discovered in 1834 by John Herschel who listed it as h 3860 and later as GC 4651 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this edge-on galaxy looks like a biconcave lens". It is part of the Indus Triplet (see above). It is part of the Indus Triplet (see below).

Dust Speckles of Dorado:

This **telescopic** asterism "Pulveráta Dorádus" is the lenticular polar ring galaxy NGC 1947 in the IAU constellation Dorado. It was discovered by James Dunlop in 1826. John Herschel listed it as h 2855 and later as GC 1153 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Dusty Foot of Pyxis:

This **telescopic** asterism "Cónipus Pýxidis" is the edge-on galaxy IC 2469 in the IAU constellation Pyxis. This was first recorded by American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this dust-rich edge-on galaxy resembles a dirty foot". The name derives from the Latin "conipus", which refers to the inhabitants of Epidauros, people with dust on their feet.

Dusty Hand:

This **telescopic** asterism is NGC 2146, a barred spiral galaxy with conspicuous dust lanes in the IAU constellation Camelopardalis. It was discovered by Friedrich August Theodor Winnecke in 1876. It is listed in the General Catalogue of 1864 as GC 5357. This name was posted on the *Deep Sky Forum* in December 2012 by American astronomer Jimi Lowrey. It is also known as the "Injured of Camelopardalis" (see below).

Dusty of Ara:

This **telescopic** asterism "Pulveruléntus Árae" is the barred spiral galaxy NGC 6300 in the IAU constellation Ara. It was discovered in 1835 by John Herschel who listed it as h 3668 and later as GC 4273 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Dusty of Cassiopeia:

This **telescopic** asterism "Conisálea Cassiopéiae" is the dwarf spheroidal galaxy NGC 185 (Caldwell 18) in the IAU constellation Cassiopeia. This is II 707 in William Herschel's catalogue and GC 90 in the General Catalogue of 1864. It is a satellite of the Andromeda Galaxy, M 31. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "contains a lot of dust".

Dusty of Hydra:

This **telescopic** asterism "Ceconimenus Hýdrae" is the edge-on spiral galaxy IC 4351 in the IAU constellation Hydra. It was discovered by Robert Innes in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the thick dust lane of this large edge-on galaxy".

Dusty of Ursa Major:

This **telescopic** asterism "Pulvéreus Úrsae Majóris" is the disrupted elliptical galaxy NGC 3077 in the IAU constellation Ursa Major. This was discovered in 1801 by English astronomer William Herschel who listed it as "I 286" in his catalogue. It is GC 1982 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Garland (see below).

Dusty Place of Coma Berenices:

This **telescopic** asterism "Conistra Cómae Bereníces" is the edge-on lenticular galaxy NGC 4710 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "II 95". It became GC 3240 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the remarkable dust concentrations in the central region of this galaxy".

Dusty Spiral Galaxy:

This **telescopic** asterism is the spiral galaxy NGC 4414 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "I 77". It became GC 2972 in the *General Catalogue* of 1864. It is also known as the "Flock of Coma Berenices" (see below).

Dying Horse:

This Lithuanian asterism "Kibleka" is the Hyades open cluster in the IAU constellation Taurus.

Dyoorutgang:

This Gundungurra star is Theta (θ) Orionis in the IAU constellation Orion (Mathews 1908).

Dziban:

See Two Wolves, below.

E:

This **telescopic** asterism Sánta 176, listed in 2015 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Draco. Gábor describes this as "E-shaped asterism of 9 – 11 [magnitude] stars, nice". NOTE: This looks like a small case "e".

E Nebula:

See Barnard's E, above.

Eagle:

This asterism from the Babylonian MUL.APIN tablets "Á.MUSHEN" (Anthony 1996), "Eru" (Bartel van der Waerden 1974) or "erû" (Anthony 1996) contains most of the stars of the IAU constellation Aquila but is extended to include some stars from Delphinus: Beta (β) Delphini (Rotanev), Delta (δ), Epsilon (ε), Gamma (γ) 2, and a Delphini. This Babylonian asterism appears in later Seleucid sky lore. Note: Some suggest that this "eagle" is carrying a dead man represented by their asterism "Corpse" (see above). This is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul.timusen" and "mul u.ri.in" (Koch-Westenholz 1995). It is listed in the BM 78161 tablets (Leichty 1988) as "ur-a".

This Sumerian asterism "multimušen" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism "Eru" above.

This Babylonian and Sumerian ziqpu "er-u" as listed in the BM 78161 tablet (Liechty 1988) is Gamma (γ) Comae Berenices in the IAU constellation Coma Berenices and is ziqpu 25 on this list.

This Akkadian asterism "e-ru-ú" or "is-su-ru" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism "Eru" above.

This Persian asterism "nasru" from the list of Lumasi stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Aquila (Boll 1918, Weidner 1971).

Sherburne also lists it as Lycophron's name for this constellation in his *Sphere of Marcus Manilius* in 1675. Lycophron (b. ~ 330 – 325 B.C.E.) was a Hellenistic Greek tragic poet, grammarian, sophist, and commentator.

This Sumerian asterism is the IAU constellation Aquila. It is related to the story of Etana of Kiš and the deities Šamaš and Ištar.

This Assyrian asterism “Amushen” is the IAU constellation Aquila.

This Greek asterism “᾽Αετός” (“᾽Aetós”) is the IAU constellation Aquila as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as described by Ptolemy (c.100 – c.170) in his *Almagest*. In the modern constellation Aquila, the star Alpha (α) Aquilae (Altair) is typically shown as the “head”, but Ptolemy’s version has Altair at the base of the “neck” of the eagle and includes stars of the IAU constellations Aquila, Hercules, and Serpens:

- The tip of the “beak” is HIP 100541, with the head being a diamond shape defined by this star and the stars Beta (β) Aquilae (Alshain), HIP 98526, Xi (ξ) Aquilae, and Altair,
- The “body” runs from one “shoulder” at Altair to a bend a Gamma (γ) Aquilae and then to the base of the “tail” at 31 Aquilae and then to the other “shoulder” at 49 Aquilae,
- One “wing” is defined by the stars 31 Aquilae, Sigma (σ) Aquilae, Delta (δ) Aquilae, 64 Serpentis, and Mu (μ) Aquilae, and
- The other “wing” is defined by the stars Gamma (γ) Aquilae, Omicron (ο) Aquilae, Phi (φ) Aquilae, and 113 Herculis.

NOTE: This Greek asterism “Aëtuse**”** is the IAU constellation Eridanus as listed in John Hill’s *Urania* in 1754*:* Hill describes this as “one of its old Greek names, and occurs in Lycophron, and some other writers”.

This Greek asterism “ακουίλα” (“Akouila”) is the IAU constellation Aquila. John Hill lists it as “Akale or al Akale” in his *Urania* in 1754. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Eagle”.

There are two Arabic “eagle” asterisms:

- One, “Alnasr” (النسر), is the IAU constellation Aquila. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “El ‘okáb, the eagle.”
- The other is the IAU constellation Phoenix.

This Saxon asterism “Adler” is the IAU constellation Aquila as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This French asterism “Aigle” is the IAU constellation Aquila.

This German asterism “Adler” is the IAU constellation Aquila.

This Hebrew asterism “Neshr” is the IAU constellation Aquila, which was variously described as an Eagle, Falcon, or Vulture.

This Norse asterism “Assa” was listed by Cleasby and Vigfusson in 1874, though it is not clear precisely which stars are involved. Reuter (1982) saw both the eagle and hawk asterisms in the northern part of the sky near or at the top of the Milky Way but didn’t give specifics. Denning describes it as the stars of Cygnus with Vedrfolnir (see Hawk, below) nearby, but again, no specifics. Timothy Stephany on his *Norse Constellations* webpage describes it as being “largely the same stars as Cygnus the swan, with one star for its body, tail (likely Deneb) and head, its left wing being four stars and its right wing being five stars” with the hawk Vedrfolnir sitting on the eagle’s head (see Hawk, below).

This Basque asterism “Arranoa” is the IAU constellation Aquila (Frank 2021) and their name for the star Alpha (α) Aquilae (Altair) is “Begi-erderra” (“Beautiful Eye”).

This **telescopic** asterism is the open cluster Messier 16 and emission nebula IC 4703 (NGC 6611, SH 2-49, RCW 165, LBN 67, Cr 375, Mel 198, Ced 159).in the IAU constellation Sagittarius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745-6 and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel’s General Catalogue of 1864 as GC 4400. English astronomer Isaac Roberts records of it resulted in it becoming IC 4703 in the *Index Catalogue*. It is known as the Eagle Nebula and Star Queen Nebula. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists it as the “Eagle Nebula”.

This Norse asterism “Asa” is the IAU constellation Aquila and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). This is depicted as an eagle in flight with a hawk standing on its head (see Vedurfolnir, below) which is the star Alpha () Aquilae (Altair). Veðrfölnir is a hawk sitting between the eyes of this unnamed eagle that is perched on top of the world tree Yggdrasil.

This Romanian asterism “Vulturul” is the IAU constellation Aquila (Ottescu 2009).

Eagle Boy:

This French asterism “Puer Aquilae” is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Eagle Eye of Grus:

This **telescopic** asterism “Áquilops Grúis” is the lenticular galaxy IC 5267 in the IAU constellation Grus. It was discovered by William Henry Finlay in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this round galaxy with its big nucleus resembles the eye of an eagle”.

Eagle Hawk:

This Arrernte, Aranda and Luritja asterism “Iritjinga” is made up of stars in the IAU constellations Crux and Centaurus: Delta (δ) and Gamma (γ) Crucis and Delta (δ) and Gamma (γ) Centaurus (Clarke 2014). This was listed as an Arrernte asterism by Maegraith in 1932.

Eagle of Prometheus:

This Latin asterism “Aquila Promethei” is the IAU constellation Aquila.

Eagle of St. John:

This German asterism is the IAU constellation Aquila as described by German poet Philipp von Zesen (1619 – 1689).

Eagle of the West:

This Elvish asterism “ Soronúmë” is probably the IAU constellation Aquila and is from the works of J. R.R. Tolkien (1892 – 1973).

Eagle of the Winds:

This is a name for the IAU constellation Aquila found in *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929).

Eagle Ray:

This **telescopic** asterism is the HII region SH 2-63 (LBN 86) in the IAU constellation Sagittarius. This name appeared on the *Astrophotography* page of Facebook in a photo by Polish astrophotographer *Cmk Photo* on 23 August 2025 who described it as "consists of gas and dust resembling the shape of a sea fish", specifically an Eagle Ray (Myliobatidae). It is also known as the "Cosmic Sailor" or the "Dark Dust Nebula".

Eagle Star:

This Hausa star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Urama 2007).

Eagles:

These Weilwan and Wiradjuri stars "Mullion" are the stars Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and Alpha (α) Lyrae (Vega) in the IAU constellation Lyra, which they considered to be eagles (Ridley 1875). This is part of their asterism "Eagle's Nest" (see below).

Eagle's Nest:

This Weilwan asterism "Mullion Wollai" is the IAU constellation Corona Borealis and the stars Alpha (α) Aquilae (Altair) and Alpha (α) Lyrae (Vega), which they considered to be eagles (Ridley 1875).

This Wiradjuri asterism "Maliyan Wollai" is identical to the Weilwan asterism "Mullion Wollai", above (Hamacher and Leaman 2019, Kemp et al 2022).

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

This is an alternate name for the Snow Globe Nebula (see below).

Ear:

This Vedic asterism is a line of three stars in the IAU constellation Aquila: Gamma (γ) Aquilae, Beta (β) Aquilae (Alshain), and Alpha (α) Aquilae (Altair).

There are two **telescopic** "ear" asterisms:

- One is the emission nebula NGC 6888 (Caldwell 27) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1792 and listed as "IV 72". It is GC 4561 in the *General Catalogue* of 1864. It is also known as the Crescent Nebula.
- One is Leiter 16 from the list of astronomer Frank Leiter. This is made up of stars in the IAU constellation Gemini including 63 Geminorum (its brightest star), HIP 36307, and 36152. Its size is 35' X 25'.

Ear and Eye of Sky:

This Korean lunar mansion "Myo" is the Pleiades cluster in the IAU constellation Taurus.

Ear of Grain:

This Babylonian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo. It also appears in Ptolemy's *Almagest* (2nd century) as part of the asterism Maiden (see below). Compare this to Distaff, above.

There are two Arabic asterisms with the name “sunbulah” (سنبلة) or “as-Sunbulah” (السنبلة):

- One is a loop of stars that forms the end of the “tail” of their asterism “Lion” (see below) and thus also bears the name “Tassel” (see below): It starts at Gamma (γ) Comae Berenices and runs around through 14, 16, 17, 21, 23, 8, 7, and 4 Comae Berenices, HIP 59364, HIP 59489, and HIP 59923.
- One is the star Alpha (α) Virginis in the IAU constellation Virgo. It was later latinized to “Spica” (“spike” or “ear of corn”), Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) called it “Spicum” (“ear of corn”), or “Spica Virginis” (“virgin’s ear of grain”):
    - “al-Sunbula” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) lists this star as “al-sunbula”.
    - This star is listed as “al sunbula”, “al subula” and “Spica” on a 14th century Christian Spanish astrolabe #4560 (King 2002).
    - The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists this star as “Spica”.
    - The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this star as “Spica”.
    - Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this star as “Spica”.
    - The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as “Spica”.
    - This star appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Spike”.
    - German astronomer Johann Bayer (1572-1625) listed this star as “Spica” and “Sunbala” in his *Uranometria* (1603).
    - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed this star as “Sumbalet”, “Sombalet”, and “Sembalet Eleandri”.
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Sunbala”.
    - German astronomer Wilhelm Schickard (1592 – 1635) listed this star as “Sunbalon”.
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Spica Virginis”.
    - “Spica vel Spicum” are listed as names for this star in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - Robert Hues listed it as “Sunbale” and “Eare of Corne” in his *A Learned Treatise of Globes* in 1659, and later lists “Spica Virginis”.
    - Spica Virginis” is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
    - Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) lists “Spica Virginis”.
    - Edward Sherburne lists it as “Súmbela” and “Spica Virginis” in his *Sphere of Marcus Manilius* in 1675.
    - The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as “Spica”.

- John Hill lists it as “Sumbela” in his *Urania* in 1754 and gives it as the Arabic name of the constellation Virgo.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as “L’Epy”.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Azimech“ and as “Spica“.
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as “Spica della Vergine” (“Spica of the Virgin”) in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as “Spica Virginis”.
- “Spica” is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- American uranographer William Croswell (1760 – 1834) lists “Spica” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Spica” in his *Celestial Atlas* in 1822.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as “Spica”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 lists “Spica”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Spica” and “Spica Virginis” and his *Bedford Catalogue* in 1844 lists “As Sumbuleh, or ear of corn”.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Spica”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Spica, in the ear of corn”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Spica Azimech” and “Spica”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Spica”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Spica” and translates it as “An ear of wheat”.
- R. H. Allen lists it as “Sumbela” in his *Star Names* in 1899 and gives it as the Arabic name of the constellation Virgo.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Spica”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list this star as “Spica”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Spica”.
- The modern Italian name is “Spiga” and the French call it “l'Epi”.
- The IAU approved the name Spica for Alpha (α) Virginis Aa.

This Seleucid asterism “AB.SIN” or “SE.BAR” (“ear of grain”) is listed in their tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) and is the IAU constellation Virgo (Foxvog 1993). Compare to their asterism Maiden (see below).

This Greek star “Στάχυς” (“Stáchys”), later latinized as “Stachys”, is Alpha (α) Virginis (Spica) in the IAU constellation as described by Aratus (315 – 240 B.C.E), Hipparchus (190 – 120 B.C.E.), and Ptolemy (c.100 – c.170). 3rd century B.C.E. Egyptian priest Manetho and 5th century Greek poet Nonnus called it “Σταχυώδης” (“Stachyódis”).

This Egyptian Dendera star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Hoffmann 2017) and part of their asterism Maiden (see below).

Ear of Hydra:

This **telescopic** asterism “Aurifórmis Hýdrae” is the spiral galaxy NGC 3312 in the IAU constellation Hydra. It was discovered in 1835 by John Herschel who listed it as h 3282 and later as GC 2161 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ear of Wheat:

This Persian asterism “Khosha” or “Khusāk” is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899.

This Persian asterism “Chûshe” is the IAU constellation Virgo as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

This Turkish asterism “Sálkim” is the IAU constellation Virgo as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

This Hebrew star “Shibbōleth” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

This Syrian star “Shebbeltā” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Earendel:

This **telescopic** star is WHL0137-LS in the IAU constellation Cetus. It was discovered by the Hubble Space telescope in 2022. It is the earliest and most distant star, 28 billion light years (8.6 billion parsecs) away. Eārendil means “lover of the sea”. NOTE: “Earendel” is from the old English poem *Crist 1*, which hailed him as the “brightest of angels”. Eārendil the Mariner is a half Elvin character in the books of J. R. R. Tolkien who is said to have carried “the evening star upon his brow”. Tolkien derived that name from Earendel in *Crist 1*.

Early Blessed One:

This Vedic nakshatra (lunar mansion) “Purva Bhadrapada”, “Purvabhadra”, or “Pūrva Bhādrapadā” is in the IAU constellation Pegasus and is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Algol). Ivanković (2021) lists it as “Bhādrapadā” and “Pūrvā Bhādrapadā” which he translates as “first of the blessed feet”. Other translations include “former happy feet”, “front legs of the deathbed”, or “highly

intuitive". Ivanković relates it to Aja Ekapad, which is an aspect of Shiva and also lists the earlier name as "Pūrvā Prósthapadā" (See Former Footstool, below). Leitz (2019) lists "Purva Bhadrapada" as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies this as "the star Andromedae": Of course, Andromedae is a suffix which could apply to any star in Andromeda. W. Brennand lists this as "Purva Bhadrapada" in his Hindu Astronomy in 1896 and translates this as "a two-faced image". Bhagwath (2019) lists its symbols as swords, two front legs of a cot, or a man with two faces.

This Vedic asterism "Prak" listed by the maharshi Parasara is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat) as listed by Leitz in 2019.

This Myanmar nekkhat (lunar mansion) "Pyobba Parabaik" (ပြုဗ္ဗာ ပုရပိုက်) is in the IAU constellation Pegasus and is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Algol).

This Tibetan gyukar (lunar house) "Khrum Stod" or "Trumtö" (Johnson-Groh 2013) is in the IAU constellation Pegasus and is the star Alpha (α) Pegasi (Markab).

Earring of the Dragon:

This **telescopic** asterism Hay-Merting 1 is in the IAU constellation Cassiopeia and was discovered by the German astronomer René Merting in 2015. Its size is 8' X 5'. Robert Zebahl lists it on his *Faint Fuzzies* webpage and describes it as being "at the northwestern star of the kite's rhombus of Kemble 3, there is an oval arc of faint stars, most of them 15th magnitude except for 3 brighter stars. The arc looks like a ring, and earring perhaps." The brightest star in the "earring" is HIP 16048 (magnitude 7.1). For Kemble 3 or "Kemble's Kite" see Kite, below.

Ears:

This Macedonian asterism "Ushi" or "Uʃi" is made up of stars of the IAU constellation Cassiopeia and represents the part of the wooden plough that goes into the soil (Cenev 2004 & 2014). It starts at the star Delta (δ) Cassiopeiae (Ruchbah) and runs through Gamma (γ) Cassiopeiae (Navi), takes a bend at the "tip" of the plough at the star Beta (β) Cassiopeiae (Caph), and ends at the star Alpha (α) Cassiopeiae (Schedar).

Ears of Grain of Ursa Major:

This **telescopic** asterism "Gránifer Úrsae Majóris" is the spiral galaxy NGC 2985 in the IAU constellation Ursa Major. It was discovered in 1785 by William Herschel who listed it as "I 78". It is GC 1909 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it looks like "like ears of grain".

Earth Goat:

This Arabic star is Gamma (γ) Andromedae in the IAU constellation Andromeda as listed by Dorn (1829), who describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). It is an alternate name for their asterism Foot of the Chained Woman (see below). Dorn describes this as "a species of lynx".

Earth Healer:

This Akimel O'odham asterism is the IAU constellation Scorpius.

Earth Oven:

This Netwar asterism “Nowanuman” is the Large and Small Magellanic Clouds (Ramik 2019).

Earthly Star:

This Latin star “Stella Terrestris” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in John Hill’s *Urania* in 1754.

Earthly Trigon:

This astronomical asterism is the IAU constellations Capricornus, Taurus, and Virgo.

Earth’s Auger:

This Romanian asterism “Sfredelul Pământului” is the three stars Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae in the IAU constellation Auriga (Ottescu 2009). Compare this to Little Auger, below.

Earthworm:

This English asterism “Lumbricus” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* and is made up of stars in the IAU constellations Cancer and Canis Minor: HIP 39180, 3 Cancri, and 11, 6 and 1 Canis Minoris.

East Road:

This Korean asterism “Dongjjog Dolo” (동쪽 도로) is a zig-zag of four stars in the IAU constellations Ophiuchus and Scorpius: 22 Scorpii, and Rho (ρ), Omega (ω), and Psi (ψ) Ophiuchi. This shares some stars with the Chinese xing guan “Eastern Door” (see below).

East Veil Nebula:

See Veil Nebula below.

East Well:

This Chinese Chenzhuo xing guan is a “box” of stars in the IAU constellation Gemini: The corners of the “box” are:

- Gamma (γ) Geminorum, which has a line running out to Xi (ξ) Geminorum
- Zeta (ζ) Geminorum, which has a line running out to Lambda (λ) Geminorum,
- 36 Geminorum, which has a line running out to Epsilon (ε) Geminorum, and
- Nu (ν) Geminorum, which has a line running out through Mu (μ) Geminorum to Eta (η) Geminorum.

Eastern Cross:

This is an alternate Quechua (Misminay) name for their asterism “Calvario Cruz” (See Calvary Cross, above (Urton 1980)). This is made up of stars in the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Pi (π) Scorpii, and Sigma (σ) Scorpii. This is also known as the Eastern Cross (Urton 1980). Compare to Linun Cruz (see Wooden Cross, below).

Eastern Crown:

This asterism is the IAU constellation Corona Australis. Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Corona Austrina; Quae et Rota” (“the Eastern Crown or the Wheel”) in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572). The constellation Corona Australis briefly had its name changed by the IAU in 1932 to “Corona Austrina” (“Eastern Crown”), but this was repealed in 1955.

Eastern Door:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of four stars in the IAU constellation Ophiuchus and Scorpius: i Scorpii, Rho (ρ) Scorpii (the determinative star), Omega (ω) Ophiuchi and 24 Scorpii.

This Chinese xing guan “Dōngxián” (东咸) is a triangle of stars in the IAU constellation Ophiuchus: Phi (ϕ), Chi (χ), Psi (ψ), and Omega (ω) Ophiuchi. This shares some stars with the Korean asterism “East Road” (see above).

This Chinese Chenzhuo xing guan “Dōngxián” is a bending line of four stars in the IAU constellations Ophiuchus and Scorpius: Rho (ρ) Ophiuchi, Omega (ω) Ophiuchi, HIP 81754, and 24 Scorpii.

Eastern Long Necked Turtle:

This Boorong star “Wanjel” is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). It is one of the Two Hunters (see below). This turtle is Chelodina longicollis.

Eastern One in the Tail of the Goat:

This Babylonian “ecliptic asterism” “Arkat sha hi-na Shahū” is the star Delta (δ) Capricorni in the IAU constellation Capricornus as listed by R. H. Allen in his *Star Names* in 1899.

Eastern One of the Twins:

This Babylonian star “Mash-mashu- arkū” is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

Eastern Pottery:

This Korean asterism “Dong-yang-ui Dojagi” (동양의 도자기) is a line of five stars in the IAU constellation Vela: q, s, t, p, and Mu (μ) Velorum.

Eastern Star:

This Bugis star “Bintoéng Timoro” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

Eastern Wall:

This Chinese Chenzhuo xing guan is a line of two stars in the IAU constellations Andromeda and Pegasus: 21 Andromedae and Gamma (γ) Pegasi.

This Korean lunar mansion “Byeok” is a line of two stars in the IAU constellation Pegasus: Gamma (γ) Pegasi and HIP 447.

Eastern Well:

This Korean lunar mansion “Zeong” in the IAU constellation Gemini is a quadrilateral of stars with star lines running off each corner. The central quadrilateral is the stars Gamma (γ), Zeta (ζ), 36, and Nu (ν) Geminorum. The four lines of stars from the corners are:

- Nu (ν) Geminorum through Mu (μ) Geminorum to Eta (η) Geminorum,
- Gamma (γ) Geminorum to Xi (ξ) Geminorum,
- Zeta (ζ) Geminorum to Lambda (λ) Geminorum, and
- 36 Geminorum to Epsilon (ε) Geminorum.

Easy Chair:

This American asterism is the IAU constellation Cetus as listed by R. H. Allen in his *Star Names* in 1899. NOTE: Allen does not identify the source of this name but this type of chair appeared in the U.S. between 1715 – 1730.

Ebla:

This telescopic Syrian star is HIP 114322 (HD 218566) in the IAU constellation Pisces (magnitude 9.21). It was given this name in the IAU NameExoWorlds campaign. It is named for an early kingdom in Syria. It has an exoplanet named Ugarit, which was a city where the Ugaritic alphabet was devised around 1400 B.C.E.

Ebo:

This Chinese asterism is the xiù (lunar mansion) “Xīnxiù” (心宿) is a line of three stars in the IAU constellation Scorpius: Sigma (σ), 21, and Tau (τ) Scorpii (see Heart, below). Ridpath (1988) relates a story of how the emperor Gaoxinshi (c 2436 B.C.E.) placed his sons Sichen and Ebo in different parts of the sky as they were always fighting. Ebo ended up ruling this xiù.

Ebuðrung:

This Old Saxon asterism “Ebuðrung” or “Ebiðring” is the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899.

Echidna:

This Greek asterism is the IAU constellation Hydra as listed by Hesiod and Mosenkis in his *Mycenaean Oecumene* (date n/k). Echidna was a half woman, half serpent who was the mate of the monster Typhon.

Edasich:

See Hyena, below.

Edge:

This **telescopic** asterism is in the IAU constellation Gemini and is Leiter 1 on astronomer Frank Leiter’s asterisms catalogue. It is a cascade of 12th magnitude stars. Its size is 5.6’ X 0.5’.

Edge On Cluster:

This **telescopic** asterism is the open cluster NGC 6834 in the IAU constellation Cygnus. This was discovered by English astronomer William Herschel in July 1784 who listed it as "VIII 16". It is GC 4518 in the *General Catalogue* of 1864. Size 5' X 5'. This is listed by Robert Zebahl on his *Faint Fuzzies* website.

Edrini Prinnios:

This Celtic (Gaulish) asterism is the IAU constellation Virgo and appears in the Coligny Calendar (Boutet 2001, 2014). Compare to their asterism Fire Month Guiding Stars (see below).

Edu:

This Babylonian ziqpu "mulDIL" from cuneiform text AO 6478 (Schaumberger 1952) is Mu (μ) Herculis (Rasalgethi) in the IAU constellation Hercules.

Edward Young Star:

This **telescopic** asterism is the galaxy Messier 110 in the IAU constellation Andromeda. This was observed by French astronomer in 1773 but not included in his Messier list. English astronomer Caroline Herschel recorded it in 1783 and her brother William Herschel described her discovery in 1785. It was added to the Messier list in 1967 at the suggestion of Kenneth Glyn Jones. This name originated in 2014 in an anonymous edit of the Wikipedia entry for Messier 110 which states that the name Edward Young Star was given to M110 "as a gift for the English astronomer Edward George Burrows Young (1922 – 2014) just before his dead in 2014 aged 92 years". This name appears in *From Cave Art to Hubble: A History of Astronomical Record Keeping* by Jonathan Powell (2019). I find it odd that it should be named "Edward Young Star" when refers to a galaxy. Messier 110 is also known as Lucida Andromedae.

Edward's Galaxy:

This **telescopic** asterism is NGC 6621 and 6622, a pair of interacting spiral galaxies in the IAU constellation Draco. It is named after American astronomer Edward D. Swift, who with Lewis A. Swift discovered this in June 1885.

Eel:

This Greek asterism "Ἐγχέλυς" ("Enchélys") is the IAU constellation Serpens.

This Latin asterism "Anguilla" is the IAU constellation Serpens. This alternate name for Serpens is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This English asterism "Anguilla" was created in 1754 by British botanist and natural philosopher John Hill. Hill's description of it in *Urania: Or a Complete View of the Heavens*, is vague. It is a wandering line of stars of the IAU constellations Aquila, Delphinus, Equuleus, Sagittarius, and Scutum: HIP 105864, Epsilon (ε) Equulei, Kappa (κ) Delphini, Epsilon (ε) Delphini, 66 Aquilae, Upsilon (υ) Sagittarii, HIP 92488, Epsilon (ε) Scuti, Delta (δ) Scuti, and Alpha (α) Scuti. It overlaps Hill's other asterism Pinna Marina (see Mussel, below).

Efforts:

This Latin asterism "Nixus" ("leaning") or "Nisus" ("efforts") is the IAU constellation Hercules as listed by Robert Hues in his A Learned Treatise of Globes in 1659 and by Edward Sherburne in his *Sphere of Marcus Manlius* in 1675.

Effulgence:

This Buddhist asterism is the Big Dipper asterism in the IAU constellation Ursa Major plus Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. The Tejaprabhā Buddha is a prominent figure in Buddhist astronomy and astrology that emerged in the late Tang Dynasty (Kotyk 2017). His name in Sankrit translates as "Effulgence" and he is typically depicted as seated in an ox cart surrounded by planets. He first appears in the text *Da shengmiao jixiang pusa shuo chuzai jiaoling falun* or *Disaster Eliminating Edifying Dharma-Wheel as Taught by the Great and Holy Excellent Auspicious Bodhisattva* in 796.

Eggez:

This star is Iota (ι) Ursae Majoris in the IAU constellation Ursa Major as listed on the astrolabe NMM AST0570 in the National Maritime Museum (Dekker 2000).

Egipan:

This Greek asterism "Ægipan" or "Egipan" is the IAU constellation Capricornus. Egipans were part human part goat rural deities inhabiting mountainous areas:

- Johann Bayer's *Uranometria* (1603) lists "Aegipan" as a name for Capricornus.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Pan sive Aegipa" as a name for Capricornus.
- John Hill lists Ægipan as a name for this constellation in his *Urania* in 1754. Hill describes this as "a name by which old astronomers have called Capricorn" and related to the God Pan.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Ægipan.

Egg:

There are three **telescopic** "egg" asterisms:

- One is in the IAU constellation Cygnus near NGC 7000 (the North America Nebula) and includes HIP 104361 and 104268 and several faint double stars and is Leiter 2 on astronomer Frank Leiter's asterism catalogue: Leiter writes that it was contributed by Klaus Spruck. It is also known as the Horseshoe (see below). Its size is 14' X 10'. Nearby is the **telescopic** asterism the Checkmark (see above).
- One is NGC 2937, a spiral galaxy in the IAU constellation Hydra. This is interacting with the nearby elliptical galaxy NGC 2936 (Arp 142), which is known as the Penguin (see below) or the Porpoise (see below). They were both discovered by German astronomer Albert Marth in 1864, becoming 175 and 176 on his list. It is GC 5497 in the General Catalogue of 1864.
- One is bipolar protoplanetary nebula PK 80-6-1 (CRL 2688, RAFGL 2688) is in the IAU constellation Cygnus. It was originally recorded as a pair of galaxies, but in 1975 a sounding rocket of the Air Force Geophysical Laboratory got data that showed it was a nebula.

Egg Layer of Pegasus:

This **telescopic** asterism "Ovípara Pégasi" is the barred spiral galaxy NGC 7674 (Arp 182) in the IAU constellation Pegasus. This was discovered in 1786 by William Herschel who listed it as I 63". It became GC 589 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy resembles an animal laying an egg”.

Egg of Antlia:

This **telescopic** asterism “Ovoides Ántliae” is the spiral galaxy NGC 3268 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3263 and later as GC 2127 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Egg-Shaped of Cetus:

This **telescopic** asterism “Ováta Céti” is the elliptical galaxy NGC 1052 in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Eggen's Nearby Star:

This **telescopic** star is CoD -31 622 in the IAU constellation Sculptor. This star was briefly thought to be near the solar system. It is named after American astronomer Olin J. Eggen (1919 – 1998).

Eggs:

This Arabic star “Bayd” (بيض) or “Al Baīḍ” is Omicron (o) Eridani in the IAU constellation Eridanus:

- This was later latinized to “Beid”.
- “Beid” appears in Giuseppe Piazzi’s *Palermo Catalogue* of 1814.
- The IAU approved the name Beid for the star Omicron (o) 1 Eridani.

Eggs and Egg Shells:

See Ostrich Nest, below.

Egret:

This Tukano asterism “Yhe” or “Garça” is made up of the stars of the IAU constellation Coma Berenices (Cardoso 2015, Cardoso 2016):

- The “body” is an irregular oval including the stars 26, 22, 21, and 18 Comae Berenices,
- One “wing” is a triangle formed by the stars HIP 61420 and 20 and 26 Comae Berenices, with a “wingtip” at 11 Comae Berenices,
- The other “wing” is a triangle formed by the stars 26 and 35 Comae Berenices and HIP 61719 with a “wingtip” at the star 39 Comae Berenices, and
- The “tail” is composed of two lines of stars:
    - The first starts at 21 Comae Berenices and runs through HIP 60891 and 16 and 14 Comae Berenices, ending at Gamma (γ) Comae Berenices, and
    - The second starts at 18 Comae Berenices and runs out to a group of stars: 12 and 13 Comae Berenices and HIP 60170, 60168, and 60066.

Egypt:

This Egyptian Dendera asterism is the IAU constellation Cetus (Hoffmann 2017). It is depicted on the ceiling as two figures walking with staffs and this may represent Egypt, but this is uncertain.

Egyptian Cross:

This is formed by the stars of another asterism, the Winter Triangle (see below). The stars Alpha (α) Canis Minoris (Procyon), Alpha (α) Orionis (Betelgeuse), and Alpha (α) Canis Majoris (Sirius) linked to another triangle formed to the south by the stars Sirius, Zeta (ζ) Puppis (Naos), and Alpha (α) Columbae (Phact). These two triangles meet at the vertex at Sirius, forming the "Egyptian X" or "Egyptian Cross". *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the "Egyptian X".

Ehuo:

The stars of this large Rapanui asterism "Ehuo" or "Ehua" are not known at this time (Edwards and Edwards 2016, Edwards et al 2018).

Eiffel Tower:

There are two **telescopic** "Eiffel Tower" asterisms:

- One is Ferrero 6 in the list of asterisms of French astronomer Laurent Ferrero, is in the IAU constellation Ursa Major. The base of the "tower" is the stars HIP 64273 and 64309 with some 9th magnitude stars forming the "tower". René Merting describes it on the *Faint Fuzzies* website: "At 72 X a conspicuous, large triangle- the outer edges are formed by 8 stars, six of which are bright- more stars are visible inside- a total of 16 stars with two different magnitudes are involved." Size 20'X 30'.
- One is Timm's Eiffel Tower, discovered by German astronomer Timm Klose in October 2017 in the IAU constellation Sagittarius. Robert Zebahl lists it on his *Faint Fuzzies* website. Zebahl describes this as being "only 14' north of the planetary nebula NGC 6567. Most of the stars have magnitudes between 11 and 12." Size 26' X 9'.

Effeminate:

This Latin asterism "Effeaminatus" is the IAU constellation Ophiuchus.

- "Effoeminatus" is listed in Johann Bayer's *Uranometria* (1603).
- "Effeaminatus" is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Eight-Burst Nebula:

This **telescopic** asterism is the planetary nebula NGC 3132 (Caldwell 74) in the IAU constellation Vela. It is GC 2017 in the *General Catalogue* of 1864. It is also known as the Southern Ring Nebula. American astronomer Harlow Shapley (1885 – 1972) and South African astronomer John Stefanos Paraskevopoulos (1189 – 1951) came up with the name "Eight Burst" in *Galactic and Extragalactic Studies, II, Photographs of Thirty Southern Nebulae and Clusters* in 1940 due to its complex structure.

Eight Cereals:

This Korean asterism "Yeodeolb Gogmul" (여덟 곡물) is a circle of stars with a star line protruding from one side that is in the IAU constellations Auriga, Lynx, and Camelopardalis. The circle of stars includes Alpha (α), Beta (β), and 16 Camelopardalis, Delta (δ) Aurigae, 15 Lyncis, and HIP 29997. At 16 Camelopardalis a line of two stars branches off through 7 Camelopardalis and 9 Aurigae. Compare this to the Chinese xing guan "Eight Kinds of Crops" (see below).

Eight Kinds of Crops:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of a twisting line of stars of the IAU constellations Camelopardalis: Beta (β) Camelopardalis (the determinative star), HIP 21601, HIP 20376, HIP 21452, 9 Camelopardalis, HIP 24017, HIP 22626, and HIP 24914.

This Chinese xing guan "Bāgǔ" (八谷） is made up of stars in the IAU constellations Camelopardalis and Auriga. There are two triangles of stars. One is made up of the stars 11 and 31 Camelopardalis and 9 Aurigae. The other is made up of the stars 14, 26, and 7 Camelopardalis, with a two star "tail" running off 26 Camelopardalis to Xi (ξ) and Delta (δ) Aurigae. Compare this to the Korean asterism "Eight Cereals" (see above).

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Auriga, Camelopardalis, and Lynx: A ring of stars consists of Delta (δ) Aurigae, 15 Lyncis, HIP 29997, 9 Camelopardalis, Beta (β) Camelopardalis, and 16 Camelopardalis. From 16 Camelopardalis a line runs out through 7 Camelopardalis to 9 Aurigae.

'Ekekeuehuehu:

This Hawaiian star is Theta (θ) Aurigae (Mahasim) in the IAU constellation Auriga.

'Ekekeu'ena'ena:

This Hawaiian star is Beta (β) Aurigae (Menkalinan) in the IAU constellation Auriga.

El Gordo:

This **telescopic** asterism "the Fat One" is the galaxy cluster ACT-CL J0102-4915 (SPT-CL J0102-4915) in the IAU constellation Phoenix.

El Nath:

See Butting, above.

Elacate:

This "Greek" asterism is the IAU constellation Corona Borealis as listed in John Hill's *Urania* n 1754.

Elands:

This /Xam asterism representing grazing elands is three stars in the IAU constellations Canis Minor and Gemini. Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) represent female elands and Alpha (α) Canis Minoris (Procyon) a male eland (Slotegraaf 2013).

Elasippus:

This Greek asterism "Elasippus" is the IAU constellation Auriga as listed in John Hill's *Urania* in 1754 and in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844. Elasippus was one of the tens sons of Poseidon and Cleito in Greek mythology.

Elatha:

This Celtic (Irish) asterism may be the IAU constellation Orion (Mosenkis, N/K date). Elatha, Elotha, Elata or Elier is a golden-haired king of the Fomorians associated with sources of light and illumination. Mosenkis describes him as sailing in a silver boat, might be compared with Orion near Argo.

Elbow:

This Dorian star "Κύβιτον" ("Kýviton") is Kappa (κ) Herculis in the IAU constellation Hercules.

There are five Arabic stars with the name "elbow":

- One, "al-Mirfaq" (المرفق), later latinized to "al Markik", "Marfik", or "Marfik" is the star Lambda (λ) Ophiuchi in the IAU constellation Ophiuchus.
    - German astronomer Johann Bayer (1572-1625) lists "Marsic" in his Uranometria (1603).
    - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Marsic".
    - American uranographer Elijah Burritt (1794 – 1838) lists it as "Marsic".
    - Robert Burnham lists it as "Mirfak or Marfak" in his *Burnham's Celestial Handbook* in 1978.
    - The IAU approved the name Marfik for Lambda (λ) Ophiuchi A.
- One, "al-Mirfaq uth-Thurayyā" ("elbow of Al Thurayya" مرفق الثّريّا), later latinized to "Mirfak", "Mirphak", "Marfak", or "Mirzac", is the star Alpha (α) Persei in the IAU constellation Perseus:
    - This is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) as "Mirfaq al-thurayyā".
    - A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) labels this star "Persus".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Mirfak, the elbow, or more fully Al Mirfak al thureyyd, the elbow of the Pleiades". This is part of their asterism Al-Thurayya (see above).
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Mirfak".
    - American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Mirfak" and translates it as "elbow".
    - The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this star as "Mirfak".
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Mirfak" for this star.
    - The IAU approved the name Mirfak for Alpha (α) Persei.
    - This is also known as the Pit of the Elbow (see below).
    - NOTE: The Arabs also gave this name to the star Gamma (γ) Pegasi.
- One is the star Mu (μ) Cassiopeiae in the IAU constellation Cassiopeia, whose name has been latinized to "Marfak", "Al Marfak", or "Marfak West". It probably shares this name with Theta (θ) Cassiopeiae as it is very close to it. The IAU has not yet chosen an official name for this star.
- One, latinized to Marfak" is the star Theta (θ) Cassiopeiae in the IAU constellation Cassiopeia. The IAU approved the name Marfak for Theta (θ) Cassiopeiae.
- One, latinized to "Marsic", "Marfak", "Marsia", "Marfic", or "Marfik" is the star Kappa (κ) Herculis in the IAU constellation Hercules.
    - "Marsic" and "Marsikon" are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - Robert Hues lists "Marfic" in his *A Learned Treatise of Globes* in 1659.
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Marsic".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Marsik" for this star.

- The IAU approved the name Marsic for Kappa (κ) Herculis A.
- NOTE: American uranographer Elijah Burritt (1794 – 1838) used the name "Marsic" and placed it in the correct position for Kappa (κ) Herculis but labelled it "Chi (χ) Herculis" and listed Lambda (λ) Ophiuchi with this name. Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Marsic" in his *Celestial Atlas* in 1822. This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Marfic" and associated with Chi (χ) Herculis and appears as Lambda (λ) Ophiuchi on the chart depicting Serpentarius in this text.

Elbow of the Nile:

This Greek asterism "Πιμεντεκέων" ("Pimentekéon") is the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

This Latin name "Cubitus Nili" is the IAU constellation Leo as listed in the 1521 edition of the *Alfonsine Tables.* It is listed in John Hill's *Urania* in 1754 as "Nile".

This Coptic asterism "Pimentekeon" is the IAU constellation Leo as listed in John Hill's *Urania* in 1754 and in R. H. Allen's *Star Names* in 1899.

Elbow of Ursa Major:

This **telescopic** asterism "Olénia Úrsae Majóris" is the barred spiral galaxy NGC 3726 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "II 730". It became GC 2445 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this because "the broken southern spiral arm looks like an elbow".

Elbow of Virgo:

This **telescopic** asterism "Ulnátus Vírginis" is the barred spiral galaxy NGC 4593 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as II 183". It became GC 3131 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the broken western arm of this galaxy resembles an elbow".

Eldest, Most Excellent:

This Vedic nakshatra (lunar mansion) "Jyeshtha", "Jyestha", or "Jyeshthā", is in the IAU constellation Scorpius and is the stars Alpha (α) Scorpii (Antares), Sigma (σ) Scorpii, and Tau (τ) Scorpii. Ivanković (2021) also gives the alternate name "Jyesthaghnī" ("Eldest Killing") and relates it to the storm God Indra, who is also known as "Vrtahan" ("slayer of Vrtra): Vrtra is a serpent demon who personifies drought, evil and chaos. It is listed as "Jyesta" in the *Atharveda* (Leitz 2019, Ivanković 2021) . Leitz lists "Jyastha" as appearing on the nakshatra list of the scholar Varahamihir, but oddly identifies this as "the star Scorpionis", although Leitz later corrects this to Alpha (α) Scorpii (Antares), and two other unidentified stars as listed by the maharshi Parasara. W. Brennand lists this as "Jyeshtha" in his *Hindu Astronomy* in 1896 and translates this as "a rich ear-ring". Bhagwath (2019) lists its symbols as a circular armlet, an umbrella, or an earring.

This Myanmar nekkhat (lunar mansion) "Zehta" (ဇေဋ္ဌ) is in the IAU constellation Scorpius and is the stars Alpha (α) Scorpii (Antares), Sigma (σ) Scorpii, and Tau (τ) Scorpii.

This Tibetan gyukar (lunar house) “Snron” or “Nrön” or “Deu” (Johnson-Groh 2013) is in the IAU constellation Scorpius and is the star Alpha (α) Scorpii (Antares).

Eldest Mingarri Sister:

This Kokatha and Ngalea asterism “Kambugudha” is part of their larger asterism “Nyeeruna Nyiruna” (“hunter of the seven thorny devil sisters”) which is the IAU constellation Orion (Leaman and Hamacher 2014). This asterism is the Hyades cluster in the IAU constellation Taurus. The other part is “Yrgarilya” or “Kunggara”, which is the Pleiades cluster (see Seven Young Mingarri Sisters, below). The eldest Mingarri sister is perpetually guarding her younger sisters against the hunter Nyeeruna (see Hunter of the Seven Sisters, below).

Electra:

This Greek star is 17 Tauri in the Pleiades cluster in the IAU constellation Taurus. Electra is one of the Pleiades sisters in Greek mythology.

- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists “Electra” for this star.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Electra”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists “Electra” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Electra”.
- The IAU approved the name Electra for 17 Tauri.

Electra Nebula:

This **telescopic** asterism is the reflection nebula vdB 20 (Ced 19d) in the Pleiades cluster in the IAU constellation Taurus. It has this name as it surrounds the star Electra (see Electra, above).

Electric Arc Galaxy:

This **telescopic** asterism is the edge-on spiral galaxy NGC 7814 (Caldwell 43) in the IAU constellation Pegasus. It was discovered in 1784 by English astronomer William Herschel who listed it as “II 240”. It is GC 5046 in the *General Catalogue* of 1864. French astronomer Lucien Rudaux [wrote] about NGC 7814: ‘It bears a curious resemblance to an electric arc”, which is how it got this name. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Electropháës Pégasi” (“Electrically Glowing of Pegasus”) It is also known as the “Little Sombrero Galaxy” (see below).

Electric Guitar:

This **telescopic** asterism, also known as the Termite Hole, is the open cluster NGC 2477 (Caldwell 71) in the IAU constellation Puppis. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751. It is GC 1593 in the *General Catalogue* of 1864. The star Beta (β) Puppis is the end of the “handle”. NOTE: The electric guitar was invented in 1932, so the name cannot predate this.

Electricity Generator:

This German asterism “Elektrisir Machine”, later latinized to “Machina Electrica” is made up of the dim stars south of the IAU constellation Cetus between the IAU constellations Fornax and Sculptor. It was created by the German astronomer Johann Ehlert Bode in 1800 to commemorate the invention of this

machine and appears in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820). It is also known as “Machine Electrique” and “Machina Elletrica”.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as “Machina Electrica”: He indicates the borders of this constellation on the chart but offers no illustration of it.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as “Machina Electrica”. *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Machina Electrica” as a hand operated generator. This asterism is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Machina Electrica”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

Elegant One of Leo:

This **telescopic** asterism “Élegans Leónis” is the elliptical galaxy NGC 3377 in the IAU constellation Leo. William Herschel listed this as “II 99”. John Herschel listed it as h 754 and later as GC 2201 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Elegant One of Virgo:

There are two **telescopic** “Elegant One of Virgo” asterisms:

- One, “Lépidus Vírginis” is the barred spiral galaxy NGC 5560 (Arp 286) in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “II 579”. It became GC 3845 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “of its fine elegant shape.” 14 20 +3 59
- One, “Lépida Vírginis” is the barred spiral galaxy NGC 5566 (Arp 286) in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “I 144”. It became GC 3846 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy merits to be called elegant, in its feminine form lepida.”

Elephant:

This asterism “Elephas” was created from stars of the IAU constellation Ursa Major by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is labeled “Dania” on Weigel’s chart and the heraldry of the Order of the Elephant, a Danish order of knighthood.

This **telescopic** asterism is in the IAU constellation Auriga and is Corder 856/857 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 100’ X 30’. The back of the elephant (Corder 857) is a line of stars starting at HIP 25733A, HIP 25735, HIP 25624, Phi (ϕ) Aurigae, HIP 25471, and HIP 25363, which is the “smile” of the “Smiley Face” asterism (see below). The feet are the stars HIP 25343 and 25476, which are the eyes of the aforementioned “Smiley Face”. The “trunk” is HIP 25558,

and the double stars HIP 25580 and 25475. NOTE: Corder separately lists Corder 856 as the “elephant” and 857 as the ”back of the elephant” for some reason.

Elephant Fish:

This Suku Bali asterism is the IAU constellation Capricornus.

Elephant of Cepheus:

This **telescopic** asterism “Bárrus Céphei” is the barred spiral galaxy NGC 6951 in the IAU constellation Cepheus. It was discovered by French astronomer Jérôme Eugène Coggia (1849 – 1919 in 1877. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “with one arm widely extending in a northwestern direction, this galaxy looks like the head of an elephant, raising its trunk.” NOTE: This is also catalogued at NGC 6952 as it was also observed by Lewis Swift in 1878.

Elephant’s Trunk Nebula:

This **telescopic** asterism is vdB 142, a concentration of dust in the ionized gas region IC 1396 (SH 2-131, LBN 451, Cr 439, Ced 195, Tr 37) in the IAU constellation Cepheus. It is part of the Misty Clover Nebula (see below). IC 1396 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923).

Elf:

This **telescopic** asterism contains the dark nebula LDN 1622 in the Barnard Loop in the IAU constellation Orion. It is listed by this name in Astrobin by an astronomer on Instagram named “langzhibo”.

Elf Princes:

This Norse Asterism is related to the first three stars to appear in the winter sky at sunset in the Northern hemisphere and consists of the stars Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion, and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. Some describe the Winter Triangle as the stars Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Beta (α) Orionis (Rigel) in the IAU constellation Orion, and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. This relates to stories of the elf princes Slagfin, Volund, and Egil (Johnsen 2024).

Elffyn’s Chair:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Elgafar:

See Hair on the Tail, below.

Elias’s Cart:

This Belarussian asterism “Pavozachka Aliashova” (“a small cart of Elias”) or ”Illyouo Voz” (“Elias’ Cart”) is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009).

Elgiaziab:

This asterism is the IAU constellation Hercules as listed in John Hill's *Urania* in 1754. Hill describes this as "a bad way of writing Giathi Ala Ruchbatichi, which is the Arab name of the constellation" and translates this as "a man on his knees". Later in *Urania* Hill gives the shorter name "Rulxbahic". The Arabs did have a name for the Greek asterism "Kneeler" (see below): "Alrajul Alraakie" (الرجل الراكع), which isn't anything like what Hill is claiming here. Edward Sherburne lists this "Arabic" name as "Giathi ala Rucbatei" and the latinized version "Elgiaziale and Rulxba" in his *Sphere of Marcus Manilius* in 1675.

Elhakaac:

This asterism is Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). Riccioli lists it as an "Arabic" name.

Elijah's Chariot:

This Estonian asterism "Eelija Vanker" is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006).

Elijah's Raven:

This German asterism is the IAU constellation Corvus as listed in John Hill's *Urania* in 1754. Hill attributes this to German astronomer Wilhelm Schickard (1592 – 1635). R. H. Allen lists it in his *Star Names* in 1899. Edward Sherburne also attributes this to Schickard but lists this as "the Crow sent out by Noah, or that of Elias" in his *Sphere of Marcus Manilius* in 1675.

Elisa's Bears:

This German asterism is the IAU constellations Ursa Major and Ursa Minor as listed by German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658). This appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

Elk:

To the Khanty, Selkup, Ket, Khalasha, Evenk, Udege and Oroch of Siberia the bucket of the Big Dipper asterism in the IAU constellation Ursa Major is a giant Elk named "Helgen" (Berezkin 2005, Svjatskij 2007): Delta (δ) Ursae Majoris (Megrez), Gamma (γ) Ursae Majoris (Phecda), Beta (β) Ursae Majoris (Merak), and Alpha (α) Ursae Majoris (Dubhe). They see the stars of the handle as the hunters (see Hunters, below). The Khanty, Selkup, Ket, and Khalasha see the star 80 Ursae Majoris (Alcor) as a cooking pot carried by one of the hunters (see Pot, below). The Oroch, Evenk, and Udege in eastern Siberia see Alcor as the hunter's dog (see Dog, above). R. H. Allen lists the Khanty name as "Los" in his *Star Names* in 1899, though he calls them by the name exonym "Ostiaks" and lists the name "Tukto" for the "Greenlanders". Some Evenk describe this as a moose rather than an elk (Dmitrieva and Romeiko 2009).

The Chukchi see the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as an elk fleeing from two hunters, each of whom is guiding a team of reindeer.

This Dakota/Lakota/Nakota asterism "Hehaka" is the IAU constellation Pisces.

This Nenets and Ugrian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

This Koryak, Kamchadal, and Aleut asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). Berezkin notes that some see this as a deer rather than an elk.

Elk Skin:

This Yakima asterism is the W asterism in the IAU constellation Cassiopeia (see W below).

This Quileute asterism is the W asterism in the IAU constellation Cassiopeia (see W below).

Elkurud:

See Solitary Ones, below.

Elnath:

See Butting, above.

Eltanin:

See Dragon's Head, above.

Elton John's Glasses:

This **telescopic** asterism is made up of stars of the IAU constellation Pegasus. It was posted by American astronomer "NYJohn S" on *Cloudy Nights* in September 2022. It is next to Epsilon (ε) Pegasi. One lens is formed by the loop of stars starting at HIP 107184 and running around through HIP 107145, Gaia 1741674388888025728, HD 206433, HD 206465, Gaia DR3 1741482283591070464, and Gaia DR3 1765503692079903232. The other "lens" is a lope of stars starting at SAO 107345 and running around through HD 206590, HD 206589, HD 206619, and Gaia DR3 1765704524751116544 to SAO 107351.

Elvarad:

This asterism is the IAU constellation Crater as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671) and R. H. Allen in his *Star Names* in 1899. The origin of the name is obscure.

Ema:

This large Tupi Guarani asterism "Ñandú" or "Piyu" is made up of stars in the IAU constellations Ara, Centaurus, Circinus, Crux, Lupus, Musca, Scorpius, and Triangulum Australe:

- The tip of the "beak" is the star Alpha (α) Muscae,
- From Alpha (α) Muscae the line of stars runs to the birds' "eye", Alpha (α) Crucis (Acrux), then down the "neck" through Iota (ι) Crucis, HIP 70264A, Beta (β) Circini, Zeta (ζ) Lupi, Gamma (γ) Lupi, Chi (χ) Lupi, Rho (ρ) Scorpii, and Eta (η) Scorpii, arriving at the "tail" at Delta (δ) Scorpii, and
- From Delta (δ) Scorpii the lower "body" runs back through Sigma (σ) Scorpii, Alpha (α) Scorpii (Antares), Tau (τ) Scorpii, Epsilon (ε) Scorpii, Mu (μ) Scorpii, and Zeta (ζ) 1 and 2 Scorpii, Epsilon (ε) 1 Arae, Zeta (ζ) Arae, and Eta (η) Arae, arriving at the lower "neck" at Delta (δ) Trianguli Australis, and then up to the "beak" through Beta (β) Trianguli Australis, HIP 72131, m Centauri, Theta (θ) Muscae and Beta (β) Muscae, arriving back at Alpha (α) Muscae.

This asterism has three extensions:

- One "leg" takes off from Epsilon (ε) 1 Arae and runs through Alpha (α) Arae to HIP 89096, where lines run off to three stars to create a "webbed foot": HIP 87846, 87936, and 88726A,

- One “leg” takes off from Zeta (ζ) 1 Scorpii and runs through Eta (η) and Theta (θ) Scorpii to Iota (ι) 1 Scorpii, where lines run off to three stars to create a “webbed foot”:
    - One line goes to G Scorpii,
    - One line goes to HIP 86698, and
    - One line goes through Kappa (κ) Scorpii to Lambda (λ) Scorpii.
- The “tail” is two lines of stars starting at Delta (δ) Scorpii:
    - One line goes to Beta (β) 1 Scorpii (Acrab), and
    - One line runs through Omega (ω) 1 and 2 Scorpii to Nu (ν) Scorpii.

NOTE: The “head” of the ema overlaps their asterism Veado (see Deer above). When the French Capuchin Claude D’Abbeville first reported this in 1614, he called it the “white ostrich”. There are no white ostriches in this part of the world. It is the ema or greater rhea or emu (Rhea americana). They call the Milky Way the “Path of the Rhea”. Compare this to the Mocoví asterism “Mañic” (see Rhea, below).

This Tupinambá asterism “Yandoutin” is identical to the Tupi Guarani asterism above.

This Bororo asterism is the dark nebulosity in the Milky Way from the Coal Sack Nebula (see Coal Sack above) through the IAU constellation Sagittarius to the IAU constellation Scorpius.

Embers:

This KhoiKhoi asterism “tsaora” is the Magellanic Clouds (Alcock 2014). NOTE: Their name for the Milky Way is “tsaob” (“ember”, masculine singular) while this name is feminine and dual.

This Arabic asterism “al-Jamra” is the IAU constellation Ara as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Embracer:

This Vedic nakshatra (lunar mansion) “Āślēṣā” (आश्लेषा), “Ashlesha”, “Aslesa”, or “Ashleshā” is in the IAU constellation Hydra, and is the stars Delta (δ), Epsilon (ε), Eta (η), Rho (ρ), and Sigma (σ) Hydrae. They also call it the “Clinging Star” or “Sarpa” (see Serpent, below). It is listed as “Āślēṣā” in the *Atharveda* (Leitz 2019, Ivanovic 2021). Ivankovic lists “Āsresā” as appearing in the *Taittirīya Samhitā* and “Āsresāh” as appearing in the *Taittirīya Brāhmana*. Leitz lists “Ashlesha” as appearing on the nakshatra list of the scholar Varahamihir but identifies this as “the star Hydrae”: Of course, Hydrae is a suffix that could be applied to any star in the constellation Hydra. The maharshi Parasara lists 6 stars: Zeta (ζ), Epsilon (ε), Delta (δ), Sigma (σ), Eta (η), and Rho (ρ) Hydrae, as do many other ancient Indian texts. Ivanković (2021) lists it as “Āślēṣā” and translates it as “intwining”. W. Brennand lists it as “Aslesha” in his *Hindu Astronomy* in 1896 and translates this as “a wheel”. Bhagwath (2019) also lists it as “Aslesha” and lists its symbol as a serpent. NOTE: Ashlesha is the name assigned to the star Epsilon (ε) Hydrae A in the IAU constellation Hydra by the IAU.

This Myanmar nekkhat (lunar mansion) “Athaleiktha” (အသလိေသ) is in the IAU constellation Hydra, and is the stars Delta (δ), Epsilon (ε), Eta (η), Rho (ρ), and Sigma (σ) Hydrae.

This Tibetan gyukar (lunar house) “Skag”, “Kak”, or “Wa” (Johnson-Groh 2013) is in the IAU constellation Hydra and is the star Alpha (α) Hydrae (Alphard).

Embracing of Aquarius:

There are two **telescopic** "Embracing of Aquarius" asterisms, one "female" and one "male". These names appear in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 7284 and NGC 7285 are two… galaxies in close physical contact".

- One, "Compléxus Aquárii" is the barred lenticular galaxy NGC 7284 (Arp 93) in the IAU constellation Aquarius. This was discovered in 1785 by William Herschel who listed it as "II 469". John Herschel listed it as h 3943 and later as GC 4792 in his *General Catalogue* of 1864.
- One, "Compléxa Aquárii" is the barred lenticular galaxy NGC 7285 (Arp 93) in the IAU constellation Aquarius. This was discovered by English astronomer William Lassell (1799 – 1880) and became GC 5078 in the General Catalogue of 1864.

Embracing of Eridanus:

This **telescopic** asterism "Peribállon Erídani" is the edge-on spiral galaxy NGC 1532 in the IAU constellation Eridanus. It was discovered by Scottish astronomer James Dunlop in October 1826. It is GC 823 in the *General Catalogue* of 1864. Interaction with the amorphous dwarf galaxy NGC 1531 has resulted in plumes of stars above the disk of NGC 1532. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to their interaction. It is also known as Halley's Coronet (see below).

Embryo Nebula:

This **telescopic** asterism is the reflection nebula NGC 1333 (vdB 17, LBN 741, Ced16) in the IAU constellation Perseus. John Louis Emil Dreyer (1852 – 1926) records in the New General Catalogue that it was "recorded by Schonfeld from Mannheim, Germany": This would be Eduard Schönfeld (22 December 1828 – 1 May 1891). It is GC 710 in the *General Catalogue* of 1864. It is O'Meara 15 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the Phantom Tiara.

Emerald Nebula:

This **telescopic** asterism is planetary nebula NGC 6572 in the IAU constellation Ophiuchus. It was discovered in 1825 by the German astronomer Friedrich Georg Wilhelm von Struve, who called it one of the "most curious objects in the heavens". John Herschel listed it as h 2000 and later as GC 4390 in the *General Catalogue* of 1864. It is also known as the Green Emerald Nebula, the Green Nebula, the Turquoise Orb, or the Planet Krypton Nebula. Steve Coe describes it as "as green as an Irishman's coat on St. Patrick's Day."

Emiw:

See Love, below.

Empanda:

This Latin asterism "Empanda", "Panda", or "Pantica" is the IAU constellation Virgo. Empanda was an aspect of the Roman Goddess Juno.

- Johann Bayer's *Uranometria* (1603) lists "Panda vel Pantica" as alternate names for Virgo.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Panda vel Pantica" as alternate names for Virgo.
- "Empanda", "Panda", and "Pantica" are listed in R. H. Allen's *Star Names* in 1899.

Emperator:

This Korean asterism is a rounded "W" shaped group of stars in the IAU constellations Andromeda, Perseus, and Triangulum. I'm assuming that the English name given on Stellarium is a misspelling of the word "imperator", a term for a commander in the Roman empire, so the Korean translation would be "Hwangje" (황제). The middle is the two stars 60 and Gamma (γ) Andromedae. From Gamma (γ) Andromedae one curve runs through Upsilon (υ), Omega (ω), and 51 Andromedae, ending at Phi (φ) Persei. The other curve starts at Gamma (γ) Andromedae and runs through Beta (β) and Gamma (γ) Trianguli, ending at 15 Trianguli.

Emperor:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Di' is Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor (Didier 2009) and is part of their xing guan Northern Pole (see below).

This Chinese Chenzhuo xing guan "Di" is the star Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor. It is part of their xing guan "Northern Pole".

This Japanese star is Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor. This name comes from the ceiling art in the Takamatsu Zuka Kofun tomb.

This Romanian star "Împăratul" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Ottescu 2009).

Emperor HeonWon:

This Korean asterism "Hwangjeheon-won" (황제헌원) in the IAU constellations Leo, Lynx, and Ursa Major is a long, winding line of stars with three prongs at one end. The line of stars starts with 31 Lyncis and runs through 35 Lyncis, 10 Ursae Majoris, HIP 44700, 38 Lyncis, Alpha (α) Lyncis, HIP 46088A, Kappa (κ) Leonis, Lambda (λ) Leonis, Epsilon (ε) Leonis, Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) 1 Leonis, Eta (η) Leonis, and HIP 49623, ending at Alpha (α) Leonis (Regulus). From Alpha (α) Leonis three lines of stars run out:

- One line runs to Rho (ρ) Leonis,
- One line runs to 31 Leonis, and
- One line runs to Omicron (ο) Leonis.

Emperor Friend:

This Chinese star "Diyou" from the Three Kingdoms to the Ming Dynasty is Tau (τ) Geminorum in the IAU constellation Gemini and is part of their xing guan Five Feudal Kings (see above).

Emperor Teacher:

This Chinese star "Dishi" from the Three Kingdoms to the Ming Dynasty is Theta (θ) Geminorum: "Dishi" ("Emperor Teacher") in the IAU constellation Gemini and is part of their xing guan Five Feudal Kings (see below).

Emperor's Bodyguard:

This Chinese xing guan “Hǔbēn” (虎贲) is the star 72 Leo in the IAU constellation Leo. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Hǔbēn” is the star 72 Leonis in the IAU constellation Leo.

Emperor’s Daughter (with a Yoke):

This Romanian asterism “Fata de Împârat” (“emperor’s daughter”), “Fata de Împârat cu Cobilita” or “Fiica împăratului cu jug” (“emperor’s daughter with a yoke”) is a line of three stars in the IAU constellation Aquila (Ottescu 2009, Lite, Lodina, and Ignat 2018): Beta (β) Aquilae (Alshain), Alpha (α) Aquilae (Altair), and Gamma (γ) Aquilae (Tarazed). Altair is the girl and the stars to either side are the “Hooks of the Yoke” to which pails of water are hooked.

Emperor’s Seat:

This Chinese xing guan “Dìzuò” (帝座) is the star 64 Herculis in the IAU constellation Hercules. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Dìzuò” is the star Alpha (α) 1 & 2 Herculis (Rasalgethi) in the IAU constellation Hercules.

Empress:

There are two Chinese stars from the Three Kingdoms to the Ming Dynasty with the name “Nüzhu”:

- One is the star Alpha (α) Leonis (Regulus) in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).
- One is the star Kappa (κ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Steps (see below).

Empress Consort:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Hou” is the star Epsilon (ε) Scorpii in the IAU constellation Scorpius and is part of their asterism Tail (see below).

Empress of Cetus:

This **telescopic** asterism “Imperátrix Céti” is the elliptical galaxy NGC 533 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as “II 462”. It became GC 315 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Emptiness:

This Chinese xiù (lunar mansion) “Xūxiù” (虛宿) which first appeared in the 3 Kingdoms to Ming Dynasty era is a line of two stars in the IAU constellation Equuleus: Alpha (α) Equulei (Kitalpha) and Beta (β) Equulei. It is identical to the Korean asterism Empty House (see below). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Xu” was associated to matters concerning the Qingzhou territory. This appears in the Tang Dynasty (618 – 907 C.E.) as “Xū” (虛) as listed by Kotyk (2017): Kotyk writes that it was compared to the Vedic nakshatra Dhanishtha (see Most Famous, below) which is in the nearby constellation Delphinus.

This Chinese Chenzhuo xing guan “Xūxiù” is a line of two stars in the IAU constellations Aquarius and Equuleus: Alpha (α) Equulei (Kitalpha) and Beta (β) Aquarii (Sadalsuud).

This Japanese sei shuku or lunar station “Tomite Boshi” is a line of two stars in the IAU constellation Aquarius: Beta (β) Aquarii (Sadalsuud) and 8 Aquarii.

Empty House:

This Korean lunar mansion “Heo” is a line of two stars in the IAU constellation Equuleus: Alpha (α) Equulei (Kitalpha) and Beta (β) Equulei. It is identical to the Chinese xing guan Emptiness (see above).

Empty Place:

The Arabic and Bedouin manzil “ʾAl-Baldah” (ٱلْبَلْدَة), “empty place” or “wasteland”, is situated in the IAU constellations Capricornus and Sagittarius and is the area of sky between the manzils Al-Naayem (see Ostriches, below) and Saad Al-Thabih (see Slaughter Prevailed, below). Compare this to their asterism “bálda” (see Town, below). It is called this because it contains no bright stars and thus appears “empty”:

- Dorn (1829) gives it the names “the Desert” and “the Fissure” which he attributes to “Ebn Mohammed Sheríf”. Dorn describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al beldah” as a “city” (see Town below), but then comments “why so blank a region should be designated city the commentator sayeth not.”
- W. Brennand lists this as “Al-Belda” in his *Hindu Astronomy* in 1896.

This Yemeni manzil “Balda” is situated in the IAU constellations Capricornus and Sagittarius (Varisco 1995) and is the area of sky between the manzils Na’ā’im (see Ostriches, below) and Sa’d al-dhābih (see Slaughter Prevailed, below). This appears in the *Kitāb al-Tabṣira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Empty Place of the Fox:

This Arabic asterism is a quadrilateral of stars in the IAU constellations Andromeda and Pegasus: Xi (ξ) Pegasi, HIP 2926, 28 Andromedae, and HIP 1215.

Empty Table:

This Latin asterism “Ignatabulum” is the IAU constellation Ara as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Emptying:

This Arabic star “al-pherg” or “Alpherg” is Eta (η) Piscium in the IAU constellation Pisces. The IAU approved the name Alpherg for Eta (η) Piscium A.

Emu:

This Tupi asterism “Nhandu” is the IAU constellation Gemini (De Freita Mourão 2009).

Emu in the Sky:

This Kamilaroi/Euahlayi asterism “Gawarrgay” or “Gowargay” is the spirit Emu in the Sky, stretched out between the IAU constellations Crux, Centaurus, Lupus, Norma, Scorpius, and Sagittarius (Parker 1905, Fuller et al 2014). In 1875 William Ridley reported that it is also called “gao-ergi” (“emu in the dark space under the tree”) the “tree” being the Southern Cross. This asterism is made up as follows:

- Its “head” is in the Coal Sack Nebula (see Coal Sack Nebula above) with the star BZ Crucis (HIP 110432) as its eye,
- Its “neck” is the dust lanes in the Milky Way between Alpha (α) Centauri (Rigil Centaurus) and Beta (β) Centauri (Hadar) and between the stars Eta (η) Lupi and Gamma (γ) 2 Normae, and
- From here the dust lanes expand to form the “body” stretching out in the dust lanes of the Milky Way (Warrambul) between Epsilon (ε) and Lambda (λ) Scorpii and tapering between 36 Ophiuchi and 3 Sagittarii, ending at Mu (μ) Sagittarii.

The Euahlayi and the Kamilaroi use this to mark seasons of the year as parts of it are not visible at various seasons as it rises and sets. They see it with legs in April and May when it is female and chasing the males. From June to August, they see it as male and sitting on its nest without legs (the males brood the chicks), and this is a signal to collect the eggs. In the evening in late August, it is vertical in the sky, and the head and body form two "eggs", meaning the eggs should not be collected. Later in the year, it appears on the horizon, so it is believed to be sitting in a waterhole, meaning the waterholes are full: The Kamilaroi call this “Ngurran.gali” and the Euahlayi “Dthnarwon.gulli” (“an emu sitting” or “emu in the water”). When it is below the horizon, then it is on Earth as the Black Emu, which is rarely seen.

This Wergaia asterism “Ngindyal” is identical to the Euahlayi asterism “Gawarrgay” (Clarke 2009).

This Wiradjuri asterism “Gugurmin” is identical to the Euahlayi asterism “Gawarrgay” (Grant and Rudder 2010).

This Marra and Moporr asterism “Torong” or “Kunkun Tuuromballank” is identical to the Euahlayi asterism, above (Hamacher 2011).

This Wardaman asterism “Gugurmin” is identical to the Euahlayi asterism, above (Cairns 1999).

Several other Australian peoples have this same asterism:

- The Guringai,
- The Pitjantjatjara,
- The Larrakia,
- The Meriam, Mabuiag and Kala Lagaw Ya, who call it Dhinawan, and
- The Kokatha and Ngalea, who call it “Kallaia” or “Kalia” (Leaman, Hamacher, and Carter 2016).

This Boorong and Wergaia asterism “Tchingal” (“the tall one” or “emu”) is the Coal Sack Nebula (Hamacher 2011) near the IAU constellation Crux as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). Tchingal pursues Bunya, who takes refuge in a tree (see Ring Tailed Possum, below).

This Ngalea and Kokatha asterism “Wej Mor” is the Coal Sack Nebula (see Coal Sack Nebula above) near the IAU constellation Crux.

Many other Australian sky cultures recognize this Emu in the Sky asterism, although some only use the Coal Sack Nebula with no reference to a body. It is also known as the “Sky Bora” (see below).

This Karajá asterism “Bi-urá-et-kú” is the dark nebulosity stretched out between the IAU constellations Crux, Centaurus, Lupus, Norma, Scorpius, and Sagittarius with the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) as its “eyes” (De Freita Mourão 2009).

Encampment:

This Chinese xiù (lunar mansion) “Shìxiù” (室宿) is a line of two stars in the IAU constellation Pegasus: Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab- the determinative star). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Ying Shi” (營） was associated to matters concerning the Bingzhou territory. This appears in the Tang Dynasty as “Shì” (室) and is compared to the Vedic nakshatra Purva Bhadrapada (Kotyk 2017, see Early Blessed One, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. A network of three lines radiating out of the central star Beta (β) Pegasi form the xing guan Resting Palace (Vassal of Encampment): see below.

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Pegasus. The central star is Beta (β) Pegasi (Scheat), from which four lines called “Resting Palace (Adjunct to Ying Shi” run out:

- One runs through Tau (τ) Pegasi to Upsilon (υ) Pegasi,
- One runs to 54 Pegasi,
- One runs through Mu (μ) Pegasi to Lambda (λ) Pegasi, and
- One runs through 43 Pegasi to Eta (η) Pegasi.

This Japanese sei shuku or lunar mansion “Hatsui Boshi” also known as “room” is a line of two stars in the IAU constellation Pegasus: Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat).

End of a Horse’s Tail:

This Hebrew star “sof zenav ha-sus” is Zeta (ζ) Sagittarii in the IAU constellation Sagittarius as listed in the star list of Abraham Bar Hiyya in 1104 (Goldstein 1985). This star’s Arabic name is given as “aşl dhanab al-faras”.

End in the Paw:

This Persian star “Muekher al Dzira” is Beta (β) Geminorum in the IAU constellation Gemini.

This Latin star “Posterior Brachii” is Beta (β) Geminorum in the IAU constellation Gemini.

End of Luck of the Homes:

This Arabic star “ākhir al-akhbiya”, later latinized to “Achr al Achbiya” or “Sadaltager”, is Zeta (ζ) Aquarii in the IAU constellation Aquarius. It was listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 as “Achr al Achbiya”.

This Latin star “Postrema Tabernaculorum” is Zeta (ζ) Aquarii in the IAU constellation Aquarius.

End Yoke:

“Endouedon” or “Eniuedon” (“end yoke” or “in-yoke”) is a proposed early Celtic name for the IAU constellation Libra from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Endless Water:

This Kamilaroi asterism “Maianba” is a dark patch in the Large Magellanic Cloud in the IAU constellation Dorado (Fuller et al Trudgett 2014). This is an opening through which the deceased pass to Bulimah (“heaven”).

Endurer:

There are two Arabic asterisms with the name “al-thābit” (الثابت):

- One, later latinized to “Tabit”, is the star Pi (π) 3 Orionis in the IAU constellation Orion. The IAU approved the name Tabit for Pi (π) 3 Orionis.
- One, later latinized to “Thabit”, is the star Upsilon (υ) Orionis in the IAU constellation Orion. The IAU is considering this name for Upsilon (υ) Orionis. American uranographer Elijah Burritt (1794 – 1838) listed “Thabit” as the name for Upsilon (υ) Orionis.

Engagement Ring:

See Ring, below.

Engraved Hourglass Nebula:

This **telescopic** asterism is planetary nebula MyCn 18 in the IAU constellation Musca. It was discovered by American astronomers Annie Jump Cannon (1863 – 1941) and Margaret W. Mayall (1902 – 1995). It is also known as the Etched Hourglass Nebula.

Enif:

See Nose below.

Enlil:

This Babylonian asterism “SHU.PA” (Anthony 1996), “Supa”, or “SHUPA-Enlil” from the MUL.APIN tablets (Bartel van der Waerden 1974) and listed as “su.pa” in the Babylonian star catalogue BM 78161 (5^{th} – 7^{th} century B.C.E.) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul.su.pa” (Koch-Westenholz 1995) is made up of stars of the IAU constellation Boötes and represents their God Enlil. The name translates as “bright”. Enlil or Elil is a Mesopotamian God associated with wind, air, earth, and storms. This appears in later Seleucid sky lore.

- The “body” is a quadrilateral of the stars Epsilon (ε) Boötis, Delta (δ) Boötis, Gamma (γ) Boötis, and Rho (ρ) Boötis.
- From the “hips” two lines form “legs”:
    - One from Epsilon (ε) Boötis to Zeta (ζ) Boötis, and Beta (β) Boötis (Nekkar), and
    - One from Rho (ρ) Boötis to Eta (η) Boötis.
- The “head” is a triangle of the stars HIP 73634, 72582, and 73555, and
- The star Alpha (α) Boötis (Arcturus) is between the “legs” and is called “Abundant One” (see above).

It appears in later Seleucid sky lore.

This Babylonian and Sumerian ziqpu “su-pa” from the BM 78161 tablet (Liechty 1988, Leitz2019) is Alpha (α) Boötis (Arcturus) and the first ziqpu on that list.

Ensnarer of Leo:

This **telescopic** asterism "Laqueátor Leónis" is the spiral galaxy NGC 3808 (Arp 87) in the IAU constellation Leo. It was discovered in 1785 by William Herschel who listed it as "III 338". It became GC 2497 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 3808 is connected with its neighbour NGC 3808A by a long thread, wound around the latter". A Laqueátor is a Roman gladiator who ensnares his opponent with a rope.

Entangled of Caelum:

This **telescopic** asterism "Confúsus Caéli" is the barred spiral galaxy NGC 1679 in the IAU constellation Caelum. It was discovered in 1835 by English astronomer John Herschel who listed it as 2666 in his catalogue and later as GC 916 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Entangled of Pisces:

This **telescopic** asterism "Implicáta Píscium" is the interacting galaxies NGC 520 (Arp 157) in the IAU constellation Pisces. It was discovered in 1784 by William Herschel who listed it as "III 253". It became GC 303 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Whirligig (see below).

Enter Arrow:

This **telescopic** asterism is in the IAU constellation Sextans and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 2076. Size 45'. Corder describes it as an "elongated group that includes 12 stars, magnitudes 6 to 10. The stars form a vague, much elongated "X" shape, oriented east/west."

Entrails:

This Carib asterism is the Pleiades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982). "Epietembo" the one-legged hunter (the belt of Orion) left these entrails in the sky.

Entry of Stars:

This Japanese asterism "Hoshi no Iri" is the belt and sword of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

Enveloping of Draco:

This **telescopic** asterism "Circumfúsus Dracónis" is the spiral galaxy NGC 5907 in the IAU constellation Draco. It was discovered in 1788 by English astronomer William Herschel who listed it as "II 759". John Herschel listed it as h 1917 and it became GC 4087 in his *General Catalogue* of 1864 It is viewed edge-on with a spiraling tidal stream of stars. NOTE: Lord Rosse thought he was looking at two objects separated by the dust lane, and created the name NGC 5907, but this was later discovered not to be a separate object. It is GC 4086 in the *General Catalogue* of 1864. NGC 5906 (GC 4086) now refers to the fainter part of the galaxy west of the dust lane, which was recorded by George Johnstone Stoney in 1850. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "large arcing structures… surrounding this galaxy". . It is

also known as the Splinter Galaxy (see below), the Cat Scratch (see above) and the Knife Edge Galaxy (see below).

Envious Farmers:

This Latin asterism "Invidum Agricolis" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Horace (65 – 8 B.C.E.).

Eoae Atlantides:

This Latin asterism "Eoae Atlantides" is the Pleiades cluster in the IAU constellation Taurus as listed by 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil) and by R. H. Allen in his *Star Names* in 1899. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Athlantides". Atlantides is another name for the Hesperides and is related to their father, the Titan Atlas. Compare this to Seven Atlantic Sisters, below. Allen notes that the *Harleian Manuscript* lists "Pliades et Athlantides".

Eoophoros:

This Greek name for the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes is listed in John Hill's *Urania* in 1754

Equilateral Triangle:

There are two American asterism "Equilateral Triangle" asterisms:

- One is made up of the stars of the IAU constellations Auriga: Alpha (α) Aurigae (Capella). Beta (β) Aurigae (Menkalinan) and Delta (δ) Aurigae. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describe these three stars as "an approach to an equilateral triangle".
- One is made up of stars of Boötes and Corona Borealis: Alpha (α) Coronae Borealis (Alphecca), Alpha (α) Boötis (Arcturus) and Delta (δ) Boötis. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes it as "a nearly equilateral triangle".

Equality:

This Korean asterism "Pyeongdeung" (평등) is a line of two stars in the IAU constellation Hydra: Gamma (γ) and Psi (ψ) Hydrae.

Equality and Fair:

This arrow shaped Korean asterism "Pyeongdeung-gwa Gongjeong" (평등과 공정) is stars in the IAU constellation Leo Minor: 10, 19, and 21 Leonis Minoris, and HIP 47029.

Equinoctial:

This Latin asterism "Aequinoctialis" is the IAU constellation Aries, which once marked the spring equinox. Johann Bayer's *Uranometria* (1603) lists "Aequinoctialis".

Equuleus:

None of the stars of Equuleus are brighter than 4th magnitude and the stars of this constellation only show up in 42 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Equ), “Little Horse” or “Foal”, was possibly created by Hipparchus (190 – 120 B.C.E.) and included by Ptolemy (c.100 – c.170) in his *Almagest* as “Ἵππου Προτομή” (“Íppou Protomí”)- see “Bust of a Horse” above. 1st century Greek astronomer Geminos of Rhodes mentioned that Hipparchus had created it, but Hipparchus does not mention in his Commentary, nor did Hyginus, 1st century Roman poet Marcus Manilius, or Vitruvius a century later. The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as the front half of a horse. Various authors and versions of the *Almagest* all describe it as a bust and not a complete horse. Three different Greek myths refer to it, the principal one describing it as the offspring or brother of the winged horse Pegasus. Variations include “Equulus”, “Eculeus” and “Equus Minor”.

This constellation appears in the Leiden *Aratea* (816) as a group of four stars in front of Pegasus.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts a left side and right side view of Equuleus on one page, depicting a horse’s head.

The 11th century *De signis caeli (“of the signs of heaven*”) lists it as “Equus, bellorum fons” (“the horse, the source of wars”).

An Islamic celestial globe dated 1275-76 in the British Museum depicts Equuleus as the bust of a horse facing to our right.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Equuleus as the bust of a horse facing to our right.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Equuleus as the bust of a horse facing to our left.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Equiculus” as the bust of a horse facing to our right.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Equuleus as the bust of a horse facing to our right. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Equuleus as the front of a horse emerging from behind Pegasus. It is not labelled.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) omits Equuleus.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Equus Prior” as the head of a horse.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Equuleus as the bust of a horse facing to our right. It is not labelled. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts it in the same fashion, except facing to our left.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, labels this constellation “Equus Prior” and depicts it as the bust of a horse facing to our right. It is positioned in front of the head of Pegasus.

German uranographers Albrecht Dürer, Conrad Heinvogel and Johann Stabius depicted this constellation on their 1515 map as the bust of a horse facing to our right and label it “Equiculs”.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius label this constellation “EQVICVLUS” and depicts it as the bust of a horse flying to our right while emerging from a cloud.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Equus Minor” as the bust of a horse facing to our right.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “EQVICULVS” as the bust of a horse in front of Pegasus.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts “EQVICVLVS” in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Equus Minor” as the bust of a horse ahead of Pegasus.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Horse Segment”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Equuleus as the bust of a horse facing to our right, partially behind the head of Pegasus.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Equiculus” as the head of a horse emerging from a cloud.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Equi Sectio siue Equiculus” as the profile of a horse head facing to our right.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as the head of a horse partially obscured by the head of Pegasus. It is not labelled.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius does not depict Equuleus.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) does not label Equuleus, but depicts it as the head of a horse emerging from behind the head of Pegasus, who is galloping to our right.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Equuleus as the head of a horse: This is slightly overlapped by the head of Pegasus.

Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists this constellation as "Equuleus" and as "Equi Sectio" ("equine section").

German uranographer Johann Bayer (1572 – 1603) lists "Equiais" and depicts this as the bust of a horse emerging from clouds in the charts in his *Uranometria* in 1603. In the text of the Uranometria Bayer lists these names for Equuleus: "Equus Minor, Equus Prior, Equuleus, Sectio Equi".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists this constellation as "Equus Minor" and depicts it as the head of a horse behind the head of Pegasus and gives the subtitles "Equuleus" and "Sectio Equi".

Equuleus is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as the head of a horse facing us ahead of Pegasus: It is labelled with the abbreviated title "Equuls," on one chart and with the full name "Equuleus" on another.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Equiculus o Equisectio" and depicts this as the head of a horse facing to our right.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Equuleus" and "Equi Sectio" for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts "Equus Minor" as the head of a horse in front of Pegasus.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Equuleus" as the bust of a horse facing to our right, partially concealed behind the head of Pegasus.

In his *A Learned Treatise on Globes* in 1659, Robert Hues notes that Hyginus does not mention it, referring to it as "the little horse".

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Equuleus as the bust of a horse facing to our left and emerging from a cloud.

Robert Hues lists "Equiculus" in his *A Learned Treatise of Globes* in 1659.

Equuleus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as the head of a horse.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Equuleus as the head of a horse emerging from a cloud: The head of Pegasus partially overlaps it.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Equuleus" as the head of a horse.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts depicts "Equuleus" as the head of a horse.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Equuleus" as a horse's head emerging from behind the head of Pegasus.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Equuleus" as the front part of a horse's head, from about just in front of the ears forward.

Equuleus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: This is depicted as the head of a horse just ahead of the constellation Pegasus.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Equuleus as the head of a horse ahead of Pegasus.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Equuleus" as a horse's head next to the head of Pegasus: It has the subtitle "Equi Sectio".

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts this constellation as the bust of a horse behind the head of Pegasus but doesn't label it.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Equuleus as the bust of a horse facing to our left which is emerging from a cloud.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Petit Cheval" as the head of a horse emerging from a cloud.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Equiculus" as the head of a horse ahead of Pegasus.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le petit Cheval" ("the little horse") and depicts it as the head of a horse just ahead of the constellation Pegasus, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "das kleine Pferd" in the text and "Fullen" on the charts, where it is depicted as the head of a horse behind Pegasus..

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Equuleus as the head of a horse behind the head of Pegasus but does not label it.

English astronomer J. Ellard Gore's translation *Astronomie Populaire* by French astronomer Camille Flammarion (1842 – 1925) lists "Equus".

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Fūllen" and depicts it as the head of a horse.

American uranographer William Croswell (1760 – 1834) depicts "Equuleus the Colt" on his *Mercator Map of the Starry Heavens* in 1810 as the head of a horse.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Equus in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): This is depicted as the head of a horse just ahead of the head of the constellation Pegasus.

"Equuleus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as the head of a horse just ahead of Pegasus.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 also lists "Equiculus" as well as "Equus Minor", "little horse", and "Praesegmen" ("fragment").

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Equuleus" as the head of a horse ahead of Pegasus.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Equuleus" as the head of a horse behind the head of Pegasus.

"Equuleus" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Equuleus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as the head of a horse before the head of Pegasus.

English astronomer Richard Anthony Proctor proposed shortening the name to "Equus" ("horse") in 1873, as he believed that shortening the name would make more room on astronomical charts. However Proctor's *A New Star Atlas* (1887) lists "Equuleus, The Little Horse" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Equuleus" in his *Star Atlas* (1893) and describes it as "The Foal".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Equuleus" and describes it as the "Little Horse".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Equuleus: The Colt".

French astronomers call it "Petit Cheval".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Equuleus in his book *The Stars - A New Way to See Them* (1952). The standard IAU version is a quadrilateral of the stars Alpha (α) Equulei (Kitalpha), 6 Equulei, Delta (δ) Equulei, and Beta (β) Equulei. Rey reduces this to a single bent line connecting Kitalpha, Delta (δ) Equulei, and Gamma (γ) Equulei. *Sky and Telescope Magazine*, founded in 1941, depicts Equuleus in their magazine and publications in the same manner as Reyersbach.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Equuleus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a five-sided figure made up of the stars Alpha (α) Equulei (Kitalpha), Beta (β) Equulei, Delta (δ) Equulei, Gamma (γ) Equulei, and Epsilon (ε) Equulei.

Erected of Pegasus:

This **telescopic** asterism "Eréctus Pégasi" is the peculiar barred spiral galaxy NGC 7549 (Arp 99) in the IAU constellation Pegasus. This was discovered by Irish astronomer Bindon Stoney in 1850. It became GC 4912 and GC 6151 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "in the conventional orientation of the sky (with north upwards) the longest arm of this galaxy is raised straight upwards, a striking pose amidst its more modest looking neighbours."

Erichthonius:

This Latin asterism “Erichthonius” or “Erechtheus” is the IAU constellation Auriga as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.). Erichthonius was the son of the Roman gods Vulcan and Minerva:

- The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists “Erichthonius”.
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this constellation as “Erichthonius”.
- The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists Erichthonius: He is depicted as a clean-shaven nude male, his back to us, kneeling on his left knee, looking over his left shoulder, with a goat on his left shoulder and carrying reins and harness in his right hand.
- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) labels this “Erichthonius”.
- The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Erichthonius in the same manner as Dürer et al.
- The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) labels this constellation “Erichthonius”.
- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Agitator sive Auriga vel Erichthonius” (“Agitator or Auriga or Erichthonius”) as a nude bearded male, running to our right, with a goat perched on his left shoulder.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671), French astronomer Ismaël Boulliau (Ismaël Bullialdus- 1605 – 1694), and Christen Sørensen Longomontanus (1562 – 1647) listed the name “Erichtonius”.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Auriga, qui et Heniochus, sev Erichtonius” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- Johann Bayer’s *Uranometria* (1603) lists “Erichtheus“ and “Erichthonius“.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Erichthonius” and “Erichthom” as alternate names for Auriga.
- “Erichthonius” and “Eriththom” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a alternative names for Auriga.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Aeritonio” (“Erichthonius”), “Agitator”, “Auriga”, and “Heniochus” and depicts him as a nude bearded male viewed from behind kneeling on his left knee with a got sitting on his left shoulder.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Auriga”, “Heniochus”, and “Ericthonius” for this constellation.
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Auriga vel Erichthonius”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists Erichthonius.

- Erichthonius is listed in Robert Hues' *A Learned Treatise of Globes* in 1659 and in John Hill's *Urania* in 1754.

Eridanus:

The brightest star of Eridanus, Alpha (α) Eridani (Achernar), is the 9th brightest star in the sky and its stars appear in 204 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Eri) was listed among Ptolemy's 48 original constellations in the *Almagest* (2nd century) as "ὁ Ποταμός" ("o Potamós" or the river" – see River, below). Greek mythology has this being the path of Phaethon's chariot. The Romans called it Eridanus, which is a Greek name for the Po River "Ἠριδανός" or "Eridanós" and is also related to that myth of Phaethon's chariot, appearing in the works of Aratus (315 – 240 B.C.E) and Eratosthenes (d.194 B.C.E.). The astrologers Teucrus of Babylon (c. 1st century) and Vettius Valens (120 – c.175) listed Eridanus among the paranatellonta of Aquarius, describing the water running from Aquarius' jug as part of this constellation on the Sphaera Graecanica. The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a stream of water running from the foot of Orion. The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Eridanus as a curving double line containing a line of circles representing stars.

This constellation is mentioned in 7th century B.C.E. poet Hesiod's *Theogonia*.

This constellation is depicted in editions of the 8th century *Revised Aratus Latinus*:

- All editions show him as a river God,
- Two editions (St Gall 250, St Gall 902) have this god making a benediction gesture with his right hand,
- In the Dresden DC 183, Paris BN 12597 and Prague IX C 6 editions he is shown as a wild haired figure up to his waist in water,
- In the Vat Reg lat 1324 edition he is a clothed, seated river God,
