“Perseus” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a male with winged sandals in a thigh length tunic with a sword raised above his head in his right hand and Medusa’s head in his left hand.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as “Perseus” and describes it as “brandishing an enormous sword in his right hand, while at his left is the head of Medusa”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Perseus, The Rescuer” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation simply as “Perseus”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Perseus” in his *Star Atlas* (1893).

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Perseus” and does not describe it.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Perseus” as “the champion”.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) radically redesigned the lines of Perseus in his book *The Stars - A New Way to See Them* (1952):

- His “helmet” is the triangle of stars Gamma (γ), Eta (η), and Tau (τ) Persei,
- His “head” is the quadrilateral of stars Gamma (γ), Tau (τ), Iota (ι), and Alpha (α) Persei (Mirfak),
- His “body” is a bent quadrilateral formed by Mirfak, Iota (ι) Persei, Kappa (κ) Persei, Beta (β) Persei (Algol), Epsilon (ε) Persei, Nu (ν) Persei and Sigma (σ) Persei,
- His “left arm” is the line of stars from Mirfak through Psi (ψ), Delta (δ), 48, Mu (μ), and b Persei to Lambda (λ) Persei,
- His “right arm” runs from Iota (ι) Persei through Theta (θ) Persei and 64 Persei to Phi (ϕ) Persei,
- His “left leg” runs from Epsilon (ε) Persei through Xi (ξ) and Zeta (ζ) Persei to Omicron (ο) Persei,
- His “right leg” runs from Algol through Rho (ρ) Persei to 16 Persei, and
- Rey does not depict Medusa’s head.

Sky and Telescope Magazine, founded in 1941, depicts Perseus in their magazine and publications in the same manner as Reyersbach.

Perseus translates into Arabic as “Barshāūsh”:

- "Barshāūsh" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010)
- Later Latinizations include "Bershâush", "Bershawish", "Fersaus", and "Siaush" (there is no letter "P" in the Arabic alphabet).
- "Bersheush" is listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.
- "Bershaush" appears in John Hill's *Urania* in 1754.

The French call this constellation "Persée" and the Italians "Perseo".

Perseus A:

This **telescopic** asterism is the Seyfert galaxy NGC 1275 (Caldwell 24) in the IAU constellation Perseus. It was discovered by Prussian astronomer Heinrich d'Arrest and became GC 675 in the *General Catalogue* of 1864. It is also known as "Conception of Perseus" (see above).

Perseus Lenticular Galaxy:

This **telescopic** asterism is the barred lenticular galaxy NGC 1023 (Arp 135) in the IAU constellation Perseus. It was discovered in 1784 by William Herschel who listed it as "I 156". It became 244 on his son John Herschel's list and GC 574 in the *General Catalogue* of 1864. It is also known as "Nodifera Persei" ("Bearing a Knot of Perseus").

Perseus' Wife:

This Latin asterism is the IAU constellation Andromeda. This asterism "Perseus Uxorem" is the IAU constellation Andromeda and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Persia:

This Chinese xing guan "Bōsī" (波斯) is an angular, tightly wound spiral of stars in the IAU constellations Indus and Telescopium. Starting at the star HIP 97816A, the line spirals inward through Xi (ξ) Telescopii, Alpha (α) Indi, HIP 106065, Delta (δ) Indi, HIP 108626, and Eta (η) Indi, ending at the star Iota (ι) Indi.

Persian:

This Jesuit star "Persian" is Alpha (α) Indi in the IAU constellation Indus. It was given this name by Jesuit missionaries in China, where the star is called Pe Sze.

Person Living on the Side of a Mountain:

This Latin star "Tramontane" or "Tramontana" is the IAU constellation Ursa Minor. The "heavenly mountain", Mons Coelius, is Alpha (α) Ursae Minoris (Polaris):

- 14th century author John Mandeville (Jehan de Mandeville) called it "Sterre Transmontane" in his *Travels of Sir John Mandeville*.
- English alchemist and translator Richard Eden (c.1520 – 1576) called it "Tramontana".
- German astronomer Johann Bayer (1572-1625) listed the name "la Tramontana" in his Uranometria in 1603.

- This is listed in R. H. Allen's *Star Names* in 1899. Allen writes that this name was by his time only used for Polaris. Allen also writes of several references to a mountain in the north that is the habitation of the Gods, including English orientalist Archibald Henry Sayce (1845 – 1933), German philosopher Johann Gottfried von Herder (1744 – 1803), and American philologist William Dwight Whitney (1827 - 1894).
- NOTE: There is an old Italian expression "losing his Tramontane" when one has lost his bearings.

Perspective:

This Greek star "Προόπτης" or "Proóptis" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Plutarch (c.46 – 119). R. H. Allen translates this as "the leader" in his *Star Names* in 1899.

Perspective of Coma Berenices:

This **telescopic** asterism "Prospectíva Cómae Bereníces" is the barred spiral galaxy NGC 4448 in the IAU constellation Coma Berenices. William Herschel listed this as "I 91". John Herschel listed it as h 1280 and later as GC 3001 in his *General Catalogue* of 1864 This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is edge-on, this being a reference to "Prospectiva", a Renaissance Latin name for a drawing in perspective.

Persson's Star:

This **telescopic** star is V733 Cephei, an FU Orionis type object in the IAU constellation Cepheus. It is named after astronomer R. Persson.

Pési:

This Kaykavian asterism is the IAU constellations Canis Major and Canis Minor.

Pestle:

This Chinese Chenzhuo xing guan is a line of three stars in the IAU constellation Telescopium: Alpha (α) Telescopii, HIP 90414, and Zeta (ζ) Telescopii.

Pestle (in Rooftop Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Lacerta and Pegasus: 29 Pegasus (the determinative star), HIP 109654, and 1 Lacertae.

This Chinese xing guan "Chǔ" (杵) is a line of three stars in the IAU constellations Lacerta and Pegasus: 1 Lacertae and Eta (η) and 23 Pegasi. NOTE: This is identical to the Korean asterism "Inner Pestle" (see above). The Chinese xing guan "Mortar" (see above) is alongside.

Pestle (in Winnowing Basket Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellations Corona Australis and Telescopium: Zeta (ζ) Telescopii, Alpha (α) Telescopii (the determinative star), and HIP 90842.

This Chinese xing guan "Chǔ" (杵) is a line of three stars in the IAU constellation Ara: Alpha (α), Beta (β), and Sigma (σ) Arae.

Peter:

This German asterism “Peter” or “Saint Peter the First Apostle” is the IAU constellation Aries and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Petrus Al Aries”. It later appears in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and in John Hill’s *Urania* in 1754.

Peter’s Boat:

This German asterism “the Boat of Saint Peter the Apostle” is the IAU constellation Ursa Major and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Navicula S. Petri al Vrsa major”. It later appears in John Hill’s *Urania* in 1754. Edward Sherburne lists it as “Saint Petre’s Fisher Boat” in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “the ship of St. Peter”. R. H. Allen lists the variants “Peter’s Ship” and “Peter’s Skiff” in his *Star Names* in 1899.

Peter’s Cross:

This Belarussian asterism “Пятроў Крыж” (“Petrou Krest”) is the Northern Cross asterism in the IAU constellation Cygnus (Avilin 2009).

Peter’s Fish:

This German asterism is the IAU constellation Piscis Austrinus as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Bartsch attributes this name to Schickard.

Peter’s Stick:

This Belarussian asterism “Petrova Palka” is the IAU constellation Cygnus (Avilin 2009). They also call it “Peter’s Cross” (see above) and “Tsarou Krest” (“Czar’s Cross”).

This Lithuanian asterism “Petro ramtis” is the belt of Orion in the IAU constellation Orion.

Peter’s Staff:

This asterism is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899.

This Finnish asterism “Pietarin sauva” is the Belt of Orion asterism in the IAU constellation Orion.

Petiux:

The ancient Celts noted the passage of the moon by the IAU constellation Coma Berenices during the month of Rivros (see Fat Month Guiding Star, above) to indicate the first of five spring celebrations called Petiux. When Coma Berenices is rising, Capella is at the zenith, and Vega is setting.

Petra:

This Jordanian star “Petra” is WASP-80 in the IAU constellation Aquila and received this name in the IAU NameExoWorlds Campaign. Petra is a UNESCO World Heritage Site in Jordan. It has an exoplanet named Wadirum: Wadi Rum (“valley of the moon”) is in southern Jordan.

Phact:

See Dove, below.

Phaethon:

This asterism appeared in the *Phenomena*, a work describing constellations by Greek didactic poet Aratus (315 – 240 B.C.E.) and in *De Astronomica* by Gaius Julius Hyginus (64 - 17 B.C.E.). In his commentary of Virgil’s *Aeneid*, 5th century grammarian Servius said the mythical character Phaethon had been transformed into the constellation Cygnus. In *Dionysiaca*, 5th century Greek poet Nonnus of Panopolis has Phaethon being transformed into the stars of the IAU constellation Auriga. Hyginus listed this as the IAU constellation Auriga (Falkner 2011). John Barentine in his *Uncharted Constellations* suggests that it originated in Mesopotamian sky lore in what became the IAU constellation Eridanus. I’m placing it in the latter constellation.

This French asterism is the IAU constellation Auriga as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). Phaethon was the son of the Oceanid Clymeme and the sun God Helios who begged to be allowed to drive his father’s chariot.

Phantom Cluster:

This **telescopic** asterism is the open cluster NGC 6400 in the IAU constellation Scorpius. It was discovered in 1826 by the Scottish astronomer James Dunlop who listed it as ‘Dunlop 568”. John Herschel listed it as h 3696 and later as GC 4313 in the *General Catalogue* of 1864.This is also known as the Long John Silver Cluster (see above).

Phantom Frisbee:

This telescopic asterism NGC 3079 is a barred spiral galaxy in the IAU constellation Ursa Major. This was discovered by English astronomer William Herschel in 1790 who listed it as “V 47” in his catalogue. It is GC 1983 in the *General Catalogue* of 1864. NOTE: The Frisbee was invented by American Walter Morrison in 1948, but it wasn’t called the “Frisbee” until 1957, when college students started calling it that, so this name cannot predate that.

Phantom Galaxy:

This **telescopic** asterism Messier 74 (NGC 628) is a large spiral galaxy in the IAU constellation Pisces. It was discovered by French astronomer Pierre Méchain in 1780. It was listed in the General Catalogue of 1864 as GC 327, and in John Herschel’s catalogue as h 142. It is also known as the “Perfect Spiral Galaxy” (see below) and the “Very Whirling of Pisces” (see below).

Phantom of the Opera Nebula:

This **telescopic** asterism is the HII region SH 2-173 (LBN 593) in the IAU constellation Cassiopeia.

Phantom Streak:

This **telescopic** asterism is planetary nebula NGC 6741 in the IAU constellation Aquila. It was discovered by American astronomer Edward Charles Pickering in 1882. Size 0.1’ X 0.1’.

Phantom Tiara:

See Embryo Nebula (above).

Pharmaz:

This asterism is the IAU constellation as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). The origin of the name is obscure.

Pharaoh's Cart:

This Belarussian asterism "Voz Faraonski" is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009). Compare this to "Voz" (see Cart, above) and "Vialiki Voz" (see Large Cart, above).

Pharaoh's Scorpion:

This Italian asterism is the IAU constellation Scorpius as listed by Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?). R. H. Allen describes this in his *Star Names* in 1899 as "the scorpion or serpent whereby Pharoah, King of Egypt, was enforced to let the children of Israel depart out of his country".

Pharos of Virgo:

This **telescopic** asterism "Phárus Virginis" is the spiral galaxy NGC 4517 (AKA NGC 4437) in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "IV 5". It became GC 3066 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)": They named it after the island of Pharos as "the extended form of this edge-on galaxy gives the impression of a far away island. The conspicuous foreground star at the northern edge of the galaxy can be regarded as the lighthouse."

Phaser Gun:

This **telescopic** asterism is in the IAU constellation Virgo and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 2481. Size 120' X 60'. The "gun" includes the stars HIP 64954A, 64983, 65067, 65119, and 64984. The "handle" is the line of stars HIP 65192, 65225, and 65355B.

Phecda:

See Thigh, below.

Phoebe's Knight:

This Latin asterism "Phoebes Miles" is the IAU constellation Ursa Major.

Pherkad:

See Calf, above.

Phillip:

This German asterism "Philip" or "Saint Philip" is the IAU constellation Libra and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the

"pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Philippus Al Libra". Edward Sherburne lists it in his Sphere of Marcus Manilius in 1675 and attributes it to Georg Philipp Harsdörffer (1607 – 1658). It later appears in John Hill's *Urania* in 1754.

Phillyrides:

This asterism "Phillyrides" is the IAU constellation Centaurus. This is a reference to the mother of Chiron, the Oceanid Philyra. This name is listed in Johann Bayer's *Uranometria* (1603).

Philomelus:

This Greek asterism is the IAU constellation Boötes. Johann Bayer's *Uranometria* (1603) lists "Philomelus" as an alternate name for Boötes. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this name. Philomelus was a Greek demi-god, the son of Demeter and Iasion.

Phiorion:

This star is Alpha (α) Tauri (Aldebaran) as listed in John Hill's *Urania* in 1754. Compare this to his asterism Orias, above.

This Latin asterism is the IAU constellation Aries as named by Publius Ovidius Naso (Ovid, b. 43 B.C.E.). This refers to the Greek myth where Phrixus and his mother Helle are rescued by a golden ram.

Phoenicia:

This telescopic Lebanese star is HIP 99711 (HD 192263) in the IAU constellation Aquila (magnitude 6.3). It was given this name in the IAU NameExoWorlds campaign. It is a reference to the ancient Phoenician civilization. It has an exoplanet named Beirut.

Phoenician Bear:

According to 1st century Greek geographer Strabo, this Greek asterism "Φοινίκη" ("Foiníki") or "Phoenice, later becoming "Ursa Phoenicia", is the Little Dipper asterism in the IAU constellation Ursa Minor (Hafez 2010). They got their name for Ursa Major from the 8th century B.C.E. poet Homer (see Great Bear, above) and this name for the Little Dipper is a reference to the Phoenician navigators calling it "The Wagon of Heaven" (see below). R. H. Allen writes in his *Star Names* in 1899 that "Phoenice" early on also became a Greek name for Polaris.

Phoenician Sphere:

This Phoenician asterism is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda.

Phoenix:

The brightest star of Phoenix, Alpha (α) Phoenicis (Ankaa) is number 84 on the list of 90 brightest stars: It is 2nd magnitude. The stars of this constellation only show up in 45 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Phe) is one of twelve constellations created by Flemish astronomer and uranographer Petrus Plancius (1495 – 1552) in 1597 from the observations of Dutch navigator Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627): Houtman called it "Den Voghel Fenicx" ("the bird phoenix") in his star catalogue in 1603. Flemish cartographer Jodocus Hondius (1563 – 1612) included it on his globe in 1598 as "Phoenix",

Dutch historian Paulus Merula (1558 – 1607) listed it as “Phoenix”, and Dutch uranographer Willem Blaeu (1571 – 1638) included it as “Phoenix” in 1603.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Phoenix as a bird rising from a fire.

German uranographer Johann Bayer (1572 – 1625) lists “Phoenix” in his *Uranometria* in 1603 and depicts it as a bird rising up from flames in a rectangular fire pit.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Phoenix” as a bird rising from a fire.

“Phoenix” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Phoenix” for this constellation.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Phoenix” as a bird rising from flames on a plinth.

Phoenix is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Phoenix as a bird rising out of a fire.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Phoenix is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted on his southern star chart of 1678 as a phoenix rising from a fire.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Phoenix” as a bird about to take flight from fire and smoke. Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts Phoenix as a bird about to take flight (there is no fire shown). The central star is Beta (β) Phoenicis, from which five lines run out:

- One through Kappa (κ) Phoenicis to Alpha () Phoenicis (Ankaa),
- One through Epsilon (ε) Phoenicis to HIP 116602,
- One through Gamma (γ) Phoenicis to Psi (ψ) Phoenicis,
- One to Delta (δ) Phoenicis, and
- One to Zeta (ζ) Phoenicis.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Phoenix” as a bird rising from a fire.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Phoenix as a bird rising from a fire.

Phoenix is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Phoenix as a bird taking flight.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Phoenix" as a bird rising from a fire.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Phoenix as a bird rising from a fire.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Phoenix as a bird rising from a flaming plinth.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "le Phenix" as a bird with wings unfurled standing on a branch.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Phenix" as a bird arising from a fire.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Phoenis" as a phoenix rising from flames.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Phenix" as a phoenix rising from flames and smoke, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Phōnix" and depicts it as a bird rising from flames on a tray of some sort.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Phenix" as a bird rising from a fire.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Phenix" as a phoenix in a cloud of smoke.

"Phoenix" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) and depicted as a bird rising from smoke.

American uranographer William Croswell (1760 – 1834) depicts Phoenix on his *Mercator Map of the Starry Heavens* in 1810 as a bird rising from flames.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Phoenix in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "the Phoenix" as a bird rising from a fire.

"Phoenix" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Phœnix" as a bird rising up out of fire and smoke.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Phoenix" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Phoenix" and describes it as a "Phoenix", incorrectly attributing it to Bayer.

The standard IAU version of this constellation is a series of interlocking triangles of stars:

- His "head" is Alpha (α) Phoenicis (Ankaa), Epsilon (ε) Phoenicis, and Kappa (κ) Phoenicis,
- His "left wing" is Kappa (κ) Phoenicis, Gamma (γ) Phoenicis, and Beta (β) Phoenicis,
- His "right wing" is Kappa (κ) Phoenicis, Zeta (ζ) Phoenicis, and Beta (β) Phoenicis,
- His "tail" is Beta (β) Phoenicis, Psi (ψ) Phoenicis, and Delta (δ) Phoenicis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Phoenix in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- The "body" is the quadrilateral of stars Beta (β), Zeta (ζ), Delta (δ), and Gamma (γ) Phoenicis,
- The "head" is a line from Beta (β) Phoenicis to Kappa (κ) Phoenicis, which then branches into two more lines:
    - One to Alpha (α) Phoenicis (Ankaa), and
    - One to Epsilon (ε) Phoenicis.

Sky and Telescope Magazine, founded in 1941, depicts Phoenix in their magazine and publications as a triangle of the stars Beta (β) Phoenicis, Alpha (α) Phoenicis (Ankaa), and Epsilon (ε) Phoenicis connected to a quadrilateral of the stars Beta (β) Phoenicis, Zeta (ζ) Phoenicis, Delta (δ) Phoenicis, and Gamma (γ) Phoenicis.

The Germans call it "Phönix", the Italians "Fenice".

R. H. Allen wrote in his *Star Names* in 1899 that the ancient Egyptians called this constellation "Bennu", although this is actually related to their name for Sirius (see below). Although there is no definitive proof, Allen notes that the Arabs had several versions of this asterism (see Boat, Eagle, and Griffin, above, and Young Ostriches, below) which may have influenced Plancius in the "creation" of this constellation.

Johann Bayer's *Uranometria* (1603) lists "Phaenice" ("phoenix") as one of the names for the Little Dipper asterism in the IAU constellation Ursa Minor.

This Latin asterism is the Little Dipper asterism in the IAU constellation Ursa Minor. The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven"*) lists "Fenix" as a name for Ursa Minor saying "the phoenix, which is both a lesser eagle and by some is called a dog's tail".

This Egyptian star "Bennu" is Alpha (α) Canis Majoris in the IAU constellation Canis Major. In Egyptian mythology the Phoenix was believed to alight every 1461 years (a Sothic cycle) on the top of the benben, a pyramidal-shaped stone at the temple at Heliopolis. There the Bennu would build a funeral pyre and is consumed by flames. It then is reborn from its ashes and the cycle repeats. They believed that the Bennu guided the Gods through the duat (the world full of demons below the horizon). The benben represented the first hillock of dry land to emerge from the primordial waters. The Egyptian hieroglyphic symbol for Sirius is a five-pointed star symbol with a semi-circular "T" symbol above it indicating the feminine form of the word star alongside a triangle representing the benben or a pyramid.

This Arabic star "al-ʿAnqāʾ" (العنقاء) is Alpha (α) Phoenicis in the IAU constellation Phoenix and later latinized to "Ankaa". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Ankaa" for this star. The IAU approved the name Ankaa for Alpha (α) Phoenicis.

There are two **telescopic** "phoenix" asterisms:

- One is in the IAU constellation Lacerta and was listed by German astronomer Robert Zebahl on the *Faint Fuzzies* website. René Merting describes it as a Phoenix on this site. The central star is HIP 112434. Size 22' X 21'.
- One is the galaxy PGC 22641 in the IAU constellation Canis Minor.

Phoenix Dwarf:

This **telescopic** asterism is the irregular dwarf galaxy PGC 6830 (ESO 245-7) in the IAU constellation Phoenix. It was discovered by Hans Emil Schuster and Richard Martin West in 1976 and first taken for a globular cluster. R. Canterna and P.J. Flower discovered it to be a dwarf galaxy in 1977. It is also known as the "Snowy of Phoenix" (see below).

Phoenix Tree Mound:

This Chinese Chenzhuo xing guan "Tongling" is the star HIP 33694 in the IAU constellation Camelopardalis. It is part of their xing guan Purple Forbidden West Wall.

Pholos:

This Greek asterism is the IAU constellation Centaurus. Pholos was a centaur in Greek mythology:

- "Pholos" is listed in Johann Bayer's *Uranometria* (1603).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Pholos".
- "Pholos" is listed by John Hill in his *Urania* in 1754.

Phorbas:

This Greek asterism is the IAU constellations Ophiuchus and Serpens as listed by John Hill in his *Urania* in 1754 and R. H. Allen in his *Star Names* in 1899. Phorbas is one of the sons of Triopas (see below) in Greek myths, which describe him as freeing Rhodes from snakes.

Phrixeum Cattle:

This Latin asterism "Phrixeum Phecus" is the IAU constellation Aries. This refers to the Greek myth where Phrixus and his mother Helle are rescued by a golden ram.

Phrixi Passenger:

This Latin asterism "Phrixi Vector" is the IAU constellation Aries. This refers to the Greek myth where Phrixus and his mother Helle are rescued by a golden ram.

Phrixian Sheep:

This Latin asterism "Phrixea Ovis" is the IAU constellation Aries as named by the Roman poet Ovid (b. 43 B.C.E.). This refers to the Greek myth where Phrixus and his mother Helle are rescued by a golden ram.

Phrixus:

This Latin asterism is the IAU constellation Aries as listed by Lucius Junius Moderatus Columella (4 – 70 C.E.) and as listed in R. H. Allen's *Star Names* in 1899. Phrixus is a character in the Greek myth where he and his mother Helle are rescued by a golden ram.

Phrygian Flutes:

This Egyptian asterism is one of the paranatellonta of the 2nd decan of Leo as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Sextans.

Phrygius:

This French asterism is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). Phrygius was a Neleid who was king of Miletus.

Phukwio-futsa-difala:

This Sotho asterism is an unidentified group of stars appearing in July (Alcock 2014).

Pi Cluster

This **telescopic** asterism is the brightest stars of the open cluster Messier 38 (NGC 1912), discovered by Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Auriga. This was listed in the *General Catalogue* of 1864 as GC 1119. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* that cluster's brightest stars form what is known as the Letter Pi Cluster, as they resemble the Greek letter π.

Piautos:

See Same, below.

Piawai:

This Māori asterism is a cluster of four stars which is unidentified at present (Thompson 2019).

Piazzi's Flying Star:

This double star is 61 Cygni B in the IAU constellation Cygnus (magnitude 5.21), whose large proper motion (seventh highest) was noted by Italian astronomer Giuseppe Piazzi in 1804. It was the first star to have its distance measured through stellar parallax: 11.4 light years. It is also known as Bessel's Star (see above). It has this name as Piazzi nominated it as a good candidate for parallax distance measurements.

Pickering's Triangle:

This **telescopic** asterism Pickering's Triangle or Flemings Triangular Wisp is a triangular nebula at the north central edge of the Cygnus Loop, next to NGC 6979 and NGC 6974 in the IAU constellation Cygnus. It was discovered photographically in 1904 by Scottish American astronomer Williamina Fleming (1857 – 1911), hence the name "Fleming's Triangular Wisp", but unfortunately credit and the name "Pickering's Triangle" went to the director of her observatory, Charles Pickering.

Pictor:

None of the stars of Pictor are on the list of 90 brightest stars and the stars of this constellation only show up in 12 asterisms in this handbook.

This IAU constellation (IAU abbreviation Pic) was created by French astronomer Abbé Nicolas Louis de Lacaille in 1756 as “le Chevalet et la Palette” (“the easel and the palette”) but renamed it “Equuleus Pictorius” on his chart in 1763. This is not a reference to the IAU constellation Equuleus, which was created by Hipparchus (190 – 120 B.C.E.) and adopted by Ptolemy (c.100 – c.170): The word Equuleus (“little horse”) is a colloquial French term for an easel, which comes from the custom of an artist carrying his easel on a donkey. Lacaille’s *Planisphère des Étoiles Ausralea* (1756) labels this “Le Chevalet et la Palette” and depicts a tripod easel with a palette hung on it.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Chevalet et la Palette” as an easel and palette.

In 1803 German astronomer Johann Elert Bode called this constellation “Pluteum Pictoris” (“painter’s desk”) in his sky charts.

English astronomer Francis Baily (1774 – 1844) shortened the name to Pictor in 1845 on the recommendation of English astronomer John Herschel (1792 – 1871).

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation under the Latin name ”Pluteum Pictoris“ (“a painter’s shelf”).

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Cavalletto” (“easel”) in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation under the Latin name “Equuleus Pictorius” in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “Equuleus Pictorius the Painter’s Easel” as a tripod easel with a palette hanging on it.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as “Equus Pictoris”: He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Equuleus Pictorius” as a painter’s easel.

This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: It is not labeled but is depicted as an easel and a palette.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Pictor, The Painter’s Easel” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Pictor” and “Equuleus Pictoris” and describes it as a “Painter’s easel”.

The 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) lists “Pictor” and gives the “original form” as “Equuleus Pictoris”, describing it as “The Painter”.

Other French names for this constellation include “Chevalet du Peintre” (“painter’s easel”), and this translates in German as “Malerstaffelei”.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) slightly redesigns the lines of Pictor in his book *The Stars - A New Way to See Them* (1952). The standard IAU charts show the bent line of three stars Alpha (α) Pictoris, Gamma (γ) Pictoris, and Beta (β) Pictoris. Rey turns this into a triangle of these three stars. *Sky and Telescope Magazine*, founded in 1941, depicts Pictor in their magazine and publications in the same manner as standard IAU charts.

Pidgeon Perch:

This Tongan asterism "Tuula-lupe" is the Hyades cluster in the IAU constellation Taurus.

This Samoan asterism "Tūlālupe" is a row of stars in the IAU constellation Scorpius: Iota (ι) 1 Scorpii, Kappa (κ) Scorpii, Lambda (λ) Scorpii, and Upsilon (υ) Scorpii (Fitisemanu 2022).

Pig:

This Babylonian asterism from the MUL.APIN tablets "Sahu" or "MUL.SAH" is made up of the stars of the IAU constellations Sagitta and Vulpecula. This is a quadrilateral with the stars Alpha (α) Sagittae (Sham) and Beta (β) Sagittae in one corner and the other three corners being 13 Vulpeculae, 29 Vulpeculae, and QR Vulpeculae. This appears in later Seleucid sky lore. It may be related to the Egyptian asterism Reret (see Hippopotamus, above).

This Babylonian asterism "SHAH" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Delphinus.

This Sumerian asterism "mulšah" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism "Sahu", above.

This Akkadian asterism "dDa-mu" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism "Sahu", above.

This Kolam asterism "Turre" is made up of stars between the IAU constellations Hydra and Vela (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

"Svinjarka" or "Svinjaruša" is a Serbian name for Alpha (α) Canis Majoris (Sirius). It indicates that it is time to release the pigs to feed on pannage.

Pig Star:

This //Gana star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Slotegraaf 2013, Alcock 2014).

Piglets:

This ancient Celtic asterism is the Hyades and Pleaides clusters. The end of Edrinios (see Fire Month Guiding Star, above) is marked when the moon passes between these open clusters.

This asterism is the Hyades cluster as it appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus.

Pigs:

This Latin star "Sucula" or "Suculae" is the Hyades cluster in the IAU constellation Taurus as listed in Robert Hues' *A Learned Treatise of Globes* in 1659 and in R. H. Allen's *Star Names* in 1899. Allen attributes this to 1st century Roman writer Lucius Junius Moderatus Columella (4 – 70 C.E.) and that this was an asterism of the "Roman country people". German astronomer Johann Bayer (1572-1625) listed it as "Succidae".

Pig's Nose:

This Finnish asterism is the Pleiades cluster in the IAU constellation Taurus (Kuperjanov 2006).

Pi'ikea:

This Hawaiian star is Beta (β) Ceti (Diphda) in the IAU constellation Cetus.

Pike:

This **telescopic** asterism is in the IAU constellation Camelopardalis and is Ennis 40 on the observing list of Canadian astronomer Charles Ennis and resembles a medieval pike weapon. The "blade" is a wedge-shaped group of 8th magnitude stars including HIP 19503, 19340, 19135, 19008, and 18966, with some dimmer stars in the middle. The "staff" is the line of stars starting at HIP 20541 and running through HIP 20108, the double star HIP 19949, HIP 19172, and HIP 18795, ending at the eclipsing binary star HIP 18585. NOTE: The stars forming the "blade" are Corder 627 on Jeffrey Corder's list.

Pi'ilani:

This Hawaiian star is Gamma (γ) Pegasi (Algenib) in the IAU constellation Pegasus.

Pikachu:

This Filipino asterism is the IAU constellation Cetus (Margiza 2022). Pikachu is one of the characters in Pokémon. Pokémon (an abbreviation for Pocket Monsters) was a video game franchise created in 1996.

Pike:

This Latin asterism "Dolones" is made up of stars in the IAU constellations Auriga and Lynx:

- Dolones I: Psi (ψ) 1 Aurigae (46 Aurigae),
- Dolones II: Psi (ψ) 2 Aurigae (50 Aurigae),
- Dolones III: Psi (ψ) 3 Aurigae (52 Aurigae),
- Dolones IV: Psi (ψ) 4 Aurigae (55 Aurigae),
- Dolones V: Psi (ψ) 5 Aurigae (56 Aurigae),
- Dolones VI: Psi (ψ) 6 Aurigae (57 Aurigae),
- Dolones VII: Psi (ψ) 7 Aurigae (58 Aurigae),
- Dolones VIII: Psi (ψ) 8 Aurigae (60 Aurigae),
- Dolones IX: Psi (ψ) 9 Aurigae
- Dolones X: Psi (ψ) 10 Aurigae (16 Lyncis)

Compare this to the earlier Greek asterism Goads (see above).

Piktorion:

This Coptic asterism “Πικοτώριων” (“Pikotórion”) is the IAU constellation Pisces as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and R. H. Allen’s *Star Names* in 1899. Allen writes that “Brown translates [this as] ‘protection’ but claims for a Coptic asterism formed by Beta and Gamma Arietis”. This is probably English orientalist Robert Brown, Jr.

Pile:

This Quechua asterism “Qutu” is the Pleiades cluster in the IAU constellation Taurus (Urton 1981). A variation is “Collca Qutu” (“storehouse pile”). Compare this to the Aymara asterism “Qutu” (see Group, above).

Pile of Bricks:

This asterism is the IAU constellation Gemini. Several medieval charts depict the constellation this way, and R. H. Allen in his *Star Names* in 1899 suggests that this refers “to the building of the first city and the fratricidal brothers — the Romulus and Remus of Roman legend”. Boutet (2014) lists it as the “Brick Stack”.

Pile of Dead:

This Korean asterism “Jug-eun Jaui Deomi” (죽은 자의 더미) is the Beehive cluster (Messier 44, see Beehive, above) in the IAU constellation Cancer, which is located inside their asterism “Eye of Sky” (see above).

Pile of Firewood:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star Mu (μ) 1 Cancri in the IAU constellation Cancer.

This Chinese xing guan “Jīxīn” (积薪) is the star Kappa (κ) Geminorum in the IAU constellation Gemini.

This Chinese Chenzhuo xing guan “Jixin” is the star Chi (χ) Geminorum in the IAU constellation Gemini.

Pilgrim Star:

This star is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia as listed by R. H. Allen in his *Star Names* in 1899.

Pilgrims that have Gone to Church:

This Lithuanian asterism “Į bažnyčią einantys maldininkai” is made up of stars of the IAU constellations Andromeda, Gemini, and Perseus: Delta (δ) Andromedae, Beta (β) Andromedae (Almach), Alpha (α) Persei (Mirfak), Alpha (α) Geminorum (Castor), and Beta (β) Geminorum (Pollux).

Pilisha:

The Chinese phonetically translated of “Vrsabha” from the Vedic *Candragarbha-parivarta* in 566 (which is the IAU constellation Taurus) as “Pilisha” (Kotyk 2017).

Pilizhijia:

This Chinese phonetic translation of “Vrscika” from the Vedic *Candragarbha-parivarta* in 566 is the IAU constellation Scorpius (Kotyk 2017).

Pillar:

This Kiribati star “Boua” or “Na Boua” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Trussel and Groves 1978).

This Romanian star “Stâlpul” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Ottescu 2009).

Pillar of Heaven:

This Māori star “Poutu-te-rangi” or “Poutūterangi” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

This Micronesian star “Maanap” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

This Rapanui star “Te Pou o Te Rangi” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Edwards and Edwards 2016, Edwards et al, 2018). The Edwards translate this as “Post of the Sky”.

Pillar of Salt:

This Hawaiian star “Kia-pa'akai” is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Hokupa’a” (“Fixed Star”), “Noho-loa” ("Eternal"), “Kumau” ("Standing Perpendicularly"), “Kio-pa'a” or “Kio-pa” ("Fixed projection"), or “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe").

Pillar of Sky:

This Korean asterism “Haneul-ui Gidung” (하늘의 기둥) is a pattern of five stars in the IAU constellation Draco. This has two triangles of stars joined at the apex, which is star HIP 79867:

- One triangle joined to this star is formed by the stars 15 Draconis and HIP 80161, and
- One triangle joined to this star is formed by the stars HIP 78893 and 79414.

Pillar of the Cross:

This Arabic star “al-ʿamūd al-ṣalīb”, later latinized to “Al Salib” is Epsilon (ε) Delphini in the IAU constellation Delphinus.

Pillars (in Arsenal):

These are five triangular Chinese Chenzhuo “Zhù” xing guans within their xing guan Arsenal (see above) in the IAU constellations Centaurus and Lupus:

- One consists of the stars Iota (ι) Lupi, HIP 70104, and Tau (τ) 1 & 2 Lupi,
- One consists of the stars HIP 70054, 70300, and 69598,
- One consists of the stars 1, 2, and 3 Centauri,
- One consists of the stars HIP 68079 and Nu (ν) 1 & 2 Centauri, and
- One consists of the stars HIP 65936, 65535, and 65593.

Pillars (in Five Chariots):

These Chinese Chenzhuo xing guans are made up of stars in the IAU constellation Auriga:

- One is the triangle of stars 1 Aurigae, Omega (ω) Aurigae, and 2 Aurigae.

- One is the triangle of stars Nu (ν) Aurigae, Upsilon (υ) Aurigae, and Tau (τ) Aurigae.
- One is the triangle of stars HIP 25492, Chi (χ) Aurigae, and HIP 25291.

Pillars in Garage for Chariot:

"Jjeoncha Chagoui Gidung" 전차 차고의 기둥) is the name of three Korean asterisms in and around their asterism "Garage for Chariot" (see above) in the IAU constellation Auriga. All three are triangles:

- One is the stars Eta (η), Epsilon (ε), and Zeta (ζ) Aurigae,
- One is the stars Upsilon (υ), Tau (τ), and Nu (ν) Aurigae, and
- One is the stars 26 and Chi (χ) Aurigae and HIP 25492.

Pillars (in Horn Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is four sets of stars in the IAU constellations Centaurus and Lupus:

- One is the triangle of stars Upsilon (υ) 2 Centauri, Zeta (ζ) Centauri, HIP 67861 and 67663,
- One is the triangle of stars a Centauri, Psi (ψ) Centauri, and HIP 68493,
- One is the triangle of stars Iota (ι) Lupi, HIP 70104, and Tau (τ) 1 and 2 Lupi, and
- One is the triangle of stars Alpha (α) Lupi, Rho (ρ) Lupi, and HIP 70931.

"Zhù" (柱) is a set of five Chinese xing guans in and around the xing guan "Arsenal" (see above). Three of the four are lines of two stars, one is a triangle of stars, and one is a single star. These stars are in the IAU constellations Centaurus or Lupus:

- One is the single star Iota (ι) Centauri,
- One is the stars Psi (ψ) and a Centauri,
- One is the stars Upsilon (υ) 1 and 2 Centauri,
- One is the stars Iota (ι) and Tau (τ) 1 and 2 Lupi, and
- The triangle of stars is Kappa (κ), 1, and 4 Centauri.

Pillars (in Net Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty Zhù (柱) is a set of three Chinese xing guans in the IAU constellation Auriga:

- Pillar one is a triangle of stars: Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae,
- Pillar two is a triangle of stars: Tau (τ), Upsilon (υ), and Nu (ν) Aurigae, and
- Pillar three is a triangle of stars Chi (χ) and 26 Aurigae and HIP 26712.

Zhù (柱) is a set of three Chinese xing guans in the IAU constellation Auriga:

- Pillar one is a triangle of stars: Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae,
- Pillar two is another triangle of stars: Tau (τ), Upsilon (υ), and Nu (ν) Aurigae, and
- Pillar three is the two stars Chi (χ) and 26 Aurigae.

Pillars of Creation:

This **telescopic** asterism is in the nebula Messier 16 (NGC 6611, IC 4703, SH 2-49, RCW 165, LBN 67, Cr 375, Mel 198, Ced 159).in the IAU constellation Serpens. These are finger-like structures formed of cool hydrogen gas and dust. This name was given to this when the Hubble Imaging Team released their famous photo of the "Pillars of Creation". This is also known as the "Star Queen" or the "Star Queen and Her Throne".

Piminer:

This Palawa star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. This is a name from the 1831 journals of George Augustus Robinson, a missionary (Hamacher 2011).

Pin of Tucana:

This **telescopic** asterism "Cnódax Túcanae" is the edge-on galaxy IC 5176 in the IAU constellation Tucana. It was discovered by DeLisle Stewart in 1908. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the thin and sharp shape of this edge-on galaxy".

Pincers:

This Netwar asterism **"**Kou" ("pinchers (or tweezers) for taking hot stones out of the fire") is the Hyades cluster in the IAU constellation Taurus (Ramik 2019).

This Nahwal (Tanna) asterism "Kuhwa" (Ramik 2019) is identical to the Netwar asterism "Kou" (above).

This **telescopic** asterism is part of NGC 2736, which is a part of the Vela Supernova Remnant in the IAU constellation Vela. It was recorded by English astronomer John Herschel in 1835 and listed it as h 3145. It is GC 1745 in the *General Catalogue* of 1864. It is next to the "Pencil Nebula" (see above), also known as Herschel's Ray (see above).

Pincoya:

This **telescopic** Chilean star is HIP 88414 (HD 164604) in the IAU constellation Sagittarius (magnitude 6.82). It was given this name in the IAU NameExoWorlds campaign. Pincoya is a female water spirit who brings drowned sailors to the Calueche so that they can live in the afterlife. It has an exoplanet named Calueche, which is a large ghost ship that sails the seas at night.

Pincushion:

There are three **telescopic** "pincushion" asterisms:

- One is the open cluster NGC 6134 in the IAU constellation Norma and is known as the Little Pincushion. This was discovered by Scottish astronomer James Dunlop in 1827. It is GC 4187 in the *General Catalogue* of 1864. This round asterism has a line of stars resembling a pin on one side.
- One is the open cluster NGC 3532 (Caldwell 91) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. English astronomer William Herschel thought it to be one of the finest star clusters he'd seen. It is also known as the Wishing Well Cluster, the Fish Cluster, the Football Cluster, the Black Arrow Cluster, and the Firefly Party. It is located between the constellation Crux and the False Cross asterism (see False Cross, above).
- One is globular cluster NGC 6934 (Caldwell 47) in the IAU constellation Delphinus. It was discovered by English astronomer William Herschel in 1785 who listed it as "I 103". It is GC 4585 and 4586 in the *General Catalogue* of 1864. American astronomer Scott Hogsten (1998) described it as a pin cushion at 150X.

Pine Tree:

This **telescopic** asterism is in the IAU constellation Andromeda and is Corder 276 on the observing list of American astronomer Jeffrey Corder. Size 30'. This includes HIP 8108, 7899, and 8034.

Pineapple:

This **telescopic** asterism is Hay-Merting 12 in the IAU constellation Cygnus. Robert Zebahl lists it on his *Faint Fuzzies* website. Its size is 40' X 25'. Zebahl notes that "the base of the pineapple is located just east of 11 Cygni, two 8th magnitude stars a good 50 arcminutes east of 11 Cygni are the spiky leaf tips at the top. The location halfway between 4 and 15 Cygni is easy to find with the naked eye." One of those two stars forming the "spiky leaf tips" is HIP 96670.

Pineapple Egret:

This Barasana asterism "Sena Yehe" is stars in the IAU constellation Lacerta (Hugh-Jones 2006).

Pineterrinner:

This Palawa star is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Gantevoort et al 2016).

Pink Pillow Nebula:

See Jewel Bug Nebula (above).

Pink Planetary:

This **telescopic** asterism is planetary nebula IC 418 in the IAU constellation Lepus. It is called this as its intricate pattern resembles one made by a spirograph. Its central star is HD 35914. American astronomer Edward Charles Pickering (1846 – 1919) first recorded it. American astronomer Barbara Wilson (1999) calls it the Pink Planetary. It is also known as the Raspberry Nebula, the Spirograph Nebula, and the Colored Contacts Nebula.

Pinwheel:

This Okinawan asterism "kajimayaabusi" (カジマヤーブシ) is the Little Dipper asterism in the IAU constellation Ursa Minor. This is from the earlier 風回りや or kaze mawar-i-ya (wind turn-NMLZ-thing|'pinwheel'). In Okinawa, pinwheels are traditionally made from the leaves of the pandanus tree.

There are two **telescopic** pinwheel asterisms:

- One is the open cluster Messier 33 (NGC 598) in the IAU constellation Auriga. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654. William Herschel listed it as "V 17" in his catalogue, and it is GC 352 in the *General Catalogue* of 1864.
- One is Messier 101 (NGC 5457), a face-on spiral galaxy in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781. It was Irish astronomer Lord Rosse who first made extensive note of its spiral structure using his 72" Newtonian reflector in the second half of the 19th century. The 1864 *General Catalogue* lists this as GC 3770 and John Herschel's catalogue as h 1744.

Pioriori:

This Māori asterism is the Large Magellanic Cloud (Orchiston 2017).

Pious Woman:

This Arabic star is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and as listed by R. H. Allen in his *Star Names* in 1899. It is part of his asterism Seven Anchorites (see below).

Pipe Nebula:

This **telescopic** asterism is dark nebula consists of Barnard 59, 65 – 67 and 78 in the IAU constellation Ophiuchus. The "pipe stem" consists of Barnard 59, 65, 66 and 67 and the "pipe bowl" is Barnard 78.

Piper:

This "Persian" asterism "Ternevelles Sandes", "Zurnai", or "Zernai Zan" is the IAU constellation Hercules as listed by Edward Sherburne in his *Sphere of Marcus Manlius* in 1675. Sherburne attributes this to the Persian astronomer "Ulugh Beigh" (Ulugh Beg Mirza (1394 – 1449)).

Pipiri and Rehua:

This Tahitian asterism "Pipiri Ma" is two stars in the IAU constellation Scorpius.

- In one version of the story, it is the stars Lambda (λ) Scorpii (Shaula) and Upsilon (υ) Scorpii (Lesath).
- In another it is the stars Mu (μ) 1 and 2 Scorpii. These are a brother and sister who flee into the sky and become stars. Their parents call them "Pipiri ma" as they chase them into the sky. Pipirima is the star Mu (μ) 2 Scorpii in the IAU constellation Scorpius. The IAU approved the name Pipirima for the star Mu (μ) 2 Scorpii A.
- In another version (Edwards 2015) it is Zeta (ζ) 1 and 2 Scorpii and Theta (θ) Scorpii.

This Cook Islands asterism is the stars Omega (ω) 1 and 2 Scorpii.

NOTE: Pipiri means "deprived". Compare to the Māori and Polynesian asterism Pipiri (see Deprived, above).

Pipirima:

See Pipiri and Rehua, above.

Pipoltr:

This **telescopic** Triesenberg star is TrES-3 in the IAU constellation Hercules (magnitude 12.4). It was given this name in the IAU NameExoWorlds campaign. It is a type of butterfly. It has an exoplanet named Umbäässa, which is a very small ant.

Piranha:

This Kobeua asterism is the IAU constellation Boötes. The star Alpha (α) Boötis (Arcturus) is the "tail".

Pirate Bird:

See Frigate Bird, above.

Pirate Moon:

This **telescopic** asterism is the open cluster NGC 1647 in the IAU constellation Taurus. It was discovered by William Herschel in 1784 who listed it as "VIII 8" in his catalogue. It is GC 896 in the *General*

Catalogue of 1864. It is O'Meara 25 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the Crow's Nest (see above).

Pirate's Hook:

This **telescopic** asterism is Ennis 18 from the observing list of Canadian astronomer Charles Ennis and is found in the IAU constellation Andromeda. The "hook" is a curve stars starting at Gaia DR3 1922416336511782168, Gaia DR3 1922419497609055360, SAO 53338, Gaia DR3 1922411182550814208, HIP 117080, and SAO 53334 to Gaia DR3 1922362426083652736. From this last star the "glove" is the four stars HIP 117190, HD 223112, SAO 53348 and SAO 53335.

Pirate's Jewels Cluster:

This **telescopic** asterism is the open cluster NGC 2362 (Caldwell 64), discovered by Italian astronomer Giovanni Battista Hodierna in 1654 in the IAU constellation Canis Major. English astronomer William Herschel listed it as "VII 17. It is GC 1513 in the *General Catalogue* of 1864. It is also known as the Mexican Jumping Star Cluster.

Pisces:

The brightest star in Pisces is 2nd magnitude, and the stars of Pisces appear in 224 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Psc) became one of Ptolemy's 48 original constellations in the 2nd century. It is associated to the Greek myths of Aphrodite and her son Eros being assisted in an escape by two fishes. It appears in Ptolemy's *Almagest* as "᾽Ιχθύες" or "᾽Ichthýes" (see Fishes, above). Cicero (106 – 43 B.C.E.) called the lines connecting the "fishes" "Vincla" ("the bonds").

The 16th nome (district) of the Old Kingdom (3100 B.C.E.) "ḫ3t-mḥ̓t" is named for their fish Goddess Hatmehit and related to this constellation and may have influenced this later constellation (Berio 2014).

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Pisces as a pair of fishes, each facing in opposite directions (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as two fishes connected with a ribbon as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts the northernmost "fish" of this constellation overlapping Andromeda.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts the two fishes of Pisces descending from the front hooves of Aries instead of joined behind Cetus: This goes back to an early iconographical tradition derived from the Catasterismes of Eratosthenes.

The globe of the 2nd century Farnese Atlas depicts "Pisces" (Stevenson 1921).

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists the two fishes

separately as “borius id est aquilonalis” (“Borius is the northern one”) and “notius qui australis” (“better known as the southern one”).

Pisces appears in the Leiden *Aratea* (816) as two fishes connected by a winding line of stars (Katzenstein & Savage-Smith, 1988).

This constellation is depicted in editions of the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) this is depicted as two fish, swimming in opposite directions with their mouths connected by a line,
- In the Paris BN n.a. 1614 edition these fish are perpendicular,
- In the Cologne 83 II edition the fish are swimming in opposite directions with a line which connects the fishes’ tails,
- In the Vat Red lat 1324 edition the line connecting the fish is missing,
- In the Munich 560 edition the line is also missing, and the fish are facing in opposite directions.

The 9th century Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict the fishes as swimming in the same direction, connected by a 3-shaped stream.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Pisces as two fishes whose tails are connected by a ribbon with a bend in it. One page shows the southern fish on our right, and the other shows the southern fish on our left. Both fish are drawn as if viewed from above, not the side.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa’id al-Wazzan and his son Mohammad, depicts Pisces as two fishes whose tails are connected by a ribbon.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Pisces as a pair of fishes whose tails are connected by a ribbon. The ribbon is off the edge of the circular chart, so we cannot say if it has a bend or knot.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) lists Pisces.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Pisces as two fishes whose tails are connected by a ribbon with no knot.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form “PISC” (Dekker 2007).

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Pisces as two fish with no connecting line or ribbon.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Pisces as a pair of fish whose tails are connected with a ribbon.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Pisces as two fishes whose tails are connected with a ribbon with a knot in the middle.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts “Pisces” as two fishes whose tails are connected by a ribbon with a knot in the middle.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Pisces as two fishes whose tails are connected by a cord with a loop in the middle. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Pisces as two fishes. The one on the left is facing upwards, and the one on the right is facing downwards. Their *mouths* are connected by a rope or cord with no knots. Elsewhere they are depicted individually, with no connection indicated.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts Pisces as two fishes, the one on top facing to the left, and the one below facing to the right. Their *mouths* are connected by a rope or cord with no knots.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts only the northern fish of Pisces, the rest of the constellation being off the edge of the vault.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Pisces" as two fish connected by a line between their mouths: This is unusual, as most of the depictions listed below have them connected by a cord or ribbon that is fastened around their tails.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Pisces in the same manner as *De Astronomica*, with the fishes connected with a line between their mouths.

Pisces appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549). Only the southern fish is shown with a ribbon connecting its tail: The northern fish is outside of this projection. It is labelled with the astrological sign for Pisces.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Pisces" as two fishes connected by a band with a knot.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Pisces as a pair of fishes whose tails are connected by a ribbon. There are no knots or loops in the ribbon and this constellation is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts it in a similar fashion, but the ribbon has two sharp bends in it.

The 1515 edition of the *Almagest* listed "Echiguen".

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Pisces as two fish whose tails are connected by a ribbon with a loop in the middle.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Pisces" as two fishes whose tails are connected with a ribbon with a loop in the middle.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "de I Pesci". The

charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The 1521 edition of the *Alfonsine Tables* listed the name “Pesces”.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Pisces in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Pisces” as two fish whose tails are connected by a knotted ribbon.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Fishes”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Pisces as two fish whose tails are connected by a ribbon with a loop in it.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Pisces in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Pisces as two fish connected by a ribbon and labels it with the astrological symbol for Pisces.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Pisces: as two fishes whose tails are connected by a ribbon with no knots.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “les Poissons” as two fishes whose tails are connected by a knotted ribbon.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Pisces as two fish whose tails are connected by a looped ribbon.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Pisces” as two fishes connected by a ribbon with a knot in the middle.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Pisces” as two fishes connected by a cord with no knots.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Pisces” as two fishes connected with a ribbon.

Pisces is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts Pisces as two fishes connected with a cord in his *Uranometria* in 1603. Bayer lists the following names for this constellation: “Pisces, Piscis, Elhautine, Ichiguen, Gemellus, Proles Dercia, Derce, Derceto, Dercetis, Phacetis, Dea Syria, Veneris mater, Venus and Cupido, Germa, Haut, Elhaut”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Pisces” as two fish connected with a ribbon.

"Pisces" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as two fish connected with a ribbon. Bartsch also lists the local name "die Fische".

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Pisces" for this constellation.

"Pisces" is listed in the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as two fish connected with a ribbon.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Pisces" as two fishes whose tails are connected by a ribbon with a bend in it. The northern fish has its head concealed behind the left shoulder of Andromeda.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Pisces as two fish whose tails are connected by a ribbon that has a knot in the middle.

Pisces is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as two fish connected with a ribbon. The northern fish is labelled "Piscis Alsemeha" and the southern fish "Piscis le quens", with the northern ribbon labelled "Linum Aust" and the other "Linum Sept."

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Pisces as two fishes connected with a red ribbon.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Pisces" as two fishes connected by a ribbon.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Pisces" as two fishes connected by a ribbon.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts these as two fish, their tails connected by a ribbon which is knotted into a loop at the middle. Hevelius took Thomas Hood's name for the cord between the fishes (Linus Piscium- see Line of Fish, above) and broke this constellation down into four subdivisions in his *Firmamentum Sobiescianum*:

- Piscis Boreas (see North Fish, above),
- Linum Boreum (see North Cord, above),
- Linum Austrinum (see South Cord, below), and
- Piscis Austrinus (see South Fish, below).

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Les Poissons", "Pisces", and "᾽Ιχθύες" ("fishes") and depicts it as two fish whose tails are connected by a winding ribbon with no knots.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Pisces hoc Cingula coligati" ("This fish is tied to the belt") and depicts two fish connected with a ribbon.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Pisces as two fish connected with a cord.

Pisces is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as two fish connected with a ribbon.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Pisces".

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Pisces" as two fish connected with a ribbon of stars.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Pisces as a pair of fish whose tails are connected with a ribbon with a knot in the middle.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Les Poissons" as two fishes connected with a ribbon.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Pisces" as two fishes connected with a ribbon.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Les Poissons" ("the fishes") as two fishes connected with a ribbon, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "die Fische" as does his *Vorstellung Der Gestirne* (1782): The northern fish is labelled "Nordlicher Fisch" and the southern fish "Sūdliche Fisch" on his charts. This is depicted as two fish connected with a ribbon with a knot in the middle.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Pesci" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Pisces" as two fishes connected with a ribbon. NOTE: Elwe also labels Piscis Austrinus with the name "Pisces".

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Pisces" as two fishes connected with a ribbon.

American uranographer William Croswell (1760 – 1834) depicts Pisces on his *Mercator Map of the Starry Heavens* in 1810 as two fishes connected with a ribbon.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Fische" and also uses this name in the various editions of his *Jahrbuch*.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation "Pisces" in his *Celestial Atlas* in 1822: It is depicted as two fish connected by a ribbon. Jamieson lists the northern "fish" as

"Pisces Borealis" on one chart and "Piscis Borealis Zodiaci" on another chart and the southern "fish" as "Piscis Australis Zodiaci". On Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) they are depicted the same way, and it is simply labeled "Pisces".

"Pisces" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and is depicted as two fish joined with a ribbon with a knot in the middle.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Echiguen" as one of the names from the "Arabo-latin Almagest".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Pisces" as two fished connected by a ribbon.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Pisces" as two fishes connected with a ribbon.

"Pisces" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as two fish connected by a ribbon.

Pisces is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. It is depicted as two fish connected by a ribbon.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) labels this constellation the "Fishes" on its chart but as "Pisces, the fishes" in the text and describes it as "two fishes tied together with a long ribbon".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Pisces, The Fishes" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Pisces, the Fishes".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Pisces" in his *Star Atlas* (1893) and describes it as "The Fish".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Pisces" and describes it as the "Fishes".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Pisces".

Standard IAU charts depict Pisces this way:

- One "fish" is the triangle of stars Phi (ϕ), Upsilon (υ), and Sigma (σ) Piscium,
- One "fish" is the pentagon of the stars Iota (ι), Theta (θ), Gamma (γ), Kappa (κ), and Lambda (λ) Piscium,
- These two "fish" are connected by lines of stars converging on a "knot" at the star Alpha (α) Piscium (Alrescha).

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Pisces in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in the same manner as the IAU except the northern "fish" is a diamond of the stars Chi (χ), Phi (ϕ), Upsilon (υ), Tau (τ), and 68 Piscium.

The French call it "Poissons", the Normans "Peisun", the Saxons "Fixas".

Pisces El-wirea:

This American asterism is made up of stars of the IAU constellation Pisces and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). The "northern fish" of the constellation has become a fish-shaped balloon on a tether attached to a "bicycle" which is made up of the rest of the constellation.

Piscis Austrinus:

The brightest star in Piscis Austrinus is the 1st magnitude Alpha (α) Piscis Austrini (Fomalhaut) which is the 18th brightest star in the sky, but the rest of its stars are 4th magnitude. The stars of this constellation appear in 105 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation PsA), the southern fish, originated in the Babylonian asterism "Nunu" (see Fish, above) and first appeared in Greek star lists around 500 B.C.E. It became one of Ptolemy's 48 original constellations in the 2nd century. Greek names for it included "Ἰχθύς" ("Ichthýs" or "fish"), "Ἰχθύς νότιος" ("Ichthýs nótios" or "southern fish"), "Ἰχθύς μέγας" ("Ichthýs mégas" or "great fish") and "Ἰχθύς μονάζων" ("Ichthýs monázon"). It was originally known as "Piscis Notus" ("known fish") or "Piscis Notius" ("fish better known") according to Aratus in the 3rd century B.C.E. Ptolemy (c.100 – c.170) listed it as "Νότιος ’Ιχθύς" ("Nótios ’Ichthýs"- see Southern Fish, below) in his *Almagest*.

One Latin name for it is "Piscis Capricorni", which relates to its position. Johann Bayer's *Uranometria* (1603) lists "Piscis Capricorni".

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a fish swimming to the right, as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

This constellation appears as "Piscis" in editions of the 8th century *Revised Aratus Latinus*:

- Piscis is depicted as an upside-down fish except for the Vat Reg lat 1324, Cologne 83 II, and Munich 560 manuscripts,
- In the Dresden DC 183, Gottwieg 7 (146), Paris BN 12597 and St. Gall 902 editions the fish's mouth is gaping.

Piscis Austrinus appears in the Leiden Aratea (816) as a single fish (Katzenstein & Savage-Smith, 1988).

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Piscis Austrinus as a fish in right profile.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Piscis Austris", "Piscis Australis", and "Piscis Aquilonius" for this constellation. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Piscis Austrinus upside down.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Piscis Austrinus as a fish swimming to our right swallowing the water poured by Aquarius.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) lists Piscis Austrinus.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts "Piscis Notus" as a fish swallowing the water poured by Aquarius.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Piscis Austrinus as a fish swimming to our left.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Piscis Meridionalis" as a fish that appears to be trying to bite its own tail.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Piscis Austrinus as a fish that appears to be trying to bite its own tail. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Piscis Austrinus as a fish swallowing the water poured by Aquarius. It is not labelled and is partially concealed as it is at the edge of the astrolabe.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Piscis" as a fish.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Piscis Austrinus as an upside-down fish swimming to our left. The former gives it the label "Piscis Magnus".

"Piscis Notius" appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a fish facing to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Piscis Meridionalis" as a fish with its head turned towards its tail.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Piscis Austrinus as a fish swallowing the water poured by Aquarius. It is not labelled and is facing to our right. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts the same thing, except it is facing to our left.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel labels this constellation "Piscis Notus" and depicts it as a circling fish with teeth.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts "Piscis Notius" as a circling fish with teeth.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Piscis" as a fish swimming in a tight circle.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Piscis Austrinus" as a fish swimming to our right onto which Aquarius is pouring water.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and labels this constellation “Piscius Notius” and depicts in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Piscis notius” as a fish with an open mouth at the end of the water being poured by Aquarius.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del pesce Australe”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Southern Fish”.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Piscis Notius” as a fish swallowing the water being poured by Aquarius.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Piscis Austrinus as a circling fish.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Piscis Austrinus, sive Notius” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Piscis Austrinus, siue notius” as a fish swimming to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Piscis Notius” as a fish swimming to our left.

In 1597 Flemish astronomer Petrus Plancius took some stars from Piscis Austrinus’ tail to create the constellation Grus (see Grus above).

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Piscis Notius” as a fish.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Poisson Australe” as a fish swimming to our left.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this constellation as “Piscis Notius” and depicts it as a fish swallowing the water poured by Aquarius. Gores of Hondius’ earlier 1598 globe list it as “Piscis Notius vel Meridionalis”.

German astronomer and uranographer Johann Bayer (1572-1625) depicts this in his *Uranometria* in 1603 as a coiled fish with teeth. Bayer lists these names for this constellation: “Piscis Notius, Piscis Meridianus, Piscis Austrinus, Piscis Capricorni, Piscis Magnus, Piscis Solitarius”.

Piscis Austrinus is omitted from Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Piscis Austrinus” as a fish swallowing the water poured by Aquarius and gives the alternate name “Piscis Notius”.

Piscis Austrinus is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Piscis Notius” and depicted as a fish swallowing the water poured by Aquarius.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Piscis Notius” for this constellation.

“Piscis Notius” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a fish swallowing the water poured by Aquarius.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Piscis Aust” as a fish swallowing the water poured by Aquarius.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) lists this constellation as “Piscis Notius” and depicts it as a fish with teeth.

Piscis Austrinus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted as a fish on his southern star chart of 1678.

English uranographer John Seller’s *A coelestiall planisphere* (1678) labels this with the abbreviated “Piscis Aust” and the creature depicted swallowing the water poured by Aquarius looks more like a seal than a fish.

Johannes Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts “Piscis Austrinus” as a fish swallowing the water being poured by Aquarius. This is a roughly “U” shaped line running from Alpha (α) Piscis Austrini (Fomalhaut) through Epsilon (ε), Eta (η), Theta (θ), Tau (τ), and Beta (β) Piscis Austrini to Delta (δ) Piscis Austrini. Hevelius’ *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Piscis Notius” as a fish swallowing the water poured by Aquarius.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Poisson Meridia”, “Pisces Notius”, and “Ἰχθύς νότιος”, depicting it as a fish swallowing the water poured by Aquarius.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation “Piscis Australis al Notius Aquarii fusuram imbibens” (“Piscis Australis al Notius Aquarius imbibing the melting”) and depicts it as a fish drinking the water poured by Aquarius.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, labels this “Piscis Notius” and depicts it as a fish at the end of the water flowing from the urn of Aquarius, which is labeled “Fusura Aquarii” (“the casting of Aquarius”).

Piscis Austrinus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Piscis Austrinus as a fish swimming to our right swallowing the water poured by Aquarius above.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Piscis Notius” as a fish swallowing the water poured out by Aquarius on one chart, and on another chart labels this “Piscis Austrinus”.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Piscis Austrinus as a fish.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Piscis Austrinus as a coiled serpent swallowing the water poured by Aquarius.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Poisson Austral” as a fish with teeth and one coil.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “le Poisson Austral” as a fish.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Piscis Aust” as a fish swimming to our right, swallowing water poured out by Aquarius.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this “le Poisson Austral” as does the 1778 edition. It is depicted as a fish swallowing the water poured out by Aquarius.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Der Sūdliche Fisch” and depicts it as a fish facing to our left swallowing the water poured by Aquarius.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Pesce Austale” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer labels this constellation “Pisces” and uses the same name for the constellation Pisces in the northern hemisphere. The chart depicts this as a fish swallowing water poured by Aquarius.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Piscis Aust” as a fish swimming to our right swallowing the water poured by Aquarius.

Piscis Austrinus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Zuidlyke Visch” (“Southern Fish”): It is depicted as a fish swallowing the water poured by Aquarius.

American uranographer William Croswell (1760 – 1834) depicts “Piscis Notius the Southern Fish” on his *Mercator Map of the Starry Heavens* in 1810 as a fish.

“Piscis Austrinus” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a long fish with a loop: It is swallowing the water poured by Aquarius.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Sūdlicher Fisch”.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation as “Piscis Australis” in his *Celestial Atlas* in 1822.

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Piscis Notius, Piscis Magnus, Piscis Australis, and Piscis Austrinus”. American astronomer Robert Burnham lists it as “Pisces Austrinus” in his *Burnham’s Celestial Handbook* in 1978.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Piscis Aust” as a fish swimming to our right swallowing water poured by Aquarius.

“Piscis Austrinus” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a fish swallowing the water poured by Aquarius.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its chart as “Southern Fish”.

English astronomer Richard Anthony Proctor lists this constellation as “Piscis, the Southern Fish” in 1873 as Proctor believed that shortening the name would make more room on astronomical charts. “Piscis” is listed in Proctor’s *A New Star Atlas* (1887) as an official constellation “recognized in the catalogue of the British Association” instead of Piscis Austrinus.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Piscis Australis, the Southern Fish”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Piscis Austrinus” in his *Star Atlas* (1893) and describes it as “The Southern Fish”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Piscis Australis” and describes it as the “Southern fish”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Piscis Australis… the Southern Fish”.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Piscis Austrinus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart depicts a curving line of stars running from Alpha (α) Piscis Austrini (Fomalhaut) through Epsilon (ε), Eta (η), Theta (θ), Tau (τ), and Beta (β) Piscis Austrini to Delta (δ) Piscis Austrini. Rey depicts this constellation like this:

- The “body” of the fish is the loop of stars Fomalhaut, Epsilon (ε), Tau (τ), Mu (μ), Beta (β), Gamma (γ), and Delta (δ) Piscis Austrini.
- The “tail” is the triangle of stars Mu (μ), Theta (θ), and Iota (ι) Piscis Austrini.

Sky and Telescope Magazine, founded in 1941, depicts Piscis Austrinus in their magazine and publications in the same manner as Reyersbach.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Piscis Austrinus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as an open diamond shape starting at the star Delta (δ) Piscis Austrini and running through Alpha (α) Piscis Austrini (Fomalhaut), Epsilon (ε) Piscis Austrini, Iota (ι) Piscis Austrini, Mu (μ) Piscis Austrini, and Beta (β) Piscis Austrini to Gamma (γ) Piscis Austrini.

In earlier star charts it appeared as “Piscis Australis” or “Piscis Meridionalis”, to the Italians it was “Pesce Australe”, to the French “Poisson Austral” and to the Germans “Südliche Fisch”.

Pistil of Cetus:

This **telescopic** asterism “Pistíllus Céti” is the barred spiral galaxy NGC 600 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as “III 432”. It became GC 354 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as its bar resembles the pistil of a flower.

Pistol Nebula:

This **telescopic** asterism is a nebula in the Quintuplet Cluster in the IAU constellation Sagittarius and contains the Pistol Star (see below).

Pistol Star:

This **telescopic** asterism is a hypergiant star which is part of the Quintuplet Cluster in the Galactic Center region in the IAU constellation Sagittarius. It has this name as it is the principal star in the Pistol Nebula (see above). It is one of the most luminous stars known.

Pit:

In the early 17th century German astronomer and uranographer Johann Bayer (1572-1625) proposed the name “Fovea” (“the pit”) for the IAU constellation Canis Minor.

Pit at the Elbow of al-Thurayyā:

This Arabic star “al-ma’bid”, later latinized to “Al Mabid”, which means “pit at the elbow” or “pit of the elbow” is Sigma (σ) Persei in the IAU constellation Perseus and is part of their asterism Al Thurayya (see Little Abundant One, above). Compare this with al-Mirfaq uth-Thurayyā (see Elbow, above).

Pitcher:

This German asterism “Pitcher” or “Water Jug at Cana” is the IAU constellation Delphinus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. Edward Sherburne lists it as “the Pitcher of the Canaanitish Woman” in his *Sphere of Marcus Manilius* in 1675. It later appears in John Hill’s *Urania* in 1754 as “Pitcher”.

Pitchfork Galaxy:

This **telescopic** asterism is NGC 4197 in the IAU constellation Virgo. This name is posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in April 2017. It has this name because this edge-on galaxy has an apparent “split” at one end.

Pitja:

This Carib asterism “Pitjayuman” or “Pitja” represents a bird in the Crotophaginae family. Its present location is unknown (Magaña, and Jara, 1982).

Piton Hammer:

This telescopic asterism is in the IAU constellation Antlia and is Ennis 74 on the observing list of Canadian astronomer Charles Ennis. Size 25' X 10'. The "hammer head" is a wedge of four 9th – 10th magnitude stars including the double star HIP 50795, HD 89985, SAO 201326, and Gaia DR3 5448633792752669824. This is the group Corder 2004 on Jeffrey Corder's list. The "handle: is the stars SAO 201319, Gaia DR3 5448617939619782912, Gaia DR3 5448571704705534848, and Gaia DR3 5448616819042003072. NOTE: A piton hammer is one of a rock climber's principal tools, used for driving in pitons as anchors for the rope system.

Pivot of the Mill:

This Arabic asterism is the IAU constellation Ursa Minor as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283) and is described as "twelve stars; seven of which lie within and five without the figure" (Dorn 1829).

Pivot of the Planets:

This Northern Indian star "Grahadhāra" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899.

Pivot of the World:

This Finnish star "Maailmantappi" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Pivot Star:

This German star "Angel Stern" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed by German astronomer Johann Bayer (1572-1625). He called it this as it was "fixed" in the sky.

Plain Oath Taker:

This Arabic star "al Suhail al Muḥlīf" is Gamma (γ) Velorum in the IAU constellation Vela. The words "al Muhlif" ("the oath-taker") and "al Suhail" ("the plain") have been combined here.

Place for Five Emperors:

This Korean asterism "Daseos Myeong-ui Hwangjeleul Wihan Jangso" (다섯 명의 황제를 위한 장소) in the IAU constellation Draco has a central star, HIP 92056, with four lines running out from it:

- One goes to the star Chi (χ) Draconis,
- One goes to the star Upsilon (υ) Draconis,
- One goes to the star Tau (τ) Draconis, and
- One goes to the star 50 Draconis.

Place Whence Wind Comes:

This Māori asterism "Naha" is the Coal Sack Nebula (see Coal Sack Nebula, above).

Placid Water:

This American star "Miaplacidus" is Beta (β) Carinae in the IAU constellation Carina. Its name was created by American astronomer Elijah Burritt (1794 – 1838) by combining the Arabic word "miyāh"

(مياه) meaning “waters” and the Latin word “placidus” (“placid”), appearing in his *Geography of the Heavens*. It was star names expert William Higgins that figured out the etymology. The IAU approved the name Miaplacidus for Beta (β) Carinae.

Planet Krypton Nebula:

See Blue Racquetball, above.

Plaskett’s Star:

This **telescopic** double, variable star is HIP 31646 (HD 47129) in the IAU constellation Monoceros (magnitude 6.06). This spectroscopic binary was named for Canadian astronomer John Stanley Plaskett, who discovered it in 1922 with the assistance of his son Harry Hemley Plaskett. This is one of the most massive binary stars known. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns calls it “Plaskett’s Monster Double”. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as “Plaskett’s Star”.

Platais’ Oddball:

This **telescopic** asterism is the open cluster NGC 6791 in the IAU constellation Lyra. It was discovered by German astronomer Friedrich August Theodor Winnecke in December 1853. It is named for Latvian astrophysicist Imants Platais, who used the Hubble Space Telescope to discover that it had three different age groups of stars, which is unusual, as open clusters typically have all their stars in the same age group. Diameter 8.2’.

Plates:

This Greek asterism “Pinacion” is the IAU constellation Corona Borealis as listed in John Hill’s *Urania* in 1754. HIll defines it with the Latin term “Discus”.

Playa Virgo:

This American asterism is a line of stars in the IAU constellation Virgo and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It starts at 109 Virginis and runs through Tau (τ), Zeta (ζ) and Delta (δ) Virginis to Epsilon (ε) Virginis.

Player:

This Arabic asterism “al-raqis” (الرقيس) is the IAU constellation Hercules.

Players:

This Latin asterism “Ludentes” is a group of stars in the IAU constellation Ursa Minor: Alpha (α) Ursae Minoris (Polaris), Beta (β) Ursae Minoris (Kochab), Gamma (γ) 1 and 2 Ursae Minoris, Delta (δ) Ursae Minoris, and Epsilon (ε) Ursae Minoris. This is listed in the 11th century De signis caeli and Scholia Strozziana (Santoni 2017). Compare this to Dancers, above.

Players on Lutes:

This Arabic asterism is the stars Beta (β) Draconis (Rastaban), Gamma (γ) Draconis, Xi (ξ) Draconis, and Nu (ν) Draconis in the IAU constellation Draco as depicted on a globe made by Mohammed ben Helal in

1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al'awad, the lute player".

Pleiades:

This open cluster, Messier 45, is located in the IAU constellation Taurus and is one of the closest open clusters to Earth. It is recognized as seasonal harbingers by cultures the world over. The principal stars of this cluster are Eta (η) Tauri (Alcyone), 21 Tauri (Asterope), 27 Tauri (Atlas), 16 Tauri (Celaeno), 17 Tauri (Electra), 20 Tauri (Maia), 23 Tauri (Merope), 28 Tauri (Pleione), 22 Tauri (Sterope II), and 19 Tauri (Taygeta). They are a prominent feature in Northern Hemisphere skies and can be seen out to mid Southern latitudes. NOTE: The Greek poet Theocritus (300 – c.260 B.C.E.) gave the seven sisters the names Coccymo, Plancia, Protis, Parthemia, Lampatho, Stonychia, and Maia.

The earliest known depiction of the Pleiades is possibly a Northern German Bronze Age artifact known as the Nebra sky disk, which dates to 1600 B.C.E. The Pleiades are the daughters of Atlas in Greek mythology. The Pleiades appear in Homer's *Iliad and Odyssey* (8th century B.C.E.) and in Hesiod's poem *Works and Days* (late 8th century B.C.E.) as "Πλειάς" ("Pleiás") and Eratosthenes (d.194 B.C.E.) also called them this. This is believed to be derived from the Greek "pleio", meaning "to sail": The rising of the Pleiades was a sign of the opening of the sailing season to Mediterranean sailors (Laouli 2006). Aratus mentioned them in his poem *Phaenomena* (270 B.C.E.) as "Πληϊάδης" ("Pliïádis"). Hipparchus (190 – 120 B.C.E.) called them "Πλειάς" ("Pleiás", later latinized to "Plias") and "Πλειάδες" ("Pleiádes"), which lead to the current name and the variant "Pliades".

The Pleiades are mentioned in the *Quran* and three times in the *Bible*.

9th century Benedictine monk Rabanus Maurus listed "Plyades".

The Pleiades have a page to themselves in the Leiden *Aratea* (816), which depicts the faces of seven women (Katzenstein & Savage-Smith, 1988).

In the 8th century *Revised Aratus Latinus* (Dresden DC 183, Paris BN 12957, Prague IX. C. 6, Vat Reg lat 1324) they are depicted as seven veiled women set in circular frames.

The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") lists "Pliades". The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict each star as a head in a roundel.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r labels a group of five stars above the back of Taurus "Pliadis".

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts the Pleiades as seven women in two rows. The upper row is two pairs of women visible from the knees up, each pair in conversation. The lower row depicts three women from the waist up. The females on either side are speaking to the woman in the middle.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict the Pleiades as the head and shoulders of seven women. The former labels them "Pleyades".

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts the "Plijades" as seven stars.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts the "Pleiades" as a cluster of stars at the shoulder of Taurus.

This asterism appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Pleiades” and the “Vergiliae” (See Vines, below).

Johann Bayer’s *Uranometria* (1603) lists the “Pleiades”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists the “Pleiades”.

The “Plejades, “Plejadum”, and “Pleiades” are all listed for this asterism in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

The “Pleiades” are listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633).

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts the “Pleiades” as the busts of seven women emerging from clouds.

The Pleiades are listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk lists the Pleiades.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) labels this cluster “Pleyades”.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this cluster as the “Plejades” and gives the alternate name “ein Häuslein kleiner Sterne” (“a little house of little stars”).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists “les Pleyades” on the northern hemisphere chart but “les Pleiades” on a closeup chart.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this asterism as “Plejades”.

American uranographer William Croswell (1760 – 1834) lists “Pleiades the Seven Stars” on his *Mercator Map of the Starry Heavens* in 1810.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts the Pleiades cluster as seven stars.

Scottish uranographer Alexander Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts the Pleiades as a single star.

The Pleiades are listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

The French edition of Flamsteed’s work, the *Atlas Céleste,* which was revised in 1778, lists this asterism as “les Pleiades”.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists the "Pleiades". Bode's *Vorstellung Der Gestirne* (1782) lists this asterism on the charts as "Plejades".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts the Pleiades cluster.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts the Pleiades.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists the Pleiades as well as the alternate name "Seven Sisters" (see below) but describes it as six stars visible to the naked eye.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists the "Pleiades" cluster.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this star cluster as "the Pleiades" and translates it as "to sail".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this cluster as the "Pleiades".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists this cluster as "Pleiades (Seven Sisters…)".

A Saxon name for them is "Pliade".

The Italians call them "Pleiadi" and the Germans "Pleiaden".

The Pleiades show up in 485 of the asterisms listed in this handbook. In South American tropical forests, they are seen as bees, wasps, a handful of flour spilled on the ground, parrots, white down, or a bunch of flowers. Western astronomers sometime call them the "Shopping Cart". The Lacandón and Manche Ch'ol burn cornfields in preparation for planting when the Pleiades are in treetops at dawn. The Ch'orti' use the Pleiades to predict the Sun's passage over the zenith around planting time.

NOTE: Sky cultures vary as to whether there are six or seven stars in the Pleiades cluster, and one explanation given by researchers involves the magnitude of the stars and the observer's ability to see them in varying seasons at various locations. Another relates to the Greek myths about the Pleiades and holds that Orion is chasing the Pleaides sisters and that there are six of them, with the seventh being the planet Venus, which may be close to the Pleiades on the Western horizon at sunset (Holbrook 2020).

Plectrum of Lyra:

This **telescopic** asterism "Pléctrum Lýrae" is the irregular galaxy NGC 6745 in the IAU constellation Lyra. It was discovered by French astronomer Édouard Stephan (1837 – 1923) in 1879. It is actually a trio of galaxies colliding. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "could be seen as the plectrum with which to play the lyre." It is also known as the "Bird's Head" (see above).

Pleione:

This Greek star is 28 Tauri in the Pleiades cluster in the IAU constellation Taurus. Pleione is one of the Pleiades sisters in Greek mythology:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) called it "Mater Pleione" and "Plione".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Pleione".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Pleione".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Pleione".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Pleione"
- The IAU approved the name Pleione for 28 Tauri Aa.

Plenty:

This Karanga asterism "Kgora" or "Maguta" is the Large Magellanic Cloud in the IAU constellation Dorado. They called the Small Magellanic Cloud "Tlala" (see Famine, above).

This Tswana asterism "Kgoro" ("plenty" (of food)) is the Large Magellanic Cloud.

Plinthion:

This Greek asterism "Πλίνθιον" ("Plínthion") is the IAU constellation Ursa Major. The plinthion is a sort of psaltery with 32 strings.

Plough:

This Egyptian asterism "Arotron" is one of the paranatellonta of the decans of Virgo as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and may be Coma Berenices.

This Norse and Old High German asterism is the IAU constellation Orion.

This Bantu asterism is the Pleiades cluster in the IAU constellation Taurus.

This Italian (Piedmont and Ligurian Alps) asterism "lu Tc¸arri Gros" ("the great plow") is the IAU constellation Ursa Major.

This English asterism is the Big Dipper asterism in the IAU constellation Ursa Major:

- English mathematician Thomas Fale called it the Plough in his *Horologiographia* in 1593.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "the Plough".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "the Plough" as an alternate name for this asterism.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., states: "Big Dipper: US name for the Plough".

This Celtic asterism was the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). The Celts used in their ancient Sequani calendar in their month Simivisonnios (see Half the Course of the Sun Guiding Star, above): When upright in the sky it marked the beginning of the ploughing season. Compare this to the later Irish asterism "Camchéachta" (see Bent Plough, above).

This Japanese asterism “Karasuki” is the belt and sword of Orion in the IAU constellation Orion (Renshaw and Ihara 2001). The three stars of the belt are the prongs of the plough, and the sword is the handle to pull it.

This Babylonian asterism from the MUL.APIN tablets and from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “MUL.APIN” (Hunger 1992, Sanders 2023), “Epinnu” (Hunger 1992, Parpola 1993), is made up of stars in the IAU constellation Cassiopeia:

- This is basically the “W” of Cassiopeia: Beta (β) Cassiopeiae (Caph), Alpha (α) Cassiopeiae (Shedar), Gamma (γ) Cassiopeiae, Delta (δ) Cassiopeiae, and Epsilon (ε) Cassiopeiae, with an additional line running from Epsilon (ε) to Iota (ι) Cassiopeiae,
- From Gamma (γ) Cassiopeiae three lines run out:
    - One line runs to Theta (θ) Cassiopeiae
    - One line runs to Kappa (κ) Cassiopeiae, and
    - One line runs to HIP 3951.

Hope Anthony (1996) lists this as “APIN” and “epinnu” and describes it as “Gamma (γ) Andromedae and Triangulum Boreale”, this later asterism being the IAU constellation Triangulum. Didier (2009) also describes it this way.

This Chaldean asterism from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul.apin” (Koch-Westenholz 1995) and on planisphere K 8538 as “mulĂŠ-iku” (Koch 1989). Barbaru (“wolf”) is the name the Babylonians gave to Gamma (γ) Cassiopeiae: They also call it the “plough’s seeder”. This asterism appears in later Seleucid sky lore. Compare this to the Akkadian asterism “Apin” (below).

This Assyrian asterism “Apin” is stars of the IAU constellation Triangulum and Andromeda. Triangulum is the plough and the star Gamma (γ) Andromedae is the star over the ploughman’s head. This is very close to the Babylonian asterism “Epinnu” (see above).

This Akkadian asterism “e-pi-in-nu” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the “W” in the IAU constellation Cassiopeia (see W below).

This Sumerian asterism “mul ĝišapin” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the “W” in the IAU constellation Cassiopeia (see W below).

This Suku Bali asterism “Tenggala” is the IAU constellation Orion. Gamma (γ) Orionis (Bellatrix) is the handle, the three stars of the belt of Orion plus the star Kappa (κ) Orionis (Saiph) are the plough, and Beta (β) Orionis (Rigel) is the yoke.

This Javanese asterism “Weluku” is identical to the Suku Bali asterism “Tenggala” (see above).

This Gond asterism “Naagardai” is the IAU constellation Orion (Vahia 2014).

There are two Quechua asterisms by this name:

- One, “Mancera”, is the belt and sword of Orion in the IAU constellation Orion (Ciancia 2018).
- One, from Lucre, “Arado”, is probably the IAU constellation Scorpius (Urton 1981).

This Romanian asterism “Plugul” is made up of stars of the IAU constellation Orion (Ottescu 2009). The “plough” is a quadrilateral created by Orion’s belt and the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph), with the handle being a line from Delta (δ) Orionis (Mintaka) to Gamma (γ) Orionis (Bellatrix). It is also known as the Little Plough (see above).

This Ainu Nociw (“asterism”) is the Little Dipper asterism in the IAU constellation Ursa Minor.

Plough Handle:

This Ukrainian asterism “ruchka pluha” (ручка плуга) is the Hyades cluster in the IAU constellation Taurus.

Plough Minor:

This **telescopic** asterism is made up of stars of the IAU constellation Cygnus. The “spoon bowl” is the stars HIP 104486, SAO 89492, HD 201615, Gaia DR3 1841854501070829824, HIP 104569, and HIP 104617. The handle runs from HIP 104617 through HD 210925, HD 202002, and HD 202166 to HIP 104825. This was posted by Irish astronomer “lunartic65” on *Cloudy Nights* in July 2018. Lunartic65 suggested the names “Plough Minor”, “the Spoon”, and “Davy Crockett’s Hat”. Later he refers to it as “the Plough”, so I’m going with the first suggestion.

Plough of Leo:

This **telescopic** asterism “Arátrum Leónis” is the irregular galaxy NGC 3239 (Arp 263) in the IAU constellation Leo. It was discovered in 1784 by English astronomer William Herschel who listed it as “IV 10”. It became h 710 and h 3246 in John Herschel’s catalogue and later GC 2099 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it “bears some resemblance to an ancient plow.”

Plough Star:

This Thai asterism “Dao Tai” is the belt and sword of Orion (Nitiyanant 2015).

Plough Stars:

This Bugis asterism “Bintoéng Rakkalaé” is the IAU constellation Orion.

Plough Oxen:

This Latin asterism “Triones” is the Big Dipper asterism in the IAU constellation Ursa Major as listed by Roman polymath Marcus Terentius Varro (112 – 27 B.C.E.) and Roman author Aulus Gellius (125 – 180). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Triones”.

Plough with Oxen:

This Macedonian asterism “Ralo so Volovi” or “Ralɔ sɔ Vɔlɔvi” is the three stars of Orion’s belt with a short line running from Zeta (ζ) Orionis (Alnitak) to Sigma (σ) Orionis (Cenev 2004 & 2014). Their asterism “Orach” (see Ploughman below) is a line of stars including Alpha (α) Orionis (Betelgeuse).

Ploughing Stars:

This Kiswahili asterism “Kilimia” is the Pleiades cluster in the IAU constellation Taurus (Slotegraaf 2013).

Ploughman:

This asterism “Βοώτης” or “Voótis” (“ploughman” or “herdsman”) is the IAU constellation Boötes as it appeared in Ptolemy’s *Almagest* in the 2nd century. This wasn’t the kite shaped asterism used to represent this constellation today on star charts:

- The “body” was an irregular pentagon with the corner stars Epsilon (ε) Boötis, Delta (δ) Boötis, HIP 72582, Gamma (γ) Boötis, and Rho (ρ) Boötis,
- From the “neck” at HIP 72582, a line goes out to a “head” at the star Beta (β) Boötis,
- From one “shoulder” at Delta (δ) Boötis, an arm runs down to a “wrist” at Psi (ψ) Boötis and a “hand” of the stars 46 and 45 Boötis, and
- From the other “shoulder” at Gamma (γ) Boötis an “arm” runs out to an “elbow” at Lambda (λ) Boötis and a “wrist” at Iota (ι) Boötis with a hand of the stars Theta (θ) and Kappa (κ) 2 Boötis.

This Greek asterism is made up of the stars of the IAU constellations Boötes and Taurus. It represents either the son of Demeter, Philomelus, who drives a plough represented by the oxen in the IAU constellation Taurus or depicts Boötes as the inventor of the plough.

This Latin asterism “Arator” is the IAU constellation Auriga as described by Roman scholars Nigidius Figulus (c. 98 – 58 B.C.E.) and Marcus Terentius Varro (116 – 27 B.C.E.). Variations include “Acator”. NOTE: The same name is used for the IAU constellation Boötes.

This Belarussian asterism “Rataj” is the IAU constellation Boötes (Avilin 2009).

This Macedonian asterism “Orach” or “Oratʃ” is in the IAU constellation Orion (Cenev 2004 & 2014). It is a line from Alpha (α) Orionis (Betelgeuse) to Nu (ν) Orionis, where it bends and heads to the star Xi (ξ) Orionis. His plough and oxen “Ralo so Volovi” (see Plough with Oxen, above) are Orion’s belt.

Ploughman and the Oxen:

This Teutonic asterism is the Greek asterism the Kids (see Kids, above).

This Lithuanian asterism “Artojis su jaučiais”, “Artojas”, “Artojai”, “Artojų žvaigždės”, or “Artojas su jaučiais” is the stars Zeta (ζ) Aurigae (Saclateni or Haedus I), Eta (η) Aurigae (Haedus), and Epsilon (ε) Aurigae (Almaaz) in the IAU constellation Auriga.

Plough’s Seeder:

This Babylonian star “MUL.UR.BAR.RA” is Gamma (γ) Cassiopeiae (Navi) from the MUL.APIN tablets and is part of their asterism “Epinnu” (see Plough, above). They also call it the “Wolf” (see Wolf, below).

Plunderer:

This ancient Egyptian asterism “Hequ en Saq” or “ḥḳw n sʿḳ” is the IAU constellation Leo Minor.

Plunging of Hercules:

This **telescopic** asterism “Dyómenus Hérculis” is the interacting spiral galaxy NGC 6040A in the IAU constellation Hercules. It was discovered by Édouard Stephan in 1870. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it appears to be plunging into NGC 6040B (PGC 56942).

Pluto’s Chariot:

This asterism is the IAU constellation Libra as listed in R. H. Allen’s *Star Names* in 1899. Allen attributes this to “early Christians”, though this does not make much sense as Pluto is a deity from ancient Roman beliefs, not Christianity.

Pohina:

This Hawaiian star is Beta (β) Cassiopeiae (Caph). It is also known as “Polo’ula” (see Shining Red, below).

Poia:

This Blackfoot star is unidentified at present (Chamberlain 2019).

Point:

This Persian star “Çpur” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

This Zoroastrian star “Çparegha” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899 and appears in the Zoroastrian *Avesta*.

This Sogdian star “Shaghar” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

This Khorasmian star “Akhshafarn” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Point of the Fishhook:

This Hawaiian star “Ka Maka” is Lambda (λ) Scorpii (Shaula) in the IAU constellation Scorpius.

Point of the Triangle:

This Arabic star is Alpha (α) Trianguli in the IAU constellation Triangulum. Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) called it “the star in the apex of the triangle”. Dorn (1829) lists it as “Point of the Triangle” and attributes this to Ulugh Beg Mirza (1394 – 1449), Zakariyya’ al-Qazwini (1203 – 1283), and “Ebn Mohammed Sherif”.

Pointed:

This Latin star “Cuspis” is Gamma (γ) Sagittarii in the IAU constellation Sagittarius and is listed under this name in John Hill’s *Urania* in 1754. Hill identifies it as “borrowed from the Arabians”. The Arabian name for this star was “al-naşl” (النصل) (see Arrowhead, above). Edward Sherburne lists the name “Cuspis” for this star in his *Sphere of Marcus Manilius* in 1675.

Pointed of Canes Venatici:

This **telescopic** asterism “Aculeátus Cánum Venaticórum” is the edge-on spiral galaxy NGC 4183 in the IAU constellation Canes Venatici. It was discovered in March 1788 by English astronomer William Herschel who listed it as “III 697”. It became GC 2779 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the sharp ends at both sides of this edge-on galaxy”

Pointed of Grus:

This **telescopic** asterism “Spiculáta Grúis” is the intermediate spiral galaxy NGC 7531 in the IAU constellation Grus. This was discovered in 1836 by John Herschel who listed it as h 3975 and later as GC 4905 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the two thin outer arms make this galaxy look like a body with two sharp points."

Pointed of Leo:

This **telescopic** asterism "Ácer Leónis" is the barred spiral galaxy NGC 3832 in the IAU constellation Leo. It was discovered in 1785 by William Herschel who listed it as "III 340". It became GC 2516 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the sharp, pointed arms of this galaxy."

Pointers:

There are two pairs of stars in the sky referred to as "the Pointers":

- One is the stars Alpha (α) Centauri (Rigil Kentaurus, Toliman, or Bungula- 3rd brightest star in the sky) and Beta (β) Centauri (Hadar- 11th brightest star in the sky) in the IAU constellation Centaurus, which are the Southern Pointers or the Pointers (which is the Hawaiian name for them) leading from the Southern Cross to the southern horizon and thus helping to distinguish Crux from the False Cross (see False Cross, below).
- One is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major have also been called "Pointers" as they point to celestial north:
    - This asterism is listed as "the Pointers" in English astronomer William Denning's *Telescopic Work for Starlight Evenings* (1891).
    - American uranographer William Croswell (1760 – 1834) lists these stars as "the Pointers" on his *Mercator Map of the Starry Heavens* in 1810.
    - Alexander Jamieson (1782 – 1850) lists these stars as "The Pointers" in his *Celestial Atlas* and on his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
    - American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) labels these star "the Pointers". Scottish uranographer.
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists these stars as "the Pointers".
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists these stars as "the Pointers".
    - R. H. Allen lists "The Pointers" in his *Star Names* in 1899.
    - American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941), listed the name "Pointers" for these stars in his book *The Stars - A New Way to See Them* (1952):
    - The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists these stars as the "Pointers".
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists these stars as the "Pointers".
    - American astronomer Jeffrey Corder lists them as Corder 2110.
    - This name was listed in October 2021 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/).

NOTE: The term “pointer stars” has also been used to refer to the reference stars used for the Nocturnal, an instrument used in the Middle Ages for determining the time at night (see Reference Stars, below).

This Hawaiian asterism “Na Kuhikuhi” is The Pointers (see above), the two stars being:

- “Kamailehope” (“the first maile”): Alpha (α) Centauri (Rigil Kentaurus), and
- “Kamailemua (“the last maile”): Beta (β) Centauri (Hadar).

Poison Place:

This Persian star “Ghāuzar” is Lambda (λ) Draconis in the IAU constellation Draco as named by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050). Variations on this name include “Gianfar”, “Giansar”, “Giausar”, and “Giauzar”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Giauzar… from al-jaúzá, the central” and goes on to list “the Persian Gau zahr, the poison place”. The IAU approved the name Giausar for Lambda (λ) Draconis in 2017.

Poisonous Dragon:

This asterism “Alghavil Altannin” is the IAU constellation Draco as listed by Arabic translator Giuseppe Simone Assemani (1687 – 1768). “Altannin” is a Latinization of the Arabic “at-tinnīn” (التنين) which was later latinized to this (see Dragon, above).

Poisonous Snake:

This Barasana asterism “Anya” is the IAU constellation Corona Australis (Hugh-Jones 2006, Kemp et al 2022).

Poisonous Spider:

This Barasana asterism “Buhu” is in the IAU constellation Centaurus. Hugh-Jones (2006) describes it as “stars in the upper portion of Centaurus”.

Polaris:

See North Star, above.

Polaris Galacticus Borealis:

This American star is 31 Comae Berenices in the IAU constellation Coma Berenices. American astronomer and science writer James Bailey “Jim” Kaler (1938 – 2022) created this name.

Polarissima Australis:

This **telescopic** asterism is the barred spiral galaxy NGC 2573 in the IAU constellation Octans. This was discovered in 1837 by English astronomer John Herschel who listed it as h 3176 in his catalogue. It is GC 1652 in the *General Catalogue* of 1864. It is the closest object to the south celestial pole. John Herschel described it in his observations as “Neb Polarissima Australis”.

Polarissima Borealis:

This telescopic asterism is the lenticular galaxy NGC 3172 in the IAU constellation Ursa Minor. This is the closest NGC object to the north celestial pole and was given this name by English astronomer John Herschel (1792 – 1871). It is GC 2043 in the *General Catalogue* of 1864.

Polarissima Cluster:

This **telescopic** asterism is open cluster NGC 188 in the IAU constellation Cepheus. This was discovered by English astronomer John Herschel in 1825. It is listed as GC 92 in the *General Catalogue* of 1864. This is listed as "Polarissima" in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844. This is Caldwell 1 on the list of English astronomer Patrick Caldwell Moore (1923 – 2012) list. It has this name as it is within 5° of the north celestial pole. Size 14' X 14'. It has this name as it is the nearest cluster to the north celestial pole.

Pole:

This Chaldean asterism "mul za-ru-u" or "ma-sad-du" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

This Latin star "Polus" is Alpha (α) Ursae Minoris (Polaris) as listed in the Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*"). This describes it as "the pole, where they say the whole world revolves". The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel labels this star "Polus Arcturus".

Pole Guardian:

This asterism "Polophylax" was created out of the stars near the south celestial pole in 1592 by the Flemish astronomer Petrus Plancius (1552 – 1622) and is now the stars of the IAU constellations Tucana and Grus.

Pole of Heaven:

This Japanese star "Ten-no-onbashira" (天の御柱)) is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Pole of the Sky:

This Finnish star "Taivaannapa" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Pole Star:

This Kiribati asterism "Bakarateaba" or "Nei Bakarateaba" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Trussel and Groves 1978).

This Hungarian star "Sarkscillag" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Pole Watcher:

This Flemish asterism "Polophilax" was created by Flemish astronomer Petrus Plancius (1552 – 1622) in 1612, in his *Orbis terrarium typus de integro multis in locis emedatus* (1594). This is depicted as a bearded figure in full length robes with his arms stretched out at his sides who appears to be regarding Crux in wonder. It is located between Crux and Piscis Austrinus on the chart, possibly where the constellation Pavo now resides, though the stars involved have not been positively identified at this time. Its creation was probably inspired by the Greek asterism "Ἀρκτοφύλαξ" or "Arktofýlax" ("bear watcher" or "bear keeper") later latinized to "Arctophylax" or "Artophilaxe", which is the IAU constellation Boötes.

Poles and Skin Ropes:

This Yupik asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

Police:

This Italian asterism "Vigiles" is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).

Polis:

See City, above.

Poling Stars:

This Palikur asterism "Takehpene" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Green and Green 2011). These stars represent two brothers poling their boat in a search for a wife who has turned into a turtle. Some Palikur see these stars as the tracks of a boat poling alongside their asterism Kayeb (see Two Headed Anaconda, below).

Pollux:

This Greek star is Beta (β) Geminorum in the IAU constellation Gemini, the original Greek name being "Polluces". Another old Greek name for this star is "Πολυδευκής" ("Polydefkís") and became the Latin "Pugil" ("pugilist"). It is named for one of the twins Castor and Pollux in Greek myth:

- Italian author Dante Alighieri (1265 – 1321) and the Italians call it "Polluce".
- *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists "Polluce".
- Edward Sherburne lists "Pollux" in his *Sphere of Marcus Manilius* in 1675.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists it as "Pollux vel Hercules".
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this star as "Pollux".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as "Pollux".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Pollux" for this star.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Pollux".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as Polluce" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Pollix".
- American uranographer William Croswell (1760 – 1834) lists "pollux" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Pollux" in his *Celestial Atlas* in 1822.

- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Pollux".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Pollux".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Pollux" for this star: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Pollux".
- English astronomers Crossley, Gledhill, and Wilson list "Pollux" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Pollux".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Pollux".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Pollux" in his *Star Atlas* (1893).
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Pollux".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Pollux".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Pollux".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Pollux".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Pollux" for this star.
- "Polelum" is the Lithuanian name for Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.
- The IAU approved the name Pollux for Beta (β) Geminorum. This star has an exoplanet named Thestias.

Poloahilani:

This Hawaiian star is Alpha (α) Cassiopeiae (Schedar) in the IAU constellation Cassiopeia.

Polygonal of Aries:

This **telescopic** asterism "Polygónius Aríetis" is the intermediate spiral galaxy NGC 877 in the IAU constellation Aries. It was discovered in 1784 by English astronomer William Herschel who listed it as "II 246". It interacts with NGC 876 (GC 517, discovered by English astronomer William Parsons, 3rd Earl of Rosse). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its "angular appearance".

Pomptina:

This Latin asterism is the IAU constellation Corvus and relates to the victory of Valerius, who was aided by a raven in the Pontine Marsh.

Poncho of the Stars:

This Inca asterism "Ch'aska Punchu" is the IAU constellation Orion (Gamarra & Gamarra 2009).

Pond:

This Arabic asterism “Al-Haud”, called the “Pond” or the “Pool”, later Latinized to “Alhaud”, is the stars Theta (θ), Tau (τ), Upsilon (υ), Phi (ϕ), 15, 18, and 23 Ursae Majoris in the IAU constellation Ursa Major (Alhaud I, II, III, IV, V, VI & VII):

- “al-Hawd” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This asterism appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists this as “ALRVCVB” (Dekker 2000).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al khud, the pond”.
- NOTE: Edward Sherburne translates “Alhaud” as “Lacus seu Cisterna” (“Lake or Cistern”) in his *Sphere of Marcus Manilius* in 1675 and lists it as a name for Coma Berenices, attributing this to “Doctor Hyde” who was the librarian of the Bodleian Library. John Hill incorrectly lists “Haud” as an Arabic name for the IAU constellation Corona Borealis and describes this as “a stream, or fountain of water” in his *Urania* in 1754, possibly influenced by English orientalist Thomas Hyde (1636 – 1703) who made the same error.

Pond for Fish:

This Korean asterism “Mulgogi Yeonmos” (물고기 연못) is a line of three stars in the IAU constellation Auriga: Mu (μ), Lambda (λ), and Rho (ρ) Aurigae.

Ponderous:

This Latin asterism “Ponderosus” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists “SVEL”.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Suhel ponderosus Canopius”.
- The 15th century *Alfonsine Tables* list “Suhel ponderosus”.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Suhel Ponderosus Canopius”.
- Johann Bayer’s *Uranometria* (1603) lists the name “Ponderosa”.
- In his *Star Names* in 1899 R. H. Allen reports that “another contemporary chronicle” lists it as “Sihil ponderosa”: This is a combination of this Latin name and an Arabic name for this star.

Poniatowski’s Bull:

This **telescopic** asterism is a miniature version of the Hyades cluster of the IAU constellation Taurus, also known as “Taurus Poniatovii” (“Poniatowski’s Bull”). This was a constellation created in 1777 by the former rector of Vilnius University, Marcin Odlanicki Poczobutt, to honor Stanislaus Poniatowski, the King of Poland, and Grand Duke of Lithuania. It is made up of parts of what are now the IAU constellations Aquila and Ophiuchus. Poczobutt picked these stars because they resemble the Hyades cluster that forms the “head” of the IAU constellation Taurus. Its size is 190’ X 120’. The five brightest stars belong to the open cluster Collinder 359 (Melotte 186): 66, 67, 68, 70 and 73 Ophiuchi.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der kōnigliche Stier von Poniatowski" and depicts it as a bull's head on one chart and as a bull walking to our right on another.

Belgian astronomer Jean-Charles Houzeau (1820 - 1888) called it "Taurus Regalis".

German uranographer Adolf Stieler (1775 – 1836) listed it on his planisphere as "Poln Stier" ("Polish bull").

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this asterism as "Taureau Royal de Poniatowiki".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich labels "Taurus Poniatowski" but does not illustrate it.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Taurus Poniatowski" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Poniatowskiche Stier".

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Tauri Poniatovii".

"Taurus Poniatowski" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

It is listed as "Taurus Poniatowskii or Poniatovii" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873. It is also known as the Mini Taurus (see above). Jeffrey Corder lists this as Corder 3456.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism as "Taurus Poniatowskii" but only describes it as "a small cluster".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Taurus Poniatowskii, Poniatowsky's Bull" as a constellation.

The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Taurus Poniatowskii" but his 14th edition (1959) omits it.

Italian astronomers called it "Toro di Poniatowski".

This is listed on Stellarium as the "Medium Bull".

Pony:

This Italian asterism "Cavallino" is the IAU constellation Equuleus.

Poodle:

This asterism is in the IAU constellation Taurus and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 829. Size 90' X 45'. Corder describes it as a "wedge-shaped asterism of 10 or more stars, magnitudes 5 to 9… including the double stars Struve 680… and Struve

674." The main star line runs from Zeta (ζ) Tauri through Omicron (ο) Tauri, Eta (η) Tauri, 105 Tauri, Iota (ι) Tauri, and 106 Tauri to 104 Tauri.

This **telescopic** asterism is the open cluster NGC 6830, found in the IAU constellation Vulpecula. This was discovered by English astronomer William Herschel in 1785 who listed it as "VII 9". It is GC 4516 in the *General Catalogue* of 1864. This is also known as the Cross in a Cross (see above) and "X" (see below).

Pool:

See Pond, above.

Pool of Harmony:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Auriga: HIP 24902A (the determinative star), Rho (ρ) Aurigae, and HIP 25143.

This Chinese xing guan "Xiánchí" (咸池) is a triangle of stars in the IAU constellation Auriga: Lambda (λ) and Rho (ρ) Aurigae and HIP 25810.

This Chinese Chenzhuo xing guan "Xiánchí" is a triangle of stars in the IAU constellation Auriga: Sigma (σ) Aurigae, Lambda (λ) Aurigae, and Mu (μ) Aurigae.

Poor Man's Double Cluster:

This asterism is the open clusters NGC 1807 and 1817 in the IAU constellation Taurus. They were discovered by English astronomer William Herschel in 1784: Herschel listed them in his catalogue as "VII 4". They are GC 1020 and GC 1030 in the *General Catalogue* of 1864. They are separated by only a few degrees and may be parts of a single extended cluster. Size 17' X 17'.

Pope:

This asterism "Papa" was created from the stars of Cetus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents the Pope and the Vatican and is depicted as a papal crown over crossed keys.

Pope's Nose:

This German star "Uropygium" is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus as listed by German poet Philipp von Zesen (1619 – 1689).

Popper's Star:

This **telescopic** variable star is HIP 69619 (HD 12448) in the IAU constellation Centaurus (magnitude 9.98). It was first described by American astronomer Daniel L. Popper in 1942. This is an extreme helium star.

Popular of Coma Berenices:

This **telescopic** asterism "Populáris Cómae Bereníces" is the supergiant elliptical galaxy NGC 4874 in the IAU constellation Coma Berenices. It was discovered by Prussian astronomer Heinrich d'Arrest. It became GC 5695 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this

because it is one of the major galaxies in the Coma Cluster, the other being NGC 4889. They describe it as “surrounded by the largest number of other galaxies… the situation… reminiscent of the old divide in Roman society between popular politicians and aristocratic, opulent landlords.”

Porcupine:

This Wardaman star “Gawillyan” or “Gawalyan” is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Cairns and Harney 2003).

Pormener:

The stars of this Tasmanian asterism are presently unidentified (Gantevoort 2015).

Poro Nociw:

This an Ainu name for Alpha (α) Ursae Minoris (Polaris).

Porphyrion:

This **telescopic** asterism is a Fanaroff-Riley class II radio galaxy which host galaxy J152932.16+601534.4 in the IAU constellation Draco. It was discovered in 2024 by an international team led by Martijn Oei with the Low Frequency Array (LOFAR).

Porpoise:

This Micronesian (Marshall Islands) asterism is made up of the stars of the IAU constellations Andromeda, Aries, Cassiopeia, and Triangulum:

- Andromeda is the “body”,
- Cassiopeia is the “tail”, and
- Aries is the “head”.

This Hindu asterism “Shī-shu-māra”, “Sim-shu-māra”, or “Zizumara” is the IAU constellation Delphinus.

This Micronesian star “Kyyw” is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda.

This **telescopic** asterism NGC 2936 is a spiral galaxy in the IAU constellation Hydra. It is interacting with the elliptical galaxy NGC 2937, which is known as the Egg Galaxy (see above). It is also known as the Penguin (see above). They were both discovered by German astronomer Albert Marth in 1864, becoming 175 and 176 on his list. It is GC 5497 in the General Catalogue of 1864. It is also known as the “Bird Like of Hydra” (see above).

Porrima:

This Latin star “Porrima” is Gamma (γ) Virginis in the IAU constellation Virgo. “Porrima”, “Antevorta”, or “Postvorta”, was one of the Camenae, who were Goddesses of prophecy. 2nd century Roman author Aulus Gellius listed it as “Prorsa” and “Prosa”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Porrima and Postvaria”. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Porrima”. The IAU approved the name Porrima for the star Gamma (γ) Virginis A in 2016.

Portentous of Canes Venatici:

This **telescopic** asterism “Portentósus Cánum Venaticórum” is the spiral galaxy NGC 4395 in the IAU constellation Canes Venatici. William Herschel listed it as “V 29:1”. John Herschel listed it as h 1252 and later as GC 2958 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Poseidon’s Trident:

See “Beehive” above.

Poses:

This Kaykavian asterism “Pozóji” is the IAU constellation Libra.

Possessing Luminous Rays:

This Khorasmian star “Achir” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Post at the End of the Sky:

This Tahitian star “Anani’a” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Edwards 2015).

Post of Gods Tu and Ta’aroa:

This Tahitian star “Epi” is unidentified at this time (Edwards 2015).

Post of Knowledge:

This Tahitian star “Anatahu’avahine a Toa te Manava” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Edwards 2015).

Post of the Cross:

This Arabic star is Epsilon (ε) Delphini in the IAU constellation Delphinus.

Post to Sit On:

This Tahitian star “Anavaru” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Edwards 2015).

Poster Girl:

This **telescopic** asterism is the interacting galaxies NGC 6670 in the IAU constellation Draco. It was discovered by Lewis Swift in 1886. This name was posted on the *Deep Sky Forum* by German astronomer Uwe Glahn in June 2022. Glahn explains: “In 208 the pair becomes fame as a ‘Poster Girl’, a compilation of interacting pairs illustrated by the HST.” It is also known as the “Leaping Dolphin” (see above) and the “Ramming Ships of Draco”.

Posts of Al-Ayyuq:

This Arabic asterism is three stars in the IAU constellations Auriga and Taurus: Beta (β) Tauri (Elnath), Theta (θ) Aurigae, and Beta (β) Aurigae (Menkalinan). This is part of their asterism Al-Ayyuq and the Posts (see Obstructor and the Posts, above).

Pot:

There are two Arabic asterisms with this name:

- One, “al qidr”, later latinized to “Al Kidr” is the star Theta (θ) Cephei in the IAU constellation Cepheus and is part of the asterism below.
- One is a loop of stars in the IAU constellations Cepheus, Cygnus, and Draconis: Theta (θ) Cephei, 66 Draconis, HIP 97892, HIP 98073, 33 Cygni, HIP 101084A, HIP 102431, HIP 102775, and Eta (η) Cephei. The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts this as a rayed semi-circle with two stars at the end.

This Mi’kmaq star “Wow” is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. It is the pot that Jiji’kes (see Chickadee, above) is carrying in the Mi’kmaq asterism Muin and the Seven Hunters (see above). Compare this to the Khanty asterism Pot below.

The Khanty, Selkup, Ket, Evenk, Khakas, and Khalasha of Siberia see the three stars of the handle of the Big Dipper asterism in the IAU constellation Ursa Major as hunters and see the star 80 Ursae Majoris (Alcor) as a cooking pot carried by one of the hunters (Berezkin 2005). Compare this to the Mi’kmaq asterism “Wow” (above).

This Iroquois star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major (Berezkin 2005).

Pot and Pitcher:

This **telescopic** asterism is in the IAU constellation Andromeda and was listed in *Pattern Asterisms* by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 298. Size 65’.

- The body of the “pitcher” is a rectangular formation of stars including HIP 9438, 9320, and 9151. The tip of the “lid” is HIP 9396. The tip of the “spout” is the double star HIP 9172A.
- The “pot” beside this “pitcher” has the stars 55 Andromedae and HIP 8922 as the pot’s “rim” and has the stars HIP 8838 and 8911 as the “base”.

Pot Bellied of Hydra:

This **telescopic** asterism “Gastródes Hýdrae” is the barred spiral galaxy NGC 3717 in the IAU constellation Hydra. It was discovered in 1834 by John Herschel who listed it as h 3348 and later as GC 2442 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its “thick central bulge”.

Pot Cover of Pyxis:

This **telescopic** asterism “Tégumen Pýxidis” is the spiral galaxy NGC 2613 in the IAU constellation Pyxis. It was discovered in 1784 by William Herschel who listed it as “II 266”. It became GC 1674 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Pot of Maize:

This Inca star “Saramanqa” is Alpha (α) Crucis (Acrux) in the IAU constellation Crux (Gamarra & Gamarra 2009) and is part of their asterism Ch’akana (see above).

Pot of Qoqa:

This Inca star "Qoqamanqa" Beta (β) Crucis (Mimosa) in the IAU constellation Crux (Gamarra & Gamarra 2009) and is part of their asterism Ch'akana (see above).

Pot Rest:

This Cochiti asterism is the Belt of Orion in the IAU constellation Orion.

Potatoes:

This Mapuche asterism "Gaw", "Gaw Poñü", or "Wüchul" is the Pleiades cluster in the IAU constellation Taurus (Menares 2008). These are a local variety of potatoes, papas amontonadas.

Pourer:

This Latin asterism "Effusor" ("pourer" or "Fusor Aquae" ("pourer of water") is the asterism Pouring Forth of Water (see below). Johann Bayer's *Uranometria* (1603) lists "Fusor Aquae" as a name for Aquarius. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Fusor Aquae".

Pouring Cup:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Cetus. A triangle of the stars Xi (ξ) Ceti (or 65 Ceti) and 64 Ceti and one 9th magnitude star are the "cup". The "handle" is an oval of stars with HIP 10171 at one end and HIP 9965 and 9915 at the other.

Pouring Forth of Water:

This Greek asterism "Χύσις ὕδατος" ("Chýsis ýdatos") is made up of stars in the IAU constellation Aquarius and is listed in the *Introduction to the Phenomena* by Geminus of Rhodes (1st century B.C.E.) according to R. H. Allen in his *Star Names* in 1899. It starts at Gamma (γ) Aquarii and runs through Zeta (ζ), Eta (η), Lambda (λ), Psi (ψ), and 94 Aquarii to 98 Aquarii. Cicero (106 – 43 B.C.E.) called it "Aqua" ("water") and Roman general Germanicus (15 B.C.E. – 19 C.E.) "Effusio aquae" ("outpouring of water"). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Stellae effusoris aquae" ("stars of the streamer of water"). Compare this to Water, below.

Pouring the Water:

This Latin asterism "Fundens Latices" is the IAU constellation Aquarius as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.) and listed in R. H. Allen's *Star Names* in 1899.

Praecipua:

See Of Special Importance, below.

Praesepe:

See Manger above.

Prajapati:

There are two Vedic asterisms by this name:

- One is the IAU constellation Orion (Bhagwath 2019, Ivanković 2021). Ivanković describes this as overlapping the constellation Taurus.
- One is the IAU constellation Taurus (Vahia 2014).

This name is also given in Vedic culture to the star Delta (δ) Aurigae in the IAU constellation Auriga. W. Brennand lists "Prajapati" as the star Delta (δ) Aurigae in his *Hindu Astronomy* in 1896. NOTE: This is listed on Stellarium as "Prijipati".

NOTE: Prajapati is the "Lord of Created Beings", an aspect of the creator Brahma, a sort of evil twin of Rudra (see below) who is there to keep Prajapati in check as he pursues his daughter Ushas who has taken the form of an antelope (see Antelope, below). There is another form of this story where Prajapati and Ushas become deer (see Deer, below).

Prancing Horse:

See Dark Horse Nebula, above.

Prawn:

There are two Tupi asterisms with this name:

- One, "Poti" is the IAU constellation Cancer (De Freita Mourão 2009).
- One, "Camarão" is made up of stars of the IAU constellations Crux and Lupus (De Freita Mourão 2009):
  - The "body" of the prawn is the stars of Crux, and
  - The "claws" are stars in Lupus.

There are two **telescopic** Prawn asterisms:

- One is planetary nebula Sh 2-188 in the IAU constellation Cassiopeia. It is listed under this name as well as the names "Shrimp Nebula" and "Dolphin Nebula" on RASC member Ron Brecher's *Astro Doc* website.
- One is IC 4628 in the IAU constellation Sagittarius. This was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923).

Praxiteles:

This is the name given by American astronomer Elijah Burritt (1794 – 1838) gave to the asterism Caelum (see above) in his *Geography of the Heavens* and *Celestial Atlas* in 1833. Praxiteles of Athens was a sculptor in the 4th century B.C.E.

Preceding:

This Arabic star "as-Sābiq" (السابق) or "as-sābiq al-awwal" is Eta (η) Ophiuchi in the IAU constellation Ophiuchus:

- This was listed by 16th century Arabic astronomer Al Tizini.
- It was later latinized to "Sabik" or "Al Sabyk al Aoul".
- The IAU approved the name Sabik for the star Eta (η) Ophiuchi A in 2016.

Preceding the Dog:

In his *Almagest*, Ptolemy (c.100 – c.170) originally called the IAU constellation Canis Minor "προκύων" ("prokýon") or "προκύον" ("prokuon"). It was called this because Procyon rises before Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. In Greek mythology Procyon is related to Maera, a hound belonging to Erigone, daughter of Icarus. Later this name was latinized as "Praecanis", "Procanis", "Procynis", or "Procyon" (which means "beforehand") and transferred to the star Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor:

- Variations from the Middle Ages include "Prochion" and "Procion".
- The 8th century *Revised Aratus Latinus* gives the name "Antecanis" ("before the dog") to the entire constellation of Canis Minor.
- Canis Minor appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a dog with a collar walking to our right and is labelled "Procyon".
- *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus lists "Procyon" and "Little Dog" as names of both this star and the constellation Canis Minor.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) gives "Procyon, sive Canis Minor" as a name for the constellation Canis Minor in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels Canis Minor "Procyon".
- "Procyon" is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) as a name for Alpha (α) Canis Minoris.
- Johann Bayer's *Uranometria* (1603) lists 'Procyon" for this st.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Procyon" for Alpha (α) Canis Minoris.
- Edward Sherburne lists "Procyon" in his *Sphere of Marcus Manilius* in 1675 for Alpha (α) Canis Minoris.
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Procyone" on some charts and as "Porcoyn" on another.
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists the name Procyon for Alpha (α) Canis Minoris.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Orionis al Procyon est Algomeisa".
- Procyon is listed in charts in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as a name for Alpha (α) Canis Minoris.
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this star as "Procyon".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as "Procyon".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Procyon" for Alpha (α) Canis Minoris, as does the 1778 edition.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Procyon".

- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists Alpha (α) Canis Minoris as "Procione" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- American uranographer William Croswell (1760 – 1834) lists "Procyon" for Alpha (α) Canis Minoris on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Procyon" for Alpha (α) Canis Minoris in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Procyon".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Procyon" for Alpha (α) Canis Minoris.
- The star Procyon is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists Alpha (α) Canis Minoris as "Procyon".
- English astronomers Crossley, Gledhill, and Wilson list "Procyon" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Procyon".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Alpha (α) Canis Majoris as "Procyon" or "the Little Dog Star".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Procyon".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Procyon" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Procyon" and describes it as "precursor dog".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Procyon" for Alpha (α) Canis Minoris.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Procyon".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lits "Procyon" for this star.
- The IAU approved the name Procyon for the star Alpha (α) Canis Minoris A.
- NOTE: 2nd century Greek physician Aeliius Galenus (Galen) listed Prokyon as a name for the star Alpha (α) Canis Majoris (Sirius) according to R. H. Allen in his *Star Names* in 1899.

This Latin star "Antecanis" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, given this name as it rises before the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major:

- Variations include "Anticanis", "Antecedens Canis" ("the most advanced dog", appearing in the 1515 edition of the *Almagest*).
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Anticanis".

- The Maass 1898 manuscript of the 11th century *De signis caeli* lists "Anticanis" for the constellation and the name "Anticanian" for Alpha (α) Canis Majoris (Syrius) "because it is the opposite of the canine". The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict a collared dog leaping to the left. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict him running to the right.
- "Antecanis" listed in Johann Bayer's *Uranometria* (1603).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Antecanis" and "Algomeisa" as names for Canis Minor.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Procyon" and "Antecanis".
- Antecanis appears in Robert Hues' *A Learned Treatise of Globes* in 1659 and in John Hill's *Urania* in 1754. Hues also lists the variation "Antecanis Coeruleus".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Procyon" and his *Bedford Catalogue* in 1844 lists "Ante Canis".

This Arabic asterism "Al Kalb al Mutaḳaddim" is the IAU constellation Canis Minor as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Predecessor of the Two Stars:

This ancient Egyptian star "Tepi-a-Sebawy" is Gamma (γ) Geminorum in the IAU constellation Gemini. The "Two Stars" is their asterism Pair of Stars (see above).

Predator's Vessel:

This Latin asterism "Navigium Praedatorium" is Ptolemy's asterism Argo's Ship (see above).

Presage Rain:

"Serogabolo" Tswana star is possibly Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Prestis:

This Greek asterism is the IAU constellation Cetus as listed in John Hill's *Urania* in 1754.

Pretty One of Leo:

This **telescopic** asterism "Béllus Leónis" is the spiral galaxy NGC 3433 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "III 20". It became GC 2240 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Pretty Woman:

This Cahuilla star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above).

Pride Double Cluster:

This **telescopic** asterism is the pair of open clusters NGC 1528 and 1545 in the IAU constellation Perseus. These were discovered by the English astronomer William Herschel in 1790: Herschel lists the first as "VII 61" and the second as "VIII 85" in his catalogue. They are GC 820 and GC 831 in the *General Catalogue* of 1864. NGC 1545 is also known as the Magic Pentagram Cluster. In March 2025 the

Sunshine Coast Pride organization in collaboration with the World Asterisms Project named this double cluster the “Pride Double Cluster” to honour 2SLGTBQ+ culture. It is also known as the “M & M Double Cluster” (see above).

Pride of Lions:

This /Xam asterism is the IAU constellation Crux (Dechend 1975). This is described as 3 lionesses and one lion.

Priest:

This Lithuanian star “Kunigas” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Prima Hyadum:

See First of the Hyades, above.

Prime Minister:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Xiàng” (相) is the star 7 Canum Venaticorum in the IAU constellation Canes Venatici.

This Chinese xing guan “Xiàng” (相) is the star 5 Canum Venaticorum in the IAU constellation Canes Venatici.

This Chinese Chenzhuo xing guan “Xiang” is the star Chi (χ) Ursae Majoris in the IAU constellation Ursa Major.

Primordial Fire:

This Mayan asterism “Oxib' Xk'ub'” is the Orion Nebula (Messier 42, NGC 1976, SH 2-281, LBN 974, Ced 55d)). The Paddler Gods (see above) carry the Maize God in a canoe to the place of creation. The Three Hearthstones at this place are Zeta (ζ) Orionis (Alnitak), Kappa (κ) Orionis, (Saiph), and Beta (β) Orionis (Rigel). This is in the middle of the Mayan asterism “Aak” (see Turtle below).

Prince of the Heavenly Signs:

This Latin asterism “Princeps signorum coelestium” is the IAU constellation Aries. This relates to its position as the indicator of the vernal equinox thousands of years ago. Around 420 C.E. this moved into Pisces. Johann Bayer’s *Uranometria* (1603) lists this name.

Prince of the Zodiac:

This Latin asterism “Princeps Zodiaci” is the IAU constellation Aries. This relates to its position as the indicator of the vernal equinox thousands of years ago. Around 420 C.E. this moved into Pisces.

Prince of Ursa Major:

This **telescopic** asterism “Princeps Úrsae Majóris” is the spiral galaxy NGC 2857 (Arp 1) in the IAU constellation Ursa Major. It was discovered by R. J. Mitchell in 1856. It became GC 1834 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Prince of Youth:

This Latin asterism “Princeps juventutis” is the IAU constellation Aries as it was shown on one of the Roman emperor Domitian’s coins as listed by English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 and by R. H. Allen in his *Star Names* in 1899.

Princelet:

This Greek star “βασιλίσκος” (“vasilískos”- “Kinglet”) or “βασιλισκός ἀστήρ” (“vasiliskós astír”) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as named by Ptolemy (c.100 – c.170):

- It was Nicolas Copernicus (1473 – 1543) that latinized this to “Regulus” (“prince” or “little king”) in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543).
- Edward Sherburne lists “Regulus” in his *Sphere of Marcus Manilius* in 1675.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists the star “Regulus”.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as “Regulus”.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Regulus“.
- American uranographer William Croswell (1760 – 1834) lists “Regulus” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Regulus” in his *Celestial Atlas* Scottish uranographer Alexander Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict this star as “Regulus”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Cor Leonis vel Regulus: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Regulus” and his *Bedford Catalogue* in 1844 lists “βασιλίσκος, from an opinion of its influencing the affairs of the heavens”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Regulus”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Regulus”.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Regulus”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Regulus”.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists “Regulus” in his *Star Atlas* (1893).
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Regulus” and translates this as “chief”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Regulus” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Regulus”.
- In 2016 the IAU approved the name Regulus for the star Alpha (α) Leonis A.

This Latin star “Basilicus” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed by Danish astronomer Tycho Brahe (1546 – 1601). “Basiliscus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and translated as “regia stella” (“royal star”). “Basilicus” is in John Hill’s *Urania* in 1754 and R. H. Allen’s *Star Names* in 1899.

Princess With a Bad Hair Day:

This Dutch **telescopic** asterism is the galaxy NGC 218 and MCG+06-02-017 (PCG 2726) in the IAU constellation Andromeda. It is also known as Vorontsov-Vel’yamiov 527 and Karachentsev 16. This name was listed in the *Deep Sky Forum* by Victor van Wulfen in October 2021.

Princip:

This asterism “Princip” was made up of stars of the IAU constellation Lepus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as a silver and red crown.

Principes de Asturias Nebula:

This **telescopic** asterism is planetary nebula PN G126.6+01.3 (IPHASX J012507.9+635652) in the IAU constellation Cassiopeia. This was discovered in 2005 in the Isaac Newton Photometric H-Alpha Survey. It was named “Nebulosa de los Príncipes de Asturias” (“Nebula of the Princes of Asturias”) after its dedication by the Instituto de Astrofísica de Canarias to the Spanish Princes on the occasion of their wedding, which took place in Madrid on May 22, 2004.

Printing Office:

This asterism “Officina Typographica” was created by astronomers Johann Elert Bode and Joseph Jérôme de Lalande in 1798 to honour the printing press of Johannes Gutenberg. Bode called it “Buchdrucker-Werkstatt” originally in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) but changed to this name in 1825. It is east of Alpha (α) Canis Majoris (Sirius), north of the IAU constellation Puppis, and south of the IAU constellation Monoceros.

Italian astronomer Father Angelo Secchi included this asterism on his planisphere in 1878.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as “L’Atelier de L’Imprimeur”: Jamieson depicts this as a typeset drawer with a piece of paper labelled “Magna Charta” next to a Gutenberg printing press .

Italian charts listed it as “Tipografia” and German as “Buchdrucker Presse”.

Prison:

This is an alternate name for the xing guan Celestial Discipline according to Kemp et al (2022). Compare to Celestial Prison (above).

This Chinese Chenzhuo xing guan “Yu” is the star Beta (β) Aurigae (Menkalinan) in the IAU constellation Auriga. It is part of their xing guan Five Chariots.

Prize Comet Cluster:

This **telescopic** asterism is globular cluster NGC 6229 in the IAU constellation Hercules. It was discovered by English astronomer William Herschel in 1787 who listed it as "IV 50". It is GC 4244 in the *General Catalogue* of 1864. It may be the remnant of a spheroidal dwarf galaxy.

Proclaimer of the Dawn:

This Babylonian star "Dil-kar" is Alpha (α) Arietis (Hamal) in the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899. Allen writes that "Jensen" lists this as "As-kar" and "others as Dil-gan, the Messenger of Light".

Procyon:

See Preceding the Dog, above.

Prometheus:

This Greek asterism is the IAU constellation Sagittarius as listed by as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k).

This asterism "Prometheus" is the IAU constellation Hercules. Prometheus was a Titan in Greek mythology, a trickster who stole fire from the Gods, which resulted in him being chained to a rock. In one version of the myth, Heracles rescues Prometheus:

- Johann Bayer's *Uranometria* (1603) lists "Prometheus" as a name for this constellation.
- "Prometheus is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as an alternate name for Hercules.
- John Hill lists "Prometheus" as a name for Hercules in his *Urania* in 1754.
- R. H. Allen lists "Prometheus" as a name for Hercules in his *Star Names* in 1899.

Prometheus' Torturer:

This Latin asterism "Tortor Promethei" is the IAU constellation Aquila.

Prone before Lycaon:

This Latin star "Prona Lycaonia" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by 1st century Roman poet Marcus Manilius. Lycaon was an Arcadian king in Greek mythology. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Lycaon".

Pronghorn:

This Seri star "Haamoha" is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion.

Propeller:

There are six **telescopic** "propeller" asterisms:

- One is HII region DWB 111 (Simeis 57) in the IAU constellation Cygnus. This name was posted on the *Deep Sky Forum* by American astronomer Paul Aisling in August 2014.
- One is NGC 7479 (Caldwell 44) is a barred spiral galaxy in the IAU constellation Pegasus. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 55". It is GC 4892 in the *General Catalogue* of 1864. It is also known as the Superman Galaxy (see below), "V" (see below), and the Lawn Sprinkler (see above).

- One is Raymond 8 in the IAU constellation Pisces. René Merting lists it on the *Faint Fuzzies* website and describes it as a "conspicuous… very flat S-curve, which runs southeast-northwest- a good dozen faint stars involved here- due to the kink in the middle one could mistake the whole thing for a propeller." Size 51' X 17'. One end of the "propeller" is HIP 117704A, the other is HIP 117445, with HIP 117529 as part of the "propeller hub".
- One, the "Propeller" or the "Fornax Propeller" is the galaxy NGC 1365 in the IAU constellation Fornax. It was discovered by English astronomer John Herschel in 1837. It is GC 731 on the *General Catalogue* of 1864. This appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Dipterus Fornácis" ("propeller of Fornax"): They gave it this name as the "wide symmetric arms… put in mind the two wings of a propeller". The Latin term "Dipteros" means "with two wings". This is O'Meara 17 on astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), who states that it "has been nicknamed the Dipterous Galaxy".
- One is the globular cluster Messier 13 in the IAU constellation Hercules. This was discovered by English astronomer Edmund Halley in 1714. English astronomer William Parsons, 3rd Earl of Rosse (1800 – 1867), noted three dark lanes radiating propellor like from the cluster's center. This is also known as the Hercules Cluster, the Great Star Cluster, the Great Globular Cluster, and the Great Hercules Cluster.
- One, "Propéllens Aríetis" ("propeller of Aries") is the edge on spiral galaxy NGC 678 in the IAU constellation Aries. It was discovered by English astronomer William Herschel in 1784. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Propus:

See Forward Foot, above.

Prosperous Frontier:

This Chinese Chenzhuo xing guan "Kaifan" is the star Zeta (ζ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Proserpine:

This Latin asterism "Proserpine" or "Proserpina" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Proserpine is the Roman version of the Greek Goddess Persephone.

This French asterism with the Latin name "Proserpine" is the IAU constellation Corona Borealis as described by French astronomer Jérôme Lalande (1732 – 1807). Persephone is the Greek Goddess of the Underworld, known to the Romans as Proserpine.

Protecting Ministers:

This Japanese asterism depicted on the ceiling of the Takamatsu Zuka Kofun tomb is believed to be four stars in the IAU constellation Cepheus: These are supposed to be protecting Polaris (see Center of the Universe, above), Kochab (see Emperor, above), Pherkad (see Crown Prince, above), and 4 Ursae Minoris (see Cadet Prince, above) in the IAU constellation Ursa Major. One is identified "2 Cep" which would be Theta (θ) Cephei in the neighbouring IAU constellation Cepheus, one is unidentified, and the other two are listed as "51H Cep" and "39H Cep" (Renshaw 2014). These last two aren't correct as the

Flamsteed list for the constellation Cepheus only goes as high as 31 Cephei. The Flamsteed list for the constellation Draco, which also borders Ursa Minor contains 39 Draconis and 51 Draconis, so I wonder if this is a mistake in identification of the constellation?

Provided with a Square of Eridanus:

This **telescopic** asterism "Quadráta Erídani" is the intermediate spiral galaxy NGC 1415 in the IAU constellation Eridanus. It was discovered in 1784 by William Herschel who listed it as "II 267. This became GC 759 in the *General Catalogue* of 1864. NOTE: American astronomer Lewis Swift observed this galaxy in 1896 and classified it as IC 1983. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to a square of foreground stars at the southeast side of this galaxy.

Provider:

This Latin star "Provindemiator" is Epsilon (ε) Virginis (Vindemiatrix) in the IAU constellation Virgo. Cicero (106 – 43 B.C.E.) gave it the name "Protygeter", which also appears as "Protrigetrix".

In his *Star Names* in 1899 R. H. Allen lists "Provindemiator" as a name used by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) for Alpha (α) Boötis in the IAU constellation Boötes. Allen acknowledges that this is also a name for Epsilon (ε) Virginis.

Prow:

This ancient Egyptian asterism "Khentet" is the IAU constellation Scorpius and is found on star tables on coffin lids c. 2000 B.C.E. NOTE: Some ethnoastronomers suggest that this is part of the Egyptian asterism "Wia" (see Boat, above) which would mean that it includes stars of the IAU constellation Sagittarius.

Proxima:

See Nearest Centaur, above.

Proxima Centauri:

See Nearest Centaur, above.

Proxima Ophiuchi:

See Barnard's Star, above.

Przybylski's Star:

This telescopic rotating variable star is HIP 56709 (HD101065) in the IAU constellation Centaurus (magnitude 8.03). It is named for Polish-Australian astronomer Antoni Przybylski, who discovered its peculiar spectrum in 1961: This star contains an unusually high abundance of lanthanide elements.

Ptah and the Three Noble Ladies:

This Egyptian asterism is the IAU constellation Crux as listed in the 19th dynasty Cairo Calendar (Hardy 2003). Ptah is the God of Memphis, creator of the world, lord of truth: He appears in the First Dynasty (c. 3150 – 2613 B.C.E.).

Ptolemaion:

This Seleucid star "Ptolemaion" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. It was given this name by the Ptolemaic rulers of Egypt as its acronychal rising marked the date of their Ptolemaia festival every four years (262 – 145 B.C.E.). This would be Ptolemy X Alexander 1, who ruled Egypt from 107 B.C.E. to 88 B.C.E. in co-regency with Cleopatra III as Ptolemy Philometor Soter until 101 B.C.E. and then with Berenice III as Ptolemy Philadelphus.

- Johann Bayer's *Uranometria* (1603) lists the names "Ptolemaeus" and "Ptolemaeon" for this star.
- John Hill lists it as "Ptolemais" in his *Urania* in 1754 and states the name honours "Ptolemy Lagus, one of the Egyptian sovereigns".
- R. H. Allen lists it as Ptolemeaon" and "Ptolemaeus" in his *Star Names* in 1899.

Ptolemy's Cluster:

This Greek asterism is the open cluster Messier 7 (NGC 6475) in the IAU constellation Scorpius, which was first recorded by Claudius Ptolemy in 130 B.C.E. as "νεφελοειδής" ("nefeloeidís" or "nebular"). The 1551 edition of the *Almagest* calls it "Girus ille nebulosus" ("the foggy gyrus"). Italian astronomer Giovanni Battista Hodierna observed it in 1654 and in 1764 French astronomer Charles Messier added it to his catalogue. The General Catalogue of 1864 lists it as GC 4340. It is also the Chinese and Korean asterism "Fish" (see above) and Ulugh Beg Mirza's "That Which Follows the Sting" (see below).

Ptolemy's Triangle:

This asterism is made up of stars in the IAU constellations Boötes and Corona Borealis: Alpha (α) Boötis (Arcturus), Alpha (α) Coronae Borealis, and Gamma (γ) Boötis.

Pua-tawhiwhi o Tautoru:

This Māori star is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Puaka:

This Māori (south island) star is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Puddle of Sky:

This Korean asterism "Haneul-ui Ungdeong-I" (하늘의 웅덩이) is a series of four lines of stars radiating out from the star AE Aurigae in the IAU constellation Auriga:

- One line goes to 14 Aurigae,
- One line goes to 16 Aurigae,
- One line goes to IQ Aurigae, and
- One line goes to 19 Aurigae.

Puff Cluster:

This **telescopic** asterism is the planetary nebula NGC 5882 in the IAU constellation Lupus. This was discovered by English astronomer John Herschel in 1835 who listed it as h 3594. It is GC 4066 in the *General Catalogue* of 1864. South African astronomer Auke Slotegraaf gave it the name "Puff Cluster" in his observations in 2009. It is also known as the Ghost of Uranus (see above).

Puffer Fish:

This Sama asterism “Buntal” is the IAU constellation Crux (Santos et al 2019, Margiza 2022). They used this for navigation and determining wind direction. Ambrosio (2008) lists it as “Bunta”.

Pulaha:

This Vedic star “Pulaha” or “Visvâmitra” is Beta (β) Ursae Majoris in the IAU constellation Ursa Major as listed in R. H. Allen’s *Star Names* in 1899, Boutet (2014), and Bhagwath (2019). This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Pulastya:

This Vedic star “Pulastya” is Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major (Bhagwath 2019). This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Puller of Cows Star:

This Japanese star “Kengyuu Boshi” or “Hiko Boshi” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Renshaw and Ihara 2001).

Pulling:

This Zulu star “inDonsemasuku” or “inDosa” (“pulling” or “stretching”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Slotegraaf).

Pulling Out the Dawn:

This Tswana and Venda star “Kgogamasigo” (“pulling out the dawn”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Slotegraaf 2013). Compare this to the Sotho star “Kgogamashego” (see Drawer Up of the Night, above) or “Kogamasigo” (see Pulls the Night Across, below).

Pulls the Night Across:

This Tswana star “Kogamasigo” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Slotegraaf 2013). Compare this to the Tswana asterism “Kgogamasigo” (see Pulling Out the Dawn, above).

Puma:

This huge Tukano asterism “Yai” consists of stars of the IAU constellations Camelopardalis, Cassiopeia, and Perseus (Cardoso 2015, Cardoso 2016):

- The “head” is a triangle of stars: Alpha (α) Cassiopeiae (Schedar), Beta (β) Cassiopeiae (Caph), and Gamma (γ) Cassiopeiae (Navi),
- Faint stars form “ears” beside Schedar and Navi,
- The front “leg” runs from Epsilon (ε) Cassiopeiae to a “foot” formed by Psi (ψ) and 43 Cassiopeiae,
- The back “leg” runs from Gamma (γ) Persei to a “foot” formed by CE and CS Camelopardalis, and
- The tightly curving “tail” starts at Alpha (α) Persei (Mirfak) and runs through Delta (δ), 48, 51, b, Lambda (λ), and 43 Persei, ending at the star HIP 17772.

This Quechua asterism is dark nebulosity in the Milky Way near the IAU constellation Centaurus (Moyano 2011).

Pumo:

This Tibetan khyim "Pumo" is the IAU constellation Virgo (Johnson-Groh 2013). It is their version of the Vedic rashi Kanya (see above).

Punish:

This Korean asterism "Beolhada" (벌하다) is a line of two stars in the IAU constellation Equuleus: Gamma (γ) and Delta (δ) Equuleus.

Punishment:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Ophiuchus: Starting with the determinative star Psi (ψ) Ophiuchi it runs through Chi (χ) Ophiuchi to Phi (ϕ) Ophiuchi.

This Chinese xing guan "Fá" (罰) is a line of three stars in the IAU constellations Scorpius and Libra: 18 and 11 Scorpii and 49 Librae.

This Chinese Chenzhuo xing guan "Fá" is a line of three stars in the IAU constellation Ophiuchus: Psi (ψ) Ophiuchi, Chi (χ) Ophiuchi, and Phi (ϕ) Ophiuchi.

Punk of Sculptor:

This **telescopic** asterism "Punkiána Sculptóris" is the barred spiral galaxy NGC 7755 in the IAU constellation Sculptor. This was discovered in 1834 by John Herschel who listed it as h 4005 and later as GC 5012 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the rather tangled and upright aspect of the spiral arms of this galaxy is reminiscent of the typical hairstyle of the punk movement".

Pup:

This **telescopic** asterism is the distorted dwarf galaxy NGC 4627 (Arp 281) in the IAU constellation Canes Venatici. William Herschel listed this as "II 659". John Herschel listed this as h 1391 and later as GC 3159 in the *General Catalogue* of 1864. Cypriot astronomer Roland Constantinides posted this name in the *Deep Sky Forum* in May 2014. It is also known as the "Small Whale of Canes Venatici". It is interacting with NGC 4631.

Pupil:

This German star with the Latin name "Pupilla" ("pupil of the eye") is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis. Johann Bayer's *Uranometria* (1603) lists "Pupilla" for this star. German astronomer Johann Bayer (1572-1625) lists "Pupilla" for this star.

This Latin asterism "Pupilla" is the IAU constellation Lyra. Johann Bayer's *Uranometria* (1603) lists "Pupillam" as a name for Lyra. German astronomer Christian Ludwig Ideler (1776 – 1846) lists the name "Pupilla".

Puppies:

This Cheyenne asterism is the Pleiades cluster in the IAU constellation Taurus.

This Finnish asterism is the Pleiades cluster in the IAU constellation Taurus (Kuperjanov 2006).

Puppis:

The brightest star in Puppis is the 2nd magnitude Zeta (ζ) Puppis which is the 71st brightest star on the list of 90 brightest stars and its stars appear in 147 of the asterisms listed in this handbook.

The IAU constellation Puppis (IAU abbreviation Pup) was once part of the larger and older constellation Argo Navis (see Argo's Ship, above). As this was such a large and unwieldy group of stars, in 1763 French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) divided it into three constellations now recognized by the IAU: Carina (the hull or keel), Puppis (the poop deck) and Vela (the sails). Note: Lacaille did not rename the stars, keeping the Greek letters of the Bayer classifications for Argo Navis, so Carina has stars in the first part of the Greek alphabet, Vela has the middle letters, and Puppis has the end of the alphabet.

"Puppis" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it. NOTE: Argelander also depicts "Argo" on another chart.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Puppis, The Poop" as an official constellation "recognized in the catalogue of the British Association", though it also mentions "Argo, The Ship Argo".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Puppis" and describes it as the "Stern (of Ship Argo)".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists this constellation as "Puppis: the poop of the good ship Argo".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) reincorporated Puppis into Argo's Ship (see Argo's Ship, above) in his book *The Stars - A New Way to See Them* (1952). *Sky and Telescope Magazine*, founded in 1941, depicts Puppis in their magazine and publications in the same manner as Reyersbach.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Puppis in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a constellation separate from Vela and Carina consisting of two interconnecting triangles, one having a "tail":

- One triangle is Tau (τ) Puppis, Nu (ν) Puppis, and Sigma (σ) Puppis,
- One triangle is Sigma (σ) Puppis, Pi (π) Puppis, and Zeta (ζ) Puppis, and
- The "tail" runs from Zeta (ζ) Puppis through Xi (ξ) Puppis to Rho (ρ) Puppis.

Puppy:

This Latin asterism "Catulus" is the IAU constellation Canis Minor.

This English asterism "Catuli" is the IAU constellation Canes Venatici. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more

room on astronomical charts. However, it is listed as "Canes Venatici, The Hunting Dogs" in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

This German asterism "Catuli" is the name German poet Philip von Zesen (1619 – 1689) gave to both the IAU constellations Ursa Minor and Ursa Major. It is probably a corruption of the asterism Cynosura (see Dog's Tail, above).

Purad:

This Gond asterism is the IAU constellation Canis Major (Vahia 2014).

Pure of Sextans:

This **telescopic** asterism "Cáthara Sextántis" is the Magellanic spiral galaxy NGC 3115 in the IAU constellation Sextans. This was discovered by English astronomer William Herschel in 1787 who listed it as "I 163" in his catalogue. It is GC 2008 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "perfect lenticular form and clean, spotless appearance". It is also known as the "Spindle Galaxy" (see below).

Pure Virgin:

This Turkish asterism "Dufhiza Pakhiza" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899.

Pure Yoke:

"Ogias Uedon" ("pure yoke" or "yoke of youth") is a proposed early Celtic name for the IAU constellation Leo from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Purle:

This unidentified Kaurna star was listed by Hamacher in 2015. It may be a generic term for "star".

Purple Crowned Lorikeet:

This Boorong asterism "Totyarguil" was listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010) and is made up of the stars of the IAU constellation Aquila:

- The body runs from the "head" at Beta (β) Aquilae (Alshain) through Alpha (α) Aquilae (Altair) to Gamma (γ) Aquilae in the "tail", and
- The "wingtips" are Mu (μ) Aquilae and HIP 99158A.

Note: Duane Willis Hamacher II in his excellent *On the Astronomical Knowledge and Traditions of Aboriginal Australians* asserts that Totyarguil (purple crowned lorikeet or Parvipsitta porphyrocephala) is the star Alpha (α) Aquilae (Altair) as Stanbridge's description of this did not refer to a group of stars. Compare this to the Kaurna asterism "Ngakallamurro" (see Lorikeet Ashes, above).

Totyarguil throws a boomerang "Won" (see Boomerang, above). Totyarguil's mother Neilloan, the star Alpha (α) Lyrae (Vega- see Mallee Fowl, above). Totyarguil is killed but his remains are rescued by his uncle Collenbitchick (see Ant, above). The stars on either side are his wives.

This Wotjobaluk koori star "Totyerquil" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Hamacher 2011). They saw it as the son-in-law of Yerredet-kurrk (Rigel).

Purple Forbidden Enclosure:

Purple Forbidden Enclosure "Zǐwēiyuán" (紫微垣) is one of the three enclosures in Chinese sky culture, the others being Supreme Palace Enclosure and Heavenly Market Enclosure (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs, above). This represented the place of the emperor (Krupp 1983).

Two asterisms mark the boundaries of this enclosure in the Yixiangkaocheng of the 18th century:

Purple Forbidden Left Wall:

This Chinese xing guan "Zǐwēizuǒyuán" (紫微左垣) is a long line of stars in the IAU constellations Cassiopeia, Cepheus, and Draco: Iota (ι), Theta (θ), Eta (η), Zeta (ζ), Upsilon (υ), and 73 Draconis, Eta (η) Cephei, and 23 Cassiopeiae. This xing guan shares some stars with one line of a pair of Korean asterisms "Purple (Violet) Low Border" (see below).

This xing guan is a long line of stars in the IAU constellations Cepheus and Draconis, each with a name:

- HIP 6522: "Shaocheng" ("Second Imperial Minister"),
- Rho (ρ) 1 and 2 Cephei: "Shaowei" ("Second Imperial Guard"),
- Kappa (κ) Cephei: "Shangwei" ("Great Imperial Guard"),
- Phi (ϕ) Draconis: "Shaobi" ("Second Protector"),
- Zeta (ζ) Draconis: "Shangbi" ("Great Protector"),
- Eta (η) Draconis: "Shaozai" ("Second Prime Minister"),
- Theta (θ) Draconis: "Shangzai" ("Great Prime Minister"), and
- Iota (ι) Draconis: "Zuoshu" ("Left Pivot").

Purple Forbidden Right Wall:

This xing guan is a long line of stars in the IAU constellations Camelopardalis, Cassiopeia, and Draco, each with a name:

- HIP 14862: "Shangcheng" ("Great Imperial Minister"),
- HIP 24254: "Shaowei" ("Second Imperial Guard")
- HIP 33827: "Shangwei" ("Great Imperial Guard")
- 24 Ursae Majoris: "Shaofu" ("Second Advisor"),
- Lambda (λ) Draconis: "Shangfu" ("Great Advisor"),
- Kappa (κ) Draconis: "Shaowei" ("Second Commandant"), and
- Alpha (α) Draconis (Thuban): "Youshu" ("Right Pivot").

This Chinese xing guan "Zǐwēiyòuyuán" (紫微右垣) is a long line of stars in the IAU constellations Camelopardalis, Draco, and Ursa Major: It starts at HIP 15520 and runs through Alpha (α) and 43 Camelopardalis, 24 Ursae Majoris, Lambda (λ) and Kappa (κ) Draconis and ends at Alpha (α) Draconis (Thuban). This xing guan shares some stars with one line of a pair of Korean asterisms "Purple (Violet) Low Border" (see below).

Purple Forbidden Palace:

This Chinese Chenzhuo xing guan Zigong (紫宫, Purple Palace) consists of two "walls" of stars:

- **Purple Forbidden West Wall**: This is a curving line of stars of the IAU constellations Camelopardalis, Draco, and Ursa Major. Starting at HIP 25110 ("Xingui" ("Trustworthy Turtle")) it runs through HIP 33694 ("Tongling" ("Phoenix Tree Mound")), HIP 40793 ("Ziguang" ("Purple

Radiance")), 27 Ursae Majoris ("Zhimen" ("Straight Gate")), HIP 52425 ("Jianxing" ("Treacherous Star")), and Lambda (λ) Draconis ("Ziming" ("Catalpa Brightness")), 6 Draconis ("Shoumen" ("Gatekeeper")), and Kappa (κ) Draconis ("Tianyi" ("Celestial Great One")), to 4 Draconis ("Taiyi" ("First Great One")).

- **Purple Forbidden East Wall**: This is a curving line of stars in the IAU constellation Draco: Starting at HIP 92056 ("Shunguang" ("Harmonious Radiance"), it runs through Phi (φ) Draconis ("Guangbo" ("Lord of Light"), Zeta (ζ) Draconis ("Longdeng" ("Dragon Ascendant")), Eta (η) Draconis ("Kaifan" ("Prosperous Frontier")), Theta (θ) Draconis ("Panxing" ("Academy Star")), and Iota (ι) Draconis ("Qingmen" ("Celebration Gate") to Alpha (α) Draconis (Thuban, "Touguan" ("First Observatory").

Purple Radiance:

This Chinese Chenzhuo xing guan "Ziguang" is the star HIP 40793 in the IAU constellation Camelopardalis. It is part of their xing guan Purple Forbidden West Wall.

Purple (Violet) Low Border:

"Bolasaeg Naj-eun Teduli" (보라색 낮은 테두리) is one of the three enclosures in Korean sky culture, the others being Sky Market Border and Big Low Border (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs, above). This consists of two asterisms of long curving lines of stars in the IAU constellations Draco and Ursa Major:

- One line starts at Kappa (κ) Draconis and runs through Lambda (λ) Draconis, HIP 52425, 27 Ursae Majoris, and HIP 33694 and ends at HIP 25110. Note that the Chinese xing guan "Purple Forbidden Right Wall" (see above), which is longer, contains some of the same stars.
- One line starts at Alpha (α) Draconis (Thuban) and runs through Iota (ι), Theta (θ), Eta (η), Zeta (ζ), and Omega (ω) Draconis, ending at Phi (φ) Draconis. Note that the Chinese xing guan "Purple Forbidden Left Wall" (see above), which is longer, contains some of the same stars.

Pursuers:

This Dakelh asterism "Enitəɬ" is the IAU constellation Orion (Cannon 2021).

Purt-mayel:

This Wotjobaluk star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Massola 1968, Hamacher 2011).

Pushan:

This Vedic star "Pūṣan" or "Pushan" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in the Rig-Veda (Ivanković 2021). This was considered a projection of the Vedic solar God Pūṣan, who was one of the children of Aditi (see above).

Putara:

This Māori star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Pwupw:

This Poluwatese asterism is the IAU constellation Crux (Holton et al 2015).

Pwuupw:

This Micronesian asterism is the IAU constellation Crux.

Pyeittha:

This Myanmar yathi (zodiac constellation) “Pyeittha” (ပြဿ) is the IAU constellation Taurus.

Pyramid:

This Latin asterism “Pyramme” is the IAU constellation Ara as listed in John Hill’s *Urania* in 1754. He describes it as a Greek name, but the Greek word for pyramid is “pyramida”.

This **telescopic** asterism is in the IAU constellation Canis Major and is Corder 1084 on the observing list of American astronomer Jeffrey Corder. Size 50’ X 25’. This is six 6^{th} – 8^{th} magnitude stars including HIP 30461, 30390, 30288, 30263, 30203, and 30066.

Python:

This Latin asterism “Python” is the IAU constellation Draco. Johann Bayer’s *Uranometria* (1603) lists the name “Python” for this constellation.

Pyxis:

None of the stars of Pyxis are on the list of 90 brightest stars and the stars of this constellation only show up in 31 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Pyx) was originally the “mast” of Ptolemy’s constellation Argo Navis (see Argo’s Ship, above). Pyxis was created by French astronomer Abbé Nicolas Louis de Lacaille in 1752, who “disassembled” Argo Navis into the three IAU constellations Carina, Puppis, and Vela. He named this part “la Boussole” (“the Marine Compass”) and it appears under this name on Lacaille’s *Planisphère des Étoiles Ausralea* (1756), depicted as a compass. Lacaille later latinized the name to “Pixis [sic] Nautica” on his 1763 sky chart.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Boussole” as a marine compass.

English astronomer Francis Baily (1774 – 1844) reattached it to the asterism Argo’s Ship (see above), but American astronomer Benjamin Apthorp Gould (1824 – 1896) listed it in his *Uranometria Argentina* in 1879.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as “Pyxis Nautica”.

German astronomer Johann Elert Bode (1747 – 1826) later extended it to form the obsolete constellation “Lochium Funis” (see Log and the Line, above) although in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) he labels it “Compas Logleine”. Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Wintelmasse”.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Pyxis Nautica” as a marine compass.

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Pyxis" and describes its "original form" as "Pyxis Nautica", describing it as "The Compass".

On a standard IAU chart this constellation is a line of three stars: Gamma (γ), Alpha (α), and Beta (β) Pyxidis.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) reassembled the obsolete constellation Argo Navis (see Argo's Ship, above) and incorporated Pyxis as the "tiller" in his book *The Stars - A New Way to See Them* (1952): He did this by extending a line from Beta (β) Pyxidis to Zeta (ζ) Puppis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Pyxis in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a bending line of the stars Theta (θ), Kappa (κ), Delta (δ), Gamma (γ), Alpha (α), and Beta (β) Pyxidis.

Sky and Telescope Magazine, founded in 1941, depicts Pyxis in their magazine and publications as the line of stars Zeta (ζ) Puppis, Beta (β) Pyxidis, Alpha (α) Pyxidis, and Gamma (γ) Pyxidis.

Q:

This **telescopic** asterism is the open cluster IC 4665 in the IAU constellation Ophiuchus. It was discovered in 1745 by Swiss astronomer Phillipe Loys de Chéseaux. Despite its brightness, it was not catalogued by Charles Messier or William Herschel. American astronomer Edward Emerson Barnard (1857 – 1923) recorded it, which resulted in it becoming IC 4665 in the *Index Catalogue*. This was listed by South African astronomer Auke Slotegraaf (1995), who described it as "a loop of nine stars with a little tail of three stars leading off to the northwest, just like the capital letter 'Q'". It is also known as the Summer Beehive, Poseidon's Trident, Mini Grus, Lambda, or the Black Swallowtail Butterfly.

Qet:

This Egyptian decan "Qet" was in the IAU constellation Aries. In later Hellenistic texts it was named "ϫονταϫρє" ("Si-ket"). In the Testament of Solomon, it became "Barsafael", Aristobulus of Paneas called it "Mensour", in Greek Hermeticism it became "Chontaret", in Latin Hermeticism "Sabaoth", Roman astrologer Julius Firmicus Maternus called it "Senacher" or "Asenter", Cosmas of Maiuma (d. 760) called it "Persephone", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Senacher", and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲁⲛⲟⲩⲃ" ("Anubis"). Variations include "Kontaret" or "Kau". It has been depicted as a figure with a dog's face with a scepter in the right hand and a disk in the left.

Qí:

This Chinese star "Qí" from the 3 Kingdoms and Ming Dynasty Period is the star 112 Herculis in the IAU constellation Hercules and is and is part of their xing guan Heavenly Market East Wall (see above).

Qín:

This Chinese star "Qín" from the 3 Kingdoms and Ming Dynasty Period is the star Epsilon (ε) Serpentis in the IAU constellation Serpens and is part of their xing guan Heavenly Market West Wall (see above).

Quadrantum:

See Rhombus, below.

Quadrilateral:

This **telescopic** asterism is made up of stars of the IAU constellation Vulpecula and was posted in *Cloudy Nights* by Will Rothfuss in July 2022. The stars are 12, 13, 16, 17, and 14 Vulpeculae. Will Rothfuss uses this to locate Messier 27, the Dumbbell Nebula, which is near 14 Vulpeculae.

Quadrireme of Libra:

This **telescopic** asterism "Quadrirémis Líbrae" is the intermediate spiral galaxy IC 4538 in the IAU constellation Libra. It was discovered by Lewis Swift in 1895. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this "because of its four spiral arms this galaxy is named after a quadriremis". A quadrireme is a galley with four banks of oars.

Quarter:

This Arabic asterism "ar-Ruba῾" (الرُّبَع) is the main body of the IAU constellation Draco (see Draco, above), later latinized to "Alawaid".

Queen Kassiepeia:

This Greek asterism "Κασσιέπεια" or "Kassiépeia" is the name for the IAU constellation Cassiopeia used in Ptolemy's *Almagest* in the 2nd century. Aratus (315 – 240 B.C.E), Euripides (480 – 408 B.C.E.), and Sophocles (d. 406 B.C.E.) all used this name. On modern star maps this is depicted as a bent W (see W below) but it is a more complex asterism in the *Almagest*:

- Queen Kassiepeia's "body" starts at her "shoulders" at Alpha (α) Cassiopeiae (Shedar) and runs down through Eta (η) Cassiopeiae to "hips" at Gamma (γ) Cassiopeiae and then to a "knee" at Delta (δ) Cassiopeiae to a "leg" that runs through Epsilon (ε) Cassiopeiae to a "foot" at Iota (ι) Cassiopeiae,
- Her "head" is the star Zeta (ζ) Cassiopeiae,
- One "arm" (draped across the back of the "throne") runs from Shedar to a "hand" at Sigma (σ) Cassiopeiae,
- The other "arm" runs from Shedar to an "elbow" at Theta (θ) Cassiopeiae and a "hand" at Phi (ϕ) Cassiopeiae, and
- Beta (β) Cassiopeiae and Kappa (κ) Cassiopeiae form parts of the "throne".

Queen of Phoenix:

This **telescopic** asterism "Basilíssa Phoenícis" is the elliptical galaxy IC 1633 in the IAU constellation Phoenix. It was discovered American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this giant elliptical galaxy dominates its neighbourhood as the queen her realm."

Queen of Virgo:

This **telescopic** asterism "Regina Virginis" is the lenticular or elliptical galaxy NGC 4406 (Messier 86) in the IAU constellation Virgo. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

It forms one of the "eyes" of the Great Galactic Face (see above) and is part of Markarian's Chain (see above).

Queen's Cache:

This **telescopic** asterism is the open cluster NGC 3228 in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "II 7" in his catalogue. It is GC 2090 in the *General Catalogue* of 1864. This is also known as the Little Flower Cluster (see above) and "V" (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this without a name.

Queen's Kite:

See Kite above.

Queen's Reflection:

This **telescopic** asterism is the open cluster Collinder 463 in the IAU constellation Cassiopeia. It is called this as it is roughly a "W" shape which is aligned with the constellation Cassiopeia, as if it was a reflection of it.

Question Mark:

There are eighteen **telescopic** "question mark" asterisms:

- One is emission nebula and open cluster NGC 7822 (SH 2-171, LBN 589, SNR G118.3+04.8) in the IAU constellation Cepheus. John Herschel listed this as h 2302 and later as GC 5051 in his *General Catalogue* of 1864. It is also known as the Devil's Head (see above).
- One, also known as the Cosmic Question Mark, can be found in the IAU constellation Cetus. The curve of stars starts with HIP 12272 and runs through HIP 12148, 12022 and 12114 then straightens out through HIP 12113 and ends at Nu (ν) Ceti. This is Patchick-Weinerroither 1 on the asterisms list of astronomer Dana Patchick. Its size is 150' X 50'.
- One is Cseh 21 listed by Hungarian astronomer Viktor Cseh which is a group of stars in the IAU constellation Pavo. Cseh describes it as a "small group with 5 – 6 cluster members. Its shape resembles a question mark.
- One is Hay-Merting 5 in the IAU constellation Sagitta. This was discovered by the German astronomer Christopher Hay in 2016. Size 12' X 5'. Robert Zebahl lists it on his *Faint Fuzzies* website and explains that it "shows the clear shape of a question mark. There are no notably bright stars in the immediate vicinity, so the pattern is quite apparent.
- One is Leiter 4 in the IAU constellation Sagitta.
- One is Prestgard 56 on the list of French astronomer Trygve Prestgard, which is in the IAU constellation Taurus. This is a group of 6^{th} – 10^{th} magnitude stars 10° north of Alpha (α) Orionis (Betelgeuse). One end of the "question mark" is HIP 28416 and the other end is HIP 28327
- One is Corder 562 in the IAU constellation Fornax, from the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25'. This includes HIP 16851, 16886, and 16904.
- One is Corder 2072 in the IAU constellation Hydra. This includes the stars HIP 52920, 52905, 52894, 52888, 52950, 52841, and 52789.
- One is Corder 2398 in the IAU constellation Hydra, from the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45' X 20'. Corder describes it as "an elongated group of eight stars that are magnitudes 8 and 9… elongated in a north/south direction."

- One is Corder 4653 in the IAU constellation Vulpecula and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 30' X 10'. Includes HIP 110508.
- One is in the IAU constellation Camelopardalis and is Ennis 35 on the observing list of Canadian astronomer Charles Ennis. A curve of 6^{th} – 8^{th} magnitude stars is formed by HD 22400, HIP 17083, HIP 17075, HIP 17008, HD 22221, HD 22057 and 16749 forms the "loop" and a line from HD 237152 through HIP 16581 to double star HIP 16303A at the end as the "period".
- One is in the IAU constellation Hydra and is Corder 2033 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is twelve 8^{th} – 10^{th} magnitude stars including HIP 51598 and 51447.
- One is in the IAU constellation Corvus and is Corder 2347 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 7^{th} – 8^{th} magnitude stars including HIP 60708, 60623, 60486, and 60474.
- One is in the IAU constellation Sagittarius and is Corder 3433 on the observing list of American astronomer Jeffrey Corder. Size 50' X 15'. This is nine 9^{th} – 10^{th} magnitude stars including the double star HIP 88477A.
- One is in the IAU constellation Draco and is Corder 3867 on the observing list of American astronomer Jeffrey Corder. Size 60' X 40'. This is eight 6^{th} – 9^{th} magnitude stars including HIP 95167 and 95382. Corder describes this as a "'question mark' or sheep herder's 'Staff'".
- One is Messier 51 (NGC 5194), a pair of interacting galaxies in the IAU constellation Canes Venatici. It was discovered by French astronomer Charles Messier in October 1773. Irish astronomer Lord Rosse first recorded its spiral structure in 1845. Dreyer describes it in the 1888 New General Catalogue as the "Great Spiral Nebula". It is listed in the 1864 General Catalogue as GC 3572 and in John Herschel's catalogue as h 1623. *1001 Wonders as Observed with Home Built Instruments*, 3^{rd} edition (1931), by American astronomer Charles Howard Barns lists it as "resembling more of an eternal question mark". It is also known as the Whirlpool (see below), Herschel's Ring, and Rosse's Galaxy (see below).
- One is Arp 148 (PGC 33423), a pair of colliding galaxies in the IAU constellation Ursa Major. It was discovered by American astronomer Nicholas U. Mayall (1906 – 1993) at the Lick Observatory in March 1940 using the 36" Crossley reflector telescope. It appears to be a ring galaxy with a tail emerging from it. Mayall described it as being shaped like a question mark. It is also known as Mayall's Object (see above).
- One is the Pleiades Cluster in the IAU constellation Taurus. It was posted on *Cloudy Nights* by female astronomer "Terra Nova" in February 2022.

Queue:

This Serbian asterism "Porednice" is the Belt and Sword of the IAU constellation Orion.

Quiet One of Fornax:

This **telescopic** asterism "Plácida Fornácis" is the intermediate spiral galaxy NGC 1371 (AKA 1367) in the IAU constellation Fornax. It was discovered by English astronomer William Herschel in 1784 and listed as NGC 1371. American astronomer Ormond Stone observed it in 1886 and listed it as NGC 1367. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Quiet One of Virgo:

This **telescopic** asterism "Tranquíllus Vírginis" is the spiral galaxy NGC 4235 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 17". It became GC 2821 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the lack of active star formation.

Quintuplet Cluster:

This **telescopic** asterism is a star cluster about 100 light years away from the Galactic Center of our galaxy in the IAU constellation Sagittarius and contains the Pistol Nebula (see above).

Quiver:

The stars of this Tanacross asterism "k'aath" are unidentified at present (Cannon 2021).

This Latin asterism "Pharetra" is the IAU constellation Sagittarius. This is listed in the *Uranometria* (1603) by German astronomer Johann Bayer (1572-1625). John Hill lists it in his *Urania* in 1754 and describes it as "one of the Arabian constellations" but does not identify the modern constellation or the source.

Quntur:

This Inca star is Delta (δ) Orionis (Mintaka) in the IAU constellation Orion (Gamarra & Gamarra 2009).

Quyllur:

This **telescopic** star is a red supergiant in the El Gordo galaxy cluster in the IAU constellation Phoenix. Quyllur is a Quechua word meaning "Star".

Rabbit:

This Pawnee asterism is the "W" asterism in the IAU constellation Cassiopeia (see W below.

This Tupi asterism "Tapiti" is the IAU constellation Libra (De Freita Mourão 2009).

This **telescopic** asterism is the star cluster Collinder 29 (Trumpler 2) in the IAU constellation Perseus. It is listed on the AstroHam blog of the William Brydone Jack Unit of the New Brunswick Centre of the RASC. Size 20'.

This Estonian asterism "Jänes" is the IAU constellation Lepus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Rabbit Nest:

This Southern Paiute asterism "Sonee" is the Pleiades cluster in the IAU constellation Taurus (Gillard 2021). This is the home for Coyote's children.

Rabbit Net:

This Shoshone asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Numic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). This is a net put out by Rabbit.

Rabbit Tracks:

This Diné asterism “Gah Hahat’ee” or “Gah Heet’e’ii” is a group of stars in the IAU constellation Scorpius at the feet of their asterism First Big One (see above): Iota (ι) 1, Kappa (κ), Lambda (λ) and Upsilon (υ) Scorpii (Childrey 2008). The Diné believed that it was inappropriate to hunt when these stars were visible.

Rabbit Warren:

This Wichi and Toba asterism was first noted in 1935 but the stars have not been identified (Mariani 2017). Compare to the Tupi asterism “Tapiti” (see Rabbit, above).

Raccoon’s Children:

This Shasta asterism is the Pleiades cluster in the IAU constellation Taurus.

Radiant of Ursa Major:

This **telescopic** asterism “Rádians Úrsae Majóris” is the intermediate spiral galaxy NGC 2841 in the IAU constellation Ursa Major. It was discovered by William Herschel in 1788. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its “very dissolved appearance”. It is also known as the “Tiger’s Eye” (see below). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as O’Meara 49 without these names.

Radio Antenna:

This asterism from the Saguaro Astronomy Club’s asterism database is the “head” of the IAU constellation Hydra: Delta (δ), Rho (ρ), Eta (η), Zeta (ζ), and Epsilon (ε) Hydrae form a circlet of stars.

Radio Telescope:

There are two **telescopic** “radio telescope” asterisms:

- One is open cluster NGC 1981 in the IAU constellation Orion. It was discovered by English astronomer John Herschel in 1827 becoming h 362 on his list and GC 1184 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a radio telescope with the dish pointing to the upper left.
- One is Vastagh 8, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cygnus. Its apparent diameter is 1° 3’. Vastagh describes this as a “Large asterism with many bright members… and resembles a radio antenna, has a moderately loose structure. Number of stars, - up to 12 cores, - at least 80 pcs. The support bracket of the astronomical antenna, its plate in profile and the sensor head are clearly visible. The surrounding area is richly dotted with fainter stars.”

Radioactive Warning Sign:

This Canadian **telescopic** asterism is in the IAU constellation Taurus and was discovered by RASC member Stephe Bedingfield, who lives in Yellowknife, NWT: He spotted this close by Alpha (α) Tauri (Aldebaran). This is a triangle of double stars, 35’ across, the three apex groupings being:

- Theta (θ) 1 and 2 Tauri,
- 80 and 81 Tauri, and
- HIP 21053 and HIP 21029.

Raedgastran:

This Anglo-Saxon asterism “Raedgastran”, “Raegasnan”, or “Redgaestrum” is the Hyades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. The meaning is unknown.

Ragged of Hydra:

This **telescopic** asterism “Tetrímmenus Hýdrae” is the spiral galaxy NGC 5085 in the IAU constellation Hydra. It was discovered in 1789 by William Herschel who listed it as “II 780”. It became GC 3492 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the outer disk of this galaxy is filled with fragmented arms”.

Ragged of Pavo:

This **telescopic** asterism “Pannúceus Pavónis” is the dwarf peculiar galaxy IC 4710 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its “ill-defined spiral structure”.

Railings:

This Chinese xing guan “Héng” (衡) is a bent line of four stars in the IAU constellation Centaurus: Nu (ν), Mu (μ), Phi (ϕ) and Chi (χ) Centauri. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Héng” is a bent line of four stars in the IAU constellation Centaurus: Nu (ν) Centauri, Mu (μ) Centauri, Phi (ϕ) Centauri, and Chi (χ) Centauri.

Rain:

This Nambikwara asterism is the Hyades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

Rain Bringing:

This Latin asterism “Imbrifer” is the IAU constellation Capricornus. Johann Bayer’s *Uranometria* (1603) lists the name “Imbrifer” for Capricornus.

Rain Bull:

This Jū/Wãsi, Jū /’hoansi, !O Kung, and Nyae Nyae !Kung asterism “Tshxum” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014). Scholars are uncertain as to which animal “Tshxum” refers. The Jū/Wãsi connect Tshxum with the stars Alpha (α) Carinae (Canopus) in the IAU constellation Carina (which they call “Naka”, the “Horn Star”) and Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (which they call the “Green Leaf Horn”): together they call the stars “the horns of the Tshxum”. These stars are separated by 98 degrees of celestial latitude, although they are near to each other in right ascension, and the Pleiades cluster is ahead of them by and hour and a half, so it is difficult for outsiders to see how they connected these three into an asterism.

Rain Star:

This Hungarian asterism “Esöcsillag” from the Hortobágy Puszta area is unidentified but may be near to the IAU constellation Perseus.

This Lithuanian star “Lietaus žvaigždė” is currently unidentified. Compare to the Hungarian star by the same name.

Rain Stars:

This /Xam and Khoikhoi asterism “tiqua” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014).

This Japanese asterism “Ame Fure Boshi” is the Hyades cluster in the IAU constellation Taurus (Renshaw and Ihara 2001).

Rainbow:

This Babylonian asterism “TIR.AN.NA” or “manzât” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Centaurus.

This Chaldean asterism “mul.tir.an.na” from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Centaurus (Koch-Westenholz 1995). It is also described in this list as “tir.an.na ud nu-uh-su mu.bi mar-ra-tum” (“Rainbow, its name is ‘day of plenty’, the rainbow”).

Rainbow of Pegasus:

This **telescopic** asterism “Íris Pégasi” is the spiral galaxy NGC 7217 in the IAU constellation Pegasus. William Herschel listed this as “II 207”. John Herschel listed this as h 2149 and later as GC 4760 in his *General Catalogue* of 1864. This galaxy is part of a group of interacting galaxies including NGC 7173, 7174, and 7176. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its “clear transition of colours”.

Rainbow Runner:

This Kiribati asterism “Kama” or “Kaáma” is the IAU constellation Crux (Trussel and Groves 1978). This is a species of fish (Elagatis bipinnulata).

Rainbow Serpent:

This Wiradjuri asterism “Wawi” is made up of the stars of the dust lanes of the Milky Way through the IAU constellations Crux, Centaurus, Norma, Scorpius, and Triangulum Australe. It stretches between Crux and Scorpius with Triangulum Australe as the tail (Clarke 2009).

This Wardaman asterism “Gorrondolmi” is made up of the stars of the dust lanes of the Milky Way through the IAU constellations Crux, Centaurus, Norma, Scorpius, and Triangulum Australe. It stretches between Crux and Scorpius with Triangulum Australe as the tail.

Rainy Goat Star:

This Greek star “Κινῆσαι Χειμῶνας” or “Kinísai Cheimónas” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as described by Aratus (3rd century B.C.E.) and listed in R. H. Allen’s *Star Names* in 1899. It indicated the beginning of the rainy season to ancient navigators. Compare this to Olympic Rainy Capella, above.

Rainy of Coma Berenices:

This **telescopic** asterism “Ímbrica Cómae Bereníces” is the elliptical galaxy NGC 4278 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it twice: Once as

"I 90" and once as "II 322". John Herschel listed it as h 1186 and later as GC 2855 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "like a cloud of droplets many globular clusters surround this galaxy".

Rainy Season Thieves' Cross:

This K'iche' asterism is the IAU constellation Crux (Milbrath 1999). It is considered a portal to the underworld as it is in a rift section (Xibalba be) in the Milky Way. They also had a Dry Season Thieves' Cross (see above).

Rainy Weather:

This Latin asterism "Pluviales" is the Haedi asterism (see Kids above) as described by 1st century B.C.E. Roman poet Quintus Horatius Flaccus (Horace (65 – 8 B.C.E.)) and 1st century Roman poet Marcus Manilius. The 1st century B.C.E. Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.) called them "Nimbosi" ("rainy"). They indicated the beginning of the rainy season to ancient navigators.

Raised Tail of the Scorpion:

This Arabic and Bedouin manzil "Al-Shawlah", "Al-Šawlah" (الشولة), or "ʾAsh-Shawlah" (ٱلْشَّوْلَة), which translates as "sting of the scorpion" or "raised tail of the scorpion" is in the IAU constellation Scorpius and is the stars Lambda (λ) Scorpii (Shaula) and Upsilon (υ) Scorpii (Lesath):

- "al-Shawla", "Shawlat al-Sura", and "Shawlat al-'Aqrab" are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists the name "al-shawla" for Nu (ν) Scorpii.
- This was later latinized to "Shaula", "Shauka", "Alascha", "Mosclek", and "Shomlek".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) labels this star "Cauda" ("tail".
- Robert Hues (1659) listed it as "Schomlek" and Hues adds the variation "Moselek".
- In his *Urania* in 1754, John Hill lists it as "Alasha" and describes it as ""a misspelling of the term alshaula, the Arabic name of this part of the constellation… it is also called Shamelau". Later in *Urania* Hill gives the name "Shaula or Al Shaula" as "a name of certain stars in the tail of the constellation Scorpio".
- W. Brennand lists this as "Al-Shaula" in his *Hindu Astronomy* in 1896.
- R. H. Allen translates it in his *Star Names* in 1899 as "the Sting" (which is actually the Arabic name for Messier 7) but notes that astronomer Abu Rayhan Muhammad ibn al-Biruni (in turn citing 8th century astrologer Mashallah ibn Athari) translated it as "raised".
- John Chilmead (1899) listed it as "Schomlek"
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists Lambda (λ) Scorpii as "Shaula".
- The IAU approved the name Shaula for the star Lambda (λ) Scorpii Aa.

This Yemeni manzil "Shawla" is the stars Lambda (λ) Scorpii (Shaula) and Upsilon (υ) Scorpii (Lesath) in the IAU constellation Scorpius (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Rake:

This Old High German asterism is the belt of Orion in the IAU constellation Orion.

This German asterism from the Chaco region of Argentina is the belt of Orion and the star Beta (β) Orionis (Rigel) in the IAU constellation Orion (Mudrik 2011).

This French asterism "le Rateau" is the belt of Orion in the IAU constellation Orion and appears in the French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719).

This Estonian asterism "Reha" is the belt of Orion asterism plus the star Beta (β) Orionis (Rigel) in the IAU constellation Orion (Kuperjanov 2003) and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala).

This English asterism is the Belt of Orion asterism in the IAU constellation Orion. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as the "Rake of husbandmen".

This Belarussian asterism "Grabli" is a line of stars running through the sword of Orion from HIP 26263A to HIP 26173A with a line running out either side of HIP 26173A to form a "T", one to 49 Orionis and the other to 36 Orionis (Avilin 2009). The three stars of Orion's belt are "the mowers" (see Mowers, above) using that "rake".

This French asterism "Râteau" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899. Allen only identifies the source as "husbandmen of France and along the Rhine".

This Romanian asterism "Grebla" is made up of stars of the IAU constellation Orion (Ottescu 2009). The "plough" is a quadrilateral created by Orion's belt and the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph), with the handle being a line from Delta (δ) Orionis (Mintaka) to Gamma (γ) Orionis (Bellatrix). It is also known as the Little Plough (see above) or simply the Plough (see above).

Rake and Scythe:

This Ukrainian asterism "Krabli ta Kosa" (Граблі та коса) is the IAU constellation Orion. Some versions describe this as a rake and flail.

Rakers:

This Italian (Piedmont and Ligurian Alps) asterism "Rastliris" is the stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) in the IAU constellation Orion. It is related to their asterism Mowers (see above).

This Lithuanian asterism "Grėbėjos" is the sword of Orion in the IAU constellation Orion.

Rakuman:

This Carib star represents Rakuman, one of the first Caribs. Its present location is unknown (Magaña, and Jara, 1982).

Ram:

This Greek asterism "Κριός" ("Kriós") is the IAU constellation Aries as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest* in the 2nd century, being made up of stars in the IAU constellations Aries and Cetus:

- Alpha (α) Arietis (Hamal) is not actually part of the asterism, being described by Ptolemy as "the star over the head",
- The "head" is a quadrilateral of the stars Gamma (γ) Arietis, Iota (ι) Arietis, Theta (θ) Arietis, and Eta (η) Arietis,
- From Gamma (γ) Arietis a curved "horn" is formed by the stars Beta (β) Arietis (Sheratan), HIP 9492, 9815, and 9248,
- One side of its "body" runs from the "neck" at Iota (ι) Arietis through HIP 10050, and Nu (ν) Arietis to Epsilon (ε) Arietis,
- The back side of the "body" runs from Epsilon (ε) Arietis through Rho (ρ) Arietis and Sigma (σ) Arietis to an "ankle" at 38 Arietis and a "hoof" at Mu (μ) Ceti, with the front of the "leg" running from 38 Arietis to 42 Arietis,
- The underside of the "body" runs from 42 Arietis through 29 Arietis and 19 Arietis back to the neck at Iota (ι) Arietis, and
- The "tail" starts at Epsilon (ε) Arietis and runs around through Delta (δ) Arietis, Tau (τ) 1 and 2 Arietis, and Zeta (ζ) Arietis then back to Epsilon (ε) Arietis.

This Seleucid asterism "LU" (see Hired Man, above) or "UDU.NIT" ('ram") from the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Aries (Foxvog 1993).

NOTE: The Greek Ram appears alongside a sitting cat in the Daressy Zodiac of the Roman Imperial Period.

This Arabic asterism "al Hamal" is the IAU constellation Aries:

- It was later listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671) as "Hammel".
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as as "Alchamalo".
- This constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Elhamel" and Alchamalo".
- John Chilmead in his *A Learned Treatise on Globes* (1889), which was a translation of the Latin work by English geographer and mathematician Robert Hues (1553 – 1632) named it "Alhamel".

This Arabic asterism "Alkabsh" (الكبش) is the IAU constellation Aries.

This Egyptian Dendera asterism is the IAU constellation Aries (Hoffman 2017). It is a ram, not the Babylonian Hired Man (see below).

This German asterism "Widder" is the IAU constellation Aries. "Widder" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a common name for Aries:

- German astronomer Johann Bayer (1572-1625) listed it as "Wider".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Widder".
- "Widder" is listed in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der Widder".

This Hittite asterism is the IAU constellation Aries as listed in the III KUB XXV 37 tablets (Boutet 2014).

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Ariete" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

This French asterism “Bélier” is the IAU constellation Aries.

This Saxon asterism “Ramm” is the IAU constellation Aries.

This Norman asterism “Multuns” is the IAU constellation Aries.

This Belarussian asterism “баран” (“Baran”) is the IAU constellation Aries.

This Romanian asterism “Berbecul” is the IAU constellation Aries (Ottescu 2009, Lite, Lodina, and Ignat 2018).

Ramming Ship of Pegasus:

This **telescopic** asterism “Ėmbolus Pégasi” is the pair of spiral galaxies NGC 7253 (Arp 278) in the IAU constellation Pegasus. They were discovered by Albert Marth in 1863. It became GC 6037 in the General Catalogue of 1864. This galaxy is part of a group of interacting galaxies including NGC 7173, 7174, and 7176. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “Galaxy NGC 7253A looks like a ship ramming NGC 7253B”.

Ramming Ships of Draco:

This **telescopic** asterism “Émbole Dracónis” is the interacting galaxies NGC 6670 in the IAU constellation Draco. It was discovered by Lewis Swift in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “both distant galaxies are seen edge-on, resembling slender ships, creating the impression of one ship ramming another”. It is also known as the “Leaping Dolphin” (see above) and the “Poster Girl”.

Rampart:

This Korean asterism “Seongbyeog” (성벽) is a line of stars attached to a quadrilateral in the IAU constellations Aquarius and Capricornus:

- The line runs from Gamma (γ) Aquarii through Sigma (σ) and Iota (ι) to Delta (δ) Capricorni at one corner of the quadrilateral, and
- The four stars in the quadrilateral are Delta (δ), Gamma (γ), Epsilon (ε), and Kappa (κ) Capricorni.

Ramphastes:

This Greek asterism is the IAU constellation Tucana as listed in John Hill’s *Urania* in 1754.

Ram’s Head:

This **telescopic** asterism Hay-Merting 3 is in the IAU constellation Orion. It was discovered in 2014 by German astronomer René Merting and listed by Robert Zebahl on his *Faint Fuzzies* website. Zebahl describes it as “located about 40’ northwest of Abell 12. A narrow and a wide curved star chain give a slightly three-dimensional impression of the horns of a ram. Observers with a lot of imagination can additionally see the ram’s skull”. The brightest star appears to be the variable star DN Orionis (HIP 28456). Size 6’ X 6’.

Ran:

This IAU star is Epsilon (ε) Eridani in the IAU constellation Eridanus and is named for Rán, the Norse goddess of the Sea. The IAU approved the name Ran for Epsilon (ε) Eridani in 2015. This has an exoplanet named Ægir.

Rangawhenua:

This Māori asterism is the IAU constellation Corona Borealis.

Ranger:

This American asterism is made up of the stars of the front end of the IAU constellation Serpens and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is depicted as a park ranger whose "hat" is the head of Serpens.

Rangi-Matanuku:

This Māori asterism is the Large Magellanic Cloud (Orchiston 2017).

Rangifer:

See Reindeer, below.

Rapasti-su:

This Babylonian ziqpu "mul sa gisKUN" from cuneiform text AO 6478 (Schaumberger 1952) is Delta (δ) and Theta (θ) Leonis in the IAU constellation Leo.

Rapeto:

This **telescopic** Malagasy star is HIP 83547 (HD 153950) in the IAU constellation Scorpius (magnitude 7.38). It was given this name in the IAU NameExoWorlds campaign. Rapeto is a giant creature in Malagasy mythology. This has an exoplanet named Trimobe, who is an ogre from Malagasy legends.

Raphael:

This German asterism "Raphael" or "Saint Raphael the Archangel" is the IAU constellations Dorado, Tucana, Hydrus, and the two Magellanic Clouds and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Raphael". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

This is one of the Archangel Stars (see above), Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

Rarae:

The stars of this Kiribati asterism "Rarae" or "Riru ma Rarae" are unidentified at present (Trussel and Groves 1978).

Rasalas:

See Northern Part of the Head of the Lion, above.

Rasalgethi:

See Head of the Kneeler, above.

Rasalhague:

See Head of the Snake Man, above.

Raspberry Nebula:

See Spirograph Nebula, below.

Rastaban:

See Head of the Snake, above.

Rat:

This Netwar asterism “Kahaur Rul”, also known as the Scorpion’s Dart, is made up of four stars of the IAU constellation Scorpius: Lambda (λ), Upsilon (υ), Kappa (κ), and Iota (ι) Scorpii.

This Micronesian star “Jiic” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This Polynesian star “Iti” or “Itiiti” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This is a name that the President of the Sunshine Coast Centre of the RASC, Bruce Fryer, came up with for the IAU constellation Ursa Major. In February 2019 I was operating the telescope at our Sunshine Coast Centre observatory in Wilson Creek, BC, when I noticed that Bruce was out on the observatory deck with another telescope and was gazing at the sky northwards. Having come to a point where I could take a break, I went out to see him and turning to look in the direction that he was, I saw he was looking at the Big Dipper asterism in the IAU constellation Ursa Major. I asked him what he was looking at, and he said: “That’s not a bear, it’s a rat.” The stars have moved since Ursa Major was first named “the Great Bear”, and I have to say that I agree with him: It does look more like a rat now. We’ve called it “the Great Rat” ever since.

Rat Seen in the Evening in Zenith When it is Time to Prepare Gardens:

“Lahuk Rul” is a Nahwal name for the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Ramík 2019).

“Kahau rul” is a Netwar name for the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Ramík 2019).

Ratatoskr:

This Norse asterism “Ratatoskur” or “Ratatoskr” is made up of stars of the IAU constellation Lacerta and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Ratatoskr is a squirrel who runs up and down the world tree Yggdrasil to carry messages between the eagles at the top and the serpent Niöhöggr, who dwells beneath its roots.

Rattle:

This Ininew asterism “Sisikwun” is made up of the stars of the IAU constellations Cepheus and Ursa Minor (Buck 2020):

- The “head” of the rattle is Zeta (ζ) Cephei, Iota (ι) Cephei, Beta (β) Cephei (Alfirk), and Alpha (α) Cephei (Alderamin),

- The “handle” extends from 31 Cephei through a line of fainter stars to Alpha (α) Ursae Minoris (Polaris).
- The “handle” of the Little Dipper asterism is seen as a thong attached to the handle.

Rattlesnake:

There are two versions of this Mayan asterism “Chaan”:

- One is made up of stars from the IAU constellations Corona Australis, Sagittarius, and Telescopium. The body is a wavy line of stars from Sigma (σ) Sagitarii through Zeta (ζ), Epsilon (ε), Eta (η) Scorpii, to a bend at Theta (θ) Scorpii and running down through Alpha (α) Telescopii to the curving line of the IAU constellation Corona Australis that forms the “rattle”.
- In the postclassic Paris Codex this Mayan asterism is a combination of the Pleiades cluster in the IAU constellation Taurus with the stars of the IAU constellation Perseus (Milbrath 2014). The line of stars from Eta (η) Persei through Alpha (α) Persei (Mirfak) to Zeta (ζ) Persei is the body of the snake with the Pleaides as the “rattle”. Compare this to the Yucatec asterism “Tzab” (see Rattlesnake’s Rattle, below) which is only the Pleaides cluster in the IAU constellation Taurus.

Rattlesnake’s Rattle:

This Yucatec asterism “Tzab” or “Tsab” is the Pleiades cluster in the IAU constellation Taurus (Milbrath 1999). Compare this to the Mayan asterism “Chaan” (see Rattlesnake, above).

This Lacandon and Manche Ch’ol asterism is the Pleiades cluster in the IAU constellation Taurus (Milbrath 1999).

NOTE: Milbrath notes that the Chiccan Serpent, which is a rain serpent prominent in Mayan culture, may be associated with this asterism as the glyph for this Serpent has a rattle tail.

Ravana:

This Hindu asterism is the IAU constellation Hydra (Bhagwath 2019). Ravana is a multi-headed demon monster.

Raven:

This Greek asterism “Κόραξ” (“Kórax”) is the IAU constellation Corvus as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy’s *Almagest* (2nd century).

This Arabic asterism “Ghurab Aswd” (غراب اسود) or “Al Ghurāb” is the IAU constellation Corvus:

- “al-Ghurāb” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Johann Bayer’s *Uranometria* (1603) lists “Algorab” and “Gorab” for Corvus.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch gives “Algorab” and “Algorabo” as names for Corvus, as well as the local names “Grapp vel Kapp/Meis Kaab”.
- Robert Hues lists “Algorab” as an Arabic name for the constellation Corvus in his *A Learned Treatise of Globes* in 1659.

This Arabic star “al-Ghurāb” (الغراب) is Delta (δ) Corvi in the IAU constellation Corvus:

- This was later latinized to “Algorab” in the *Alfonsine Tables* (Kunitzsch 1986), “Algores”, or “Algorel”.

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Algorab" (Dekker 2000).
- This is listed on the 14th century astrolabe #4560 from Christian Spain as "9ORUUS", the "9" representing a hard "C" sound, making this "Coruus", from the Latin "Corvus" (King 2002) and associates it with Gamma (γ) Corvi.
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists "Algorab" for this star.
- The 15th century *Alfonsine Tables* list Algorab as a name for Gamma (γ) Corvi (Gienah).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Algorab" for Gamma (γ) Corvi.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Algorab" and "Corab" as both a name for Corvus and as a name for Delta (δ) Corvi.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Algorab".
- William Herschel lists "Algorah" in his *Catalogue of 500 new Nebulae* in 1802.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Algorab" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al ghoráb, the raven".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Algores".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the names "Algorab", "Algorel", and "Algores", but his 14th edition only lists "Algorab" for Delta (δ) Corvi.
- The IAU approved the name Algorab for the star Delta (δ) Corvi A.

Raven is the IAU constellation Corvus as described by English author Geoffrey Chaucer (c.1340s – 1400).

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists Delta (δ) Corvi as "Algorab".

This German asterism "Rabe" is the IAU constellation Corvus.

This Hebrews asterism "'Ōrebh" or "Ōrev" is the IAU constellation Corvus.

This Romanian asterism "Corbul" is the IAU constellation Corvus (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Babylonian asterism from the MUL.APIN tablets "MUL.UGA.MUSHEN" or "UGA(.MUSHEN)" (Anthony 1996) is the IAU constellation Corvus. The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) list it as "MUL.UGA" or "u-ga" and the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul.ug.ga" or "mul.uga" (Koch-Westenholz 1995). It appears in later Seleucid sky lore.

This Assyrian asterism "Aribu" (Anthony 1996, Hunger 1992) or "u-ga[MUL.UGA]" (Hunger 1992) and "UGA" as listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Corvus.

This Babylonian and Sumerian asterism "uga" as listed in the BM 78161 tablet (Liechty 1988) is made up of stars of the IAU constellations Corvus and Crater.

Ravens:

This Arabic asterism “Al Aghribah” is a bending line of stars in the IAU constellation Canis Majoris and Columba listed by the 16th century Arabic astronomer Al Tizini: Zeta (ζ) Canis Majoris, Delta (δ) Columbae, Beta (β) Columbae, Alpha (α) Columbae, and Epsilon (ε) Columbae. It is also known as the Solitary Ones (see below).

Raven’s Beak:

This Arabic star “al-manxar al-ghurab” (منقار) is Alpha (α) Corvi in the IAU constellation Corvus:

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “minqār al-ghurāb”.
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists the name “Alglari” as a name for Gamma (γ) Corvi (Dekker 2000).
- “al-manxar al-ghurab” is listed in the *Calendarium* of Al Achsasi al Mouakket in 1650.
- “Al Minẖar al Ghurāb” (الغراب) is listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- This was later latinized to “Al Minliar al Ghurab” or “Minkar al Ghurab”.
- John Hill lists this star as “Mimkaralgerah” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Minkár al ghoráb, the raven’s beak”.
- NOTE: The IAU are considering the latinized name Minkar as the name for the nearby star Epsilon (ε) Corvi.

Rawa:

This Kiribati star “Rawa” or “Te Rawa” is one of the stars of the IAU constellation Aquila (Trussel and Groves 1978).

Rayfish:

This Karajá asterism “Boró” is made up of the Coal Sack Nebula and stars of the IAU constellation Crux (De Freita Mourão 2009):

- The “body” is the Coal Sack Nebula, and’
- Its “eyes” (“Borórruéneare”) the stars Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa).

Ray’s Shrimp:

This **telescopic** asterism, Howard 1 from the asterism list of Ray Howard of the Eastbay Astronomical Society, is in the IAU constellation Puppis 1.5 deg south of the star 19 Puppis. The brightest star, 7th magnitude HIP 40100, is the nose of Ray’s Shrimp with a cluster of 8th and 9th magnitude stars forming the body.

Ready:

This Chakavian asterism “Gâta” is the IAU constellation Cassiopeia.

Reaper:

This Hungarian asterism “Kaszás” or “Kaszáscsillag” (“reaper constellation” is the IAU constellation Orion. It is also known as “Nimrod” (see below), and Archer (see above). 15th century sources name it “Kaza Hug”.

This Italian asterism “Mietitore” is the asterism Custos Messium (see Harvest Keeper, above).

Reapers:

This Lithuanian asterism “Pjovėjos” is the belt of Orion in the IAU constellation Orion. Compare this to the asterism Rakers (see above) and the Old High German asterism “Three Reapers” (see below).

This Hungarian asterism “Kaszás Csillag” is made up of stars of the IAU constellation Orion. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a row of three reapers (the three stars of the “Belt of Orion”) with the “sword of Orion” and the star Beta (β) Orionis (Rigel) representing field workers bundling what has been reaped.

Rear Foot of the Lion:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star “GIS KUN A” is Beta (β) Virginis (Zavijava) in the IAU constellation Virgo (Hunger and Sachs 1988).

Rear Foot of the Little Twins:

This Babylonian star is part of the asterism “mul mas.tab.ba.tur.tur” (see Little Twins, below) listed in *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as and depicted on the K 8538 planisphere as “mulmaš-tab-ba-tur-tur”. The specific star is Xi (ξ) Geminorum as listed in the BM 78161 tablet as the 19th ziqpu (Liechty 1988, Leitz 2019).

Rear Footstool of Al-Jawza:

This Arabic asterism “al-kursi al-mu’akhar” (الكرسي المؤخر) or “Kursiyy al-Jawzā' al-Mu'akhkhar” is a quadrilateral of stars in the IAU constellation Lepus: Alpha (α) Leporis, Beta (β) Leporis, Gamma (γ) Leporis, and Delta (δ) Leporis. Compare this to Footstool of Al-Jawza, above. This has also been translated as the “Hindmost Chair of Jawza”, the “Throne of Jawzā'” (see below) or “Camels Quenching their Thirst” (see above). In English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 Smyth writes that the Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) called this asterism “al muakkherah, the succeeding” but claims that it consisted of “λ, β, and ψ Eridani”.

Rear Head:

This Chukchi star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. The star Arcturus is the “Front Head” (see above). They use these two stars for navigation.

Rear Knight:

This Arabic star is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus. Dorn (1829) lists this as “backrider” and describes this as appearing depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). It is part of their asterism Knights (see above).

Rear of Scorpius:

This Arabic star “tālī al-shawla” is Lambda (λ) Scorpii in the IAU constellation Scorpius as listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

Rear One of the Fish:

This Arabic star is Beta (β) Gruis (Alnair) in the IAU constellation Grus as listed by 16th century Arabic astronomer Al Tizini. He saw this as part of the "tail" of nearby Piscis Austrinus, and listed Gamma (γ) Gruis as "Tail" (see below).

Rear Ostrich:

This Arabic star "Al Thalimain Posterior", "Al Thalimain II", or "Althalimain" is Iota (ι) Aquilae in the IAU constellation Aquila and is part of their asterism Two Ostriches (see below).

Rear Pillar:

This Tahitian star "Anamuri" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Edwards 2015).

Rear Spear Tassel:

See Armed One, above.

Rear Star:

This Arabic star "tali an-najm" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. It is called this as it rises after the Pleiades.

- "Tālī al-Najm" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "tali an-najm" appears in the list of "rain stars" of Qutrub (d. 821 C.E.) but as an indicator of the second period of summer heat.
- English Admiral Henry William Smyth lists this as "Táliyu l nejm" and as "Taliy-n-nejm, as following or driving the Pleiades" in his *Bedford Catalogue* in 1844.
- Compare to "Follower of the Star" (above).

Rear Star of the Crab to the North:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL ar sa ALLA sa SI" is Gamma (γ) Cancri in the IAU constellation Cancer (Hunger and Sachs 1988) and is part of their asterism Crab (see above).

Rear Star of the Crab to the South:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL ar sa ALLA sa ULU" is Delta (δ) Cancri in the IAU constellation Cancer (Hunger and Sachs 1988) and is part of their asterism Crab (see above).

Rear Star of the Goat Fish:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL ar sa SUHUR MAS" is Delta (δ) Capricorni in the IAU constellation Capricornus (Hunger and Sachs 1988).

Rear Star of the Head of the Hired Man:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL ar sa SAG HUN" is Alpha (α) Arietis (Hamal) in the IAU constellation Aries (Hunger and Sachs 1988) and is part of their asterism Hired Man (see below).

Rear Star of the Twin's Feet:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL ar sa se-pit MAS-MAS" is Mu (μ) Geminorum in the IAU constellation Gemini (Hunger and Sachs 1988) and is part of their asterism Twins (see below).

Rear Twin Star:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MAS-MAS ar" is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Hunger and Sachs 1988) and is part of their asterism Twins (see below).

Rear Two Crossbars of the Bucket:

This Arabic asterism "al-'arquwatan al-mu'akharatan min ad-dalw" (العرقوتان المؤخرتان من الدلو) is two stars in the IAU constellations Andromeda and Pegasus: Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi. It is also known as the Second Spout (see below) or the Lower Crossbar of the Bucket (see above).

Rebar:

This American asterism is a line of two stars in the IAU constellation Virgo and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006): Mu (μ) and Iota (ι) Virginis.

Reber's of Cygnus:

This **telescopic** asterism "Rebérius Cýgni" is the galaxy PGC 63932 (3C 405, Cygnus A) in the IAU constellation Cygnus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this "was discovered by Grote Reber (1911 – 2002) in 1939. It was the first hyper-active galaxy to be discovered".

Rebua:

This Kiribati star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Trussel and Groves 1978). Rebua is the name of one of two legendary waves, the other being Tokia. Rigil Kentaurus and Hadar are known to them as "Tokia ma Rebua" (see below).

Receptacle:

This Latin asterism "Conceptaculum" is the IAU constellation Ara as listed in John Hill's *Urania* in 1754.

Recommending Virtuous Men:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Jinxian" is the star Theta (θ) Virginis in the IAU constellation Virgo.

This Chinese xing guan "Jìnxián" (进贤) is the star 44 Virginis in the IAU constellation Virgo.

This Chinese Chenzhuo xing guan is the star Theta (θ) Virginis in the IAU constellation Virgo.

Record of Family:

This Korean asterism "Gajog Gilog" (가족 기록) in the IAU constellation Ophiuchus is three lines of stars radiating out of the central star 70 Ophiuchi:

- One goes out to the star 66 Ophiuchi,
- One goes out to the star 67 Ophiuchi, and
- One goes out to the star 68 Ophiuchi.

Recover and Protector Star:

This Mongolian star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major (see Big Dipper, above). It is in a binary system with the star Zeta (ζ) Ursae Majoris (Mizar): The ancient Mongolians believed Alcor had been placed there by their God of Heaven, Tengeriin, to protect Mizar and that you could not be an archer unless you could see both stars (Lagain & Rousseau 2015).

Rectangle:

There are six **telescopic** "rectangle" asterisms:

- One is in the IAU constellation Lynx and is Corder 1627 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 7^{th} – 9^{th} magnitude stars including HIP 41933, 41836, and the double star HIP 41844.
- One is in the IAU constellation Ursa Minor and is Corder 1742 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8^{th} – 9^{th} magnitude stars including HIP 44490.
- One is in the IAU constellation Ursa Major and is Corder 1907 on the observing list of American astronomer Jeffrey Corder. Size 45' X 30'. This is four 7^{th} magnitude stars including HIP 47791, 48132, 48266, and 47929.
- One is in the IAU constellation Centaurus and is Corder 2577 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is six 7^{th} – 8^{th} magnitude stars including HIP 68273 and 68231.
- One is in the IAU constellation Microscopium and is Corder 4213 on the observing list of American astronomer Jeffrey Corder. Size 90' X 25'. This is a 6^{th} magnitude star and three 8^{th} magnitude stars including HIP 102014 and 101918.
- One is in the IAU constellation Pegasus and is Corder 4707 on the observing list of American astronomer Jeffrey Corder. Size 65'. This is four 6^{th} – 7^{th} magnitude stars including HIP 111541 and 111263 and the double stars 39 Pegasi and HIP 111535A.

Rectitude:

This Sogdian asterism "Rashnawand" is the belt of Orion in the IAU constellation Orion (see above) as listed in R. H. Allen's *Star Names* in 1899.

This Khorasmian asterism "Khawiya" is the belt of Orion in the IAU constellation Orion (see above) as listed in R. H. Allen's *Star Names* in 1899.

Red:

This Chaldean star "mul sa" or "ul.sa" is listed in the *Great Star List* (Koch-Westenholz 1995) and is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

This Persian lunar mansion “Gel” is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by R. H. Allen in his *Star Names* in 1899.

This Kamilaroi star “Guembila” or “Guebilla” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (William Ridley 1875).

Red and Blue of Phoenix:

This **telescopic** asterism “Erythrocyáneus Phoenícis” is the pair of interacting galaxies NGC 454 in the IAU constellation Phoenix. It was discovered by John Herschel in 1834 who listed it in his catalogue as 2397. It became GC 253 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as one red elliptical galaxy appears red and the other irregular galaxy blue.

Red Ant:

This Wardaman asterism is made up of the stars of the IAU constellation Capricornus (Cairns 1999). Compare this to the Boorong asterism “Marpeankurrk” (See “Meat Ant”, above).

This Barasana star “Mekahianmu” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. This is the leaf-cutter ant, and Hugh-Jones (2006) translates this as “Leaf Cutter”.

Red Backed Spider:

This Noongar star “Kara” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Red Bar of Aquarius:

This **telescopic** asterism “Rubritrabeátus Aquárii” is the barred spiral galaxy NGC 7723 in the IAU constellation Aquarius. This was discovered in 1785 by William Herschel who listed it as “I 110”. It became GC 4998 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the beautiful reddish bar in the central region”.

Red Blonde of Volans:

This **telescopic** asterism “Fúlvia Volántis” is the elliptical galaxy NGC 2434 in the IAU constellation Volans. It was discovered in 1834 by John Herschel who listed it as 3096 and later as GC 1561 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its “reddish colour”.

Red Blue of Boötes:

This **telescopic** asterism “Rubricaésius Boótis” is the interacting galaxy UGC 9618 (Arp 302) in the IAU constellation Boötes. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “consists of a blue spiral galaxy, seen face-on, MCG+4-35-18, and a reddish edge-on galaxy MCG+4-35-19”. It is also known as the Exclamation Point Galaxy (see above).

Red Dog:

This Latin asterism “Rubra Canicula” is Canis Majoris. This is listed in William Henry Smyth’s *Bedford Catalogue* in 1844: Smyth attributes this to the Roman poet Quintus Horatius Flaccus (Horace, 65 – 27 B.C.E.).

Red Dragonfly:

This Lacandon star “Chäk Tulix” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Milbrath 1999).

Red Emperor:

This Chinese star “Chidi” from the Three Kingdoms to Ming Dynasty is HIP 57779 in the IAU constellation Leo and is part of their xing guan Seats of the Five Emperors (see above).

Red Fox:

This Inuit asterism “Kaguyagat” is the Pleaides cluster in the IAU constellation Taurus (MacDonald 1998).

This Nunamiut star “Kajuqtuq Tiriganniaglu” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is sometimes interpreted as “white fox”.

Red Jaguar:

This Kogi asterism “Neb-Šiža” or “Neb-Siji” (“puma” or “red jaguar”) is identified either as the belt or the sword of Orion in the IAU constellation Orion.

Red Kangaroo:

This Boorong asterism “Purra” is made up of the stars of the IAU constellations Auriga and Perseus and was listed by Stanbridge (1857), Morieson (1999) and Hamacher and Frew (2010). The kangaroo’s “feet” are the star Alpha (α) Aurigae (Capella). The “body” contains the stars Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae and the tip of the kangaroo’s “tail” is the star Zeta (ζ) Persei. This kangaroo was pursued and killed by Yurree (see Fan Tailed Cockatoo, above) and Wanjel (see Eastern Long Necked Turtle, above).

This Wotjobaluk star “Purra” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Hamacher 2011). It is part of their asterism Two Hunters (see below).

Red Kangaroo Leader:

This Wardaman star “Unumburrgu” is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Cairns and Harney 2003) and is related to their asterism Red Kangaroo (see above). The rest of the stars in this constellation are his ceremonial tools and entourage.

Red-Kneed Dotterel:

This Boorong asterism “Berm-berm-gle” or “Bermbermgle” is made up of stars in the IAU constellations Centaurus and Circinus and was listed by Stanbridge (1857), J. Morieson (1999), and Hamacher and Frew (2010). The “head” is the star Alpha (α) Centauri (Rigil Kentaurus). The middle of the “body” is HIP 72131. From HIP 72131 four lines go out:

- One goes to HIP 70235,
- One goes out to HIP 73036,
- One goes out to Eta (η) Circini, and
- One goes out to Alpha (α) Circini.

Red Light of Virgo:

This **telescopic** asterism "Erýthrophos Vírginis" is the elliptical galaxy NGC 5813 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "I 127". It became GC 4026 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the red colour of this elliptical galaxy".

Red Limbed of Pegasus:

This **telescopic** asterism "Erythrocólus Pégasi" is the barred lenticular galaxy NGC 7743 in the IAU constellation Pegasus. This was discovered in 1784 by William Herschel who listed it as "II 256". It became GC 5006 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the smooth red arms of this… galaxy".

Red Necked Emu:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is in the IAU constellation Cygnus and is also known as the Bent Fan or Spiral. It is Harrington 26 on American astronomer and author Phil Harrington's list of asterisms. This is Corder 4088 on Jeffrey Corder's list. Size 45'. It is close to open cluster Do Dz 3:

- The body is a quadrilateral of six 8^{th} – 9^{th} magnitude stars including HIP 99719 and 99628,
- The "neck" is the stars HIP 99769, 99777, and 29 Cygni, and
- The "foot" is four stars forming a right-angle including HIP 99667.

Red Ochre:

This Maasai star "Orkaria" is the red dwarf star GJ 1214 in the IAU constellation Ophiuchus. It received this name in the IAU's NameExoWorlds competition in 2022. It has an exoplanet GJ 1214b, "Enaiposha", which refers to large bodies of water and their tumultuous nature.

Red Ochre Woman:

This Arrernte star "Alknarinja" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Maegraith 1932) and is part of their asterism Three Women (see below).

Red of Cetus:

This **telescopic** asterism "Rubicúnda Céti" is the lenticular galaxy NGC 357 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as II 434. It is GC 190 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "reddish colour".

Red of the Prow:

This ancient Egyptian star "Tjmes en Khentet" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Prow (see above).

Red One:

There are two Vedic stars by this name:

- One is Vedic nakshatra (lunar mansion) “Rohinī” or “Rohini” (“the red one” or “ruddy”) is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and appears in the *Artharveda*, the Rig-Veda and the *Taittirīya Brāhmana* (Bhagwath 2019, Ivanković 2021) and on the nakshatra list of the scholar Varahamihir (Leitz 2019). It is part of their larger asterism Climber (see above). The maharshi Parasara listed this asterism “Rohini” as Alpha (α) Tauri (Aldebaran), Delta (δ) 1 Tauri, Epsilon (ε) Tauri, Gamma (γ) Tauri, and Theta (θ) 1 Tauri (Leitz 2019). It is related to their deity Brahma or Prajapati. They also call it the “Star of Ascent” or “Brahmi”. They call the constellation Orion “Mriga” (see Deer, above) and Rohini is the roe that he is chasing. W. Brennand lists this as “Rohini” in his *Hindu Astronomy* in 1896 and translates this as “a wheel carriage”. Bhagwath (2019) lists the symbols of this nakshatra as a cart, temple, or banyan tree.
- One, “Rohinī”, found in the *Taittiriya Samhita* and the *Taittiriya Brahmana*, is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Leitz 2019, Ivanković 2021): This is an alternate name for their nakshatra Jyestha (see Eldest, above), sometimes described as “second Rohini”.

This Myanmar nekkhat (lunar mansion) “Yawhani” (ရောဟဏီ) is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

This Tibetan gyukar (lunar house) “Snar Ma” or “Narma” is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Johnson-Groh 2013).

Red Phoenix:

This **telescopic** Chinese star “Danfeng” (丹凤) is the red dwarf type star L 168-9 in the IAU constellation Tucana. It received this name in the IAU’s NameExoWorlds competition in 2022. Danfeng is the red phoenix which symbolizes good fortune. It has an exoplanet L 168-9b, “Qingluan” (青鸾). This refers to the sacred blue bird, a messenger of love.

Red Rectangle Nebula:

This **telescopic** asterism is protoplanetary nebula HD 44179 is in the IAU constellation Monoceros.

Red Ringed of Aquarius:

This **telescopic** asterism “Rubrocíncta Aquárii” is the barred spiral galaxy NGC 7184 in the IAU constellation Aquarius. This was discovered in 1783 by William Herschel who listed it as “II 1”. It became GC 4739 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy has a beautiful inner ring in the central region, which is especially visible in red and infrared light”. It is also known as the “Saturn Ring Galaxy”.

Red-Rumped Parrot:

This Boorong asterism “Djuit” is made up of the stars of the IAU constellation Scorpius as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). The “body” runs from Tau (τ) Scorpii through Alpha (α) Scorpii (Antares) and Sigma (σ) Scorpii. The “wings” run from the multiple star system Beta (β) Scorpii (Acrab) to Rho (ρ) Scorpii. Djuit is the son of Marpeankurrk (see Meat Ant, above). Compare this to the Ngarrindjeri asterism “Waiyungari” (see Waiyungari below).

This Wotjobaluk star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Hamacher 2011).

Red Sea:

This German asterism is the IAU constellation Eridanus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 as "the Passage of the Israelites through the Red Sea" and in John Hill's *Urania* in 1754.

Red Spider Nebula:

This **telescopic** asterism is planetary nebula NGC 6537 in the IAU constellation Sagittarius. This was discovered by American astronomer Edward Charles Pickering in 1885.

Red Square Nebula:

This **telescopic** asterism is protoplanetary nebula containing the star MWC 922 in the IAU constellation Serpens. It was first imaged by the Mount Palomar Hale Telescope in 2007.

Red Star:

This Hawaiian star "Hoku'ula, also known as "Kapuahi" (see Sacred Fire, below) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

This is also an alternate Hawaiian name for their star Lehuakona (Alpha (α) Scorpii (Antares) - see Southern Lehua Blossom, below).

This Elvish (Sindarin) star "Borgil" ("red star" or "hot star") is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and appears in the works of J. R. R. Tolkien (1892 – 1973). It is related to Luinil (see Blue Star, above).

This Skidi star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Krupp 1983). They considered it to be one of the four pillars of heaven.

"Izar Gorria" is a Basque name for Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Knörr 1999).

"Tsahal k'anal" is a Tzotzil name for Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Milbrath 2000). NOTE: They also use this name for Mars.

Red-Tail:

This Wardaman star "Gamakba" is Gamma (γ) Tauri in the IAU constellation Taurus and one of the stars in their asterism "Little Fishes" (see above).

Red that is in the Neck of the Victor:

This Hebrew star "ha-adom she-hu' be-savar ha menasse'h" ("The red that is in the neck of the victor") is Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra as listed in the star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985)

Redback Spider:

This Kokatha star "Kara" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Leaman, Hamacher, and Carter 2016).

Reddish of Coma Berenices:

This **telescopic** asterism “Rubélla Cómae Bereníces” is the elliptical galaxy NGC 4473 in the IAU constellation Coma Berenices. It was discovered by William Herschel in 1784. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is part of Markarian’s Chain (see above).

Reddish of Corvus:

This **telescopic** asterism “Rubéllula Córvi” is the intermediate spiral galaxy NGC 4050 in the IAU constellation Corvus. It was discovered in 1785 by William Herschel who listed it as “II 509”. It became GC 2689 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Reddish of Horologium:

This **telescopic** asterism “Rússula Horológii” is the lenticular galaxy NGC 1527 in the IAU constellation Horologium. It was discovered in 1826 by James Dunlop. John Herschel listed it as h 2616 in his catalogue and later as GC 819 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Reddish of Hydra:

This **telescopic** asterism “Rubécula Hýdrae” is the ringed lenticular galaxy NGC 2855 in the IAU constellation Hydra. It was discovered in 1786 by William Herschel who listed it as “I 132”. It became GC 1835 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “although mostly two-armed in the inner regions, the spiral pattern could be interpreted as being six-armed in the outer regions”.

Reddish One:

This Bedouin (coastal Saudi Arabia) star “al-Iḥaimir” (الاحيمر) is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Redness of Virgo:

This **telescopic** asterism “Rubor Vírginis” is the lenticular galaxy NGC 4546 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “I 160”. It became GC 3092 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Reed Bundle:

This Babylonian asterism “MUL.GILIM.MA” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and “mul.gilim” or “mul.min” in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Centaurus (Koch-Westenholz 1995)..

Reed Forest:

This Vedic moon station is a line of three stars in the IAU constellations Monoceros and Orion: Epsilon (ε) Monocerotis and 67 and 54 Orionis.

Reef:

This Kiribati star "Atinikabo" or "te Atinikabo" is the star Iota (ι) Ceti in the IAU constellation Cetus (Trussel and Groves 1978).

Reference Stars:

An instrument for determining the time at night based on the relative positions of two or more stars in the night sky during the Middle Ages was the "Nocturnal" or "Horologium" (French "Nocturlabe"). This was an important instrument in determining tides for certain ports. It was first mentioned by Raymond Lull in the 12th century as sphaera horarum noctis or astrolabium nocturnum. This system used "reference stars" (also known as "pointer stars") with most commonly used reference stars for this instrument being:

- Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak), or
- Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris (Pherkad).

Regor:

This American star is Gamma (γ) Velorum in the IAU constellation Vela. It was created by American astronaut Gus Grissom and is the name "Roger" backwards (Roger being first name of fellow astronaut Roger Chaffee. It is believed that Grissom was influenced by the stars Sualocin and Rotanev which were reversed Latinized names of Giuseppe Piazzi's assistant Nicolo Cacciatore and decided to name some other stars in this area with reversed names.

Regulus:

See Princelet, above.

Rehoboam's Scorpion:

This German asterism is the IAU constellation Scorpius as listed by German poet Philipp von Zesen (1619 – 1689). Rehoboam is listed in the *Hebrew Bible* as the last monarch of the United Kingdom of Israel. R. H. Allen describes this connection between Rehoboam and a scorpion in his *Star Names* in 1899 as "mistakenly considered": There doesn't appear to be any mention of a scorpion in the accounts of Rehoboam.

Rehua:

This Māori star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. Rehua is a plant with red flowers. In their sky lore it is a bird with one wing broken who mates with Pekehawani or Ruhi-te-rangi (a star close by). The other star close by, Whaka-onge-kai ("she who makes food scarce before the new crops can be harvested"), is his other mate. Compare this to the Hawaiian star Lehuakona (see Southern Lehua Blossom, below) and to the Kiribati "Rebua" (see above).

Reichsapfel:

See Leopold's Orb, above.

Reindeer:

This asterism “Rangifer” or “Tarandus” was created in 1736 by the French astronomer Pierre Charles Le Monnier to commemorate the expedition of Maupertuis to Lapland to prove the Earth’s oblateness. Le Monnier called it “Renne”, the Germans “Rennthier”. It is the stars Iota (ι) and Psi (ψ) Cassiopeiae and 43, 46, 48, and 50 Cassiopeiae:

- German astronomer Johann Elert Bode (1747 – 1826) listed it in his *Die Gestirne* and in Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) as “Renthier” and depicts it as a reindeer standing in front of a Cepheus.
- Scottish astronomer Alexander Jamieson (1782 – 1850) listed “Tarandus” in his Celestial Atlas in 1822.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Le Réene” as a reindeer running to our right. This also appears in the 1778 edition.
- English Admiral Henry William Smyth mentions Rangifer in his *Bedford Catalogue* in 1844.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Tarandus”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

This large Sami asterism “Sarva” or “Sarvis” is made up of the stars of the IAU constellations Cassiopeia, Perseus, and Taurus (Lundmark 1982, Persson 2022). Some Sami describe it as an elk. This is how it is constructed:

- The “W” of Cassiopeia is the “antlers” (see W below),
- The “neck” runs down from Delta (δ) Cassiopeiae to Alpha (α) Persei (Mirfak) and Delta (δ) Persei,
- The “body” runs from Delta (δ) Persei to Alpha (α) Aurigae (Capella), and
- The elk’s “feet” are the stars Beta (β) Tauri (Elnath), Iota (ι) Aurigae, Zeta (ζ) Persei, and Beta (β) Persei (Algol).

NOTE: R. H. Allen lists this Sami asterism as “Sarw” in his *Star Names* in 1899 and calls these people “Lapps”.

This Chukchi and Koryak asterism is the IAU constellation Cassiopeia (see W below). The reindeer is being pursued by a hunter represented by Orion (see Hunter, above).

This Nganasan asterism is the Pleiades cluster in the IAU constellation Taurus. Some versions have the Pleiades as a group of hunters with a net (see Hunters, above) and some have Orion as the Hunter and the Pleiades as the reindeer.

Reins Holder:

This Greek asterism “Ενίοχος” or “Eniochos”, latinized to “Heniochus” is the IAU constellation Auriga (see Charioteer, above).

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This lists the names “Heniochus” and “Auriga” and depicts this as a male in tunic and pointed cap in a four wheeled cart drawn by two horses and two oxen. He is holding the reins in his left hand and waving with his right hand. A goat is perched on his left shoulder and another on the back of his left hand.

Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists Heniochus as a name for Auriga.

John Hill lists "Heniochus" as a name for Auriga in his *Urania* in 1754.

This Arabic asterism "Masick Al Inan", "Al Dhu al ʻInān", "Al Māsik al ʻInān", or "Al Mumsik al ʻInān, , is the IAU constellation Auriga:

- John Hill lists it as "Masick Al Inan" in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Mumsiki-l a' inan, or holder of the reins".
- John Chilmead (1899) lists it as "Mumassich Alhanam", which he derived from Robert Hues' *A Learned Treatise of Globes* (1659), where it is listed as "Memassich Alhanam".

This Arabic asterism "Hamil Maqalid" (حامل مقاليد) is the IAU constellation Auriga.

This Hebrew asterism "Masik" is the IAU constellation Auriga as listed in John Hill's *Urania* in 1754.

Rejoicing in Fire of Leo:

This **telescopic** asterism "Pyríchares Leónis" is the elliptical galaxy NGC 3379 (Messier 105) in the IAU constellation Leo. It was discovered by Pierre Méchain in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Relic Galaxy:

This **telescopic** asterism NGC 1277 is a lenticular galaxy in the IAU constellation Perseus. It was discovered by Irish astronomer Lord Rosse in 1875. It was entered in the *General Catalogue* of 1864 as GC 5304 and 5055. It has been called the "Relic" or "relic of the early universe" due to its stars being formed during a 100-million-year long interval about 12 billion years ago.

Reliquary:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. It is also known as the Hole in a Cluster, "83", Nefertiti's Headpiece, the Smoke Ring, and the Bicycle.

Remainder:

This Gaelic asterism "An Còrr" is the IAU constellation Ursa Major.

Remen-heru-an-Sah:

This Egyptian decan "Remen-heru-an-Sah" was in the IAU constellation Taurus. In later Hellenistic texts it was named "ρємєииαρє" ("Remen-hare"). In the Testament of Solomon, it became "Sphendonael", Aristobulus of Paneas called it "Ballat", in Greek Hermeticism it became "Rhomenos", in Latin Hermeticism "Erchmubris", Roman astrologer Julius Firmicus Maternus called it "Romanae" or "Arfa", Cosmas of Maiuma (d. 760) called it "Litai", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Aharph" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲁⲡⲱⲡⲓⲥ" ("Apopis"). Variations include "Hromenos". It has been depicted as a dog's head with curls with a scepter in the right hand and the left hand touching his backside.

Remen-kher-Sah:

This Egyptian decan "Remen-kher-Sah" was in the IAU constellation Gemini. In later Hellenistic texts it was named "ⲟⲩⲁⲣⲉ" ("Uaret"). In the Testament of Solomon, it became "Belbel", Aristobulus of Paneas called it "Vaspan", in Greek Hermeticism it became "Ouari", in Latin Hermeticism "Samurois", Roman astrologer Julius Firmicus Maternus called it "Ver" or "Asuae", Cosmas of Maiuma (d. 760) called it "Kybele", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Verasua" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ϰⲟⲩϰⲗⲟⲯ" ("Cyclops"). It has been depicted as a man with a goat head with a staff in his right hand and his left hand on his thigh.

Remote One of Virgo:

This **telescopic** asterism "Remótus Vírginis" is the edge-on spiral galaxy NGC 4703 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "III 514". It became GC 3232 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Renshin:

This Japanese star Renshin (廉貞) is Epsilon (ε) Ursae Majoris (Alioth) in the IAU constellation Ursa Major (Kotyk 2018).

Rep un kamuy noka-nociw:

This Ainu Nociw ("asterism") is the IAU constellation Canis Minor.

Rerehu:

This Māori star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius**.** Compare to Rehua, above.

Rescuer:

This asterism is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899. Robert Burnham lists it as a classical Greek name for this constellation in his *Burnham's Celestial Handbook* in 1978.

Resting Palace:

This Chinese Chenzhuo xing guan "Lígōng" is four lines of stars radiating out of a central star in the IAU constellation Pegasus: The central star is Beta (β) Pegasi (Scheat). From this star four lines called "Resting Place (Adjunct to Ying Shi" run out:

- One runs through Tau (τ) Pegasi to Nu () Pegasi,
- One runs to Alpha (α) Pegasi (Markab),
- One runs through Mu (μ) Pegasi to Lambda (λ) Pegasi, and
- One runs through Omicron (ο) Pegasi to Eta (η) Pegasi.

Resting Palace (Vassal of Encampment):

This Chinese xing guan “Lígōng” (离宫(附室宿)) is a network of star lines radiating out of the central star Beta (β) Pegasi (Algol) in the IAU constellation Pegasus and is part of their asterism Encampment (see above):

- One star line goes out to Eta (η) and Omicron (ο) Pegasi,
- One star line goes out to Mu (μ) and Lambda (λ) Pegasi,
- One star line goes out to Tau (τ) and Upsilon (υ) Pegasi.

This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Restrained Cloud:

This Anutan asterism “Te Ao Toka” is the Small Magellanic Cloud.

Resurrected Christ:

This star “Christo Resucitado” from the German Volga Community in Argentina is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Mudrik 2011).

Reticulum:

None of the stars of Reticulum are brighter than 3rd magnitude and the stars of this constellation only show up in 20 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Ret) first appeared on a globe by French professor of astronomy and mathematics Isaac Habrecht II in 1621. Habrecht named it “Rhombus”. French astronomer Abbé Nicolas Louis de Lacaille repurposed this in a slightly different form in 1755 as “le Réticule Rhomboide” (“the rhomboid reticule”) to commemorate the reticule in his telescope eyepiece. Lacaille later latinized it to “Reticulum Rhomboidalis” and shortened to “Reticulum” in his later star catalogue *Coelum Australe Stelliferum*. Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts this as a circle in a square: inside the circle, which represents the eyepiece of a telescope, one sees a rhomboidal reticule and spots representing stars.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) labels this constellation with the abbreviated “Retic” and depicts it as a parallelogram.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this as the “Rhomboid” (Stevenson 1921).

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Romboide” and depicts it as a parallelogram.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation “Quadrantum” and depicts it as a square frame with cross hairs inside.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Reticule Romboide” as a reticule eyepiece.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) depicts this constellation as a rhomboid reticule, however I could not make out the label on the chart that I examined.

"Reticulum" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Reticulum" as a reticule eyepiece.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its charts as "Reticule".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Reticulum, The Net" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Reticulum" and describes it as a "Net".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Reticulum" and gives the "original form" as "Reticulum Rhomboidalis", describing it as "The Net".

A standard IAU chart shows Reticulum as a diamond shaped pattern of five stars: Alpha (α) Reticuli, Epsilon (ε) Reticuli, Iota (ι) Reticuli, Delta (δ) Reticuli, and Beta (β) Reticuli.

To the French it is "Réticule" or "Rhombe", to the Germans "Rhomboidische Netz" ("rhomboid mesh"), and to the Italians "Reticolo".

Reticulum Cluster:

See Sérsic Cluster below.

Retina Nebula:

This **telescopic** asterism is planetary nebula IC 4406 in the IAU constellation Lupus. This was discovered by American astronomer Williamina Paton Stevens Fleming (1857 – 1911) and American astronomer DeLisle Stewart (1870 – 1941), both of whom worked at the Harvard Observatory.

Retinue (In Room Mansion):

This Chinese xing guan "Cóngguān" (从官) is a line of two stars in the IAU constellation Lupus: Psi (ψ) and Chi (χ) Lupi. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Cóngguān" is a line of two stars in the IAU constellation Scorpius: 4 Scorpii and HIP 77900.

Retinue (In Supreme Palace Enclosure):

This Chinese xing guan "Cóngguān" (从官) is the star 92 Leo in the IAU constellation Leo. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Congguan" is the star 92 Leonis in the IAU constellation Leo.

Retireti:

This Kiribati star "Retireti" is an unidentified star in the IAU constellation Scorpius (Trussel and Groves 1978).

Retracted Arm:

This Arabic asterism "Al Dhirāʿ al Asad al Maḳbuḍah" is part of their asterism Lion (see above) and is the stars Alpha (α) Canis Majoris (Sirius) and Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major.

Returning Ostriches:

There are two versions of the Arabic asterism "al-Naʿām al-Ṣādir" (النعم الصادر), translated as "Returning Ostriches" or "Ostriches Leaving the River", later latinized to "Al Naʿām al Ṣādirah" or "Namalsadirah", which is made up of stars in the IAU constellation Sagittarius:

- One is the stars: Phi (ϕ) Sagittarii (Namalsadirah I), Tau (τ) Sagittarii (Namalsadirah II), Xi (ξ) 1 Sagittarii (Namalsadirah III), and Xi (ξ) 3 Sagittarii (Namalsadirah IV). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al na'ám al sádirah, the ostriches returning" but later in the text describes "Min al na'aim al Sádirah" as "going camels".
- One, "an-na'am as-sadir", "the Returning Ostriches" or "Ostriches Leaving the River", is the stars Phi (ϕ), Sigma (σ), Tau (τ), and Zeta (ζ) Sagittarii, which form the "handle" of the asterism "Teapot" (see below). These are seen as leaving the "river" (the Milky Way) to return to the Ostrich Nest (see above). W. Brennand lists this as "Al-Sadira" in his *Hindu Astronomy* in 1896.

NOTE: The "river" that these "ostriches" are leaving is the Milky Way.

Revati:

See Wealthy, below.

Revealer of Stars of Ursa Major:

This **telescopic** asterism "Astróphantor Úrsae Majóris" is the Magellanic spiral galaxy NGC 5204 in the IAU constellation Ursa Major. It was discovered by Prussian astronomer Heinrich d'Arrest. William Herschel listed it as "IV 63". It became GC 3575 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy… is relatively easily resolvable in stars, as already mentioned by Edwin Hubble in 1949".

Revenant of the Swan:

This star is the luminous blue variable star 34 Cygni in the IAU constellation Cygnus. It was unknown until 18 August 1600 by Dutch astronomer Willem Janszoon Blaeu, when it suddenly brightened to 3rd magnitude. German Johann Bayer (1572-1625) listed it as a "nova" in his *Uranometria*. The name of course refers to the constellation that it is situated in.

Reverse Kids:

This asterism is in the IAU constellation Auriga and is listed by Jeffrey Corder of the Ancient City Astronomy Club in Florida as Corder 839. Corder attributes it to John Raymond. Size 120' X 70'. It runs from HIP 24738 through Rho (ρ) Aurigae, HIP 25143, and HIP 24902A to Lambda (λ) Aurigae. It is called this as it is situated on the opposite side of the star Alpha (α) Aurigae (Capella) from the asterism the Kids (see above).

Revolved of Lepus:

This **telescopic** asterism "Convolúta Léporis" is the spiral galaxy NGC 2196 in the IAU constellation Lepus. It was discovered in 1784 by English astronomer William Herschel who listed it as "II 265". It became GC 1384 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Revolver Galaxy:

This **telescopic** asterism PGC 29152 is a galaxy in the IAU constellation Sextans.

Revolving One of Cetus:

This **telescopic** asterism "Contórta Céti" is the edge on spiral galaxy NGC 881 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as "II 436". It became GC 518 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of "its beautiful winding spiral arms".

Rhea:

This Mocoví and Toba (Qom) asterism "Mañic" or "el Ñandú" ("the Rhea") has two versions (Mudrik 2014, 2015):

- One is dark nebulosity in the Milky Way stretching from its "head" in the Coal Sack Nebula (see Coal Sack Nebula, above), with the "body" extending to the IAU constellation Scorpius and the legs reaching the IAU constellation Sagittarius. NOTE: This represents the rhea or ema or emu (Rhea Americana). Compare this to Suri (above).
- The other is the Southern Cross in the IAU constellation Crux or stars in that region (Mudrik 2014).

The Mocoví tell of a powerful man who chased this Mañic around the world. The Mañic climbed an ombú tree into the sky where the shadow of his soul (la'al) is seen. They used this asterism to indicate when the rainy seasons were to begin. Mudrik reports that a Piemontese family in this region referred to this asterism as "the ostrich".

This Apinajé asterism "Mã-tí" One is dark nebulosity in the Milky Way stretching from its "head" in the Coal Sack Nebula (Lima and De M. Figueirôa, 2007), with the "body" extending to the IAU constellation Scorpius and the legs reaching the IAU constellation Sagittarius. NOTE: This represents the rhea or ema or emu (Rhea Americana).

There are three Wichi asterisms "Ñandú" or "Suri" (Mariani 2017):

- One, representing a male Rhea, is the Coal Sack Nebula (see Coal Sack Nebula, above).
- One, representing a female Rhea and her chicks, is made up of stars of the IAU constellations Scorpius and Ara.
- One is the IAU constellation Crux.

Rhea Foot:

This Mapuche asterism "Namün Choyke" ("rhea foot") is the IAU constellation Crux (Menares 2008). It is also known as "Pünon Choyke" (See Rhea Footprint, below).

Rhea Footprint:

This Mapuche asterism "Pünon Choyke" ("rhea footprint") is the IAU constellation Crux (Menares 2008). It is also known as "Namün Choyke" (See Rhea Foot, above).

Rhea's Nest:

This Mapuche asterism is the Pleiades cluster in the IAU constellation Taurus.

Rhea's Trail:

This Mapuche asterism is the belt of Orion in the IAU constellation Orion.

Rhineland Palatinate Coat of Arms:

This asterism was made up of stars of the IAU constellations Aquila and Sagittarius by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted by a wagon wheel (which appears to be labelled "Mainz") with a cross on either side, one labelled "Colon" and the other "Frevir".

Rhinoceros:

This Venda asterism "Makhali" is the belt and sword of Orion in the IAU constellation Orion with the "sword" being the "horn" of the rhinoceros.

Rhinoceros and Its Infant:

This **telescopic** asterism is NGC 4490, a barred spiral galaxy, which is interacting with the smaller galaxy NGC 4485 in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1778 who listed it as "I 198". It is GC 3042 in the *General Catalogue* of 1864. South African astronomer Magda Streicher wrote in April 2006 that it "Reminds me of a Rhino animal and little infant on its side". It is also known as the "Cocoon Galaxy" (see above).

Rhinoceros Beetle:

This English asterism "Scarabaeus" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens***.** It is made up of the stars of the IAU constellation Scorpius:

- The "body" is a triangle of the stars Psi (ψ), Chi (χ) and Xi (ξ) Scorpii.
- From Psi (ψ) Scorpii an "antenna" is a line running through 16 Scorpii to 18 Scorpii.

Rho:

This **telescopic** asterism is in the IAU constellation Eridanus and was listed as Corder 477 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. It resembles a Greek letter Rho (ρ) and includes the stars HIP 14124, HIP 13944, Rho (ρ) 1, 2, and 3 Eridani, and HIP 14355. Size 50' X 20'

Rho Ophiuchi Streamers:

See Ophiuchus Nebula, above.

Rhombus:

This French asterism "Quadrantum" is made up of the stars of the IAU constellation Reticulum and first appeared on a globe by French professor of astronomy and mathematics Isaac Habrecht II in 1621. Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675. It has a rhombus shape. French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) later repurposed it as the IAU constellation Reticulum (see above).

There are two **telescopic** Rhombus asterisms:

- One is Cseh 37, listed by Hungarian astronomer Viktor Cseh, is in the IAU constellation Octans. Cseh describes it as "a small group of stars located around the 9th magnitude star TYC 9529-792. Its shape resembles a rhombus, and its size is 10' X 5'".
- One is Hahn 2 in the IAU constellation Triangulum. German amateur astronomer Christoph Hahn discovered it in October 2023. The stars forming the rhombus are 12 Trianguli, 13 Trianguli, HIP 11541 and HIP 11490A.

Ribbon of the Fishes:

This is an alternate name for the Seleucid asterism "Tails" (see below).NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 frequently refers to a "kheït, or ribbon, connecting the two fishes".

Rice Hat Nebula:

This **telescopic** asterism is the supernova remnant SH 2-224 in the IAU constellation Auriga.

Rice Stars:

This Japanese asterism "Komeinya Boshi" is the belt of Orion in the IAU constellation Orion.

Rich and the Poor:

This Italian (Piedmont and Ligurian Alps) asterism "lu Rik" ("the rich") and "lu Paure" ("the poor") is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. They were used to forecast good or poor harvests.

Rich Man's Jewel Box:

This **telescopic** asterism is the open cluster NGC 3766 (Caldwell 97) in the IAU constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "III 7" in his catalogue. It is GC 2468 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster and Hilda's Cluster. South African astronomer Auke Slotegraaf noted in 1997 that it appears like a "lop sided jewel box" and lists it as the "Rich Man's Jewel Box" and "Hilda's Cluster" in his observations at Mount Ceder in 2008.

Richest One:

See Most Famous, above.

Ricks of Grain:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Fornax: Mu (μ) Fornacis, Nu (ν) Fornacis (the determinative star) and n Fornacis.

This Chinese xing guan “Tiānyǔ” (天庾) is a line of three stars in the IAU constellation Fornax: Beta (β) Fornacis, Omega (ω) Fornacis and Nu (ν) Fornacis.

This Chinese Chenzhuo xing guan “Tiānyǔ” is a triangle of stars of the IAU constellation Fornax: Omega (ω), Kappa (κ), and Nu (ν) Fornacis.

Rider:

This Lithuanian asterism “Jojkėlis” is the IAU constellation Cassiopeia (Vairkünas 1999). A variation is “Justandis”.

Riders:

There are two Arabic asterisms with this name:

- One, “al-Fawāris” (الفوارس) is made up of the stars of the IAU constellation Cygnus. Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts this as a hen in flight as viewed from below but has “al-Fawāris” written across its wings. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “el fawaris, the riders” (and adds the star Epsilon (ε) Cygni). The Arabs saw this as three stars:
    - Kappa (κ) Cygni: Fawaris I,
    - Delta (δ) Cygni: “Fawaris II”, a binary star. The IAU has approved the name Fawaris for Delta (δ) Cygni A.
    - Zeta (ζ) Cygni: “Fawaris III”.
- One, “Al Rakabah” or “Al Rukkabah” is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor:
    - The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists this star as “CAVDA”.
    - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Alrucaba Stella polaris”.
    - This appears in the 1521 edition of the *Alfonsine Tables* as “Alrucaba” (Kunitzsch 1986) and another edition mentioned by English Admiral William Henry Smyth’s Bedford Catalogue in 1844 lists “Reicchabba” and assigns it to Beta (β) Ursae Minoris (Kochab).
    - The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as “Alrukaba” and “Stella Polaris”.
    - “Alrukabah” and “Arrucabatho” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - Robert Hues lists it as “Alrucaba” in his *A Learned Treatise of Globes* in 1659 and translates it as “a Wagon or Chariot”.
    - Irish astronomer Agnes M. Clerke (1842 – 1907) lists the name “Alruccaba”.
    - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists “Dubherukabah”.
    - German astronomer Johann Bayer (1572-1625) lists “Alruccabah” and “Ruccabah Ismaelitis” as names for this star and “Eruccabah” as a name for Ursa Minor in his *Uranometria* in 1603.
    - John Hill lists it as “Arrucha”, “Al Rucha”, and “Rucha” in his *Urania* in 1754.

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Al Dubb-al-ahgar", going on to say that this becomes "Alrucaba" in the *Alfonsine Tables*. NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "rider" as an Arabic name for 80 Ursae Majoris (Alcor).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alruccabah" and describes it as "the chariot".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alruccabah" for this star.
- In his *Star Names* in 1899, R. H. Allen notes that 17th century Dutch astronomer Hugo Grotius (1583 – 1645) "asserted that it is from the Chaldee Rukub, a Vehicle, the Hebrew Rɛkhūbh".

Ridged and Wrinkled:

This Basotho star "Tsika le maropo" is unidentified at present (Alcock 2014). Possible but unconfirmed identities include Saturn, Canopus, and Arcturus.

Riding Camel:

This Arabic asterism "Al Ḳaʿūd" is the IAU constellation Delphinus:

- "Al Ḳaʿūd"was listed by Iranian scholar and astronomer Abu Rayhan Muhammad ibn al-Biruni (973 – c.1050).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "el ʻakúd, the necklace."
- "Al Ḳaʿūd"was listed in R. H. Allen's *Star Names* in 1899.

Riding Reindeer:

The Chukchi see the IAU constellation of Auriga as a scene of traveling by reindeer.

Rigel:

See Left Foot of al Jawza, above.

Right Angle of Canes Venatici:

This **telescopic** asterism "Órthus Cánum Venaticórum" is the irregular galaxy IC 883 (Arp 193) in the IAU constellation Canes Venatici. It was discovered by Austrian astronomer Rudolf Ferdinand Spitaler in 1891. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this… system has two tails perpendicular to each other."

Right Angle Triangle:

There are two American asterisms labeled "Right Angle Triangle":

- One is made up of the stars of the IAU constellations Andromeda and Perseus: Alpha (α) Persei (Mirfak), Beta (β) Persei (Algol), and Gamma (γ) Andromedae (Almach). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 –

1886) uses the name “Algenib” for Alpha (α) Persei and describes it as “a right-angled triangle opening toward Cassiopeia. The figure is so perfect that the stars may easily be recognized.”

- One is made up of stars of the IAU constellations Boötes and Canes Venatici: Alpha (α) Boötis (Arcturus), Gamma (γ) Boötis (Seginus) and Alpha (α) 2 Canum Venaticorum (Cor Caroli). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes it this way: “Seginus forms with Cor Caroli and Arcturus a triangle, right-angles at Seginus”.

Right Conductor:

This Chinese xing guan “Yòushètí” (右攝提) is a triangle of stars in the IAU constellation Boötes: Eta (η) Boötis (the determinative star), Tau (τ) Boötis, and Upsilon (υ) Boötis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Yòushètí” is a triangle of stars in the IAU constellation Boötes: Eta (η) Boötis, Tau (τ) Boötis, and Upsilon (υ) Boötis.

Right Dog:

This Latin asterism “Canis Dexter” is the IAU constellation Canis Major. German astronomer Johann Bayer (1572-1625) lists “Canis Dexter”.

Right Elm:

This Korean asterism “Oleunjjog Neuleub Namu” (오른쪽 느릅 나무) is a diamond of stars with a line running off one end in the IAU constellation Pisces:

- The “diamond” is the four stars Eta (η), 102, and 105 Piscium and HIP 7447.
- From HIP 7447 a line runs off to Iota (ι) Arietis.

Next to this is the similar Korean asterism “Left Elm” (see above).

Right Flag:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a zagged line of stars in the IAU constellation Aquila: Sigma (σ) Aquilae, Upsilon (υ) Aquilae, Mu (μ) Aquilae, 22 Aquilae, Delta (δ) Aquilae (the determinative star), Iota (ι) Aquilae, 36 Aquilae, 26 Aquilae and Kappa (κ) Aquilae.

This Chinese xing guan “Yòuqí” (右旗) is a zagged line of stars in the IAU constellation Aquila: Mu (μ), Sigma (σ), Delta (δ), Nu (ν), Iota (ι), 42, Kappa (κ), and 56 Aquilae and HIP 96392. The xing guan Left Flag (see above) is nearby. Note: this xing guan shares some stars with the Korean asterism “Right Flag” (see below).

This Korean asterism “Oleunjjog Gisbal” (오른쪽 깃발) is a curving line of stars in the IAU constellation Aquila with a fork at the end. A line of stars starts at Theta (θ) Aquilae and runs through Eta (η), Iota (ι), and Nu (ν) Aquilae to Delta (δ) Aquilae. At Delta (δ) Aquilae, one line runs off to the star Mu (μ) Aquilae and the other to the star Sigma (σ) Aquilae. Note: this asterism shares some stars with the Chinese xing guan “Right Flag” (see above).

Right Foot:

This Chinese star “Youzu” from the 3 Kingdoms and Ming Dynasty Period is Beta (ν) Orionis (Rigel) in the IAU constellation Orion and is part of their xing guan Send Armed Forces to Suppress (see below).

This Chinese Chenzhuo xing guan “Youzu” is the star Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Right Foot of Al Jawza:

This Arabic star “Rijl al-jawzā’ al-yumnà” is Kappa (κ) Orionis (Saiph) in the IAU constellation Orion as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992). R. H. Allen in his *Star Names* in 1899 lists “Rijl Jauzah al Yamnā”, which he translates as “Right Leg of the Jauzah” (even though “Rijl” means “foot”).

Right Forearm:

This Arabic star “adh-Dhirāʿu l-Yamīn” (الذراع اليمين) or “Al Dhirāʿ al Yamīn” (“right forearm”) is the star Alpha (α) Cephei in the IAU constellation Cepheus:

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “Alderaim” (Dekker 2000).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Alderaimim”.
- This was later latinized to “Al Deraimin” in the *Alfonsine Tables* of 1521 and in another edition as “Alderaimim” (Kunitzsch 1986). Other variations include “Alderamin”, “Al Derab”, “Al Deraf”, “Alderaf”, and “Alredat”.
- It is listed as “Alderaimin” by German astronomer Johann Bayer (1572-1625).
- Johann Bayer’s *Uranometria* (1603) lists “Aderaimin” and “Alderamin” for this star.
- It is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Alderaimon” and “Addherao”.
- It is listed as “Adderoiaminon”, “Assemani”, and “Alderal jemin” by German astronomer Wilhelm Schickard (1592 – 1635).
- Robert Hues lists it as “Alderaimin” in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists this star as “Alderamin“.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Alderamin” and his *Bedford Catalogue* in 1844 lists “Alderamin, a corruption of the Aldera-imin of the Alphonsine [sic] Tables” and “the Arabic al-dhirá al yemin, the right arm”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Alderamin” in his Celestial Atlas in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Alderamin”: The author is unknown, but it is based on Jameison’s *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists “Alderamin” for this star.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Alderamin”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Alderamin” and describes it as “the arm”.
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list “Alderamin” for this star.

- The IAU Working Group on Star Names chose Alderamin as name for Alpha (α) Cephei in 2016.

Right General:

This Chinese star "Youjiangjun" from the Three Kingdoms to the Ming Dynasty is the star Gamma (γ) Aquilae in the IAU constellation Aquila and is part of their asterism Drum at the River (see above).

Right Hand of Al Jawza':

This Arabic star "Yad al-jawzā' al-yumnà" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992):

- Scottish uranographer Alexander Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists it as "Betelgeux".
- R. H. Allen lists it as "Al Yad al Yamnā" in his *Star Names* in 1899.
- John Chilmead in his *A Learned Treatise on Globes* in 1889 listed the name "led Algeuze" as "Orion's hand".
- NOTE: This is part of their asterism Al Jawza' (see above).

Right-Handed Brother:

This Kokatha and Ngalea asterism "Mugaru" or "Badhu-Wudha" is the Large Magellanic Cloud, which is part of their asterism "Boolbarradu" or "Balbaradu" (see Brothers, above) which is both Magellanic Clouds. The "left-handed brother" is "Oimbu" or "Kurulba" the Small Magellanic Cloud (see Left-Handed Brother, above). Compare this to the Luritja and Arrernte asterism Tracks of Men Pursuing an Emu (below).

Right Knee of the Giant:

This Arabic star "Rekbah al Jauza al Yemeniat" is Kappa (κ) Orionis in the IAU constellation Orion as listed in the Calendarium of 17th century Egyptian astronomer Al Achsasi al Mouakket. This was later latinized as "Genu Dextrum Gigantis".

Right Law Administrator:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Youzhifa" is the star Beta (β) Virginis (Zavijava) in the IAU constellation Leo and is part of their xing guan Supreme Palace Right Wall (see below).

This Chinese Chenzhuo xing guan "Youzhifa" is the star Beta (β) Virginis (Zavijava) in the IAU constellation Virgo. It is part of the Supreme Palace Right Wall.

Right Linchpin (Adjunct to Chariot):

This Chinese Chenzhuo xing guan "Yoùxiá" is the star 3 Corvi in the IAU constellation Corvus. It is part of their xing guan "Chariot".

Right Linchpin (Vassal of Chariot):

This Chinese xing guan "Yoùxiá" (右辖(附轸宿)) is a line of two stars in the IAU constellation Corvus, attached to their xing guan "Chariot" (see above): Alpha (α) Corvi (Alchiba) and Epsilon (ε) Corvi. This

xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Right Pivot:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Youshu" is the star Alpha (α) Draconis (Thuban) in the IAU constellation Draco and is part of their xing guan Purple Forbidden Right Wall (see above).

Right Shoulder:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Youjian" is Gamma (γ) Orionis in the IAU constellation Orion.

This Chinese Chenzhuo xing guan "Youjian" is the star Gamma (γ) Orionis in the IAU constellation Orion.

Right Wing of the Raven:

This Arabic star "Al Janāḥ al Ghurāb al Ayman" is Gamma (γ) Corvi in the IAU constellation Corvus:

- "Al Janāḥ al Ghurāb al Ayman" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Al Janāḥ al Ghurāb al Aiman" as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).

Rigil Kentaurus:

See Foot of the Centaur, above.

Rigilalsabie:

This English star is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda as listed on the Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 (Dekker 2000). NOTE: This could also be Gamma (γ) Andromedae (Dekker 2000).

Rim Nebula:

This **telescopic** asterism is emission nebula NGC 6188 in the IAU constellation Ara. It is also known as the Dragons of Ara. John Herschel listed this as h 3640 and later as GC 4223 in the *General Catalogue* of 1864.

Rim of Aquarius:

This **telescopic** asterism "Perídromus Aquárii" is the lenticular galaxy NGC 7585 (Arp 223) in the IAU constellation Aquarius. This was discovered in 1784 by William Herschel who listed it as "II 236". John Herschel listed it as h 2226 and h 3979 and later as GC 4928 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the special feature of this galaxy is the big rim structure."

Rimwimata:

This Kiribati star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Trussel and Groves 1978). It indicated a good season for sailing ("Rimwimata, tai n rimwimata").

Rimwimata ni meang:

This Kiribati star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Trussel and Groves 1978).

Ring:

There are forty-six **telescopic** "ring" asterisms:

- One is Sánta 59, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a ring of 10th – 14th magnitude stars in the IAU constellation Canis Majoris.
- One is Sánta 122, listed in 2007 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Cepheus. Gábor describes it as "ring of stars, Kron. 23, BDSB03 are parts of it".
- One is Sánta 172, listed in 2007 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Lyra. Gábor describes it as "circle of stars 9 – 13 [magnitude], nice."
- One is Sánta 202, listed in 2015 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Lacerta. Gábor describes it as "very tiny oval of stars 11 – 15 [magnitude]".
- One is Sánta 211, listed in 2015 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Camelopardalis. He describes it as "HD 76702 group, a drop-like ring of 8 – 11 [magnitude] stars, nice asterism". The double star HIP 44815 A (HD 76702) is the brightest star in this "ring".
- One is Kernya 9, listed by listed in 2007 by Hungarian astronomer Gábor János Kernya, which is a group of 11th – 17th magnitude stars in the IAU constellation Cepheus. Kernya describes it as a "very small, ring-like shape, made up of only six stars."
- One is Kernya 13, listed by Hungarian astronomer Gábor János Kernya, which is a group of 10th – 15th magnitude stars in the IAU constellation Piscis Austrinus. Kernya describes it as "an elongated ring of stars in the neighbourhood of the spiral galaxy NGC 7314.
- One is Kernya 48, listed in 2013 by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Monoceros. Kernya describes it as the "HD 50528 group" (HIP 33110) and as "ring shaped. The bright stars are visible in the middle and on the northern and western sides of the ring, while the rest of the ring is made up of faint components."
- One is Kernya 71, listed in 2015 by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Cygnus. Kernya describes it as a "great little asterism." Size 2'. This consists of six faint stars.
- One is Kernya 79, listed by Hungarian astronomer Gábor János Kernya, a group of stars of magnitude 14 or less in the IAU constellation Pegasus. Kernya describes this as "a very small and faint group, its main mass ring shaped… a distant faint galaxy shines behind the ring shape, but two or three stars of the asterism can prove that they are actually distant compact galaxies."
- One is Kernya 81, listed in 2015 by Hungarian astronomer Gábor János Kernya, a group of stars of magnitude 13 or less in the IAU constellation Pegasus. Kernya describes it thus: "Its main mass is ring-shaped. It can be partially resolved with smaller telescopes."
- One is Kernya 85, listed in 2016 by Hungarian astronomer Gábor János Kernya, which is a group of 8th – 14th magnitude stars in the IAU constellation Camelopardalis. Kernya describes this as a "distorted ring shape" which he discovered "using 10 cm binoculars".
- One is Kernya 87, listed by Hungarian astronomer Gábor János Kernya in 2016, which is a group of 7th – 14th magnitude stars in the IAU constellation Draco.

- One is Kernya 91, listed in 2016 by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Pegasus. Kernya describes the middle star as HD 208122. Kernya notes that this is also listed as Bedo 1.
- One is Kernya 116, listed in 2022 by Hungarian astronomer Gábor János Kernya, a group of 16.5 – 19 magnitude stars in the IAU constellation Canis Major. Kernya describes this as a "very faint ring".
- One is Hay-Merting 4 or "Hay's Ring" in the IAU constellation Cassiopeia. Robert Zebahl lists it on his *Faint Fuzzies* website and describes it as a "ring-shaped star pattern with a diameter of slightly more than 0.7°. The open cluster NGC 225 is involved in the southeastern edge of the ring, the cluster Stock 24 lies slightly inside the western edge. From NGC 225 to Stock 24 a band of stars runs through the ring, with a short branch to the north. The northeastern edge of the ring is broken briefly. Long exposure photos actually show that a dark nebula band crosses the ring there".
- One is the planetary nebula Messier 57 (NGC 6720), discovered by French astronomer Charles Messier in 1779 in the IAU constellation Lyra.
    - English astronomer John Herschel listed it in his *General Catalogue* of 1864 as GC 4447 and described it as a vast, flat, nebular ring.
    - The Earl of Rosse described it in Observations on some of the Nebulae (1844) as an "annular nebula".
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) labels this the "Annular Nebula in Lyra".
    - John Dreyer describes it in the New General Catalogue of 1888 as an "annular nebula".
    - English astronomer William Denning's *Telescopic Work for Starlight Evenings* (1891) lists it as the "Ring Nebula".
    - German astronomer Hermann Joseph Klein (1844 – 1914) lists the "Ring Nebula" in his *Star Atlas* (1893).
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as "the Famous Ring".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this as the "Ring Nebula".
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Ring Nebula".
- One is Alessi-Teutsch 10, from the lists of Brazilian astronomer Bruno Alessi, which is in the IAU constellation Taurus. Size 30' X 30'. René Merting describes it on the *Faint Fuzzies* website: "…looks like a ring with a loop, five stars in the SW form a ring, six stars in the NE form a larger, slightly elongated loop. This is Corder 573 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This includes HIP 17423 and 17474.
- One is the Engagement Ring in the IAU constellation Ursa Minor. Alpha (α) Ursae Minoris (Polaris) represents the "diamond" of this asterism, with a fainter ring of stars about one degree across forming the ring, including HIP 17195, 11980, 8846 and 7283. Size 60' X 60'. This was listed in 1961 by astronomer William L. Dutton (Sky and Telescope, Jan 1961) and is Harrington 1 on American astronomer Phil Harrington's list of asterisms. It is also listed as the Diamond Ring and Sánta 110 on the list of Gabor Sánta.

- One is the planetary nebula PK 238 +34.1 (Abell 33) which is the "Engagement Ring" in the IAU constellation Hydra. This name was posted by Cypriot astronomer Rolandos Constantinides on the *Deep Sky Forum* in February 2016.
- One is the Lindsay-Shapley Ring asterism, PGC 19481, a lenticular ring galaxy in the IAU constellation Volans. It is also known as the Southern Ellipse (see below) and appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as Graham's Ring ("Ánulus Grahamiánus Volántis").
- One, the Ruby Ring, also known as Webb's Wreath, is in the IAU constellation Hercules. This has a golden 7th magnitude star HIP 88348 as the "ruby" on the east side, with a ring of 11th and 12th magnitude stars forming the ring. This asterism is 2.7 degrees southwest of the star Xi (ξ) Herculis. Size 25'. Jeffrey Corder lists this as Corder 3426.
- One is Corder 1596 in the IAU constellation Cancer, from the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 12'. This is six 9th magnitude stars.
- One is Corder 2583 in the IAU constellation Virgo and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 30'. This oval of six stars includes HIP 68398, 68453, 68535, and 68430.
- One is in the IAU constellation Perseus and is Corder 265 on the observing list of American astronomer Jeffrey Corder. Size30'. Corder describes this as an "obvious oval of 10 or 11 stars, magnitudes 8 to 10." This includes HIP 7729, HIP 7660, and the double star HIP 7665A.
- One is in the IAU constellation Perseus and is Corder 541 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is in the cluster Melotte 20. The "ring" includes the stars HIP 16340, 16079, 16137, and 16275 and four other 7th magnitude stars. The "gem" in the "ring" is Sigma (σ) Persei.
- One is in the IAU constellation Perseus and is Corder 618 on the observing list of American astronomer Jeffrey Corder. Size 30'. Circlet of six stars of 8th – 10th magnitude including the double star HIP 18915 and HIP 18867.
- One is in the IAU constellation Auriga and is Corder 916 on the observing list of American astronomer Jeffrey Corder. Size 5'. Corder describes this as "a small circlet of five… stars magnitude 9 to 11."
- One is in the IAU constellation Draco and is Corder 2115 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is ten 7th – 9th magnitude stars including HIP 54039, 53732, 53979, and the double star HIP 53683.
- One is in the IAU constellation Eridanus and is Ennis 64 on the observing list of Canadian astronomer Charles Ennis. Size 5'. This is six 9th – 12th magnitude stars in a ring including Gaia DR3 3187668003459498368 with 7th magnitude star HIP 22301 as the "gem".
- One is in the IAU constellation Lepus and is Corder 938 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is a group of 8th – 10th magnitude stars including HIP 27539 and 27481.
- One asterism is in the IAU constellation Canis Major and is Ennis 71 on the observing list of Canadian astronomer Charles Ennis. Size 15'. Five 8th – 9th magnitude stars form the "ring": HD 54496, SAO 173010, SAO 173011, HD 54391, and SAO 173038. The "gem" is delta (δ) Canis Majoris. This includes stars of Corder 1265 on Jeffrey Corder's list.
- One is in the IAU constellation Puppis and is Corder 1328 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is a ring of ten 8th – 9th magnitude stars including HIP

35899. Towards the north end of the ring is a smaller ring of 9th magnitude stars which one could interpret as a "gemstone".

- One is in the IAU constellation Carina and is Corder 1737 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 7th – 9th magnitude stars including HIP 43879.
- One is in the IAU constellation Antlia and is Corder 1856 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is twelve stars of 6th magnitude and dimmer, including HIP 46810, 46777, 46585, 46593, 46646, and the double star HIP 46705.
- One is in the IAU constellation Hydra and is Corder 2702 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is five 6th – 7th magnitude stars including HIP 71862, 72011, and 72035, and the double star HIP 72102A.
- One is in the IAU constellation Libra and is Corder 2773 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 9th – 10th magnitude stars including HIP 73888 and 73929.
- One is in the IAU constellation Ophiuchus and is Corder 3277 on the observing list of American astronomer Jeffrey Corder. Size 50' X 35'. This is twenty 8th – 9th magnitude stars including HIP 85601.
- One is in the IAU constellation Sagittarius and is Corder 3512 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is twelve 8th – 9th magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3548 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is fifteen 9th – 10th magnitude stars.
- One is in the IAU constellation Telescopium and is Corder 3561 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is eight 7th – 8th magnitude stars including HIP 90555, 90448, and the double star HIP 90470A.
- One is in the IAU constellation Pavo and is Corder 3681 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is ten 8th – 9th magnitude stars.
- One is in the IAU constellation Cygnus and is Corder 4144 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 8th – 9th magnitude stars including HIP 100701 and100795.
- One is in the IAU constellation Pegasus and is Corder 4719 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 9th magnitude stars including HIP 111739.
- One is in the IAU constellation Pegasus and is Corder 4764 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is seven 8th – 9th magnitude stars including HIP 112728 and 112680.
- One is in the IAU constellation Andromeda and is Corder 4982 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is a "circlet" of twelve 9th – 11th magnitude stars including the double star HIP 117762.
- One is the planetary nebula NGC 6894 in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as "IV 13". It is GC 4565 in the *General Catalogue* of 1864. It is also known as the Diamond Ring Nebula or the Little Ring Nebula.
- One is the planetary nebula Minkowski 1-64 (M 1-64, PN G064.9+15.5, PK 064+15.1) in the IAU constellation Lyra. This is 2.3° NNW of Messier 57, the most well known "Ring Nebula". This name was posted on the *Deep Sky Forum* by German astronomer Uwe Glahn in February 2012.

Ring Bearer of Hydra:

This **telescopic** asterism “Paenanuláta Hýdrae” is the lenticular galaxy NGC 2781 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as “I 66”. It became GC 1777 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this (“bearer of a nearly complete ring”) due to “the almost complete ring formed by the outer spiral arms”.

Ring Dance:

This Romanian asterism “Dans de Inel” or “Hora” is the IAU constellation Corona Borealis (Ottescu 2009, Lite, Lodina, and Ignat 2018). The star Alpha (α) Coronae Borealis (Alphecca) is called the Great Maiden in the Ring Dance (see above) and Delta (δ) and Iota (ι) Coronae Borealis are the Singers (see below).

Ring Bearer of Carina:

This **telescopic** asterism “Anulífera Carínae” is the barred spiral galaxy NGC 2381 in the IAU constellation Carina. It was discovered in 1834 by John Herschel who listed it as 3084 and later as GC 1523 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has a ring.

Ring Maker of Horologium:

This **telescopic** asterism “Cricopoétria Horológii” is the barred spiral galaxy NGC 1512 in the IAU constellation Horologium. This was discovered by James Dunlop and became 2607 on John Herschel’s list. Later it became GC 808 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ring of Boötes:

This **telescopic** asterism “Sphéndone Boótis” is the barred spiral galaxy NGC 5876 in the IAU constellation Boötes. It was discovered by Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy resembles a ring with an embedded stone”.

Ring of the Nibelungen:

This **telescopic** asterism Ferrero 27 from the asterisms list of French astronomer Laurent Ferrero, is a ring of five 11^{th} to 13^{th} magnitude stars in the IAU constellation Draco. Size: 1.7’ X 0.5’.

Ring Tail:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. It was given this name by American astronomer Harlow Shapley (1885 – 1972) and South African astronomer John S. Paraskevopoulos (1889 – 1951) because of the two long “tails” of stars, gas, and dust ejected from the collision, resembling an insect’s antennae. This is also known as the Antennae Galaxies or Antennae (see above), the Snorter (see below), and the Mosquito Larvae (see below).

Ring-Tailed Possum:

This Boorong asterism “Bunya” is the IAU constellation Crux as listed by Stanbridge (1857), Morieson (1999) and Hamacher and Frew (2010). Bunga is pursued by Tchingal, who in his fright lays down his spears at the foot of a tree and climbs it. For his cowardice, he is turned into an opossum.

This Wotjobaluk star “Bunya” is Gamma (γ) Crucis in the IAU constellation Crux (Hamacher 2011).

Ringed of Cygnus:

This **telescopic** asterism “Cricóte Cýgni” is the spiral galaxy NGC 7013 in the IAU constellation Cygnus. It was discovered in 1784 by William Herschel who listed it as “II 203”. It became GC 4632 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the small ring in the inner region of this galaxy”.

Ringed Rope:

This Arabic asterism is a loop of stars with two lines running out of either end in the IAU constellation Pisces:

- The loop starts at Iota (ι) Piscium and runs around through Theta (θ) Piscium, 7 Piscium, Gamma (γ) Piscium, Kappa (κ) Piscium, 15 Piscium, Lambda (λ) Piscium, and 19 Piscium.
- From Iota (ι) Piscium a line runs out to Omega (ω) Piscium, and
- From 7 Piscium a line runs out to Beta (β) Piscium.

Rip Torn Cluster:

This **telescopic** asterism is the open cluster IC 2714, discovered by the Scottish astronomer James Dunlop in 1826 in the IAU constellation Carina. It was later recorded by American astronomer Solon Irving Bailey (1854 – 1931) and became IC 2714. It has received this name as the stars are arranged in lanes as if torn apart.

Ritual Cup:

This Sama (Tawi-Tawi) asterism “Basung” is the Hyades cluster in the IAU constellation Taurus (Masong 2017).

Rival:

This Belarussian asterism “Sapernik” is the IAU constellation Lyra (Avilin 2009). It is also known as “Twa Braty” (see Two Brothers, below) and “Niavesta” (see Bride, above).

Rival Fish:

This Wardaman star “Lawara” is Delta (δ) 3 Tauri in the IAU constellation Taurus (Cairns and Harney 2003) and one of the stars in their asterism “Little Fishes” (see above).

Rival to Ares:

This Greek star “Ἀντάρης” (“Antáris”), which has been translated as “like Ares” or “rival to Ares”, later latinized to “Antares”, is Alpha (α) Scorpii in the IAU constellation Scorpius. This star got this name due to its similarity to Mars (whom the Greeks called Ares) in the sky. Hesychius of Alexandria called it “Ἀνταρτης” (“Ántartis” or “rebel”). The Latin version of Ptolemy’s *Tetrabiblos* described it as “Marti

Comparatur" ("Compared to Mars"). Some texts have shortened the name to "Antar", which leads to confusing it with "Antar's Star" (see above):

- The 1515 edition of the *Almagest* lists "Natar" ("rapine"), and the 1521 edition of the *Almagest* lists the translation "tendit ad rapinam" ("tends to prey"). Richard Allen speculates that this might have something to do with the star being associated with Ares.
- "Antares" appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus.
- This star is listed on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as "Antares".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Antares".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Antares".
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Cor Scorpi Antares".
- Edward Sherburne lists it as "Antares, Heart of Scorpius" in his *Sphere of Marcus Manilius* in 1675.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists this star as "Antares Cor Scorpii" ("Antares Heart of Scorpio").
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Antares".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Antares".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Antares" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- "Antares" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- American uranographer William Croswell (1760 – 1834) lists this star as "Antares" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Antares" in his *Celestial Atlas* in 1822.
- Antares is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Antares".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Antares" in his *Star Atlas* (1893).
- R. H. Allen writes in his *Star Names* in 1899 that German orientalist Georg Wilhelm Sigismund Beigel (1754 – 1837) interpreted "Antar" as an Arabic word for "Shone".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Antares" and describes it as the "heart of the Scorpion".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Antares" and "Cor Scorpionis".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Antares".

- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Antares" and describes it as "Equal to Mars (red color)".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Antares… Rival to Mars".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Antares" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Antares".
- The IAU approved the name Antares for Alpha (α) Scorpii A.

River:

This Greek asterism "ὁ Ποταμός" ("o Potamós" or "the river") is the IAU constellation Eridanus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described by Ptolemy (c.100 – c.170) in his *Almagest* and is a bit shorter than the modern constellation. The bending line starts at Lambda (λ) Eridani and runs through Beta (β) Eridani (Cursa), Psi (ψ) Eridani, Omega (ω) Eridani, Mu (μ) Eridani, Nu (ν) Eridani, Xi (ξ) Eridani, Omicron (ο) 1 and 2 Eridani, Gamma (γ) Eridani, 26 Eridani, Delta (δ) Eridani, Epsilon (ε) Eridani, Zeta (ζ) Eridani, Rho (ρ) 2 and 3 Eridani, Eta (η) Eridani, Tau (τ) 1, 2, 3, 4, 5, 6, 7, 8 and 9 Eridani, Upsilon (υ) 1, 2, 3 and 4 Eridani, g Eridani, f Eridani, and h Eridani, ending at Theta (θ) 1 Eridani.

This Arabic asterism "Alnahr" (النهر) or "Al Nahr" is the IAU constellation Eridanus:

- "al-Nahr" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Johann Bayer's *Uranometria* (1603) lists "Nar", and "Nahar".
- "Nahar" and "Nahron" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues (1659) and John Chilmead (1899) listed it as "Alvahar".
- John Hill lists it as "Nahr" in his *Urania* in 1754.

This Indian asterism "Srotaswini" is the IAU constellation Eridanus.

This is also one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old, made up of stars of the IAU constellations Andromeda, Lacerta, and Perseus: It starts at 2 Lacertae at one end and runs through 7 Andromedae, 51 Andromedae, Theta (θ) Persei, Beta (β) Persei (Algol), Omega (ω) Persei, and ends at HIP 17584.

This Berber asterism "Guad" is the IAU constellation Eridanus.

- "Guad" is listed by German astronomer Johann Bayer in his *Uranometria* in 1603 and attributes it to "Mauritanis".
- "Guad" is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675: Sherburne also includes the name "Nah'r". Sherburne describes it as "Moorish", which may mean Arabic, as this was an exonym applied to all Arab peoples, or simply the Berbers
- A 1720 edition of the *Uranometria* lists "Guagi".
- It appears as "Guad" in John Hill's *Urania* in 1754. Hill.
- In his *Star Names* in 1899 R. H. Allen suggests that this is derived from the Arabic "wādī" ("valley" or "ravine"), which is a dry channel that floods during rainy periods.

This Latin asterism “Amnis”, “Flumen”, or “Fluvius” (“a river”) is the IAU constellation Eridanus.

- The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists “Fluvius, quem Eridanus dicunt” (“The river, which they call Eridanus”) and the 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* list “Fluvius”.
- The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict this God with the stream beneath him and a flowing plant above him: He is holding his right hand out palm upwards.
- The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict this God as horned, lying alongside a stream, holding a fish in his left hand. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts the God sitting in the stream.
- The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts this river God holding a spear.
- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) labels this constellation “Flumen”.
- Johann Bayer’s *Uranometria* (1603) lists “Flumen” and “Fluvius” for Eridanus.
- Edward Sherburne lists “Fluvius” and “Fluvius Orionis” (“Orion’s River”) in his Sphere of Marcus Manilius in 1675
- John Hill lists “Fluvius” in his *Urania* in 1754.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as “Amnis Infirmus” (“weak stream”) in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth lists “Fluvius” and “Orion’s River” in his *Bedford Catalogue* in 1844.

This asterism “Gyhon” is the IAU constellation Eridanus as listed in John Hill’s *Urania* in 1754. He does not identify his source but Edward Sherburne also lists this name in his *Sphere of Marcus Manilius* in 1675.

This Berber asterism “Vardi” is the IAU constellation Eridanus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671) and as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and in John Hill’s *Urania* in 1754: Riccioli and Hill both describe this name as “Moorish”.

This Hawaiian asterism “Nu’uanu” is the IAU constellation Eridanus, which they have named for a river on O’ahu.

River Adjoining Tower:

This Korean asterism is a quadrilateral in the IAU constellation Lyra: Beta (β) Lyrae (Sheliak), Gamma (γ), Eta (η), and Delta (δ) 2 Lyrae.

River of Ocean:

This Latin asterism is the IAU constellation Eridanus and relates to the 8th century B.C.E. poet Homer’s Ocean Stream flowing around the Earth.

River of Orion:

This Greek asterism is the IAU constellation Eridanus, one end of which is next to the IAU constellation Orion. This name was used by Hipparchus (190 – 120 B.C.E.) and the 5th century Greek philosopher Proclus.

River of Sky:

This Korean asterism "Gang Injeob Tawo" (강 인접 타워) is a line of four stars in the IAU constellation Ophiuchus: 36, Theta (θ), 44, and 51 Ophiuchi.

River of Stars:

This **telescopic** Nawat star "Citalá" is HIP 33719 (HD 52265) in the IAU constellation Monoceros (magnitude 6.29). It was given this name by the IAU NameExoWorlds campaign. It has an exoplanet named Cayahuanca, which means "rock looking at the stars".

River Tigris:

This Dutch asterism, also known as "Tigris", was created in 1612 by the Flemish astronomer Petrus Plancius. One end was near the "shoulder" of the IAU constellation Ophiuchus and the other near the IAU constellation Pegasus. It passed through the IAU constellation Vulpecula between Cygnus and Aquila. "Tigris Fluvius" appears on Plancius' celestial globe published in Amsterdam by Pieter van der Keere in 1613. In his *Star Names* in 1899, R. H. Allen described it thus: "Its course was from β and γ, in the right shoulder of Ophiuchus, onwards between Aquila and the left hand of Hercules; thence between Albireo (β Cygni) and Sagitta to Equuleus and the front parts of Pegasus, ending at the latter's neck."

In the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch this asterism is listed as "Tigris Fluvius" and abbreviated on charts as "Tigris Flu".

"Tigris Fluvius" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633).

This asterism is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Tigris Flu".

Edward Sherburne lists it as "River Tigris or Euphrates" in his *Sphere of Marcus Manilius* in 1675.

River Turtle:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Corona Australis: Starting at the determinative star Alpha (α) Coronae Australis, it runs through Gamma (γ) Coronae Australis, Epsilon (ε) Coronae Australis, Lambda (λ) Coronae Australis, Kappa (κ) 2 Coronae Australis, HIP 90887, Theta (θ) Coronae Australis, HIP 91494, Eta (η) 1 Coronae Australis, HIP 92953, Zeta (ζ) Coronae Australis, Delta (δ) Coronae Australis, and Beta (β) Coronae Australis.

This Chinese asterism "Biē" (鱉) is made up of stars of the IAU constellations Corona Australis and Telescopium. It is an oval of stars with one side flattened: Starting at Alpha (α) Telescopii, it runs through Eta (η) 1 Coronae Australis, Zeta (ζ) Coronae Australis, Delta (δ) Coronae Australis, Beta (β) Coronae Australis, Alpha (α) Coronae Australis, Gamma (γ) Coronae Australis, Epsilon (ε) Coronae Australis, Kappa (κ) 2 Coronae Australis, and Theta (θ) Coronae Australis.

This Chinese Chenzhuo xing guan “Biē” is an oval of stars formed by the IAU constellation Corona Australis: Alpha (α), Gamma (γ), Epsilon (ε), Lambda (λ), Kappa (κ) 2, Theta (θ), Eta (η) 1, Zeta (ζ), Delta (δ), & Beta (β) Coronae Borealis and HIP 90887, 91494 and 92953.

River’s End:

There are two stars derived from the Arabic “Ākhir an-nahr” (آخِر النَّهْر) or “Al Āḥir al Nahr” which translates as "the end of the river" or “stream’s end”, “edge”, or “border”:

- One is the star “Acamar” which is the star Theta (θ) 1 Eridani in the IAU constellation Eridanus:
  - “Ākhir al-Nahr” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name of this star as “akhi al-nahr” and the Hebrew name as “aharit ha-nahar”.
  - An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name as “akhir al-nahr” and the Hebrew name as “aharit ha-nahar”.
  - The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists “Acarnar” for this star.
  - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Acarnar” for this star.
  - This appears in the 15th century *Alfonsine Tables* as “Acarnar” (Kunitzsch 1986): The Latin translator misread "rn" as "m".
  - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Acamar”.
  - The IAU approved the name Acamar for the star Theta (θ) 1 Eridani A.
- One is the star “Achernar” or “Achenar” which is the star Alpha (α) Eridani in the IAU constellation Eridanus:
  - The Astronomicon Caesarium (1540) of Petrus Apianus (1495 – 1552) lists this star as “Acarnar”.
  - The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists “Acarnar”.
  - German uranographer Johannes Stöffler’s Constance Celestial Globe (1493) lists “Achernar” for this star.
  - German astronomer Johann Bayer (1572-1625) listed this star as “Acharnar”, “Acharnahar”, and “Acharnarim”.
  - A celestial globe (late 1597) of Flemish astronomer Petrus Plancius published by Amsterdam cartographer Jodocus Hondius the Elder lists “Achernar”.
  - “Acharnar” and “Achiron-nahri” are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
  - German poet Philipp von Zesen (1619 – 1689) listed this star as “Acarnar”.
  - This star is listed on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as “Alcarnar”.
  - Johann Bayer’s *Uranometria* (1603) lists “Acharnar” and “Acharnarim”
  - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Acharnar” and “Nahar”.

- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Acarnar”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed this star as “Acarnaharim” and “Acharnaar”
- French scholar Joseph Justus Scaliger (1540 – 1609) listed this star as “Acharnarin”
- German astronomer Wilhelm Schickard (1592 – 1635) listed this star as “Achironnahri”.
- Hondius also lists “Alcarnar” for this star (Dekker 2016).
- Robert Hues listed “Acharnahar” and “Acarnar” for this star in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne lists this star as “Acher Nah’r” and “Acarnar” in his *Sphere of Marcus Manilius* in 1675 and translates this as “Ultima Fluminis” (“The Last of the River”).
- Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists this star as “Acarnar”.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists “Achernar” for this star.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Achernar”.
- American uranographer William Croswell (1760 – 1834) lists this star as “Achernar” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Achernar” in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 translates “ákher-nahr” as “Ultima Fluvii, end of the river”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list “Achernar” for this star.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Achernar”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists Alpha (α) Eridani as “Achernar”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Achernar” and describes it as the “end of the river”.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Achernar”.
- The 1st edition (1910) and 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list “Achernar”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985 by Valerie Illingworth, ed., lists “Achernar”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Achernar”.
- Variations include “Achenar” and “Archarnar”.
- The IAU Working Group on Star Names approved Achernar as the name for Alpha (α) Eridani A in 2016.

Road for Emperor:

This Korean asterism “Hwangjeleul Wihan Gil” (황제를 위한 길) is a line of four stars in the IAU constellations Cygnus and Lyra: 39, Eta (η), and 15 Cygni and 13 Lyrae.

Road of the Lost Men:

This Romanian asterism “Calea Rătăciţilor” is the IAU constellations Serpens and Ophiuchus (Ottescu 2009).

Roaring Bright One:

This Arabic star “Suhail Hadar” (سهيل هدار) is Zeta (ζ) Puppis in the IAU constellation Puppis and was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars*.

Robber:

This Chaldean star “mul lu.sa.gaz” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Robe:

This German asterism “Robe” is the IAU constellation Corvus as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Robert’s Quartet:

This **telescopic** asterism is a quartet of galaxies in the IAU constellation Phoenix:

- Diffuse barred irregular galaxy NGC 87,
- Barred spiral galaxy NGC 88,
- Barred spiral or lenticular galaxy NGC 89, and
- Spiral galaxy NGC 92.

These galaxies were all discovered by English astronomer John Herschel in September 1834. They became GC 43, GC 44, GC 45, and GC 46 in John Herschel’s 1864 *General Catalogue*. Halton Arp and Barry F. Madore named it after Robert Freedman, who generated many of the updated positions of galaxies in their *A Catalogue of Southern Peculiar Galaxies and Associations* in 1987.

Robin:

This Mi’kmaq star “Jipjawej” is Epsilon (ε) Ursae Majoris (Alioth) in the IAU constellation Ursa Major. It is part of their asterism Muin and the Seven Hunters (see above).

This Ininew star “Pipichew” is Alpha (α) Coronae Borealis in the IAU constellation Corona Borealis (Buck 2016) and is part of their asterism “Tehpakoop Pinesisuk” (see Seven Birds, below).

This Kamilaroi and Euahlayi star “Guniibuu” is 36 Ophiuchi in the IAU constellation Ophiuchus. This is named for the Robin (Petroica boodang). The IAU approved the name Guniibuu for 36 Ophiuchi A in 2018.

Robin’s Egg Nebula:

This **telescopic** asterism is planetary nebula NGC 1360 in the IAU constellation Fornax. It was discovered by American astronomer Lewis Swift (1820 – 1913) in 1857 and recorded in 1868 by the German astronomer Friedrich August Theodor Winnecke. It is GC 5315 in the *General Catalogue* of 1864. This is O’Meara 16 on astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007). It is also known as the Comet Nebula (see above).

Rocket:

This **telescopic** asterism is French 3 on the asterism list of American astronomer Sue French and is found in the IAU constellation Vulpecula. German astronomer René Merting lists it on the *Faint Fuzzies* website. Merting describes it as "overall impression of a rocket- I can think of something else, but that is not suitable for minors- this pattern points straight in the direction of the star cluster Czernik 40 (King 27). Size 2.2' X 1'.

Rocket Ship:

There are three **telescopic** "rocket ship" asterisms:

- One in the IAU constellation Pisces is Posey 1 on the asterism list of Dan Posey of the Austin Astronomical Society. A triangle of three stars with another in the middle forms the rocket ship, including 6th magnitude star HIP 114864 at the tip, the double star HIP 114914A in the middle and HIP 115012A on one corner. A short equally distanced group of three stars of descending magnitude (8.2 to 9.3) form the "flame". Its size is 50' X 23'.
- One is the open cluster NGC 1807 in the IAU constellation Taurus. It was discovered by English astronomer William Herschel in 1784 who listed it along with NGC 1817 in his catalogue as "VII 4". It is GC 1020 in the *General Catalogue* of 1864. This is the name given to it by American astronomer Wayne Schmidt, who describes it as a fat rocket ship 10 arcminutes long.
- One in the IAU constellation Orion is Elosser 1 (see Semi-Circle, below), halfway between the stars Pi (π) 2 and 3 Orionis. It consists of thirteen stars hooked around a golden 9th magnitude star. It is part of a list by American amateur astronomer David Elosser from North Carolina. René Merting lists it on Robert Zebahl's *Faint Fuzzies* website and notes that it looks like an "old fashioned rocket ship". Merting's "rocket ship" has the aforementioned "golden star" as the flame at the base of the rocket, with a triangle of 8th-9th magnitude stars as the "nose" of the rocket. The "golden star" forms a slightly larger triangle with a couple of 10th magnitude stars resembling the "fins" of the rocket, and the curve of stars that forms the rest of Elosser 1 is the smoke trail behind it.

Rocket's Red Glare:

This **telescopic** asterism is the proto-planetary nebula AFGL 915 (PN G218.9-11.7, IRAS 06176-1036) in the IAU constellation Monoceros. This was posted on the *Deep Sky Forum* by Dutch astronomer Victor van Wulfen in March 2023.

Rocking Horse:

There are two **telescopic** "rocking horse" asterisms:

- One is the open cluster NGC 6910 in the IAU constellation Cygnus. It was discovered by William Herschel in 1786 who listed it as "VIII 56". His son John Herschel listed it as h 2077 in 1828. It is GC 4575 in the *General Catalogue* of 1864. It is also known as the Inchworm Cluster. It is located a half degree east-northeast of Sadr (Gamma (γ) Cygni) and may be related to the nebula IC 1318 (the Gamma Cygni Nebula). American astronomy author Alan M. MacRobert described it as looking "for all the world like a stick-figure horse in profile pulling against a rope- perhaps a rocking horse, with the two bright orange stars for feet. It is facing northwest." Size 8' X 8'. NOTE: IC 1318 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923) and Dreyer's *Index Catalogue of Nebulae* (1888 – 1894) describes it as "γ Cygni, surrounded by L patches of F neby".

- One is in the IAU constellation Cancer and is listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 1735. Size 60'. A shallow curve of stars including HIP 44162, 44017A, 43798, 43655, and 43623 forms the "rocker". The "horse" includes HIP 44075, 44478, 44923, 43899, 44083, 43899, and 43920A.

Rod:

This Latin asterism "Virga" ("rod" or "staff") is the IAU constellation Sagitta as listed by R. H. Allen in his *Star Names* in 1899.

Rod of Ursa Major:

This **telescopic** asterism "Scipio Úrsae Majóris" is the edge-on spiral galaxy NGC 2820 in the IAU constellation Ursa Major. It was discovered in 1791 by William Herschel who listed it as "II 869". It became GC 1798 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rod of Virgo:

This **telescopic** asterism "Régula Vírginis" is the edge-on lenticular galaxy NGC 4762 in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784 who listed it as "II 75". It is GC 3278 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Kite" or "Paper Kite" (see above).

Roll of Cetus:

This **telescopic** asterism "Volumen Ceti" is the dwarf irregular galaxy WLM (Wolf-Lundmark-Melotte or UCGA 444) in the IAU constellation Cetus. It was discovered by Max Wolf in 1909. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its apparent cylindrical shape.

Rolled Tongue:

This Chinese xing guan "Juǎnshé" (卷舌) is a curve of stars in the IAU constellation Perseus: Nu (ν), Epsilon (ε), Xi (ξ), Zeta (ζ), 38, and 40 Persei. This is identical to the Korean asterism "Rolled Tongue" (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Juǎnshé" (卷舌) is a hooked line of stars in the IAU constellation Perseus. Starting at Nu (ν) Persei the line runs through Epsilon (ε) Persei, Xi (ξ) Persei, Zeta (ζ) Persei, and 38 Persei to 40 Persei.

This Korean asterism "Gullin Hyeo" (굴린 혀) is identical to the Chinese xing guan "Rolled Tongue" (see above).

Rolled Up of Antlia:

This **telescopic** asterism "Involútus Ántliae" is the spiral galaxy NGC 3449 in the IAU constellation Antila. It was discovered in 1834 by John Herschel who listed it as h 3302 and later as GC 2249 in his *General*

Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Roller Coaster:

There are two **telescopic** "roller coaster" asterisms:

- One is "Eddie's Coaster" or "Eddie's Roller Coaster", which is a wave of stars in the IAU constellation Cassiopeia resembling a roller coaster and is from an asterism list by Eddie Carpenter of the Bristol Astronomical Society and the Cotswold Astronomical Society. The stars run between Kappa (κ) Cassiopeiae and Epsilon (ε) Cassiopeiae. The top of the "track" is around the star HIP 5696 and goes through a curving line of 7th to 8th magnitude stars through HIP 5239, 5106, and 4567, ending at HIP 4449 and 4318.
- One is Hay-Merting 10 in the IAU constellation Cassiopeia. Robert Zebahl lists it on his *Faint Fuzzies* website. Its size is 20' X 8'. This is a winding chain of stars with the planetary nebula IC 1747 in the middle of the chain.

Roller of Hydra:

This **telescopic** asterism "Vólvola Hýdrae" is the intermediate spiral galaxy NGC 2947 in the IAU constellation Hydra. It was discovered by American astronomer Francis Leavenworth in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rom Rimwimata:

This Kiribati asterism "Rom Rinwimata" is made up of stars of the IAU constellation Scorpius (Trussel and Groves 1978). They are described as "under Antares".

Roman Empire:

This German asterism "Impery Rom" is the IAU constellation Aquila as listed in the charts of the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Roman Military Eagle:

This German asterism is the IAU constellation Aquila as described by German poet Philipp von Zesen (1619 – 1689).

Romulan War Bird:

This **telescopic** asterism is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as "VI 27" in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. In the 19th century it was known as Copeland's Golden Worm, later named the Great Bird Cluster (see above) by Phil Harrington and as the "Sparrow" by South African astronomer Carol Botha. More recently astronomers who are fans of J. K. Rowling's *Harry Potter* series named it Hagrid's Dragon. This is O'Meara 36 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), which lists the names "Hagrid's Dragon", "Romulan War Bird", and "Klingon Battle Cruiser".

Roni Kama:

This Kiribati asterism “Roni Kama” or “Tauri ni Kama” is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Trussel and Groves 1978). NOTE: They also list “Ronikaáma” as the name of an unidentified star without specifying the constellation.

Roni Kameang:

This Kiribati star is a star in the IAU constellation Auriga (Trussel and Groves 1978).

Roofing:

This Chinese xing guan “Gàiwū” (盖屋) is a line of two stars in the IAU constellation Aquarius: Omicron (o) and 32 Aquarii. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Gàiwū” is a line of two stars in the IAU constellation Aquarius which is part of their xing guan “Rooftop: Alpha (α) Aquarii (Sadalsuud) and Omicron (o) Aquarii.

Rooftop:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Aquarius and Pegasus. From the star Theta (θ) Pegasi three lines run out:

- One runs to the star Epsilon (ε) Pegasi,
- One runs to the determinative star Alpha (α) Aquarii (Sadalmelik)
- One runs through 52 Aquarii to Zeta (ζ) 1 Aquarii and the attached xing guan Tomb (Vassal of Rooftop) -see below.

This Chinese xiù (lunar mansion) “Wēixiù” (危宿) is a bending line of stars in the IAU constellations Aquarius and Pegasus: The line starts at Zeta (ζ) Aquarii, runs to a bend at Alpha (α) Aquarii (Sadalmelik), runs to another bend at Theta (θ) Pegasi, and ends at Epsilon (ε) Pegasi. Their xing guan “Tomb, Vassal of Rooftop” (see below) is attached at Zeta (ζ) Aquarii. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Wei” was associated to matters concerning the Qingzhou territory. This appears in the Tang Dynasty as “Wēi” (危) and is compared to the Vedic nakshatra Satabhishak (Kotyk 2017, see Comprising a Hundred Physicians, above).

This Chinese Chenzhuo xing guan “Wēixiù” is three lines of stars radiating out of a central star in the IAU constellations Aquarius and Pegasus: The central star is Theta (θ) Pegasi. From this star three lines run out:

- One to Epsilon (ε) Pegasi,
- One (called “Roofing”) through Alpha (α) Aquarii (Sadalsuud) to Omicron (o) Aquarii, and
- One (called “Tomb (Adjunct to Wei)”) runs through Pi (π) Aquarii to Zeta (ζ) 1 Aquarii, where it splits into two lines:
    - One runs to Eta (η) Aquarii, and
    - The other runs to Gamma (γ) Aquarii.

This Japanese sei shuku or lunar station “Umiyame Boshi” (sometimes translated as “danger” or “steep”) is a triangle of stars in the IAU constellation Aquarius: 34, Epsilon (ε), and Theta (θ) Aquarii.

Room:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of four stars of stars of the IAU constellation Scorpius. Each star has a name:

- Beta (β) 1 Scorpii (Acrab): “Shangxiang” (“Great Premier”),
- Delta (δ) Scorpii: “Cixiang” (“Second General”),
- 6 Scorpii: “Cixiang” (“Second General”), and
- Rho (ρ) Scorpii: “Shangjiang” (“Great General”).

This Chinese Chenzhuo xing guan “Fáng” is a hooked line of six stars in the IAU constellation Scorpius, each star having a particular title:

- “Shangjiang” (“Great General”): Rho (ρ) Scorpii,
- “Cijiang” (“Second General”): Pi (π) Scorpii,
- “Cixiang” (Second General”): Delta (δ) Scorpii,
- “Shangxiang” (“Great Premier”): Beta (β) Scorpii (Acrab), and
- “Lock (Adjunct of Room)”: Omega (ω) 1 & 2 Scorpii.

This Chinese xiù (lunar mansion) “Fángxiù” (房宿) is a line of four stars in the IAU constellation Scorpius: Beta (β) Scorpii (Acrab), Delta (δ), Eta (η), and Rho (ρ) Scorpii. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Yuzhou territory. It appears in the Tang Dynasty (618 – 907 C.E.) as ““Fáng” (房) and was compared to the Vedic nakshatra Anuradha (Kotyk 2017, see Following Radha, above).

This Chinese star “Fang” (房) is the star Pi (π) Scorpii in the IAU constellation Scorpius. The IAU approved the name Fang for Pi (π) Scorpii Aa.

Rooster:

This asterism from the Babylonian MUL.APIN tablets “Tarlugallu” (“the cock” or “the rooster”) is made up of stars of the IAU constellation Lepus and also appears in later Seleucid star lore:

- The “body” is a quadrilateral of stars: Alpha (α) Leporis (Arneb), Beta (β) Leporis, Epsilon (ε) Leporis, and Mu (μ) Leporis.
- The “head” is the triangle of stars Mu (μ) Leporis, Kappa (κ) Leporis, and Lambda (λ) Leporis, with three lines running out:
    - One from Kappa (κ) Leporis to 3 Leporis, and
    - Two from Lambda (λ) Leporis to 8 and Nu (ν) Leporis.
- From the other three corners of the quadrilateral two lines run out:
    - From Epsilon (ε) Leporis to HIP 23430 and HIP 25045A
    - From Beta (β) Leporis to Gamma (γ) and Delta (δ) Leporis, and
- From Arneb:
    - One line runs to 17 Leporis
    - One line runs through Zeta (ζ) and Eta (η) Leporis to Theta (θ) Leporis.

This asterism from the MUL.APIN “DAR.LUGAL” (Anthony 1996) is tentatively identified as the IAU constellation Canis Minor.

This star “Dar-lugal” or from the Babylonian star catalogue BM 78161 (5^{th} – 7^{th} century B.C.E.) is Mu (μ) Leporis in the IAU constellation Lepus (Liechty et al 1988).

This Egyptian Dendera asterism (Hoffman 2017) is basically identical to the Babylonian asterism Tarlugallu (see Rooster).

This Macedonian star “Petal” or “Petel” (“Rooster” or “Cock”) is Beta (β) Tauri (Elnath) in the IAU constellation Taurus (Cenev 2004 & 2014). It is near to their asterisms “Jastreb” (see Hawk above) and “Kvachka” (see Mother Hen above).

This asterism “Gallus” was created by the Flemish astronomer Petrus Plancius in 1612 from the stars of what are now the IAU constellation Canis Majoris: Tau (τ) and Eta (η) Canis Majoris and HIP 35083. A celestial globe (1613) of Plancius published in Amsterdam by Pieter van der Keere depicts “Gallus” as a rooster facing to our left, positioned between the rear of Canis Minor and the sail of Argo. NOTE: The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts an object in this position which is not labelled which could be an early version of Gallus.

- German uranographer Johannes Stöffler’s Constance Celestial Globe (1493) depicts Cygnus as a bird in flight labelled “Olor Avt Gallus”
- “Gallus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a rooster.
- “Gallus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a rooster.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Gallus” as a rooster facing to our left.
- Gallus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 which depicts a rooster.
- This asterism was listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.
- “Gallus” appears in the *Theatrum Cometicum* of Stanislaus Lubienietski in 1681.
- Gallus is listed in John Hill’s *Urania* in 1754.

Rooster Tail Feather Headdress:

This Rapanui star “Te Hau Vaero” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). The Edwards note that this may have been the Rapanui zenithal star.

Root:

This Vedic nakshatra (lunar mansion) “Mula”, “Mūla”, or **“**Mūlat" (Devanagari मूल/मूळ, Tamil: மூலம்) is in the IAU constellation Scorpius and is the stars Epsilon (ε), Xi (ξ), Eta (η), Theta (θ), Iota (ι), Kappa (κ), Lambda (λ), Mu (μ), and Nu (ν) Scorpii. Ivanković (2021) lists the variation “Mūlabárhanī” (from the *Taittirīya Brāhmana*) or “Mūlavárhanī” (“uprooting”) and relates this to the Pitrs (spirits of the departed ancestors) and to the Goddess Nirrti, Nirruti, or Nirriti (“calamity” or “decay”), who personifies death, decay, and sorrows. Ivanković also lists the variation “vicrtau” (see Untying, below) as an alternate name. Leitz (2019) relates it to Nirriti and Alakshimi, an aspect of the Goddess Kali. It is listed as “Mūla”, in the *Atharveda* (Leitz 2019, Ivanković 2021). Leitz lists it as “Mulam” on the nakshatra list of the scholar Varahamihir. However, Leitz oddly identifies this as “the star Scorpionis”: Of course, the suffix Scorpionis could refer to any star in this constellation. Leitz goes on to write that the maharshi Parasara listed two stars for this asterism, the *Atharvavveda Parisista* lists sevem, and the *Brhat Samhita* lists eleven. W. Brennand lists this as “Mula” in his *Hindu Astronomy* in 1896 and translates this as “the tail of a fierce lion”. Bhagwath (2019) lists its symbols as a bunch of roots tied together or an elephant goad.

This Vedic star “Mula” is Kappa (κ) Scorpii in the IAU constellation Scorpius.

This Myanmar nekkhat (lunar mansion) “Mula” (မူလာ) is in the IAU constellation Scorpius and is the stars Epsilon (ε), Xi (ξ), Eta (η), Theta (θ), Iota (ι), Kappa (κ), Lambda (λ), Mu (μ), and Nu (ν) Scorpii.

This Tibetan gyukar (lunar house) “Snrub" or “Nup” is in the IAU constellation Scorpius and is the star Lambda (λ) Scorpii (Johnson-Groh 2013).

This Chinese xiù (lunar mansion) “Dīxiù” (氐宿) is a quadrilateral of stars in the IAU constellation Libra: the double star Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), Iota (ι) Librae and Gamma (γ) Librae. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Yanzhou territory. It appears in the Tang Dynasty (Kotyk 2017) as “Dī” (氐) and was compared to the Vedic asterism Visakha (see Forked, above).

This Chinese Chenzhuo xing guan “Dīxiù” is a square of four stars in the IAU constellation Libra: Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), Gamma (γ) Librae and Iota (ι) Librae.

This Japanese sei shuku or lunar mansion “Tomo Boshi”, sometimes translated as “shoulder” or “base”, is a quadrilateral of stars in the IAU constellation Libra: the double star Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), Gamma (γ) Librae, and Iota (ι) Librae. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Rope Dancer of Virgo:

This **telescopic** asterism “Schoenóbates Vírginis” is the pair of interacting galaxies NGC 5331 in the IAU constellation Virgo. It was discovered in 1793 by William Herschel who listed it as “III 929”. It became GC 3678 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the remarkable balancing act of this pair of galaxies, perpendicular to each other, and to the northwestern tidal extension”. It is also known as the “Fox Eyes”.

Rope-like Objects Extended in a Line:

This Dena’ina asterism “Ninla’I” or “Ninalyi” is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021).

Rope of the Great Boat of Tama Rereti:

This Māori asterism “Te Taura-O-Te-Waka-O-Tamarereti” connects their asterism “Great Boat of Tama Rereti” (see above) to the anchor, “Taki-O-Autahi” (see Anchor above). This is the Pointer Stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar)- see Pointers, above.

Rope Star:

This Dravidian star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Leitz 2019).

Rosalíadecastro:

This **telescopic** Spanish star is HIP 81022 (HD 149143) in the IAU constellation Ophiuchus (magnitude 7.89). It was given this name in the IAU NameExoWorlds campaign. It is named for the writer Rosalia de Castro. It has an exoplanet named Riosar: Rio Sar is a river that appears in many of de Castro’s works.

Rose:

This asterism “Rosa” is the IAU constellation Coma Berenices as listed in the *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552). It is also listed as “Rosa” by German astronomer Johann Bayer (1572-1625).

This asterism “Rosa” is the Coma Star Cluster (Melotte 111) in the IAU constellation Coma Berenices. It was given this name by German astronomer Petrus Apianus in 1536 in his *Imagines Syderum Coelestium*.

Rose Cluster:

This **telescopic** asterism is the globular cluster Messier 5 (NGC 5904) in the IAU constellation Serpens. It was discovered by German astronomer Gottfried Kirch in 1702. It is listed in the 1864 General Catalogue as GC 4083 and in John Herschel’s catalogue as h 1916.

Rose Cockatoo:

This Boorong asterism “Gellarlec” or “Galla” is the Hyades cluster in the IAU constellation Taurus as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). this is the Rose Cockatoo (Eolophus Roseicapilla) and is the name of an old man chanting and keeping time to Kulkunbulla and Larnankurrk dancing. Compare this to the Wardaman asterism “Mulyan” (see White Cockatoo, below).

This Wotjobaluk asterism “Gallerlec” is the Hyades cluster in the IAU constellation Taurus (Hamacher 2011).

Rose Garden:

This Hungarian asterism “Rózsás kert” is the IAU constellation Corona Borealis. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as the semi circle of stars of this constellation amongst trellises of roses.

Rose-Like of Cetus:

This **telescopic** asterism “Rhódeus Céti” is the spiral galaxy NGC 1042 in the IAU constellation Cetus. It was discovered by American astronomer Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rose of Cetus:

This **telescopic** asterism “Rósa Céti” is the barred spiral galaxy NGC 521 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as “II 461”. It became GC 304 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Rose of Hydra:

This **telescopic** asterism “Rosácea Hýdrae” is the barred spiral galaxy NGC 3124 in the IAU constellation Hydra. It was discovered in 1835 by John Herschel who listed it as h 3226 and later as GC 2012 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rose of Phoenix:

This **telescopic** asterism "Rhodoídes Phoenícis" is the spiral galaxy IC 5325 in the IAU constellation Phoenix. This was first recorded by American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rosemund:

This German star "Os Rosae" is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus as listed by German poet Philipp von Zesen (1619 – 1689).

Rosette Nebula:

This **telescopic** asterism is the open cluster NGC 2244 (Caldwell 50, NGC 2239) and HII region NGC 2238 in the IAU constellation Monoceros and includes the nebulae NGC 2237 (Caldwell 49, LBN 948, Ced 76a), and NGC 2246. Size 80' X 60'. English astronomer John Flamsteed discovered NGC 2244 in 1690. William Herschel observed NGC 2244 in 1784 and listed it as "VII 2" in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. American astronomer Lewis Swift (1820 – 1913), who discovered NGC 2237 and 2246, first called attention to its large size. American astronomer Edward Emerson Barnard (1857 – 1923) came across it in 1883 while searching for comets, and his observations motivated Swift to publish a note about it in 1884. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Rosette Nebula". It is also known as the Skull Nebula (see below). NOTE: In April 2019 the Oklahoma Legislature passed HB1292 making the Rosette Nebula the official state astronomical object. NGC 2244 is also known as the Pearl Cluster.

Rosse's Galaxy:

This **telescopic** asterism is Messier 51 (NGC 5194), a pair of interacting galaxies in the IAU constellation Canes Venatici. It was discovered by French astronomer Charles Messier in October 1773. Irish astronomer Lord Rosse first recorded its spiral structure in 1845, which is how it got this name: Dreyer describes it in the 1888 New General Catalogue as the "Great Spiral Nebula". It is listed in the 1864 General Catalogue as GC 3572 and in John Herschel's catalogue as h 1623. English astronomer Thomas William Webb described it as "Rosse's wonderful spiral" in his *Webb's Celestial Objects for Common Telescopes* in 1893. It is also known as the Question Mark Galaxy (see above), Herschel's Ring, and the Whirlpool (see below).

Rosse's of Coma Berenices:

This **telescopic** asterism "Róssius Cómae Bereníces" is the grand design spiral galaxy NGC 4254 (Messier 99) in the IAU constellation Coma Berenices. French astronomer Pierre Méchain discovered it in March 1781. It is listed in the General Catalogue of 1864 as GC 2838 and in John Herschel's catalogue as h 1173. Dreyer lists it in the New General Catalogue of 1888 as "3 branched spiral". This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name to honor William Parsons, the 3rd Earl of Rosse, who observed it in 1850 and noted its spiral structure for the first time. It is also known as St. Catherine's Wheel (see below), the Virgo Cluster Pinwheel (see below), and the Coma Pinwheel (see above).

Rosy One of Dorado:

This **telescopic** asterism "Rhodópis Dorádus" is the barred lenticular galaxy NGC 1533 in the IAU constellation Dorado. It was discovered in 1834 by John Herschel who listed it as 2622 in his catalogue and later as GC 824 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rotanev:

This Italian star is Beta (β) Delphini in the IAU constellation Delphinus. It first appeared in Giuseppe Piazzi's *Palermo Star Catalogue*. When it was first published in 1814, this was the name associated with this star. British astronomer Rev. Thomas Webb (1807 – 1885) later figured out that Piazzi's assistant was Niccolò Cacciatore (the surname translating as "Nicolas Hunter" in English and "Nicolaus Venator" in Latin): Webb notes this in the third edition of his *Celestial Objects for Common Telescopes* in 1873. This Latin version of the surname, reversed, is Rotanev:

- American uranographer Elijah Burritt (1794 – 1838) listed it as "Rotanen".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Rotanev".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists the name "Rotanev" for this star.
- The IAU approved the name Rotanev for the star Beta (β) Delphini A.

Rotating of Sculptor:

This **telescopic** asterism "Volútans Sculptóris" is the barred spiral galaxy NGC 418 in the IAU constellation Sculptor. It was discovered by English astronomer John Herschel in 1834 who listed it in his catalogue as 2385. It is GC 227 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its resemblance to a whirlpool.

Rotating of Ursa Major:

This **telescopic** asterism "Cyclophóricus Úrsae Majóris" is the spiral galaxy NGC 4100 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "III 717". It became GC 2715 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rotator of Hydra:

This **telescopic** asterism "Rotátor Hýdrae" is the barred spiral galaxy NGC 3450 in the IAU constellation Hydra. It was discovered in 1835 by English astronomer John Herschel who listed it as h 3303 and later as GC 2250 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Rotten Egg Nebula:

This is an alternate name for the Calabash Nebula (see above). It was given this name partly because of its appearance and partly because it contains a relatively large amount of sulfur.

Rotten Fish Nebula:

This **telescopic** asterism is dark nebula LDN 1251 in the IAU constellation Cepheus. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024)

Rotten Gourd:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Bàiguā” (败瓜) is a diamond of stars in the IAU constellation Delphinus: Epsilon (ε) Delphini (the determinative star), Eta (η) Delphini, Theta (θ) Delphini, and Iota (ι) Delphini. The “stem” is the star Zeta (ζ) Delphini. Their xing guan Good Gourd (see above) is alongside.

This Chinese xing guan “Bàiguā” (败瓜) is a diamond of stars in the IAU constellation Delphinus: Epsilon (ε), Eta (η), Theta (θ), and Iota (ι) Delphini. The “stem” is the star Kappa (κ) Delphini. Their xing guan Good Gourd (see above) is alongside.

This Chinese Chenzhuo xing guan “Bàiguā” is a diamond shape of four stars with a “stem” at one end in the IAU constellation Delphinus: The “diamond” is the four stars Eta (η) Delphini, Epsilon (ε) Delphini, Kappa (κ) Delphini, and Iota (ι) Delphini. From Eta (η) Delphini a line runs out to Theta (θ) Delphini to form the “stem”.

Rotunda of Hydra:

This **telescopic** asterism “Stróngyle Hýdrae” is the elliptical galaxy NGC 5061 in the IAU constellation Hydra. It was discovered in 1786 by William Herschel who listed it as “I 138”. It became GC 3477 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Strongule is the Greek version of “rotunda”.

Rotunda of Virgo:

This **telescopic** asterism “Rotúnda Vírginis” is the elliptical galaxy NGC 5044 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “II 511”. It became GC 3465 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the large, sharp-edged empty region at the western side of this galaxy”.

Rough of Corvus:

This **telescopic** asterism “Fragósus Córvi” is the intermediate spiral galaxy NGC 4094 in the IAU constellation Corvus. It was discovered in 1836 by John Herschel who listed it as h 3376 and as GC 2710 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “rather rough and fragmented”.

Round Body of Leo:

This **telescopic** asterism “Glóbus Leónis” is the lenticular galaxy NGC 3607 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “II 50”. It became GC 2358 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Round Shield of Ursa Major:

This **telescopic** asterism “Párma Úrsae Majóris” is the barred lenticular galaxy NGC 3941 in the IAU constellation Ursa Major. It was discovered in 1787 by William Herschel who listed it as “I 173”. It

became GC 2600 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Roundish is Illuminated:

This Tanacross name, “Nesdzeek”, is an alternate name for their asterism “Neek’e’elteen” (see That Which Moves Following Us, below (Cannon 2021)).

Row:

This Estonian asterism “Ridamus” is made up of a long line of smaller asterisms starting at the Twins (see below), Christmas Stars (see above), and ending at the Square (see Square, below) spanning the IAU constellations Andromeda, Auriga, Gemini, and Pegasus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Rowboat:

This Malay asterism “Biduk” is made up of stars of the IAU constellations Ursa Major and Ursa Minor. The stars that form the handle of the Big Dipper asterism (see Big Dipper, above), Eta (η) Ursae Majoris (Alkaid), Zeta (ζ) Ursae Majoris (Mizar), Epsilon (ε) Ursae Majoris (Alioth) and Delta (δ) Ursae Majoris (Megrez), are linked up to the stars of the handle of the Little Dipper asterism (see Little Dipper, above), Alpha (α) Ursae Minoris (Polaris), Delta (δ) Ursae Minoris, Epsilon (ε) Ursae Minoris, Zeta (ζ) Ursae Minoris, and Beta (β) Ursae Minoris (Kochab) to form the shape of this boat, with Polaris being the prow (Jaafar and Khairuddin 2019). Compare this to the Orang Asli asterism Jong (see Sailing Vessel, below).

This Palawan asterism “Gubang ni Asak” (“Rowboat Belonging to Asak”) is made up of stars of the IAU constellations Ursa Major and Ursa Minor. The stars that form the handle of the Big Dipper asterism (see Big Dipper, above), Eta (η) Ursae Majoris (Alkaid), Zeta (ζ) Ursae Majoris (Mizar), Epsilon (ε) Ursae Majoris (Alioth) and Delta (δ) Ursae Majoris (Megrez), are linked up to the stars of the handle of the Little Dipper asterism (see Little Dipper, above), Alpha (α) Ursae Minoris (Polaris), Delta (δ) Ursae Minoris, Epsilon (ε) Ursae Minoris, Zeta (ζ) Ursae Minoris, and Beta (β) Ursae Minoris (Kochab) to form the shape of this boat, with Polaris being the prow (Jaafar and Khairuddin 2019)

This Maguindanao asterism “Biduk” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaafar and Khairuddin 2019).

Royal:

This Korean lunar mansion “Baang” is a line of two stars attached to the corner of their asterism “Chariot of Emperor” (see above) in the IAU constellation Corvus: Delta (δ) and Eta (η) Corvi.

This Latin star “Regia” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed as listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia* and in R. H. Allen’s *Star Names* in 1899.

Royal Arch:

This **telescopic** asterism is an arc of stars in the IAU constellation Cetus. It is described as a “royal arch of suns” in *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns. Barns only describes these stars as “North eastward” of Gamma (γ) Ceti.

Royal Council of Stars:

This **telescopic** asterism is the open cluster Melotte 20/Collinder 39, the Alpha Perseus Cluster in the IAU constellation Perseus, a cluster of 50 bright stars to one side of the star Alpha (α) Persei (Mirfak). It is also known as the Saxophone, the Secret Garden Cluster and the Little Cloud of Pirates.

Royal Family:

This Korean asterism "Wangsil" (왕실) is a line of two stars in the IAU constellation Ophiuchus: 71 and 72 Ophiuchi.

This asterism is the constellations Andromeda, Cassiopeia, Cepheus, and Perseus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), gives this name for this group of constellations, but does not identify a source.

Royal Guards:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a "W" of stars in the IAU constellation Ursa Major: Starting at the determinative star HIP 59856, it runs through HIP 58369, 58460, 58512, 58654, 57670, 61 Ursae Majoris, and HIP 56410.

This Chinese xing guan "Chángchén" (常陈) is a jagged line of stars in the IAU constellation Canes Venatici: It starts at 67 Canum Venaticorum and runs through 2, 6, Beta (β) Canum Venaticorum (Chara), 9, and 10 Canum Venaticorum, ending at the double star Alpha (α) Canum Venaticorum (Cor Caroli).

This Chinese Chenzhuo xing guan "Chángchén" is a "Y" shaped asterism in the IAU constellations Canes Venatici and Ursa Major: Beta (β) Canum Venaticorum (Chara), 6 Canum Venaticorum, HIP 59856, HIP 59923, HIP 58654, HIP 57670, and 61 Ursae Majoris.

Royal Hall:

This Korean asterism "Wangsil" (왕실) is a line of four stars in the IAU constellation Scorpius: Rho (ρ), Eta (η), Delta (δ), and Beta (β) 1 Scorpii (Acrab). Their asterism "Door Lock and Key" (see above) is attached at Acrab.

Royal House:

This Chinese xing guan "Yingshi" (營室） from the *Zhuanxu Calendar* of the Xia Dynasty (2180 – 1600 B.C.E.) is the Great Square of Pegasus (see Great Square, above). It translates as "Royal House/Encampment" (Didier 2009). It is also known to them as the Palace of Darkness, the Ancestral Temple, and as the Four Supports of Heaven.

Royal Man:

This Greek asterism "Ἀνήρ βασιλήϊος" or "Anír vasilíïos" is the IAU constellation as listed by the 5th century Greek poet Nonnus.

This Latin asterism "Vir Regis" is the IAU constellation Cepheus.

Royal of Antlia:

This **telescopic** asterism "Regillus Ántliae" is the spiral galaxy NGC 3271 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3265 and later as GC 2130 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They call it this as it is “the principal galaxy of the Antlia cluster”.

Royal Secretary:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Draco: Starting at the determinative star 15 Draconis it runs through HIP 80161, 78893, 79414, and 80682.

This Chinese star from the Three Kingdoms to the Ming Dynasty “Shangshu” is 29 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism “Wénchāng” (文昌) - see Administrative Centre, above.

This Chinese xing guan “Shàngshū” (尚书) is made up of stars in the IAU constellation Draco. This is two triangles, one nested inside the other and sharing an apex at the star 27 Draconis:

- The inner triangle includes the stars 15 and 18 Draconis, and
- The outer triangle includes the stars HIP 80161 and 19 Draconis.

There are two Chinese Chenzhuo xing guans called “Shangshu”:

- One is the star 23 Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan “Administrative Centre”.
- One is four lines of stars radiating out of a central star in the IAU constellation Draco. The central star is HIP 77277 from which four lines run out:
  - One to HIP 75696,
  - One to HIP 75256,
  - One to HIP 75260, and
  - One to HIP 75974

Royal Star:

This English star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo:

- Wyllyam Salysbury in 1552 who wrote: “The Lyon’s herte is called of some men, the Royall Starre”.
- Johann Bayer’s *Uranometria* (1603) lists “Rex” and “Regia Stella” for this star.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 attributes this name to Wyllyam Salysbury and also lists the Latin name “Stella regia”.
- R. H. Allen’s *Star Names* in 1899 “Royal Star“ for this star.

This Arabic star “Malakiun” (ملكي) which means “royal” or “my king” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed by Dorn in his *Description of the Celestial Globe Belonging to Major-General Sir John Malcolm, G.C.B., K.L.S., &c. &c., Deposited in the Museum of the Royal Asiatic Society of Great Britain and Ireland* in 1829. Dorn attributes this to the astronomer Ulugh Beg Mirza (1394 – 1449). The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “qalb al-asad malakī” (“heart of the lion, the Royal One”).

Royal Stars:

This Romanian asterism is four stars that supposedly support the heavens (Ottescu 2009). Compare this to the Archangel Stars (see above) and the Persian Four Guardians of Heaven (see above). The stars are:

- Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus,
- Alpha (α) Leonis (Regulus) in the IAU constellation Leo,
- Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus, and
- Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.

Royal Throne:

This Latin asterism "Sedes Regalis", "Sedes Regia" is the IAU constellation Cassiopeia, sometimes " is the IAU constellation Cassiopeia. It is sometimes shortened to "Sedes" ("throne" or "seat"). It is listed as "Sedes Regia" by John Hill in his *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sedes Regia".

Royals:

This Chinese xing guan "Tàizūn" (太尊) is the star Psi (ψ) Ursae Minoris in the IAU constellation Ursa Minor. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Taizun" is the star HIP 50546 in the IAU constellation Ursa Major.

Ruawahia:

This Māori star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Rubber Stamp Nebula:

This is an alternate name for the Thirteenth Pearl Nebula (see below).

Rubeola:

This star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. It is a reference to its red colour.

Rubin of Cetus:

This **telescopic** asterism "Rubíneus Céti" is the spiral galaxy NGC 450 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as III 440. It became GC 254 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its having been studied by the American astronomer Vera Rubin in the 1980s and due to its color.

Rubin's Galaxy:

This telescopic asterism is the galaxy UGC 2885 in the IAU constellation Perseus. It was named for astronomer Vera Rubin. This name is posted on the *Deep Sky Forum* in January 2020 by American astronomer Jimi Lowrey.

Ruby Bearer of Libra:

This **telescopic** asterism "Rubínifer Líbrae" is the barred spiral galaxy NGC 5792 in the IAU constellation Libra. It was discovered in 1787 by William Herschel who listed it as "II 683". It became GC 4013 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "very red 9.6 magnitude star at 1.1' NW of the nucleus".

Ruby Ring:

See Ring, above.

Ruby Star:

This English star "Ruby Star" or "Herschel's Ruby Star" is RT Capricorni (HIP 99990) in the IAU constellation Capricorn, discovered by John Herschel (1792 – 1871), and given this name due to its colour.

Another "Ruby Star" is the red giant 119 Tauri in the IAU constellation Taurus.

Ruchbah:

See Knee, above.

Rudder:

This Greek asterism "Πηδάλιον" or "Pidálion" is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina. It has this name as it is part of Ptolemy's asterism Argo's Ship (see above). Aratus (315 – 240 B.C.E), Eudoxus (400 – 350 B.C.E.), and Hipparchus (190 – 120 B.C.E.) all used this name.

Rudra:

There are Three Vedic asterisms by this name:

- In one story Rudra is an aspect of the creator Brahma, a sort of good twin of Prajapati (see above) who is trying to keep his evil twin in check, hunting him with his bow and arrow as Prajapati pursues his daughter Usha (Vahia 2014, Bhagwath 2019). In this version of the story, Rudra is the IAU constellation Orion.
- There is another version of the story where Prajapati becomes a male deer "Mriga" (see Deer, above) to pursue Usha in the form of a female deer. In this version of the story Rudra the hunter is the stars Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Vahia 2014).

Rukbat:

See Knee of the Archer, above.

Ruler of the Spheres of Pisces:

This **telescopic** asterism "Sphaerárches Píscium" is the elliptical galaxy NGC 474 (Arp 227) in the IAU constellation Pisces. It was discovered in 1784 by William Herschel who listed it as "III 251". It became GC 269 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Ruler Stars:

This Japanese asterism “Shakugo Boshi” is the belt of Orion in the IAU constellation Orion.

Ruling Star:

This Latin star “Stella Dominatrix” is is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. English Admiral Henry William Smyth lists this name in his *Bedford Catalogue* in 1844.

Runner:

This Sami star “Cuoigahægjek” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Lundmark 1982).. He is a hunter chasing the reindeer Sarva (see Reindeer, above) with Favdna (see above), Galla (see above), and the Ski Runners (see below).

Runner of Boötes:

This **telescopic** asterism “Cúrsor Boótis” is the barred spiral galaxy NGC 5859 in the IAU constellation Boötes. It was discovered in 1788 by William Herchel who listed it as “II 752”. It became GC 4052 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “NGC 5859 and its neighbour NGC 5857 [II 751, GC 4051] seem to be involved in a race”.

Runners:

This Inuit asterism “Ullaktut” (“the runners”) is the three stars of the belt of Orion in the IAU constellation Orion (MacDonald 1998). It is also known as “Steps in a Snowbank” (see below).

Running Bull:

This Romanian asterism “Gonitorul” is the IAU constellation Taurus (Ottescu 2009).

Running Cloud:

This Anutan asterism “Te Aro Rere” is the Large Magellanic Cloud.

Running Chicken Nebula:

This **telescopic** asterism is the open cluster IC 2944 (Caldwell 100) in the HII region IC 2948 in the IAU constellation Centaurus. These were discovered in the early 1900s by American astronomer Royal H. Frost at the Arequipa Station of Harvard University in Peru. NOTE: This is also known as the Lambda Centauri Nebula as this star is contained within.

Running Dog Nebula:

This **telescopic** asterism is the open cluster and nebula IC 1805 (SH 2-190, LBN 654, Mel 15, Ced 7) in the IAU constellation Cassiopeia. It was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923).

Running Man Nebula:

This **telescopic** asterism is the nebula NGC 1977 and open cluster IC 1805 (SH 2-190, LBN 654, Mel 15, Ced 7) in the IAU constellation Cassiopeia. NGC 1977 was discovered by English astronomer William Herschel in 1787 and listed as V 30. It is GC 1180 in the *General Catalogue* of 1864. IC 1805 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). This is also known as the Heart Nebula (see above), the Mermaid Nebula (see above) and the Valentine Nebula (see below).

Russia:

This asterism “Curania” was created from stars of the IAU constellation Draco by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents Russia and is represented by the serpent Draco as a dragon with a red and gold shield next to it.

Rutilicus:

See Armpit, above.

RV:

This American asterism “RV” (“the recreational vehicle”) is made up of the stars of the IAU constellation Pegasus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). The square of Pegasus asterism is the back end of this “RV” and the stars normally viewed as the horse’s head and front legs are the front end of the “RV”.

Ryeong:

This Korean star is Gamma (γ) Ursae Majoris (Phecda) in the IAU constellation Ursa Major.

S:

There are eleven **telescopic** letter “S” asterisms:

- One is the open cluster NGC 663, also known as the Lawnmower (see above), located in the IAU constellation Cassiopeia. It was discovered by English astronomer William Herschel in 1787, who listed it as “VI 31”. It is GC 392 in the *General Catalogue* of 1864.
- One is Renou 18 in the asterism list of French astronomer and author Alexandre Renou, located in the IAU constellation Pisces. It looks like Superman’s S and is located 37 arcminutes west of the star Tau (τ) Piscium. This is listed as Simonic 4 on the list of Hungarian astronomer Ilona Simon Mogyorósi.
- One is in the IAU constellation Orion between Epsilon (ε) and Delta (δ) Orionis. It starts at HIP 25976 and winds through HIP 26149, 26188, 26210, 26213, 26174, 26106, VV Orionis, HIP 25980, and 26020 and ends at 26117. Jeffrey Corder lists this as Corder 884 and describes it as an “omega shape” or a “fancy dress hat”. Size 180’ X 120’.
- One is in the IAU constellation Hercules and consists of twelve stars making a backwards “S”: One end is HIP 81312, the other is a magnitude 8.75 star, and the stars winding between are magnitude 10.
- One is Cseh 15 listed by Hungarian astronomer Viktor Cseh, which is a line of eight stars in the IAU constellation Indus forming a backwards “S”. Cseh describes them as forming “a beautiful letter ‘S’, of which the brightest star is 8.4 magnitude star TYC 8799-814”.
- One is an “S” shaped row of 10th to 12th magnitude stars in the IAU constellation Scutum known as the Essertoo String. This is one of American astronomer Tom Lorenzin's asterisms (Lorenzin 5) and is listed in the 1987 *1000+ Field Guide to Deep Sky Observing* by Tom Lorenzin and Tim Sechler. Its size is 6’ X 2’.
- One is in the IAU constellation Cygnus and is Corder 4432 on the observing list of American astronomer Jeffrey Corder. Size 100’ X 35’. This is eight 6^{th} – 8^{th} magnitude stars including HIP 105891, 106171, 106256, 106518, and the double stars HIP 106132 and 106267.

- One is NGC 2442 and NGC 2443, a single intermediate spiral galaxy in the IAU constellation Volans. It is also known as the Meathook Galaxy (see above), an "Cobra" (see below), or the Cobra and Mouse (see above). NGC 2442 and 2443 are two parts of the same galaxy: John Louis Emil Dreyer (1852 – 1926) assumed it was two separate objects from William Herschel's earlier observations that this was a "double nebula". It is entered in the General Catalogue of 1864 as GC 1568 and 1569. English astronomer John Herschel, William's son, confirmed that it was a single "nebula" in December 1834. This appears as "Sigmoídes Volántis" ("S-shaped of Volans") in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010):
- One is the galaxies NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as "I 176" and "I 177". The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Hockey Stick Galaxies (see below), the Hook (see below), the Fishhook (see below), the "Crowbar Galaxy" (see above), and the Hummingbird (see below). Herschel described it this way: "Both join and form the letter S".
- One is open cluster NGC 6025 (Caldwell 95) in the IAU constellation Triangulum Australe. This was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1755. South African astronomer Magda Streicher (2009) described it as having an "'S' shape". It is also described as a Japanese Fan (see Fan, above).
- One is the dark "S nebula", Barnard 72 in the IAU constellation Ophiuchus. It is part of the larger Dark Horse Nebula (see above). It is also known as the "Snake Nebula".

Sa Ga:

This Tibetan gyukar (lunar house) "Sa Ga" or "Saga" is identical to the older Vedic nakshatra (lunar mansion) Vishākhā (see below), which is the double star Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra (Johnson-Groh 2013).

Sa-mas-a-ti:

This Babylonian and Sumerian asterism from the BM 78161 tablet is Beta (β) Herculis (Kornephoros) and Gamma (γ) Herculis in the IAU constellation Hercules (Liechty 1988, Leitz 2019) and is the 4th ziqpu on this list.

Sabamia:

This asterism "Sabamia" was male up of the stars of the IAU constellation Libra by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as a lion's head with wings. I am uncertain as to what part of the world this refers.

Sabik:

See Preceding, above.

Sachung Telheiba:

This Meitei star "Sachung Telheiba" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Sacks of Coals:

This English asterism is the Magellanic Clouds as listed by American astronomer Maria Mitchell (1818 – 1889), but R. H. Allen wrote in his *Star Names* in 1899 that this is actually a reference to the Coal Sack Nebula (see above).

Saclateni:

See Second Arm of the Charioteer, below.

Sacred:

This Latin asterism "Sacris" is the IAU constellation Ara.

Sacred Fire:

This Hawaiian star "Kapuahi", also known as "Hoku'ula (see Red Star, above) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

This Euahlayi star "Whi" is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus.

Sacred Fires:

This Murrawarri asterism is the Southern Cross in the IAU constellation Crux (Fuller et al 2014). Their hero Baiame lifted these people and their fires into the sky to keep the neighbouring tribes from stealing them. Their two guards are "Giduba:mbi" and "Dhadeba:mbi" (see Guards, above).

Sacred Fish:

This Greek asterism "Ἱερος Ἰχθύς" ("Íeros Ichthýs") is the IAU constellation Delphinus.

This Latin asterism "Piscis Sacer" is the IAU constellation Delphinus as listed in John Hill's *Urania* in 1754.

Sacred Hoop:

This Dakota/Lakota/Nakota asterism, "Can Gleshka Wakan" is a huge asterism of stars in the IAU constellations Auriga, Gemini, Canis Major, Canis Minor, Orion, and Taurus. It is a circle around the stars Alpha (α) Aurigae (Capella), Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Alpha (α) Canis Minoris (Procyon), Alpha (α) Canis Majoris (Sirius), Beta (β) Orionis (Rigel), and the Pleiades cluster. The stars involved were called "Hoop Markers".

Sacred Mushroom:

This **telescopic** asterism is PGC 60379 (ESO 138-029 and ESO 138-30, AM 1724-622), a ring galaxy in the IAU constellation Ara that has a "stem" created by an interaction. This name was assigned by Arp and Madore in 1986. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Panaéolus Árae" ("Sacred Mushroom of Ara").

Sacred One:

This Hawaiian star "La'amaikahiki" is Beta (β) Arietis (Sheratan) in the IAU constellation Aries. La'a is a famous Hawaiian ancestor.

Sacred Wheel Yoke:

"Uecoretas Uedon" is a proposed early Celtic name for the IAU constellation Gemini from the *Book of Ballymote* through an etymological reconstitution (Boutet 2014).

Sacrificial Lamb:

This German asterism is the IAU constellation Aries as described by German poet Philipp von Zesen (1619 – 1689), who saw it as a lamb sacrificed on Calvary for sinful humanity.

Sadachbia:

See Auspice of the Wooden Tents, above.

Sadalbari:

See Auspice of the Exalted One, above.

Sadalmelik:

See Auspice of the King, above.

Sadalsuud:

See Auspice of Auspices, above.

Saddle of the Camel:

This Bedouin (Western Saudi Arabia) "al-Šdād" (الشداد) is the "W" asterism in the IAU constellation Cassiopeia (see W below).

Saddle of the Horse:

There are three Arabic stars with the name "Markab (ul-Faras)" (مركب الفرس):

- One is the star Alpha (α) Pegasi in the IAU constellation Pegasus:
  - This was later latinized to "Markab", "Merkeb".
  - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "HVMER EQ" which is an abbreviation of "humerus equi" (Dekker 2000).
  - Austrian astronomer John of Gmunden (d. 1442) lists this as "Markab Alferaz id est humerous equi" ("Markab Alferaz that is the humerus of the horse" -Kunitzsch 1986).
  - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Markab" for this star.
  - "Markab" and "Markabon" are listed for this star in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
  - English astronomer John Flamsteed (1646 – 1719) listed it as "Marchab".
  - American astronomer Robert Burnham lists both "Markab" and "Marchab" in his *Burnham's Celestial Handbook* in 1978.
  - Johann Bayer's *Uranometria* (1603) lists "Markab" for this star.
  - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Markab" for this star.
  - The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Marcab" for this star.

- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) and the 1778 edition lists "Markab" for this star.
- William Herschel lists "Markab" in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) lists this star as "Markab" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists the star "Markab" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Markab" and his *Bedford Catalogue* in 1844 lists "Markab, a thing ridden upon, a vehicle, a ship, perhaps a saddle".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Markab".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Markab".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Markab": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Markab".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Markab".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Markab".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Markab" and describes it as the "Saddle".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Markab" for this star.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Markab" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Markab" for this star.
- The IAU approved the name Markab for Alpha (α) Pegasi in 2016.

- One is the star Kappa (κ) Velorum in the IAU constellation Vela, later latinized to "Markeb":
  - It was listed as "Markeb" in the *Alfonsine Tables* of 1521 (Kunitzsch 1986).
  - Johann Bayer's *Uranometria* (1603) lists "Markeb" for this star.
  - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Markab".
  - Robert Hues lists it as "Merkeb" in his *A Learned Treatise of Globes* in 1659.
  - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Markeb".
  - Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Markab" in his *Celestial Atlas* in 1822.
  - R. H. Allen writes in his *Star Names* in 1899 that this name was given to the asterism Argo's Ship by the Arabs.
  - The name Markeb was approved for the star Kappa (κ) Velorum A by the IAU in 2016.
  - NOTE: The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "MARkEB" as the name for Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor though it could also refer to Rho (ρ) Puppis (Dekker 2000).

- One is the star Rho (ρ) Puppis in the IAU constellation Puppis:
    - The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "Markeb" for this star.
    - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Markeb" for this star.

Sadhayam:

This Tamil star "Sadhayam" is Gamma (γ) Aquarii (Sadachbia) in the IAU constellation Aquarius. Compare this to the Vedic asterism Satabhishak (below).

Sadr:

See Breast, above.

Sagarmatha:

This **telescopic** Nepalese star is HIP 56572 (HD 100777) in the IAU constellation Leo (magnitude 8.42). It was given this name in the IAU NameExoWorlds campaign. This is their name for Mount Everest. It has an exoplanet named Laligurans, which is their national flower, a variety of rhododendron.

Sage:

This Chaldean asterism "mul nun.me" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Sage's Star:

This ancient Egyptian star "Sebeshen" is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus.

Sagitta:

The brightest stars of this constellation are 3rd magnitude, and the stars of this constellation show up in 64 asterisms in this handbook.

This IAU constellation (IAU abbreviation Sge) became one of Ptolemy's 48 original constellations in the 2nd century, which Ptolemy called "Oistos" (Ὀιστός – "arrow") in his *Almagest*: This was also the name that Hipparchus (190 – 120 B.C.E.) gave it. Aratus (315 – 240 B.C.E) called it "ἄλλος ὀϊστός" ("állos oïstós" or "another arrow") to differentiate it from Sagittarius. Sagitta ("arrow") is the Latin translation. Eratosthenes (d.194 B.C.E.) called it "Τόξον" ("Tóxon" or "bow"). Cicero (106 – 43 B.C.E.) used the adjectives "clara" ("bright") and "fulgens" ("shining") to describe it. To the Italians it is "Saetta".

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a simple arrow without fletching. It is depicted with its mid section crossed by the solstitial colure, when it should be east of this location.

Sagitta appears in the Leiden *Aratea* (816) as an arrow facing to our right on which Aquila the eagle is standing (Katzenstein & Savage-Smith, 1988).

The 11th century *De signis caeli ("of the signs of heaven"*) does not list it. It appears in some of the 15th to 16th century *Alfonsine Tables* as "Istusc" ("this one") and in the 1515 edition of the *Almagest* as "Istiusc".

An Islamic celestial globe dated 1275-76 in the British Museum depicts Sagitta as an arrow beneath the feet of Aquila, who appears to be landing on it.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Sagitta as an arrow.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Sagitta" as a fletched arrow in flight.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Sagitta as a fletched arrow in flight. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Sagitta as a fletched arrow being held by the diving eagle Aquila. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Sagitta as a fletched arrow.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Sagicta" as a fletched arrow and a bow parallel to each other.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Sagicta (sic)" as a fletched arrow.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Sagitta as an arrow on which Aquila is standing. It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts it in the same fashion.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Sagitta" as a fletched arrow.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Sagitta" as a fletched arrow.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists this constellation as "TELVM" and depicts it as an arrow flying to our right.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "de la Saetta". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Arrow".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Sagitta as a long, fletched arrow with a double point.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Sagitta, sive Telum” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Sagitta as an arrow beside Aquila, and the label appears to read “Fessus” (Latin “tired”).

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Sagitta seu Telum” (“Sagitta or Telum”) as a fletched arrow.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Sagitta as a fletched arrow flying to our right above Aquila. It is not labelled.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Sagitta” as a fletched arrow flying to our right.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Sagitta” as an arrow being carried by Aquila the eagle. NOTE: Antinous is not depicted.

Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Sagitta sive Telum” (“an arrow or a weapon”) for this constellation.spea

German astronomer Johann Bayer (1572-1625) depicts Sagitta in his Uranometria in 1603 as an arrow with some sort of rectangular attachment in the middle. Bayer lists these names for Sagitta: “Sagitta, Telum, Iaculum, Arundo, Canna, Missore Ciceroni, Musator, Vectis vel Fossorium, Daemon, Temo Meridianus, Orfercalim, Obelus, Virgula iacens, Istusc, Alahance, Alhance, Feluco”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Sagitta” as a fletched arrow flying to our right overlapping one wing of Aquila.

“Sagitta” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as an arrow in flight overlapping one wing of Aquila.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Telo o Saeta” (“cloth or arrow”) and depicts it as a fletched arrow.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Sagitta sive Telum” for this constellation.

“Sagitta” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a fletched arrow in flight to our left, overlapping the wing of Aquila.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Sagitta” as a fletched arrow flying to our right behind the raised wing of Aquila.

Sagitta is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as an arrow.

Robert Hues lists “Istusc” in his *A Learned Treatise of Globes* in 1659. For the original version in Ptolemy’s *Almagest* see “Arrow”, above.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Sagitta as a fletched arrow in flight above one wing of Aquila.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Sagitta as an arrow through the wing of Aquila but does not label it.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Sagitta” as an arrow overlapping the right wing of Aquila.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Sagitta” as an arrow overlapping the left wing of Aquila.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Sagitta” as a fletched arrow flying to the left alongside the left wing of Aquila.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Sagitta” as an arrow flying to our left.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Sagitta as a fletched arrow flying to our left.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Fléche” as an arrow overlapping one wing of Aquila.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Sagitta” as an arrow facing right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “La Fleche” (“the arrow”) as an arrow flying to our left.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”der Pfeil“ and depicts it as an arrow in flight to our left.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Sagitta as an arrow piercing one wing of Aquila but does not label it.

American uranographer William Croswell (1760 – 1834) depicts “Sagitta the Arrow” on his *Mercator Map of the Starry Heavens* in 1810 as an arrow.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Sagitta in his *Celestial Atlas* in 1822. It is depicted as a fletched arrow. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) has the label “Sagitta” but does not depict anything.

“Sagitta” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as an arrow flying to our left.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Sagitta" as an arrow.

Sagitta is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Sagitta" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as an arrow in flight to our left.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Sagitta, The Arrow" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Sagitta, the Arrow".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Sagitta" in his *Star Atlas* (1893) and describes it as "The Arrow".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Sagitta" and describes it as an "Arrow".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Sagitta".

A standard IAU chart shows Sagitta like this:

- The "shaft" of the arrow is a line of the three stars Eta (η) Sagittae, Gamma (γ) Sagittae, and Delta (δ) Sagittae, and
- The "fletching" of the arrow is two lines running out of Delta (δ) Sagittae:
    - One going to Beta (β) Sagittae, and
    - One going to Alpha (α) Sagittae (Sham).

Sagittarius:

The stars of Sagittarius show up in 396 of the asterisms of the world's sky cultures.

The IAU constellation Sagittarius (IAU abbreviation Sgr) became one of Ptolemy's 48 original constellations in the 2nd century. In his *Almagest* he listed it as "Τοξότης" ("Toxótis"- see Archer, below). It originated in the Babylonian asterism PA.BIL.SAG (see Pabilsag, below). The Greeks usually depicted Sagittarius as a centaur and associated him with Chiron. 1st Century Roman poet Marcus Manilus listed it as "Sagittifer" ("carrying arrows"), 4th century Latin writer Postumius Rufius Festus Avienus listed it as "Sagittiger", Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) listed "Sagittipotens" ("the archer").

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Sagittarius as a galloping centaur (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a centaur galloping to the left drawing a bow and arrow, as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

The globe of the 2nd century Farnese Atlas depicts “Sagittarii” as a centaur riding to our left (Stevenson 1921).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Sagittarius is depicted as a horned centaur galloping to the left,
- In the Cologne 83 II edition he is a centaur facing right,
- In the Vat Reg lat 1324 edition he is shown as a hybrid centaur/satyr,
- In the Paris BN 12597 edition Sagittarius has Sagitta beneath his feet,
- In the Munich 560 edition he is shown as a satyr with Sagitta flying in front of him.

Sagittarius is depicted in the Leiden *Aratea* (816) as a bearded Centaur riding to our right drawing a bow and arrow: He has a leopard skin as a cape (Katzenstein & Savage-Smith, 1988).

The 9th century Berlin 130, Madrid 3307, Monza F.9/176, Los Angeles Getty Ludwig XII 5, Paris BN lat 8663, and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Sagittarius as a satyr.

The 9th century Paris BN, n.a. 1614 manuscript of the *De ordine ac positione stellarum in signis* depicts Sagittarius with a long cape and horns, but the horns and cape are omitted in the Austin, TX, Ransom Ms 29 and St. Petersburg, Q.V. IX, no.2 manuscripts.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Sagittarius as a centaur wearing a turban with a long band flying in the wind. He is wearing a jacket and drawing a recurve bow and arrow. One page shows him galloping to the right and the other shows him galloping to the left.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depict Sagittarius as a centaur running to the left, but the Oxford manuscript also shows him with tufts of hair resembling horns on his head. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Sagittarius as a running man in an animal skin cape with an arrow under his feet (except Paris BN 5239, which omits the arrow). The Durham Hunter 100 manuscript of *De signis caeli* depicts him wearing a hat and gesturing to his head with his right hand.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Sagittarius as a centaur galloping to our left drawing a bow and arrow. He has a scarf tied around his head which is streaming back in the wind.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Sagittarius as a centaur wearing a turban.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Sagittarius as a centaur wearing a red tunic and drawing a bow and arrow. He is wearing a hat with a red and green feather.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form “SAGI” (Dekker 2007).

English author Geoffrey Chaucer (c.1340s – 1400) in his treatise on astrolabes lists it as “Saagittare” and “Sagittarie”: In his *Star Names* in 1899, R. H. Allen writes that Chaucer got these names from the Anglo-Norman poet Philip de Thaun.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Sagittarius as a centaur galloping to our right. He has a fluttering scarf tied around his head and is wearing a tunic. He is drawing a bow and arrow.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Sagittarius” as a centaur galloping to our left drawing a bow and arrow. He has a scarf tied around his head which leaves the ends streaming in the breeze as he gallops.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts “Sagittarius” as a centaur galloping to our left drawing a bow and arrow. He has a scarf tied around his head which leaves the ends streaming in the breeze as he gallops.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Sagittarius as a centaur riding to our left drawing a bow and arrow.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Sagittarius as a centaur galloping to our left drawing a recurve bow and arrow.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts Sagittarius as a winged male centaur riding to our left, drawing a bow and arrow.

The *Germanicus Aratea* (Siciliensis, c. 1469) labels Sagittarius “Belligerum” (“warrior“) and depicts him as a centaur riding to our left with an animal skin cape and drawing a bow and arrow. An arrow is laying on the ground beneath the centaur’s feet.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Sagittarius as a centaur galloping to our right with a drawn bow and arrow.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Sagictarius” as a horned bearded centaur drawing a bow and arrow with a double ended spear parallel to the constellation below it.

Sagittarius appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a centaur drawing a bow and arrow and labelled with the astrological sign for Sagittarius.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “SAGICTAI(VS)” as a long-haired centaur wearing a hat, drawing a bow and arrow.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Sagittarius as a centaur galloping to our right drawing a bow and arrow. He has a red scarf tied around his head which is blowing behind him in the breeze. It is not labelled.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Sagittarius” as a bearded centaur galloping to our left. He has a head band with ends streaming back. He is drawing a bow and arrow.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts “Sagittarius” as a bearded centaur galloping to our left. He has a head band with ends streaming back. He is drawing a bow and arrow.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Sagittarius” as a centaur with a flowing scarf tied around his head drawing a bow and arrow as he gallops to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “Sagittarius” as a centaur galloping to our left drawing a bow and arrow.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Sagittarius in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Sagittarius” as a centaur galloping to our left drawing a bow and arrow.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Sagittario”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Archer”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Sagittarius as a male centaur galloping to our left. He has a headband with ends fluttering in the wind. He is drawing a bow and arrow.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Sagittarius in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Sagittarius as a centaur drawing a bow and arrow, riding to our left, and labels it with the astrological symbol for Sagittarius. NOTE: This centaur appears to have breasts and may be female.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Sagittarius” as a centaur drawing a bow and arrow riding to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a centaur armed with a bow and arrow galloping to our right. He has a cap with ribbons fluttering.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Sagittarius” as a centaur galloping to our left, drawing a bow and arrow. His head is

concealed by a ring around this chart: It is hard to tell if there is a head scarf flapping behind him or a cape. The centaurs limbs are concealed by the edge of the chart.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Sagittarius” as a centaur riding to our right drawing a bow and arrow.

“Sagittarius” is listed on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a centaur riding to our left drawing a bow and arrow.

“Sagittarius” is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts it in his *Uranometria* (1603) as a winged, bearded centaur carrying a bow and arrow: Bayer lists these names for this constellation: “Sagittarius, Sagittipotens, Arcitenens, Centaurus, Croton vel ut alij Crotus, Chiron, Eumenes, Semiuir, Philirides, Arcus, Telum, Thessalicae Sagittae, Elkufu, Elkaufu, Schütz, Pharetra”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Sagittarius” as a bearded centaur riding to our left drawing a bow and arrow.

“Sagittarius” and “Sagittary” are listed as names of this constellation in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a centaur drawing a bow and arrow, walking to our right. Bartsch also lists the local name “der Schüz”.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Sagittarius” for this constellation.

This constellation is listed on *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) with the abbreviated title “Sagitari” and depicted as a centaur drawing a bow and arrow.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Sagittarius” as a bearded centaur riding to our left drawing a bow and arrow. He has a cloth wrapped around his midsection.

Sagittarius is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: He is depicted as a centaur drawing a bow and arrow.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) as a centaur drawing a bow and arrow.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Sagittarius” as a centaur drawing a bow and arrow.

Sagittarius is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted as a centaur brandishing a bow and arrow in his southern star chart of 1678.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Sagittarius” as a centaur drawing a bow and arrow.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Sagittarius" as a centaur drawing a bow and arrow, riding to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "le Sagittaire", "Sagittarius", and "Τοξότης" ("archer") and depicts it as a centaur with a flowing cape who is about to draw a bow and arrow. He is galloping to our left.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Sagittarius" as a centaur drawing a bow and arrow.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Sagittarius as a centaur with a red cape drawing a bow and arrow.

This is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as "Sagittarius": He is depicted as a centaur drawing a bow and arrow.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Sagittarius".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Sagittarius" as a centaur riding to our right drawing a bow and arrow.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Sagittarius" as a centaur riding to our right drawing a bow and arrow.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Sagittarius as a centaur drawing a bow and arrow.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Sagittarius as a bearded centaur galloping to our right. He has a ragged cape flapping in the wind. He is carrying a bow and arrow.

French astronomer Abbé Nicolas Louis de Lacaille's Planisphère des Étoiles Ausralea (1756) depicts "le Sagittaire" as a centaur brandishing a bow and arrow.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Sagittaire" as a centaur drawing a bow and arrow.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Sagitaire" as a centaur galloping to our right drawing a bow and arrow, as does the 1778 edition.

Many early catalogues including English astronomer John Flamsteed's *Atlas* of 1781 list "Sagittary", with variations including "Sagitary".

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Schütze" and depicts it as a centaur with a cape drawing a bow and arrow. The various editions of Bode's *Jahrbuch* also list this name. Johann Elert

Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Schūtze" in the text and "Schutze" on the charts, depicting him as a centaur trotting to our right, drawing a bow and arrow.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Sagittarius" as a centaur drawing a bow and arrow.

Sagittarius is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Sagittarius of Boogschutter" ("Sagittarius or Archer"): He is depicted as a bearded centaur drawing a bow and arrow, riding to our right.

American uranographer William Croswell (1760 – 1834) depicts "Sagittarius the Archer" on his *Mercator Map of the Starry Heavens* in 1810 as a bearded centaur drawing a bow and arrow.

"Sagittarius" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a winged, bearded centaur armed with a bow and arrow: He is trotting to our right.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Sagittarius in his *Celestial Atlas* in 1822: He is depicted as a Centaur with a quiver on his back drawing a bow and arrow.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Sagittarius" as a centaur wearing a cape and drawing a bow and arrow as he rides to our left.

Sagittarius is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. This is depicted as a centaur with a flowing cape drawing a bow and arrow.

"Sagittarius" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a bearded centaur riding to our right drawing a bow and arrow.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Sagittarius, The Archer" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Sagittarius, the Archer".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Sagittarius" in his *Star Atlas* (1893) and describes it as "The Archer".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as "Sagittarius, the archer,… represented as a centaur with his bow bent as if about to let fly an arrow at Scorpio".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Sagittarius" and describes it as an "Archer".

W. Brennand uses "Sagittary" in his *Hindu Astronomy* in 1899 and attributes it to the 5th century Roman Macrobius Ambrosius Theodosius.

NOTE: R. H. Allen in his *Star Names* in 1899 notes that “cuneiform inscriptions” give the names “Strong One”, “Giant King of War”, and “Illuminator of the Great City” but doesn’t identify specific star lists from that era and I can’t find any references to these in modern listings from cuneiform tablets.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the in his book *The Stars - A New Way to See Them* (1952). The standard star chart shows this constellation with the Teapot asterism (see Teapot, below) in the middle with star lines coming out of the “spout”, “lid”, and “handle”. Rey transforms it from a centaur into just a human archer like this:

- The “bow” is the loop of stars Delta (δ), Lambda (λ), Mu (μ), 1, Gamma (γ), Eta (η), and Epsilon (ε) Sagittarii,
- His “head” is the triangle of stars Pi (π),Xi (ξ) 1, and Sigma (σ) Sagittarii,
- His “body” is a quadrilateral of Sigma (σ), Phi (ϕ), Zeta (ζ), and Tau (τ) Sagittarii,
- He is wearing a “skirt” which is the quadrilateral of stars Tau (τ) Sagittarii, Zeta (ζ) Sagittarii, Alpha (α) Sagittarii (Rukbat), and Theta (θ) 1 Sagittarii,
- One “leg” runs from Theta (θ) 1 Sagittarii to Iota (ι) Sagittarii,
- One “leg” runs from Rukbat to Beta (β) 1 and 2 Sagittarii (Arkab),
- His “arm” holding the bow runs from Phi () Sagittarii to Delta () Sagittarii,
- His other “arm” runs from Pi () Sagittarii through d Sagittarii and Rho () 1 Sagittarii to Upsilon () Sagittarii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Sagittarius in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- His “head” and “neck” is a line from Mu (μ) Sagittarii to Lambda (λ) Sagittarii,
- His “body” is a line from Lambda (λ) Sagittarii through Phi (ϕ) Sagittarii and Sigma (σ) Sagittarii to Tau (τ) Sagittarii,
- One “arm” runs from Sigma (σ) Sagittarii, through Xi (ξ) 2, Omicron (ο), Pi (π) d, and Rho (ρ) 1 Sagittarii to Upsilon (υ) Sagittarii,
- One “arm” runs from Lambda (λ) Sagittarii to Delta (δ) Sagittarii,
- His “bow” is the curve of stars Gamma (γ), Delta (δ), Epsilon (ε), and Eta (η) Sagittarii,
- Two lines of stars run out from Tau (τ) Sagittarii to form “legs”:
    - One runs through Zeta (ζ) Sagittarii and Alpha (α) Sagittarii (Rukbat) to Beta (β) 1 and 2 Sagittarii, and
    - One runs through Psi (ψ), Chi (χ), and h 1 and 2 Sagittarii to Omega (ω) Sagittarii.

Sky and Telescope Magazine, founded in 1941, depicts Sagittarius in their magazine and publications as simply the Teapot asterism (see below) with two additional lines:

- One from Epsilon (ε) to Eta (η) Sagittarii, and
- One from Lambda (λ) to Mu (μ) Sagittarii.

The French call this constellation “Sagittaire” and the Italians “Sagittario”

Sagittarius Dwarf Irregular Galaxy:

This telescopic **asterism** is the dwarf galaxy PGC 63287 (ESO 594-4) in the IAU constellation Sagittarius. It was discovered by Cesarsky et al in 1977 and by Longmore et al in 1978. It is also known as the Little Swarm of Sagittarius.

Sagittarius Dwarf Spheroidal Galaxy:

This telescopic asterism is the elliptical loop-shaped satellite galaxy of the Milky Way. It is also known as SagDEG, and was discovered in 1994 by Ibata, Gilmore, and Irwin. It is also known as "Torn in Pieces of Sagittarius" (see below).

Sagittarius Holding a Bowl:

This Latin asterism "Sagittarius tenens pateram seu crateram" is the IAU constellation Centaurus as listed in the 15th century *Alfonsine Tables*.

Sah:

This ancient Egyptian asterism "sꜣḥ" resembles an Egyptian king and is made up of the stars of the IAU constellations Orion, Eridanus, Monoceros, Lepus, and Columba:

- Alpha (α) Orionis (Betelgeuse) is the tip of a "Pharaoh's crown" with Orion's belt being a row of "jewels" around its rim,
- Kappa (κ) Orionis and Beta (β) Orionis (Rigel) are the figure's "shoulders",
- Sah is wearing an "Egyptian kilt" with the four stars Alpha (α) Leporis (Arneb), Beta (β), Epsilon (ε), and Mu (μ) Leporis at the corners, and
- His "feet" are the stars Epsilon (ε) Columbae and 52 Eridani.

Sah is a form of the Egyptian God Osiris and was known to the ancient Egyptians as the "father of the gods" and his consort was Sopdet (see Sopdet, below). This asterism appeared from the Middle Kingdom (2030 — 1650 B.C.E.) onward. R. H. Allen lists this in *Star Names* in 1899 as "Sahu" and writes that it appears in the step temple of Sakkara, the Ramesseum of Thebes (c. 3285 B.C.E.), and twice in the *Book of the Dead*, which is one of the places that the reference to Osiris is made.

Sail:

This Western asterism is in the IAU constellation Corvus. The stars Gamma (γ) Corvi (Gienah), Epsilon (ε) Corvi (Minkar) and Alpha (α) Corvi (Alchiba) are the mast, with the stars Delta (δ) Corvi (Algorab) and Beta (β) Corvi (Kraz) the corners of the sail. Size 420' X 300'. American astronomer Jeffrey Corder lists this as Corder 2338. It is also known as "Spica's Spanker".

This **telescopic** asterism is part of the Orion Nebula (Messier 42) in the IAU constellation Orion.

This German asterism "Segel" is the IAU constellation Vela.

The Uppsala Archaeoastronomical Project proposed the Great Square of Pegasus asterism in the IAU constellations Pegasus and Andromeda for this Minoan asterism. This represents the square sails used during the Bronze Age.

Sail of Tainui:

This Māori "Te Ra I Tainui" asterism is the Hyades cluster in the IAU constellation Taurus. This triangular star cluster is the sail of Tainui's boat, which stretches from "Tai Toro" (Orion's belt) to "Makariti" (the Pleiades cluster).

This Tahitian asterism “Ra’o Tainui” is the Hyades cluster in the IAU constellation Taurus (Edwards 2015). This triangular star cluster is the sail of Tainui’s boat, which stretches from the belt of Orion to the Pleiades Cluster in Taurus.

Sailboat:

There are seven **telescopic** “sailboat” asterisms:

- One is the open cluster NGC 225 in the IAU constellation Cassiopeia. This was discovered by English astronomer William Herschel in 1788. This is listed as GC 120 in the *General Catalogue* of 1864. Size 12’ X 12’. Astronomer Stephen James O’Meara’s Hidden Treasures Catalogue (2007) lists this as O’Meara 2 and states that “I can actually see the bright star outline of the hull of a boat here, and the nebulosity roughly corresponds to the sail”. O’Meara includes the adjacent dark nebulae vdB 4 and LDN 1302. This is also known as the Broken Heart Cluster (see above), “W” (see below), and the Igloo (see above).
- One is found in the IAU constellation Leo Minor: The mast contains three 9th magnitude stars, the middle star being HIP 50150. The “deck” is a line of four stars: 22 Leonis Minoris, HIP 50143, and 50059, ending in a magnitude 8.45 star. Two stars form the “keel”: HIP 50136 and a magnitude 8.9 star. Size 35’ X 35’. This is Harrington 6 on American astronomer and author Phil Harrington’s list. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011 and by René Merting on the *Faint Fuzzies* website. John Raymond calls it “22” as it contains 22 Leo Minoris. Jeffrey Corder lists it as Corder 1976.
- One, also known as the Yacht, is in the IAU constellation Cepheus 2 degrees north of 4 Cassiopeiae. The “keel” is the stars HIP 115788 and 115569. The “top deck” is a line of stars from HIP 116022 through 115710 to a group of four stars including HIP 114898 creating the prow. A line of four 8th – 9th magnitude stars parallel to the “top deck” including HIP 115362 form the top of a “cabin” or the bottom edge of the “sail”. The curving front edge of the “sail” is the stars HIP 115304, 115203, 115503, 115772 and 116161.
- One, Do Dz 7, is found in the IAU constellation Hercules near the star Alpha (α) Herculis (Rasalgethi) with a six-star hull, one star as the mast, and a three-star sail.
- One is in the IAU constellation Cancer and is Ennis 49 on the observing list of Canadian astronomer Charles Ennis. Size 160’ X 210’. The “sail” is a triangle of stars: Tau (τ) Cancri and the double stars 67 and 61 Cancri. The “bowsprit” is 57 Cancri and HIP 43732. The “hull” is a line of 5th – 8th magnitude stars including HIP 43616, 43549, HIP 43551, the double stars Rho (ρ) 1 Cancri and 53 Cancri, and Rho (ρ) 2 Cancri.
- One is made up of stars of the IAU constellation Leo Minor. It was posted by American astronomer “Illinois” in February 2022 on *Cloudy Nights*. The “boat” is the stars 27, 28, and 30 Leo Minoris, the top of the “sail” is the two stars HIP 50951 and HIP 50929.
- One is the star cluster Collinder 15 (Trumpler 1) in the IAU constellation Cassiopeia. It is also known as the Zipper (see below). The “boat” is a row of four stars including TYC 4031-1133-1, Gaia DR3 509978545521639296, and OCI 328. The “Sail” is a group of stars alongside this line of stars. This was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in November 2023.

Sailing:

This Kiribati star “Boborau” or “Bobórau” is currently unidentified (Trussel and Groves 1978).

Sailing Vessel:

This Orang Asli asterism “Jong” is made up of stars of the IAU constellations Ursa Major and Ursa Minor. The stars that make the handle of the Big Dipper asterism (see Big Dipper, above), Eta (η) Ursae Majoris (Alkaid), Zeta (ζ) Ursae Majoris (Mizar), Epsilon (ε) Ursae Majoris (Alioth) and Delta (δ) Ursae Majoris (Megrez), are linked up to the stars of the handle of the Little Dipper asterism (see Little Dipper, above), Alpha (α) Ursae Minoris (Polaris), Delta (δ), Epsilon (ε), Zeta (ζ) and Beta (β) Ursae Minoris (Kochab) to form the shape of this boat, with Alpha (α) Ursae Minoris (Polaris) being the prow (Jaafar and Khairuddin 2019). Compare this to the Malay asterism Biduk (see Rowboat, above).

This Bugis asterism “Kappala’e” or “Bintoéng Kappaka’é” is made up of stars of the IAU constellations Ursa Major and Ursa Minor. The stars that make the handle of the Big Dipper asterism (see Big Dipper, above), Eta (η) Ursae Majoris (Alkaid), Zeta (ζ) Ursae Majoris (Mizar), Epsilon (ε) Ursae Majoris (Alioth) and Delta (δ) Ursae Majoris (Megrez), are linked up to the stars of the handle of the Little Dipper asterism (see Little Dipper, above), Alpha (α) Ursae Minoris (Polaris), Delta (δ), Epsilon (ε), Zeta (ζ) and Beta (β) Ursae Minoris (Kochab) to form the shape of this boat, with Alpha (α) Ursae Minoris (Polaris) being the prow (Jaafar and Khairuddin 2019).

Sailing Vessel Star:

This Orang Asli (Batek Dè) star “Bintang Jong” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Jaafar and Khairuddin 2014). Compare to the Semelai asterism “Bintang Jong” (see Foot Star, above).

This Malay star “Bintang Jong” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Jaafar and Khairuddin 2014).

Sailors:

The Uppsala Archaeoastronomical Project proposed the Pleiades cluster in the IAU constellation Taurus for this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne’s Tribe in Tacoma, Washington in November 2023. The heliacal rising and setting of the Pleiades marks the opening and closing of the sailing season (The Blessing of the Ships and Harbor Home).

Sailor’s Stars:

This German asterism “Schiffahrts Gestirn” is the Pleiades cluster in the IAU constellation Taurus as listed by German astronomer Christian Ludwig Ideler (1776 – 1846) and R. H. Allen in his *Star Names* in 1899. It earlier appeared in the *Tables of Some Obscure Words of King James I* (1611) as “Seamans stares – the seven starres.”

Saint Andrew’s Cross:

This asterism the IAU constellation Serpens as listed by R. H. Allen in his *Star Names* in 1899. He only identifies the source as “the Biblical school”. Allen describes it as the “stars in the head”, which would be Beta (β) Serpentis, Delta (δ) Serpentis, Kappa (κ) Serpentis, and Gamma (γ) Serpentis.

Saint Catherine’s Wheel:

This **telescopic** asterism is Messier 99 (NGC 4254), a grand design spiral galaxy in the IAU constellation Coma Berenices. French astronomer Pierre Méchain discovered it in March 1781. It is listed in the General Catalogue of 1864 as GC 2838 and in John Herschel’s catalogue as h 1173. Dreyer lists it in the

New General Catalogue of 1888 as “3 branched spiral”. It is also known as the Virgo Cluster Pinwheel (see below) and the Coma Pinwheel (see above).

Saint Friday:

This Belarussian asterism “Paraskeva Piatnitsa” is one of the stars in the belt of Orion asterism in the IAU constellation Orion (Avilin 2009). Saint Paraskeva (d. 11th century) was a female saint whose cult spread through Wallachia and Moldavia in the 14th century. There was confusion over her name as “Paraskeva” means “Friday”, so when this name was later translated into Serbian and Romanian it came out as “Sveta Petka” or “Sfanta Vineri” which means “Saint Friday”.

Saint John’s Cross:

This Lithuanian asterism “Šv. Jono kryžius” is the IAU constellation Cygnus.

Saint George:

This English asterism is the IAU constellation Perseus, first mentioned by Sir Thomas Browne in 1646. Robert Burnham lists this in his *Burnham’s Celestial Handbook* in 1978.

Saint Marguerite:

This star is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis and the name is probably a corruption of the earlier name “Margarita Coronae” (see Pearl of the Crown, above).

Saint Mary’s Crown:

This Lithuanian asterism “Šv. Marijos karūna” is the IAU constellation Corona Borealis.

Saint Patrick’s Cross:

This asterism is made up of stars in the IAU constellation Serpens as listed by R. H. Allen in his *Star Names* in 1899. He only identifies the source as “the Biblical school”. Allen describes it as the “stars in the head”, which would be Beta (β) Serpentis, Delta (δ) Serpentis, Kappa (κ) Serpentis, and Gamma (γ) Serpentis.

Saint Paul:

This asterism is the IAU constellation Perseus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes “about a thousand years ago theologians… transmogrified [Perseus] into St. Paul”. Serviss doesn’t identify his source.

Saint Peter:

This asterism is the IAU constellation Aries. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), claims that this was a name given to Aries, “with the Triangles [Triangulum] as his mitre.” Serviss claims that this name is about a thousand years old but doesn’t give a specific source.

Saint Peter’s Cross:

This Lithuanian asterism “Šv. Petro kryžius” is the IAU constellation Cygnus.

This **telescopic** asterism is open cluster NGC 2547 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as Lac III 2 in his catalogue. It is GC 1636 in the *General Catalogue* of 1864. It is also known as the Golden Earring (see above), "T" (see below), the "Heart" (see above), and the Malus Cluster (see above). American astronomer Phil Harrington describes this as "a crooked cross lying on its side". Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 40.

Saint Peter's Fish:

This German asterism is the IAU constellation Piscis Austrinus as listed by German astronomer German astronomer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists this as "the Fish taken by St. Peter with a Piece of Mony [sic] in his Mouth" in his *Sphere of Marcus Manilius* in 1675.

Saint Peter's Keys:

This Lithuanian asterism "Šv. Petro raktai" is the Hyades open cluster in the IAU constellation Taurus.

Saiph:

See Sword of the Giant, below.

Sajik:

This Meitei asterism "Sajik" is the IAU constellation Aries.

Sakurai's Object:

This telescopic star is the red giant V4334 Sagittarii in the IAU constellation Sagittarius (magnitude 10.90). It is believed to have been a white dwarf that swelled in a late thermal pulse. It was discovered in 1996 by Japanese astronomer Yukio Sakurai.

Sal:

This Korean star is Epsilon (ε) Ursae Majoris (Alioth) in the IAU constellation Ursa Major.

Salamander:

This Dakota/Lakota/Nakota asterism "Ahdeska" or "Agleska" is the IAU constellation Cygnus.

Salibobo:

This Ibaloi asterism "Salibobo" is the Hyades cluster in the IAU constellation Taurus (Santos et al 2019).

Salibubo:

This Kankanaey asterism "Salibubo" is the Big Dipper asterism in the IAU constellation Ursa Major (Santos et al 2019).

Salibubu:

This Kankanaey asterism "Salibubu" is the Pleiades cluster in the IAU constellation Taurus (Santos et al 2019).

Salkeim:

This Turkish asterism is the IAU constellation Virgo as listed in John Hill's *Urania* in 1754.

Salm:

See Leather Bucket, above.

Salmon Weir:

This Finnish asterism "Otava" or "Otavainen" ("salmon weir" or "salmon net") is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006) and is mentioned in Carl Axel Gottlund's classic *The Kalevala* and in the *Kantelettare*. R. H. Allen lists it as "Otawa" and "Otawainen" in his *Star Names* in 1899 and it appears elsewhere as "Ottawa". The Estonians call it "Odamus" but the meaning of this ancient name is unclear. In Finnish mythology Ilmarinen hung this and the smaller net "Pikku Otava" (see Little Salmon Weir, above) on the firmament to dry when the world was just being created. Ilmarinen used these fishnets to drag the shards of eggs from the initial waters so that he could forge the world from a bird's eggs.

Salt and Pepper:

There are three **telescopic** "salt and pepper" asterisms:

- One, also known as the Scutum Salt and Pepper Cluster or the July Salt & Pepper Cluster, is the open cluster Messier 11 in the IAU constellation Scutum. It was discovered by German astronomer Gottfried Kirch in 1681. It is listed in John Herschel's General Catalogue of 1864 as GC 4437. It is also known as the Wild Duck Cluster (see below).
- One is the open cluster Messier 52 (NGC 7654) in the IAU constellation Cassiopeia. It was discovered by French astronomer Charles Messier in 1774. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4957. It is also known as the Cassiopeia Salt and Pepper Cluster or October Salt and Pepper Cluster, the Flying Bird (see above), the Scorpion (see below).
- One is the January Salt and Pepper Cluster or Auriga Salt and Pepper Cluster and is the open cluster Messier 37, discovered by Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Auriga. The 1864 General Catalogue lists it as GC 1295. John Herschel listed it as h 369.

Saluki Dog:

This Bedouin asterism from the Negev desert is the IAU constellation Canis Major (Steiner 2017). They see it as a dog chasing Orion for 40 days. This forty-day period represents the cold weather of December and January when Orion is in the sky and the dog represents their desire to see Orion gone and the return of better weather. The Saluki is also known as the Persian greyhound.

Saluted One of Lynx:

This **telescopic** asterism "Salutáta Lýncis" is the barred spiral galaxy NGC 2798 (Arp 283) in the IAU constellation Lynx. It was discovered by Ralph Copeland in 1874. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "NGC 2799 is inclined to its neighbour NGC 2798 as if it bows to greet him politely".

Sāmaya:

See Peace, above.

Samdar:

This Gond asterism is the IAU constellation Auriga (Vahia 2014).

Same:

This Coptic star "Piautos" is Lambda (λ) Cancri in the IAU constellation Cancer. It is a star in the Coptic lunar station "πιαυτος" or "piautos" which comes from a Greek root meaning "the same" or "the very one". The IAU approved the name Piautos for Lambda (λ) Cancri.

Sammara Squirrelfish:

This Anutan asterism "Te Paka Poi Ika Tapu" is found in the IAU constellation Sagittarius. The "head" is a quadrilateral formed by the stars Epsilon (ε) Sagittarii, Gamma (γ) Sagittarii, Lambda (λ) Sagittarii, and Sigma (σ) Sagittarii. The "tail" is formed by the star Eta (η) Sagittarii.

Sampilos:

This Coptic star "Σάμπιλος" or "Sámpilos" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in R. H. Allen's *Star Names* in 1899. Allen attributes this to "Hyde as from Kircher" (English orientalist Thomas Hyde (1636 – 1703) and German astronomer Athanasius Kircher (1602 – 1680)) and describes the meaning as "unintelligible".

Samson:

This asterism is the IAU constellation Hercules. "Samson" is an alternate name for this constellation listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists it in his Sphere of Marcus Manilius in 1675 and attributes it to German astronomer Wilhelm Schickard (1592 – 1635). It appears on the 1710 globe of Italian monk and uranographer Amantius Moroncelli (Stevenson 1921). "Samson" is listed by R. H. Allen in his *Star Names* in 1899.

Samson's Hair:

This German asterism is the IAU constellation Hercules as listed by German astronomer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754.

Sanctuary:

This Latin asterism "Sacrarium" is the IAU constellation Ara:

- This appears in editions of the 8th century *Revised Aratus Latinus* as "Sacrarium".
- The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") lists "Sacrarius" and "Sacrarium".
- This appears in the 15th century *Alfonsine Tables* as "Sacrarius".
- Johann Bayer's *Uranometria* (1603) lists "Sacrarium".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Phares vel Sacrarium" ("Lighthouse or Shrine") as a name for Ara.
- Robert Hues lists "Sacrarium" in his *A Learned Treatise of Globes* in 1659.
- Kauffmann's translation of the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in 1888 lists "Sacrarium".

- The Paris BN 5239, Paris BN 5543, and Vat lat 643 manuscripts of *De signis caeli* depict this tapering towards the top. The Paris BN 5239 and Vat lat 643 manuscript illustrators replace the flame at the top with a trefoil. The Klosterneuberg 685 and Zwettl 296 manuscripts depict a multi-story church, with three towers. The Durham Hunter 100 manuscript of *De signis caeli* depicts a multi-story structure with a domed top from which flames erupt.

Sancus:

This Latin asterism is the IAU constellation Hercules as listed in R. H. Allen's *Star Names* in 1899. Sancus was the Roman God of trust, honesty, and oaths.

Sand for Life:

This Korean asterism "Salm-eul Wihan Molae" (삶을 위한 모래) is a line of two stars attached to the corner of their asterism "Chariot of Emperor" (see above) in the IAU constellation Corvus: Epsilon (ε) and Zeta (ζ) Crv.

Sand of the Moon:

This is an Ibibio name for all the stars in the sky (Slotegraaf 2013).

Sand Shovel:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found beside the globular cluster Messier 53 in the IAU constellation Coma Berenices. The handle is a line of stars including HIP 64449, 64496, and 64654. The "shovel" is a circle of stars including HIP 64751, 64781, 64855, and 64849. Size 90' X 30'.

Sandal:

This Mixe, Totonac, and Nahua asterism is the Pleiades cluster in the IAU constellation Taurus.

This Tzotzil, Ch'ol and Tzeltal asterism "Sonom" is the Pleiades cluster in the IAU constellation Taurus. Compare this to the Tzotzil asterism "Chak Shonob" (see High Backed Ceremonial Sandal, above).

Sandals:

This KhoiKhoi asterism "//haron" is the stars Epsilon (ε) and Delta (δ) Orionis and belong to the husband of Khunuseti (see Stars of Spring, below), who is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Alcock 2014).

Sandgrouses:

This Arabic asterism is two lines of stars forming a "V" in the IAU constellation Grus, Microscopium, and Piscis Austrinus: Both lines radiate out from Gamma (γ) Microscopii:

- One runs through Gamma (γ) Gruis to Delta (δ) 1 and 2 Gruis, and
- One runs through Epsilon (ε) Microscopii, Iota (ι) Piscis Austrini, Mu (μ) Piscis Austrini, Beta (β) Piscis Austrini and Delta (δ) Piscis Austrini.

Sanduleak's Star

This possible symbiotic star (binary system with a white dwarf and a red giant) is located in the Large Magellanic Cloud in the IAU constellation Dorado. It was named for American astronomer Nicholas Sanduleak.

Sansuna:

This **telescopic** Maltese star "Sansuna" is HAT-P-34 in the IAU constellation Sagitta (magnitude 10.2). It received this name in the IAU NameExoWorlds Campaign. Sansuna is a mythological giant that carried the stones of the Gozo megalithic temples on her head. It has an exoplanet named Ġgantija ("giantess").

Santa Claus:

There are two **telescopic** "Santa Claus" asterisms:

- One is Sánta 50 is listed on the webpage of Hungarian astronomer Gabor Sánta. It is a triangular group of 6 – 11th magnitude stars in the IAU constellation Corvus which includes HIP 59728, 59791, 59336, and 59465.
- One, Ennis 17 from the observing list of Canadian astronomer Charles Ennis, is made up of stars in the IAU constellations Equuleus and Delphinus.
    - Santa's "face" is a curve of stars starting at Epsilon (ε) Equulei and running around through HIP 103472, 103301A through three 7th – 8th magnitude stars to HIP 102680, 102631, 102653, 102832, and 103262, to 103391.
    - Santa's "nose" is a group of 7th – 8th magnitude stars inside this curve including HIP 103217
    - Santa's "hat" is a curve of stars starting at HIP 103863 and running through HIP 104041, 104048, 103892A, 103742, and 103722 to the tip of the hat at HIP 103414.
    - Santa's "beard" is a wedge of stars including HIP 102833, 13 Delphini, HIP 102297, 102166, and 102299.

Santa's Sleigh:

This **telescopic** asterism is the open cluster NGC 6664 in the IAU constellation Scutum. It was discovered by English astronomer William Herschel in 1785 who listed it as "VIII 12". It is GC 4426 in the *General Catalogue* of 1864. It is also known as the Teacup (see below) and the Figure Outline (see above).

Sant's Wain:

This Estonian asterism "Sandivanker" is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006). "Sant" is a modern Estonian word referring to a physically or mentally defective person.

Sapt-khennu:

This Egyptian decan "Sapt-khennu" was in the IAU constellation Scorpius. In later Hellenistic texts it was named "ϹΠΤΧΝЄ" ("Si-sesme"). In the Testament of Solomon, it became "Akton", Aristobulus of Paneas called it "Alleinac", in Greek Hermeticism it became "Aphebis", in Latin Hermeticism "Psermes", Roman astrologer Julius Firmicus Maternus called it "Sentineu" or "Aterceni (-cem)", Cosmas of Maiuma (d. 760) called it "Kairos" (a name he also used for the decan "Ṭepā-khentet", see below), French scholar Joseph Justus Scaliger (1540 - 1609) called it "Senicer" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲡⲁⲛⲟⲧⲣⲁⲅⲟⲥ" ("Panotragus"). It has been depicted as a man with a goat's head covered in wrappings and holding reins.

Sar en:

This Santal asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen does not supply a translation.

Sarah's Butterfly on a Knife Edge:

This **telescopic** asterism is Gebauer 3 (SG 3) in the IAU constellation Aquila. German amateur astronomer Sarah Gebauer discovered this in September 2023. Robert Zebahl describes it on the *Faint Fuzzies* website as "In the same field of view Leiter 5 (the glowing sword) is located. Two fine chains of stars bent to each other in the northwest, which immediately remind of a butterfly. With a little imagination a feeler can also be guessed".

Sarah's Galaxy:

This **telescopic** asterism is NGC 3628, a spiral galaxy with a prominent dust lane in the IAU constellation Leo. This was discovered by English astronomer William Herschel in 1784 who listed it as "V 8" in his catalogue. It is GC 2378 in the *General Catalogue* of 1864. It is also known as King Hamlet's Ghost (see below), the Hamburger Galaxy (see above), and the Vanishing Galaxy (see below). It was named for the author Sarah Williams, who shortly before she died of cancer wrote: "I have loved the stars too fond to be fearful of the night." Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 58 and lists the names "Hamburger Galaxy" and "Sarah's Galaxy".

Sarah's Golden Leaf:

This **telescopic** asterism is Gebauer 1 (SG 1) in the IAU constellation Cepheus. German amateur astronomer Sarah Gebauer discovered this in May 2023. Robert Zebahl describes it on the *Faint Fuzzies* website as "Starting from the orange, 4.9 mag bright star VV Cep, seven other stars with magnitudes between 5 and 8 mag form a flat, 1.6° long ellipse to the southeast, which looks quite like a leaf." The stars are VV Cep (HIP 108317), HIP 108083, HIP 107862, SAO 19678, Gaia DR3 2216816072411241856, Gaia D3 2216805111654844416, Gaia DR3 2216801022846026112, and Gaia DR3 2216596994721852032.

Sargas:

See Stinger, below.

Sargasso Sea:

This **telescopic** asterism is the spiral galaxy Messier 88 (NGC 4501) in the IAU constellation Coma Berenices and part of the Virgo Cluster. It was discovered by French astronomer Charles Messier in 1781. It is listed in the 1864 General Catalogue as GC 3049 and in John Herschel's catalogue as h 1312. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this as "a vast Sargasso Sea of star-illuminated cosmic matter". This is of course a reference to the Sargasso Sea in the Atlantic Ocean. It is also known as the "Brightly Whirling of Coma Berenices" (see above).

Sarin:

This star is Delta (δ) Herculis in the IAU constellation Hercules. The IAU approved the name Sarin for the star Delta (δ) Herculis Aa in 2016.

Sariru:

This Babylonian asterism "MUL.AN.TA.SUR.RA" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Sagittarius. Sariru is believed to be an alloy of gold and copper. Hope Anthony (1996) listed it as "AN.TA.SUR.RA" and "sariru" and described it as "probably a meteor" and translated it as "flashing".

This Sumerian asterism "mulan-ta-sur-ra" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is part of the IAU constellation Sagittarius.

This Akkadian asterism "sa-ri-ri" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) and "Sariru" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Sagittarius.

Sarutapiko-no-kami:

Sarutapiko-no-kami (猿田毘古神) is a Japanese God whose face is like a monkey with a long nose and is the Hyades cluster in the IAU constellation Taurus.

Sasa-sert:

This Egyptian decan "Sasa-sert" was in the IAU constellation Aquarius. In later Hellenistic texts it was named "ϲιϲρω" ("Tpa-χu"). In the Testament of Solomon, it became "Aleureth" or "Hephesimireth", Aristobulus of Paneas (2nd century B.C.E.) called it "Tonghel", in Greek Hermeticism it became "Isi", in Latin Hermeticism "Ularis", 4th century Roman astrologer Julius Firmicus Maternus called it "Oro" or "Asoer", Cosmas of Maiuma (d. 760) called it "Dike", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Oroasoer" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ϐρονδεογϲ" ("Brondeus").

Sasaqet:

This Egyptian decan "Sasaqet" was in the IAU constellation Aries. In later Hellenistic texts it was named "ϲικετ" ("Xont-χre"). In the Testament of Solomon, it became "Artosael" or "Arôtosael", Aristobulus of Paneas called it "Carexon", in Greek Hermeticism it became "Siket", in Latin Hermeticism "Disornafais", 4th century Roman astrologer Julius Firmicus Maternus called it "Sentacher" or "Asentacer", Cosmas of Maiuma (d. 760) called it "Eros", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Acentacer", and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ωροϲ" ("Horus"). It has been depicted as a woman with a drum on her head, with a scepter in her right hand and a flask in her left.

Sash:

This Latin star "Cingulum" ("sash") is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda. Compare this to Waist Cloth, below.

Satakara:

This Vedic star "Satakara" is Lambda (λ) Aquarii in the IAU constellation Aquarius as listed by W. Brennand in his *Hindu Astronomy* in 1896. Compare to their asterism "Shatabhisha" (see Comprising a Hundred Physicians, above).

Satan:

This German asterism is the IAU constellation Sagitta as listed by German astronomer and Jesuit scholar Athanasius Kircher (1602 – 1680) and later listed in John Hill's *Urania* in 1754.

This is an alternate name for the Egyptian decan "Kenmu" (see above) used by Aristobulus of Paneas.

Satan's Head:

This Hebrew asterism "Rōsh ha Sāṭān" is the asterism Medusa's Head (see above) and is listed in R. H. *Allen's Star Names* in 1899. John Chilmead (1899) listed it as "Rosch Hassatan", which he derived from Robert Hues' *A Learned Treatise of Globes* (1659).

Satellite Cluster:

This **telescopic** asterism is the open cluster NGC 2244 in the Rosette Nebula (Caldwell 49) in the IAU constellation Monoceros. English astronomer William Herschel discovered this open cluster (NGC 2244) in 1784 and listed it as "VII 2" in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster and the Harp Cluster.

Satellite Galaxy:

This American **telescopic** asterism is the interacting dwarf elliptical galaxy NGC 770 in the IAU constellation Aries. Its core is rotating in the opposite direction to its outer parts. It has this name as it is orbiting the Fiddlehead galaxy NGC 772. This name was posted on the *Deep Sky Forum* in November 2014 by Mark Friedman.

Satet:

See Sopdet, below.

Saturn Like of Leo Minor:

This **telescopic** asterism "Saturnína Leónis Minóris" is the barred lenticular galaxy NGC 2859 in the IAU constellation Leo Minor. William Herschel listed this as "I 137", his son John Herschel listed it as h 593, and later as GC 1837 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Saturn Nebula:

This **telescopic** asterism is the planetary nebula NGC 7009 (Caldwell 55) in the IAU constellation Aquarius. It was discovered by English astronomer William Herschel in 1782 who listed it as "IV 1". It is GC 4628 in the *General Catalogue* of 1864. This was the first deep sky object to be discovered using a reflector telescope. English astronomer William Parsons, 3rd Earl of Rosse, gave it this name in the 1840s when telescopes had improved to the extent that they allowed the observer to see the "Saturn" shape: Parsons described it as having "ansae" (i.e. most protruding part of planetary rings as seen from a distance) and as having "a surrounding nebulous ring seen edgeways". German astronomer Hermann Joseph Klein (1844 – 1914) lists the "Saturn Nebula" in his *Star Atlas* (1893). *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes it as resembling the planet Saturn, and attributes this to the observations of Lord Rosse. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Saturn Nebula". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Saturn Nebula". Size 1' X 0.7'. It is also known as the "Alien Ship" (see above).

Saturn Ring Galaxy:

This **telescopic** asterism is the barred spiral galaxy NGC 7184 in the IAU constellation Aquarius. This was discovered in 1783 by William Herschel who listed it as "II 1". It became GC 4739 in the *General Catalogue* of 1864. This name was posted in October 2022 by Jimi Lowrey in the *Adventures in Deep Space* site (https://adventuresindeepspace.com/dsf_ootw_constellation.html). It is also known as the "Red Ringed of Aquarius".

Saturnus:

This asterism is the IAU constellation Orion as listed by R. H. Allen in his *Star Names* in 1899. The origins of this name are unsure.

Satyr of Virgo:

This **telescopic** asterism "Sátyrus Vírginis" is the barred spiral galaxy NGC 4178 in the IAU constellation Virgo. It was discovered in 1835 by John Herschel who listed it as h 1125 and later as GC 2775 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this because of "its rather rough aspect and the prominent, 'erect' extension at its lower part".

Satyros:

This Egyptian asterism is one of the paranatellonta of the decans of Cancer as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and may be the IAU constellation Capricornus.

Saucepan:

This Dutch asterism "Steelpanetje" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This French asterism "Casserole" is the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

This Kamilaroi asterism, also known as the "old saucepan", is the IAU constellation Orion (Fuller et al 2014). One end of the constellation is the "pot" with the belt of Orion being one end of this and a line of stars from Delta (δ) Orionis (Mintaka) through Gamma (γ) Orionis (Bellatrix) and Lambda (λ) Orionis (Meissa) to Alpha (α) Orionis (Betelgeuse) is the "handle". Their rainy season occurs when this "saucepan" tips (in February).

Saucer of Cetus:

This **telescopic** asterism "Scutélla Céti" is the barred lenticular galaxy NGC 936 in the IAU constellation Cetus. This was discovered by English astronomer William Herschel in 1785, who listed it as IV 23. It is listed as GC 544 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "it looks like a dish", although they also say that "the name ironically hints at flying saucers". It is also known as "Darth Vader's Starfighter" (see above).

Saul's Cup:

See Joseph's Cup, above.

Savetis:

This Persian star "Savetis" ("watcher of the west") is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Four Guardians of Heaven (see above). Compare this to Sargaz, above and to the Zoroastrian asterism "Sadwēs" (see General of the South, above).

Savitra:

This Vedic asterism listed by the maharshi Parasara, is Alpha (α) Corvi (Alchiba), Beta (β) Corvi (Kraz), Gamma (γ) Corvi, Delta (δ) Corvi, and Epsilon (ε) Corvi for this asterism, which later became the asterism Hasta (see Hand, above).

Saw Whet Owl:

This Mi'kmaq star "Kupkwe'j" is Eta (η) Boötis (Muphrid) in the IAU constellation Boötes. It is part of their asterism Muin and the Seven Hunters (see above).

Saxen:

This asterism "Saxen" is made up of the stars of the IAU constellation Equuleus and Cygnus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as a laurel wreath with crossed swords in front above which is a red and white striped sphere with a golden crown around it.

Saxophone:

There are four **telescopic** "saxophone" asterisms:

- One, also known as Little Cloud of Pirates, is Melotte 20, the Alpha Perseus Cluster in the IAU constellation Perseus, a cluster of 50 bright stars to one side of the star Alpha (α) Persei (Mirfak). This is O'Meara 14 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) and O'Meara states "some people call this the Saxophone Cluster".
- One is Ennis 1, in the IAU constellation Virgo next to M 104, listed in November 2021 by Canadian astronomer Charles Ennis. The "mouthpiece" is HD 110050, and the body of the instrument runs down through Gaia DR3 3530242119771017472, Gaia DR3 3530205904606774016, Gaia DR3 3530205320491219968, HD 109898, HD 109916, HD 109899, HIP 61654, HIP 61656, to HD 109863.
- One is Corder 3881 in the IAU constellation Sagittarius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 65' X 25'. This includes the stars HIP 96096, 95965, and 96021.
- One is in the IAU constellation Pisces and is Corder 4922 on the observing list of American astronomer Jeffrey Corder. Size 75' X 35'. This is ten 8^{th} – 11^{th} magnitude stars including HIP 116479, 116344, 116185, and 116223.

Sažáry

This Russian asterism "Sažáry" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Scabbard:

This Latin asterism “Vagina” is the sword of Orion in the IAU constellation Orion as listed by Roman general Germanicus (15 B.C.E. – 19 C.E.) and in R. H. Allen’s *Star Names* in 1899.

Scale:

This Persian asterism “šāhīn” is made up of stars in the IAU constellation Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain), and Gamma (γ) Aquilae.

Scale Beam:

There are four Arabic asterisms with the name “Al Mīzān”:

- One is two stars in the IAU constellation Triangulum: Alpha (α) and Beta (β) Trianguli:
    - This was later latinized to “Al Mizan”, “Mizan”, “Almisan”, “Almizen”, and “Mizin”.
    - A 14th century Christian Spanish astrolabe #4560 lists “al mīzān” (King 2002).
    - German astronomer Wilhelm Schickard (1592 – 1635) listed it as “Midsanon”.
    - “Mizin” and “Midsanon” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - Robert Hues (1659) and John Chilmead (1899) listed it as “Mizan Aliemin”: Hues translated this as “the Right-hand or Southern Balance”.
- One is the star Beta (β) Trianguli, which has the latinized name “Mizan”.
- One is the stars Delta (δ), Eta (η), and Theta (θ) Aquilae, whose name was latinized to Almizan (I, II, & III) in the IAU constellation Aquila. German astronomer Christian Ludwig Ideler (1776 – 1846) lists these.
- One, “al-Mīzān” is a name for the IAU constellation Libra as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010):
    - Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) lists the name “al-Mīzān for Libra.
    - Johann Bayer’s *Uranometria* (1603) lists “Mizan” as an alternate name for Libra.
    - John Hill lists “Misan” or “Al Misan” as “a pair of scales” and identifies this as an Arabic name for the constellation Libra in his *Urania* in 1754.
    - German astronomer Johann Bayer (1572-1625) gave “al Mizan” as a Hebrew name for Libra

This asterism with the Greek name “Σταθμός” (“Stathmós”) is the IAU constellation Libra as listed by German astronomer Johann Bayer (1572-1625).

This Hebrew asterism “Mozenaim” is the IAU constellation Libra as listed in John Hill’s *Urania* in 1754.

Scales:

This Chinese xing guan “Hengshi” from the 3 Kingdoms and Ming Dynasty Period is the belt of Orion in the IAU constellation Orion. e

This Chinese Chenzhuo xing guan “Hengshi” is the Belt of Orion asterism in the IAU constellation Orion: Zeta (ζ) Orionis, Epsilon (ε) Orionis, and Delta (δ) Orionis. This is also known as “Three Stars”.

This Babylonian asterism from the MUL.APIN tablets “ZI.BA.AN.NA” (Anthony 1996), or “GIŠ.ERIN” is made up of the stars of the IAU constellations Libra and Virgo. It is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “MUL.zi-ba-ni-tum” (Hunger 1992), in the

from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul zi-ba-ni-tum” (Bartel van der Waerden 1974) and “mul zi.ba.an.na” (Koch-Westenholz 1995), and on the K 8538 planisphere as “mulGI-GI” or “mulzi-ba-an-na” (Koch 1989). The center star is Mu (μ) Virginis. A circle of stars around Mu (μ) Virginis include the double star Alpha (α) Librae (Zubenelgenubi) and the stars Beta (β) Librae (Zubeneschamali) and Iota (ι), Kappa (κ), 109 and 110 Virginis.

This Babylonian and Sumerian asterism “zi-ba-nit” from the BM 78161 catalogue (Leichty 1988) is identical to the Babylonian asterism “ZI.BA.AN.NA” above.

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is “Zibānītu”, or “Zibanitu” (Hunger 1992, Parpola 1993, Anthony 1996) and is identical to the Babylonian asterism “ZI.BA.AN.NA” above.

This Seleucid asterism “ZI” or “RIN” (“Scales”) from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Libra (Foxvog 1993).

This Sumerian asterism “mulzi-ba-an-na” as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “ZI.BA.AN.NA” above.

This Akkadian asterism “zi-ba-ni-tum” as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “ZI.BA.AN.NA” above.

This Persian asterism “Zibanitu” from the list of Masu Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) as listed by Franz Boll’s *Ancient Observations of Coloured Stars* in 1918 and Alfred Jeremias in his *Handbuch der Altorientalischen Geisteskultur* in 1929 and “zi.ba-ni-tu” from the list of Zodiacal Signs in VAT 4956 from the same period (Bartel van der Waerden 1974) is identical to the Babylonian asterism ZI.BA.AN.NA above. Ernst Weidner lists it as “zi-ba-an-na” and “ku-an-mku-ki-sikil-la” in his *Fixsterne* in 1971.

This Egyptian Dendera asterism is the IAU constellation Libra (Hoffman 2017). It is depicted as scales with a seated figure above.

This Hebrew asterism “Moznayim” is the IAU constellation Libra as listed in their list of constellations of the zodiac (mazzaroth) in their Talmud and is related to their month Tishrei. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as “Miznaim”.

This German asterism “Waage” is the IAU constellation Libra as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Syrian asterism “Masaʾthā” is the IAU constellation Libra. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Masathre”.

This Persian asterism “Terāzū” or “Tarāzūk” is the IAU constellation Libra.

This Romanian asterism “Solzi” or “Cântarul” is the IAU constellation Libra (Ottescu 2009, Lite, Lodina, and Ignat 2018). It is also known as the “Balance” (see above).

This Macedonian asterism, “Libra” or “Terezii”, is made up of stars of the IAU constellations Lepus and Orion (Cenev 2014):

- The “balance beam” of the scales is a line between the stars Kappa (κ) Orionis and Beta (β) Orionis (Rigel), and
- The “suspended scale” is three lines running from 29 Orionis down to the line of stars HIP 25353, Nu (ν) Leporis, and Iota (ι) Leporis with a curving line formed by Lambda (λ) and Kappa (κ) Leporis forming the bottom of the scale cup.

Scales Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Libra as “Tiānchèng shén” (天秤神) or “scales deity” (Kotyk 2017).

Scales of Astaea:

This asterism is the IAU constellation Libra. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes Libra as representing “the scales of Astraea (Virgo), the goddess of justice”.

Scales of Justice:

One is the open cluster the Theta (θ) Carinae cluster, IC 2602 (Melotte 102, Caldwell 102) in the IAU constellation Carina. It appeard in Abbé Nicholas Louis de Lacaille’s original catalogue of 1755. Later it was recorded by American astronomer Solon Irving Bailey (1854 – 1931). It was given this name by South African astronomer Pierre de Villiers in 2016. It is also known as the Southern Pleiades (see below), and the Bow Tie (see above).

Scâpi:

This Chakavian asterism is the IAU constellation Orion.

Scar Three:

This **telescopic** asterism is a straight line of stars in the IAU constellation Vela. It is Lorenzin 25 on Tom Lorenzin’s list of asterisms. This is the four stars HD 95582, HIP 53836, HIP 53806, and HIP 53771.

Scar Too:

This **telescopic** asterism is a straight line of stars in the IAU constellation Circinus. It is Lorenzin 24 on Tom Lorenzin’s list of asterisms. This starts at HIP 72332 and runs through HIP 72364, HIP 72403, HD 129918, and HD 129936 to HIP 72438.

Scarab:

There are two Egyptian asterisms by this name:

- One, “Scarabeus”, dates to about 2000 B.C.E. and is the IAU constellation Cancer.
- One, “Scarabeus”, is a is one of the paranatellonta of Cancer as listed in the Sphaera Barbarica described by Teucros (Mosenkis, date n/k) and is the IAU constellation Lepus.

NOTE: Scarabs are insects found in desert tombs and related to the Sun God Ra. It is found in the Old Kingdom (3100 B.C.E.) related to the 13th nome (district) of Lower Egypt “ḫḳꜣ-ʿnḏw”.(Berio 2014).

This Greek lunar mansion “Scarabeus” is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes it as being made up

of stars of the IAU constellation Lepus or Ophiuchus. NOTE: Compare this to the Egyptian asterism Scarab. This “scarabeus” also appears next to the Greek asterism Crab (see above) on the Daressy Zodiac of the Roman Imperial Period.

This **telescopic** asterism is the planetary nebula NGC 40 in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1787 and listed in his catalogue as IV 58. It is GC 20 in the 1864 *General Catalogue*.

Scarecrow:

There are two **telescopic** “Scarecrow” asterisms:

- One is the open cluster Messier 25 (IC 4725) in the IAU constellation Sagittarius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745 and included in French astronomer Charles Messier’s list in 1764. It is American astronomer DeLisle Stewart (1870 – 1941) that got it listed in the *Index Catalogue* as IC 4725. It was given this name by American astronomer Wayne Schmidt, who describes it as a windblown scarecrow.
- One is the irregular dwarf galaxy IC 1613 (Caldwell 51) in the IAU constellation Cetus. It was discovered by Max Wolf in 1906. American astronomer Stephen O’Meara gave it this name in 2002, inspired by the Straw Man in *The Wizard of Oz*.

Scarlet Ibis:

This Carib asterism “Warayuman” or “Wara” represents the scarlet ibis (Eudocinus Ruber). Its present location is unknown (Magaña, and Jara, 1982).

Scarlet Macaw:

This Carib asterism “Knoloyuman” or “Knolo” represents the scarlet macaw (Ara macao). This is known to rise in September, but its present location is unknown (Magaña, and Jara, 1982).

Scattered of Serpens:

This **telescopic** asterism “Dissipátus Serpéntis” is the barred spiral galaxy NGC 5964 in the IAU constellation Serpens. John Herschel listed this as h 1929 and later as GC 4118 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the spiral arms of this late-type galaxy are irregular and scattered”.

Scattering Auspice:

This Arabic asterism “Saʿad Nāshirah” (سعد ناشرة) “Al Saʿd al Nashirah”, or “sa’d Nashira” is a line of two stars in the IAU constellation Capricornus: Gamma (γ) Capricorni and Delta (δ) Capricorni. This has been translated as “Lucky One”, “Bearer of Good News”, or “Lucky Star of Nashira”, but appears on the Arabic list of Auspicious Asterisms as “Scattering Auspice” (Adams 2016):

- This was later latinized to “Nashira”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Saʿdubnáshirah, the fortunate star bringing good tidings” and assigned it to Gamma (γ) and Delta (δ) Capricorni.
- Dorn (1829) lists this as “Beneficent Star of the Concealed” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).

- Gamma (γ) Capricorni is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Sad naschurah": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- NOTE: R. H. Allen wrote in his *Star Names* in 1899 that the "Standard Dictionary" gave the name "Saib' Nasch-rú-ah": I believe this to be the *Standard Dictionary of Facts* (1908 – 1924). The Arabs named it the Scattering Auspice as it represents the wind that distributes rain clouds.
- The IAU approved the name Nashira for the star Gamma (γ) Capricorni A.

Sceptre:

This German star "Sceptrum" is 53 Eridani in the IAU constellation Eridanus. It was formerly listed as "Rho (ρ) Sceptri" or "Brandenburgici" in the obsolete asterism "Sceptrum Brandenburicum" (see Brandenburg Sceptre, above). "Sceptrum" appears in Giuseppe Piazzi's *Palermo Catalogue* of 1814. The IAU approved the name Sceptrum for the star 53 Eridani A in 2017.

Sceptre and Hand of Justice:

This French asterism "Sceptum et Manus Iustitiae" is the IAU constellation Lacerta. It was created by French architect and uranographer Augistin Royer to honor Louis XIV in 1679. The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Sceptre", "Sceptre", and "σκήπτρο".

Sceptrum:

See Sceptre, above.

Schaeberle's Flaming Star:

This runaway star is AE Aurigae, the source of the Flaming Star Nebula, IC 405 (Caldwell 31, SH 2-229, vdB 34, LBN 795, Ced 42), in the IAU constellation Auriga. It is named after American astronomer John Martin Schaeberle (1853 – 1924) who first recorded it.

Scheat:

See Upper Arm, below.

Schedar:

See Breast, above.

Scheiner's Star:

This star is BD +15°2083 (HIP 47211, HD 83225) in the IAU constellation Leo. It is named after German astronomer Julius Scheiner (1858 – 1913).

Scholz's Star:

This **telescopic** binary star system is a late-M dwarf and a T-type brown dwarf in the IAU constellation Monoceros (magnitude 18.3). It discovered in 2013 by Ralf-Dieter Scholz. It has large parallax, but relatively small proper motion, and it is known for its close flyby to the Sun about 70,000 years ago.

Sciapod of Corvus:

This **telescopic** asterism "Scíapus Córvi" is the barred lenticular galaxy NGC 4027 (Arp 22) in the IAU constellation Corvus. William Herschel listed this as "II 296". John Herschel listed this as h 3371 and later as GC 2661 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The Plinian Sciapods were one-legged people who protected themselves from sunlight by using their big foot as a parasol.

Science Yoke:

"Eulas Uedon" or "Eolas Uedon" is a proposed early Celtic name for the IAU constellation Cancer from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Scimitar:

This Babylonian asterism "Gamlu" (Hunger 1992, Boutet 2014) is an alternate translation of the name of the Babylonian asterism "Crook" (see above).

This Khorasmian and Sogdian asterism "Khamshish" is the Sickle of Leo asterism as listed in R. H. Allen's *Star Names* in 1899.

Scissor Handles:

This **telescopic** asterism is Vastagh 2, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Gemini. Vastagh describes it as a "scissor handle shape" formed of "two intersecting cascades of bright stars" with an apparent diameter of 18.5'. Vastagh notes that "it is very interesting that the 8 members of the association form 4 opposite mirror image pairs… It's brightest star is HD 257331 of magnitude 8.48".

Scissors:

This **telescopic** asterism is Corder 3762 in the IAU constellation Sagittarius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 180' X 120'. Corder describes it as "2 star chains that cross and form a 'scissors' shape. There are about 25 stars involved, mostly 8th and 9th magnitudes. The short handles of the scissors are at the south and the long 'blades' are to the north". This includes the stars HIP 93736 and 93767 in the "handles". One "blade" runs out through HIP 93963 to 94045 and the other "blade" runs out to HIP 94491.

Scoop:

This Estonian asterism "Kulp" is the IAU constellation Ursa Minor and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Scores of Stars:

This Lokono or Arawak asterism "Yôkoro Wiwa" is the Pleiades cluster in the IAU constellation Taurus (Rybka 2018).

Scorpion:

This Greek asterism "Σκορπίος" ("Skorpíos") is the IAU constellation Scorpius as it originally appeared in Ptolemy's *Almagest* (2nd century). This was Latinized to "Scorpios" and "Scorpio", the latter term being the most commonly used, although Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.), Roman writer Quintus Ennius (239 – 169 B.C.E.), and 1st century Roman poet Marcus Manilius all called it "Nepa" or "Nepas". The difference between today's Scorpius and Ptolemy's is that he included two extra

lines of stars originating in Alpha (α) Scorpii (Antares). One runs out to Rho (ρ) Scorpii and the other to Nu (ν) Scorpii. The name "Nepa" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and in Johann Bayer's *Uranometria* (1603).

This Arabic asterism "Burj Aleaqrab" (برج العقرب) is the IAU constellation Scorpius.

This Bedouin asterism "Al-ʿAqrab" (العقرب) is the IAU constellation Scorpius.

NOTE: This Greek asterism appears on the Daressy Zodiac of the Roman Imperial Period next to a bull or ox.

This Arabic asterism "ʿAqrab" (عَقْرَب) or "Al ʿAḳrab" is the IAU constellation Scorpius:

- "al-'Aqrab" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Acrab", "Akrab", "Alacrab", "Alatrab", "Alatrap", and "Hacrab".
- Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) lists the name "al-'aqrab" for this constellation.
- A 14th century Christian Spanish astrolabe # 4560 lists "al 'aqrab" (King 2002).
- It is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a scorpion labelled "Scorpius" and "Alatrab",
- in Johann Bayer's *Uranometria* (1603) lists "Hacrab", "Alatrab", and "Alacrab".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Arato", "Hacrab", and "Alacrab" as alternate names for Scorpius.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Aakrab", "Hacerab" and."Acrobo Chaldaeis" ("Acrobo of the Chaldeans").
- The names "Alacrab", "Alatrab", Arato", and "Alacrabo" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues lists it as "Alatrab" and "Alacrab" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists "Akrab" in his *Urania* in 1754.
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Acrab" for Beta (β) 1 Scorpii.
- The first edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists both "Acrab" and "Akrab" for Beta () Scorpii, but his 14th edition (1959) just lists "Acrab".
- The IAU approved the name Acrab for Beta (β) Scorpii Aa.

This Egyptian Dendera asterism is the IAU constellation Scorpius (Hoffman 2017).

This Hebrew asterism "'Akrab" or "ʿAḳrabh" is the IAU constellation Scorpius as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud* and is related to their month Cheshvan. John Hill lists the Hebrew name as "Akalkrab" in his *Urania* in 1754. R. H. Allen writes in this *Star Names* in 1899 that 12th century Spanish Rabbi Abraham ibn Ezra described the Hebrew name as "Kᵉsīl" ("Kesil"), but elsewhere points out that this is related to Orion (see Fool, above).

This Romanian asterism "Scorpia" ("female scorpion") is the IAU constellation Scorpius (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Maricopan asterism is the IAU constellation Scorpius.

This Kolam asterism "Tuntor" or "Tootera" is the IAU constellation Scorpius (Vahia 2014).

This Gond asterism “Michu” is the IAU constellation Scorpius (Vahia 2014). It is related to their asterism Corpse (see above).

This Mayan asterism, its name in modern K’iche language (Sokol 2022) being “pa raqan kej” (“under the deer’s leg”) appears in several forms depending on the source:

- To the Tojolabal it is the IAU constellation Ursa Major.
- To The Tzotzil (Zinacantán) asterism “Tsek K’anal” is the IAU constellation Scorpius (Milbrath 1999).
- To the Yucatec (Yucatán and Quintana Roo) it is the IAU constellation Scorpius (Milbrath 1999).
- To the Yucatec southeast of Valladolid, it runs between the IAU constellations Gemini and Canis Major: This is probably a line of stars from Alpha (α) Canis Majoris (Sirius) through Alpha (α) Canis Minoris (Procyon) to the stars Beta (β) Geminorum (Pollux) and Alpha (α) Geminorum (Castor).
- To the Yucatec in Yalcobá it runs between the IAU constellations Orion and Canis Major: This is probably a line of stars from Alpha (α) Canis Majoris (Sirius) through the belt of Orion to Gamma (γ) Orionis (Bellatrix).
- Colonial period sources list the Mayan asterism “Sina’an” as made up of stars of the IAU constellations Scorpius and Lupus. This doesn’t follow the pattern of the IAU constellation Scorpius. It is made up of the stars Alpha (α) Scorpii (Antares), Rho (ρ), Zeta (ζ), and N Scorpii, and h Lupi. The Paris Codex associates it with Scorpius (Milbrath 1999, Milbrath 2014).

NOTE: The modern K’iche name suggests that the nearby constellation Sagittarius was considered a deer (see Deer, above).

This Kogi asterism “Seiku” is the stars around Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.

This Q’eqchi’ and Tojolabal asterism “Tzec” or “Xok” is the Big Dipper asterism in the IAU constellation Ursa Major (Milbrath 1999).

This Barasana asterism “Kotibaha” is the stars of the IAU constellations Centaurus and Lupus (Hugh-Jones 2006).

This Ikoots asterism “Napïp” is the IAU constellation Scorpius.

This Babylonian asterism from the MUL.APIN tablets “GIR.TAB”, “MUL.GIR.TAB” (Parpola 1993), or “MUL.GABA-GIR.TAB” (Hunger 1992) is the IAU constellation Scorpius (Boutet 2014). Anthony Hope lists it as “GÍR.TAB” or “zuqaqipu” in his *A Guide to Ancient Near Eastern Astronomy* in 1996. It is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “MUL.GIR.TAB” (Bartel van der Waerden 1974) or “MUL.GABA-GIR.TAB” and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul gir.tab” (Koch-Westenholz 1995), and in the BM 78161 tablets (Liechty 1988) as “gir-tab”. Oddly, “Lisi” or “Lisin” (“Lion’s heart”) is the name that the Babylonians gave to the star Alpha (α) Scorpii (Antares).

This Seleucid asterism “GIR” or “GIR.TAB” from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Scorpius (Foxvog 1993). These names also appear in Assyrian sky lore.

This Sumerian asterism “mulĝír-tab” listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) and as “gir-tab” in the BM 78161 tablets (Liechty 1988) is the IAU constellation Scorpius.

This Assyrian asterism “Irat Zuqaqipi” (Hunger 1992) listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Scorpius.

This Akkadian asterism “zu-qa-qi-pi” listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Scorpius.

This Persian asterism “GIR.TAB” from the list of Tikpi Stars from the K 250 and VAT 4918 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Scorpius (Jeremias 1929, Bartel van der Waerden 1974). Ernst Weidner lists it as “gir-tab” in his *Fixsterne* in 1971.

NOTE: The name Girtab is under consideration by the IAU for the star Kappa (κ) Scorpii in the IAU constellation Scorpius.

This Tibetan khyim (zodiac constellation) “sThig” or “Dikpa” is the IAU constellation Scorpius (Johnson-Groh 2013).

This Syrian asterism “Akrevā” is the IAU constellation Scorpius as listed in R. H. Allen’s *Star Names* in 1899.

This Persian asterism “Ghezdhum” or “Kazhdūm” is the IAU constellation Scorpius as listed in R. H. Allen’s *Star Names* in 1899 and in John Hill’s *Urania* in 1754.

This Vedic asterism “Kaurpya” is the IAU constellation Scorpius as listed by Indian astrologer Varāhamihira (c. 505 – c. 587) and in R. H. Allen’s *Star Names* in 1899. Allen notes that Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) listed the Vedic name as “Kaurba”.

This Tamil asterism “Vrishaman” is the IAU constellation Scorpius.

This Hindu asterism “Āli”, “Viçrika”, or “Vrouchicam” is the IAU constellation Scorpius as listed in R. H. Allen’s *Star Names* in 1899. Allen describes this as names from “Early India”.

This Sinhalese asterism “Ussika” is the IAU constellation Scorpius as listed in R. H. Allen’s *Star Names* in 1899.

This English asterism “Scorpioun” is the IAU constellation Scorpius as listed by Geoffrey Chaucer (c.1340s – 1400) in his *Hous of Fame*.

This Norman asterism “Escorpiun” is the IAU constellation Scorpius.

This Saxon asterism “Throwend” is the IAU constellation Scorpius.

This Carib asterism “Sibirisiyuman”, Sibirisi”, or “Scorpiones” is the IAU constellation Scorpius (Magaña, and Jara, 1982).

There are seven **telescopic** “scorpion” asterisms:

- One, called the “Baby Scorpion”, “Mini Scorpion”, or “Mini Scorpius,” is in the IAU constellation Hydra near the star Sigma (σ) Librae. One end is a “Y” of stars including HIP 71770, 72056, 71943 and 53 Hydrae. A line of stars runs from 53 Hydrae through 54, 55, 56, 57, and 58 Hydrae before curving through a tail of the stars HIP 72930 and 59 Hydrae. Size 300’.

- One is the open cluster NGC 1342 in the IAU constellation Perseus. It was discovered by William Herschel in 1799 and listed in his catalogue as “VIII 88”. It is GC 717 in the *General Catalogue* of 1864. It is located almost halfway between Beta (β) Persei (Algol) and Zeta (ζ) Persei. It is also known as the Little Scorpion, the Stingray, or the Sea Robin
- One is the open cluster NGC 5281 in the IAU constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 and listed as “I 7”. It is GC 3640 in the *General Catalogue* of 1864. It is also known as the Little Scorpion.
- One, also known as Mini Scorpius, is Do Dz 6, in the IAU constellation Hercules in the corner of the Keystone (see Keystone of Hercules, above) near Eta (η) Herculis. This asterism has a “tail” of four stars and a “head” of five stars including the star HIP 81967.
- One is the open cluster Messier 52 (NGC 7654) in the IAU constellation Cassiopeia. It was discovered by French astronomer Charles Messier in 1774. It is listed in John Herschel’s *General Catalogue* of 1864 as GC 4957. It is also known as the Cassiopeia Salt and Pepper Cluster, the October Salt and Pepper Cluster, the Scorpion, and a Crab (Jumping off a Rock).
- One is the Stinging Scorpion Cluster, open cluster NGC 2451 in the IAU constellation Puppis. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654 and recorded by English astronomer John Herschel in 1835 as h 3099. It is GC 1573 in the *General Catalogue* of 1864. This is a sparse cluster of stars that has a cluster for a body and a tight curve of stars for the tail. It is also known as the Welcome Mat (see below).
- One “Baby Scorpion” is open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius discovered by Italian astronomer Giovanni Battista Hodierna before 1654. It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel’s catalogue as h 3652. American astronomer Tom Lorenzin describes it as “the ‘Baby Scorpion’ that clings to the back of its mother’s tail” in the e-version of *1000+ The Amateur Astronomers’ Field Guide to Deep Sky Observing*.

Scorpion Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Scorpius as “Xiē shén” (蝎神) or “scorpion deity” (Kotyk 2017).

Scorpion Face:

This Aztec asterism “Colotlixayac” is made up of stars in the IAU constellation Scorpius. According to the *Florentino Codex*, Sahagun's informants identified a star known as “Citlalcolotl” (“scorpion star”) as Alpha (α) Scorpii (Antares). In turn, Tezozomoc also mentions the scorpion star and he called it “Colotlixayac” (“face of a scorpion”).

Scorpion of Sculptor:

This **telescopic** asterism “Scórpio Sculptóris” is the barred spiral galaxy NGC 613 in the IAU constellation Sculptor. This was discovered in 1785 by William Herschel who listed it as “I 281”. It became GC 361 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name “by apparent likeness to a scorpion, the curved eastern arm of the galaxy being the scorpion’s tail”.

Scorpion Star:

This Aztec star “Citlalcolotl” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism “Colotlixayac” (see Scorpion Face, above).

This Yucatec asterism “Sina’an éek” is made up of stars of the IAU constellations Scorpius to Orion.

This Tojolabal (of Chaneabal) and Q’eqchi’ asterism is the IAU constellation Ursa Major.

Scorpions:

This Batak asterism is the IAU constellations Orion and Scorpius, which they see as two scorpions facing one another and use them as stellar markers in their calendar. This spans the sky and seasons as Orion and Scorpius are at opposite ends of the sky. In 2400 B.C.E. Betelgeuse and Antares would have both been visible just before the vernal equinox, which fits into their use of this asterism.

Scorpion’s Claws:

This Arabic asterism is the IAU constellation Libra. It is described as two stars (Northern Claw and Southern Claw) but sometimes includes a third:

- Northern Claw of the Scorpion: “az-Zubān ush-Shamāliy” (الزبان الشمالي) is the star Beta (β) Librae in the IAU constellation Libra:
    - This was later latinized to “Zubeneschamali”, “Zuben Eschamali”, “Zuben Elschemali”, or “Zubenelschamali”.
    - The IAU approved the name Zubeneschamali for Beta (β) Librae.
- Southern Claw of the Scorpion: “az-Zubān ul-Janūbiy” (الزبان الجنوبي) is the double star Alpha (α) Librae in the IAU constellation Libra, later latinized to “Zubenelgenubi”. The IAU approved the name Zubenelgenubi for Alpha (α) 2 Librae Aa.
- Claws of the Scorpion: This Arabic star “Zuban al-ʿAqrab” (زبانى العقرب) is the star Gamma (γ) Librae in the IAU constellation Libra, later latinized to “Zubenelhakrabi”, “Zuben Elakrab”, or “Zuben Elakribi”.

This Latin asterism “Scorpionis Forceps” is the stars Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra.

Scorpion’s Dart:

This Netwar asterism also known as the “Kahaur Rul” (“rat”), is made up of four stars of the IAU constellation Scorpius: Lambda (λ), Upsilon (υ), Kappa (κ), and Iota (ι) Scorpii.

Scorpion’s Heart:

This Babylonian star “MUL.LI.SI”, “Lisi” or “li-si” (Parpola 1993) or “Lisin” is Alpha (α) Scorpii (Antares). Anthony Hope lists it in his *A Guide to Ancient Near Eastern Astronomy* in 1996 as “LI.SI”.

This Egyptian Dendera star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Hoffman 2017) and was part of their asterism Scorpion (see above). This star shows up in Seleucid sky lore.

Scorpius:

The stars of this constellation show up in 582 asterisms of the world’s sky cultures.

The IAU constellation Scorpius, “the Scorpion” (IAU abbreviation Sco) became one of Ptolemy’s 48 original constellations in the 2nd century, which Ptolemy listed as “Σκορπίος” (“Skorpíos”) in his *Almagest* (see Scorpion, below). This originated in the Babylonian asterism “GIR.TAB” (see Scorpion above). The original constellation included what we now consider the IAU constellation Libra as the “claws”, this occasionally being described by Latin authors as “Scorpius cum Chelis” (“Scorpius with claws”).

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Scorpius as a scorpion facing to our left (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a scorpion with claws as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

The globe of the 2nd century Farnese Atlas depicts the claws of Scorpius holding the Scales. Robert Hues, in his *A Learned Treatise on Globes* in 1659, notes that Roman author Julius Hyginus (1st century B.C.E.) "doth not number Libra among the signs, but divideth Scorpio into two signs". Kauffmann's translation of the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in 1888 also describes it as "id est in spatium duorum signorum" ("that is, in the space of two signs"). In the Leiden *Aratea* (816) Scorpius includes the stars of Libra.

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) "Scorpio" is following Ophiuchus with Ophiuchus standing on another scorpion,
- In some editions (Paris BN n.a. 1614, Cologne 83 II) Scorpius is facing right.

The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Scorpius with claws but no legs. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* orient Scorpius so that its head is facing upwards. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts Scorpius with human hands.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Scorpius as a scorpion. There are two views, one page showing the tail curving to our left, and the other showing it curving to our right.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Scorpio" and "Scorphius" and in most lists it twice: Once with Serpentarius standing on it, and again without Serpentarius. The Klosterneuberg manuscript only shows Serpentarius standing on Scorpius. The Klosterneuberg 685, and Zwettl 296 manuscripts of *De signis caeli* depict Scorpius with a humanoid face with a moustache.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Scorpius as a scorpion facing to our left.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Scorpius as a scorpion.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Scorpius as a scorpion facing Libra, with one of its claws overlapping Libra.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists "SCORPIVS" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Scorpius as a scorpion.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Scorpio” as a scorpion facing to our left.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts “Scorpio” as a scorpion facing to our left with its claws overlapping Libra.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Scorpius as a scorpion facing to our left. It is unlabelled and only the front half of the constellation is visible at the circular edge of the astrolabe.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Scorpius as a scorpion facing to our left.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts Scorpius as a scorpion turned to our left.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts “Ophiochus” standing on a scorpion facing to our left.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Scorpius” as a scorpion holding a set of scales (which would be Libra) in one claw.

Scorpius appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a scorpion facing to our right and labelled with the astrological sign for Scorpius.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Scorpio” as a scorpion.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Scorpius as a scorpion below Ophiuchus, facing to our right. It is not labelled.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Scorpio” as a scorpion with its claws bracketing Libra.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists “Scorpio” and depicts this as a scorpion.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Scorpius” as a scorpion facing to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “SCORPIVS” as a scorpion facing to our left.

The Horoscopion generale (1533) of Petrus Apianus (1495 – 1552) depicts Scorpius as a scorpion facing to our right.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al lists this as “Scorpio” and depicts it in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Scorpius” as a scorpion facing to the left.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De lo Scorpione”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Scorpion”: Copernicus lists what is now Libra as the “Claws”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Scorpius as a scorpion facing to our left.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Scorpius in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Scorpius as a scorpion and only labels it with the astrological symbol for this constellation.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Scorpio” as a scorpion facing to our right.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le scorpion” from above, moving to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Scorpius” as a scorpion whose claws bracket Libra.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Scorpio” as a scorpion facing to our left with its claws overlapping Libra.

“Scorpio” is listed on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) and depicted as a scorpion. It is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a scorpion labeled “Scorpius” with the subtitle “Alatrab”.

Scorpius is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

Dutch navigator Frederick de Houtman’s catalogue of fixed stars (1603) lists this constellation as “De steert van Scorpio” (“Scorpio’s star”).

German uranographer Johann Bayer (1572 – 1603) depicts this as a scorpion separate from Libra in his *Uranometria* (1603). Bayer lists these names for this constellation: “Scorpio, Scorpius, Ciceroni Nepa, Scorpion, Hacrab, Alatrab, [and] Alacrab”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Scorpius” as a scorpion.

Johannes Kepler's *Stella Nova in Pede Serpentarii* (1606) lists this constellation as "Scorpionis". The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Scorpius".

Scorpius is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Scorpio", "Scorpi", "Scorpius", "der Scorpion" and depicted as a scorpion.

"Scorpio" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a scorpion.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Scorpio" as a scorpion whose claws bracket Libra.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Scorpio".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Scorpius as a scorpion.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Scorpius" as a scorpion.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Scorpio" as a scorpion.

Scorpius is depicted by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 as a scorpion.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Scorpius" as a scorpion facing towards our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Scorpion", "Scorpius", and "Σκορπίος" and depicts it as a scorpion whose claws encircle Libra.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Scorpio" with the subtitle "Orionem se invictum a quacunque fera jac tantem inter fecit" ("Orion made himself invincible by any beast among them") and depicts it as a scorpion.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Scorpio" and depicts it as a scorpion.

This constellation is listed as "Scorpio" in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a scorpion.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Scorpio".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Scorpio" as a scorpion.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Scorpius" as a scorpion.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Scorpius as a scorpion facing to our right.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Scorpius as a scorpion.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Scorpion" as a scorpion.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Scorpio" as a scorpion facing to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Scorpion" as a scorpion, as does the 1778 edition.

Scorpius is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Scorpioen": It is depicted as a scorpion with his claws grasping the scales of Libra.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Scorpion" in the text and "Scorpion" on the charts, depicting this as a scorpion facing to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Scorpione" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Scorpius" as a scorpion.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Scorpion" as do the various editions of his *Jahrbuch*.

American uranographer William Croswell (1760 – 1834) depicts "Scorpio the Scorpion" on his *Mercator Map of the Starry Heavens* in 1810.

This constellation is listed as "Scorpio" in Scottish uranographer Alexander Jamieson's Celestial Atlas in 1822: It is depicted as a scorpion.

"Scorpius" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a scorpion.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Scorpio" as a scorpion facing to our left.

This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Scorpio": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Scorpius" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a scorpion whose claws are clutching at Libra.

This constellation is listed as "Scorpio" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on its charts and in its text as "Scorpio".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Scorpio, The Scorpion" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Scorpio, the Scorpion".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Scorpio" in his *Star Atlas* (1893) and describes it as "The Scorpion".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Scorpius" and describes it as a "Scorpion".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Scorpio… the zodiacal Scorpion".

Part of this constellation, which involves seven of the brightest stars in the sky, is the "fishhook" asterism. This is a large "J" shaped figure which starts with the bright star Alpha (α) Scorpii (Antares- 15th brightest star). From here the line of stars runs through Tau (τ) Scorpii, Epsilon (ε) Scorpii (Larawag- 78th brightest star), Mu (μ) Scorpii, Zeta (ζ) Scorpii, Eta (η) Scorpii, Theta (θ) Scorpii (Sargas- 37th brightest star), Iota (ι) Scorpii, Kappa (κ) Scorpii (Girtab- 82nd brightest star) and Lambda (λ) Scorpii (Shaula - 23rd brightest star). Delta (δ) Scorpii (Dschubba- 77th brightest star) and Beta (β) Scorpii (Acrab- 92nd brightest star) are two of the three stars fanning out to the other side of Antares alongside 6 Scorpii (Fang or Nur).

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of this constellation in his book *The Stars - A New Way to See Them* (1952): The part from Alpha (α) Scorpii (Antares) down to the "tail" is basically the same as the standard IAU charts, but the front end which on standard charts is three lines of stars emerging from Antares and running to Beta (β) 1 Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii was redrawn by Rey. Rey transforms this into two pincers emerging from a line starting at Antares and running to Sigma (σ) Scorpii:

- One "pincer" runs through Nu (ν) Scorpii and Beta (β) 1 Scorpii to Delta (δ) Scorpii. And
- One "pincer" runs through 13 Scorpii and Rho (ρ) Scorpii to Pi (π) Scorpii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Scorpius in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in the same manner as the IAU charts in the "J" shaped "tail" section but have modified the part on the other side of Antares: From Alpha (α) Scorpii (Antares) a line runs through Sigma (σ) Scorpii to Delta (δ) Scorpii. From Delta (δ) Scorpii two lines run out:

- One runs through Pi (π) Scorpii to Rho (ρ) Scorpii, and
- One runs through Beta (β) 1 and 2 Scorpii to Nu (ν) Scorpii.

Sky and Telescope Magazine, founded in 1941, depicts Scorpius in their magazine and publications in the same manner as Hlad et al.

Scourge of Christ:

This German asterism “Flagellum Christi” is the IAU constellation Coma Berenices and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Flagellum XPI Al Coma Berenices”. It later appears in Edward Sherburne’s sphere of Marcus Manilius in 1675 and in John Hill’s *Urania* in 1754.

Scout of Three Troops:

This Korean asterism “Se Gundaeui Jeongchalbyeong” (세 군대의 정찰병) is a line of two stars in the IAU constellations Canis Major and Columba: Delta (δ) Columbae and Zeta (ζ) Canis Majoris.

Screaming Skull Cluster:

This **telescopic** asterism is the open cluster NGC 7789 in the IAU constellation Cassiopeia. It was discovered in 1783 by English astronomer Caroline Herschel. John Herschel listed it as “”VI 30”. John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864. It is also known as Caroline’s Rose, the White Rose, the Star Mist Cluster, Herschel’s Spiral Cluster, and the Ghost Cluster.

Screen:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Lepus: Epsilon (ε) Leporis (the determinative star) and HIP 24927A.

This Chinese xing guan “Píng” (屏) is a line of two stars in the IAU constellation Lepus: Mu (μ) and Epsilon (ε) Leporis.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Lepus: Epsilon (ε) and Mu (μ) Leporis.

Scroll:

This Arabic asterism “Rabesco” is the IAU constellation as it appears on the Borgian globe of 1225 and listed by translator Giuseppe Simone Assemani (1687 – 1768).

Sculptor:

The brightest star of Sculptor is 4th magnitude, and the stars of this constellation only show up in 49 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Scl) created in 1751 by French astronomer Abbé Nicolas Louis de Lacaille. He originally called it “l’Atelier du Sculpteur” (“the sculptor’s studio”) but later shortened the name. Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “l’Atelier du Sculpteur” as a rectangular workbench with sculptor’s tools on top with a tripod stand at one end with a bust displayed on top.

German astronomer Johann Bayer (1572-1625) listed it as “Bildhauer Werkstadt” and German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists it as “Bildhauer Werkstadt” and depicts it as a mallet and chisel next to a three-legged stand on which stands a bust of a male wearing a laurel wreath.

Other Germans listed it as “Bildhauerwerkstätte” and the Italians called it “Scultore”.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Atelier de Sculpteur" as a tripod stand with a bust and a bench with sculptors tools on it.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Die Bildhauer Werkstadt".

American uranographer Elijah Burritt (1794 – 1838) listed it as "Officinia Sculptoria" ("sculptor shop") and "Apparatus Sculptoris" ("Sculpture Apparatus").

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as "Apparatus Sculptoris": This is depicted as a two-level table with a bust and tools on top.

Sculptor is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated title "Apparat Sculptor": He indicates the borders of this constellation on the chart but offers no illustration of it.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Apparatus Sculptoris".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich labels "Apparatus Sculptor" but does not illustrate it.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Officinia Sculptoris" as a tall table with a bust on top.

This constellation is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Apparatus Sculptoris": It is depicted as a two-level wooden table with a bust and tools on top.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Sculptor, The Sculptor's Workshop" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Sculptor" and "Apparatus Sculptoris" and describes it as a "Sculptor's Apparatus".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Sculptor" and gives the "original form" as Apparatus Sculptoris, the Sculptor's Workshop".

Standard IAU charts show Sculptor as the triangle of the stars Alpha (α) Sculptoris, Eta (η) Sculptoris, Beta (β) Sculptoris, and Gamma (γ) Sculptoris.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Sculptor in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a "J" shaped figure starting at the star Alpha (α) Sculptoris and running through Eta (η), Beta (β), and Gamma (γ) Sculptoris to Delta (δ) Sculptoris.

Sky and Telescope Magazine, founded in 1941, depicts Sculptor as a "J" shaped figure in their magazine and publications: Starting at Beta (β) Sculptoris, the line runs through Gamma (γ), Delta (δ), and Iota (ι) Sculptoris, ending at Alpha (α) Sculptoris.

Sculptor Dwarf Galaxy:

This dwarf spheroidal galaxy, a satellite of our galaxy, PGC 3589 (ESO 351-30) in the IAU constellation Sculptor. It was discovered by American astronomer Harlow Shapley in 1937. It is also known as the Sculptor Dwarf Elliptical Galaxy, the Sculptor Dwarf Spheroidal Galaxy, or "Shapley's of Sculptor".

Sculptor Pinwheel:

This **telescopic** asterism is NGC 300 (Caldwell 70), a spiral galaxy in the IAU constellation Sculptor. Scottish astronomer James Dunlop discovered this in 1827. It is GC 169 in the 1864 *General Catalogue*. John Dreyer describes it in the New General Catalogue of 1888 as "a complex object with several nuclei". It is also known as the Southern Pinwheel.

Sculptor's Knot:

This **telescopic** asterism "Nódus Sculptóris" is the barred spiral galaxy NGC 150 in the IAU constellation Sculptor. It was discovered by American astronomer Lewis A. Swift in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it "looks like a knot in a rope".

Scutum:

None of the stars of Scutum are brighter than 4th magnitude and the stars of this constellation only show up in 35 asterisms in this handbook.

This IAU constellation "the Shield" (IAU abbreviation Sct) was created by Polish astronomer Johannes Hevelius (1611 – 1687) in 1684. Hevelius named it "Scutum Sobiescianum" ("Sobieski's Shield") to honor the coat of arms of John Sobieski, King of Poland. In his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, Hevelius depicts it as a curved kite shaped shield decorated with a cross with "INRI" on a banner at the top of the cross.

German mathematician George Christopher Eimmart (1638 – 1705) included "Scutum Subiescianum" on his celestial globe of 1705 (Stevenson 1921).

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Scutum Sobieski" and depicts it as a shield decorated with a shining cross.

English astronomer John Flamsteed (1646 – 1719) shortened the name of this constellation to "Scutum".

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Scutum Sobiecianum" as a curved shield decorated with a cross.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Scutum Sobiese" and depicts it as a shield decorated with a cross.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Scutum as a shield decorated with a cross.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Scutum as a triangular shield with a cross on it.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts a shield decorated with a crucifix and labels it "L'Ecu de Sobieski" ("Sobieski's Shield") as does the 1778 edition. A variation is "Bouclier de Sobieski".

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "das Sobieskische Schild" and depicts it as a roughly triangular shield decorated with a crucifix.

Scutum is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Schild van Sobieski": It is depicted as a shield decorated with a cross.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Scutum Sobieski" in his *Celestial Atlas* in 1822: This depicts a shield with a cross on it.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Sobiekische Schild".

This constellation is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as Scutum: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

English Admiral Henry William Smyth's *Prolegomena* and his *Bedford Catalogue* in 1844 lists "Clypei Sobieskii".

"Scutum" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a shield decorated with a cross.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Scutum Sobieski" as a shield decorated with a crucifix.

Scutum is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877) as "Scutum Sobiesii": It is depicted as a shield decorated with a cross.

It is listed as "Clypeus Sobieskii" ("shield of Sobieskii") and the "Shield of Sobieski" (note the two different spellings of Sobieski) in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Sobieski's Shield".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Scutum Sobieski" in his *Star Atlas* (1893) and describes it as "The Shield of Sobieski".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Scutum (Sobiesii)" and describes it as the "Shield of Sobieski".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Scutum" and gives the "original form" as "Scutum Sobieskii, Sobieski's Shield".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Scutum in his book *The Stars - A New Way to See Them* (1952). Standard IAU star charts show Scutum as a roughly triangular "shield" formed by the stars Alpha (α) Scuti, Gamma (γ) Scuti, HIP 92814, and Beta (β) Scuti. Rey turns this into a diamond shaped shield of the four stars Beta (β) Scuti, Alpha (α) Scuti, Gamma (γ) Scuti, and Delta (δ) Scuti. *Sky and Telescope Magazine*, founded in 1941, depicts Scutum in their magazine and publications in the same manner as Reyersbach.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Scutum in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a bent line of the three stars Beta (β), Alpha (α), and Gamma (γ) Scuti.

The Italians call this constellation “Scudo di Sobieski”, and the Germans “Sobieskischer Schild”.Variations include “Scutum Sobieskii”, “Scutum Sobiesii”, and “Clypeus Sobieskii” or “Clipeus Sobieskii” (“shield of Sobieski”).

Scutum Salt and Pepper Cluster:

See Salt and Pepper, above.

Scythe:

This Romanian asterism “Coasă” is the IAU constellation Cepheus (Ottescu 2009, Lite, Lodina, and Ignat 2018). The stars Alpha (α) Cephei (Alderamin) and Gamma (γ) Cephei are called the “Coporâia”, “Coporâșca, or “Coada Coasei” (the “Scythe’s Tail”). The star Beta (β) Cephei is “Mânerul Coporâii” (“Tail Handle”). The stars Mu (μ), Zeta (ζ), and Delta (δ) Cephei are the “Fierul Coasei” (“Scythe’s Iron Blade”).

This Finnish asterism “Viikate” is the Belt of Orion asterism in the IAU constellation Orion.

This Lithuanian asterism “Pjautuvas” is made up of stars of the IAU constellation Leo. This is a line of stars from Epsilon (ε) Leonis through Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis and Eta (η) Leonis to the star Alpha (α) Leonis (Regulus).

This **telescopic** asterism is in the IAU constellation Sagittarius and is Corder 4018 on the observing list of American astronomer Jeffrey Corder. Size 70’ X 20’ This is six 7^{th} – 9^{th} magnitude stars including HIP 98310 and 98319.

Scythes:

This Belarussian asterism “Kosy” is the constellation Orion (Avilin 2009). It is also known as “Matawila” (see Wheel, below), “Traiko” (see Three Times, below), “Karomyselko” (see Small Yoke, above), “Grabli” (see Rake, above), “Kastsy” (see Mowers, above), “Try Karali” (see Three Kings, below), “Kasar” (see Mower, above), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, above), “Tri Siostry” (see Three Sisters, below), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Asilki” (see above), “Kigachi ragachy” (see Shaft of a Plough, above), “Kryzhe” (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, below).

This Polish asterism “Kosary” is the constellation Orion (Avilin 2009).

Sdaikwasa’:

This Xerénte asterism “Sdaikwasa’” is the belt of Orion in the IAU constellation Orion (Dechend 1975). This asterism and their asterism Asare’ (see above) are followers of the Sun.

Sea:

This asterism is the part of the sky which includes Aquarius, Capricornus, Cetus, Delphinus, Eridanus, Hydra, Pisces, and Piscis Austrinus and was described by R. H. Allen in his *Star Names* in 1899 as common to “Euphratian astronomy.”

Sea and Mountain:

This Chinese xing guan “Hăishān” (海山) is a bent line of stars in the IAU constellation Carina: q, p, Theta (θ), Omega (ω) and Beta (β) Carinae (Miaplacidus).

Sea and Mountain II:

This Chinese xing guan “Hăishān II” (海山二) is the HII region NGC 3372 (the Homunculus Nebula).

Sea Bear:

This Latin asterism "Ursus Marinus" is the IAU constellation Cetus. This is a name listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

Sea Chariot:

This Greek asterism "Arma Thalases" is the asterism Argo's Ship (see above) as listed in John Hill's *Urania* in 1754.

Sea Cow of Lynx:

This **telescopic** asterism "Sirénium Lýncis" is the barred spiral galaxy UGC 4881 (Arp 55) in the IAU constellation Lynx. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the general form of this merging pair of galaxies… brings to mind a sea cow." It is also known as the Shrimp Galaxy (see below) and the "Grasshopper" or "Grasshopper Galaxy" (see above).

Sea From Which Rain Comes:

There are two versions of this Kolam asterism "Samdur" as described by Vahia (2014):

- One is the Great Square of Pegasus asterism in the IAU constellation Pegasus.
- The other is made up of stars of the IAU constellation Centaurus and is surrounded by a group of animal asterisms: Peacock, Buffalo, Frog, Deer, Horse, and Pig.

Sea Goat:

This English asterism is the IAU constellation Capricornus as listed by John Hill in his *Urania* in 1754. Compare this to Kid of the Sea, above.

Sea Horse:

This Ikoots asterism "Pilmiïk" is made up of stars of the IAU constellations Ursa Major and Lynx.

This English asterism "Hippocampus" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens***.** It represents a pipefish, which is in the sea horse family. This asterism is made up of the stars of the IAU constellations Cetus, Eridanus, and Taurus:

- One side of the "body" runs from a "tail" at 45 Eridani through 35, 32, and 24 Eridani to 10 Tauri,
- The other side of the "body" runs from 10 Tauri through 17 and 30 Eridani to the "tail" at 45 Eridani, and
- The "head" is the triangle of stars: 10 Tauri, 94 Ceti, and Kappa (κ) 1 Ceti.

Compare this to the asterism "Psalterium Georgii" or "Psalterium Georgianum" (see George's Psaltery, above).

There are three **telescopic** Sea Horse asterisms:

- One from *Pattern Asterisms* by American astronomer John A. Chiravalle is in the IAU constellation Hydra. This includes stars of Corder 2449 and 2457 on Jeffrey Corder's list. Size 15':

  - The "head" has the star Psi (ψ) Hydrae forming the "eye" and the star HIP 64133 the "nose",
  - The "body" is a line of stars including the star HIP 64271 and the "tail" includes the star HIP 64303A and 64396, and
  - A "wing" is a bent line of three stars roughly parallel to the "body" line: HIP 64135, 64124 and 64095.
- One, the "Sea Horse", the "Dark Sea Horse", or the "Sea Horse in the Red Sea" is Barnard 150 in the IAU constellation Cepheus. It is also known as the "Hippocampus Nebula" or the "Hippocampi Dark Nebula".
  - One is made up of stars of the IAU constellation Hydra. The "head" is the stars Psi (ψ) Hydrae, HD 114205, and HIP 64133. The "body" starts at HD 114180 and runs through HIP 64095, HIP 64124, HIP 64135, HIP 64271, and HD 114312. The "tail" is a line of stars from HD 114346 through HD 114383, HD 114384, and HIP 64303 to HD 114420. American amateur astronomer "Surveyor 1" listed this in November 2020 on *Cloudy Nights*.

Sea Horse in the Red Sea:

See Sea Horse, above.

Sea Horse of Eridanus:

This **telescopic** asterism "Hippocámpus Erídani" is the irregular galaxy NGC 1487 in the IAU constellation Eridanus. It was discovered in 1826 by James Dunlop who listed it as 2597 in his catalogue and later as GC 790 in his *General Catalogue* of 1864. NOTE: American astronomer Lewis Swift observed this galaxy in 1896 and classified it as IC 1983. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sea Lion:

This Latin asterism "Leo Marinus" is the IAU constellation Cetus as listed in John Hill's *Urania* in 1754

Sea Monster:

This Greek asterism "Κῆτος" ("Kitos") which translates as "sea monster" or "whale" is the IAU constellation Cetus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest* (2nd century). Another common Greek name also interpreted as "sea monster" for this constellation is "Πρῆστις", ("Prístis") and "Πρίστις" ("Pristis"), from "πρῆθειν" ("príthein", "to blow or spout"). This was later latinized to "Pristis", "Pristix", and "Pistrix". These Latin names were often accompanied by the adjectives "Auster" ("south wind"), "Nereia" ("Nereus"), "Fera" ("Wild Animal"), "Neptunia", "Aequorea" ("marine"), or "Squammigera" ("scaly"). The only difference between the modern constellation and Ptolemy's original is that the star lines do not go through Tau (τ) Ceti, but through Upsilon (υ) Ceti. A common name used in the 17th century way was "Cete".

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels this constellation "Pistrix" and "Cetus" and depicts it as a sea monster resembling a whale with long tusks.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists the alternate name “Pistrix” for Cetus.

This constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch with the alternate name “Pistrix”.

German astronomer Johann Bayer (1572-1625) lists the name “Monstrum Marinum”.

“Monstrum Marinum” is listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists the names Cetus and Pistrix, attributing the latter to Hydinus.

This Arabic asterism “ul-Qaytus” is the IAU constellation Cetus:

- This was later latinized to Kaitos.
- Robert Hues lists “Elkaitos” in his *A Learned Treatise of Globes* in 1659.
- In 1754 in his *Urania*, John Hill listed it as “Alketus”.

The stars of this Kiribati asterism “Teawanei” or “Ten Teawanei” are unidentified at present (Trussel and Groves 1978).

This Samoan asterism “Tanifā” is made up of stars of the IAU constellation Cetus and Pisces (Fitisemanu 2022):

- The “head” of is a circle of the stars Alpha (α) Ceti (Menkar), Lambda (λ) Ceti, Mu (μ) Ceti, Xi (ξ) 2 Ceti, and Gamma (λ) Ceti,
- The “body” runs from Gamma (γ) Ceti through Omicron (ο) Ceti to Zeta (ζ) Ceti
- An “arm” runs from Omicron (ο) Ceti to Alpha (α) Piscium (Alrescha)
- From Zeta (ζ) Ceti two lines run out to form legs:
    - One runs through a “knee” at Tau (τ) Ceti to a “foot” at Upsilon (υ) Ceti,
    - One runs through a “knee” at Theta (θ) Ceti to a “foot” at Eta (η) Ceti, this latter star part of a triangle including Beta (β) Ceti (Diphda) and Iota (ι) Ceti.

Tanifā is pursuing their asterism Matāli‘i (see Chief’s Eyes, above).

Sea Robin:

This **telescopic** asterism is the open cluster NGC 1342 in the IAU constellation Perseus. It was discovered by William Herschel in 1799 and listed in his catalogue as “VIII 88”. It is GC 717 in the *General Catalogue* of 1864. It is located almost halfway between Beta (β) Persei (Algol) and Zeta (ζ) Persei. It is also known as the Scorpion, or the Stingray.

Sea Rock:

This Chinese xing guan “Hǎishí” (海石) is a bent line of stars in the IAU constellation Carina: At one end is Epsilon (ε) Carinae, and the line runs down through Iota (ι) Carinae to a bend at h Carinae and then through I Carinae, ending at Upsilon (υ) Carinae.

Sea Serpent:

This Arabic star "'ash-Shujaāʿ", "Ash-Shujaaʿ", "'ash-Shujāʿ", or "Ash-Shujaaʿe" (الشجاع) is Beta (β) Draconis (Rastaban) in the IAU constellation Draco:

- This was later latinized to "Asuja", "Asvia", or "Asuia".
- German astronomer Wilhelm Schickard (1592 – 1635) listed "Attanino Al Shujāʿ".
- John Hill lists it as "Alsugia" or "Alshugia" in his *Urania* in 1754.
- NOTE: "Asugia" and "Sugia" are both names listed for Orion in Johann Bayer's *Uranometria* (1603). "Asugia" and "Asschagio" are names is listed for Orion in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Robert Hues lists "Asugia" as a name for both Orion and Hydra in his *A Learned Treatise of Globes* in 1659.

Sea Star:

This Italian star "Este`la Marina" is Alpha (α) Ursae Minoris (Polaris).

This Lithuanian star "Tavorčka Sietyno" or "Marių žvaigždė" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Sea Swallow:

This Latin asterism "Hirundo Marina" is the IAU constellation Volans. Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts this as a flying fish and labels it "Hirundo Mari".

Dutch historian Paulus Merula (1558 – 1607) lists this constellation as "Hirundo Marina" and "Zeezwaluwe" ("swallowtail").

Edward Sherburne lists this constellation as "Hirundo Marina" in his *Sphere of Marcus Manilius* in 1675. Sherburne also gives the Greek name "Chelidon Thalassia".

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation "Hirundo Marina".

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this constellation as "Hirundo Marina" and depicts it as a flying fish.

Sea Turtle:

This Carib asterism "Kataruyuman" or "Kataru" represents the sea turtle (Chelone mydas). Its present location is unknown (Magaña, and Jara, 1982) but it is known to be rising in June – August when the sea turtles lay eggs in the sand.

Sea Worms:

This Chaldean asterism "ku mes tu-la-a-tum" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Seacrest Cluster

This **telescopic** asterism, also known as the Ghost Bush Cluster (see below), the Flying Geese (see above), and the Silk Fan Cluster (see below), is the open cluster NGC 6939 in the IAU constellation

Cepheus. It was discovered by William Herschel in 1798 who listed it as VI 42. It is GC 4590 in the *General Catalogue* of 1864. It lies 0.6 degrees northwest of the spiral galaxy NGC 6946 and 2 degrees southwest of the star Eta (η) Cephei. American astronomer David Knisely named it the Seacrest Cluster "since at first glance, some of its stars seemed to look like a row of stadium lights at Lincoln-East High School's Seacrest Field".

Seagull:

This Palikur asterism "Wanawna" is stars in the area of the IAU constellation Orion (Green and Green 2011). It is the name of Kusuvwi Isamwitye's small canoe for going ashore (see Kusuvwi the Younger Brother, above).

This **telescopic** asterism is the open cluster Trumpler 2 (Collinder 29) in the IAU constellation Perseus. Robert Zebahl lists it on his *Faint Fuzzies* website, where René Merting describes "five bright stars form a bird with two wings…looks like a seagull with outstretched wings, the brightest star in the center forms the [body]". The body includes HIP 12152 and 12128

Seagull Nebula:

This **telescopic** asterism is reflection nebula IC 2177 (SH 2-292, vdB 93, RCW 2, LBN 1027, Ced 89c) in the IAU constellation Monoceros. This was discovered by Welsh astronomer Isaac Roberts (1829 – 1904) in 1898. John Sanford lists it as the Seagull in his *Observing the Constellations* in 1989.

Seagull's Wings:

This **telescopic** asterism is HII region is SH 2-296 (LBN 1033) in the IAU constellation Canis Major.

Seal:

This Chukchi asterism is the IAU constellation Delphinus.

Seal Hunters:

This Inuit asterism is the belt of Orion in the IAU constellation Orion (MacDonald 1998).

This Greenland Inuit asterism "Siktut" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Seashell:

This **telescopic** asterism NGC 5291 is a system of interacting galaxies in the IAU constellation Centaurus. It is surrounded by a collisional ring containing a tidal dwarf galaxy. It was discovered by English astronomer John Herschel in 1847 who listed it as h 3535. It is GC 3646 in the *General Catalogue* of 1864.

Seasons:

This Kedahan asterism "Piama" is the Pleiades cluster in the IAU constellation Taurus. They used this asterism as part of a seasonal calendar tracking wind directions and monsoons. Piama literally translates as "seasons", but it is believed to be derived from an earlier term translating as "paddy farmer" (Jaafar and Khairuddin 2019).

Seat:

This Dutch star “Seat” is Pi (π) Aquarii in the IAU constellation Aquarius. It was given this name by the Dutch astronomer Hugo Grotius (Huig de Groot, 1583 – 1645).

Seat Flags:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellation Auriga: Starting at the determinative star Kappa (κ) Aurigae it runs through WW Aurigae, UU Aurigae, 51 Aurigae, Psi (ψ) 3 and 2 Aurigae, 47 Aurigae, Psi (ψ) 1 Aurigae, and 45 Aurigae.

This Chinese xing guan “Zuòqí” (座旗) is a jagged line of stars in the IAU constellation Auriga: Psi (ψ) 3, 4, 5, 6, 7, 10, and 51 Aurigae.

This Chinese Chenzhuo xing guan “Zuòqí” is a zig-zagging line of stars in the IAU constellations Auriga and Taurus: Starting at Psi (ψ) 10 Aurigae it runs through HIP 33269, Psi (ψ) 7 Aurigae, Psi (ψ) 2 Aurigae, HIP 31579, HIP 29451, Kappa (κ) Aurigae, HIP 27629, and 125 Tauri to 121 Tauri.

Seat for Longevity:

This Korean asterism “Jangsuleul Wihan Jwaseog” (장수를 위한 좌석) is a triangle of stars in the IAU constellation Boötes: 12, 22, and 6 Boötis.

Seat of Emperor:

This Korean lunar mansion “Shim” is a line of three stars in the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Tau (τ) Scorpii, and Sigma (σ) Scorpii.

Seat of God:

This Arabic asterism is the IAU constellation Draco. It was called this as it never set and thus was very reliable (Steiner 2017). Compare this to the Bedouin asterism Sign of God (below).

Seat of the Azure Emperor:

This Chinese Chenzhuo xing guan “Cangdi” is the star 95 Leonis in the IAU constellation Leo.

Seat of the Black Emperor:

This Chinese Chenzhuo xing guan “Heidi” is the star HIP 57646 in the IAU constellation Leo.

Seat of the Emperor (at Great Horn):

This Chinese Chenzhuo xing guan is a triangle of stars in the IAU constellation Boötes: 10, 12, and 26 Boötis.

Seat of the Flowing Waters:

This Akkadian asterism “Ku-ur-ku” is the asterism Great One (see above).

Seat of the Red Emperor:

This Chinese Chenzhuo xing guan “Chidi” is the star HIP 57779 in the IAU constellation Leo.

Seat of the Yellow Emperor:

This Chinese star “Huangdizuo” from the Three Kingdoms to Ming Dynasty is Beta (β) Leonis (Denebola) in the IAU constellation Leo and is part of their xing guan Seats of the Five Emperors (see above).

This Chinese Chenzhuo xing guan “Huangdizuo” is the star Beta (β) Leonis (Denebola) in the IAU constellation Leo.

Seated Three:

This Italian (Piedmont Alps) asterism “Sete¨u” or “i Tre Sete`y” is the belt of Orion in the IAU constellation Orion. Its appearance and disappearance marked the beginning and end of the winter watches.

Seats of the Five Emperors:

This Chinese xing guan “Wǔdìzuò” (五帝座) is a cross of stars in the IAU constellation Leo: The middle star is Beta (β) Leonis (Denebola), with the four stars at the ends of the “cross” HIP 57646, 57320, 57779, and Omicron (o) Leonis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore except that in the earlier xing guan the five stars each were named for an emperor:

- Denebola: Huangdizuo (Seat of the Yellow Emperor)
- HIP 57646: Heidi (Black Emperor).
- HIP 57320: Baidi (White Emperor).
- HIP 57779: Chidi (Red Emperor).
- Omicron (o) Leonis: Cangdi (Azure Emperor).

In the Tang Dynasty (619 – 907 C.E.) this was listed as “Yi” (Kotyk 2017) and compared to the Vedic nakshatra Uttara Phalguni (see Second Reddish One, below).

This Chinese Chenzhuo xing guan “Wǔdìzuò” is made up of stars of the IAU constellation Leo: From the star Beta (β) Leonis (Denebola, “Seat of the Yellow Emperor”) three lines run out:

- One to HIP 57779, “Seat of the Red Emperor”,
- One to Omicron (o) Leonis, “Seat of the Azure Emperor”, and
- One to HIP 57646 “Seat of the Black Emperor”.

Second:

This German asterism “Secundus” is the IAU constellation Canis Major as listed by German astronomer Johann Bayer (1572-1625). This is actually a translation of the size of the original asterism.

Second Advisor:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaofu” is the star 24 Ursae Majoris in the IAU constellation Ursa Major and is part of their xing guan Purple Forbidden Right Wall (see above).

Second Arm of the Charioteer:

This Arabic star “as-sācid aθ-θānī” (الساعد الثاني) is Zeta (ζ) Aurigae in the IAU constellation Auriga. It is part of their asterism The Kids (see Kids, above).:

- This was later latinized to “al Said al Thani”, “Saclateni” (in the 1515 edition of the *Almagest*).
- It is listed as “Sadatoni” in the 15th century *Alfonsine Tables.*
- It is listed as “Haedus I”, or “Hoedus”

- Robert Hues lists “Saclateni” as a name from the *Alfonsine Tables* and “Sadateni” as a name used by Joseph Justus Scaliger in his *A Learned Treatise of Globes* in 1659 and translates this as “the hindmost arm”.
- John Hill lists the name “Sadateni” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Dhát-al-‘inán, corrupted to Sadatoni in the *Alfonsine Tables*”.
- The IAU approved the name Saclateni for Zeta (ζ) Aurigae A in 2017.

Second Circle:

This Greek asterism “Δευτέρα Κύκλα” (“Deftéra Kýkla”) or simply “Δευτέρος” (“Deftéros”- “second”) is the IAU constellation Corona Australis as listed by 1st century Greek astronomer Geminus of Rhodes. This is probably a reference to it being the second crown, the other being Corona Borealis.

Second Commandant:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaowei” is the star Kappa (κ) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Right Wall (see above).

Second Connected of Hydra:

This **telescopic** asterism “Concatenáta Secúnda Hýdrae” is the peculiar spiral galaxy NGC 2993 (Arp 245) in the IAU constellation Hydra, which is interacting with NGC 2992. It was discovered by William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Second Dancer:

This German star with the Greek name “Χορευτής δευτέρα” (“Choreftís deftéra”) is Epsilon (ε) Ursae Minoris as listed by German astronomer Johann Bayer (1572-1625). It is part of the Latin asterism Dancers (see above).

Second Dog:

This asterism “Canis Secundus” is the IAU constellation Canis Major. This name is listed in Johann Bayer’s *Uranometria* (1603).

Second Dog of the Shepherd:

This Arabic star is Beta (β) Ophiuchi (Cebalrai) in the IAU constellation Ophiuchus and is also known as the “Second Dog of the Southern Shepherd”. It is part of their asterism Desert Garden and the Goats (see above).

Second Donkey Colt:

This Latin Star “Asellus Secundus” star is Iota (ι) Boötis in the IAU constellation Boötes and is part of their asterism Donkey Colts (see above). Compare this to the Arabic asterism Whelps of the Hyenas (see below). German astronomer Johann Bayer (1572-1625) listed it under this name. The IAU approved the name Asellus Secundus for Iota (ι) Boötis.

Second Eastern General:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Dongcijiang” is the star Epsilon (ε) Virginis in the IAU constellation Virgo and is part of their xing guan Supreme Palace Left Wall (see below).

This Chinese Chenzhuo xing guan “Dongcijiang” is the star Epsilon (ε) Virginis in the IAU constellation Virgo. It is part of the Supreme Palace Left Wall.

Second Eastern Premier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Dongcixiang” is the star Delta (δ) Virginis in the IAU constellation Virgo and is part of their xing guan Supreme Palace Left Wall (see below).

This Chinese Chenzhuo xing guan “Dongcixiang” is the star Delta (δ) Virginis in the IAU constellation Virgo. It is part of the Supreme Palace Left Wall.

Second Frog:

This Arabic star “aḍ-Ḍifdaʿ ath-Thānī” (الضّفدع الثاني) or “Al Ḍifdiʿ al Thānī”” is Beta (β) Ceti in the IAU constellation Cetus:

- This was later latinized to “Diphda” or “Difda”.
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists “Denebcaitoz” (Dekker 2000).
- The rete of the 14th century Spanish astrolabe NMM AST0570 lists “Denebcaitoz” (Dekker 2000).
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists “Cauda” (“tail”).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Denebcayton”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Difda’ al tháni, or the second frog”.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists “Diphda”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Deneb Kaitos”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Diphda”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Diphda” and “Deneb Kaitos Jenubi” for this star, but his 14th edition (1959) only lists “Diphda” for this star.
- R. H. Allen lists “Deneb Kaitos” and “Difda” in his *Star Names* in 1963.
- The IAU approved the name Diphda for the star Beta (β) Ceti. NOTE: The “first frog” is Fomalhaut (see First Frog, above).

This Latin star “Rana Secunda” is Beta (β) Ceti in the IAU constellation Cetus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this name for Beta (β) Ceti, indicating that it is an Arabic name but not giving the Arabic name.

Second General:

There are four Chinese xing guans from the Three Kingdoms to the Ming Dynasty using the name "Cijiang":

- One is the star 29 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism "Wénchāng" (文昌) - see Administrative Centre, above.
- One is the star Delta (δ) Scorpii, part of their xing guan Room (see above).
- One is the star 6 Scorpii, part of their xing guan Room (see above).
- One is the star Gamma (γ) 1 Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

There are three Chenzhuo xing guans by this name:

- Cijiang" ("Second General"): Pi (π) Scorpii in the IAU constellation Scorpius, which is part of their xing guan "Room", and
- "Cixiang" (Second General"): Delta (δ) Scorpii in the IAU constellation Scorpius which is part of their xing guan "Room",
- "Cijiang" is the star Tau (τ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan "Administrative Centre".

Second Giedi:

This Latin star "Secunda Giedi" is Alpha (α) 2 Capricorni (Algedi) in the IAU constellation Capricornus:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Secun. Giedi".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Secunda Giedi".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Secunda Giedi" for this star.
- Compare this to Goat, above.

Second Horn of the Goat:

This Arabic star "Qarn al-jadi al-thāni" is Alpha (α) Capricorni (Algedi) in the IAU constellation Capricornus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Second Horse:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is a curving line of stars made up of stars of the IAU constellation Cygnus: HIP 102635, 60 Cygni, HIP 103736, 101756, and 100515A.

This Arabic asterism "Al Faras al Thānī" ("second horse") is the IAU constellation Equuleus. The idea is that Equuleus is the second horse as it is a smaller constellation than Pegasus. Having two "horse" constellations side by side in the sky, Pegasus and Equuleus, leads to some confusion. The Latin adjective "Secundus" was often applied in the past to Pegasus to differentiate it from Equuleus, this referring to the fact that Equuleus would rise before Pegasus.

- German astronomer Johann Bayer (1572-1625) called it "Equus Posterior" for this reason, but also lists "Equus Major" and "Equus Posterior".

- John Hill lists it as “Alpharos” in his *Urania* in 1754 and lists it as a name of Pegasus and goes on to claim that the Arabs called this constellation “Alpharas Adam” so that it would “not be confounded with Equuleus”. To further add to the confusion, Hill later lists “Kita Al Phoras” as a name for Equuleus, translating this as “part of a horse”, which of course is what the Arabic name Surrat al-Faras means, although as noted in my entry regarding Pegasus earlier, you can see that his constellation was also frequently listed as half of a horse. Then later still Hill lists “Pharas” as a name for Equuleus, claiming it is a version of “Al Pharas” or “Al Acuval” and translating this as “foremost horse”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al faras al tháni, the second horse” and goes on to say that this is now a name for just Alpha (α) Equulei (Kitalpha).
- Second Horse is listed as an alternate name in R. H. Allen’s *Star Names* in 1899.

NOTE: The Arabic asterism “(Surrat) al-Faras” (see Navel of the Mare, above) is latinized into variations of “Alpheratz” as is this one.

Second Ibex:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. This is made up of stars of the IAU constellation Cygnus:

- The “body” is an irregular shape starting at a “nose” at Upsilon (υ) Cygni, running to the top of the “head” at 72 Cygni, then down the “back” through HIP 105229 and 68 Cygni to a “back foot” at 55 Cygni, then across a “belly” through Xi (ξ) and Nu (ν) Cygni, and HIP 103894 to the “neck” at HIP 105269, then back to Upsilon (υ) Cygni,
- The “front leg” runs from HIP 103894 to Lambda (λ) Cygni, and
- The “horns” run from 72 Cygni through 74 Cygni to 75 Cygni.

Second Imperial Guard:

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty with the name “Shaowei”

- One is the stars Rho (ρ) 1 and 2 Cephei in the IAU constellation Cepheus and is part of their xing guan Purple Forbidden Left Wall (see above).
- One is the star HIP 24254 in the IAU constellation Camelopardalis and is part of their xing guan Purple Forbidden Right Wall (see above).

Second Imperial Minister:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaocheng” is the star HIP 6522 in the IAU constellation Cepheus and is part of their xing guan Purple Forbidden Left Wall (see above).

Second in the Forearm:

This Arab star “Al Thānī al Dhirāʿ” is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899.

Second Leap of a Gazelle:

This Arabic asterism “al-Qafzat uth-Thāniyah” (لقفزة الثّانية) or “Al Fiḳrah al Thānia” is the stars Lambda (λ) and Mu (μ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Leaps of a Gazelle:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al thaniyah" as the second leap.
- R. H. Allen lists the name as "Al Ḳafzah al thānīyah" in his *Star Names* in 1899.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "el Phekrah": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

Second of Luck of Lucks:

This Persian star "thānī sa'd al-su'ūd" (ثاني سعد السعود–), later latinized to "Thanih Saad al Saaoud", is Xi (ξ) Aquarii in the IAU constellation Aquarius as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 and was part of their asterism Auspice of Auspices (see above).

Second of the Aṣāḍhā:

This Vedic nakshatra (lunar mansion) "Uttara Ashadha" or "Uttara Aṣāḍhā" (translated as "second of the Ashadha" or "Later Victory", is a line of two stars in the IAU constellation Sagittarius: Zeta (ζ) and Sigma (σ) Sagittarii. Ivanković (2021) lists it as "Ūttarā Asādhā" from the *Rig-Veda* and "Úttarāh" from the *Taittirīya Brāhmana*, translates this as "former invincible", and relates it to the Visve devas or Visvedevas, which is all the Gods together. sons of Dharma, representing the laws of time and karma. In 2019 Leitz lists this as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies this as "the star Sagitarrii": Of course, Sagitarii is a suffix which could be applied to any star in Sagittarius. Leitz also writes that the maharshi Parasara listed the stars Tau (τ), Sigma (σ), Phi (ϕ), and Zeta (ζ) Sagitarii, while the *Brhad Samhita* and *Atharvaveda Parisistha* list eight stars. W. Brennand lists this as "Uttarashadha" in his *Hindu Astronomy* and translates this as "the tooth of a wanton elephant, near which is the kernel of the sringataca nut". Bhagwath (2019) lists its symbols as either an elephant's tusk or a small bed.

This Myanmar nekkhat (lunar mansion) "Ottara Than" (ဥတ္တရာသင်္ဃ) is a line of two stars in the IAU constellation Sagittarius: Zeta (ζ) and Sigma (σ) Sagittarii.

This Tibetan gyukar (lunar house) "Chu Smad" or "Chume" is a line of two stars in the IAU constellation Sagittarius: Zeta (ζ) and Sigma (σ) Sagittarii (Johnson-Groh 2013).

Second of the Blessed Feet:

This Vedic nakshatra (lunar mansion) "Uttara Bhadrapada" or "Uttarabhadra" also known as "Uttṛṭṭāti" (उत्तरभाद्रपदा) is a line of two stars in the IAU constellations Andromeda and Pegasus: Gamma (γ) Pegasi and Alpha (α) Andromedae (Alpheratz). It is translated as "second of the blessed feet", "later happy feet", or "higher fortune". It is related to their deity Ahir Budhnya, Dragon of the Deep. Ivanković (2021) lists the older name "Úttarā Prósthapadā" (see Latter Foot Stool, above). In 2019 Leitz lists "Uttara Bhadrapada" as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies this as "the star Andromedae": Of course, Andromedae is a suffix which could be applied to any star in Andromeda. W. Brennand lists this as "Uttarabhadrapada" in his *Hindu Astronomy* in 1896 and translates this as "another couch". Bhagwath (2019) lists its symbols as twins, the back legs of a cot, or a snake in the water.

This Myanmar nekkhat (lunar mansion) "Ottara Parabaik" (ဥတ္တရာ ပုရပိုက်) is a line of two stars in the IAU constellations Andromeda and Pegasus: Gamma (γ) Pegasi and Alpha (α) Andromedae (Alpheratz).

This Tibetan gyukar (lunar house) “Khrum Smad” or “Trume” (Johnson-Groh 2013) is a line of two stars in the IAU constellations Andromeda and Pegasus: Gamma (γ) Pegasi and Alpha (α) Andromedae (Alpheratz).

Second of the Hyades:

This Latin star “Secunda Hyadum” is Delta (δ) Tauri in the Hyades cluster in the AIU constellation Taurus. The IAU approved the name Secunda Hyadum for the star Delta (δ) Tauri Aa in 2017.

Second of the Virgins:

This Arabic star “thaanii al-aðārii” (ثاني ألعذاري) or “al-ʿAdhāriy”, in the *Calendarium* of Al Achsasi Al Mouakket in 1650, whose name was later latinized to “Thanih al Adzari” is Omicron (o) 2 Canis Majoris in the IAU constellation Canis Major.

This Latin star “Secunda Virginum” is Omicron (o) 2 Canis Majoris in the IAU constellation Canis Major.

Second of Warida:

This Persian star “Thani al Waridah” is Delta (δ) Sagittarii in the IAU constellation Sagittarius as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 and is part of the asterism Going Ostriches (see above).

Second Prime Minister:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaozai” is the star Eta (η) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Left Wall (see above).

Second Protector:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaobi” is the star Phi (ϕ) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Left Wall (see above).

Second Reddish One:

This Vedic nakshatra (lunar mansion) “Uttara Phalgunī” is in the IAU constellation Leo and is the star Beta (β) Leonis (Denebola). It is also known as “Uthiram” and translated as “Back Feet of Marriage Bed”. It is related to their deity Aryman or Aryaman, who presides over marriages, family, and children. Leitz (2019) lists this as “Uttara Phalguni” in the *Atharveda* and on the nakshatra list of the maharshi Varahamihir. The maharshi Parasara listed the stars Beta (β) Leonis (Denebola) and 93 Leonis for this asterism, as do several other ancient texts (Leitz 2019). Ivanković (2021) lists it as “Phalgunī” and “Úttarā Phálgunī” from the Rig-Veda and “Úttare” in the *Taittirīya Brāhmana*, and relates it to the Hindu God Aryaman, a protector of horses. W. Brennand lists it as “Uttara Phalguni” in his *Hindu Astronomy* in 1896 and translates this as “another bedstead”. Bhagwath (2019) lists its symbols as four legs of a bed or a hammock. Along with their asterism Purva Phalguni (see First Reddish One, above) this is known as “Phálgunyau” (“Reddish Ones”).

This Myanmar nekkhat (lunar mansion) “Ottara Baragonni” (ဥတ္တရာ ဘရဏီဏ္ဍီ) is in the IAU constellation Leo and is the star Beta (β) Leonis (Denebola).

This Tibetan gyukar (lunar house) “Dbo” or “Wo” (Johnson-Groh 2013) is in the IAU constellation Leo and is the star Beta (β) Leonis (Denebola).

Second Son of the Sun:

This Arawak star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. The Sun had two twin sons, and this one was swallowed by the sky anaconda and became the star Antares. The other the Sun placed in a safe place in the sky as the Pleiades (see First Son of the Sun, above).

Second Spout:

This Arabic manzil "al-fargh ath-thani (الفرغ الثاني) is two stars in the IAU constellations Andromeda and Pegasus as listed by Ibn Qutayba: Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi. It is also known as the Rear Bucket Mouth or Rear Spout (al-fargh al-mu'akhar) or Last Spout (al-fargh al-akhir):

- Variations of this name include "Al Fargu", "Al Farigh al Muʾaḥḥar" ("hind spout of the water jar").
- Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283) called it "Al Farigh al Thānī ("the second spout").
- English Admiral William Henry Smyth (1788 - 1865) listed it as "Alfargu" and "Al farigh al-muäkhker, the hindmost loiterer" in his Bedford Catalogue of 1844.
- R. H. Allen lists this as "Al Fargh al Thānī" in his *Star Names* in 1899, adding that American philologist William Dwight Whitney (1827 – 1894) listed it as "Al Fargh al Mu'hir".
- NOTE: This manzil was later replaced by the asterism Back Side of the Bucket for Water Pouring (see above). It is also known as Rear Two Crossbars of the Bucket (see above) and Lower Crossbar of the Bucket (see above) and part of their asterism Two Spouts (see below).

Second Star of the Butting One:

This Arabic star "al-awwal min al-nath" is Beta (β) Arietis in the IAU constellation Aries and appears in the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).Compare to Butting (above).

Second Western General:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Xicijiang" or "Tsze Tseang" is the star Iota (ι) Leonis in the IAU constellation Leo and is part of their xing guan Supreme Palace Right Wall (see below).

This Chinese Chenzhuo xing guan "Xicijiang" is the star Iota (ι) Leonis in the IAU constellation Leo. It is part of the Supreme Palace Right Wall.

Second Western Premier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Xicixiang" is the star Theta (θ) Leonis in the IAU constellation Leo and is part of their xing guan Supreme Palace Right Wall (see below).

This Chinese Chenzhuo xing guan "Xishangxiang" is the star Theta (θ) Leonis in the IAU constellation Leo. It is part of the Supreme Palace Right Wall.

Secret Garden Cluster:

This **telescopic** asterism is the open cluster IC 4756 in the IAU constellation Serpens. It was discovered by American astronomer Solon Irving Bailey (1854 – 1931) in 1908. It is also known as the Tweedledee Cluster and Graff's Cluster or Graff 1.

Secunda Hyadum:

See Second of the Hyades, below.

Šedân Brodih:

This Chakavian asterism is the IAU constellation Ursa Major.

Sedlatschek's Rope Jumping Star:

This **telescopic** asterism "Sedlatscheks seilspringender Stern", "SsS", or "Sedlatschek's Rope Jumping Star" is in the IAU constellation Auriga. Its size is 50' X 50'. René Merting lists it on the *Faint Fuzzies* website and describes it as "a filigree elongated arc of stars around Theta [θ] Aurigae." Size 50' X 50'.

Seed:

This Korean asterism "Ssias" (씨앗) is in the IAU constellation Delphinus. A quadrilateral of stars represents the "seed": Eta (η), Epsilon (ε), Kappa (κ), and Iota (ι) Delphini. A line out from Eta (η) to 17 Delphini represents the "sprout".

Seed Basket:

This Gond asterism "Topli" is stars of the IAU constellation Canis Major (Vahia 2014).

Seed Like Sparkles:

This Diné asterism "Dilyéhé" is the Pleiades cluster in the IAU constellation Taurus (Childrey 2008). It is a time keeping asterism for the Diné, who have a saying: "Don't let Dilyéhé see you plant your seeds." The Pleiades disappear in early May and reappear in late June or early July, and this indicates the time to plant seeds. Other Diné stories tell of seven mischievous young boys who follow the ones who plant too late and snatch their seeds out of the ground.

Seed Sowing Instrument:

This Kolam asterism "Tipan", "Tivpate", or "Trivpate" is the IAU constellation Orion (Vahia 2014).

This Gond asterism "Tipan" is the Belt of Orion in the IAU constellation Orion (Vahia 2014) and part of their asterism "Naagardai" (see Plough, above).

Seedling:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is in the IAU constellation Pegasus ½ a degree from the star 8 Pegasi. A chevron of 9th magnitude stars forms the roots, and the base of the stem is the star HIP 107184 with a cloud of stars next to it to the southeast the branches. Size 15'. John Raymond calls this asterism "Eniph" and Jeffrey Corder lists it as Corder 4491..

Seeds:

This Zuni asterism is the Pleiades cluster in the IAU constellation Taurus.

This Dogon asterism is three stars from the IAU constellation Canis Major: Alpha (α) Canis Majoris (Sirius), Theta (θ) Canis Majoris, and Beta (β) Canis Majoris (Mirzam). One of these (although we're not certain which one) is called "Po Tolo" ("deep beginning"). These and five other stars in this constellation were considered to be "seeds" scattered in the sky by their creator God, Amma.

Seeming of Draco:

This **telescopic** asterism "Dócon Dracónis" is galaxy PGC 39975 (Mrk 205) in the IAU constellation Draco. It was discovered by Cuno Hoffmeister in 1929 but originally thought to be a variable star. John Schmitt identified it as a radio source in 1968. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 4319 seems to embrace the quasar MRK 205 but the two objects are actually widely separated."

Segin:

This star is Epsilon (ε) Cassiopeiae in the IAU constellation Cassiopeia. It is a corruption of the name Seginus, the name for Gamma (γ) Boötis, which is itself of uncertain origin. The IAU approved the name Segin for Epsilon (ε) Cassiopeiae in 2016.

Seginus:

This star is Gamma (γ) Boötis in the IAU constellation Boötes. The name "Ceginus", "Theguius", "Teginus", or "Seginus" are believed to be Latin mistranslations of an Arabic rendering of the name of the constellation Boötes in the *Almagest*.

- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists it as "Seguin".
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists it as "Teginus".
- The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Teginus".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Seginus".
- The IAU approved the name Seginus for the star Gamma (γ) Boötis Aa in 2016. Compare this to Ceginus (above) which is the star Phi (ϕ) Boötis and Segin (above) which is Epsilon (ε) Cassiopeiae.

Segment of Perseus:

This asterism is a chain of stars in the IAU constellation Perseus: Eta (η) Persei, Gamma (γ) Persei, Alpha (α) Persei (Algol), Delta (δ) Persei, Epsilon (ε) Persei, and Zeta (ζ) Persei. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists the "Segment of Perseus" asterism and describes it as "several stars arranged in a line curving toward Ursa Major" and includes the star Alpha (α) Persei (Algenib). R. H. Allen lists this asterism in his *Star Names* in 1899 but does not identify the source.

Segner's Wheel:

This **telescopic** asterism PGC 52283 (Arp 241) is an interacting galaxy in the IAU constellation Boötes. It is called this because it resembles a Segner Wheel, a type of water turbine invented by Johann Andreas Segner in the 18th century.

Seizer:

This Khorasmian asterism "Dharind" is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by R. H. Allen in his *Star Names* in 1899.

Sekhmet:

This Egyptian star is Delta (δ) Leonis in the IAU constellation Leo as listed in the 19th dynasty Cairo Calendar (Hardy 2003). Sekhmet was a Goddess of destruction, healing, and winds: She is depicted with a lion's head.

Sekopa Morokotšo:

This Tswana morning star is currently unidentified (Alcock 2014).

Selemela se setona:

This Tlôkwa star is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus. The meaning of the name is uncertain but has to do with digging or ploughing (compare this to Digging stars, above).

Self Mover:

This Vedic star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. This is also their nakshatra (lunar mansion) "Very Good" (see below).

Selkis:

This ancient Egyptian asterism is made up of the stars of the IAU constellations Virgo, Leo, and Libra:

- The "body" is a quadrilateral of four stars: Alpha (α) Virginis (Spica), Zeta (ζ) Virginis, Delta (δ) Virginis, and Gamma (γ) Virginis,
- One "foot" is 9 Librae, the other being the star 109 Virginis,
- One "hand" is the star Epsilon (ε) Virginis, and
- The other "arm" runs from Gamma (γ) Virginis to an "elbow" at 91 Leonis, then on through Sigma (σ) Leonis to a "hand" at Nu (ν) Virginis.

Selkis, Selket, Serqet, or Serkis was a funerary Goddess first mentioned in the First Dynasty (c. 3150 – 2890 B.C.E.) and best known from a golden statue from the tomb of Tutankhamun. Compare this to Serket (see below).

Semi-Circle:

There are four **telescopic** "semi-circle" asterisms:

- One is Vastagh 14, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 22.5'. Vastagh describes it as "A semicircular [asterism] in the neighborhood of NGC7795. The semicircle is formed by 7 bright stars. In the center, stars fainter than 10.7 mag are grouped. The semicircle and the group of dim members are 10.2 and it is connected by 10.6 core individuals. The total number of members is 18. I find this formation interesting because of its duality and particularly regular shape."
- One is open cluster Collinder 21 in the IAU constellation Triangulum and is listed by René Merting on Robert Zebahl's *Faint Fuzzies* website. Its size is 6' X 6'.
- One is Elosser 1 in the IAU constellation Orion, halfway between the stars Pi (π) 2 and 3 Orionis. It consists of thirteen stars hooked around a golden 9th magnitude star. It is part of a list by American amateur astronomer David Elosser from North Carolina. René Merting lists it on Robert Zebahl's *Faint Fuzzies* website and notes that it looks like an "old fashioned rocket ship" (see Rocket Ship, above).

- One is Simonic 8 from the list of Hungarian astronomer Ilona Simon Mogyorósi, which is in the IAU constellation Eridanus. This is Ennis 13 listed by Canadian astronomer Charles Ennis.

Semtet:

This Egyptian decan "Semtet" was in the IAU constellation Capricornus. In later Hellenistic texts it was named "ϲϺϪΤ" ("Smat"). In the Testament of Solomon, it became "Hapax" or "Harpax", Aristobulus of Paneas (2nd century B.C.E.) called it "Eracto", in Greek Hermeticism it became "Tair", in Latin Hermeticism "Renpsois", 4th century Roman astrologer Julius Firmicus Maternus called it "Themeso", Cosmas of Maiuma (d. 760) called it "Asklepios", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Themeso" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ϲϢΔϪ" ("Soda"). This has been depicted as a headless man with a scarab-shell girdle with a flask in his right hand and a scepter in his left.

Send Armed Forces to Suppress (Vassal of Three Stars):

This Chinese asterism "Fá" (伐(附参宿)) is the IAU constellation Orion. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Senior Judge:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Sili" is Theta (θ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism "Wénchāng" (文昌) - see Administrative Centre, above.

Separate:

This Kiribati star "Kamaranga" is currently unidentified (Trussel and Groves 1978).

Septet:

This Egyptian decan "Septet" was in the IAU constellation Cancer. In later Hellenistic texts it was named "ϲϢϴIϹ" ("Sopdet"). In the Testament of Solomon, it became "Metathiax", Aristobulus of Paneas (2nd century B.C.E.) called it "Panem", in Greek Hermeticism it became "Sotheir", in Latin Hermeticism "Seneptois", 4th century Roman astrologer Julius Firmicus Maternus called it "Sothis" or "Socius", Cosmas of Maiuma (d. 760) called it "Nike", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Sothis" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ΔΠΟΛΛΟΥΝ" ("Apollun"). It has been depicted as a man with a dog's head and serpent's body seated on a pedestal. Compare this to Sothis, below.

Sepulchre:

See Christ's Tomb, above.

Sergeant's Stripes:

This **telescopic** asterism is the open cluster Messier 93 in the IAU constellation Puppis. It was discovered by French astronomer Charles Messier in 1781. It was independently discovered by English astronomer Caroline Herschel two years later. It is listed in the 1864 General Catalogue as GC 1571 and in John Herschel's catalogue as h 3098. It was given this name by American astronomer Wayne Schmidt.

Serikoai:

This Carib asterism is the IAU constellation Orion (Magaña, and Jara, 1982). Wawaiya is the wife of Serikoai. Wawaiya ran off with a tapir. Serikoia chased them caught the tapir and ate all of it except its head. Wawaiya and the tapir's head (the Hyades) ran up into the sky where Serikoai chases them.

Serious Snake:

This Latin asterism "Coluber Furiosus" is the IAU constellation Hydra. Johann Bayer's *Uranometria* (1603) lists "Coluber Furiosus".

Serket:

This ancient Egyptian asterism is made up of stars of the IAU constellation Virgo. Serket (Serqet, Selket, Selqet or Selcis) is a Goddess of fertility, animals, and medicine. It is believed that she originated in a deification of the scorpion, as she was believed to be a healer of venomous stings and is usually depicted as a woman with a scorpion on her crown. The earliest known example is on a sky map on the ceiling of the tomb of Senmut, adviser of Hatschepsut, in Thebes. Compare this to Selkis (see above).

Serpens:

The brightest stars of Serpens are 2nd magnitude, and the stars of this constellation show up in 116 asterisms in this handbook.

This IAU constellation "the Serpent" (IAU abbreviation Ser), the serpent, was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and became one of Ptolemy's 48 original constellations "Ὄφις" ("Ófis" - see Snake, below) or "Ερπετόν" ("Erpetón" or "serpent") in the 2nd century, though it was originally considered part of Ophiuchus and called "Ὄφις Ὀφιοῦχου" ("Ófis Ofioúchou"). Greek mythology identifies this as the snake of the healer Asclepius. The Roman general Germanicus (15 B.C.E. – 19 C.E.) first called it "Serpentarius", and this later became "Serpentum", "Serpentiger", "Serpentinarius", and "Serpens". This constellation has been called the "Serpent of Aesculapius", "Caesius", "Glaucus", "Laocoön", and "Ophiuchus". It has been described as "Serpens Herculeus", "Serpens Lernaeus", and "Serpens Sagarinus".

Serpens is unique amongst IAU constellations in that it is split into two non-contiguous parts:

- Serpens Caput ("serpent head"): This is the western portion.
- Serpens Cauda ("serpent tail"): This is the eastern portion.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a nude male striding to our left holding a snake in front of him with the snake's head to the his right (our left).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Serpentarius as a nude male facing away from us, looking over his left shoulder, holding a snake which winds around his waist.

The globe of the 2nd century Farnese Atlas depicts Serpens as a snake being held by "Serpentarius" (Stevenson 1921).

The *Revised Aratus Latinus* (8th century) lists "Serpentarius" as the IAU constellations Serpens and Scorpio. The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Serpentarius" and "qui Graece Ophiuchus vocatur" ('which the Greeks call Ophiuchus" as holding Serpens.

Kauffmann's translation of the *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in 1888 lists "qui Graece Ophiuchus vocatur" ("who in Greek is called Ophiuchus") and "quem Hydrum nominant" ("whom they call Hydra"). The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Serpentarius nude as seen from the rear with Serpens facing away from him. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Serpentarius facing us, holding a snake in front of him. The Austin, TX, Ransom Ms 29, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Serpens facing Serpentarius, but the Paris BN n.a. 1614 manuscript does not. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Serpentarius nude walking to the left, looking backwards over his shoulder, holding Serpens so that its body is horizontal.

This constellation appears in the Leiden *Aratea* (816) as "Serpens" and is a depicted as a snake being held by a nude male viewed from the rear.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Serpens as a serpent being held by Ophiuchus. On one page its head is to the right, and on the other it is to the left. The serpent runs behind the back of Ophiuchus and has two coils.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Serpentarius" and "Asclepius" for this constellation. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict him holding the snake under his left arm and standing on Scorpius. The Germanicus text in Aberyswyth 735C and in the Hyginus text in Leiden 8° 15 manuscripts of *De signis caeli* depict the snake making an "X" across the body of Serpentarius.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Serpentarius facing forward.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Serpens as a serpent with two coils that is being held in front of Ophiuchus.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Serpens Caput as a snake with its jaws wide with one knot in its length.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Serpens as a serpent with two coils being held behind the back of Ophiuchus.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Serpens as a snake wound around the wrists and middle of Ophiuchus.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Serpens as a snake wrapped around the wrists and waist of Ophiuchus.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Serpens as a serpent with two coils that is tied around the waist of Ophiuchus. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Serpens as a serpent coiled around the waist of Ophiuchus, its head on our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Serpens” as a serpent with four coils being held by “Serpentarius”:

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Serpens as a snake being held in front of Ophiuchus and running between his legs. It is not labelled.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts Serpens as a serpent wound around the arms and knotted about the waist of Ophiuchus, its head to our left. It is not labelled.

The 1515 edition of the *Almagest* and 1521 edition of the *Alfonsine Tables* listed it as “Serpens Alangue”.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Serpens” as a serpent with five coils being held by “Serpentarius”.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Serpe d’Esculapio” (“Of the Serpent of Aesculapius”). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Serpent of the Serpent Carrier”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Serpens as a serpent wound around the arms and knotted around the waist of Ophiuchus, its head to our left.

Jesuit German mathematician Christopher Clavius (1538 – 1612) Lists this constellation as “Serpens Ophiuchi” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Serpens Ophiuci” as a snake with pointed ears and sharp teeth with one coil: Elsewhere he depicts Ophiuchus holding a serpent, but only the serpent’s straight body is seen as its head and tail are out of view.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a serpent being held in front of Ophiuchus. The label is unintelligible.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Serpens” as a serpent coiling around the arms and waist of Ophiuchus, its head to our left.

German uranographer Johann Bayer (1572 – 1625) depicts it in his *Uranometria* in 1603 as a Serpent on its own but elsewhere shows it as part of Ophiuchus.

Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Serpentarius” as a name for Ophiuchus and “Serpens Ophiuchi” for Serpens.

Johann Bayer’s *Uranometria* (1603) lists “Serpens” as an alternate name for Draco.

The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Serpentarius” as an alternate name for Ophiuchus.

German astronomer Johann Bayer (1572-1625) lists both Serpens with Ophiuchus on one chart and Serpens alone on another in his *Uranometria* in 1603.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Serpens" as a serpent being held by Ophiuchus.

"Serpens" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a serpent being held by Ophiuchus.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Orphiuchi Serpiente", "Serpentario" and "Orphicus" and depicts it separately from the serpent bearer Ophiuchus, as a serpent with a single loop.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Serpens Ophiuchi" for this constellation.

"Serpens" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a serpent being held by "Serpentarius".

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts only the upper half of Ophiuchus and parts of Serpens, including its head, above the edge of this dome.

Robert Hues lists it as "the serpent" and "Serpentarius" in his *Learned Treatise on Globes* in 1659.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Serpentarius" and "Ophiuchus" and is depicted as a nude male holding a serpent in both hands which runs between his legs. The serpent is labelled "Serpens Ophiuchi".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Serpens as a serpent coiled around the waist of Ophiuchus.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Serpens" as a serpent being held by Serpentarius.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Serpens" as a serpent being held by Serpentarius.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Serpens" as a serpent with a arrow point tongue and floppy ears being held in front of Serpentarius.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Serpent", "Serpens", and "Ερπετόν" and depicts it as a dragon headed serpent with two coils being held by Ophiuchus.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Serpens as a serpent being held by Ophiuchus (that he labels Serpentarius) that is wound around his waist.

Serpens is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Serpens” as a serpent being held by Ophiuchus. It shows him having two coils.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Serpens Ophiuchi” as a snake being held by “Serpentarius”: This snake is facing to our right.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Serpens as a serpent being held in front of Ophiuchus (which he labels “Serpentarius”).

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Serpens as a serpent being held in front of Ophiuchus.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Serpent” as a serpent being held by Ophiuchus.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Serpens as a serpent being held by Ophiuchus.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Le Serpent” as a snake being held by “Le Serpentaire”.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Kopf und Hals der Schlange“.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Serpente” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Serpens as a serpent being held by Ophiuchus.

In John Hill’s *Urania* in 1754 this constellation is listed as “Serpentary” and “Serpentarius”, which were both commonly used names in his day.

The French edition of Flamsteed’s work, the *Atlas Céleste,* which was revised in 1778, lists “le Serpentaire”. He is depicted as a bearded male holding a snake with both hands. The snake runs between his legs.

American uranographer William Croswell (1760 – 1834) depicts “Serpens the Serpent” on his *Mercator Map of the Starry Heavens* in 1810 as a serpent being held by Ophiuchus, running between the legs of Ophiuchus.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Ophiuchus vel Serpentarius” for Ophiuchus and Serpens for just the snake his *Celestial Atlas* in 1822. This is depicted as an older balding bearded man in a toga holding a snake in his hands which passes between his legs. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts it the same way, but lists “Serpens” and “Ophiuchus” separately.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Schlange”. Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Schlange” and depicts it as a snake being held by Ophiuchus.

"Serpens" is listed in in two parts either side of Ophiuchus in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875)

"Serpens" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a snake being held in front of Ophiuchus.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts Serpens as a four coiled serpent being held by Ophiuchus, but does not label it.

Serpentarius is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. It is depicted as a bald bearded man in a toga with the snake passing between his legs.

"Serpens" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a serpent being held by Ophiuchus, with its head to our right.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Serpens, The Serpent" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as one: "Ophiuchus et Serpens, the Serpent-bearer and the Serpent".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Serpens" in his *Star Atlas* (1893) and describes it as "The Serpent".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Serpens" and describes it as a "Serpent".

Serpens is depicted on standard IAU charts in two parts:

- The "head" is a triangle of the stars Beta (β) Serpentis (Chow), Gamma (γ) Serpentis, and Kappa (κ) Serpentis, with the "front half" of the serpent running from Chow through Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (ε) Serpentis, and Omega (ω) Serpentis to Mu (μ) Serpentis,
- The "tail" is the line running from Nu (ν) Serpentis through Xi (ξ) Serpentis, Omicron (ο) Serpentis, Eta (η) Serpentis, and 4 Aquilae to Theta (θ) 1 Serpentis.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Ophiuchus and Serpentis in his book *The Stars - A New Way to See Them* (1952):

- The "head" is a triangle of the stars Beta (β) Serpentis (Chow), Gamma (γ) Serpentis, Kappa (κ) Serpentis, and Iota (ι) Serpentis,
- The front part of the serpent's "body" runs from Chow through Delta (δ) Serpentis, Lambda (λ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (ε) Serpentis, Omega (ω) Serpentis, Mu (μ) Serpentis, Delta (δ) Ophiuchi, and Epsilon (ε) Ophiuchi, to Upsilon (υ) Ophiuchi,
- The "tai" of the serpent starts at Nu (ν) Ophiuchi and runs through Xi (ξ) Serpentis, Omicron o() Serpentis, Nu (ν) Ophiuchi, Eta (η) Serpentis, Rho (ρ) Serpentis, 71 Ophiuchi, and 72 Ophiuchi to Theta (θ) 1 Serpentis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) redesigned Ophiuchus and Serpens in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*:

- Serpens' "head" is an "X" formed by the stars Rho (ρ), Iota (ι), Kappa (κ), Gamma (γ), and Beta (β) Serpentis (Nasak Shamiya).
- Serpens' "body" runs from Beta (β) Serpentis (Nasak Shamiya) through Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), and Epsilon (ε) Serpentis, to Delta (δ) Ophiuchi.

Sky and Telescope Magazine, founded in 1941, depicts in their magazine and publications like this:

- The "head" is a triangle of the stars Beta (β) Serpentis (Chow), Gamma (γ) Serpentis, Kappa (κ) Serpentis, and Iota (ι) Serpentis,
- The "body" is a line running from Chow through Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (υ) Serpentis, Omega (ω) Serpentis, Mu (μ) Serpentis, Delta (δ) Ophiuchi, Epsilon (ε) Ophiuchi, Zeta (ζ) Ophiuchi, Eta (η) Ophiuchi, Xi (ξ) Serpentis, Nu (ν) Ophiuchi, and Eta (η) Serpentis to Theta (θ) Serpentis.

It is known as "le Serpent" in France and "il Serpente" in Italy.

Serpent:

This asterism from the Babylonian MUL.APIN tablets "Nirah", "Mush", or "MUSH" (Anthony 1996) is named for their snake God. This is the IAU constellation Hydra. Later Seleucid sky lore simply calls it "the Snake".

This Babylonian asterism "MUL.DINGIR.MUŠ" or "Mušḫuššu "was a serpent that later became the IAU constellation Hydra. It is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul mus" (Koch-Westeholz 1995).

This Persian (Achaemenid, 539 – 331 B.C.E.) asterism "mus" is the IAU constellation Hydra (Weidner 1971).

This Euphratian asterism "Nu-tsir-da" is the IAU constellation Serpens as listed in R. H. Allen's *Star Names* in 1899. Allen translates this as "image of the serpent".

This Arabic asterism "al-ḥayya", later latinized to "Al Hayya" and "Al Hayyah", is the stars Alpha (α) Draconis (Thuban), Kappa (κ) Draconis, Lambda (λ) Draconis, and 10 Draconis in the IAU constellation Draco:

- A 14th century Christian Spanish astrolabe #4560 lists "al hayya" (King 2002).
- Italian astronomer Giovanni Batista Riccioli (1598 – 1671) lists it as "El Havic".
- John Hill lists "Haiya", "Al Hayro" "Haijer", and "Hawitz" as Arabic names of the entire constellation Draco in his *Urania* in 1754.
- In his *Star Names* in 1899, R. H. Allen writes that later translations of this Arabic name appeared as a name for the entire constellation.

There are two Egyptian asterisms with the name "Ophis" that are paranatellonta of Gemini as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k);

- One (rising in the morning) Mosenkis describes as "Lynx or Eridanus".

- One (rising in the evening) Mosenkis describes as “Serpens or Lacerta”.

This Hebrew asterism “Hajah” is the IAU constellation Draco as listed by John Hill in his *Urania* in 1745.

This Vedic asterism “Sarpa” is the stars Delta (δ), Epsilon (ε), Eta (η), Rho (ρ), and Sigma (σ) Hydrae in the IAU constellation Hydra (Ivanković 2021). It is also known as “Āślēṣā” (see Embracer, above).

This asterism “Aphaak” is the IAU constellation Draco as listed in John Hill’s *Urania* in 1754: HIll describes this as “one of the Arabic names… that signifies a serpent” which is not the case.

This Greek asterism “Ophis” is the IAU constellation Serpens as listed in John Hill’s *Urania* in 1754. NOTE: A serpent appears next to the Greek asterism Twins (see below) in the Daressy Zodiac of the Roman Imperial Period.

This Belarussian asterism “Zmej” is made up of stars of the IAU constellation Draco and the star Alpha (α) Ursa Minoris (Polaris- Avilin 2009).

This Romanian asterism “şarpe” or “Şarpele” is a combination of the IAU constellations Serpens and Ophiuchus (Ottescu 2009, Lite, Lodina, and Ignat 2018): They’ve combined the two to create this large asterism.

There are two Inca asterisms with the name “Mach’aqway”, “Mach’acuay”, or “Machacuay” (Brosseder 2010, Urton 2022):

- One from Misminay and Sonqo is the dark nebulosity between the star Epsilon (ε) Canis Majoris (Adhara) in the IAU constellation Canis Major and the IAU constellation Crux.
- One from Yucay is the “tail” of the IAU constellation Scorpius: Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 2, Mu (μ) 2, and Epsilon (ε) Scorpii.

This Wiradjuri asterism “Wāwi” is the dark nebulosity between the IAU constellations Crux and Vela in the Milky Way. Wāwi is a magical serpent who lives in deep waterholes.

This **telescopic** asterism is in the IAU constellation Cepheus and is Corder 693 on the observing list of American astronomer Jeffrey Corder. Size 25’. This is a winding line of stars starting at HIP 20982 and running through the double star HIP 20860A, HIP 10629, HIP 22166, HIP 23010, and HIP 23206, then turning and ending at a 7.70 magnitude star.

Serpent Bearer:

This Hebrew asterism “Utzerath Hajah” is the IAU constellation Serpens as listed in John Hill’s *Urania* in 1754.

This German asterism “Schlangenträger” is the IAU constellation Ophiuchus.

This Latin asterism “Serpentis Lator” (“serpent bearer”) is the IAU constellation Ophiuchus. Johann Bayer’s *Uranometria* (1603) lists “Serpentis lator” as an alternate name for Ophiuchus. The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Anuitenens”, “Anguiger” and “Serpentis Lator” (“the serpent’s bearer”) as alternate names for Ophiuchus.

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Serpentis Lator”.

Serpent between the two Arcturus:

"Serpens Inter Ambas Arcturos" is the IAU constellation Draco as described in several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) of the *Revised Aratus Latinus* (8th century). This is a reference to it being between Arcturus Major (Ursa Major, see Arcturus Major, above), and Arcturus Minor (Ursa Minor, see Arcturus Minor, above). The snake is depicted as having three curves.

Serpent Bitten:

This Khorasmian asterism "Markhashik" is the stars Theta (θ) and Xi (ξ) Ophiuchi in the IAU constellation Ophiuchus. It is identified by this name in Richard H. Allen's *Star Names* in 1899.

Serpent Changing to the Condor:

"Amaru Contor" is a Quechua name for the IAU constellation Scorpius (Urton 1981) from Chumbiyilcas.

Serpent Defender:

This Latin asterism "Serpentis Praeses" is the IAU constellation Ophiuchus.

Serpent Frame:

This Moche asterism is the IAU constellation Orion. The star Epsilon (ε) Orionis (Alnilam) is a thief, and the stars to either side, Zeta (ζ) Orionis (Alnitak) and Delta (δ) Orionis (Mintaka) are the people holding him and the other stars of the constellation are vultures attacking him.

Serpent Lisi:

This Chaldean asterism "mul mus mul li.si" from the Great Star List (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Hydra (Koch-Westenholz 1995). Compare this to the Akkadian asterism Lion's Heart (see above) and Seleucid asterism Scorpion's Heart (see above).

Serpent on the Tree:

This Egyptian asterism "Serpent on the Tree which was hunted by Heracles" is one of the paranatellonta of decans of Gemini as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Serpens.

Serpent Tailed of Ophiuchus:

This **telescopic** asterism "Ophiúra Ophiúchi" is the intermediate barred spiral galaxy NGC 6384 in the IAU constellation Ophiuchus. It was discovered by Albert Marth in 1863. It became GC 4306 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "it has many thin curved arms, like serpent tails".

Serpent Tamer:

This Persian asterism "Garafsa" is the stars Zeta (ζ), Eta (η), Theta (θ), and Xi (ξ) Ophiuchi in the IAU constellation Ophiuchus as listed in R. H. Allen's *Star Names* in 1899. The name "Garafsa" is also used for Theta (θ) Ophiuchi alone.

Serpentine Chain:

This **telescopic** asterism Kernya 86 was listed by Hungarian astronomer Gábor János Kernya in 2016 and is a line of stars in the IAU constellation Cepheus. Kernya describes this "small asterism" as being "at the base of Sharpless 130".

Serpentine Column:

This **telescopic** asterism, also known as the "Orion Belt Cluster" is open cluster Collinder 70 in the IAU constellation Orion. This is an S curve of stars between Epsilon (ε) Orionis and Delta (δ) Orionis.

Serpent's Tail:

This **telescopic** asterism is in the IAU constellation Scorpius and is on the observing lists of John A. Chiravalle. Jeffrey Corder lists it as Corder 3152. Size 45'. This includes the stars HIP 82598, 82731, 82792, and 82848.

Sérsic Cluster:

This **telescopic** asterism is globular cluster is ESO 118-31 in the IAU constellation Reticulum. It is named after Argentine astronomer José Luis Sérsic (1933 – 1993), who created Sérsic's law, a function describing how the intensity of a galaxy varies with distance. It is also known as the Reticulum Cluster or Reticulum Dwarf Galaxy.

Sert:

This Egyptian decan "Sert" was in the IAU constellation Capricornus. In later Hellenistic texts it was named "ϲρω" ("Si-rat"). In the Testament of Solomon, it became "Physikoreth" or "Alleborith", Aristobulus of Paneas (2nd century B. C.E.) called it "Seros", in Greek Hermeticism it became "Epichnaus", in Latin Hermeticism "Marcois", 4th century Roman astrologer Julius Firmicus Maternus called it "Omot", Cosmas of Maiuma (d. 760) called it "Tolma", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Homoth" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ʜoɴoγϕϳ" ("Monuphta").

Servant Cooking:

This is an alternate name for the Pawnee asterism Errand Man (see above) and is part of their asterism Council of Chiefs.

Servant of Ursa Major:

This **telescopic** asterism "Famulus Úrsae Majóris" is the dwarf galaxy UGC 5336 in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "as a dwarf companion of NGC 3031… this galaxy can deservedly be considered a servant of its big neighbour."

Servants:

This German star is Gamma (γ) Arietis in the IAU constellation Aries:

- This star originally shared the name "Al-Šarṭain" with the star Beta (β) Arietis (Sheratan- see Two Signs, below), but the name got corrupted in Medieval manuscripts to "Sartai", which German astronomer Johann Bayer (1572-1625) assumed was a corruption of the Hebrew term "מְשָׁרְתִים" ("m^{e}shār^{e}thīm") and later astronomers adopted this name "Mesarthim" or "Mesartim".
- German poet Philipp von Zesen (1619 – 1689) gave the name "Scartai", a corruption of Sartai.

- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Mesarthim".
- Scottish uranographer Alexander Jamieson (1782 – 1850) listed "Mesarthim" it in his *Celestial Atlas* in 1822.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Mesarthim" s does Bode's *Vorstellung Der Gestirne* (1782).
- English astronomer William Henry Smyth (1788 - 1865) listed the name as "Mesartun".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sartai, a corruption of Al Sharataïn" and "Mesartim".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list "Mesarthim".
- "Mesarthim" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Mesartim".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Mesarthim".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Mesarthim" and "Mesartim" for this star, but his 14th edition (1959) only lists "Mesarthim" for this star.
- The IAU has approved the name Mesarthim for the star Gamma (γ) 1 Arietis A.

Serving Antinoum:

This Latin asterism "Servans Antinoüm" is the IAU constellation Aquila and relates to the obsolete constellation Antinous (see above). Johann Bayer's *Uranometria* (1603) lists "Servans Antinoum" as a name for Aquila.

Servius Sulpicius Rufus Lemonia:

This Latin asterism is the IAU constellation as listed by 1st century Roman poet Marcus Manilius, who named it after this great Roman lawyer and friend of Cicero (106 – 43 B.C.E.).

Settlement:

This Arabic star "Ḥaḍār" (حضار) is Beta (β) Centauri in the IAU constellation Centaurus:

- "Hidār" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "hadāri al-munith yatlu' qabla Suhayl min matla'ihi" is listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003). "al-munith" means "swearing of a bad oath" (Kunitzsch & Langerman 2003).
- This was later latinized to "Hadar".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Hadar" for this star.
- The IAU approved the name Hadar for the star Beta (β) Centauri Aa.

Seulainer:

This Teutonic asterism is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Seven:

This Hawaiian asterism "Na Hiku" ('the seven") is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). The full name is actually "Na Hiku-ka-Huihui-a-Makalii" ("the cluster of the seven of Makalii"). The Hawaiians gave each of the seven stars a number:

- "Hiku-kahi" ("Seven-one"): Dubhe
- "Hiku-['a]lua" ("Seven-two"): Merak
- "Hiku-kolu" ("Seven-three"): Phad
- "Hiku-[a]ha" ("Seven-four"): Megrez
- "Hiku-lima" ("Seven-five"): Alioth
- "Hiku-ono" ("Seven-six"): Mizar, and
- "Hiku-pau" ("Seven-finished"): Alkaid.

This Shona asterism "Chinyamunomwe" is the Pleiades cluster in the IAU constellation Taurus.

This Babylonian asterism "d.BI" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the Pleiades cluster in the IAU constellation Taurus.

This Akkadian asterism "Sebetti" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period is the Pleaides cluster in the IAU constellation Taurus (Parpola 1993, Belmonte Esteve 2018).

This Bedouin asterism "al-Sibbaʿ" (السبَّع) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Hungarian asterism "Heteveny" is the Pleiades cluster in the IAU constellation Taurus.

This Finnish asterism "Het'e wāʻne" is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

This Kazakh asterism "Zhetigen" is the Big Dipper asterism in the IAU constellation Ursa Major.

Seven Antelopes:

This Vedic asterism is the is the Big Dipper asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Seven Arrows in the Sky:

This telescopic asterism is an arc of stars in the vicinity of Flamsteed 43 about 1.3 degrees west of Beta (β) Ursae Majoris (Merak). The group subtends less than 0.3 degrees and includes six stars of 8^{th} – 9^{th} magnitude (including HIP 53061 and 53052), and one of 7^{th} magnitude (HIP 53036). This was reported in Chapter XIV of Pierrre Borel's 1655 book *De Vero Telescopii Inventore* ("On the True Inventor of the Telescope") as being discovered by Dutch spectacle maker Johannes Sachariassen. Borel included a woodcut of this asterism, depicting 7 stars interspersed with arrows representing the seven Dutch provinces. Johannes Sachariassen is the son of Sacharias Janssen, a man thought for two centuries to be the true inventor of the telescope.

Seven Atlantic Sisters:

This English asterism is the Pleiades cluster as listed by English poet John Milton (1608 – 1674) and by R. H. Allen in his *Star Names* in 1899. This is a reference to the Atlantides, another name for the Hesperides. English author Geoffrey Chaucer (c.1340s – 1400) called them "Atlantes Doughtres Sevene" in *House of Fame*. Compare this to Eoae Atlantides, above.

Seven Assassins:

This Chinese star "Qisha" is Mu (μ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) "Dǒuxiù" (斗宿) – see Dipper, above.

Seven Bears:

This Vedic asterism is the is the Big Dipper asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Seven Birds:

This Ininew (Cree) asterism, "Tepahkoop Pinesisuk", is the stars of the IAU constellation Corona Borealis (Buck 2016).

Seven Boys:

This Mono asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Cherokee asterism "Ani Tsutsa" is the Pleiades cluster in the IAU constellation Taurus.

Seven Brothers:

This Sardinian asterism "sos sette frades" is the Big Dipper asterism in the IAU constellation Ursa Major (Putzolu 2019).

This Shíshálh asterism is the Big Dipper asterism (see Big Dipper, above), with each star being a brother representing one of their clans. This information was obtained from Shíshálh artist ?antuni "Tony" Paul in 2019 while working on his Reconciliation Totem Pole.

There are two Japanese asterisms by this name:

- The first is the stars of the tail of Scorpius in the IAU constellation Scorpius).
- The second is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Serbian asterism "Vlašiči" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018). Each of them has a name, and these vary from region to region. The regional names of these stars include:

- Mika, Mioka, Raka, Raoka, Orisav, Borisav, and Milisav.
- Vole, Voleta, Rale, Raleta, Mile, Mileta, and Pržožak.
- Vao, Vaska, Mio, Mioka, Skarabojo, Borisav, and Biliurak.
- Mile, Mileta, Rade, Radeta, Bore, Boreta, and Prigimaz.
- Ale, Aleta, Šurko, Burko, and Mišurko

This Blackfoot, Cheyenne, Kitkiti'sh, and Apsáalooke asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). Each of the seven stars is a brother and the star 80 Ursae Majoris (Alcor) is a younger sister.

This Tsuut'ina asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). Each of the seven stars is a brother and the star 80 Ursae Majoris (Alcor) is their sister's dog.

Seven Brother's Driver:

This Sardinian star "su trubadore de sos sette frades" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Putzolu 2019).

Seven Buddhas:

This Mongolian asterism, "Doloon Burkan", is the Big Dipper asterism in the IAU constellation Ursa Major (Lagain & Rousseau 2015).

Seven Bulls:

This Vedic asterism is the is the Big Dipper asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899. Boutet (2014) notes that the Pleiades were considered seven cows (see Seven Cows, above) associated to these seven bulls.

Seven Champions of Christendom:

This Christian asterism is the IAU constellation Ursa Major. These saints are St. George, St. Andrew, St. Patrick, St. Denis, St. James Boanerges, St. Anthony the Lesser, and St. David, who are the patron saints of, respectively, England, Scotland, Ireland, France, Spain, Portugal, and Wales. This is listed in R. H. Allen's *Star Names* in 1899. Allen does not identify the source.

Seven Cousins:

This Arrernte asterism is the Pleaides cluster in the IAU constellation Taurus (Clarke 2009). It is seven female cousins. Compare this to Seven Sisters (below).

Seven Cows:

This Vedic asterism is the Pleiades cluster in the IAU constellation Taurus (Boutet 2014). It is associated with their asterism Seven Bulls (see above).

Seven Doves:

This Greek asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

This Sicilian asterism "Sette Palommielle" ("seven dovelets") of Giambattista Basile's *Pentamerone* is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

Seven Elders:

This Kazakh asterism "Zheti Qart" is the Big Dipper asterism in the IAU constellation Ursa Major.

Seven Excellencies:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of seven stars in the IAU constellations Boötes, Corona Borealis, and Hercules: Starting at the determinative star Gamma (γ) Boötis it runs through Beta (β) Boötis (Nekkar), Mu (μ) 1 Boötis, Lambda (λ) Coronae Borealis, 25 Herculis, Eta (η) Herculis, and HIP 83947.

This Chinese xing guan "Qīgōng" (七公) is a line of stars in the IAU constellation Hercules: 42, Tau (τ), Phi (ϕ), Chi (χ), Nu (ν) 1 and 2, Mu (μ) 1 and 2, and Delta (δ) Herculis.

Seven Flames:

This Portuguese asterism "Sete Flammas" is the Big Dipper asterism in the IAU constellation Ursa Major as listed by the Portuguese poet Luís de Camões (1524 – 1580).

Seven Foxes:

This Khakas asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

Seven Girls:

This Dakota/Lakota/Nakota asterism "Wicincala Salowin" is the Pleiades cluster in the IAU constellation Taurus.

Seven Girls of Bear Lodge:

This Mayan, Aztec, and Kiowa asterism is the Pleiades cluster in the IAU constellation Taurus.

Seven Goats:

This Basque asterism "Zazpi Ahuntzak" is the Little Dipper asterism in the IAU constellation Ursa Minor (Knörr 1999, Frank 2021). It is related to their asterism "Artzain" (see Shepherd, below).

This Spanish asterism (Cuzco area) "Siete Cabrillas" is the is the Pleiades cluster in the IAU constellation Taurus (Urton 1981). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 simply lists "Cabrillas".

Seven Godmothers:

This Armenian asterism "Sayl" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). They believe God turned these seven godmothers into seven stars in the sky.

Seven Gods:

This Babylonian asterism "dIMIN.BI" or "ilu sibitti" (Anthony 1996) is the Pleiades cluster in the IAU constellation Taurus.

This Seleucid asterism is the Pleiades cluster in the IAU constellation Taurus.

This Mongol asterism "Dolen Khan" is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

Seven Hermits:

This asterism "Saptar Shayar" is the IAU constellation Ursa Major as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050), quoting Indian astrologer Varāhamihira (c. 505 – c. 587). In this asterism the star Alcor is the Pious Woman (see above). Al Biruni wrote that another star, not identified, is the "Chaste Woman, Vumdhati".

Seven Houses of Your Cousins:

This Tibetan khyim (zodiac constellation) is the Pleiades cluster in the IAU constellation Taurus.

Seven Hunters:

This Carib asterism is the Pleiades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982).

Seven Husbands:

This Mono asterism is the Hyades cluster in the IAU constellation Taurus. This is associated to their asterism Six Wives (see below). These husbands are chasing their wives (the Pleiades) across the sky.

Seven Little Girls:

This Lakota asterism is the Pleiades cluster in the IAU constellation Taurus (Hollow Horn Bear 2013).

Seven Little Goats:

This Spanish and Piemontese (Chaco Region, Argentina) asterism "los siete cabritos" is the Pleiades cluster in the IAU constellation Taurus (Mudrik 2011).

This Visayan asterism is the Pleiades cluster in the IAU constellation Taurus as listed by Miguel de Loarca in 1582.

Seven Little Nanny Goats:

This asterism "las Siete Cabrillas" is the Pleiades cluster in the IAU constellation Taurus as listed by Spanish author Don Miguel de Cervantes Saavedra in *Don Quixote* in 1605.

Seven Macaw:

This K'iche' asterism "Vucub Caquix", found in some K'iche' dictionaries, is the Big Dipper is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). In the Mayan creation story, Popol Vuh, Vucub Caquix is a bird deity who climbs up a tree to proclaim himself the Sun but is shot down by Hunahpu.

Seven Marias:

This Ch'orti' and Tzotzil (Zinacanatán) asterism is the belt and sword of Orion in the IAU constellation Orion (Milbrath 1999). The belt of Orion is known to them as the Three Marias (see below).

Seven Men:

This Belarussian asterism "Siem Malciev" or "Siem Malcov" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Seven Moment:

This Kedehan asterism "Bintang Ketika" is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairuddun 2019).

Seven Oxen:

This Latin asterism "Septentriones" or simply "Septem" has been used for both the Big Dipper in the IAU constellation Ursa Major, and the Little Dipper in Ursa Minor. Because there are seven stars in both of these Dippers, the Latin word for "north" is "septentrio" ("seven oxen"). The ploughman driving these oxen is Boötes (see Ploughman, above).

The *De Natura Rerum Liber ("book on the nature of things*") by Isidori Hisapensis (Isidore of Seville, ca 560 – 636 C.E.) has this entry: "Arcturus [Alpha (α) Boötis] is that constellation which the Latins call Septentrion, which revolves in its own revolution shining with the rays of seven stars" and refers to it as "the chariot": This is clearly a reference to the Big Dipper

Geoffrey Chaucer (c.1340s – 1400) listed it as "Septentrioun" and William Shakespeare (1564 – 1616), in *King Henry VI*, called it "Septentrion" as did Shakespeare's friend Michael Drayton (1563 – 1631), and John Milton (1608 – 1674) in *Paradise Regained*, and Robert Bulwer-Lytton (1831 – 1891).

Johann Bayer's *Uranometria* (1603) lists "Septentrio" as a name for both Ursa Minor and Ursa Major.

Robert Hues lists "Septentriones" in his *A Learned Treatise of Globes* in 1659.

Edward Sherburne lists it as "Septem Triones" in his *Sphere of Marcus Manilius* in 1675, associating it with Ursa major.

John Hill lists it as "Septemtriones" in his *Urania* in 1754.

American uranographer William Croswell (1760 – 1834) depicts the Big Dipper asterism on his *Mercator Map of the Starry Heavens* in 1810 and labels it "Septentrio Charles's Wain".

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Septentrionis". Boutet (2014) lists it as "Septemtrion".

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Septentrio" as a name for Boötes.

This Romanian asterism "Şapte Boi" is the Big Dipper asterism in the IAU constellation Ursa Major (Ottescu 2009). They are being driven by the Little Herdsman (see above).

Seven Parakeets:

This Aruanãs asterism "Birri" is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

Seven Poets:

This Greek asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen places this in the 3rd century B. C. and identifies the poets as "Apollonius of Rhodes, Callimachus or Philiscus, Homer the Younger of Hierapolis in Caria, Lycophron, Nicander, Theocritus, and our Aratos".

This French asterism, also known as the "Great Pléiade" is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen places this in the 16th century and identifies the poets as including "Charlemagne… Ronsard, the "Prince of Poets,… [and] d'Aurat, or Dorat, the "Modern Pindar."

This American asterism, also known as the Pleiades of Connecticut, is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen lists the poets as Richard Alsop, Joel Barlow, Theodore Dwight, Timothy Dwight, Lemuel Hopkins, David Humphreys, and John Trumbull.

Seven Portuguese Towers:

This Portuguese asterism “Portugalia” was created from the stars of the IAU constellation Virgo by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Portugal and is depicted by a semi circle of seven towers.

Seven Princesses:

This Malay asterism “Jula Juli Bintang Tujuh” is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairuddun 2019). This is related to a Malay myth about seven princesses whose affections were contested by three different parties.

Seven Quail:

This Kedehan asterism “Bintang Puyuh” is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairuddun 2019).

Seven Sacraments:

This Yucatec asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Milbrath 1999). They believe that counting them will result in the death of one’s spouse.

Seven Sages:

This Vedic asterism “Saptarshis”, Saptarsayah”, or “Saptarsi” is the Big Dipper asterism in the IAU constellation Ursa Major (Boutet 2014, Bhagwath 2019). The Big Dipper is a boat in which the seven sages are sailing, protected by the Vedic asterism Shisumara (see Dolphin, above). The seven sages are each assigned a star and their names are:

- Alpha (α) Ursae Majoris (Dubhe): Kratu or Jamadagni.
- Beta (β) Ursae Majoris: Pulaha, Visvâmitra
- Eta (η) Ursae Majoris: Bhrigu, Bhrgu, Kasyapa, Gautama or Marìci,
- Delta (δ) Ursae Majoris: Atri or Daksa
- Epsilon (ε) Ursae Majoris: Angiras, Angirā, or Bharadvàja
- Zeta (ζ) Ursae Majoris: Vasishtha, Vasistha, Vaśiṣṭha
- Gamma (γ) Ursae Majoris: Pulastya.

Some lists name Eta (η) Ursae Majoris “Marichi” (see above) and Merak as “Pulaha”. The star 80 Ursae Majoris (Alcor) is called “Arundhati”.

This asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen places this in “the Philosophical Pleiad of 620 to 550 B.C.” and identifies them “as Bias, Chilo, Cleobūlus, Epimenides or Periander, Pittacus, Solon, and the astronomer Thales”.

This Celtic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Boutet 2014). The seven sages are each assigned a star and their names are:

- Uesos (“knower”)
- Uocomarcos (“research”)
- Sulacsus or Eulacsus (“wisdom”)
- Uirionos (“truth”)
- Ueros (“overly”)

- Andiatis (“superior”), and
- Uindonos (“dazzling”).

Seven Siblings:

This Tibetan khyim (constellation) “Karma Pun Dhun” is the Little Dipper asterism in the IAU constellation Ursa Minor (Johnson-Groh 2013). These siblings got into a race and the first two tied. The fifth star is a hunter with a dog (Mizar and Alcor).

Seven Sisters:

This Ngarrindjeri and Ngemba asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009, Fuller and Bursill 2021).

This Wiradjuri asterism “Malandyang” is the Pleiades cluster in the IAU constellation Taurus. They are being chased by the “Gibirgang” (see Three Brothers, below). Compare this to the Yolgnu asterism Mayi Mayi (see Seven Young Sisters, above) or the Kamilaroi/Euahlayi asterism “Miyaay Miyaay” (see below).

This Kamilaroi/Euahlayi asterism “Miyaay Miyaay” is the Pleiades cluster in the IAU constellation Taurus. They are being chased by the Birray Birray (see Uninitiated Boys, below). The Kamilaroi believe that these sisters were pushed into the sky when the two trees they were cutting bark from suddenly grew higher and higher (Clarke 2009).

This Bundjalung area asterism “War-ring-garai” is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009, Matthews 1904). Their rising and setting indicated the beginning of cold and warm seasons.

The peoples indigenous to the area of Kimberley, Australia, see the Pleiades cluster in the IAU constellation Taurus as sisters being chased across the sky by old man which is the planet Venus (Clarke 2009).

This Nunkunu asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). They were chased into the sky by three brothers.

NOTE: Tindale (1980) and Clarke (2009) write that in Western Australia these sisters are often accompanied by dingo dogs and that in the Darling River area the people told that the sisters were out gathering yams and were carried into the sky by a whirlwind (Clarke 2009). In the Kokatha area the people tell of how the sisters were devoured by the Serpent Ancestor Akurra, who were released into the sky when he drowned.

This Ojibwe asterism is the Pleiades cluster in the IAU constellation Taurus (Morin 2022).

This German (Volga Community, Argentina) asterism “las siete hermanas” is the Pleiades cluster in the IAU constellation Taurus (Mudrik 2011).

This Irish asterism is the Pleiades cluster in the IAU constellation Taurus (Boutet 2014). One of the stars was known as the “Old Woman” or the Hag of Beara, a triune Goddess who appears with her sisters Cailleach Bolus and Cailleach Corca Duibhne.

This American asterism is the Pleiades cluster in the IAU constellation Taurus. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes the “Pleiades (Job xxxviii.31) or the Seven Sisters”.

Seven Sisters-in-Law and Brother-in-Law:

This Ben Raji asterism “Hatai Halyou daa Salla” is the Pleiades cluster in the IAU constellation Taurus.

Seven Sisters of the Pole:

This **telescopic** asterism is made up of the stars of the IAU constellations Cepheus and Ursa Minor close to Alpha (α) Ursae Minoris (Polaris). This is listed by German astronomer Robert Zebahl, is Corder 4965 on Jeffrey Corder’s list, and is listed in the SAC database. The seven stars include 2 Ursae Minoris, HIP 115746, 109693, 112833, 113116 and 112519. Its size is 180’. It is also known as the “False Pleiades”.

Seven Sleepers of Ephesus:

This Greek asterism is the IAU constellation Ursa Major and is related to the story of this name written by 10th century chronicler of saints Symeon Metaphrastes. These seven people slept on the slopes of Mount Coelian: Compare this to the star “Mons Coelius” (see Heavenly Mountain, above).

Seven Sons:

This Korean asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Seven Star:

This Northern Icelandic asterism “Sjaustirni” is the Pleiades cluster in the IAU constellation Taurus (Bender 2020, Cleasby and Vigfusson 1874). While in the singular, the word is used to refer to a cluster of stars.

Seven Stars:

This Chinese Chenzhuo xing guan is a winding line of seven stars in the IAU constellation Hydra: Iota (ι) Hydrae, Tau (τ) 1 & 2 Hydrae, HIP 46404, Alpha (α) Hydrae (Alphard), 27 Hydrae, and 26 Hydrae.

This Malay and Temuan asterism “Bintang Tujuh” is the Pleiades cluster in the IAU constellation Taurus. Many seafaring peoples of Malaysia see this star cluster as some sort of creature with a tail, but the identity of this creature is uncertain: Jaafar and Khairuddun (2019) believe that it may be a stingray. It is also known as “Bintang Suraya”, which is a reference to the Arabic asterism “Al Thurayya” (see Little Abundant One, above).

This “Turkish” asterism “Yidigher Yilduz” is the IAU constellation Ursa Major as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675. John Hill lists it as “Yidgher Yilduz” in his *Urania* in 1754 as does R. H. Allen in his Star Names in 1899.

This Old High German asterism “Sibunstirri” is the Pleiades cluster in the IAU constellation Taurus (Bender 2020, Grimm 1873). This is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “das Sieben Gestirn” and “Septistellium”.

This Basque asterism “Zazpi Izarrak” is the Big Dipper asterism in the IAU constellation Ursa Major (Frank 2021). Knörr (1999) identifies it as the Little Dipper.

This Bugis asterism “Worong-porongngé Bintoéng Pitu” (“cluster of seven stars”) is the Pleiades cluster in the IAU constellation Taurus.

This Icelandic asterism “Siebengestien Gluke” or “Ebergedrängel” is the Pleiades cluster in the IAU constellation Taurus. Compare this to the Northern Icelandic asterism Seven Star, above.

This Saxon asterism “Siebengestirn” is the Pleiades cluster in the IAU constellation Taurus as depicted in the “Nördliche Sternhimmel” sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). R. H. Allen lists “Sifunsterri” in his *Star Names* in 1899.

This German asterism “Siebengestirn” is the Pleiades cluster as listed by R. H. Allen in his *Star Names* in 1899. German astronomer Johann Bayer (1572-1625) listed “Septistellum”.

This English asterism is the Pleiades cluster in the IAU constellation Taurus. Geoffrey Chaucer (c.1340s – 1400) listed “sterres seven”. “Seven Stars” is listed in John Hill’s *Urania* in 1754.

This American asterism is the Pleiades cluster in the IAU constellation Taurus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name for the Pleiades. R. H. Allen lists it in his *Star Names* in 1899 and writes that it occurs “in various early Bible versions”.

This Elvish asterism “Ostelen” or “Egedil” is is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) and appears in the later works of J. R. R. Tolkien (1892 – 1973).

This Finnish asterism “Seitsemän Tähteä” ” is the Big Dipper asterism in the IAU constellation Ursa Major. R. H. Allen lists this as “Seitsen tahtinen” in his *Star Names* in 1899.

This Tupi asterism “Setestrelo” is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

This Xerente asterism is the Pleiades cluster in the IAU constellation Taurus (Urton 2016).

This /Xam asterism is the Pleiades cluster in the IAU constellation Taurus (Holbrook and De Prada-Samper 2016).

This Salish asterism “Čsṕeʔlčs Kʷkʷusm” may be either the IAU constellation Ursa Major or Ursa Minor (Pete 2023). It was documented in the early 1800s by Schaeffer.

Seven Stars of the North:

This Korean asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Seven Thieves:

This Basque asterism “Zazpi Ohoinak” is the Big Dipper asterism in the IAU constellation Ursa Major (Knörr 1999, Frank 2021). Compare this to the Macedonian asterism Thieves (see below). Knörr also lists it as a name for the Little Dipper.

This Kazakh asterism “Zheti Qaraqshy” or “Jeti karakshi” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

This Altai and Kyrghyz asterism “Jeti Karaksy” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

This Tuvan asterism “Zhety-uragan” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

This Telengit asterism “Zhety-gan” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

This Uyghur asterism “Ity-gan” is the Big Dipper asterism in the IAU constellation Ursa Major (Jaambayeva 2019).

Seven Virgins:

This Greek asterism is the Pleiades cluster as listed by the Greek poet Hesiod and by R. H. Allen in his *Star Names* in 1899.

This Northern Sotho asterism is the Pleiades cluster in the IAU constellation Taurus. These virgins are fleeing from a hunting dog, the star Sirius (see Hunting Dog, above).

Seven Wise Men:

There are two Greek asterisms by this name:

One is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen places this in “the Philosophical Pleiad of 620 to 550 B.C.”

One is the Big Dipper asterism in the IAU constellation Ursa Major as listed in R. H. Allen’s *Star Names* in 1899.

Seven Young Men:

This Yolgnu asterism “Berai Berai” is the IAU constellation Orion. They pursue the Mayi Mayi (see Seven Young Sisters, below). They died of love after being rejected and the music from the Mayi Mayi (the Pleiades) makes them dance at night.

Seven Young Sisters:

This Yolgnu asterism “Mayi Mayi” or “Meamai” is the Pleiades cluster in the IAU constellation Taurus. They had long hair and bodies of icicles and thunder is the sound of them laughing and playing. A large family of young men, the Berai Berai (see Seven Young Men, above) followed them. One of them, Karambal (see above) made off with one of them, and the sisters sent wintry weather to force him to release her. Another version of this story has a “Werrinah”, “Wurunna” or “Wurrunnah” (“wise man”) stealing some of the sisters (see Wise Man, below). The Yolgnu have a custom of throwing coals from the fire towards them to keep these icy women from making it too cold.

In the Mldrin Nations area of Australia this asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). It was believed that these women controlled the cold and warm seasons.

This Ngarrindjeri asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). Like the Yolgnu, they have a custom of throwing coals from the fire towards them to keep these icy spirit women from making it too cold.

This Ngiyampaa asterism is the Pleiades cluster in the IAU constellation Taurus. They were chased into the sky by a man who became the Moon, while an old clever woman chasing him became the Sun and teaches him the law.

Seven Young Women (Sisters):

This Kamilaroi/Euahlayi asterism “Miyay Miyay”, “Mai Mai”, “Miai Miai”, “Mirrai Mirrai”, or “MeaMei” (Parker 1905) or “Miyaymiyay” (Fuller et al 2014) is the Pleiades star cluster in the IAU constellation Taurus. “Miyay” means “girl” and Miyay Miyay means “several girls”. These women, depending on the story, were chased by the Birray Birray (see Uninitiated Boys, below), or by various Wiringins or other bad persons. These women prayed for deliverance and Bhaiami and Turramulan heard them and lifted

them into the sky. The Kamilaroi believe that as one sister is shy, normally we only see six stars. They are protected from the Birray Birray in Orion by the Wiringin, Old Dthillar (see above), who is the star Alpha (α) Tauri (Aldebaran).

This Bunjalung asterism "Wareenggary" is the Pleiades cluster in the IAU constellation Taurus. One of them was captured by Karambal (see above). This was listed in *Folklore of the Australian Aborigines*, Science of Man, Vol. 1, 1898, p. 119.

Seventh:

This Bedouin star "al-Swaibi'" (السويبع) is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

Severed Leg:

This Caribbean star is Beta (β) Orionis (Rigel) in the IAU constellation Orion and is part of their asterism "Troi Rois" (see below).

Sextans:

None of the stars of Sextans are on the list of 90 brightest stars: Only one 4th magnitude star, Alpha (α) Sextantis, is above the fifth magnitude. The stars of this constellation only show up in 39 of the asterisms in this handbook.

This IAU constellation "the Sextant" (IAU abbreviation Sex) was created in 1687 by Polish astronomer Johannes Hevelius and originally named "Sextans Uraniae" ("Urania's sextant"). This was an instrument frequently used by Hevelius to make his observations. Hevelius' *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, labels it "Sextans" on one chart page and "Uraniae Sextans" on another.

Sextans is listed in German astronomer Johann Doppelmayr's *Atlas Coelestis* (c. 1730).

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Sextans Urania" and depicts it as a sextant.

Sextans is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Sextans Uraniæ" as a sextant.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Sextans Uraniae" and depicts it as a sextant.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Sextans as a sextant.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Sextans" as a sextant as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Sextant".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation as "Sextans Uraniae" on one chart in his *Celestial Atlas* in 1822 and simply as "Sextans" on another.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Sextans" as a sextant.

Sextans is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Uran-Sextant" and Bode's *Vorstellung Der Gestirne* (1782) lists this constellation on the charts as "Sextant" and depicts it as a sextant.

"Sextans" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a sextant.

"Sextans" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a sextant.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Sextans, The Sextant" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Sextans" in his *Star Atlas* (1893) and describes it as "The Sextant".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Sextans" and describes it as a "Sextant".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Sextans" and gives the "original form" as "Sextans Uraniae, Urania's Sextant".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Sextans".

Standard IAU charts depict Sextans as a line of the two stars Alpha (α) and Beta (β) Sextantis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Sextans in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a "V" shape of three stars: Alpha (α), Gamma (γ), and Beta (β) Sextantis.

Sky and Telescope Magazine, founded in 1941, depicts Sextans in their magazine and publications as a bending line of the stars Delta (δ), Beta (β), Alpha (α) and Gamma (γ) Sextantis.

Sextans A:

This **telescopic** asterism is the dwarf irregular galaxy UGCA 205 (PCG 29653) in the IAU constellation Ursa Major. It is also known as the "Little Square of Sextans" (see above).

Seyfert's Sextet:

This **telescopic** asterism Hickson 79 is a group of galaxies in the IAU constellation Serpens:

- Lenticular galaxy NGC 6027,
- Spiral galaxy NGC 6027a,
- Interacting lenticular galaxy NGC 6027b,
- Barred spiral galaxy NGC 6027c

- Barred spiral galaxy NGC 6027d, and
- The tidal tail of NGC 6027, called NGC 6027e.

It is named after American astronomer Carl Keenan Seyfert who discovered it in 1951. NGC 6027 appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Seyfertiána Serpéntis" ("belonging to Seyfert of Serpens").

Shackled Woman:

This Arabic asterism "Almar'at Almuqayada" (المرأة المقيدة) which translates as "shackled woman" is the IAU constellation Andromeda, following the Greek myth of Andromeda. Compare this to Chained Woman, above.

Shade:

This Chinese star "Yin" is Tau (τ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) "Dǒuxiù" (斗宿) – see Dipper, above.

Shaft:

This asterism "Shafte" is the stars Beta (β) Ursa Minoris (Kochab) and Gamma (γ) Ursae Minoris (Pherkad), which are the two end stars in the "Little Dipper" asterism of the constellation Ursa Minor (see Little Dipper, above). English Admiral Henry William Smyth lists this in his *Bedford Catalogue* in 1844 and attributes it to Welsh physician Robert Recorde (d 1558) who included it in his *Castle of Knowledge*.

Shaft and Wheels:

This Estonian asterism is the IAU constellation Orion (Kuperjanov 2006). It was first recorded by Robert Livländer in 1923.

Shaft of a Plough:

This Belarussian asterism "Kigachi ragachy" is the constellation Orion (Avilin 2009). It is also known as "Kosy" (see Scythes, above), "Matawila" (see Wheel, below), "Traiko" (see Three Times, below), "Karomyselko" (see Small Yoke, below), "Grabli" (see Rake, above), "Kastsy" (see Mowers, above), "Try Karali" (see Three Kings, below), "Kasar" (see Mower, above), "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Tri Siostry" (see Three Sisters, below), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Asilki" (see above), "Kryzhe" (see Cross, above), "Lisa" (see Fox, above), and "Trohkutnaia" (see With Three Corners, below).

Shaftbow:

This Estonian asterism is the "W" asterism in the IAU constellation Cassiopeia (Kuperjanov 2006). This is from the island of Saaremaa.

Shag:

This Wardaman asterism is the stars Epsilon (ε) and Sigma (σ) Cygni in the IAU constellation Cygnus (Cairns and Harney 2003).

Shaken of Lepus:

This **telescopic** asterism "Labefáctus Léporis" is the barred spiral galaxy NGC 1744 in the IAU constellation Lepus. It was discovered in 1835 by British astronomer John Herschel who listed it as 2692 and later GC 964 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its "disordered shape".

Shaker:

This Greek star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). It got this name as it was observed to be twinkling (due to turbulence in the atmosphere, part of what modern astronomers call "seeing"). The ancient Greeks thought that the star emitted "emanations" that caused disease and anxiety. Compare to the Inuit asterism Flickering (above).

Shala:

See Maiden, above.

Sham:

See Arrow, above.

Shama:

See "Small Lamp", below.

Shapley's of Sculptor:

This telescopic **asterism** "Shapléia Sculptóris" is the dwarf galaxy PGC 3589 (ESO 351-30) in the IAU constellation Sculptor. It was discovered by Harlow Shapley in 1937. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor Harlow Shapley (1885 – 1972). It is also known as the Sculptor Dwarf.

Sharing Foxes:

This Inuit asterism is the Pleiades cluster in the IAU constellation Taurus (MacDonald 1998). It is also known as "Breastbone" (see above).

Sharjah:

This **telescopic** United Arab Emirates star is HIP 79431 in the IAU constellation Scorpius (magnitude 79431). It was given this name in the IAU NameExoWorlds campaign. It is named for their cultural capital. It has an exoplanet named Barajeel, which is a type of wind tower used to recirculate air as a form of air conditioning.

Shark:

This Mayan asterism "Xoc" is made up of stars of the IAU constellations Hydra, Libra, Centaurus, and Lupus: Alpha (α) and Beta (β) Lupi, Eta (η), Zeta (ζ), Iota (ι), and Theta (θ) Centauri, and Eta (η) Hydrae, and Nu (ν) Librae. Compare this to the postclassic Mayan asterism Fish Snake (see above).

This Kala Lagaw Ya asterism "Baidam" is centered on the Big Dipper asterism in the IAU constellation Ursa Major (Hamacher 2017).

This Meriam Mir asterism "Baizam" is centered on the Big Dipper asterism in IAU constellation Ursa Major (Hamacher 2017).

This Māori asterism “Māngō” or “Māngōroa” has its “head” in the Coal Sack Nebula (see Coal Sack, above), and its “neck and body” stretching out through the dust lanes of the Milky Way past the galactic bulge near the IAU constellation Scorpius.

This Polynesian asterism from the Tuamotu archipelago “Te Aku” has its “head” in the Coal Sack Nebula (see Coal Sack, above), and its “neck and body” stretching out through the dust lanes of the Milky Way past the galactic bulge near the IAU constellation Scorpius.

This Tahitian asterism has its “head” in the Coal Sack Nebula (see Coal Sack, above), and its “neck and body” stretching out through the dust lanes of the Milky Way past the galactic bulge near the IAU constellation Scorpius.

This Kiwai Papuan asterism “Baidamu” is the IAU constellation Ursa Major.

This Kiribati asterism “Baibure”, “Nei Tebaibure”, or “Baiburebure” is a group of five stars in a V shape in the IAU constellation Pegasus (Trussel and Groves 1978). A baibure is a type of shark with white spots on its fins.

This Kiribati asterism “Bakoa” is the sword of Orion in the IAU constellation Orion (Trussel and Groves 1978). Bakoa is a general term for sharks in this culture.

This 12-star **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Ursa Minor, 2 degrees from the star 21 Ursae Minoris. Jeffrey Corder lists this as Corder 3093. John Raymond calls this the “Ursa Minor Pseudo Cluster”. Size 120’ X 90’:

- Four stars form the “tail”: HIP 83184, 82847, 82871 and 83225,
- The star HIP 82061 is the “back”,
- A chevron of five stars forms the “nose”: HIP 81528, 81219, 81156, 80850, and 81854, and
- HIP 82571 is the “fin”.

Shark Nebula:

This **telescopic** asterism is dark nebula is LDN 1235 in the IAU constellation Cepheus. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024). It is also known as the Dark Shark Nebula (see above).

Shark of the Heavenly Night:

This Hawaiian star “Manokalnipo” is Delta (δ) Pegasi (Alpheratz) in the IAU constellation Pegasus. This is a title of Mō’i of O’ahu, who brought prosperity to his people.

Shark Stars:

This Bugis asterism “Bintoéng Balé Mangngiweng” is the “tail” end of the IAU constellation Scorpius: Eta (η), Theta (θ), Iota (ι), Kappa (κ), Lambda (λ), and Nu (ν) Scorpii.

Shark Tooth:

This **telescopic** asterism in the IAU constellation Taurus is Corder 883 on the observing list of American astronomer Jeffrey Corder. Size 90’. Corder describes this as a “prehistoric shark tooth” and it is bounded by the double star 125 Tauri, the double star HIP 26332, HIP 25969, HIP 26291, the double star HIP 26396B, and the double star HIP 26571.

Shark’s Entrails:

This Kiribati asterism “kurikuri” is made up of stars of the IAU constellations Leo and Centaurus (Trussel and Groves 1978). Kurikuri is a part of a shark’s entrails.

Sharmishtha:

This Hindu asterism is the IAU constellation Cassiopeia. Sharmishtha is the daughter of King Vrishparva.

Sharp Leaf of Canes Venatici:

This **telescopic** asterism “Acutifólium Cánum Venaticórum” is the barred spiral galaxy NGC 5297 in the IAU constellation Canes Venatici. It was discovered in 1787 by William Herschel who listed it as “I 180”. It became GC 3652 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has “sharp ends and thin arms”. It is also known as the “Hook Galaxy”.

Sharp Sighted of Lynx:

This **telescopic** asterism “Oxydérces Lýncis” is the barred spiral galaxy UGC 3685 in the IAU constellation Lynx. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “in Hevelius’ 17th century Uranographia star atlas, this galaxy is situated in the head of Lynx, an animal famous for its keen eyesight”.

Sharply Pointed of Virgo:

This **telescopic** asterism “Oxýpages Vírginis” is the edge-on barred spiral galaxy NGC 5073 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “III 282”. It became GC 3483 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Shattered:

This Iñupiat asterism “Siqupsiqat” is the Pleaides cluster in the IAU constellation Taurus.

Shaula:

See Raised Tail of the Scorpion, above.

She Bear:

This Evenk asterism is the IAU constellation Ursa Major (Dmitrieva and Romeiko 2009).

This Belarussian asterism “Viadmedzitsa” is the IAU constellation Ursa Major (Avilin 2009).

She Camel:

This Arabic asterism “Jamal” (جمل) is made up of the stars of the IAU constellations Andromeda, Cassiopeia, and Perseus:

- The “head” is the stars Lambda (λ), Kappa (κ), Iota (ι) and Phi (ϕ) Andromedae,
- The “neck” is a curving line running from Lambda (λ) Andromedae through 22 Andromedae, HIP 2225, HIP 2900, Pi (π) Cassiopeiae, Omicron (ο) Cassiopeiae, Xi (ξ) Cassiopeiae, and Zeta (ζ) Cassiopeiae to Lambda (λ) Cassiopeiae.

- The “hump” is Beta (β) Cassiopeiae (Caph) and its “body” is an oval of stars running around from Caph through Lambda (λ) Cassiopeiae, Alpha (α) Cassiopeiae (Sheddar), Eta (η) Cassiopeiae, Upsilon (υ) 1 and 2 Cassiopeiae, Gamma (γ) Cassiopeiae, HIP 4151 and Kappa (κ) Cassiopeiae,
- The “tail” is a line from Kappa (κ) Cassiopeiae to Epsilon (ε) Cassiopeiae,
- The “legs” are two lines of two stars:
    - One runs from HIP 5251 to Phi (ϕ) Persei, and
    - One runs from HIP 4998 to 51 Andromedae.

She Camel’s Hump:

This Arabic star “Al Sanām al Nākah” is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia:

- “Sinām al-Nāqa” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- “Al Sanām al Nākah” as listed by the 16th century Arabic astronomer Al Tizini and is part of their asterism the “She Camel” (see above).
- English Admiral Henry William Smyth lists “Al Sanām al Nākah” in his *Bedford Catalogue* in 1844 and translates this as the “camel’s hump”.

She Elk and Her Calf:

This Mari asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

She-Goat:

This asterism from the Babylonian MUL.APIN tablets and from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “MUL.UZ” (Hunger 1992, Parpola 1993) or “u-za” and in the from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mu luz” and listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 as “ÙZ” is the IAU constellation Lyra. The parallelogram of stars that forms the “harp” of Lyra is the body of the she-goat. A triangle of stars formed by Zeta (ζ) Lyrae, Epsilon (ε) Lyrae, and Alpha (α) Lyrae (Vega which the Babylonians called the Goddess Lamassatu) form the “head”. This asterism appears in later Seleucid sky lore.

This Akkadian asterism “Enzu” (Hunger 1992, Anthony 1996) from the *Astrological Reports to the Kings* of the late Assyrian period (Parpola 1993) or “en-zu” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism MUL.UZ above.

This Sumerian asterism “mulùz” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism MUL.UZ above.

This Latin star “Capra” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. The Arabic name for this star was “al-cayyūq” (see Goat, below).

- Variations of the name include “Caper”, and “Crepa”.
- In Ptolemy’s *Almagest* (2nd century) “Capra” is the goat that the charioteer is carrying.
- In Bayer’s 1603 *Uranometria*, it is one the charioteer’s back and a name for Alpha (α) Aurigae (Capella) but is also given as an alternate name for Capricornus.
- John Hill lists the name “Capra” for this star in his *Urania* in 1754.

- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Capra" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Capra as a name for this star.

This Greek lunar mansion "Capra" is the star Alpha (α) Aurigae (Capella) is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This Latin asterism is the IAU constellation Auriga as described by 1st century Roman poet Marcus Manilius and Pliny the Elder (24 – 79), who used the names "Capra" and "Caper".

This Arabic asterism "'l-Arḍ" or "'l-Ardh" ("she-goat" (of the land)) is the star Gamma (γ) 1 and 2 Andromedae in the IAU constellation Andromeda. It is also known as the Caracal (see above).

This Belarussian star "Kaza" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Avilin 2007, 2009).

She-Goat with Three Kids:

This Romanian asterism "Ea Capră cu Trei Copii" or "Capra cu Trei Iezi" is made up of stars of the IAU constellation Auriga (Ottescu 2009, Lite, Lodina, and Ignat 2018). The star Alpha (α) Aurigae (Capella) is the she-goat, "Capra", and the three kids "Iezzi Caprei" are a triangle of stars alongside: Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae. In modern times this has been adopted as a **telescopic** asterism (see Goatlings, above).

She is the Hand of God:

This Hebrew star "ha-yad ha-sevu'a" is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda as listed in an anonymous Hebrew star list from 1392 (Goldstein 1985). This list gives the Arabic name "Kaff al-nasīr" ("palm of the supporter").

She of the Throne:

This Greek asterism "Η τοῦ θρόνου" or "I toú thrónou" is the IAU constellation Cassiopeia.

She Who Makes Food Scarce:

This Māori star "Whaka-onge-kai" is close by their star Rehua, Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. She is a bird that is the mate of Rehua (see above). This is either Tau (τ) Scorpii or Sigma (σ) Scorpii.

She Who Runs After of Corvus:

This **telescopic** asterism "Metadoma Córvi" is the interacting galaxy NGC 4783 in the IAU constellation Corvus. It was discovered in 1786 by English astronomer William Herschel who listed it as "I 136". It became GC 3294 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this galaxy and NGC 4782 are connected with a "material bridge".

She Who Runs Before of Corvus:

This **telescopic** asterism "Pródroma Córvi" is the interacting galaxy NGC 4782 in the IAU constellation Corvus. It was discovered in 1786 by English astronomer William Herschel who listed it as "I 135". It became GC 3293 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One*

Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this galaxy and NGC 4783 are connected with a "material bridge".

Sheaf of Ears:

This Latin asterism "Spicarum Manipulum" is the IAU constellation Coma Berenices as listed in John Hill's *Urania* in 1754. He only identifies his source as "some of the Latin writers".

Sheath of the Penis:

This Arabic star "al-qunb" ("sheath of the penis") or "qunb al-asad" (قنب الأسد) or "sheath of the penis of the lion" is Beta (β) Leonis (Denebola) in the IAU constellation Leo. It was called this because of its location slightly between and ahead of their asterism Two Haunches (see below).

Sheep:

This ancient Egyptian "Seret" asterism is made up of stars of the IAU constellation Grus and appeared from the New Kingdom onward. Locher (1981) constructed this out of the stars of the IAU constellations Capricornus, Aquarius, and Grus.

This Arabic star "aš-šā[t]" (الشاة) or "ash-shat", later latinized to "Alshat" or "Al Shat" is Nu (ν) Capricorni in the IAU constellation Capricornus as listed in 13th century Persian astronomer Zakariyya' al-Qazwini's *Wonders of the Creation and Unique of the Existence* and is part of their asterism "Lucky Star of the Slaughterer" (see above). It represents the "sheep" that is to be slaughtered. The IAU approved the name Alshat for Nu (ν) Capricorni A.

This Tibetan khyim (zodiac constellation) "Lug" or "Luk" is the IAU constellation Aries (Johnson-Groh 2013).

This Seleucid asterism is made up of stars of the IAU constellations Aries, Cetus, and Taurus and is a forerunner of the modern IAU constellation Aries:

- An irregular oval of stars forms the "body", including Iota (ι), 65, Zeta (ζ), Delta (δ), 40, and Theta (θ) Arietis, Xi (ξ) 1, Upsilon (υ), and Lambda (λ) Ceti, Omicron (ο), Xi (ξ), and 5 Tauri, and HIP 16641, and
- From Iota (ι) Arietis a curving line runs off through the stars Gamma (γ) Arietis, Beta (β) Arietis (Sheratan) and Alpha (α) Arietis (Hamal).

This Etruscan asterism "Evi" is the IAU constellation Aries.

Sheep Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Aries as "Chí yáng zhī shén" (持羊之神) or "deity of sheep" (Kotyk 2017).

Sheepfold:

This ancient Egyptian asterism "Qed" is made up of the stars of the IAU constellation Cetus. It is a quadrilateral with four stars at the corners: Alpha (α) Ceti (Menkar), Mu (μ) Ceti, Xi (ξ) Ceti, and Gamma (γ) Ceti.

Sheepskin Cloak:

This Khoikhoi asterism “kaross” is Theta (θ) and Gamma (γ) Tauri in the IAU constellation Taurus (Alcock 2014). This is the kaross of Tsui //Goab (see below).

Shekel:

This Bedouin star “Al-Miss.hil” or “al-Mishil” (المسهل) is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus.

Sheliak:

This Arabic star “ash-Shiliyāq” (الشلياق) or “Al Shilyāk” is Beta (β) Lyrae in the IAU constellation Lyra:

- This was later latinized to “Sheliak” and “Shiliak”.
- John Hill lists this as “Shelyak” in his *Urania* in 1754 as a “bright star” but then states that this is “Lucida Lyrae”, which is a name he assigned to Alpha (α) Lyrae (Vega) and reports that is it in “Hugh Beigh’s tables of the heavens”, which would be a reference to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- Italian astronomer Giuseppe Piazzi (1786 – 1846) listed it as “Salibāḳ“ and cites Persian astronomer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Sheliak, from Shelyâk” and says that it was originally the name for the entire constellation.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Sheliak”.
- In his *Star Names* in 1899 R. H. Allen cites “Ulugh Beg’s translator” (without naming the translator) as giving the name “Shelyāk” and translates it as Arabic “words for the tortoise”, as the early Greek name was Tortoise Shell (see below).
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list the name “Sheliak” for this star.
- The IAU approved the name Sheliak for the star Beta (β) Lyrae Aa1.

Shell:

This Latin asterism “Testa” is the IAU constellation Lyra. This relates to the myth of Mercury creating the first lyre from a turtle or tortoise shell. German astronomer Johann Bayer (1572-1625) mistranslates this as “Βάσανος” (“Vásanos” or “torture”) which R. H. Allen suggests is a misinterpretation of “Testa” as “test” in his *Star Names* in 1899. In the 1551 edition of the *Almagest*, it is described as “Fulgens quae in testa est vocatur Lyra” (“The glittering things in the shell called Lyra”). English astronomer John Flamsteed (1646 – 1719) described it as “Testa fulgida dicta Lyra” (“A bright shell called Lyra”).

Shell Parakeet:

This Wiradjuri star “Bidgerigang” is possibly Eta (η) Carinae in the IAU constellation Carina. This was listed by Howitt in 1905, who described it only as “a small star in Argus”. Alternate names listed in 2010 by Grant and Rudder include “Gidyerriga”, “Gidyerrigaa”, and “Badyarigar”.

Shellfish:

This English asterism “Gryphites” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens***.** It is made up of the stars of the IAU constellation Hercules: 112, 110, 109, 98, 95, and 102 Herculis.

Shenelto:

This Syrian asterism is the IAU constellation Virgo as listed in John Hill's *Urania* in 1754.

Shepherd:

There are to Arabic stars by this name:

- One, "ar-Rāʿī" (الراعي) is the star Gamma (γ) Cephei in the IAU constellation Cepheus and later latinized to "Errai", "El Rai", or "Alrai". This is part of their asterism Shepherd and the Sheep (see below) and is also called the Northern Shepherd:
    - This is depicted on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - John Hill lists it as "Al Rai" in his *Urania* in 1754.
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Ar rái, the shepherd".
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "en rai": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Errai".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1910) and the 14th edition (1959) both list "Alrai" and "Errai" for this star.
    - The IAU approved the name Errai for the star Gamma (γ) Cephei Aa. This has an exoplanet named Tadmor, which is an ancient Palmyrene and modern Arabic name for Palmyra.
- One is Alpha (α) Ophiuchi (Rasalhague) in the IAU constellation Ophiuchus and is part of their asterism Desert Garden and the Goats (see above). It is also known as the Southern Shepherd.:
    - It is described by Dorn (1829) as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of al-Qazwini).
    - This is attributed to Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) by R. H. Allen in his *Star Names* in 1899
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al râyi, from ar-ra'i the shepherd".

This Inca asterism "Michiq" is the dark nebulosity in the region of the IAU constellation Scorpius.

This Basque asterism "Artzain", also known as "Artzaina Makoarekin" (See Shepherd and his Crook, below) is the Big Dipper asterism in the IAU constellation Ursa Major (Knörr 1999,.Frank 2021). It is related to the nearby asterism "Zazpi Ahuntzak" (see Seven Goats above).

This Romanian star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Ottescu 2009). This is part of their asterism "Ciobanul cu Oile" (see Shepherd with the Sheep, below).

Shepherd and his Crook:

This Basque asterism "Artzaina Makoarekin" ("the shepherd and his crook") is the Big Dipper asterism in the IAU constellation Ursa Major (Knörr 1999,.Frank 2021). It is also known as "Artzain" (see Shepherd, above). It is related to the nearby asterism "Zazpi Ahuntzak" (see Seven Goats above).

Shepherd and the Sheep:

This Arabic asterism is an oval of stars in the IAU constellations Cassiopeia, Cepheus, Draco, and Ursa Minor: Iota (ι) Cephei, HIP 117371, 23 Cassiopeiae, HIP 5626, 2 Ursae Minoris, HIP 109693, HIP 101044, Kappa (κ) Cephei, 73 Draconis, and 11 Cephei. In the middle is the Northern Shepherd, Gamma (γ) Cephei:

- The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts this asterism as a shepherd with a staff surrounded by sheep.
- John Hill lists this as "Shepherd and Flock" in his *Urania* in 1754.
- R. H. Allen lists it as "the Fold" (that is sheepfold) in his *Star Names* in 1899.

Shepherd, Dogs, and Sheep:

This asterism "Pastor Canes et Oves" was created by German astronomer Petrus Apianus in 1533 in his *Horoscopion Apiani General*. It is made up of stars between the IAU constellations Cassiopeia and Cepheus. It is probably influenced by the Arabic asterism Shepherd and the Sheep (see above). 12th century Spanish Rabbi Abraham ibn Ezra called it "Pastor in cujus manu est frenum" ("the shepherd in who's hand is the bridle").

Shepherd Holding a Bridle:

This Hebrew asterism "Roah" or "Ha Roah Schehido Ha Resan" is the IAU constellation Auriga as listed in John Hill's *Urania* in 1754. He translates this as "shepherd holding a bridle". Compare this to Reins Holder (above).

Shepherd of the Jauza:

This Arabic asterism "Rā'ī al-Jauzā'" is Beta (β) Orionis (Rigel) in the IAU constellation Orion:

- "Rā'ī al-Jauzā'" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Ra'l al-Jauza… shepherd of the Jauza, whose herds, or thirst allaying camels" is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and Smyth describes this as the stars Alpha (α) Orionis (Betelgeuse), Lambda (λ) Orionis, Delta (δ) Orionis, and Kappa (κ) Orionis. Smyth does not identify his source.

Shepherd of the Ostriches:

This Arabic star "Ra'i al-Nayyem" (راعي النعايم) is Lambda (λ) Sagittarii in the IAU constellation Sagittarius as listed in the poems of Muhammad al-Mukrī and Mohammad al-Qadhi (Kunitzsch 1989).

Shepherd with the Sheep:

This Romanian asterism "Ciobanul cu Oile" is the IAU constellation Lyra (Ottescu 2009, Lite 2018). The star Alpha (α) Lyrae (Vega) is the Shepherd and the rest of the stars in this constellation are the sheep.

Shepherd's Dog:

There are two Arabic stars with this name:

- One, "kalb al-rā'ī" (كلب الراعي) is the star Beta (β) Ophiuchi in the IAU constellation Ophiuchus:

- "Kalp al-Rā'ī" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Al Kalb al Rai", "Cebalrai", "Celbalrai", "Cheleb", "Celabrai", "Kelb Alrai", or "Alrai".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kelb ar rái, the shepherd's dog".
- "Celbalrai" appears in Giuseppe Piazzi's *Palermo Catalogue* of 1814.
- German astronomer Johann Elert Bode (1747 – 1826) lists it as "Chelb Er Rai".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Cebalrai".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Kelp al Rai" and "Celb al Rai" for this star, but his 14th edition (1959)only lists this star as "Kelb al Rai".
- In 2106 the IAU Working Group on Star Names approved the name Cebalrai for Beta (β) Ophiuchi.
- NOTE: R. H. Allen translated this Arabic name as "Heart of the Shepherd" in his *Star Names* in 1899.

- One is the star Pi (π) Cephei in the IAU constellation Cepheus and is part of their asterism Shepherd and the Sheep (see above). It is also known as Northern Shepherd Dog:
  - This appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
  - John Hill lists this as "Kelb" in his *Urania* in 1754.

Shepherd's Star:

This Romanian star "Steaua Ciobanului" is Alpha (α) Ursae Minoris (Polaris)in the IAU constellation Ursa Minor (Ottescu 2009). NOTE: They also use this as a name for Venus.

This star is Alpha (α) Arietis (Hamal) in the IAU constellation Aries as listed in *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a name for Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Shepherd's Yoke:

This Romanian asterism "Cobiliţa Ciobanului" is the IAU constellation Cygnus (Ottescu 2009). It is called this as it rises and sets as the same time as their star Shepherd (See above).

Sheratan:

See Two Signs, below

Shesmu:

This Egyptian decan "Shesmu" was in the IAU constellation Sagittarius. In later Hellenistic texts it was named "ϲЄϹϺЄ" or "ϹΙϹЄϹϺЄ" ("Sesme"). In the Testament of Solomon, it became "Enautha" or "Enenuth", Aristobulus of Paneas (2nd century) called it "Daha", in Greek Hermeticism it became "Teuchmos", in Latin Hermeticism "Thursois", 4th century Roman astrologer Julius Firmicus Maternus called it "Sagon", Cosmas of Maiuma (d. 760) called it "Kore", French scholar Joseph Justus Scaliger

(1540 - 1609) called it “Sagen” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲧⲟⲙⲣⲁⲥ” (“Tomras”). Variations include “Teukhmos”. It is depicted as a man with a bird’s head with a flask in his right hand and a scepter in his left.

Shi Shen:

This Chinese asterism “Shi Shen” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Gemini (Kotyk 2017).

Shichen:

This Chinese asterism is the xiù (lunar mansion) “Shēnxiù” (参宿), which is the three stars of the “belt of Orion” in the IAU constellation Orion (See Three Stars, below). Ridpath (1988) relates a story of how the emperor Gaoxinshi (c 2436 B.C.E.) placed his sons Sichen and Ebo in different parts of the sky as they were always fighting. Shichen ended up ruling this xiù.

Shield:

This Latin star “Scutulum” is Iota (ι) Carinae in the IAU constellation Carina.

This star “Clypeo” is Theta (θ) Persei in the IAU constellation Perseus. This name is listed in Johann Bayer’s *Uranometria* (1603).

This Greek star “ασπιδίσκε”, “Aspidiske”, or “Asmidiske”, is Iota (ι) Carinae in the IAU constellation Carina. “Asmidiske” appears in Giuseppe Piazzi’s *Palermo Catalogue* of 1814. The IAU approved the name Aspidiske for Iota (ι) Carinae.

This Greek star “Asmidiske”, “Azmidi”, or “Azmisdiske” is Xi (ξ) Puppis in the IAU constellation Puppis. Its name is a misspelling and misplacement of the name “Aspidiske” (see above) which was the name of the star Iota (ι) Carinae.

This Latin asterism is the stars Omicron (ο) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis and 6 Orionis in the IAU constellation Orion and was listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia* and in R. H. Allen’s *Star Names* in 1899.

Shield Bearer:

This Chaldean asterism “mul a-ri-tum” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Shield of Antlia:

This **telescopic** asterism “Peltáta Ántliae” is the lenticular spiral galaxy NGC 3358 in the IAU constellation Antila. It was discovered in 1835 by John Herschel who listed it as h 3293 and later as GC 2188 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Shield of Eridanus:

This **telescopic** asterism “Clípeus Erídani” is the almost edge-on elliptical galaxy NGC 1332 in the IAU constellation Eridanus. It was discovered in 1784 by English astronomer William Herschel who listed it as “I 60”. This became GC 709 in the *General Catalogue* of 1864. This name appears in *The Catalogue of*

One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "looks like an ancient Roman shield in oblique view".

Shield of Hydra:

This **telescopic** asterism "Scútum Hýdrae" is the barred spiral galaxy NGC 2811 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as "II 505". It became GC 1796 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this as "this nearly edge-on barred spiral galaxy resembles a shield".

Shield Star:

This Yucatec star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. They also call it "Xaman Ek" (see Star of the North, below).

Shield Stars:

This Cochiti asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Shin Bone of the Lion:

This Arabic star "Sāḳ al Asad" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo:

- This was listed by Persian astronomer Zakariyya' al-Qazwini (1203 – 1283).
- This was listed by R. H. Allen in his *Star Names* in 1899.

Shine (like a Star):

This **telescopic** Manx star "Gloas" is WASP 13 in the IAU constellation Lynx (magnitude 10.42). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Cruinlagh ("to orbit (like a planet)").

Shining Boat:

This English star "Lucida Cymbae" is Alpha (α) Phoenicis in the IAU constellation Phoenix as listed in R. H. Allen's *Star Names* in 1899. Compare this to the Arabic asterism Bright One of the Boat

Shining Brightly:

This Sotho and Tswana star "U-Canzibe" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Holbrook and Baleisis 2007, Alcock 2014).

This Zulu star "uCwazibe" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

This Xhosa star "uCanzibe" ("shining" or "sparkling") or "inKwenkwezi" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Lock and Slotegraaf 2022). This star and iQhawe (see Champion, above) are seen by some as suitors, though it is not clear whose affection they are seeking.

Shining Copper of Ursa Major:

This **telescopic** asterism "Chalcóphanes Úrsae Majóris" is the lenticular galaxy NGC 2768 in the IAU constellation Ursa Major. William Herschel listed it as "II 490", his son John Herschel listed it as h 562

and later as GC 1768 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Shining in Heaven:

This Hawaiian star "Polo-ahi-lani" is Alpha (α) Cassiopeiae (Shedar) in the IAU constellation Cassiopeia.

Shining Jewel:

See Bright One, above.

Shining One:

There are two Arabic stars with this name:

- One, "al-Maysān" (الميسان) is the star Gamma (γ) Geminorum in the IAU constellation Gemini:
    - This was later latinized to "Almeisan", "Al Maisan", "Almeisan", "Almisan", "Almeisam", and "Almisam".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Al meïsan, the proud marcher".
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as Meissa: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - R.H. Allen translates it as "proudly marching one" in his *Star Names* in 1899.
- One, "al-Maysān" (الميسان) is the star Lambda (λ) Orionis in the IAU constellation Orion:
    - This was later latinized to "Meissa".
    - R. H. Allen writes in his *Star Names* in 1899 that Persian lexicographer "Firuzbadi… applied to this star Meissa, and is now common for it". This would be Fairūzābādī (فیروزآبادی), also known as el-Fīrūz Abādī", "al-Fayrūzabādī (الفيروزآبادي) and "Firuzbadi" (1329–1414) whose al-Qamous (القاموس) dictionary was in use for five centuries.
    - The IAU approved the name Meissa for the star Lambda (λ) Orionis A.

This Latin asterism "Maera" is the IAU constellation Corona Borealis as listed by 4th century Latin Christian poet Aurelius Clemens Prudentius (Prudens).

Shining Red:

This Hawaiian star "Polo'ula" is Beta (β) Cassiopeiae (Caph). It is also known as "Pohina".

Shining Ring of Leo:

This **telescopic** asterism "Cyclóphaës Leónis" is the barred spiral galaxy NGC 3705 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "II 13". John Herschel listed it as h 902 and h 903, and later as GC 2434 and GC 2436 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its "bright inner ring".

Ship:

This Arabic star "Al-Safinah" (السفينة) is Delta (δ) Velorum in the IAU constellation Vela:

- "al-Safīna" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Alsephina" or "Alsafina"
- Johann Bayer's *Uranometria* (1603) lists "Sephina".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Sephina".
- Robert Hues lists "Alsephina" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists "Sephina" and "Al Sephina" as names for the asterism Argo's Ship (see above) in his *Urania* in 1754 and confirms that he recognizes that the translation of this term is "ship".
- "Alsephina" or "Alsafina" are listed in R. H. Allen's *Star Names* in 1899. Allen wrote that this was a name given by the Arabs to Ptolemy's asterism Argo's Ship (see above).
- The IAU approved the name Alsephina for the star Delta (δ) Velorum Aa.

This Greek star "*ναύς*" or "Naos" is Zeta (ζ) Puppis in the IAU constellation Puppis:

- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Naos".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Naos" for this star.
- The IAU approved the name Naos for this star.

This German asterism "Schiff" is the asterism Argo's Ship (see above).

This Greek asterism "κάραβος" or "Káravos" is the IAU constellation Cancer as it appears in a 12th century illustrated astronomical manuscript according to R. H. Allen in his *Star Names* in 1899.

This Egyptian asterism "Skaphos" is one of the paranatellonta of decans of Leo as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the Greek asterism Argo's Ship (see above).

This **telescopic** asterism Leiter 10 from the list of American astronomer Frank Leiter is a group of 9th magnitude stars in the IAU constellation Pegasus. Five stars of 10th magnitude form a "V". A pair of stars and a single star make a "deck" across it. Leiter also describes his as a "Little Teapot". Its size is 18' X 8'. Robert Zebahl lists it on his *Faint Fuzzies* website and describes it as resembling a "Star Trek A".

Ship of Horus:

This ancient Egyptian asterism is the belt of Orion in the IAU constellation Orion.

Ship of Hydra:

This **telescopic** asterism "Návis Hýdrae" is the edge-on spiral galaxy NGC 3404 in the IAU constellation Hydra. It was discovered by English astronomer Andrew Ainslie Common in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "the profile of this edge-on galaxy puts in mind a ship's shape".

Ship of Sky:

This Korean asterism "Haneul-ui Bae" (하늘의 배) is a curving line of stars in the IAU constellation Perseus. The line starts at Eta (η) Persei and runs through Gamma (γ) Persei, Alpha (α) Persei (Mirfak), Psi (ψ) Persei, Delta (δ) Persei, 48 Persei, Mu (μ) Persei, and b Persei, ending at HIP 19949.

Shipping Star:

This asterism "Schifffahrts Gestirn" is the Pleiades cluster as listed by German astronomer Christian Ludwig Ideler (1766 – 1846). English Admiral Henry William Smyth lists this in his *Bedford Catalogue* in 1844 and attributes it to Ideler.

Ship's Star:

This Anglo-Saxon star "Scip-steorra" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It is mentioned in the 8th or 9th century Old English *Rune Poem* which has stanzas on 29 Anglo Saxon runes and is associated to the run "ᛏ" or "Týr" which is in turn associated with a circumpolar constellation compared to steadfastness of honour. This Rune Poem was found in the manuscript Cotton Otho B.x, which was destroyed in a fire in 1731, but recorded in a facsimile by George Hickes in 1705.

This German star "Schif-stern" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Shi'ra Who Crossed Over:

This Arabic star "ash-shi'ra al-'abur is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and is part of the asterism Two Shi'ra Sisters (below). It is called this represents the sister (also called the Teary-Eyed Woman, see below) who crosses the "river" (the Milky Way) to be with her brother Suhayl (see Glorious, above). NOTE: Sirius 50,000 years ago was on the other side of the Milky Way as viewed from Earth. That doesn't mean this story is that old, but if you go back between 15,000 and 20,000 years ago it would be emerging from the Milky Way and the old story could conceivably date back that far. "al-Shi'ra al-'Abūr" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Shoe:

This Greek asterism is the "claw" of the IAU constellation Cancer as described by the Greek poet Aratus (315 – 240 B.C.) in his *Phenomena*.

Shoe-Buckle Cluster:

This **telescopic** asterism is the open cluster Messier 35 in the IAU constellation Gemini. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745. It is listed in the General Catalogue of 1864 as GC 1360 and in John Herschel's catalogue as h 377. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply refers to this as a "Gemini Nebula". One of the reasons that it got this name is because it is above the "foot" of the twin Castor in this constellation. The other is that the stars of the cluster form a rectangular shape like a "buckle" with a line of stars running out one side like the "tongue". This is also known as the Sky-Rocket Burst.

Shoeprint Nebula:

This is an alternate name for NGC 6309 (see Box Nebula, above).

Sholbi:

This Mursi star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (see Pointers, above). They used it as part of a system to tell when the local Omo River would flood.

Shopping Cart:

See “37” above.

Short Horizon:

This Māori star “Kapae-poto” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Short Yoke:

This Netwar asterism “Kasulia Reparep” is a quadrilateral of stars in the IAU constellation Orion (Ramík 2019): Kappa (κ) Orionis (Saiph) and Beta (β) Orionis (Rigel) and the Belt of Orion.

This Nahwal asterism “Kasulia Kuakua” (Ramik 2019) is identical to the Netwar asterism “Kasulia Reparep” (see Short Yoke, above).

Shorter Post:

This Tahitian star “Anatahu’ata Metu te Tupu Ma Vae” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Edwards 2015). Edwards listed the name of the star as “Articus”.

Shou Xing:

This Chinese asterism “Shou Xing from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Libra (Kotyk 2017).

Shoulder:

There are two Arabic stars with the name “Al Mankib” (المنقب):

- One is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion:
    - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name “mankib al-jawzā ayman” for this star and the Hebrew name “sad te’omim yemini”. NOTE: It also gives Gamma (γ) Orionis the Arabic name “mankib al-jawzā” and the Hebrew name “sad semol te-omim”, as does an anonymous Hebrew star list from 1392 (Goldstein 1985).
    - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) gives the Arabic name “mankib al-jabbār” and the Hebrew name “shekhem ha-gibbor”.
    - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists “Algenie” (Dekker 2000).
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Menkib al jauzá” as a name for this star.
- One, “Al Mankib” (المنقب) or “Mankib al-Thurayya” is Xi (ξ) Persei in the IAU constellation Perseus and is part of their asterism “Al Thuraya” (see above). This was later latinized to “Menkib”. The IAU approved the name Menkib for Xi (ξ) Persei.

Shoulder Blade:

This Arabic asterism “al-‘atiq” (العاتق) is Omicron (ο) and Zeta (ζ) Persei in the IAU constellation Perseus and is part of their asterism Al-Thurayya (see Little Abundant One above).

Shoulder of Al Jawza:

This Arabic star “Al Manib” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion:

- "Mankib al-Jauzā'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "mankib al-jawzā' al-yusrā".
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "mankib al-Yamin" and the Hebrew name "yemin te'omim".
- NOTE: R. H. Allen writes in his *Star Names* in 1899 that 14th century Greek geographer and astronomer Georgius Chrysococcas gave the Greek name "Ὦμος διδύμων" ("Ómos didýmon" or "shoulder of") for this star.

Shoulder of Al-Thurayya:

There are two Arabic stars with this name:

- One, "al-ʿĀtiq ath-Thurayyā" (عاتق الثّريّا), is the star Omicron (o) Persei in the IAU constellation Perseus as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449):
    - This was later latinized to "Atik", "Ati", or "Al Atik".
    - The Borgian Globe of 1225 depicts this star. It is part of their asterism Al-Thurayya, (see above).
    - In 2016 the IAU Working Group on Star Names assigned the name Atik to Omicron (o) Persei A.
- One, "Al-Mankib uth-Thurayyā" (منكب الثّريّا) or "Mankib al Thurayya" is the star Xi (ξ) Persei in the IAU constellation Perseus. It is part of their asterism Al-Thurayya, (see above).:
    - This was later latinized to "Menkib", "Menchib", "Menkhib", or "Al Mankib".
    - American uranographer Elijah Burritt (1794 – 1838) listed "Menkib".
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Menchib": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - The IAU approved the name Menkib for Xi (ξ) Persei in 2016.

Shoulder of the Centaur:

This Arabic star "Mankib ul-Qanṭūris" (منكب قنطورس) is Theta (θ) Centauri in the IAU constellation Centaurus, later latinized to "Menkent". The IAU approved the name Menkent for Theta (θ) Centauri.

Shoulder of the Eagle:

This Persian star "mankib al-nasr" (منكب ألنسر), later latinized to "Menkib al Nesr", is Gamma (γ) Aquilae in the IAU constellation Aquila as listed in the *Calendarium* of Al Achsasi Al Mouakket in 1650.

Shoulder of the Giant:

This Arabic star "makib al-jabbār al-aysar" is Gamma (γ) Orionis in the IAU constellation Orion as listed in the star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985). Ibn Ezra gives the Hebrew name "shekhem ha-gibbor ha-semoli".

Shoulder of the Horse:

This Arabic star "Mankib (ul-Faras)" (منكب الفرس) is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus:

- "Mankib al-Faras" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as "Mankib al-faras" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "mankib al-faras".
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "mankib al-faras" and the Hebrew name "yemin ha-sus". .
- The Sloan astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "MENkeb" (Dekker 2000).
- This was later latinized to "Mankib" and "Menkib".
- R. H. Allen lists it as "Mankib al Faras" in his *Star Names* in 1899 and attributes the later name to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- John Chilmead (1899) lists "Almenkeb", which he derived from Robert Hues' *A Learned Treatise of Globes* (1659).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Menkib al feres, the horse's shoulder".

Shoulder of the Lion:

This Arabic star "mankib al-asad" is Gamma (γ) Leonis in the IAU constellation Leo as it appears in the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

Shoulder of the Panther:

This Babylonian star MUL.KUMARU" from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or "MUL.ku-ma-ru" (Parpola 1993) is Delta (δ) Cygni in the IAU constellation Cygnus and is part of the asterism Panther (see above).

This Akkadian star "Kumaru" from the *Astrological Reports to the Kings* of the late Assyrian period Parpola 1993) is Delta (δ) Cygni in the IAU constellation Cygnus and is part of the asterism Panther (see above).

Shoulder of the Rein Holder:

There are two Arabic stars with this name:

- One, "Kaʿab Dhiy l-ʿInān" (كعب ذي العنان) is the star Iota (ι) Aurigae in the IAU constellation Auriga, later latinized to "Kalb".
- One, "Mankib Dhiyi l-ʿInān" (منكب ذي العنان) is the star Beta (β) Aurigae in the IAU constellation Auriga:
    - This was later latinized to "Menkalinan", "Menkalinam", "Menkalina", or "Menkarlina".
    - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "katif mumsik al-'inān" and the Hebrew name "ketef 'oser ha-resen".
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "mankib dhī 'l-inān al-aysar" and "mankib dhī 'l-inān".

- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Menkalinan".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Menkib dhi l'inán, the rein holder's shoulder".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Menkalinan".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Menkalinan".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Menkalina (sic)".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Menkalinan" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Menkalinan" for this star.
- The IAU approved the name Menkalinan for the star Beta (β) Aurigae Aa.

Shoulder of the Water Pourer:

This Arabic star "Mankib sākib al-mā" is Alpha (α) Aquarii (Sadalmelik) in the IAU constellation Aquarius as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Shouter:

This Latin asterism "Vociferans" ("shout") is the IAU constellation Boötes. This is related to their asterism Cryer (see above):

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Vociferator" as an alternate name for Boötes.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Vociferator" for Boötes.
- Robert Hues lists it as "Vociferator" ("shouter") in his *A Learned Treatise of Globes* in 1659.
- "Vociferator" is listed by English Admiral Henry William Smyth in his *Bedford Catalogue* in 1844, who additionally lists "Clamator".

This Latin asterism "Vociferans" is the IAU constellation Cepheus. Compare this to Singing (below) and Making Sound (above).

Shrewmouse:

This Greek lunar mansion is possibly the IAU constellation Leo Minor and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

Shrine of Sky:

This Korean asterism "Haneul-ui Sinjeon" (하늘의 신전) is a bending line of stars in the IAU constellation Sagittarius. It starts at Zeta (ζ) Sagittarii and runs through Tau (τ), Sigma (σ), Phi (ϕ), and Lambda (λ) to Mu (μ) Sagittarii.

Shrine of the Mace:

This Gallic asterism “Massae Feretrum” is made up of stars of the IAU constellation Gemini. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. This is a “box” formed by the stars Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Upsilon (υ) Geminorum, Delta (δ) Geminorum, Epsilon (ε) Geminorum, and Tau (τ) Geminorum.

Shrimp Galaxy:

See Grasshopper.

Shrimp Nebula:

This **telescopic** asterism is planetary nebula Sh 2-188 in the IAU constellation Cassiopeia. It is listed under this name as well as the names “Prawn Nebula” and “Dolphin Nebula” on RASC member Ron Brecher’s *Astro Doc* website.

Shrimp of Triangulum:

This **telescopic** asterism “Pandalus Triánguli” is the barred spiral galaxy IC 1727 in the IAU constellation Triangulum. It was discovered by British astronomer Isaac Roberts in 1896. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Shroud of Vernonica:

This Czech asterism “Sudarium Veronicae” was created by Czech astronomer, optician, and friar Antoine Marie Schyrle de Rheita in 1643. It is a rectangle of stars with the corners being Rho (ρ) and Omicron (ο) Leonis, Beta (β) Sextantis, and Iota (ι) Hydrae. De Rehita writes “Sudarium Veronicae sive faciem Domini maxima similitudine in astris expressum” (“The shroud of Veronica, or the face of the Lord, expressed in the greatest similitude in the stars”). Compare this to Face of the Lord, above.

Shu:

This Egyptian star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003). Shu is a God of air whose name means “emptiness”. The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Shu, with an ostrich feather for a head (Bullinger 1882, Seiss 1882).

Shŭ:

This Chinese star “Shŭ” from the 3 Kingdoms and Ming Dynasty Period is the star Alpha (ε) Serpentis (Unukalhai) in the IAU constellation Serpens and is part of their xing guan Heavenly Market West Wall (see above).

Shullat:

This Seleucid star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus and is part of the “foot” of their asterism Numushda (see above). Compare this to the Babylonian star dSullat (above).

Siamese Twins:

This **telescopic** asterism is NGC 4567 and NGC 4568, a pair of colliding unbarred spiral galaxies in the IAU constellation Virgo: They are part of the Virgo Cluster. These were discovered by English astronomer

William Herschel in 1784 who listed them as “IV 8” and “IV 9”. His son John Herschel listed them as “1358” and “1359” in his catalogue. They are GC 3108 and GC 3109 in the *General Catalogue* of 1864. They are also known as the Butterfly Galaxies (see above), or the Fish and Chips Galaxies (see above). They are listed separately in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as the “Very Elegant of Virgo” and the “Very Wonderful of Virgo” (see below).

Sibilut:

This Sama star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Santos et al 2019).

Sibyl:

This Greek asterism “Σίβυλλα” (“Sívylla”) is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists the “Singing Sibyl” for this constellation. The Sibyls were prophetesses of Ancient Greece, who prophesied at holy sites.

Sicily:

This Latin asterism “Sicilia” is the IAU constellation Triangulum. It is called this as the island of Sicily was considered to be roughly the same shape. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Sicilia”. “Sicilia” is listed in R. H. Allen’s *Star Names* in 1899. Other names for Sicily used for this asterism include “Trinacria” and “Triqueta”.

Sickle:

This Latin star “Falx Italica” is 38 Boötis in the IAU constellation Boötes.

This Sardinian asterism “sa frache” is the curve of stars at the front end of the IAU constellation Leo from the star Epsilon (ε) Leonis to the star Alpha (α) Leonis (Regulus), resembling a mirror-image question mark (Putzolu 2019 - see Sickle of Leo, below).

This Gallic asterism “Falx” is made up of stars of the IAU constellation Leo. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. This line of stars starts at Epsilon (ε) Leonis and runs through Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis and Eta (η) Leonis to the star Alpha (α) Leonis (Regulus).

This Norwegian asterism “Sigden” is the curve of stars at the front end of the IAU constellation Leo from the star Epsilon (ε) Leonis to the star Alpha (α) Leonis (Regulus), resembling a mirror-image question mark (see Sickle of Leo, below).

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a sickle shaped curve of stars in the IAU constellation Sculptor:

- The “handle” is the determinative star Alpha (α) Sculptoris and HIP 6502,
- The “blade” is the stars Sigma (σ) Sculptoris, Alpha (α) Sculptoris, HIP 2661 and Eta (η) Sculptoris.

This Chinese xing guan “Fūzhì” (钬铚) is a sickle shaped curve of stars in the IAU constellation Cetus:

- The “handle” is the stars Iota (ι) and Eta (η) Ceti, and

- The “blade” runs from Eta (η) Ceti through Theta (θ), Zeta (ζ), Tau (τ), and Upsilon (υ) Ceti, ending at 48 Ceti.

The area inside of the curved blade of their asterism “Fūzhì” is known as the “Square Celestial Granary” (see below).

This Chinese Chenzhuo xing guan is made up of the stars of the IAU constellation Sculptor. The “handle” runs from Alpha (α) Sculptoris to HIP 6502. The “sickle blade” is the curve of stars Sigma (σ) Sculptoris, Alpha (α) Sculptoris, HIP 2661 and Eta (η) Sculptoris.

This Romanian asterism “Secera” is in the IAU constellation Orion (Ottescu 2009, Lite 2018). The “handle” is the sword of Orion and the arc of stars 49 Orionis, Nu (ν) Orionis, 29 Orionis and Tau (τ) Orionis is the “blade”.

This Hobbit asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) and appears in the later works of J. R. R. Tolkien (1892 – 1973). In Tolkien’s early notes (1910) he called it “Telpea Kalka” (“Silvern Sickle”).

There are four **telescopic** “sickle” asterisms:

- One is Leiter 17 from the list of astronomer Frank Leiter and is in the IAU constellation Pegasus. This includes HIP 479. Its size is 11’ X 8’.
- One is in the IAU constellation Ursa Major and is Corder 1959 on the observing list of American astronomer Jeffrey Corder. Size 25’. This is five 8^{th} – 9^{th} magnitude stars including HIP 49649 and the double star HIP 49596A.
- One is in the IAU constellation Boötes and is Corder 2717 on the observing list of American astronomer Jeffrey Corder. Size 125’ X 80. The “blade” is five 4^{th} – 5^{th} magnitude stars including Psi (ψ) Boötis, 46 Boötis, Omega (ω) Boötis, and the double stars HIP 74096 and 45 Boötis. The “handle” is eight 7^{th} – 8^{th} magnitude stars including HIP 73303, 73203, 73071, 72982, and 73301, and the double star HIP 72762.
- One is the galaxy UGC 10402 in the IAU constellation Hercules. This name was posted by American astronomer Jimi Lowrey on the *Deep Sky Forum* in May 2025.

Sickle of Cronus:

This Greek asterism is the IAU constellation Scorpius as listed by Hesiod (Mosenkis, date N/K).

Sickle of Hydrus:

This **telescopic** asterism “Falcátus Hýdri” is the barred spiral galaxy NGC 646 in the IAU constellation Hydrus. This was discovered in 1834 by John Herschel who listed it as 2434 in his catalogue. This became GC 384 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): Along with nearby PGV 6014 it forms the shape of a sickle.

Sickle of Leo:

The curve of stars at the front end of the IAU constellation Leo resembles a mirror-image question mark or a sickle, and according to R. H. Allen in his *Star Names* of 1899, this goes back centuries. This is a line of stars from Epsilon (ε) Leonis (Algenubi, Ras Elased Australis, or Ras Elased) through Mu (μ) Leonis (Rasalas, Alshemali, or Ras Elased Borealis), Zeta (ζ) Leonis (Adharera or Adhafera), Gamma (γ) Leonis

(Algieba or Al Gieba- 50th brightest star) and Eta (η) Leonis (Al Jabhah, Chort, Chertain or Coxa) to the star Alpha (α) Leonis (Regulus, Cor Leonis, Rex, Kabeleced, or Al Kalb al Asad- 21st brightest star). Another star in this constellation, Beta (β) Leonis (Denebola), is the 60th brightest star. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this "sickle of Leo". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this "Sickle of Leo" asterism.

Sickle of the Valar:

This Elvish (Qenya) asterism "Valacirca" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) and appears in the later works of J. R. R. Tolkien (1892 – 1973). In his earlier works Tolkien called it Valakirka ("Sickle of the Gods"). Its name in Sindarin is "Circh i-Mbelain".

Side General:

This Chinese star "Bianjiang" from the Three Kingdoms to the Ming Dynasty is Alpha (α) Tauri (Aldebaran). It is also known as Celestial High Terrace (see above).

Side of the Chained Woman:

This Arabic star "Al Janb al Musalsalah" is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda:

- "Janab al-Musalsala" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 but this may be 12 Andromedae (Hafez 2010).
- "janb-al-musalsala wa-huwa batn al-hūt" ("the side of the chained [woman]; it is the belly of the fish") appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Jenb-al-muselselah".

Side of Perseus:

This Arabic star "Janb Barshāūsh" is Beta (β) Persei (Mirfak) in the IAU constellation Perseus:

- "Janb Barshāūsh" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists janb barsāwus".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Jenb Bersháwush", … the side of Perseus".

Side Star:

This KhoiKhoi star "!nam /gamirob" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

This G/wi star "g/aokhu" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

Sided One:

This Bedouin star "al-Ǧinīb" (الجنيب) is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Sieve:

There are three Belarussian asterisms by the name “Sita”, “Sito”, “Sitačko”, “Sitca”, “Sitsiachko”, “Sicca”, “Sitechko”, or “Reshata”:

- One is the IAU constellation Coma Berenices (Avilin 2009).
- One is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018). It is also known as the Heavenly Sieve (see above). This is believed to be a sieve used by the angels to sift righteous souls. It is also known as “Maloe Sita” (see Little Sieve, above).
- One, “Sitso”, is the IAU constellation Ursa Major (Avilin 2009).

This Latvian asterism “Sietiņš” is the Pleiades cluster in the IAU constellation Taurus.

This Finnish asterism “Seulaset” (“colander holes”) is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen lists this as “Sieve” in his *Star Names* in 1899.

This Lithuanian asterism “Sietinas, Sétas”, “Sietis”, “Sytas”,”Seitas”, or “Sėtis” is the Pleiades open cluster in the IAU constellation Taurus. R. H. Allen listed it as “sieve” in his *Star Names* in 1899.

This Estonian asterism “Sõel” is the Pleiades cluster in the IAU constellation Taurus (Kuperjanov 2006). This comes from the island of Saaremaa.

Sieve of Heaven:

This Estonian asterism “Taeva Sõel” is the Pleiades cluster in the IAU constellation Taurus. Compare this to the Belarussian asterism “Нябеснае Сіта” (see Heavenly Sieve, above).

Sieve of Stars:

This Lithuanian asterism “Žwaizdziusytas” is the Pleiades open cluster in the IAU constellation Taurus. Variations include: “Žvaigždžių sietas”, “Žvaizdžių sietas”, and “Zwayzdzių sitas”.

Sigma:

This **telescopic** asterism is Do Dz 17 or Stratton 2 on the asterism list of Troy Stratton, Observing Program Coordinator of The Astronomical League. It is in the IAU constellation Orion near the star Gamma (γ) Orionis (Bellatrix). It resembles a capital Greek letter Sigma (Σ) with the middle star being the 7th magnitude star HIP 25073.

Sigmas:

This **telescopic** asterism is made up of a pair of stars of the IAU constellation Taurus: Sigma (σ) 1, and 2 Tauri. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels these the “Sigmas”.

Sign:

This Arabic asterism “ash-sharat” is Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) in the IAU constellation Aries as listed in the rain stars calendars of Qushayr and Qays. Compare this to their asterism ash-sharatan (see Two Signs below) and al-ashrat (see Signs below). This appeared around the 9th century and although the original meaning is uncertain it is believed that it might have been called this because at that time the sun began its new year in Aries (Adams 2018).

Sign of Christ:

This Gallic asterism “Signum Christi” is made up of stars of the IAU constellations Andromeda and Pisces. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. It is a circle of stars starting at Phi (ϕ) Piscium and running through Upsilon (υ) Piscium, Tau (τ) Piscium and Sigma (σ) Piscium (all part of the northern “fish” of Pisces), Delta (δ) Andromedae, Epsilon (ε) Andromedae, Zeta (ζ) Andromedae, and Eta (η) Andromedae. McKay (2020) describes this “fish” as a sign of Christ.

Sign of God:

This Bedouin asterism is the IAU constellation Draco. It was seen as a reminder or sign (“ayah”) of God’s existence (Steiner 2017). Compare this to the Arabic asterism Seat of God (above).

Sign of Tau:

This German asterism “Signum Tau” is the IAU constellation Triangulum Australe as listed by German uranographer Julius Schiller (c. 1580 – 1627). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Signum Tau Al Triangulum Australe”.

Sign of Three:

This Bugis asterism “Tanra Tellué” is the belt of Orion in the IAU constellation Orion. It is related to their asterism “Bintoéng Rakkalaé” (see Plough Stars, above).

Sign of Thuraya:

This Bedouin asterism from the Negev desert “Wasm-ath-Thuraya” is the Pleiades cluster in the IAU constellation Taurus (Steiner 2017).

Signatures of Lights:

This German asterism is “Signatricia Lumina” is the Pleiades cluster as listed by German astronomer Johann Bayer (1572-1625) and by R. H. Allen in his *Star Names* in 1899.

Signs:

This Arabic asterism “al-ashrat” is Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) 2 Arietis (Mesarthim) in the IAU constellation Aries as listed by Ibn Qutayba (d. 879 C.E.). Compare this to their asterism ash-sharatan (see Two Signs below) and ash-sharat (see Sign, above). This plural reference to this asterism appeared in many poetic references in Arabic star lists.

Sihor:

This “Egyptian” asterism is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in John Hill’s *Urania* in 1754.

Silent Carriage:

This Estonian asterism “Väike Vanker” is the IAU constellation Ursa Minor and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Silk Fan Cluster:

This telescopic asterism is also known as the Flying Geese Cluster and the Ghost Bush Cluster and is the open cluster NGC 6939 in the IAU constellation Cepheus. It was discovered by William Herschel in 1798 who listed it as VI 42. It is GC 4590 in the *General Catalogue* of 1864.It lies 0.6 degrees northwest of spiral galaxy NGC 6946 and 2 degrees southwest of the star Eta (η) Cephei.

Silkworm Nebula:

This **telescopic** asterism is the protoplanetary nebula PN G004.2+02.1 in the IAU constellation Sagittarius.

Silver Coin:

This **telescopic** asterism is NGC 253 (Caldwell 65), an intermediate spiral galaxy in the IAU constellation Sculptor. It was discovered by English astronomer Caroline Herschel in 1783 and observed by her son John Herschel (1792 – 1871) about a half century later. This is listed as GC 138 in the 1846 *General Catalogue*. South African astronomers Magda Streicher and Carol Botha (2011) lists this name in their observation logs on the DOCdb. It is also known as Caroline's Galaxy (see above), the Sculptor Galaxy (see above), and the Silver Dollar Galaxy (see below).

Silver Dollar:

This **telescopic** asterism is NGC 253 (Caldwell 65), an intermediate spiral galaxy in the IAU constellation Sculptor. It was discovered by English astronomer Caroline Herschel in 1783 and observed by her son John Herschel (1792 – 1871) about a half century later. This is listed as GC 138 in the 1846 *General Catalogue*. It is also known as Caroline's Galaxy (see above), the Sculptor Galaxy (see above), and the Silver Coin Galaxy (see above).

Silver Needle:

This **telescopic** asterism is NGC 4244 (Caldwell 26), an edge-on spiral galaxy in the IAU constellation Canes Venatici near Beta (β) Canum Venaticorum. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 41". It is GC 2831 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Rháphis Cánum Venaticórum" ("the needle of Canes Venatici").

Silver Nugget Cluster:

This **telescopic** asterism is the globular cluster NGC 6441 in the IAU constellation Scorpius. It was discovered in 1827 by Scottish astronomer James Dunlop. John Herschel listed it as h 3705 and later as GC 4332 in the *General Catalogue* of 1864.

Silver Road of Centaurus:

This **telescopic** asterism "Argyróporus Centaúri" is the barred spiral galaxy NGC 4945 (Caldwell 83) in the IAU constellation Centaurus. It was discovered by Scottish astronomer James Dunlop in 1827. This is listed as GC 3386 in John Herschel's General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Cigar Galaxy (see above), the Tweezers (see below), and the Golden Coin (see above).

Silver Sliver:

This **telescopic** asterism NGC 891 (Caldwell 23) is an edge-on spiral galaxy in the IAU constellation Andromeda with a prominent dust lane. It is also known as the Outer Limits Galaxy (see above). It was discovered by English astronomer William Herschel in October 1784 who listed it as "V 19). It is listed as GC 527 in the *General Catalogue* of 1864. It is also known as the Silver Needle, the Outer Limits Galaxy, and "Surrounded by Dust".

Silver Streak:

This **telescopic** asterism is NGC 4216, an edge-on intermediate spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 35". It is GC 2806 in the *General Catalogue* of 1864. Size 7.8' X 1.8'. It is also known as the "Spindle of Virgo" (see below), and the "Weaver's Shuttle" (see below). This is part of O'Meara 60 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where he lists it as the "Silver Streak" and as part of the "Stairway to Heaven".

Silver Wheel:

This Gaulish asterism "Arangtoreta" is the IAU constellation Corona Borealis (Boutet 2001).

Simon:

This German asterism "Simon" or "Saint Simon the Zealot, Apostle" is the IAU constellation Capricornus as listed by German poet Philipp von Zesen (1619 – 1689), who also listed it as "Simon Zelotes". This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Simon al Capricornus". Edward Sherburne lists "St. Simon" in his Sphere of Marcus Manilius in 1675 and it later appears in John Hill's *Urania* in 1754.

Simon the Sailor:

This Latin asterism "Smon Nautis" is the IAU constellation Delphinus.German astronomer Johann Bayer (1572-1625) listed this in his *Uranometria* (1603). Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed "Smon barbaris". Simon ("flat nosed") was a very common and popular name in ancient times. Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sinon" or "Simon nautis".

Sinew:

This Sahtúotine star "kw'ə" is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Cannon 2021) and is one of the components of an arrow.

Singers:

This Romanian asterism "Lăutarii" is Delta (δ) and Iota (ι) Coronae Borealis in the IAU constellation Corona Borealis (Ottescu 2009). This is part of their asterism Ring Dance (see above).

Singing:

This Latin asterism "Cantans" is the IAU constellation Cepheus. Compare this to Making Sound (above) and Shouter (below).

Singing Bushlark:

This Boorong asterism “Weetkurrk” is in the IAU constellation Boötes as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010) and is the singing bushlark (Mirafra cantillans): The bird’s “body” is the stars 2 and 6 Boötis. Weetkurrk is the daughter of Marpeankurrk (see Meat Ant, above).

This Wotjobaluk star “Weet-kurrk” is Eta (η) Boötis in the IAU constellation Boötes (Hamacher 2011).

Single Bull:

This Seleucid asterism “MUL” (see Jaw of the Wild Bull, above) or “al-pi-i[n]” (“single bull”) listed in the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the Pleiades cluster in the IAU constellation Taurus (Foxvog 1993).

Single Log Bridge:

This Korean asterism “Dan-il Tongnamu Dali” (단일 통나무 다리) is a winding line of stars in the IAU constellation Draco: Starting at HIP 104968 it runs through 77 Draconis, HIP 105727, 104756, 102599, and 75 Draconis, ending at 76 Draconis.

Single Stalk of Virgo:

This **telescopic** asterism “Unicaúlis Virginis” is the intermediate spiral galaxy NGC 4457 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 35”. It became GC 3009 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “one well-developed spiral arm extending from the southern part of the nucleus”.

Single Star:

This Mayan star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo, which they used to track the time at night.

Single Star in Front of the Furrow:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star “DELE sa IGI ABSIN” is Gamma (γ) Virginis in the IAU constellation Virgo (Hunger and Sachs 1988).

Single Star of the Knee of Uz:

This Babylonian and Sumerian star from the BM 78161 tablet is Mu (μ) Herculis in the IAU constellation Hercules and is the 6th ziqpu on this list (Liechty 1988, Leitz 2019).

Single Star of the Tail of the Eagle:

This Babylonian and Sumerian ziqpu “single star of the tail of ur-a” is the star Beta (β) Leonis (Denebola) in the IAU constellation Leo and is listed as ziqpu 24 in the BM 78161 tablet (Liechty 1988).

Sinister:

This Chaldean star “[mu]l man-ma” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Sinistra:

See Left Side, above.

Sink Hole:

This dark nebula Barnard 59 is in the IAU constellation Ophiuchus and is part of the Pipe Nebula (see above).

Sinuous of Leo:

This **telescopic** asterism “Sinuósus Leónis” is the barred spiral galaxy NGC 3187 in the IAU constellation Leo. It was discovered by Irish astronomer George Stoney in 1850. It is GC 2055 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is part of the Leo Quartet (see above).

Siphambano:

This Swazi asterism “Siphambano” is the belt of Orion in the IAU constellation Orion.

Siren:

This Dutch asterism appeared on a globe by Dutch uranographer Willem Jansz Blaeu (1571 – 1638) in the place of the IAU constellations Musca and Triangulum Australe.

Sirius:

See Glowing, above.

Sister Barking at an Animal:

This Dena’ina star is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major (Cannon 2021). Variations include “A Barking Puppy”.

Sister Dog-Child:

This Dakelh star is unidentified at present (Cannon 2021).

Sister of Kwányip:

This Selk’nam star is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion. Kwányip (see above) is a mythical shaman.

Sisters of Children:

This Carib asterism is the Pleiades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982).

Sisters of Suhail:

This Arabic star “Al Aliawāt al Suhail” is s Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. Suhail is the star Alpha (α) Carinae (Canopus).

Sitting God:

This Babylonian asterism “MUL.UR.KU” is the IAU constellation Hercules.

Sitting Gods:

This Babylonian asterism “DINGIR.KU.A.MESH” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified. Compare this to Sitting God, above.

Sitting Hen:

This Russian asterism “Nasēdha” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

Sitting Vulture:

This Greek asterism “Γυψ καθήμενος” (“Gyps kathímenos”) is the IAU constellation Lyra as listed by 14th century Greek geographer and astronomer Georgius Chrysococcas. Compare this to Alighting Vulture, above.

Situla:

See Bucket, above.

Six:

This Ligurian asterism “r Se´ss” (“the six”) is the Pleiades cluster in the IAU constellation Taurus.

This Shona asterism “Chimutanhatu” is the Pleiades cluster in the IAU constellation Taurus.

Six Attendants:

This Pirt-Kopan-noot asterism is the Pleiades cluster in the IAU constellation Taurus. They are the six attendants of Gneeanggar (see Wedge Tailed Eagle, below). Waa (see Crow, above) tricks these women by turning into a grub. When they dig him out, he turns into a giant and carries them off.

Six Departments:

This Korean asterism “6Gae Buseo” (6개 부서) is a curve of stars in the IAU constellation Ursa Major: Omicron (ο), Tau (τ), 23, Upsilon (υ), Phi (ϕ), Theta (θ), and 15 Ursae Majoris.

Six Elk:

This Tse’khene asterism is the Pleaides cluster in the IAU constellation Taurus (Cannon 2021).

Six from Two of Hydra:

This **telescopic** asterism “Sexeduóbus Hýdrae” is the intermediate spiral galaxy NGC 2835 in the IAU constellation Hydra. It was discovered by Wilhelm Tempel in 1884. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “although mostly two-armed in the inner regions, the spiral pattern could be interpreted as being six-armed in the outer regions”.

Six Jia:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of six stars in the IAU constellation Cepheus: Starting at the determinative star HIP 5626 it runs through HIP 10054, 10623, 4283, 3132, and 2142.

This Chinese xing guan “Liùjiă” (六甲） is a spiral of stars in the IAU constellation Camelopardalis: HIP 25110, 23265, 36547, 39538, and 33694, with HIP 32439 in the center.

This Chinese Chenzhuo xing guan “Liùjiă” is an angular loop of stars in the IAU constellation Draco: Starting at 75 Draconis it runs through 74 Draconis, HIP 102599, HIP 105727, HIP 104756, and 76 Draconis to HIP 101550.

Six on a Dice:

This **telescopic** asterism is listed by Robert Zebahl on his *Faint Fuzzies* website and is in the IAU constellation Aquila. Zebahl describes this as “pretty compact group of 7 stars, whereby 6 of them look like a ‘6’ [on the face]of a dice.” NOTE: This could also be easily interpreted as a kite.

Six Related Stars:

This Japanese asterism “Muzura Boshi” is the belt and sword of Orion in the IAU constellation Orion (see Orion, above).

Six Stars:

This asterism “Cajupal” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen only identifies the cultures involved as “South American tribes”.

Six Wives:

This Mono (moʊnoʊ) asterism is the Pleiades cluster in the IAU constellation Taurus. These wives were eating wild onions and their husbands objected to their breath, so they fled into the sky where their husbands couldn’t reach them. Their husbands (the Hyades) chase them across the sky (see Seven Husbands, below).

Sixth:

This Bedouin star “al-Satt” (السات) is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major.

Škárnik:

This Kaykavian asterism is the IAU constellation Aquarius.

Skat:

See Leg, above.

Skate Stars:

This Bugis and Titan asterism “Bintoéng Lambarué” is the tail of the IAU constellation Scorpius: Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ), Mu (μ), Epsilon (ε), Tau (τ), and Alpha (α) Scorpii (Antares).

Skeletal Snake:

This Mayan asterism from Copán, Palenque and the sarcophagus of Pacal is a skeletal snake associated with the IAU constellation Scorpius and is associated to the rift in the Milky Way they call “Xibalba Be”, a path to the underworld. It is also known as “White Bone Snake”.

Skeleton:

This postclassic Mayan asterism from the Paris Codex is the IAU constellation Pisces.

Skeleton Bird:

This Ojibwe asterism "Bineshi Okanin" is the IAU constellation Cygnus (Lee et al 2014). It is also known as the Crane (see above).

Skellings:

This Irish asterism is the IAU constellation Cassiopeia. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). This is a reference to the Skelligs islands.

Ski Runners:

This Sami asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Lundmark 1982).

Skiing Cluster:

This **telescopic** asterism is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. It is also known as the Owl Cluster, Kachina Doll Cluster, Massed Jewels, the Dragonfly Cluster, and the E.T. Cluster.

Skillfully Wrought of Pisces:

This **telescopic** asterism "Daédalus Píscium" is the barred spiral galaxy NGC 266 in the IAU constellation Pisces. It was discovered in 1784 by English astronomer William Herschel who listed it as III 153. It is GC 149 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "looks as if constructed by a skillful maker". Daedalus is also the name of a mythical constructor.

Skip Loader:

This asterism from the Saguaro Astronomical Club asterism database and Corder 2379 on Jeffrey Corder's list is made up of the stars of the IAU constellations Leo and Virgo. Size 14° X 14°:

- The "tractor" is the IAU constellation Leo, and
- The "bucket" is the stars Epsilon (ε), Delta (δ), Gamma (γ), Eta (η), and Beta (β) Virginis (Zavijava).

Skipping Stone:

This asterism is made up of stars of the IAU constellations Boötes, Serpens, Ophiuchus, and Ursa Major. It is the handle of the Big Dipper asterism (see Big Dipper, above) with the line of stars extending down through 25 Boötis, Epsilon (ε) Boötis (Izar), 24 Serpentis, 37 Serpentis, 12 Ophiuchi, 13 Ophiuchi, & 35 Ophiuchi.

Škraplûne:

This Chakavian asterism is the IAU constellation Scorpius.

Skuld:

This Norse star "Skuld" (from the Old Norse "skulu" which means "need/ought to be/shall be") is the star Sigma (σ) Librae in the IAU constellation Libra and was created by Canadian Bjorn Jónsson (1920 –

1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Skuld is one of the three Norns in Norse mythology.

Skull:

This Romanian asterism "Căpăţâna" is the IAU constellation Perseus (Ottescu 2009).

There are three **telescopic** "skull" asterisms:

- One is the planetary nebula NGC 246 (Caldwell 56) in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. This is listed as GC 131 in the 1846 *General Catalogue*. It is also known as the Soap Bubble Nebula and the Voodoo Mask Nebula. Size 4' X 3.5'.
- One is the open cluster Messier 37 (NGC 2099) in the IAU constellation Auriga. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654 and listed by French astronomer Charles Messier in 1764. The 1864 General Catalogue lists it as GC 1295. John Herschel listed it as h 369. It was given this name by American astronomer Wayne Schmidt, who describes it as a long skull. It is also known as the "Diamond Starburst" (see above) and the "Cartwheel" (see above).
- One is the open cluster NGC 2244 (Caldwell 50) and HII region NGC 2238 in the IAU constellation Monoceros and includes the nebulae NGC 2237, 2239, and NGC 2246. Size 80' X 60'. It was discovered by German astronomer Albert Marth (1828 – 1897) in 1864. English astronomer William Herschel discovered this open cluster (NGC 2244) in 1784 and listed it as "VII 2" in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. It is also known as the Rosette Nebula (see above).

Skull and Crossbones Nebula:

This **telescopic** asterism is the HII region NGC 2467 (SH 2-311, RCW 16, LBN 1065, Cr 164, Ced 103) in the IAU constellation Puppis. This was discovered by English astronomer William Herschel in 1784 who listed it as "IV 22" in his catalogue. It is GC 1589 in the *General Catalogue* of 1864. It is also known as the Chained Broach Nebula (see above). This is O'Meara 39 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where the names "Skull and Crossbones Nebula" and "Mandrill Nebula" are listed. It is also known as the "Death's Head Nebula" and the "Chained Broach Nebula".

Skunkâči:

This Kaykavian asterism is the IAU constellation Aries.

Sky:

This asterism "Coelum" is the IAU constellation Corona Australis as listed by Persian astronomer Abu Ma'shar (Albumasar- 787 – 886).

- This appears in the 5th century *Satyricon* of Martianus Mineus Felix Capella as "Coelulum".
- Johann Bayer's *Uranometria* (1603) lists "Coelulum".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Ceolulum".

This **telescopic** Korean asterism “Maru” (마루) is the DQ white dwarf star WD 0806-661 in the IAU constellation Volans. It received this name in the IAU’s NameExoWorlds competition in 2022. It has a Y type brown dwarf exoplanet WD 0806-661b, “Ahra” (아라), which means “ocean”.

Sky Bora:

This Kamilaroi, Butchulla, Jinibara, and Wakka Wakka asterism is in the IAU constellations Crux and Centaurus. The Bora is the male initiation ceremony, and in southeast Australia one finds Bora ceremonial grounds which consist of two separated circles, one larger than the other. This consists of two adjacent dark patches in the Milky Way:

- One is the Coal Sack Nebula (see Coal Sack, above), which is adjacent to Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa). NOTE: This represents the area of the head of their asterism “Emu in the Sky” (see above).
- The other is a larger dark patch between the stars Alpha (α) Centauri (Rigil Centaurus) and Beta (β) Centauri (Hadar).

Sky Camel:

This Somali asterism “Awrka-Cirka” is the Coal Sack Nebula (see Coal Sack Nebula, above) near the IAU constellation Crux. The Milky Way is the camel’s path across the sky.

Sky Chief:

This Payómkawichum star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above.

Sky Coyote:

This Yakut star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Krupp 1983).

This Chumash star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Krupp 1983). Sky Coyote was the captain of a team playing a gambling game with the Sun.

Sky Dog:

This Tibetan asterism “Helki” is the IAU constellation Ursa Major (Johnson-Groh 2013).

Sky Keeper:

This is an alternate Dane-zaa name, “Yaak’ih Sadę”, for their asterism “Yèshta” (see Traveler, below (Cannon 2021)).

Sky Keeper’s Kettle:

This Dane-zaa asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021) and is related to their asterism “Yèshta” (see Traveler, below), which is also known as Sky Keeper (see above). Compare this to the Sahtúotine asterism ““Yíhda” or “Yámoréya” (see Traveler, below): The Sahtúotine call this his “ladle” (lıbóchǻ) or kettle.

Sky Market Border:

“Haneul Sijang Gyeong-gye” (하늘 시장 경계) is one of the three enclosures in Korean sky culture, the others being Purple (Violet) Low Border and Big Low Border (see Lunar Mansions, Stations of the

Moon, Nakshatra, and Zodiacs above). This two-part Korean asterism is two long curving lines of stars in the IAU constellations Aquila, Hercules, Ophiuchus, and Serpens:

- The end of one line starts with the star 95 Herculis and runs through 102, 109, and 110 Herculis, Zeta (ζ) Aquilae, Theta (θ) Serpentis, Eta (η) Serpentis, Nu (ν) Ophiuchi, and HIP 86266, ending at Eta (η) Ophiuchi. It is in a similar location and resembles the Chinese xing guan "Heavenly Market Left Wall" (see above).
- The end of the other line starts at the star Beta (β) Herculis (Kornephoros) and runs through Gamma (γ) Herculis and Kappa (κ) Herculis, Gamma (γ) Serpentis, Beta (β) Serpentis (Nasak Shamiya), Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (ε) Serpentis, Delta (δ) Ophiuchi and Epsilon (ε) Ophiuchi, ending at Zeta (ζ) Ophiuchi. This is identical to the Chinese xing guan "Heavenly Market Right Wall".

Sky Neck:

This is an alternate Upper Tanana name, "Yaak'oh", for their asterism "Yihdaa" (see Traveler, below (Cannon 2021)).

Sky Rocket Burst:

This **telescopic** asterism is the open cluster Messier 35 (NGC 2168) in the IAU constellation Gemini. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745. It was listed in the 1864 General Catalogue as GC 1360 and John Herschel's catalogue as h 377. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 describes this as "the bursting of a sky-rocket". *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), cites Smyth and also lists his name "Sky Rocket Burst". This is also known as the Shoe Buckle Cluster.

Sky Story:

This Estonian asterism "Taevalook" is the IAU constellation Cassiopeia (Kuperjanov 2006).

Sky Support:

This Sami star "Boahjenaste" or "Boahji" is Alpha (α) Ursae Minoris (Polaris). If Favdna (see above) shoots his arrow at the Elk (see above) and hits Boahjenaste, the sky will fall ((Lundmark 1982, Persson 2022).

Sky's Votive Light:

This Romanian star "Candela Cerului" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Ottescu 2009).

Slaughter Prevailed:

This Arabic and Bedouin manzil "Saad Al-Thabih", "Saʿd al-Dhabiḥ" (سعد الذابح), "Saʿdu ʾdh-Dhābiḥ" (ٱلذَّابِح سَعْدُ), or "ʾAdh-Dhābiḥ" (ٱلذَّابِح), translated as "slaughter prevailed" or "lucky star of the slaughterer", is in the IAU constellation Capricornus and is the stars Alpha (α) Capricorni (Algedi) and Beta (β) Capricorni (Dabih).

This Yemeni manzil "Sa'd al-dhābih" is the stars Alpha (α) Capricorni (Algedi) and Beta (β) Capricorni (Dabih) in the IAU constellation Capricornus (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Slanting of Virgo:

This **telescopic** asterism “Oblíquus Vírginis” is the intermediate spiral galaxy NGC 4818 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “II 549”. His son John Herschel listed it twice, once as h 1484 and once as h 3445, then later listed it as GC 3318 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the major axis of the elongated central region is not aligned with the major axis of the disk”.

Slave Star:

This Estonian star “Orjatäht” or “Orjastäht” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Slave’s Ell:

This Finnish asterism “Orjan kyynärä” is the Belt of Orion asterism in the IAU constellation Orion.

Sleeper:

This Bedouin (Central and Northern Saudi Arabia) asterism “Al Nayem” or “al-Naʿāyem” (النعايم) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). The meaning of the name is uncertain but may be “the camels”. Compare this to the Arabic asterism Ostriches (see below).

Sleeping Beauty Galaxy:

This **telescopic** asterism is Messier 64 (NGC 4826), a spiral galaxy with prominent dust lanes in the IAU constellation Coma Berenices. It is also known as the Black Eye Galaxy (see above) or Evil Eye Galaxy (see above). This was discovered by English astronomer Edward Pigott in March 1779, observed by German astronomer Johann Elert Bode in April of the same year, and by French astronomer Charles Messier the following year. It is listed in the 1864 General Catalogue as GC 3321 and in John Herschel’s catalogue as h 1486.

Sleeping Giraffe:

This asterism is the IAU constellation Leo as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Sleeping of Virgo:

This **telescopic** asterism “Sopítus Virginis” is the edge-on spiral galaxy NGC 4469 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 157”. It became GC 3019 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy is rich in dust but lacks star formation activity, as if it has fallen asleep”.

Sleeping With Open Eyes:

This asterism “apertis oculis dormiens” is the IAU constellation Lepus. This name is listed in Johann Bayer’s *Uranometria* (1603) and attributed to the Roman poet Nicander of Colphon (197 B.C.E. - ?).

Sleepy Eye of Dorado:

This **telescopic** asterism "Hypnódes Dorádus" is the lenticular galaxy NGC 1546 in the IAU constellation Dorado. This is listed by John Herschel as 2628 in his catalogue and later as GC 832 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sleeve:

There are two Arabic asterisms with this name "al kumm", later Latinized to "Al Kumm":

- One, the Arabic asterism is the stars Omicron (o) 1 and 2 Orionis in the IAU constellation Orion (Al Kumm I & II).
- One, described by the astronomer Al Tizini, is the stars Omicron (o) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis and 6 Orionis.

Slender Arms of Fornax:

This **telescopic** asterism "Tenuibrachiátus Fornácis" is the barred spiral galaxy NGC 1398 in the IAU constellation Fornax. It was discovered by Friedrich Winnecke in 1868. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Slender Limbs of Lepus:

This **telescopic** asterism "Léptopus Léporis" is the barred spiral galaxy NGC 1784 in the IAU constellation Lepus. It was discovered in 1836 by British astronomer John Herschel who listed it as 2719 and later as GC 1001 in his *General Catalogue* of 1864. This is O'Meara 19 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Slender of Virgo:

This **telescopic** asterism "Grácilis Vírginis" is the edge-on spiral galaxy NGC 4307 in the IAU constellation Virgo. It was discovered by Christian Peters in 1881. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as they see it as a "slender, graceful… galaxy".

Sliced Lime Nebula:

See Lemon Slice Nebula, above.

Sliced Onion:

This **telescopic** asterism NGC 3344 is a barred spiral galaxy in the IAU constellation Leo Minor. It was discovered by English astronomer William Herschel in 1785 who listed it as "I 81" in his catalogue. It is GC 2178 in the *General Catalogue* of 1864. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 55 without a name.

Slightly Undulating of Gemini:

This **telescopic** asterism "Úndulans Geminórum" is the edge-on spiral galaxy NGC 2357 in the IAU constellation Gemini. It was discovered by Édouard Stephan in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Slim One of Lacerta:

This **telescopic** asterism "Léptus Lacértae" is the spiral galaxy UGC 11973 in the IAU constellation Lacerta. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the slim aspect of this highly inclined galaxy with the slender arms".

Sling:

This Quechua asterism "Warak'a" or "Honda" is made up of stars of the IAU constellation Scorpius (Ciancia 2018): Alpha (α) Scorpii (Antares), Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Omega (ω) Scorpii, and Tau (τ) Scorpii. It is related to their nearby asterism "Hondero" (See Slinger, below).

Slinger:

This Quechua asterism "Hondero" is dark nebulosity in the Milky Way midway between the IAU constellations Sagittarius and Scorpius (Ciancia 2018). Alternate names include "Tatalito" (see Father, above) and "Llamero" (see Llama Herder, above). This represents the ancient thunder God Illapa. It is related to their nearby asterism "Warak'a" (see Sling, above).

Slinger of Eridanus:

This **telescopic** asterism "Fúnditor Erídani" is the spiral galaxy NGC 1253 (Arp 279) in the IAU constellation Eridanus. It was discovered in 1784 by English astronomer William Herschel who listed it as "IV 17". It became GC 664 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to "the long extending northern arm, ending in [the Magellanic spiral galaxy NGC 1253A, which] makes this galaxy resemble someone slinging a stone.

Slingshot:

This asterism is the IAU constellation Cancer as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Slipher's of Coma Berenices:

This **telescopic** asterism "Sliphérius Cómae Bereníces" is the edge-on spiral galaxy NGC 4565 (Caldwell 38) in the IAU constellation Coma Berenices. It was discovered in 1785 by English astronomer William Herschel who listed it as "V 24": Herschel described it as a "lucid ray 20' long or more, 3' or 4' broad". It is GC 3106 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor "Vesto Slipher (1875 – 1969) at Lowell Observatory". Slipher measured the redshift of this galaxy in 1917. It is also known as the "Needle Galaxy " (see above), the "Flying Saucer Galaxy" (see above), and "Berenice's Hair Clip" (see above).

Sloping of Coma Berenices:

This **telescopic** asterism "Declivis Cómae Bereníces" is the spiral galaxy NGC 4206 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "II 165". It

became GC 2795 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sloth:

This Carib asterism "Kupirsiyuman" or "Kupirisi" represents the sloth (Bradypus trydactilus) and is known to rise preceding the dry season, but its present location is unknown (Magaña, and Jara, 1982).

Slow:

This Latin asterism "Tardus" is the IAU constellation Boötes as described by 4th century Latin poet Claudius Claudianus (Claudian), 2nd century Roman poet Decimus Junius Juvenalis (Juvenal), and 1st century Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.). They also used the term "Piger" ("sluggish"). 16th century Italian poet Ludovico Ariosto called it "Pigro Arturo" ("lazy Arthur"), another meaning of the term "Piger" being "lazy".

Slow Heartbeat of Hydra:

This **telescopic** asterism "Bradycárdius Hýdrae" is the intermediate spiral galaxy NGC 2935 in the IAU constellation Hydra. It was discovered in 1786 by William Herschel who listed it as "II 556". It became GC 1882 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "low star formation activity in its central region".

Slow Moving:

This Samoan star "Telegese" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Fitisemanu 2022). This is a zenith star for travel between Sāmoa and Fiji. It is also called "Fētūsolonu'u" (see Gliding Star, above) and "Ta'ulua" (see Two Salutations, below).

Slug:

This English asterism "Limax" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens.* It is a bent triangle of stars in the IAU constellation Eridanus: 47, 53, 54, 58, and 60 Eridani. Compare this to the asterism "Sceptum Brandenburgium" (see Brandenburg Sceptre, above).

Small and Beautiful of Andromeda:

This **telescopic** asterism "Pulchéllus Andrómedae" is the intermediate spiral galaxy IC 239 in the IAU constellation Andromeda. It was discovered by English astronomer Isaac Roberts in 1893. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it has low surface brightness.

Small and Exuberant of Pisces:

This **telescopic** asterism "Violéntula Píscium" is the double radio galaxy NGC 383 (Arp 331) in the IAU constellation Pisces. This was discovered by William Herschel and listed as II 247. It became GC 206 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "intense star formation activity".

Small and Rightward of Canes Venatici:

This **telescopic** asterism "Dextéllus Cánum Venaticórum" is the distorted dwarf galaxy NGC 4625 in the IAU constellation Canes Venatici. William Herschel listed this as "II 660". John Herschel listed this as h 1392 and later as GC 3160 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "This galaxy forms a physical pair with NGC 4618… Similar to its companion it has one remarkably dominant spiral arm, but winding in the right direction, contrary to its companion".

Small and Slow of Indus:

This **telescopic** asterism "Léntulus Índi" is the irregular galaxy IC 5152 in the IAU constellation Indus. It was discovered by DeLisle Stewart in 1908. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "IC 5152's velocity with respect to the cosmic background radiation field" is slow.

Small Balk of Coma Berenices:

This **telescopic** asterism "Docídium Cómae Bereníces" is the edge-on barred spiral galaxy NGC 4634 in the IAU constellation Coma Berenices. It was discovered in 1787 by William Herschel who listed it as "III 603". It became GC 3167 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Band of Cetus:

This **telescopic** asterism "Fascíola Céti" is the barred spiral galaxy NGC 1015 in the IAU constellation Cetus. It was discovered by Wilhelm Tempel in and became GC 5263 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name as it resembles "the shape of an old-fashioned cigar band".

Small Bear:

This asterism Μικρή ᾽΄Αρκτος is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above) as described in Ptolemy's *Almagest* (2nd century). It appears on the Tabula Bianchini.

Small Belly:

This Arabic and Bedouin manzil **"**Al-Botain" ("small belly", "little abdomen", or "little ram"), also known as "Al-Bṭain" (البطين), "'al-Butayn" (ٱلْبُطَيْن) is in the IAU constellation Aries and is the stars Epsilon (ε) Arietis, Rho (ρ) 3 Arietis, and Delta (δ) Arietis (Botein). Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) has this manzil "al-butayn" marked in silver.

This Yemeni asterism "Buţayn" is made up of stars of the IAU constellation Aries (Varisco 1995): Epsilon (ε) Arietis, Rho (ρ) 3 Arietis, and Delta (δ) Arietis. This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Small Bird:

This Yucatec star "Chamukuy" is the double star Theta (θ) Tauri in the IAU constellation Taurus: This is a star in the Hyades cluster and the IAU approved the name Chamukuy for Theta (θ) Tauri Aa in 2016.

Small Bodies of Orion:

This **telescopic** asterism “Corpúscula Oriónis” is the spiral galaxy IC 412 in the IAU constellation Orion. It was discovered by American astronomer Edward Emerson Barnard in 1888. It was also recorded by French astronomer Stéphane Javelle (1864 – 1917). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this galaxy and its partner are small, interacting galaxies.

Small Booby Bird of Lono:

This Hawaiian star “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono") is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as “A’a” (‘burning brightly”), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-kau'opae” ("Star for placing shrimp"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

Small Boy of Virgo:

This **telescopic** asterism “Púpulus Virginis” is the spiral galaxy NGC 4445 in the IAU constellation Virgo. It was discovered by Prussian astronomer Heinrich d’Arrest. It became GC 5651 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its small size.

Small Broken Disc:

This Greek asterism “Πινάκιν κεκλασμένον”.(“Pinákin keklasménon”) is the IAU constellation Corona Borealis as described by Georgius Chrysococcas, a 14th century Greek geographer and astronomer. 17th century French astronomer Ismaël Boulliau (Ismaël Bullialdus) gave it the Latin name “Discus parvus confractus”. In his *Star Names* in 1899 R. H. Allen corrects Chrysococcas, pointing out that the first word should be “Πινάκιον” (“Pinákion”) as Chrysococcas has written “cracked board”.

Small Candle:

This **telescopic** asterism is a dwarf galaxy ~6’ north of NGC 1023 (Arp 135) in the IAU constellation Perseus. It was discovered in 1784 by William Herschel who listed it as “I 156”. It became 244 on his son John Herschel’s list and GC 574 in the *General Catalogue* of 1864. Astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists NGC 1023 as O’Meara 10. O’Meara describes this as a “small candle”.

Small Cart:

This Belarussian asterism “Pavozachka” or “Maly vos” is the Little Dipper asterism in the IAU constellation Ursa Minor (Avilin 2009). It is also called “Kolesnitsa” (see Chariot, above). They call the star Alpha (α) Ursae Minoris (Polaris) “the nail”.

This Estonian asterism “Väike Vanker” is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Small Cell of Fornax:

This **telescopic** asterism “Céllula Fornácis” is the barred spiral galaxy NGC 1317 (AKA 1318) in the IAU constellation Fornax. It was discovered by Julius Schmidt in 1865. It became GC 5312 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as “Fornax B”.

Small Chief:

This Hawaiian star “Kaikilani” is Alpha (α) Phoenicis (Ankaa) in the IAU constellation Phoenix.

Small Cloud:

This Arabic asterism “as-Saḥābat uş-Şaghirah” (السَحَابَة الصَغِيرَة) is the Andromeda Galaxy, Messier 31, and was mentioned by 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of Fixed Stars*.

This French asterism le Petit Nuage” is the Large Magellanic Cloud as listed by French astronomer Nicolas Louis de Lacaille (1713 – 1762). The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this “le Pt Nuage”.

Small Cluster:

This Kaykavian asterism “Malakóla” is the IAU constellation Ursa Minor.

Small Cluster Nebula:

This **telescopic** asterism is the reflection nebula NGC 7129 (vdB 146, LBN 497, Cr 441, Ced 196) in the IAU constellation Cepheus. It was discovered in 1794 by English astronomer William Herschel who listed it as “IV 75”. It is GC 4702 in the *General Catalogue* of 1864. It is also known as the “Cosmic Rosebud” (see above).

Small Column:

This Latin asterism “Columella” is the IAU constellation Aries as named by 1st century Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.).

Small Cross:

This Quechua asterism “Huch’uy Cruz” or “Huchuy Cruz” is the IAU constellation Crux (Urton 1980 & 1981).

This is an alternate name for the Macedonian asterism “Krst” (Cross), above.

Small Dipper:

This **telescopic** asterism is listed by René Merting on the *Faint Fuzzies* website and is in the IAU constellation Pisces. Merting writes: “The small dipper is conspicuous in binoculars- at first glance, four stars form a flat arc moving north-south – on closer inspection three more faint stars can be seen to the northeast of the arc, which are probably intended to represent the dipper.” This includes HIP 116816 at the base of the “handle”.

Small Distant One of Centaurus:

This **telescopic** asterism “Longínquulus Centaúri” is the spiral galaxy NGC 4219 in the IAU constellation Centaurus. It was discovered in 1834 by John Herschel who listed it as h 3385 and later as GC 2809 in his

General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Dog:

This Latin asterism "Canis Parvus" is the IAU constellation Canis Minor, so called as it is north of Canis Major. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Parvus".

Small Dust Speckle of Hydra:

This **telescopic** asterism "Pulvisculáta Hýdrae" is the barred spiral galaxy NGC 3885 in the IAU constellation Hydra. It was listed by William Herschel as "III 828". John Herschel listed it as h 3359 and later as GC 2553 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "small dust speckle in the central region of this galaxy."

Small Eyed of Piscis Austrinus:

This **telescopic** asterism "Microphthálmus Píscis Austríni" is the spiral galaxy NGC 7314 (Arp 14) in the IAU constellation Piscis Austrinus. This was discovered in 1834 by John Herschel who listed it as h 3949 and later as GC 4810 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the bright small nucleus of this galaxy resembles a small eye."

Small Female Goat:

This Greek star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga and is part of their asterism "Capra and Haedi" ("goat and kids"- see Kids above). 1st century Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.) and Pliny the Elder (24 – 79) both listed it under the name "Capella". The ancient Greeks associated it with the mythological she-goat Amalthea, who breast-fed the infant God Zeus. Capella is a Latin name, the diminutive of "Capra" ("female goat"):

- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star: It is hard to make out the label as it overlaps the artwork, but it appears to read "Capellum".
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this star as "Capella".
- Johann Bayer's *Uranometria* (1603) lists the name "Capella" for this star.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Capella" for this star.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Capella seu Capra".
- This star is named "the goat" and "Capellam" in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this star as "Capella", "La Chevre", and "De Gei" (Gei being the Dutch name for "goat").

- The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this star as "la Chevre" ("the goat").
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782 lists this star as both as "Capella" and as "Alhajoth".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists "Capella".
- William Herschel lists "Arcturus" in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) lists this star as "Capella" on his *Mercator Map of the Starry Heavens* in 1810.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Capella".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Capella vel Alioth" in his *Celestial Atlas* in 1822. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists "Capella".
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Capella".
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Capella".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Capella".
- "Capella" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Capella, the goat star".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Capella".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Capella".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Capella" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Capella" and describes it as "A little she-goat".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Capella" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Capella" for this star.
- The IAU approved the name Capella for the star Alpha (α) Aurigae Aa.

This Spanish star "Cabrilla" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Small Flower of Perseus:

This **telescopic** asterism "Flósculus Pérsei" is the Seyfert type 2 galaxy NGC 1058 in the IAU constellation Perseus. This was listed as "II 633" by William Herschel and became GC 592 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Gap:

This Arabic asterism “al-Dayīqa” (“small/narrow gap”) is described by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as the small gap between the setting of their asterism al-Thurayyā and Aldebaran in the IAU constellation Taurus (Hafez 2010).

Small Goats:

This Quechua asterism “Cabrillas” is the Pleiades cluster in the IAU constellation Taurus (Ciancia 2018).

Small Golden Ring of Canes Venatici:

This **telescopic** asterism “Auréolus Cánum Venaticórum” is the spiral galaxy Messier 94 (NGC 4736) in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1781. It is listed in the 1864 General Catalogue as GC 3258 and in John Herschel’s catalogue as h 1456. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “a splendid little ring of active star formation regions surrounds the nucleus”. It is also known as the “Croc’s Eye” (see above) and the “Cat’s Eye” (see above).

Small Group of Stars Together:

This T’atsaol’ine and Wiidiideh asterism “kwǫ̀ tsòa” is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021).

Small Hen:

This Belarussian asterism “Kurochka” is the IAU constellation Ursa Minor (Avilin 2009).

Small Husband of Centaurus:

This **telescopic** asterism “Andriscus Centaúri” is the lenticular galaxy IC 3290 in the IAU constellation Centaurus. It was discovered by Lewis Swift in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because “this galaxy is the male partner (according to our gender rules) of the pair with NGC 4373. They named NGC 4373 “Wife of Centaurus” (see below).

Small Hut:

This Quechua asterism “Cabañuelas” is an unidentified small group of stars used for crop predictions (Urton 1981).

Small Iguana:

This Euahlayi star “Gani” is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (William Ridley 1875).

Small Lamp:

This **telescopic** Urdu star “Shama” (“small lamp” or “flame”) is HIP 55664 (HD 99109) in the IAU constellation Leo (magnitude 9.06). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Perwana (“moth”).

Small Lance of Eridanus:

This **telescopic** asterism “Lancéola Erídani” is the edge-on lenticular galaxy NGC 1461 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as “II 460”. It became GC 780 in the General Catalogue of 1864. NOTE: American astronomer Lewis Swift observed this galaxy in 1896 and classified it as IC 1983. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Lens of Fornax:

This **telescopic** asterism “Lenticula Fornácis” is the elliptical galaxy NGC 1340 (AKA 1344) in the IAU constellation Fornax. It was discovered in 1790 by William Herschel (“I 257”) and added to the General Catalogue of 1864 as GC 175 and later in the NGC catalogue as NGC 1344, but when his son John Herschel observed it in 1835, he added it to the General Catalogue as GC 714 and later it was added to the NGC catalogue as NGC 1340. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Limb:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Small Lump of Puppis:

This **telescopic** asterism “Glébula Púppis” is the barred spiral galaxy NGC 2566 in the IAU constellation Puppis. It was discovered in 1785 by William Herschel who listed it as “III 288”. It became GC 1648 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because “This galaxy looks like a little lump, almost a snow flock, with the Milky Way stars as a snow shower in the foreground”.

Small Magellanic Cloud:

This dwarf irregular galaxy NGC 292 is in the IAU constellation Tucana. Persian astronomer Abd Al Rahman al Sufi listed it as “Al Bakr” (see White Ox, below). This is listed as GC 165 in the 1846 *General Catalogue*. Portuguese and Dutch sailors called them the Cape Clouds (see above). German astronomer Johann Bayer named it “Nubecula Minor” in his Uranometria in 1603 (see Nubecula Minor, above).

Small Man:

This Egyptian asterism is one of the paranatellonta of the decans of Leo as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is possibly Canes Venatici.

Small Mouse:

This Ukrainian asterism “malen’ka mysha” (маленька миша) is the star 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. It is described as a small mouse gnawing on the handle of the Cart (“Viz” or “Vizok”) every night.

Small Nucleus of Ursa Major:

This **telescopic** asterism “Parvinúcleus Úrsae Majóris” is the spiral galaxy NGC 3917 in the IAU constellation Ursa Major. It was discovered in 1790 by William Herschel who listed it as “II 824”. John

Herschel listed it as h 994, but later as GC 2579 and GC 2583 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "small nuclear bulge".

Small Nucleus of Virgo:

This **telescopic** asterism "Micropyrénus Virginis" is the spiral galaxy NGC 4504 in the IAU constellation Virgo. It was discovered in 1789 by William Herschel who listed it as "II 771". It became GC 3054 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)": They called it this because it has "a rather small nucleus."

Small Otters:

This Barasana asterism "Wania Timia" or "Ria Timia" is a collection of stars, each representing an otter: Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor and Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Hugh-Jones 2006).

Small Saddle:

This Arabic star "Al Ḳatab" is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

Small She Dog:

This Hebrew star "ha-kelev ha-qatan" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed on star list of Abraham Bar Hiyya in 1104, who gives the Arabic name "shi'rā 'abūr". (Goldstein 1985).

Small Shield:

There are two Arabic stars with the name "turais" (تُرَيْس), later latinized to "Turais" or "Tureis":

- One is Iota (ι) Carinae in the IAU constellation Carina. English Admiral Henry William Smyth lists "Tureïs, the scutulum or little shield" in his *Bedford Catalogue* in 1844.
- One is Rho (ρ) Puppis in the IAU constellation Puppis. The IAU approved the name Tureis for Rho (ρ) Puppis A.

Small Staff of Ursa Major:

This **telescopic** asterism "Bacíllus Úrsae Majóris" is the barred spiral galaxy NGC 4144 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "II 747". It became GC 2749 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Star 4 Cubits Behind the King:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL TUR sa 4 KUS ar LUGAL" is Rho (ρ) Leonis in the IAU constellation Leo (Hunger and Sachs 1988).

Small Sword of Eridanus:

This **telescopic** asterism "Xiphidium Erídani" is the edge-on spiral galaxy NGC 1045 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as II 488". It became GC 585 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it this due to its slender shape.

Small Thief:

This Macedonian star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major (Cenev 2014). It is part of their asterism "Aramii" (see Thieves, below). It is described as a child kidnapped by the other thieves and made to become one of them.

Small Umari Fruit Fence:

This Barasana asterism "Wamu Saniro Kihika" is the line of stars Upsilon (υ), Kappa (κ) 1 and 2, and Omega (ω) Tauri in the IAU constellation Taurus. Hugh-Jones (2006) describes it as Upsilon (υ), Chi (χ), and Omega (ω) Tauri.

Small Vortex of Leo:

This **telescopic** asterism "Vertículus Leónis" is the spiral galaxy NGC 3370 in the IAU constellation Leo. It was discovered by William Herschel in 1784, who provided it with the designation II 81. His son John later designated it 750. William Herschel cataloged I 80 to NGC 3348 before and II 82 to NGC 3455 after NGC 3370. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Small Wagon:

This Belarussian asterism "Малы Воз" ("Maly Vos") is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Small Whale of Canes Venatici:

This **telescopic** asterism "Cetéllus Cánum Venaticórum" is the distorted dwarf galaxy NGC 4627 (Arp 281) in the IAU constellation Canes Venatici. William Herschel listed this as "II 659". John Herschel listed this as h 1391 and later as GC 3159 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is a companion of NGC 4631, commonly known as "the Whale".

Small Wheel of Phoenix:

This **telescopic** asterism "Orbículus Phoenícis" is the spiral galaxy NGC 238 in the IAU constellation Phoenix. It was discovered by John Herschel in 1834 and appears as GC 116 in his General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its small apparent diameter.

Small Yoke:

This Belarussian asterism "Karomyselko" is the belt of Orion in the constellation Orion (Avilin 2009). They saw it as a girl carrying water with a yoke. It is also known as "Grabli" (see Rake, below), "Kastsy" (see Mowers, below), "Try Karali" (see Three Kings, below), "Kasar" (see Mower, below), "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Tri Siostry" (see Three Sisters, below), "Prahi" or

“Prapradki” (see Yarn Spinners, below), “Traiko” (see Three Times, below), “Asilki” (see above), “Matawila” (see Wheel, below), “Kosy” (see Scythes, above), “Kigachi ragachy” (see Shaft of a Plough, above), “Kryzhe” (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, below). Compare this to their asterism “Karomisla” (see Yoke, below).

Smaller Chariot:

This Danish and Icelandic asterism “Litli Vagn” is the IAU constellation Ursa Minor as listed in R. H. Allen’s *Star Names* in 1899.

Smaller Dog:

This Sardinian asterism “su gajone” is the IAU constellation Canis Minor (Putzolu 2019).

Smaller Fish:

This Arabic asterism “as-samaka as sughra” (السمكة الصغرى) is from 'Abd al-Rahman al-Sufi (903 – 986)’s *Book of Fixed Stars* and is an oval of stars of the IAU constellations Andromeda and Perseus, and there are two versions of this:

- The first version (Adams 2016) starts at the star Beta (β) Andromedae (Mirach - called “Abdomen of the Fish” or “Abdomen of the Whale”) and runs around through Nu (ν) Andromedae, 32 Andromedae, Pi (π) Andromedae, Epsilon (ε) Andromedae, Zeta (ζ) Andromedae, Psi (ψ) 3 Piscium, Chi (χ) Piscium, Upsilon (υ) Piscium, and 91 Piscium.
- The second version:
  - One side starts at 9 Persei and runs through 4 Persei, Phi (ϕ) Persei, 51 Andromedae, Chi (χ) Andromedae, and Upsilon (υ) Andromedae to 53 Andromedae.
  - The other side runs from 53 Andromedae through 55 Andromedae, Gamma (γ) Andromedae, 60 Andromedae, 62 Andromedae, and 65 Andromedae back to 9 Persei.
  - The Double Cluster (see above), which is the double clusters NGC 869 and 884, were also included in this asterism by 'Abd al-Rahman al-Sufi (903 – 986).

Note: This is next to the Arabic asterism “Great Fish” (see above) and part of their asterism complex Two Fish (see below). On Stellarium it is labelled “the Other Fish”.

Smaller Plough Handle:

This is a Welsh name for the Little Dipper asterism in the IAU constellation Ursa Minor as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909).

Smart Beaver:

This Kaska asterism “Tsa’ Ushyqq” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)).

Smart Boy:

This is an alternate Dena’ina name, “Kil Qeyu”, for their asterism “Yéhda” (see Traveler, below (Cannon 2021)).

Smart Young Man:

This Ahtna name, “Ciił Hywaa” or “Ciil Kuyaan”, is an alternate name for their asterism “Nek’eltaeni” (see That Which Moves Over Us, below (Cannon 2021)).

NOTE: This character shows up in Dena’ina culture as “Kil Qeyu”.

Smell:

This Latin asterism “Olor” is the IAU constellation Cygnus. “Olor” and “Cygnus” both appear as names for Cygnus in *De Astronomica* (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). This was likely influenced by Latin asterism Lilium (see Lily, above). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt.

- The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the names “Olor avt Gallus” for this constellation.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Olor, sive Cygnus qvi Etiam. Auis, feu Gallina dicitur” (“Olor, also Cygnus. A fowl is called a hen”) in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- “Olor” appears in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).
- Johann Bayer’s *Uranometria* (1603) lists the names “Olor” and “Auis” for this constellation.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Cygnus” and “Olor” for this constellation.
- John Hill’s *Urania* in 1754 lists the name “Olor” for this constellation.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Olor”.

Smelly Hands:

This Kiribati star “Baibingao” is currently unidentified (Trussel and Groves 1978). This name specifically refers to smelly or dirty hands.

Smile of Hydra:

This **telescopic** asterism “Mediásis Hýdrae” is the edge-on barred spiral galaxy NGC 5078 in the IAU constellation Hydra. William Herschel listed this as “II 566”. John Herschel listed it as h 3484 and later as GC 3487 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the slightly curved dark band across the large bulge”. This is probably caused by its interaction with the nearby galaxy IC 879.

Smiley Face:

There are eight **telescopic** “smiley face” asterisms:

- One, also known as the Cheshire Cat or Carol’s Smiley, is found in the IAU constellation Auriga 30 arcminutes south of the Starfish Cluster (Messier 38). The “smile” is a curved chain of stars: LY Aurigae, HIP 25735, HIP 25624, Phi (ϕ) Aurigae, HIP 25471 and HIP 25363. The “eyes” are the stars HIP 25476 and 25343. Size 80’ X 40’. This is listed in Asterisms: Small Star Patterns for Telescopes and Binoculars by Dutch astronomer Demelza Ramakers in 2011 and on Robert

Zebahl's Faint Fuzzies website by René Merting. Jeffrey Corder incorporates this into his "Elephant" asterism Corder 856/857 (see above).

- One, also known as "Vultus Irrisorie" (Latin for "looking ironically") is listed in Asterisms: Small Star Patterns for Telescopes and Binoculars by Dutch astronomer Demelza Ramakers in 2011. Size 84'. It is in the IAU constellation Cygnus:
- The curving "lips" consist of the five stars HIP 97774, 97845, 98013, 98071 and 98028.
- The "eyes" are the two stars HIP 97757 and 97700.
- One is in the IAU constellation Ursa Major and is Ennis 55 on the observing list of Canadian astronomer Charles Ennis. Size 100' X 35'. Two double stars form the eyes: HIP 57985 and HIP 57705. A curve of five 9th – 10th magnitude stars form the "lips": SAO 43936, HIP 57954, SAO 43928, SAO 43919 and Gaia DR3 769583235214110080. A rectangle of 9th – 12th magnitude stars including HIP 57862 form the nose. The curve of stars is Corder 2259 on Jeffrey Corder's observing list: Corder describes it as a "faint arc or 'C'".
- One is in the IAU constellation Scorpius and is Ennis 79 on the observing list of Canadian astronomer Charles Ennis. Size 70'. HIP 82489 and Gaia DR3 5970014750633758080 are the "eyes". Between them 8.85 magnitude Gaia DR3 5970014613194775552 and a tight cluster of dimmer stars form the "nose". A curve of three stars forms the "mouth": HD 151870, Gaia DR3 5969966543909143168, and HD 151790. Jeffrey Corder lists this as Corder 3136, which he describes as "two arcs of three stars".
- One is in the IAU constellation Hercules and is Ennis 80 on the observing list of Canadian astronomer Charles Ennis. Size 30'. The "eyes" are Rho (ρ) Herculis and HIP 85137. The "lips" are a curve of four 6th – 8th magnitude stars: HD 158015, SAO 66026, double star HIP 85181 and 85160. This includes stars of Corder 3264.
- One is made up of stars of the IAU constellation Pegasus. It is Ennis 89 on the asterism list of Canadian astronomer Charles Ennis and Bedö 1 on the list of Hungarian astronomer Veronika Bedö. Ennis posted it in July 2025. The "eyes" are HIP 108212 and HIP 107956. The "nose" is HIP 108063, SAO 90081 and HD 208225. The smiling "mouth" is HIP 108121, HIP 108060, HIP 107887, and HIP 107734. Size 1° 30'.
- One is made up of stars of the IAU constellation Orion. It is Ennis 91 on the asterism list of Canadian astronomer Charles Ennis and Dezsi 20 on the list of Hungarian astronomer Attila Dezsi. The "eyes" are the stars HIP 281129 and HD 249448. The "mouth" includes Gaia DR3 3348833387069792128 and Gaia DR3 3348833146551644288. Size 4'.
- One is the galaxy NGC 3758 in the IAU constellation Leo. It was found by Ralph Copeland in March 1874. This name was posted by American astronomer Jimi Lowrey on the Deep Sky Forum in April 2018. It is also known as the Owl Galaxy. This name relates to the two black holes in this galaxy that are spiraling in towards each other.

Smiting Sun Face:

This "Euphratian" asterism "Ukdagaba" is the IAU constellation Lepus as listed in R. H. Allen's *Star Names* in 1899. Allen attributes this to German orientalist Fritz Hommel but notes that English orientalist Robert Brown Jr. places it in Sagittarius.

Smoke:

This Wotjobaluk asterism is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda (Hamacher 2011).

This Mara and Moporr asterism "Barnk" is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda (Hamacher 2011).

Smoke from the Ancestor's Fires:

This Wiradjuri asterism is the Orion Nebula, Messier 42 (NGC 1976, SH 2-281, LBN 974, Ced 55d) in the IAU constellation Orion (Clarke 2014). They saw it as smoke from the fires of the ancestors who were cooking mussels from the river which was the Milky Way.

Smoke Ring:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. American astronomer Walter Scott Houston (1973) attributes the "smoke ring" to Tommy Christensen and gives a detailed description of how to see it. It is also known as the Hole in a Cluster, "83", Nefertiti's Headpiece, the Bicycle, or the Reliquary.

Smoking Gun:

This **telescopic** asterism is the galaxy Messier 87 (NGC 4486) in the IAU constellation Virgo. This was discovered by French astronomer Charles Messier in 1781. It contains the supermassive black hole known as Virgo A, which emits jets of plasma which inspired this name.

Smooth Arrow:

This Turkish asterism "Otysys Kalem" is the IAU constellation Sagitta. Johann Bayer's *Uranometria* (1603) lists "Orfercalim" as an alternate name for Satitta. R. H. Allen's *Star Names* in 1899 lists "Otysys Kalem" and writes that this is probably the source of the name "Orfercalim" listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). Allen also lists the name "Albumasar" and attributes this to Georg Wilhelm Sigismund Beigel (1753 – 1837).

Smooth One of Virgo:

This **telescopic** asterism "Móllis Vírginis" is the lenticular galaxy NGC 5838 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "II 542". It became GC 4038 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Snail:

This Greek asterism "τετράπλευρον" ("tetráplevro"), later latinized to "Terebellum" was first described by Ptolemy (c.100 – c.170) and is a small quadrilateral or cross of four faint stars in the IAU constellation Sagittarius made up of the stars Omega (ω) Sagittarii (which also bears the name Terebellum) plus the stars 59 Sagittarii (Terebellum II), 60 Sagittarii (Terebellum III), and 62 Sagittarii (Terebellum IV). Terebellum is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. NOTE: This is in recent years often described as a **telescopic** asterism, despite being originally listed as a unaided eye object. As a **telescopic** asterism it is also known as Herman's Cross. Terebellum is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based

on the Celestial Atlas of Alexander Jamieson, published in 1822. The IAU approved the name Terebellum for the star Omega (ω) Sagittarii A. Compare this to the asterism Drill, above.

This is also an alternate name for the **telescopic** asterism called the Coat Hanger (see above).

This **telescopic** asterism is the planetary nebula NGC 6543 (Caldwell 6) in the IAU constellation Draco. It was discovered by English astronomer William Herschel in 1786 who listed it as IV 37". It is GC 4373 in the *General Catalogue* of 1864. It is also known as the Cat's Eye Nebula or the Sunflower Nebula. Size 0.3' X 0.3'.

Snake:

This Greek asterism "Ὄφις" ("Ófis") is the IAU constellation Serpens as described by Ptolemy (c.100 – c.170) in his *Almagest*. It was originally considered part of Ophiuchus had the additional name "Ὄφις Ὀφιοῦχου" ("Ófis Ofioúchou"). This was later Latinized to "Anguis", "Anguis Æsculapis", and "Coluber".

The original asterism included stars of the IAU constellations Serpens and Ophiuchus:

- The "head" is the quadrilateral of the stars Beta (β) Serpentis, Gamma (γ) Serpentis, Rho (ρ) Serpentis and 21 Serpentis,
- The "body" is the line of stars from Beta (β) Serpentis through Delta (δ) Serpentis, Alpha (α) Serpentis, Epsilon (ε) Serpentis, Mu (μ) Serpentis, HIP 79195, Delta (δ) Ophiuchi, 23 Ophiuchi, Mu (μ) Ophiuchi, Zeta (ζ) Serpentis, and Eta (η) Serpentis, with the tip of the "tail" being the double star Theta (θ) Serpentis, and
- The Greek asterism "Serpent Bearer" is holding this "snake" at the star Delta (δ) Ophiuchi (see Serpent Bearer, above).

NOTE: Eudoxus (408 – 355 B.C.E.) used the name "ὁ διά τῶν" ("Ἄrkton Ὄfi B") or just "ὁ Ὄfi B" (Snake) for the constellation Draco. Aratus (315 – 240 B.C.E) changed this to Dragon (see above), probably to avoid confusion with the constellation Serpens.

This Gallic asterism "Anguis" is made up of stars of the IAU constellation Hydra. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. This is the circular group of stars that forms the modern "head" of Hydra: Epsilon (ε) Hydrae, Delta (δ) Hydrae, Sigma (σ) Hydrae, Eta (η) Hydrae, and Rho (ρ) Hydrae (McKay 2020).

This Egyptian Dendera asterism is a combination of the Babylonian asterism MUL.DINGIR.MUŠ (see Serpent, above) which later became the Greek asterism Hydra, and the Babylonian asterism MUL.UGA.MUSHEN (see Raven, above) which later became the Greek asterism Corvus (Hoffman 2017).

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts a serpent held by "OPHIVLCVS" but does not label it.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) labels this constellation "Anguis" and depicts it as a serpent wrapped around the arms and knotted around the waist of Ophiuchus. It head is on our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Anguis in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Anguis” as a serpent wound around the waist of Ophiuchus.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Anguis” as a snake wrapped around the middle of Ophiuchus.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Anguis” as a serpent wound around “Serpentarius” twice.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Ophiuchus” as a nude male standing on “Scorpius” holding a serpent in front of him which is labelled “Anguis”.

Johann Bayer’s *Uranometria* (1603) lists “Coluber”, “Anguis”, and “Anguilla” as names for Serpens and lists “Anguis” as a name for Draco and Hydra.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Ophiuchi”, “Coluber”, and “Anguis” as alternate names for Serpens.

“Anguis” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as an alternate name for Serpens.

John Hill lists “Anguis” for Serpens in his *Urania* in 1754.

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Anguis” as a “Latin” name for Serpens, Draco, and Hydra.

This Latin asterism “Anguis”, “Coluber”, or “Serpens” is the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899.

This Arabic asterism “Al'aqeaa” (الأقعى) is the IAU constellation Serpens.

- “Al-Hayyā” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Variations include “Al Ḥayyah”:
- It was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Robert Hues (1659) lists it as “Alhafa”.
- John Chilmead (1899) lists it as “Alhafa”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Huweyyah, the snake”.

This Arabic star “ath-Thuʿabān”, or “Ath-ThuʿAbaan” (الثعبان) is Alpha (α) Draconis (Thuban) in the IAU constellation Draco:

- It was later latinized to “Thuban”.
- Robert Hues lists it as “Taben” in his *A Learned Treatise on Globes* in 1659 and attributes this name to French Scholar Joseph Justus Scaliger (1540 – 1609).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Thuban, from the Arabian al-Thu’bán, the dragon”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Thuban”.

- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Thuban" and describes it as "a dragon".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list this star as "Thuban".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Thuban".
- The IAU approved the name Thuban for the star Alpha (α) Draconis A.

This "Hebrew" asterism "Fleuban" is the IAU constellation Draco. In his *Urania* in 1754 John Hill gives this as a "Hebrew name" for this constellation. This is clearly a reference to the Arabic name Thuban (see above).

This Sumerian asterism "mul dnirah" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Hydra. It is related to the story of Etana of Kiš and the deities Šamaš and Ištar.

This Akkadian asterism "ni-ra-ḫu" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Hydra. It is related to the story of Etana of Kiš and the deities Šamaš and Ištar. R. H. Allen lists this in his *Star Names* in 1899 as "Tsir" or "Sir" and describes it as the stars Eta (η), Theta (θ), and Xi (ξ) Ophiuchi in the IAU constellation Ophiuchus.

This Coptic asterism "Tshiō" is the stars Theta (θ) and Eta (η) Ophiuchi in the IAU constellation Ophiuchus as listed in R. H. Allen's *Star Names* in 1899.

This Tukano asterism "Aña Diaso", "Aña" ("viper"), "Jaracae", "Jararaca", or "Fer-de-lance" is made up of stars of the IAU constellation Scorpius, Sagittarius, and Corona Australis (Cardoso 2015, Cardoso 2016, Urton 2016). The constellation Scorpius makes up the front of this asterism, and then it extends from Scorpius' "stinger" to a curving line of stars (Eta (η), Epsilon (ε), Delta (δ), Lambda (λ), Phi (ϕ), Sigma (σ), Tau (τ), and Zeta (ζ) Sagittarii to a spiral of stars that is the IAU constellation Corona Australis. This is divided into segments including the head, body, venom, liver, egg sack, and tail, each associated with a particular flood season.

This Kogi asterism "Tarbi" or "Takbi" is the IAU constellation Scorpius.

This Persian asterism "EN.TE.NA.MAS.SIG" from the list of Lumasi Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Hydra:

This Dakota/Lakota/Nakota asterism "Zuzuecha" is made up of stars in the IAU constellations Canis Major, Puppis, and Columba. This is a wavy line of stars running from Rho (ρ) Puppis through Xi (ξ) Puppis and Kappa (κ) Puppis and on through Eta (η), Delta (δ), Sigma (σ), Epsilon (ε), Kappa (κ) and Zeta (ζ) Canis Majoris to Beta (β) Columbae (Wazn), Alpha (α) Columbae (Phact), and Epsilon (ε) Columbae.

This Pawnee asterism is the IAU constellation Scorpius.

This Skidi asterism is the IAU constellation Scorpius.

This Belarussian asterism "Змей" ("Zmej") is the IAU constellation Draco. This is the serpent killed by St. George.

This Kolam asterism "Borenagu" or "Nago" is the IAU constellation Scorpius (Vahia 2014).

This Estonian asterism “Siulik” (“snakelike”) is made up of stars of the IAU constellation Orion (Kuperjanov 2006): It is an “S” shape starting at Alpha (α) Orionis (Betelgeuse) and running through Gamma (γ) Orionis, Delta (δ) Orionis, Epsilon (ε) Orionis, Zeta (ζ) Orionis, and Iota (ι) Orionis, ending at Beta (β) Orionis (Rigel).

This Ainu Nociw (“asterism”) is made up of stars of the IAU constellation Draco.

This asterism is the IAU constellation Pisces as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

There are two **telescopic** Snake asterisms:

- One is in the IAU constellation Orion and is Ennis 41 on the observing list of Canadian astronomer Charles Ennis. The “head” is a triangle of four 8^{th} – 9^{th} magnitude stars: HD 30559, Gaia DR3 3230130764567833216, HD 30520, and HD 30533. The “body” is a curving line of eight 8^{th} – 10^{th} magnitude stars starting at HIP 22296 and running through HD 30428 and SAO 112076 to HIP 22230. This is Corder 733 on Jeffrey Corder’s list, which Corder describes as a “thick arc”.
- One is made up of stars of the IAU constellation Perseus. It was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in December 2023. The “head” of the snake is the loop of stars starting at HIP 18207 and running around through HIP 18309, HIP 18366, HD 24503, and HIP 18370. The “body” is the cascade of stars from HIP 18207 through HIP 17963, HIP 17800, HIP 17675, HIP 17718, HIP 17807, HIP 17869, and HIP 17827 to HIP 17772.

Snake Charmer:

This Arabic asterism “Sahir Althaeabin” (ساحر الثعابين) is the IAU constellation Ophiuchus.

Snake Climbing a Tree:

This Latin asterism “Coluber Arborem Conscendens” is the IAU constellation Draco and is a reference to the Staff of Aesculapius (see Aesculapius, above). Johann Bayer’s *Uranometria* (1603) lists “Coluber Arborem Conscendens”.

Snake Goddess:

Lithuanian archaeologist Marija Gimbutas (1996) and others identify the IAU constellations Ophiuchus and Serpens as a goddess holding a snake, which was a common theme in ancient cultures. The Uppsala Archaeoastronomical Project proposed this Minoan asterism, which they call the Serpent Mother. This asterism was passed on to me by Dana Corby of Ariadne’s Tribe in Tacoma, Washington in November 2023.

Snake Head:

This French asterism “Serpentaire” is the IAU constellation Ophiuchus.

Snake Large Anus:

This Tukano asterism “Sipé Phairo”, also known as “Cobra de Ânus Grande” (“Snake Large Anus”) is their name for the Big Dipper asterism in the IAU constellation Ursa Major (Cardoso 2007). Their legends tell that when this asterism touches the horizon after the sunset almost all fishes in the main river are swallowed by it.

Snake Man:

This Arabic asterism “ul-Ḥawwā'” or “Al Hawwāʿ” is the IAU constellation Ophiuchus:

- “al-Hawwā” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Catholic librarian Giuseppe Simone Assemani (1687 - 1768) listed it as “Alhava”.
- Robert Hues listed it as “Alhava” and “Hasalangue” in his *A Learned Treatise of Globes* in 1659.
- Other variations include “Al Haur”, “Al Hague”, “Alangue”, “Hasalangue”, “Alange”, and “Yilange”.
- German astronomer Johann Bayer (1572-1625) lists it as “Elhague” and describes it as “the Crane or Stork of the Serpent”, this being a reference to Serpens.
- John Hill lists it as “Hauwa” or “Al Hauwa” in his *Urania* in 1754.
- R. H. Allen lists the “Moorish” name “El Hauwe” in his *Star Names* in 1899. Allen suggests that this interpretation comes from “a drawing of a Crane, or Stork, on a Turkish planisphere”: Compare this to Stork, below.
- The *Century Cyclopedia* of 1894 lists “Hawwa”.

This Romanian asterism “Zmeu” is the IAU constellation Draco (Ottescu 2009). In Romanian legend the Zmei are men with snake skin with the ability to fly who come from “the other space” (“taramul celalalt”).

Snake Mouth:

This **telescopic** asterism is Corder 3491 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 40’. Corder describes it as “12 stars of magnitude 8 to 9 that make up the ‘mouth’ shape, with a 10th magnitude star making up a ‘fang’ at top of the mouth”. This includes HIP 89204, 89400, and 89175.

Snake Nebula:

This **telescopic** asterism is dark nebula is Barnard 72 in the IAU constellation Ophiuchus. It is part of the larger Dark Horse Nebula (see above). It is also known as the “S Nebula”.

Snake of North:

This Estonian asterism is the IAU constellation Draco (Kuperjanov 2006).

Snake of Pegasus:

This **telescopic** asterism “Serpens Pégasi” is the barred spiral galaxy NGC 7479 (Caldwell 44) in the IAU constellation Pegasus. It was discovered by English astronomer William Herschel in 1784 who listed it as “I 55”. It is GC 4892 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “with its long, thin, widely curved arms this galaxy resembles a twisting snake”. It is also known as the “Superman Galaxy” (see below), the “Propeller Galaxy” (see above) and the "Lawn Sprinkler” (see above).

Snake of Ursa Major:

This **telescopic** asterism “Opheódes Úrsae Majóris” is the barred spiral galaxy NGC 2854 (Arp 285) in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as “III 714”. It became GC 1823 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Snake’s Abdomen:

This Chinese xing guan “Shéfù” (蛇腹) is a curving line of four stars in the IAU constellation Hydrus: Zeta (ζ), Epsilon (ε), Delta (δ), and Eta (η) 2 Hydri. This xing guan is roughly parallel to a nearby xing guan: “Snake’s Head” (see below).

Snake’s Head:

This Chinese xing guan “Shéshǒu” (蛇首) is a line of four stars in the IAU constellations Horologium, Hydrus, and Reticulum: Alpha (α) Hydri, Gamma (γ) and Beta (β) Horologii, and Beta (β) Reticuli. It is roughly parallel to a nearby xing guan: “Snake’s Abdomen” (see above).

This asterism “Anguicomum Caput” is an alternate name for the asterism “Medusa’s Head” (see above) in the IAU constellation Perseus and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Snake’s Nose:

This Arabic star “Al Minḥar al Shujāʿ” is Rho (ρ) Hydrae in the IAU constellation Hydra as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449) and listed in R. H. Allen’s *Star Names* in 1899.

Snake’s Tail:

This Chinese xing guan “Shéwěi” (蛇尾) is a line of four stars in the IAU constellations Octans and Hydrus: Beta (β) Hydri and Psi (ψ), Nu (ν) and Alpha (α) Octantis.

Snapping Turtle:

This Korean asterism “Mulgeobug” (물거북) is the IAU constellation Corona Australis extended to form an oval of stars, including Alpha (α) Coronae Australis (Meridiana), Gamma (γ), Epsilon (ε), Lambda (λ), Theta (θ), Eta (η) 1 and 2, Zeta (ζ), Delta (δ), and Beta (β) Coronae Australis and HIP 90887, 91494, and 92953.

Sneden's Star:

This **telescopic** old population II giant star, BPS CS22892-0052 is located in the galactic halo in the IAU constellation Aquarius and is an ultra-metal-poor star (magnitude 13.21). This was discovered by astronomer Tim C. Beers but is named for American astronomer Chris Sneden who led the extensive spectroscopic observations of this star.

Sneaky One of Camelopardalis:

This **telescopic** asterism “Obrépens Camelopardális” is the edge-on spiral galaxy NGC 1560 in the IAU constellation Camelopardalis. It was discovered by German astronomer W. Tempel in 1883. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name is a reference to this galaxy approaching ours.

Sneeze:

This Arabic asterism is the open cluster Messier 44 in the IAU constellation Cancer and is part of their asterism “an-nathra” (see Tip of the Nose, below).

Snorter:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. They got this name because of the two long “tails” of stars, gas, and dust ejected from the collision, resembling an insect’s antennae. This is also known as the Ring Tail Galaxy (see below), the Antennae or Antennae Galaxies (see above), and the Mosquito Larvae (see below).

Snout:

This Latin star “Grumium” is the binary star Xi (χ) Draconis in the IAU constellation Draco. This is a corruption of the Latin “Grunnum”, which is a reference to the name Ptolemy (c.100 – c.170) gave this star “γένυς” (“génys”). “Grumium” appeared in the 1515 edition of the *Almagest*. German astronomer Johann Bayer (1572-1625) listed it as “Genam”. This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Grummium”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists “Grumium”. The IAU approved the name Grumium for Xi (χ) Draconis A in 2016. NOTE: German astronomer Johann Bayer incorrectly listed Grumium as the name for Epsilon (ε) Pegasi (Enif), claiming that he was quoting “the interpreters of the Almagest”.

This Arabic star “al-Khatem” is Omicron (ο) Ursae Majoris in the IAU constellation Ursa Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Snow Clad of Triangulum Australe:

This **telescopic** asterism “Niphóbolus Triánguli Austrális” is the spiral galaxy IC 4585 in the IAU constellation Triangulum Australe. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “IC 4584 and its companion IC 4585, located behind a thick curtain of Milky Way stars, seem to be covered by snow”.

Snow Collar:

This **telescopic** asterism NGC 1291 (also known as NGC 1269) is a lenticular galaxy in the IAU constellation Eridanus. It was discovered by James Dunlop in 1826. John Herschel listed it as h 2518 and h 2521, which later became GC 670 and GC 685 in the *General Catalogue* of 1864 and later NGC 1269 and NGC 1291. It is called this as it has a distinct “ring” surrounding it: This ring was first noted by English astronomer William Parsons (1800 – 1867). This name was posted on the Deep Sky Forum in December 2017 by American astronomer Mark Friedman. It is also known as the Golden Eye of Eridanus (see above).

Snow Covered of Triangulum Australe:

This **telescopic** asterism “Niphóstibes Triánguli Austrális” is the spiral galaxy IC 4584 in the IAU constellation Triangulum Australe. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger

(2010): They called it this because it is “IC 4584 and its companion IC 4585, located behind a thick curtain of Milky Way stars, seem to be covered by snow”.

Snow Globe Cluster:

This **telescopic** asterism is the open cluster NGC 5466 in the IAU constellation Boötes. It was discovered by English astronomer William Herschel in 1784 who listed it as “VI 9”. It is GC 3776 in the *General Catalogue* of 1864. It is also known as the Ghost Cluster.

Snow Globe Nebula:

This **telescopic** asterism is the planetary nebula NGC 6781 in the IAU constellation Aquila. This was discovered by English astronomer William Herschel in 1788 who listed it as “III 743”. It is GC 4487 in the *General Catalogue* of 1864. It is also known as the Ghost of the Moon Nebula or the Eagle’s Nest. Size 1.9’ X 1.9’.

Snow Lion:

This Tibetan khyim (zodiac constellation) “Sengge” or “Senge” is the IAU constellation Leo (Johnson-Groh 2013).

Snow Sled:

This **telescopic** asterism is the open cluster NGC 1778 in the IAU constellation Auriga. This was discovered by English astronomer William Herschel in 1787 who listed it as “VIII 61” in his catalogue. It is GC 996 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a 17-arcminute long sled.

Snowball:

There are eight **telescopic** “snowball” asterisms:

- One is the planetary nebula NGC 7662 (Caldwell 22) in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1864 who listed it as “IV 18”. It is GC 4964 in the *General Catalogue* of 1864. It is also known as the “Blue Snowball” or “Copeland’s Blue Snowball” after American amateur astronomer and poet Leland S. Copeland in the February 1960 Issue of *Sky and Telescope*. It is a bright nebula that definitely appears pale blue in the eyepiece.
- This is also an alternate name for the Incredible Shrinking Nebula (see above).
- One is the globular cluster NGC 5139 (Caldwell 80) in the IAU constellation Centaurus. It is also known as “Omega Centauri” (see below) and the “Star in the Cloud on the Horse’s Back” (see below), which was how it was described by Ptolemy (c.100 – c.170). . It is listed in the *General Catalogue* of 1864 as GC 3531 and in John Herschel’s catalogue as h 3504.It is also known as the Ice Cream Cone (see above). South African astronomer Richard Ford describes it in his observations from 2015 as a “giant mottled snowball”.
- One is the globular cluster Messier 22 (NGC 6656) in the IAU constellation Sagittarius. It was discovered by German amateur astronomer Abraham Ihle in 1665 and included in Charles Messier’s catalogue in 1764. It is GC 4424 in the *General Catalogue* of 1864. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply describes it as “Sagittarius, Nebula”. South African astronomer Richard Ford described this in 2015 as a “large out of focus snowball”.
- One is the planetary nebula NGC 6804 in the IAU constellation Aquila. This was discovered by English astronomer William Herschel in 1791 who listed it as “VI 38”. It is GC 4499 in the *General*

Catalogue of 1864. It is also known as the Incredible Shrinking Nebula and Lipstick Marks on a Mirror.

- One is globular cluster NGC 5897 in the IAU constellation Libra. This was discovered by English astronomer William Herschel in 1784 who listed it as "VI 19" and "VI 8?". It is GC 4075 in the *General Catalogue* of 1864. South African astronomer Richard Ford described it in 2015 as "a large out of focus snowball glowing like mist in the night sky."
- One is the globular cluster Messier 75 (NGC 6864) in the IAU constellation Sagittarius. This was discovered by French astronomer Pierre Méchain in 1780. John Herschel's General Catalogue of 1864 lists it as GC 4543. South African astronomer Richard Ford (2016) described it as a "roundish snowball". It is also known as a "Mini Messier 3" (see above).
- One is the asterism "Niphosphaéra Erídani" ("snowball of Eridanus"), which is the elliptical galaxy NGC 1199 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as "II 503". It became GC 643 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as to them it resembled "a snowball".

Snowflake Cluster:

This **telescopic** asterism is a smaller cluster of stars with a pinwheel shape inside the Christmas Tree Cluster (see above), open cluster Melotte 49, which is found within the emission nebula NGC 2264 (the Cone Nebula) in the IAU constellation Monoceros. This is O'Meara 35 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), which lists the names "Cone Nebula", "Fox Fur Nebula" and "Christmas Tree Cluster".

Snowman Nebula:

This **telescopic** asterism is Sharpless 2 302 (LBN 1046), an H II region in the IAU constellation Puppis adjacent to the open cluster NGC 2409. This was discovered by Stewart Sharpless and included in his 1959 catalogue. A dust lane dividing the oval region makes it look like a snowman.

Snowshoe Trail of Sister and Brothers:

This Dena'ina asterism is Delta (δ) Ursae Majoris, Epsilon (ε) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Cannon 2021).

Snowy of Phoenix:

This **telescopic** asterism "Nivális Phoenícis" is the irregular dwarf galaxy PGC 6830 (ESO 245-7) in the IAU constellation Phoenix. It was discovered by Hans Emil Schuster and Richard Martin West in 1976 and first taken for a globular cluster. R. Canterna and P.J. Flower discovered it to be a dwarf galaxy in 1977. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the galaxy looks like a small snowy patch in the sky."

Snowy Star:

This Latin asterism "Pliadum nivosum sidus" is the Pleiades cluster in the IAU constellation Taurus as listed by the 1st century poet Publius Papinius Statius and by R. H. Allen in his *Star Names* in 1899.

Soap Bubble Nebula:

There are two **telescopic** "soap bubble" asterisms:

- One is the planetary nebula NGC 246 (Caldwell 56) in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. This is listed as GC 131 in the 1846 *General Catalogue*. It is also known as the Skull Nebula and the Voodoo Mask Nebula.
- One is planetary nebula PN G75.5+1.7 in the IAU constellation Cygnus. This was discovered by American amateur astronomer Dave Jurasevich in 2007.

Sob:

This Korean asterism "Heuneukkim" (흐느낌) is a line of two stars in the IAU constellation Capricornus: 42 and Gamma (γ) Capricorni. Their asterism "Weeping" is nearby (see below).

Soccer Ball:

There are twos **telescopic** "Soccer Ball" asterisms:

- One is the "Soccer Ball Nebula", planetary nebula Kronberger 61 in the IAU constellation Cygnus. This was discovered by Austrian amateur astronomer Mattias Kronberger, a member of the Deep Sky Hunters, in January 2011 using images from the Gemini Observatory.
- One is the globular cluster NGC 6723 in the IAU constellation Corona Australis. It was discovered by Scottish astronomer James Dunlop in 1827. It is GC 4450 in the *General Catalogue* of 1864. South African astronomer Richard Ford described it in 2015 as "a slightly irregular soccer ball". It is also known as the Chandelier (see above).

Soccer Player of Pavo:

This **telescopic** asterism "Pedilúsor Pavónis" is the spiral galaxy IC 4721 in the IAU constellation Pavo. It was discovered by Stephane Javelle in 1896. American astronomer DeLisle Stewart (1870 – 1941) also recorded it, resulting in it being listed in the *Index Catalogue*. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy at its south end [is] accompanied by a small E0 galaxy [PGC 3096774], bringing to mind a soccer player with a ball at his foot."

Soft Arms of Camelopardalis:

This **telescopic** asterism "Mollibrachiátus Camelopardális" is the spiral galaxy NGC 2460 in the IAU constellation Camelopardalis. It was discovered by William Herschel in 1788. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the "soft looking, weak arms of this spiral galaxy".

Soft Chair:

This German asterism "Cathedra Mollis" is the IAU constellation Cassiopeia. German astronomer Johann Bayer (1572-1625) lists "Iuuenali Cathedra Mollis" ("Juvenal's Soft Chair") in his Uranometria (1603). English Admiral Henry William Smyth lists "Cathedra Mollis" in his *Bedford Catalogue* in 1844 and attributes this to 2nd century poet Juvenal. R. H. Allen in his *Star Names* in 1899 describes this as "an error from misreading of the original text".

Soft Palate:

This Arabic asterism “Al Lihāʿ” is their manzil Tip of the Nose (see below) as listed by Iranian scholar and astronomer Abu Rayhan Muhammad ibn al-Biruni (973 – c.1050).

Soft Patch of Grass:

This Jū/Wãsi, Jū /’hoansi, and !Kung asterism “//Galli Ding” or “//Gali Ding” is the Large Magellanic Cloud, which they see as a patch of thornless grass which they use for bedding (Slotegraaf 2013, Alcock 2014). Their God sleeps there when not hunting. Another version has this patch of grass as packing for ostrich eggs.

This G/wi asterism is the Large Magellanic Cloud, which they see as a patch of thornless grass which they use for bedding.

This Nyae Nyae !Kung asterism “//Gali Ding” is the Large Magellanic Cloud, which they see as a patch of thornless grass which they use for bedding.

Solar Luminosity:

This Chinese star from the Tang Dynasty (Krupp 1983) is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Krupp 1983). It was part of a shamanistic ritual called “Pace of Yu” involving a ritual dance based on the pattern and sequence of stars in the Big Dipper (which they called the Northern Dipper, see above).

Solar Star:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star 2 Scorpii in the IAU constellation Scorpius.

This Chinese xing guan “Rì” (日) is the star Kappa (κ) Librae in the IAU constellation Libra.

There are two Chinese Chenzhuo xing guans by the name “Ri” in the IAU constellation Scorpius:

- One is the star HIP 78246, and
- One is the star 2 Scorpii.

Solaris:

This **telescopic** Polish star is BD+14 4559 in the IAU constellation Pegasus (magnitude 9.64). It received this name in the IAU NameExoWorlds Campaign. This is the name of an ocean planet in a science fiction novel by Stanislaw Lem. It has an exoplanet named Pirx, which is the name of one of Lem’s characters.

Solarium:

See Sundial, below.

Soldier:

This Basque asterism “Soldadua” is the IAU constellation Orion (Knörr 1999, Frank 2021).

Soldier’s Bow:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Sole of the Left Foot:

This Euphratian asterism “Ur-ner-gub” is the stars Beta (β) 1 and 2 Sagittarii in the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899.

Sole One:

See Solitary One, below.

Solitary:

This Māori star “Kauanga” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

This Arabic star “Suhel al Shām” is Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra. It is also known as the Northern Suhail:

- Dorn (1829) describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- “Suhel al Sham” is listed in R. H. Allen’s *Star Names* in 1899.

This Coptic star “Khoritos” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Solitary Fish:

This Latin asterism “Piscis Solitarius” is the IAU constellation Piscis Austrinus.

- Johann Bayer’s *Uranometria* (1603) lists “Piscis Solitarius”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Piscis Solitarius”.

Solitary of Coma Berenices:

This **telescopic** asterism “Eremítis Cómae Bereníces” is the elliptical galaxy NGC 4494 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as “I 83”. It became GC 3043 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Solitary One:

This Arabic star “al-Fard” (الفرد) (“solitary one” or “sole one”) or “Al Fard al Shujāʿ” (“solitary one in the serpent”) is Alpha (α) Hydrae in the IAU constellation Hydra:

- “al-Fard” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- It is listed as “Fard al-shujā’” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- Later it was latinized to “Alphard”, “Alfard”, “Alphora”, and “Alpherd”.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “’unuq al-shujā’ wa huwa al-fard” (“the neck of the snake; it is the solitary one”).

- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Alfard" as does the Sloane astrolabe BM SL 54 (1290 – 1300) in the British Museum (Dekker 2000).
- The 15th century *Alfonsine Tables* (Kunitzsch 1986) list this star as "Alphart".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Alphart Serpenteidra".
- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists this star as "Alphard".
- Dutch uranographer Hugo Grotius (1583 – 1645) list this star as "Alphart"
- Italian astronomer Giovanni Batista Riccioli (1598 – 1671) listed "Kalbelaphard" and "Kalb Elhavich".
- Johann Bayer's *Uranometria* (1603) lists "Alphard".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Alpharad".
- Robert Hues in his *A Learned Treatise of Globes* in 1659 lists "Alphart".
- German poet Philipp von Zesen (1619 – 1689) listed it as "Alpharad", and Allen writes that the "Reuter wall map" labelled it as "Alphrad".
- Hugo Grotius (d. 1645) listed it as a star in Ptolemy's asterism Argo's Ship (see above) but later added that it was in Hydra. This star is close to the asterism Argo's Ship and might be considered the top of a mast according to R. H. Allen.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Alphard Cor Hydrae".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alphard".
- "Alphard" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- American uranographer William Croswell (1760 – 1834) lists "Alphard Cor Hydrae" on his *Mercator Map of the Starry Heavens* in 1810.
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Alphard".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Alphora vel Alphard" on one chart in his *Celestial Atlas* in 1822 and "Cor Hydra vel Alphard" on another chart.
- Alphard is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Alphard".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alphard".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Alphard" but incorrectly translates it as the "Hydra's Heart".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alfard" and describes it as "the solitary".
- In his *Star Names* in 1899 R. H. Allen writes that English orientalist Thomas Hyde (1636 – 1703) listed it as "Pherd".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alphard" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alphard" for this star.

- NOTE: Robert Burnham incorrectly names “solitary one” as a name for Alpha (α) Piscis Austrini (Fomalhaut) in his *Burnham’s Celestial Handbook* in 1978.
- The IAU approved the name Alphard for Alpha (α) Hydrae.

Solitary One of the Lancer:

This Arabic star “Mufrid ur-Rāmiḥ” (المفرد الرامح) is Eta (η) Boötis in the IAU constellation Boötes:

- This was later latinized to “Muphrid”, “Mufrid”, and “Mufride”.
- Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed it as “al Rāmiḥ” according to R. H. Allen in *Star Names* in 1899.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Muphrid… from the Arabic al mufrid al rámih, the single, or solitary star of the lancer.”
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Muphrid”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as “Muphrid”.
- The IAU approved the name Muphrid for Eta (η) Boötis Aa.
- Compare this to Lance of the Lance Bearer (above).

Solitary Ones:

There are three Arabic asterisms with the name “al-furūd” (الفرود) meaning “solitary ones” or “single ones”:

- One, later latinized to “Elkurud”, is the star Theta (θ) Columbae in the IAU constellation Columba:
    - The IAU approved the name Elkurud for Theta (θ) Columbae in 2018.
    - NOTE: English Admiral Henry William Smyth writes in his *Bedford Catalogue* in 1844 that this is “probably an error of transcription”, claiming that it comes from “Al kurúd, the monkeys” and in another entry as “El-Kurúd, the apes”, and describing this as “from 2 to 5 of the smaller stars of Canis Major, with θ, κ, and λ Columbae”, though he also lists “el-furúd, bright and insulated”. In his *Star Names* in 1899 R. H. Allen suggested that “al-furūd” was a transcriber’s error for “al-qurūd” (“the apes”) which he listed as “Al Ḳurūd”. Neither Smyth’s nor Allen’s suggestion has received scholarly support.
- One, later latinized to “Furud” and “Phurud” is the star Zeta (ζ) Canis Majoris:
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Phurud… from Al-furúd, the single ones”.
    - The IAU approved the name Furud for Zeta (ζ) Canis Majoris Aa.
- One, “Al Aghribah”, is a bending line of stars in the IAU constellation Canis Majoris and Columba listed by the 16th century Arabic astronomer Al Tizini: Zeta (ζ) Canis Majoris, Delta (δ) Columbae, Beta (β) Columbae, Alpha (α) Columbae, and Epsilon (ε) Columbae.
    - Dorn (1829) lists this as “the Solitary” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). \
    - This is also known as the Ravens (see Ravens above).

Solitary Thrush:

This French asterism “Turdus Solitarius” or “Solitaire” is made up of stars of the IAU constellations Hydra and Libra: 4 Librae and 54 to 57 Hydrae. It was created by French astronomer Pierre Charles Le Monnier in 1776: It was supposed to represent the extinct flightless bird Rodrigues solitaire, but the image used in the star atlas was that of a rock thrush, genus Turdus. It was later repurposed by Scottish schoolmaster Alexander Jamieson in the asterism “Noctua” (see Owl, above). German astronomer Christian Ludwig Ideler (1776 – 1846) called it “Einsiedler”, which is the German drossel or thrush. English Admiral Henry William Smyth lists “Turdus Solitarius” in his *Bedford Catalogue* in 1844. Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Solitarius” as a bird standing on Hydra’s tail (behind Corvus).

Solomon:

This German asterism is the IAU constellation Cepheus as listed in John Hill’s *Urania* in 1754. Hill identifies his source as German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658), but German poet Philipp von Zesen (1619 – 1689) also used this name for it.

Solomon’s Crown:

This German asterism is the IAU constellation Corona Australis and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. It later appears in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675 and in John Hill’s *Urania* in 1754.

Soma:

This Vedic star “Soma” (which translates as “moon” or “celestial drink”) is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion (Vahia 2014). Soma is a Hindu God of the Moon, the night, and vegetation. NOTE: This is also a Vedic name for the Moon, which they also call “Chandra”.

Sombre Lance:

This Chinese xing guan “Xuángē” (玄戈) is the star Lambda (λ) Boötis in the IAU constellation Boötes. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. The IAU approved the name Xuange for this star.

This Chinese Chenzhuo xing guan “Xuángē” is the star Lambda (λ) Boötis in the IAU constellation Boötes.

Sombrero:

This **telescopic** asterism is the galaxy Messier 104 (NGC 4594) in the IAU constellation Virgo. Its classification is unclear: It has a major dust lane and a large central bulge. It was discovered by French astronomer Pierre Méchain in 1781. English astronomer William Herschel noted the prominent dust lane in 1784 and listed this as “I 43”. It is GC 3132 in the *General Catalogue* of 1864. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this “Sombrero Galaxy”. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Subumbrátor Vírginis” (“Sombrero of Virgo”).

Son:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Columba: Beta (β) Columbae (the determinative star) and Gamma (γ) Columbae.

This Chinese xing guan “Zǐ” (子) is a line of two stars in the IAU constellation Columba: Beta (β) Columbae (Wazn) and Lambda (λ) Columbae.

This Chinese Chenzhuo xing guan “Zǐ” is two stars in the IAU constellation Columba: Beta (β) Columbae (Wazn) and Gamma (γ) Columbae.

This Korean lunar mansion “Zaa” is a triangle of stars in the IAU constellation Orion: Phi (ϕ) 1 and 2 and Lambda (λ) Orionis.

Son of Beaver:

This Northern Tutchone asterism “Sojee” or “tsé’zhi?” may be cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)).

Son of Heaven:

This Chinese star “Tianzi” ” from the 3 Kingdoms and Ming Dynasty Period is Iota (ι) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Steps (see below).

Son of M76:

This **telescopic** asterism is the planetary nebula NGC 6778 in the IAU constellation Aquila. This was discovered by German astronomer Albert Marth (1828 – 1897). It is GC 5942 in the *General Catalogue* of 1864.

Son of the Shunammite:

This German asterism is Antinous (see above) in the IAU constellation Aquila as listed by German astronomer Philipp von Zesen (1619 – 1689). This was a person raised to life by the prophet Elisha in Hebrew legends.

Song:

This Latin asterism “Canticum” is the IAU constellation Lyra. Johann Bayer’s *Uranometria* (1603) lists the name “Canticum” for Lyra.

Sòng:

This Chinese star “Sòng” from the 3 Kingdoms and Ming Dynasty Period is the star Eta (η) Ophiuchi in the IAU constellation Ophiuchus and is and is part of their xing guan Heavenly Market East Wall (see above).

Son’s Crown:

This Estonian asterism “Põjah Kroon” is the IAU constellation Hercules and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Sons of Baayami:

This Kamilaroi/Euahlayi asterism is the bright patches either side of the galactic bulge in the IAU constellation Scorpius. They are the sones of their hero “Baayami” or “Byaame”, who after his sons disobeyed him, turned them into large rocks in the Barwon River and their spirits into these bright patches in the sky.

Soothsayer:

This Latin asterism “Suculae” is the Hyades cluster in the IAU constellation Taurus as listed in John Hill’s *Urania* in 1754.

Sopdet:

This ancient Egyptian star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. Sopdet, Sopedet, or Satet was an Egyptian archer Goddess known to the Greeks as Sothis, and an aspect of Isis. Her consort was Sah (see Sah, above). Satet is depicted alongside Hathor (see above) in the Circular Zodiac ceiling of the temple in Dendera (Holberg 2007, Bomhard 2009). This asterism appeared from the Middle Kingdom onward, and its heliacal rising marked the beginning of the flooding of the Nile: The Egyptians called this “prt spdt” (“the going forth of Sopdet”) and had a festival by that name to celebrate the event. Hephaestion of Thebes (c. 425 C.E.) noted that the Egyptians noted the color of the rising Sirius: If it appeared white, they believed that the Nile flood would be high with a strong current and if “fiery red and the color of red ochre there would be war” (Holberg 2007). Compare this to Hathor (see above). Isis follows her brother Osiris (represented by Orion) across the sky (Holbrook 2020). John Hill lists Sothis in his *Urania* in 1754. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), calls this the “Nile Star” and says that the name is related to the flooding of this river. Compare this to Sothis, below.

Sorcerer Men on the Trail:

This Kokatha and Ngalea asterism “Warramula” (“kadaicha (sorcerer) men on the trail”) is the IAU constellation Pisces.

Sorority Cluster:

This **telescopic** asterism is the open cluster NGC 2169 in the IAU constellation Orion. This was discovered by William Herschel in 1784 who listed it as “VIII 24” in his catalogue. It is GC 1361 in the General Catalogue of 1864. American Don Pensack wrote: “I see NGC 2169 as Sigma Nu, not 37. My wife calls it the Sorority Cluster.” It is also known as “37” (see above), the Shopping Cart (see above). “LE” (see above), or the Little Pleiades (see above).

Sosicles of Virgo:

This **telescopic** asterism “Sósicles Vírginis” is the spiral galaxy NGC 4995 in the IAU constellation Virgo. William Herschel listed this as “I 42”. John Herschel listed this as h 1540 and h 3472 and later as GC 3430 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is paired with NGC 4981 and they saw this as one of the twins in the comedy *the Menaechmi* by Roman author Plautus.

Sothis:

This Egyptian Dendera asterism is the IAU constellation Canis Major (Soliman 2015, Hoffman 2017). It is depicted as an archer with a bow and arrow and is clearly influenced by the earlier Babylonian asterism Qastu (see Bow, above). Sothis is the Greek name for the Egyptian Goddess Sopdet (Compare this to Sopdet, above). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Sothis” as a name for Alpha (α) Canis Majoris (Sirius).

Soul Nebula:

This **telescopic** asterism is emission nebula IC 1848 (SH 2-199, LBN 667, Cr 34, Ced 9a) in the IAU constellation Cassiopeia. It was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). American astrophotographer Matt BenDaniel named it this as it is beside IC 1805, the Heart Nebula. It is also known as the Baby Nebula.

South:

This Latin star "Meridiana" is Alpha (α) Coronae Australis in the IAU constellation Corona Australis. Its full name was "Alphekka Meridiana" ("Alphekka South") which came from Latin translator Ali Aben Reduan. It was later contracted to "Meridiana". The IAU approved the name Meridiana for Alpha (α) Coronae Australis.

South Cord:

This Polish asterism "Linum Austrinum" is made up of the stars of the IAU constellation Pisces and was created as one of four subdivisions of this constellation by the Polish astronomer Johannes Hevelius (1611 – 1687). It is the stars Alpha (α) Piscium (Alrescha), Xi (ξ) Piscium, Nu (ν) Piscium, Mu (μ) Piscium, Zeta (ζ) Piscium, Epsilon (ε) Piscium, Delta (δ) Piscium, 41 Piscium, 35 Piscium, and Omega (ω) Piscium.

South Fish:

This Polish asterism "Piscis Austrinum" is made up of the stars of the IAU constellation Pisces and was created as one of four subdivisions of this constellation by the Polish astronomer Johannes Hevelius (1611 – 1687). It is the stars Omega (ω) Piscium, Iota (ι) Piscium, Theta (θ) Piscium, 7 Piscium, Beta (β) Piscium (Fumalsamakah), 5 Piscium, Kappa (κ) Piscium, Lambda (λ) Piscium, and 19 Piscium. John Hill lists it as "Auratus Piscis" in his *Urania* in 1754. The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778 lists this as "le Poisson Australe".

South River:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Canis Minor: Alpha (α) Canis Minoris (Procyon- the determinative star), Beta (β) Canis Minoris (Gomeisa) and 1 Canis Minoris.

This Chinese xing guan "Nánhé" (南河) is a line of three stars in the IAU constellation Canis Minor: Alpha (α) Canis Minoris (Procyon), Beta (β) Canis Minoris (Gomeisa) and Epsilon (ε) Canis Minoris. Note: This asterism is identical to the Korean xing guan "South River" (see below).

This Chinese Chenzhuo xing guan "Nánhé" is two stars in the IAU constellation Canis Minor: Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa).

The Korean asterism "Namjjog Gang" (남쪽 강) is identical to the Chinese xing guan "South River" (see above). Note: Some versions have the stars Alpha (α) Canis Minoris (Procyon), Beta (β) Canis Minoris (Gomeisa), and Gamma (γ) Canis Minoris: The stars Epsilon (ε) and Gamma (γ) Canis Minoris are side by side, so it works out about the same.

South Side of Second Leap of a Gazelle:

This Latin star "Tania Australis" is Mu (μ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their asterism Second Leap of a Gazelle (see above). The IAU approved the name Tania Australis for Mu (μ) Ursae Majoris A in 2016.

South Star:

This Norse star “Sudrstjarna” or “Sunnr Stjarna” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Bender 2020, Persson 2022).

This Anglo-Saxon star “Sûðsteorra” or “Sûðorsteorra” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Bender 2020).

This Old Icelandic star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

This Saxon star “Sudstern” or “Süd Stern” is Alpha (α) Lyrae (Vega) as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters in 1934 (Bender 2020).

This Latin star “Polaris Australis” is Sigma (σ) Octantis in the IAU constellation Octans. This name is a contraction of “Stella Polaris Australis” (“south polar star”) which first appeared in the 18th century.

This Pawnee star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Dechend 1975).

This Estonian star is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Kuperjanov 2006).

Southeast Wind:

This Latin asterism “Eurus” is the IAU constellation Eridanus as listed in the Maass 1898 manuscript of the 11th century *De signis caeli (“of the signs of heaven*”). Eurus is a Roman name for the southeast wind. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict the bust of a figure with wild hair with a star nested in it with his open right palm in front of him and a long rectangular shape below him. All but the Klosterneuberg manuscript depict a plant beside him. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict just the head with wild hair, set above a rectangular block. The Durham Hunter 100 manuscript of *De signis caeli* depicts a nude river God with a cloak over his right shoulder, holding an urn on his right knee. The Montecassino 3 manuscript of *De signis caeli* depicts him as a disembodied head with wild hair making a gesture of benediction.

Southeastern Star in the Crab:

This Babylonian star “As Arkū-sha-nangaru-sha-shūtu” is Delta (δ) Cancri in the IAU constellation Cancer.

Southern Antenna of Corvus:

This **telescopic** asterism “Anténna Austrális Córvi” is the barred lenticular galaxy NGC 4039 (Arp 244/Caldwell 61) a pair of colliding galaxies in the IAU constellation Corvus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): This is part of the Antennae Galaxies (see above). These galaxies were discovered by English astronomer William Herschel in 1789 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. They got this name because of the two long “tails” of stars, gas, and dust ejected from the collision, resembling an insect’s antennae. This is also known as the Ring Tail Galaxy (see below), the Snorther (see below), the Antennae or Antennae Galaxies (see above), and the Mosquito Larvae (see above).

Southern Arrow:

This asterism “Sagitta Australis” was created by Flemish astronomer Petrus Plancius (1552 – 1622) from the stars of the IAU constellations Ophiuchus, Scorpius, and Sagittarius. The “tip” of the arrow is Epsilon

(ε) Scorpii, and the shaft runs through 45 Ophiuchi to 2 Sagitarii. A celestial globe (1613) of Plancius published in Amsterdam by Pieter van der Keere depicts this as a fletched arrow about to strike Scorpius in the base of its tail, and labels this "Sagitta Austr" on the chart. It looks like it has been shot by Sagittarius.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Sagitta Austr".

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Sagitta Austr" as a fletched arrow flying to our left which appears about to strike the base of the tail of Scorpius and to have been shot by Sagittarius.

Southern Beehive:

This **telescopic** asterism is the open cluster NGC 2516 (Caldwell 2516) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as "Lac II 3". It is GC 1619 in the *General Catalogue* of 1864. It is also known as the Diamond, the Christmas Tree, and the Sprinter.

Southern Birds:

This is a name for the four southern IAU constellations Tucana, Phoenix, Grus, and Pavo.

Southern Boat:

This Chinese xing guan "Nánchuán" (南船) is a curving line of stars in the IAU constellation Carina: Beta (β) Carinae (Miaplacidus), Omega (ω) Carinae, Theta (θ) Carinae, p Carinae, and q Carinae.

Southern Bow:

This Latin star "Kaus Australis" is Epsilon (ε) Sagittarii in the IAU constellation Sagittarius. This name is derived from the Arabic "gaws" ("bow" قوس) and Latin "austrālis" ("southern"):

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Kaus Australis".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Kaus Australis" for this star.
- The IAU Working Group on Star Names approved the name Kaus Australis for the star Epsilon (ε) Sagittarii A.

Southern Butterfly:

See Butterfly, above.

Southern Celestial Clock:

This Portuguese asterism is the IAU constellation as listed by Portuguese naturalist Cristoval d'Acosta (1550 – 1580).

Southern Chariot:

In 1455 Venetian navigator Alvise Cadamosto gave this name to the IAU constellation Crux.

Southern Claw of Al-Jawza:

This Bedouin star "Zabin al-Ǧawza al-Ǧunūbī " (زابن الجوزا الجنوبي) is Beta (β) Orionis (Rigel) in the IAU constellation Orion as inferred from the name of their star Northern Claw of Al-Jawza (see above)

Southern Claw of the Scorpion:

This Greek star "Χηλή νότιος" ("Chilí nótios") is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra.

This Arabic star "az-Zubān ul-Janūbiy" (الزبان الجنوبي) or "Al Zubān al Janūbiyyah" is the double star Alpha (α) Librae in the IAU constellation Libra, later latinized to "Zubenelgenubi":

- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists "ha-niqdam mi-shtei".
- Johann Bayer's *Uranometria* (1603) lists "Zubenelgenubi".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Zubenelgenubi".
- Robert Hues lists it as "Zubenalgenubi" in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Zubenelgemubi".
- American uranographer Elijah Burritt (1794 – 1838) and American astronomy author Hannah Mary Bouvier Peterson (1811 – 1870) listed the name "Zubenelgemabi".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Zuben el Genubi" in his *Celestial Atlas* in 1822.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Zuben el Genubi".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Zuben el Genubi": The author is unknown, but it is based on Jamieson's *Celestial Atlas.*
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Zuben el Genula".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists "Zuben el Genubi" for this star.
- NOTE: American uranographer Elijah Burritt (1794 – 1838) assigned the name Zubenelgenubi to Gamma (γ) Librae. The IAU approved the name Zubenelgenubi for Alpha (α) 2 Librae Aa.

Southern Coil:

This German asterism "Spira Australis" was a name given to the IAU constellation Corona Australis by the German poet Philipp von Zesen (1619 – 1689).

Southern Crab Nebula:

This **telescopic** asterism is nebula Hen 2-104 in the IAU constellation Centaurus. It has a red dwarf white dwarf pair at its center.

Southern Cross:

This asterism is the most recognizable part of the IAU constellation Crux. The main stars of this asterism are Alpha (α) Crucis (Acrux- 13th brightest star), Beta (β) Crucis (Mimosa or Becrux- 20th brightest star), Delta (δ) Crucis (Imai) and Gamma (γ) Crucis (Gacrux- 25th brightest star), with Epsilon (ε) Crucis tucked in between Acrux and Imai. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists the "Southern Cross". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the "Southern Cross" asterism.

This Somali asterism "Wadaamo-Xooro" or "Waadaamo-Lugud" is the Southern Cross asterism (see Southern Cross, above) in the IAU constellation Crux.

This Quechua (Misminay) asterism is made up of stars in the IAU constellations Centaurus and Lupus (Urton 1980): Alpha (α) Centauri (Rigil Kentaurus), Epsilon (ε) Centauri and Omicron (ο) and Sigma (σ) Lupi. Compare to "Huch'uy Cruz" (see Small Cross, above).

This Northern Andes asterism is the IAU constellation Crux (Quinatoa 2018).

Southern Cross Galaxy:

This **telescopic** asterism NGC 3621 is a field spiral galaxy with an internal ring in the IAU constellation Hydra. This was discovered in 1790 by English astronomer William Herschel who listed it as "I 241" in his catalogue. It is GC 2371 in the *General Catalogue* of 1864. It is also known as the Frame Galaxy (see above) and the "Wreath Wearer of Leo" (see above). South African astronomer Magda Streicher gave it the name Southern Cross Galaxy c. 1997. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 57 without a name.

Southern Crown:

This Greek asterism "Στεφάνος νοτίος" ("Stefános notíos") is the IAU constellation Corona Australis as originally described by Ptolemy (c.100 – c.170) in his *Almagest*.

This Arabic asterism "Altaaj Aljanubiu" (التاج الجنوبي) or "al-Iklīl al-Janūbī" is the IAU constellation Corona Australis. "al-Iklīl al-Janūbī" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Southern Dipper:

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Sagittarius: The "handle" is the stars Lambda (λ) Sagittarii and Phi (ϕ) Sagittarii. The "dipper" is the four stars Phi (ϕ) Sagittarii, Sigma (σ) Sagittarii, Tau (τ) Sagittarii, and Zeta (ζ) Sagittarii.

This an alternate name for the Chinese xing guan Dipper, (see above).

Southern Dog:

This asterism "Canis Australis" is the IAU constellation Canis Major as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Southern Donkey Colt:

This Greek star "Asellus Australis" is Delta (δ) Cancri in the IAU constellation Cancer and is part of their asterism Donkey Colts (see above):

- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Asellus Austr".
- Edward Sherburne calls this the "Southern Asinego" ("southern donkey") in his *Sphere of Marcus Manilius* in 1675.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) labels this star "Asellus Aust" on his charts.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Asellus Australis" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 in the abbreviated form "Asellus Aust": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

- The IAU approved the name Asellus Australis for the star Delta (δ) Cancri Aa.

Southern Eel:

This Greek star "Chele Notios" is a "prominent star" in the IAU constellation Libra as listed by John Hill in his *Urania* in 1754.

Southern Ellipse:

This **telescopic** asterism PGC 19481 is a lenticular ring galaxy in the IAU constellation Volans. It is also known as the Lindsay-Shapley Ring (see above).

Southern Fish:

This Greek asterism Νότιος Ἰχθύς is the IAU constellation Piscis Austrinus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described by Ptolemy (c.100 – c.170) in his *Almagest*. Johann Bayer's *Uranometria* (1603) lists "Piscis Meridianus" and "Piscis Austrinus" as names for this constellation.

This Arabic asterism "Al Ḥūt al Janūbiyy" is the IAU constellation Piscis Austrinus:

- "al-Hūt al-Janūbī was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Haut Elgenubi".
- Robert Hues (1659) and John Chilmead (1899) list it in *A Learned Treatise on Globes* as "Ahaut Algenubi".
- English Admiral Henry William Smyth lists this name in his *Bedford Catalogue* in 1844.
- "Haut Elgenubi" is listed by R. H. Allen in his *Star Names* in 1899 and writes that this asterism extended into the IAU constellation Grus, as 16th century Arabic astronomer Al Tizini listed stars in Grus as part of the tail of this "fish".

Southern Fly:

This German asterism "Südliche Fliege" is the IAU constellation Musca.

This French asterism "Mouche Australe ou Indien" is the IAU constellation Musca.

This Italian asterism "Mosca Australe" is the IAU constellation Musca.

Southern Garland:

This French asterism "Sertum Australe" was a name given to the IAU constellation Corona Australis by the French astronomer Jérôme Lalande (1732 – 1807).

Southern Gate:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of 4 stars in the IAU constellation Centaurus: Starting at the determinative star Xi (ξ) 2 Centauri, it runs through HIP 64515A, 64933, and Epsilon (ε) Centauri.

This Chinese xing guan "Nánmén" (南门) first appeared in the Xia xiao zheng (夏小正 Small Calendar of the Xia Dynasty) which dates to the 21st to 17th century B.C.E. It is a line of two stars in the IAU constellation Centaurus: Alpha (α) Centauri (Rigil Kentaurus) and Epsilon (ε) Centauri.

This Chinese Chenzhuo xing guan is two stars in the IAU constellations Centaurus and Crux: Beta (β) Centauri (Hadar) and Beta (β) Crucis (Mimosa).

Southern Grinder:

This **telescopic** asterism "El Molinillo Austral" is Messier 83 (NGC 5236), a barred spiral galaxy in the IAU constellation Hydra. French astronomer Charles Messier added it to his catalogue in 1781, but it was first observed by French astronomer Nicolas Louis de Lacaille in February 1752 who listed it as Lac I6. It is GC 3606 in the *General Catalogue* of 1864. It is also known as the Thousand Ruby Galaxy and the "Southern Pinwheel".

Southern Horn of Al-Jawza:

This Bedouin star "Qarn al-Ǧawza al-Ǧunūbī" (قرن الجوزا الجنوبي) is Beta (β) Orionis (Rigel) in the IAU constellation Orion. See Giant, above.

Southern Integral Sign:

This **telescopic** asterism IC 5173 is an interacting galaxy in the IAU constellation Indus. This was first recorded by American astronomer DeLisle Stewart (1870 – 1941).

Southern Leg of the Water Pourer:

This Arabic star "Sāq sākib al-mā' al-janūbi" is Delta (δ) Aquarii in the IAU constellation Aquarius as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Southern Lehua Blossom:

This Hawaiian star "Lehuakona" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. It is their form of the Maori star Rehua. Lehuakona is also know to the Hawaiians as Hoku'ula (see Red Star, above).

Southern Light:

This Babylonian ecliptic constellation "Nūru-sha-Shūtu" is Alpha (α) 1 and 2 Librae (Zubenelgenubi) the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899.

Southern Line of al-Nasaqān:

See Two Lines, below.

Southern Little Queen:

This **telescopic** asterism, Streicher 6, is a miniature version of the "W" of Cassiopeia (hence the reference in the name to a queen) in the IAU constellation Puppis, discovered by South African astronomer Magda Streicher. It is made up of 8^{th} – 9^{th} magnitude stars including HIP 39838A. Size 10'. Jeffrey Corder lists it as Corder 1516.

Southern Military Gate:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star Alpha (α) Trianguli in the IAU constellation Triangulum.

This Chinese xing guan “Jūnnánmén” (军南门) is the star Phi (ϕ) Andromedae in the IAU constellation Andromeda.

This Chinese Chenzhuo xing guan “Jūnnánmén” is the star Phi (ϕ) Andromedae in the IAU constellation Andromeda.

Southern of Lilium:

This French star “Līliī Austrīnā” is 41 Arietis in the IAU constellation Aries. French astronomer Nicolas-Louis de Lacaille (1713 – 1762) gave it this name as it was part of the now obsolete constellation Lilium (see Fleur de Lis, above) created by French architect Augustin Royer.

Southern of the Chariot:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star “SUR GIGIR sa ULU” (“southern [unknown part] of the chariot”) is Zeta (ζ) Tauri in the IAU constellation Taurus (Hunger and Sachs 1988).

Southern Owl Nebula:

This **telescopic** asterism is planetary nebula PK 283+25.1 (PLN 283+25.1, ESO 378-1) in the IAU constellation Hydra.

Southern Part of the Scales:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star “RIN sa ULU” is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra (Hunger and Sachs 1988).

Southern Pinwheel:

There are two **telescopic** asterisms by this name:

- One is Messier 83 (NGC 5236), a barred spiral galaxy in the IAU constellation Hydra. French astronomer Charles Messier added it to his catalogue in 1781, but it was first observed by French astronomer Nicolas Louis de Lacaille in February 1752 who listed it as Lac I6. It is GC 3606 in the *General Catalogue* of 1864. Its name comes from its resemblance to the Pinwheel Galaxy, Messier 101. It is also known as the Thousand Ruby Galaxy and “El Molinillo Austral” (“the Southern Grinder”).
- One is NGC 300 (Caldwell 70), a spiral galaxy in the IAU constellation Sculptor. Scottish astronomer James Dunlop discovered this in 1827. It is GC 169 in the 1864 *General Catalogue*. John Dreyer described it in the New General Catalogue of 1888 as “a complex object with several nuclei”. It is also known as the Sculptor Pinwheel and “With Many Grains” (Granósus Sculptóris).

Southern Pleiades:

This **telescopic** asterism is the open cluster the Theta (θ) Carinae cluster, IC 2602 (Melotte 102, Caldwell 102). The name comes from Abbé Nicholas Louis de Lacaille’s original catalogue of 1755, where he describes it as a “large number of stars of 6th, 7th, and 8th magnitude, which resemble the Pleiades”. American astronomer Solon Irving Bailey (1854 – 1931) recorded it and it became IC 2602. It is also known as the “Bow Tie” (see above), and the “Scales of Justice” (see above).

Southern Ring Nebula:

There are two **telescopic** asterisms by this name:

- One is the planetary nebula NGC 3132 (Caldwell 74) in the IAU constellation Vela. It is GC 2017 in the *General Catalogue* of 1864. It is also known as the Eight-Burst Nebula (see above).
- One is the planetary nebula NGC 6563 in the IAU constellation Sagittarius. This was discovered in 1847 by English astronomer John Herschel who listed it as h 3734 and later as GC 4386 in the *General Catalogue* of 1864.

Southern Seagull Nebula:

This **telescopic** asterism is HII region NGC 2032 in the IAU constellation Dorado. This was discovered by Scottish astronomer James Dunlop in 1827. It is listed as GC 1235 in the *General Catalogue* of 1864.

Southern Shaft:

This Latin asterism "Temo Meridianus" is the IAU constellation Sagitta. Johann Bayer's *Uranometria* (1603) lists "Temo Meridianus" as an alternate name for Sagitta. R. H. Allen's *Star Names* in 1899 lists "Temo Meridianus" for Sagitta.

Southern Shepherd:

This Arabic star is Alpha (α) Ophiuchi in the IAU constellation Ophiuchus. It is part of their asterism Two Lines (see below).

Southern Shi'ra:

This Arabic star "Al Shīʿrā al 'Abur al Yamaniyyah" "Brightly Shining Star of Passage of Yemen" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major:

- "al-Shi'ra al-Yamāniya" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) as "Shi'rà Yamānīyah".
- Dorn lists this as "the Star of Yemen" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- John of London, in a letter to R. De Guedinge (1246) discusses the star "Alhabor" (Nothaft 2022).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-shi'rā al-yamāniya".
- It is listed as "Σιαὴρ Ιαμανὴ" or "Siaír Iamaní" in *Syntaxis ton Person (Persian Compendium)* by the 14th century Greek geographer and astronomer Georgius Chrysococcas and "Sirius Jemenicus" in C. Edward Sachau's translation of the *Chronology* of Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Alhabor" (Dekker 2000).
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "ALhABOR" (Dekker 2000).
- A 14th century Christian Spanish astrolabe #4560 lists "Alabor" (King 2002).
- The 15th century *Alfonsine Tables* list "Asceher" and "Aschere Aliemini".
- This was latinized in the 1515 edition of the *Almagest* to "Asehere" and "Alahamor Aliemenia" and in the 1551 edition as "Elsheere". The 1515 edition of the *Almagest* also lists "Halabor".

- John Chilmead (1889) and Robert Hues (1659) lists “Gabbar”, “Gabbir”, “Ecber”, and “Habor”.
- German astronomer Johann Bayer (1572-1625) listed it as “Aschere”, “Aschemie”, “Aliemini”, “Elscheere”, “Scheereeliemini”, “Elfere”, “Elfeiri”, “Sceara”, “Scera”, “Alhabor”, “Elhabor”, and “Elchabar” in his *Uranometria* (1603) and attributes these names to the Alphonsine Tables.
- Dutch astronomer Hugo Grotius (1583 – 1645) listed it as “Elsere”, “Sceara”, “Scera”, and “Scheereliemini”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Alhabor”, “Elhabor”, Elchabar”, and “Aliemini”.
- “Elahbor”, “Alachbaro”, “Aliemini”, and Aliaminio” are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch
- Robert Hues (1659) and John Chilmead (1899) listed it as “Alsahare Aliemalija”, “Elchabar”, and “Scera” (which Hues attributes to Joseph Justus Scaliger (1540 – 1609)).
- German astronomer Johann Bayer (1603) lists “Aschere” and “Elscheere” in his *Uranometria*.
- Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star “Sirius Asehere Aliemeni”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Alshira, from the Arabic Ash-shi’ra l Yemenihya, the bright star of Yemen, or Arabia Felix”. This name indicates the southern province where it set, so this was latinized to “Southern Shi’ra”. It was also known as the “Crossing Shi’ra”.

Southern Star:

This Lithuanian star “Pietinė žvaigždė” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

Southern Star in the Head of the Lion:

This Arabic star “raʾas ul-asad ul-janūbiy” or “Al Rās al Asad al Janūbiyyah” is Epsilon (ε) Leonis in the IAU constellation Leo:

- This was later latinized to “Ras Elased”, “Ras Elased Australis”, “Asad Australis“, and “Algenubi”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Rás al asad al jénúbi, or Australis, to denote the south or undermost of two stars in the Lion’s head”.

Southern Stars:

This Bugis asterism “Bintoéng Sallatang” is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Southern Tadpoles:

This **telescopic** asterism is open cluster NGC 3572 in the IAU constellation Carina. John Herschel listed this as h 3323 and later as GC 2331 in his *General Catalogue* of 1864.

Southern Tail of the Eagle:

This star “Deneb al Okab Australis”, “Deneb al Okab”, or “Dheneb” is Zeta (ζ) Aquilae in the IAU constellation Aquila. It was given this name as the nearby star Epsilon (ε) Aquilae is called Deneb al Okab Borealis (see Tail of the Eagle, above). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Dheneb el ‘Okáb, the Eagle’s tail”.

Southern Tail of the Sea Monster:

There are two Arabic stars with the name “al-dhanab al-qayṭas al-janūbī” (ذنب القيطس الجنوبي), “Dhanab ul-Qayṭus ul-Janūbīyy”:

- One is Beta (β) Ceti (Diphda) in the IAU constellation Cetus, later latinized to “Deneb Kaitos”:
  - “Dhanab Qītus” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - This star is listed as or “Dhanab al-qītus al-janūbi” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
  - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Hebrew name “qase zenav kokhav qaytus”.
  - The *Alfonsine Tables* list “Denebcaiton” (Kunitzsch 1986).
  - A 14th century Christian Spanish astrolabe #4560 lists the abbreviated form “Dnp Caitos” (King 2002).
  - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists “Denebcaitoz” (Dekker 2000).
  - The Sloan astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “Denebcaitoz” (Dekker 2000).
  - 14th century Greek geographer and astronomer Georgius Chrysococcas listed it as “Denebcation”.
  - This star is listed on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as “Deneb Kaitos”.
  - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists this star as “Deneb Kaitos”.
  - Johann Bayer’s *Uranometria* (1603) lists “Deneb Kaitos” and “Ketos”.
  - This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Denebketos” and “Dhanbolkitosi”.
  - Robert Hues lists this as “Deneb Elkaitos” in his *A Learned Treatise on Globes* in 1659.
  - This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Daneb kaitos”.
  - John Hill lists this star as “Danab Alketus” in his *Urania* in 1754.
  - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Dheneb Kaïtós jenúbi” which is translated as “south branch of the Whale’s tail”.
  - German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Deneb Kaitos”.
  - American uranographer William Croswell (1760 – 1834) lists this star as “Deneb Kaitos” on his *Mercator Map of the Starry Heavens* in 1810.
  - Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Deneb Kaitos” in his *Celestial Atlas* in 1822.
  - American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Deneb Kaitos” and describes it as “Tail of the whale”.
  - Compare this to Northern Tail of the Sea Monster, above.
- One is Eta (η) Ceti in the IAU constellation Cetus, later latinized to “Dheneb Algenubi” (in the *Century Cyclopedia* of 1894).or “Dheneb”.

Southern Tent:

This Arabic asterism “Al Ḥibā Yamaniyyah” is a quadrilateral of stars in the IAU constellation Corvus: Beta (β), Delta (δ), Gamma (γ), and Epsilon (ε) Corvi. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “al khibá al yemáni, the southern tent and attributes it to Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986).

Southern Tray of the Scale:

This Arabic star “Al Kiffah al Janūbiyyah” is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra:

- This was later latinized to “Kiffa Australis”.
- This is listed as “Kiffah janūbi” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992): Savage-Smith translates this as “southern plate [of the balance]”.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Kiffa Australis” and his *Bedford Catalogue* in 1844 lists Kiffa Australis, from Kiffa al jenúbiyah, the southern scale”.
- “Al Kiffah al Janūbiyyah” is listed in R. H. Allen’s *Star Names* in 1899.

Southern Triangle:

This English asterism is the IAU constellation Crux as described by English author Thomas Blundeville (1522 – 1606). English explorer Francis Crozier (1796 – 1848) also used this name. R. H. Allen writes in his *Star Names* in 1899 that “Theodor and Bayer” also listed this, but that it was “composed of some unformed stars of Ara and Lupus”.

Southern Weight:

This Arabic star “Al Wazn al Janūbiyyah” is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra:

- Italian astronomer Giovanni Batista Riccioli (1598 – 1671) listed this as “Vazneganubi”.
- “Al Wazn al Janūbiyyah” is listed in R. H. Allen’s *Star Names* in 1899.

Southern Whale:

This Arabic asterism “Alhawt Aljanubiu” (الحوت الجنوبي) is made up of the stars of the IAU constellations Grus and Piscis Austrinus: the curve of stars starts at Delta (δ) Piscium Austrini, then runs through Beta (β), Tau (τ), and Mu (μ) Piscium Austrini, Gamma (γ) Gruis, Iota (ι), Theta (θ), Eta (η), and Epsilon (ε) Piscium Austrini, ending at Alpha (α) Piscium Austrini, which they call “the mouth of the fish” (“Fam Alsamaka” (فم السمكة).

Southern Wild Duck:

This Tongan asterism “Toloatonga” is the IAU constellation Crux.

Southern Wreath:

“Stephanos Notios” (Στεφάνος νοτιος) is the name that Ptolemy (c.100 – c.170) gave to the IAU constellation Corona Australis. He included Alpha (α) Telescopii of the IAU constellation Telescopium in this asterism.

Southerner:

See Blue Planetary Nebula, above.

Southernmost of the Triad of Leo:

This **telescopic** asterism "Triadonótius Leónis" is the intermediate spiral galaxy NGC 3627 (Messier 66) in the IAU constellation Leo. It was discovered by Charles Messier in 1780. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Southernmost Old Man:

This Chinese Chenzhuo xing guan "Laoren" ("Old Man") or "Nanjilaoren" ("Southernmost Old Man") is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Southernmost Scale:

This Latin star "Lanx Meridionalis" is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899. Allen identifies this as a name from the 17th century.

Sow and her Piglets:

This Romanian asterism "Scroafa cu Purcei" is the Hyades cluster in the IAU constellation Taurus (Ottescu 2009).

Sower:

This Celtic (Gaulish) asterism "Siltarios" or "Samonios" or "Samoni Prinnios" ("harvest" or "gathering of the sower") is the IAU constellation Scorpius (Boutet 2001, 2014, 2017) and appears in the *Coligny Calendar*.

This Celtic asterism "Samoni" from the Sequani calendar is the Beehive cluster (Messier 44, see Beehive, above) in the IAU constellation Cancer. They used the full moon's passage past this open cluster to mark their cross-quarter festival day of Imbolc, halfway between the winter solstice and spring equinox, which is the origin of today's Ground Hog Day. It is related to their Goddess Brigid, Brigantia, or Brigantu.

Sower of Ursa Major:

This **telescopic** asterism "Sátor Úrsae Majóris" is the disrupted elliptical galaxy NGC 3180 (3184) in the IAU constellation Ursa Major. This was discovered in 1801 by English astronomer William Herschel who listed it as "I 286" in his catalogue. It is GC 1982 in the *General Catalogue* of 1864. Due to an error, it appears as both NGC 3180 and 3184 in the NGC Catalogue. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "the wide open spiral arms". It is also known as the "Little Pinwheel Galaxy" (see above).

Sowers:

This Lithuanian asterism "Sėjikai", "Sėjukai", or "Sėjukas" is the Pleiades open cluster in the IAU constellation Taurus. An alternate translation of this is "Plovers".

Space Between the Shoulders of the Lion:

This Arabic manzil “Al Kāhil al Asad” is the stars Delta (δ) and Theta (θ) Leonis in the IAU constellation Leo as listed by R. H. Allen in his *Star Names* in 1899. It was also known as “Al Zubrah” (see Mane, above).

Spade:

This German asterism “Fossorium” is the IAU constellation Sagitta as listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* (1603) and listed in R. H. Allen’s *Star Names* in 1899.

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is a group of eleven stars found in the IAU constellation Ursa Major 1.6 degrees southwest of the star Phi Ursae Majoris. Szie 60’ X 25’:

- There are three stars in the “handle”: HIP 47799, 47705, and 47670, and
- There are eight stars the “shovel”: Including HIP 47475 and 47437.

Spadix of the Goddess Erua’s Date Palm:

This Babylonian asterism from the MUL.APIN tablets “Erua” and listed in the Babylonian star catalogue BM 78161 (5^{th} – 7^{th} century B.C.E.) as “e-ru” is the IAU constellation Coma Berenices. It appears in earlier Akkadian and later Seleucid sky lore. Gamma (γ) Comae Berenices is the 25^{th} ziqpu of “e-ru” in this tablet (Leitz 2019).

Spaghetti Nebula:

This **telescopic** asterism is supernova remnant is Simeis 147 (SH 2-240, LBN 822) in the IAU constellation Taurus. It was discovered in 1952 at the Crimean Astrophysical Observatory by astronomer Grigory Shajn.

Spangled of Canes Venatici:

This **telescopic** asterism “Aéola Cánum Venaticórum” is the edge-on spiral galaxy NGC 4220 in the IAU constellation Canes Venatici. William Herschel listed this as “I 209”. John Herschel listed it as h 1151 and later as GC 2811 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the inner ring and central region of this galaxy is rather knotty, indicating star formation activity.”

Spanish Dancer:

This **telescopic** asterism is the galaxy NGC 1566 in the IAU constellation Dorado. It was discovered by Scottish astronomer James Dunlop in 1826. It is GC 844 in the General Catalogue of 1864. It is also known as the Very Beautiful of Dorado (see below).

Spare Tire Nebula:

This **telescopic** asterism is planetary nebula IC 5148 in the IAU constellation Grus about 1 degree west of Lambda (λ) Gruis. It was discovered by Australian amateur astronomer Walter Frederick Gale (1865 - 1945) in 1894. This is also known as the Ghost Ring Nebula.

Sparks:

This Kiribati star “Taukaro” is currently unidentified (Trussel and Groves 1978).

Sparrow:

This Latin asterism “Passer” is the IAU constellation Volans as listed by Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae,* though he also listed the name “Piscis Volans”. Volans is given the alternate name “Passer Marinus” (“sea sparrow” in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. John Hill lists “Passer” in his *Urania* in 1754. Hill also lists the name “Passer Marinus” (“marine sparrow”) for this constellation. Edward Sherburne lists this as “Sea Sparrow” in his *Sphere of Marcus Manilius* in 1675.

This **telescopic** asterism is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as “VI 27” in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. Size 12’ X 12’. In the 19th century it was known as “Copeland’s Golden Worm”. American astronomer Phil Harrington called it the “Great Bird Cluster” (see above) as to him it “resembles a bird in flight”: South African astronomer Carol Botha also describes it as a “Sparrow”. More recently astronomers who are fans of J. K. Rowling’s *Harry Potter* series named it “Hagrid’s Dragon” (see above).

Spatula:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Pisces between the stars 96 and 110 Piscium:

- Four stars form the “blade”, including HIP 8545, and
- Five stars the curving “handle”, including HIP 8571 and 8528.

Spear:

This asterism “Iaculum” is the IAU constellation Sagitta. This name is listed in Johann Bayer’s *Uranometria* (1603).

See also Spear of the Spear Bearer, below.

Spear Bearing Sky Raiser:

See Uplifted One of the Lancer, below.

Spear of Antlia:

This **telescopic** asterism “Pilum Ántliae” is the edge-on spiral galaxy IC 2531 in the IAU constellation Antlia. It was discovered by Lewis Swift in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the narrow long straight edge-on galaxy resembling a spear.”

Spear of the Great One:

This Chinese xing guan from the Han dynasty is the stars Kappa (κ) Draconis, Lambda (λ) Draconis, and HIP 52425 in the IAU constellation Draco (Didier 2009). Didier writes that the last star may be 10 or 11 Draconis rather than HIP 52425. This is related to their xing guan “Tàiyǐ” (see Great One, above).

Spear of the Spear Bearer:

There are two versions of this Arabic asterism:

- One is the Arabic star ""Al Rumḥ al Rāmiḥ", translated as "Spear of the Spear Bearer" or "Lance of the Lance Bearer", which is Eta (η) Boötis in the IAU constellation Boötes as described by Syrian astronomer Tayyeb Tizini.
    - 13th century Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) listed it as "Al Rumh" ("the Spear") in his *Wonders of the Creation and Unique of the Existence*.
    - Dorn (1829) describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of al-Qazwini.
    - Compare this to Solitary One of the Lancer, below.
- One is the Arabic asterism "ar-rumh" (الرمح)" or "the Spear" which is part of the Arabic asterism Armed One (see above) This asterism is a line of three stars crossing the line of stars forming the "High One": Epsilon (ε) Boötis, Eta (η) Boötis, and Tau (τ) Boötis. At each end of the "spear" is a "tassel": The "Rear Spear Tassel" or "Flag of the High One" is the star Upsilon (υ) Boötis. The "Front Spear Tassel" is the star Rho (ρ) Boötis:
    - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Alramec" as Alpha (α) Boötis (Dekker 2000).
    - The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Alramec" (Dekker 2000).
    - It is listed on the 14th century astrolabe #4560 from Christian Spain as "Alrame", and abbreviation for "Alramech" (King 2002) and associated with Alpha (α) Boötis (Arcturus).
    - The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists Alpha (α) Boötis (Arcturus) as "Alrameth".
    - German uranographer Johannes Stöffler's Constance Celestial Globe (1493) lists Alpha (α) Boötis (Arcturus) as "Alramech".
    - Robert Hues lists Alpha (α) Boötis (Arcturus) as "Alramech" and "Alsamech" in his *A Learned Treatise of Globes* in 1659 and translates it as "the Launce bearer".
    - English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) labels Alpha (α) Boötis (Arcturus) as "Arture" and "Alramec".

Spear Thrower:

This Boorong asterism "Karik Karik", also known as the "Australian Kestrel", is made up of stars of the IAU constellations Sagittarius and Scorpius (Stanbridge 1858, Hamacher 2011).

- The tip of the "tail" is Lambda (λ) Scorpii,
- The "body" is a line running through the star Kappa (κ) Scorpii, and
- The "wingtips" are the stars Eta (η) Scorpii and Eta (η) Sagittarii.

Spearman:

This Estonian star "Odamees" is Beta (β) Leonis (Denebola) in the IAU constellation Taurus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Speckled of Phoenix:

This **telescopic** asterism "Maculátus Phoenícis" is the dwarf spiral galaxy NGC 625 in the IAU constellation Cetus. This was discovered by James Dunlop in 1826 who listed it as number 471 in his catalogue. It became GC 369 in the *General Catalogue* of 1864. This name appears in *The Catalogue of*

One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They named it this due to its "noticeable dark and bright spots".

Spectacle Lens of Centaurus:

This **telescopic** asterism "Perspicillum Centaúri" is the interacting lenticular galaxies NGC 5215 A and B in the IAU constellation Centaurus. This was discovered in 1836 by John Herschel who listed it as h 3529 and later as GC 3589 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the appearance of the galaxies NGC 5215A and B brings to mind a pair of glasses".

Spectatus:

This American asterism is made up of the stars of the IAU constellation Perseus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). They depict this as a man seated in a chair taking photographs with a camera.

Spectre Cluster:

This **telescopic** asterism is the globular cluster Messier 55 (NGC 6809) in the IAU constellation Sagittarius. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752. French astronomer Charles Messier catalogued it in 1788. It is listed in John Herschel's General Catalogue of 1864 as GC 4503. It is also known as the Summer Rose Star.

Speech Yoke:

"Enisqiàs Uedon" or "Enispiàs Uedon" is a proposed early Celtic name for the IAU constellation Taurus from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Spermatozoon:

This **telescopic** asterism is a string of stars in the IAU constellation Taurus, 35 arcminutes east of the star Zeta (ζ) Tauri. A curve of 8th magnitude stars forms one side of an oval "sperm", including HIP 27214, 27205, 27120, with a curve of 10th magnitude stars the other side. A straight line of stars forms a "tail" starting at HIP 26967 and running through HIP 26912 to 26684. Its size is 21' X 2'. This is noted in Randy Pakan's *Midnight Ramblings 1A* logbook for 3 January 1989. This is Lorenzin 1 on American astronomer Tom Lorenzin's asterism list.

Sphere of Pisces:

This **telescopic** asterism "Sphaéra Píscium" is the lenticular galaxy NGC 524 in the IAU constellation Pisces. It was discovered by William Herschel in 1786. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Spica:

See Ear of Grain, above.

Spica's Spanker:

This Western asterism is in the IAU constellation Corvus. The stars Gamma (γ) Corvi (Gienah), Epsilon (ε) Corvi (Minkar), Alpha (α) Corvi (Alchiba), Delta (δ) Corvi (Algorab) and Beta (β) Corvi (Kraz). Size

420’ X 300’. This name was listed in February 2023 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/). American astronomer Jeffrey Corder lists this as Corder 2338. It is also known as “the Sail”.

Spicy Virgin:

This asterism is the IAU constellation Virgo. “Spicifera Virgo Cereris” (“spicy virgin Ceres”) and the “Virgo spicea munera gestans” (“Maiden carrying spicy gifts”) were names used by 1st century astrologer Marcus Manlius. Johann Bayer’s *Uranometria* (1603) lists “Spicifera Dea” (“Spicy Goddess”).

Spider:

This Akimel O'odham asterism is the “W” in the IAU constellation Cassiopeia (see W below).

This Hawaiian asterism “Ku’uku’u” is the seven brightest stars of the IAU constellation Orion. It is also known as “Ka Hei-Hei o Na Keiki” (see Cat’s Cradle of the Children, above) or “Po” (see Night, above). Hawaiian navigators called the celestial equator “Ke Alanui o Ke Ku’uku’u” (“the roadway of the spider”) as the constellation Orion travels along the celestial equator.

There are four **telescopic** “spider” asterisms:

- One is PGC 31923 (UGC 5829) is an irregular dwarf galaxy in the IAU constellation Leo Minor. This name is posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in April 2023.
- One is the globular cluster Messier 4 (NGC 6121) in the IAU constellation Scorpius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745. It was catalogued by French astronomer Charles Messier in 1764. It is listed in the *General Catalogue* of 1864 as GC 4183.
- This **telescopic** asterism is the open cluster NGC 3114 in the IAU constellation Carina. It was discovered by Scottish astronomer James Dunlop in 1827 who listed it as h 3224 in his catalogue. It is GC 2007 in the General Catalogue of 1664. South African astronomer Auke Slotegraaf described this in 1994 as a spider or octopus. It is also known as the Hand (see above).
- One is the globular cluster Messier 13 in the IAU constellation Hercules. This was discovered by English astronomer Edmund Halley in 1714. Finnish astronomer Timo Karhula (1996) describes it as a “Spider” in his observations noted in the DOCdb database.

Spider God:

This Blackfoot asterism is made up of the stars of the IAU constellations Corona Borealis and Hercules. The spider’s home is Corona Borealis, and its “web” is Hercules.

Spider Spit Cluster:

This asterism is open cluster NGC 3293 in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751. It is GC 2144 in the *General Catalogue* of 1864. It is also known as the Gem Cluster (see above), the Little Jewel Box (see above), the Hubbly Bubbly Pipe (see above), “U” (see below), and the Horseshoe (see above).

Spider Nebula:

This **telescopic** asterism is the emission nebula IC 417 in the IAU constellation Auriga. This was discovered by German astronomer Max Wolf in 1893.

Spider’s Web of Camelopardalis:

This **telescopic** asterism “Araneósus Camelopardális” is the barred spiral galaxy NGC 2336 in the IAU constellation Camelopardalis. It was discovered by William Tempel in 1876. This became GC 5372 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Spinal Cord:

This Caribou Inuit star “Qitirarjuk” is Alpha (α) Ursae Minoris (Polaris).

Spinal Vertebrae:

This Arabic asterism “al-fiqarat”,(الفقرات) or “al-faqār”, later latinized to “Al Faqar”, is the stars Epsilon (ε), Zeta (ζ) 1 and 2, Eta (η), Theta (θ), Iota (ι) 1 and 2, Kappa (κ), and Mu (μ) 1 and 2 Scorpii in the IAU constellation Scorpius. “al-Fiqarāt” and “Fiqra” are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Spindle:

There are five **telescopic** “spindle” asterisms:

- One is NGC 2686, a pair of interacting lenticular galaxies in the IAU constellation Ursa Major. It is GC 1715 in the *General Catalogue* of 1864. It is also known as the “Pancake” (see above).
- One is the field lenticular galaxy NGC 3115 (Caldwell 53) in the IAU constellation Sextans. This was discovered by English astronomer William Herschel in 1787 who listed it as “I 163” in his catalogue. It is GC 2008 in the *General Catalogue* of 1864. Steinicke (2022) lists it as the “Spindle Galaxy”.
- One is Messier 102 (NGC 5866), a galaxy in the IAU constellation Draco. This was originally discovered by French astronomer Pierre Méchain in 1781. It is also known as the Fool’s Gold Galaxy and the Straight Line of Draco. Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as the “Spindle”.
- One, Elácate Píscium (“Spindle of Pisces”) is the lenticular galaxy NGC 128 in the IAU constellation Pisces. It was discovered in 1790 by English astronomer William Herschel who listed it as II 854. It is GC 62 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its edge-on appearance.
- One is the intermediate spiral galaxy NGC 4216 in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784 who listed it as “I 35”. It is GC 2806 in the *General Catalogue* of 1864. This is part of O’Meara 60 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007), what he calls the ”Stairway to Heaven”. O’Meara states that “it is one of at least three galaxies referred to as the Spindle Galaxy”.

Spindle of Crater:

This **telescopic** asterism “Fusifórmis Cratéris” is the edge-on lenticular galaxy NGC 3957 in the IAU constellation Crater. It was discovered in 1785 by British astronomer William Herschel who listed it as “II 294”. It became GC 2611 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the edge-on galaxy has the form of a spindle”.

Spindle of Virgo:

There are two **telescopic** "Spindle of Virgo" asterisms:

- One, "Atractoïdes Vírginis" is the lenticular galaxy NGC 4179 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "I 9". It became GC 2776 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).
- One, "Fúsus Vírginis", is the edge-on intermediate spiral galaxy NGC 4216 in the IAU constellation Virgo. It was discovered in 1784 by English astronomer William Herschel who listed it as "I 35". It is GC 2806 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Silver Streak" (see above). 12 15 +13 08

Spine of al-Jauzā':

This Arabic asterism "Faqār al-Jauzā'" is the Belt of Orion asterism in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Spinning Chariot:

This Latin asterism "Currus Volitans" is the asterism Argo's Ship (see above) as described by Catullus. Johann Bayer's *Uranometria* (1603) lists "Currus Volitans". "Currus Volitans" is listed in John Hill's *Urania* in 1754.

Spinning Wheel of the Sky:

This Finnish asterism "Taivaanrukki" is the IAU constellation Orion.

Spiral:

There are two **telescopic** "spiral" asterisms:

- One in the IAU constellation Cygnus is also known as the Red Necked Emu or Bent Fan. It is close to open cluster Do Dz 3. All the stars in this asterism are blue/white except one red star, and they are all 9th magnitude with the brightest star being 29 Cygni.
- One is Naillon 1 or Nagel 1 in the IAU constellation Andromeda. This includes the stars HIP 4390 and 4457. Size 33' X 33'.

Spiral Cascade:

This **telescopic** asterism is Vastagh 7, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Leo Minor. Its apparent diameter is 1° 5'. Vastagh describes it as "A spiral-shaped cascade around the star HD 94218…. The smallest equilateral triangle I have observed so far, with side lengths of 1', can be seen 21', NNW from the mentioned bright star. This mini shape is located between the winding spiral rows. GX, NGC3414, can be seen halfway between the line connecting the last and first members of the constellation. The entire [asterism] consists of 30-35 members."

Spiral Cluster:

There are two **telescopic** "Spiral Cluster" asterisms:

- One is the open cluster Messier 34 (NGC 1039), discovered by Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Perseus. French astronomer Charles Messier catalogued it in 1764. John Herschel lists this in his catalogue as h 248. The 1864 General Catalogue lists this as GC 584. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns describes it as "a celestial aegis hung aloft in splendor".
- One is the open cluster NGC 2506 in the IAU constellation Monoceros. English astronomer William Parsons, the 3rd Earl of Rosse first described this as a spiral. Rosse described this in his second paper in 1861 as: "frequently observed, several observers have fancied that the stars exhibit some approach to a spiral arrangement, with cellular center, not unresolved neby".

Spiral Planetary Nebula:

This **telescopic** asterism is planetary nebula NGC 5189 in the IAU constellation Musca. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3514 and later as GC 3570 in the *General Catalogue* of 1864.

Spirit of a Polar Bear:

This Inuit star "Nanurjuk" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (MacDonald 1998).

Spirit of Death:

This Kamilaroi and Euahlayi asterism "Yowee" is the stars of the Southern Cross in the IAU constellation Crux (Fuller et al 2014). Two of the stars of the Southern Cross are Yowee's eyes and the other two are the eyes of the first man to die. The nearby Pointer Stars are two cockatoos which were in the tree when Yowee lifted it into the sky (see Sulfur-Crested Cockatoos, below).

Spirit of GuRyoung:

This Korean asterism "Gulyeong-ui Jeongsin" (구령의 정신) in the IAU constellations Carina and Vela is a line of two stars with a pair of lines running off each end:

- The pair of stars in that central line are Delta (δ) and b Velorum,
- From b Velorum lines run out to Lambda (λ) and Gamma (γ) Velorum, and
- From Delta (δ) Velorum lines run out to Kappa (κ) Velorum and Epsilon (ε) Carinae.

Spirit of the Awara Palm:

This Lokono or Arawak asterism "Awarhakoya" is made up of stars of the IAU constellation Coma Berenices (Rybka 2018). The "trunk" of the palm tree is a line of stars with Beta (β) Comae Berenices at the base and 17 Comae Berenices at the top. A cloud of stars around 17 Comae Berenices are the palm fronds.

Spirit of the Black Curassow:

This Lokono or Arawak asterism "Hithikoya" is the IAU constellation Crux (Rybka 2018). "Yokharhin and Aleti" are their names for the Pointer Stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar)- See Pointers, above.

Spirit of the Blue Crab:

This Lokono or Arawak asterism “Kwakoya” is made up of stars of the IAU constellations Orion and Taurus (Rybka 2018):

- The “shell” of the crab is a long arc of stars from Phi (ϕ) and Lambda (λ) Orionis, through 110 and 116 Tauri, Omicron (ο) 1, 2 and 3 Orionis, and ending up with the curve of stars 23, 30, 33, and 38 Orionis, and
- Between Lambda (λ) Orionis and 23 Orionis is the blue/white star Gamma (γ) Orionis (Bellatrix), which might be the inspiration for this “blue crab”.

Spirit of the Bow and Arrow:

This Lokono star “Shimarhabokoya” is currently unidentified.

Spirit of the Cocoi Heron:

This Lokono or Arawak asterism “Anorhâkoya**”** is the Big Dipper asterism in the IAU constellation Ursa Major (Rybka 2018).

Spirit of the Four-Eyed Fish:

This Lokono or Arawak asterism “Kasorhowakoya” is the two stars Lambda (λ) and Upsilon (υ) Scorpii in the “tail” of the IAU constellation Scorpius (Rybka 2018).

Spirit of the Green Iguana:

This Lokono star “Yôwanakoya” is currently unidentified (Rybka 2018).

Spirit of the Green Sea Turtle:

This large Lokono or Arawak asterism “Katarokoya” is made up of stars from the IAU constellations Hercules, Corona Borealis, Boötes, and Serpens (Rybka 2018). The central star is Zeta (ζ) Herculis. From this star four lines of stars run out:

- The first is a short one ending in Epsilon (ε) Herculis,
- Another line runs out through Beta (β) Herculis (Kornephoros) and Gamma (γ) Herculis, and Gamma (γ) Serpentis, takes a bend at Beta (β) Serpentis (Nasak Shamiya), and ends at Kappa (κ) Serpentis,
- Another runs out through Eta (η) and Sigma (σ) Herculis, takes a bend at Tau (τ) Herculis, and ends at Phi (ϕ) Herculis, and
- The last line runs out through Epsilon (ε) Coronae Borealis, Delta (δ) Coronae Borealis, Gamma (γ) Coronae Borealis, Alpha (α) Coronae Borealis (Alphecca), and Beta (β) Coronae Borealis (Nusakan), takes a bend at Delta (δ) Boötis, and ends at the double star Mu (μ) Boötis.

Spirit of the Gun:

This Lokono star “Arakabosakoya” is currently unidentified (Rybka 2018).

Spirit of the Hyades:

This **telescopic** asterism found in the IAU constellation Taurus. René Merting describes it on the *Faint Fuzzies* website as “Geist der Hyaden” (“spirit of the Hyades”). This resembles the nearby larger Hyades cluster with the stars involved being HIP 20417, HIP 20349, 51, 53 and 56 Tauri, and HIP 20557. It forms one end of the asterism Harrington 16, which is known as “Davis’ Dog” (see above).

Spirit of the Jaguar:

This Lokono star “Kabadarokoya” is currently unidentified (Rybka 2018).

Spirit of the Lilac-Tailed Parrot:

This Lokono star “Yarheyarherokoya” is currently unidentified (Rybka 2018).

Spirit of the Little Cuckoo:

This Lokono star “Hikarowanakoya” is currently unidentified (Rybka 2018).

Spirit of the Marail Guan:

This Lokono star “Marodikoya” is currently unidentified (Rybka 2018). The Marial Guan or Cayenne Guan is a bird in the Cracidae family found in Brazil, French Guiana, Guyana, Suriname, and Venezuela.

Spirit of the Muscovy Duck:

This Lokono or Arawak asterism “Ifakoya” is made up of stars of the IAU constellations Scorpius, Sagittarius, and Corona Australis (Rybka 2018):

- Corona Australis forms much of the body of the “duck”,
- The “wingtip” is Epsilon (ε) Sagittarii, and
- The “neck” is Kappa (κ) and Iota (ι) Scorpii.

Spirit of the Ocelot:

This Lokono star “Korhirhwathekoya” is currently unidentified.

Spirit of the Pale-Throated Sloth:

This Lokono star “Hawkoya” is currently unidentified.

Spirit of the Parrot:

This Lokono star “Korherokoya” is currently unidentified.

Spirit of the Red Acouchi:

This Lokono star “Hadorhikoya” is currently unidentified.

Spirit of the Red-Handed Tamarin:

This Lokono star “Sûtukoya” is currently unidentified.

Spirit of the Red-Rumped Agouti:

This Lokono star “Hokorherokoya” is currently unidentified.

Spirit of the Scorpion:

This Lokono star “Imenarikoya” is currently unidentified.

Spirit of the Tortoise:

This Lokono star “Kasipenikoya” is currently unidentified.

Spirit of the Two-Toed Sloth:

This Lokono star “Warhemedokoya” is currently unidentified.

Spirit of the White-Faced Saki:

This Lokono star “Howakoya” is currently unidentified.

Spirit of the Yellow-Footed Tortoise:

This Lokono star “Hikorhikoya” is currently unidentified.

Spirit Tree:

This Kamilaroi asterism “Minggah” or “Mingga”, is the roots of the Yarran or Yarraan tree (river red gum, an Acacia (Eucalyptus camaldulensis)) of “Yarran-Doo”, which is the tree that their hero “Baayami” or “Byaame” took up to the Warrambul with the first man to die (Fuller et al 2014). This is the IAU constellation Crux. This asterism is centered on the Coal Sack Nebula (see Coal Sack Nebula, above), and the dark nebula is the hollow of the tree seen from below, with the roots spreading around. When someone dies and goes to Bulimah, they go through the hollow of the Yarran. Compare this to the Ngiyampaa asterism Nguu (see Tea Tree, below) and the Euahlayi asterism “Mullyan” (see Coolabah Tree above).

This Wiradjuri asterism “Yarran-doo” is the IAU constellation Crux (McKeown 1938, Leaman and Hamacher 2019).

Spirited Person

This Gaelic asterism “Meanmnach” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Spirograph Nebula:

This **telescopic** asterism is planetary nebula IC 418 in the IAU constellation Lepus. American astronomer Edward Charles Pickering (1846 – 1919) first recorded it. It is called this as its intricate pattern resembles one made by a spirograph. Its central star is HD 35914. It is O’Meara 26 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007), where he lists it as the “Spirograph Nebula”. It is also known as the Raspberry Nebula, the Pink Planetary, and the Colored Contacts Nebula.

Splendor of Canes Venatici:

This **telescopic** asterism “Luculéntus Cánum Venaticórum” is the intermediate spiral galaxy Messier 106 (NGC 4258) in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1781. English astronomer William Herschel listed it as “V 43”. It is GC 2841 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Pear” (see above).

Splendors of the Heavens:

This **telescopic** asterism is the open cluster Messier 6 in the IAU constellation Scorpius. It was first recorded by Italian astronomer Giovanni Battista Hodierna in 1654, although credit for the discovery is usually given to Swiss astronomer Jean-Philippe Loys de Chéseaux in 1746.

Splinter:

This **telescopic** asterism NGC 5907 is a spiral galaxy in the IAU constellation Draco. It was discovered in 1788 by English astronomer William Herschel who listed it as "II 759". John Herschel listed it as h 1917 and it became GC 4087 in his *General Catalogue* of 1864. It is viewed edge-on with a spiraling tidal stream of stars. NOTE: Lord Rosse thought he was looking at two objects separated by the dust lane, and created the name NGC 5907, but this was later discovered not to be a separate object. It is GC 4086 in the *General Catalogue* of 1864. NGC 5906 now refers to the fainter part of the galaxy west of the dust lane, which was recorded by George Johnstone Stoney in 1850. It is also known as the Cat Scratch Galaxy (see above), the Enveloped of Draco (see above), and the Knife Edge Galaxy (see above).

Split of Sextans:

This **telescopic** asterism "Fissus Sextántis" is the barred spiral galaxy NGC 3044 in the IAU constellation Sextans. It was discovered in 1784 by William Herschel who listed it as "III 254". It became GC 1958 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the split disk of this edge-on galaxy, especially at its western end".

Splitting Stars:

The stars of this Temuan asterism "Bintang Pecah Dua" are unidentified at present (Jaafar and Khairuddin 2014).

Sponge of Leo:

This **telescopic** asterism "Astridecórus Leónis" is the spiral galaxy NGC 3346 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "V 7". It became GC 2180 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Spooky Face Nebula:

This **telescopic** asterism is HII region Sh 2-54 in the IAU constellation Serpens.

Spoon:

This K'iche' asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Milbrath 1999).

This **telescopic** asterism is in the IAU constellation Ursa Major and is Ennis 54 on the observing list of Canadian astronomer Charles Ennis. Size 75' X 35'. This is a line of nine 6^{th} – 9^{th} magnitude stars starting at HIP 55936, and running through HIP 55950, HIP 55944, HIP 55994, HIP 56145, 58 Ursae Majoris, and HIP 56018 to HD 99327.

Spoonbill Bird:

This Carib asterism "Arapapayuman" or "Arapapa" represents the Spoonbill bird, but its present location is unknown (Magaña, and Jara, 1982).

Spoor of the Horn Star:

This Sotho asterism "Setlhako sa Naka" is the Large Magellanic Cloud, the "Horn Star" being "Naka" (Alpha (α) Carinae (Canopus)) in the IAU constellation Carina (Slotegraaf 2013). Alcock (2014)

translates it as “shield of the Horn Star”. Breutz (citing Breyer 1919) translates it as “sandal of the Horn Star”.

Spoor of the Little Horn Star:

This Sotho asterism “Setlhako sa Senakane” is the Small Magellanic Cloud, the “Little Horn Star” being “Senakane” (Alpha (α) Eridani (Achernar)) in the IAU constellation Eridanus (Slotegraaf 2013). Alcock (2014) translates it as “shield of the Little Horn Star.” Breutz (citing Breyer 1919) translates it as “sandal of the Little Horn Star”.

Spout:

This Latin asterism “Fusus” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo. Compare this to Ear of Grain, below.

Spray:

This Arabic asterism “Al Rihadh” (أل رذاذ) is the IAU constellation Cygnus:

- It was later Latinized to “El Rided”, “Arided” (in the 15th century *Alfonsine Tables*), “Aridif”, and “Arrioph” and was used for Alpha (α) Cygni (Deneb).
- “Al Rihadh” as listed by French astronomer Joseph Justus Scaliger (1540 - 1609)
- Johann Bayer’s *Uranometria* (1603) lists the name “Arided” for Cygnus.
- Robert Hues (1659) lists this as “Arided” which he translates as “quasi redolens lilium” (“smelling like a lily”).
- “Al Rihadh” is listed in R. H. Allen’s *Star Names* in 1899. Allen writes “its signification is uncertain, although the word is said to have been found in an old Latin-Spanish-Arabic dictionary for some sweet-scented flower”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Arided” for this star.

Spread Wings Eagle:

This Bedouin star “al-Nasr al-Basiṭ” (النسر الباسط) is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

Spring:

This **telescopic** Moquoit star “Nosaxa” is HIP 31895 (HD 48265) in the IAU constellation Puppis (magnitude 7.52). It was given this name in the IAU NameExoWorlds campaign. It is derived from the words “nosahuec” (“renew”) and “ñaaxa” (“year”). It has an exoplanet named Naqaÿa, which is their term for a brother-family-relative.

Spring Bringer:

This German asterism “Vernus Portitor” is the IAU constellation as named by German poet Philipp von Zesen (1619 – 1689).

Spring of Indus:

This **telescopic** asterism “Pegórrhytus Índi” is the spiral galaxy NGC 7083 in the IAU constellation Indus. It was discovered by James Dunlop in 1826. John Herschel listed it as h 3870 and later as GC 4674 in his

General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name comes from the poetic Greek "πηγ_ρρυτος" (pègorrhutos – "flowing from a spring") and they called it this because "many spiral arms spring from the central flocculent region".

Spring Star:

This Kaurna star "Wilto" or "Wilto-willo" ("wedge tailed eagle") is Alpha (α) Leonis in the IAU constellation Leo. The rising of this star marks the autumn season, Wullutti.

Spring Trap:

This Meratus Dayak and Banjar asterism "Baur Bilah" is made up of the stars of the IAU constellation Orion (Jaafar and Khairuddin 2019): The spear of the trap is the stars of the belt of Orion and Pi (π) 3 and 4 Orionis, which points towards the wild boar's jaw "Ra'ang Bayi" (see Wild Boar's Jaw, below).

This Malay asterism "Belantik", "Balatic" (Magahat, Bilaan), "Balatik" (Bukidnon, Bilaan, Bagobo, Antique, Ibaloi, Tagalog, and Maguindanao (Santos et al 2019)), "Bayatik" (Mandaya), "Belatik" (Manobo), "Balbalays" (Mayawyaw Ifugao), "Gendaw Balatik" (Subanen), "Batik" (Jama, Sama in Mapun and Tawi-tawi (Masong 2017)), "Binawagan Bagasawad" (Palawan), and "Bintang Peyh" (Orang Asli/Semelai), or "P'lantek" (Orang Asli) is made up of the stars of the IAU constellation Orion: The spear of the trap is the stars of the belt of Orion and Pi (π) 3 and 4 Orionis (Jaafar and Khairuddin 2019). There are several different versions of the spring trap: "B'lantek parap" ("slapping spring-spear"), "B'lantek paut" ("draw-back spring spear"), and "B'lantek terbang" ("flying spring-spear").

This Orang Seletek asterism "Bintang Balatek" is the IAU constellation Orion (Jaafar and Khairuddin 2014).

Spring Triangle:

This Western asterism consists of stars in the IAU constellations Boötes, Leo, and Virgo: Alpha (α) Boötis (Arcturus), Alpha (α) Leonis (Regulus), and Alpha (α) Virginis (Spica). This name was listed in May 2016 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/).

Sprinter:

This **telescopic** asterism, also known as the Diamond, the Christmas Tree, and the Southern Beehive, is the open cluster NGC 2516 (Caldwell 96) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as "Lac II 3". It is GC 1619 in the *General Catalogue* of 1864.

Sprot of Horologium:

This **telescopic** asterism "Spráttus Horológii" is the spiral galaxy NGC 1448 in the IAU constellation Horologium. It was discovered in 1835 by John Herschel who listed it in his catalogue as 2585 and later in his General Catalogue of 1864 as GC 776. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to its resemblance to a sprot, a type of fish.

Sprout From Hiva:

This Rapanui asterism "Nga Rau Hiva" is the Hyades cluster in the IAU constellation Taurus (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). Hiva is the Rapanui homeland. It is also known as "the Twins" or "the Weak".

Spruce Pitch:

This Sahtúotine star “ts’I dzéh” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Cannon 2021) and is one of the components of an arrow.

Square:

This Estonian asterism “Nekiland” is the Great Square of Pegasus asterism in the IAU constellation Pegasus (Kuperjanov 2006).

This **telescopic** asterism is in the IAU constellation Cetus and is Corder 12 on the observing list of American astronomer Jeffrey Corder. Size 3’. This is a tiny square of four 10th magnitude stars.

Square Celestial Granary:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellation Cetus: Starting at Upsilon (υ) Ceti it runs through Tau (τ) Ceti, Zeta (ζ) Ceti, Theta (θ) Ceti (the determinative star), Eta (η) Ceti, and Phi (ϕ) Ceti.

This Chinese xing guan “Tiāncāng” (天仓) is a bending line of stars in the IAU constellation Cetus: 57, 52, Zeta (ζ), Theta (θ), Eta (η) and Iota (ι) Ceti. The xing guan “Sickle” (see above) is at one end.

This Chinese Chenzhuo xing guan “Tiāncāng” is a bent line of stars in the IAU constellation Cetus: From Nu (ν) Ceti it runs through Tau (τ) Ceti, Zeta (ζ) Ceti, Theta (θ) Ceti, and Eta (η) Ceti to Phi (ϕ) 1 Ceti.

Squid Galaxy:

This **telescopic** asterism is the barred spiral galaxy Messier 77 (NGC 1068) in the IAU constellation Cetus. This was discovered by French astronomer Pierre Méchain in 1780 and listed by his colleague Charles Messier. William Herschel described it as a “star cluster” and his son John Herschel did also, including it on his list as h 262. It was listed in John Herschel’s 1864 *General Catalogue* as GC 600. It is also known as the “Fiery-Spirited of Cetus” (see above) and Cetus A.

Squidward Cluster:

This telescopic asterism is the Double Cluster, NGC 869 and NGC 884 (C 14) in the IAU constellation Perseus. Squidward Quincy Tentacles is a fictional character in Nickelodeon’s animated series SpongeBob SquarePants and first appeared in that series in May 1999. This was posted on *Cloudy Nights* by American astronomer Jordan “jrazz” in October 2023.

Squinter of Ursa Major:

There are two **telescopic** “Squinter of Ursa Major” asterisms:

- One, “Paétulus Úrsae Majóris” is the spiral galaxy NGC 4096 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as “I 207”. It became GC 2711 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the nucleus of this galaxy is not in the geometric centre of the optical disk, accounting for its leering gaze”.

- One, “Strábo Úrsae Majóris” is the peculiar dwarf galaxy NGC 5474 in the IAU constellation Ursa Major. William Herschel listed this as “I 214”. It became GC 3783 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy is not in the geometric centre of the optical disk, making it look like a squinter”.

Squirrel of Crater:

This **telescopic** asterism “Sciúrus Cratéris” is the barred spiral galaxy NGC 3905 in the IAU constellation Crater. It was discovered by British astronomer Andrew Ainslie Common in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the “western spiral arm resembles a [squirrel’s] tail”

Sshil:

This Ayt Xebbac star (Arabic: esshil) is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Souag 2019).

Stable of Sky:

This Korean asterism “Haneul-ui Anjeong” (하늘의 안정) is an oval of stars in the IAU constellations Cygnus and Vulpecula: 52, 41, and 23 Cygni, and 24, 25, 28, 30, 31, and 32 Vulpeculae, and HIP 99824A.

Stack of Cereals:

This Korean asterism “Gogmul Deomi” (곡물 더미) is a triangle of stars in the IAU constellation Cetus: 48 Ceti and HIP 7679 and 8209A.

Staff:

This Norse asterism “Fiskikarlar” is the belt of Orion in the IAU constellation Orion. as listed by R. H. Allen in his *Star Names* in 1899.

This Estonian asterism is the Belt of Orion asterism in the IAU constellation Orion (Kuperjanov 2006). Some call it the “Staff Stars”.

Staff Ones:

This Finnish asterism “Sauvaset” is the Belt of Orion asterism in the IAU constellation Orion.

Staffs:

This Romanian asterism “Toiege” is the belt of Orion in the IAU constellation Orion (Ottescu 2009).

Stag:

This Babylonian asterism from the MUL.APIN tablets “MUL.LU.LIM”, “LU.LIM” (Bartel van der Waerden 1974, Anthony 1996), “Lulimu” (Anthony 1996), or “Lulimmu” is a triangle of stars in the IAU constellation Andromeda: Iota (ι), 50, and 51 Andromedae.

This Persian asterism “LU.LIM” or “Lu” from the list of Tikpi Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is described as the IAU constellations “Cassiopeia + Andromeda” plus an unknown group of stars (Boll 1918, Jeremias 1929). Ernst Weidner lists it as “lu-[lim]” in his *Fixsterne* in 1971. This means that it is incorporating stars of the Babylonian asterism Plough

(see above). Since the "W" of Cassiopeia has been used in other cultures as "antlers", I presume that this is what is happening here.

This Seleucid asterism is made up of stars of the IAU constellations Andromeda, Cassiopeia, and Perseus:

- The "body" is a bent oval of the stars 17 Andromedae, HIP 3293 (beside Messier 31, the Andromeda Galaxy), 41 Andromedae, HIP 5554, HIP 4298, Omicron (ο) Cassiopeiae, 20 Cassiopeiae, HIP 2900, HIP 2225, 22 Andromedae, Psi (ψ) Andromedae, and Kappa (κ) Andromedae.
- The "head" is a quadrilateral of the stars 49 Andromedae, Phi (φ) Andromedae, Xi (ξ) Andromedae and Omega (ω) Andromedae.
- Two "horns" run out:
    - One from Phi (φ) Andromedae to 25 Cassiopeiae, and
    - One from 49 Andromedae through 51 Andromedae to Phi (φ) Persei.

This Ainu Nociw ("asterism") "Siyapka: is the IAU constellation Orion. The belt of Orion is an arrow that was shot by the archer "Kimun kur-nociw" (see Archer, above).

Stairway to Heaven:

This **telescopic** asterism is the galaxies NGC 4206, 4216, and 4222 in the IAU constellation Virgo. NGC 4206 was discovered in 1784 by William Herschel who listed it as "II 165". It became GC 2795 in the *General Catalogue* of 1864. These are part of O'Meara 60 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where he lists them as the "Virgo Trio" and as the "Stairway to Heaven".

Stake from a Horse Threshing Area:

This Romanian star "Steajărul de la Arie" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Ottescu 2009).

Stake in the Sky:

This Ukrainian star "Kilok u Nebi" (кілок у небі) is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It was seen as a pivot around which the rest of the sky rotated. It is also sometimes referred to as a stick (palytsya, палиця) or a pole (stovp, стовп). Later versions described this as a stake to which two horses, represented by Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris were tethered, perpetually circling the pole star. Compare this to the Kazakh asterism "Timir Qazyq" ("Iron Pole").

Staked Star:

The Chukchi see the star Alpha (α) Ursae Minoris (Polaris) as being staked down to render it immovable.

Stall:

This Arabic star "Al Maʾlaf" is Epsilon (ε) Cancri in the IAU constellation Cancer:

- This was later latinized to "Meleph" or "Almalaf".
- The IAU approved the name Meleph for the star Epsilon (ε) Cancri Aa.

- NOTE: R. H. Allen writes in his *Star Names* in 1899 that while this is now a name for Epsilon (ε) Cancri, that in “early Arabia” it was a name for the IAU constellation Crater.

Stamp:

This Chinese star “Yin” is Lambda (λ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, above.

Stand:

This Hindu asterism “Praṭishthana” (“stand” or “support”) is the Great Square in the IAU constellation Pegasus (see Great Square of Pegasus, above) and is attributed to German Sanskrit scholar Albrecht Friedrich Weber (1825 – 1901) by R. H. Allen in his *Star Names* in 1899.

Stand Alone:

This Māori star “Atutahi”, “Aotahi”, or “Atuatahi” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. They used the twinkling of this star as an indication of windy conditions.

This Rapanui star “Atutahi” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Edwards and Edwards 2016, Edwards et al 2018). The Edwards translate this as “Wayward One” or “First Apprentice”.

Standard:

This German asterism “Standard” or “Roman Standard” is the IAU constellation Aquila as listed by German astronomer Wilhelm Schickard (1592 – 1635). John Hill lists this asterism in his *Urania* in 1754. Edward Sherburne lists it as “Ensign or Standard of the Roman Empire” in his Sphere of Marcus Manilius in 1675.

Standard of Centaurus:

This **telescopic** asterism “Nómimus Centaúri” is the spiral galaxy IC 3253 in the IAU constellation Centaurus. It was discovered by DeLisle Stewart in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this Sc-type galaxy has the standard morphology of a multi-arm spiral pattern, according to the Carnegie Atlas”.

Standing Alone and Sacred:

This Hawaiian star “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as “A’a” (‘burning brightly”), “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “Hoku-kau'opae” ("Star for placing shrimp"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

Standing Gods:

This Babylonian asterism “MUL.DINGIR.GUB.BA.MESH” was a man with a serpent’s body instead of legs and was made up of stars of the IAU constellations Hercules and Draco. Bartel van der Waerden lists “AN.GUB.BAmesh” in in his *Science Awakening II: The Birth of Astronomy* in 1974 and Anthony Hope lists “DINGIR.GUB.BA.MESH” in his *A Guide to Ancient Near Eastern Astronomy* in 1996. The BM

78161 tablets list “dingir-ku-a-mes”. The Neo-Babylonian (Chaldean) Great Star List (636 – 539 B.C.E.) lists “mul.dingir.gub.ba.mes” (Koch-Westenholz 1995).

Standing Perpendicularly:

This Hawaiian star “Kumau” ("Standing Perpendicularly"), is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Hokupa’a” (“Fixed Star”), “Noho-loa” ("Eternal"), “Kio-pa'a” or “Kio-pa” ("Fixed projection"), “Kia-pa'akai” (Biblical: "Pillar of salt"), or “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe").

Standing Still Star:

This Ininew (Plains Cree) star “Ekatachet Atchakos” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Star:

This Chinese xiù (lunar mansion) “Xīngxiù” (星宿) is made up of the stars of the IAU constellation Hydra:

- The “head” is the four stars Alpha (α) Hydrae (Alphard), 27 Hydrae, and 26 Hydrae and HIP 46744, and
- The “tail” is a line going out to Iota (ι) Hydrae.

In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Qi Xing” (七星) was associated to matters concerning the San He territory. This xiù “Xīng” (星) appeared in the Tang Dynasty (618 – 907 C.E.) and was compared to the Vedic nakshatra Magha (Kotyk 2017, see Bountiful, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This **telescopic** Sesotho, SeTswana, and SePedi star “Naledi” is WASP 62 in the IAU constellation Dorado (magnitude 10.21). It was given this name in the IAU NameExoWorlds campaign. Naledi is a name given to girls in the hope that they will bring light, joy, and peace to their communities. It has an exoplanet named Krotoa: Krotoa is the name of a community builder and educator in colonial times who was considered the “Mother of Africa”.

This **telescopic** Sami star “Násti” is HIP 40687 (HD 68988) in the IAU constellation Ursa Major (magnitude 8.19). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Albmi (“sky”).

This Arabic star “al-Kawkab” (كوكب) is Beta (β) Ursae Minoris in the IAU constellation Ursa Minor:

- “Kocab” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Kochab”, Kochah”, or “Kocab” (Hafez 2010).
- Johann Bayer’s *Uranometria* (1603) lists “Kochab” for this star.
- American uranographer Elijah Burritt (1794 – 1838) listed it as “Kochah”.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists this star as “Kochab”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Kocab, from the Arabian Kaúkab al sehmáli, the north star”.

- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Kochab".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Kochas": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Kochab".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Kochab" and describes it as "Star".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Kocab" and "Kochab" for this star, but his 14th edition (1959) only lists "Kocab" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Kochab" for this star.
- The IAU approved the name Kochab for Beta (β) Ursae Minoris.

This Arabic asterism "an-najm" (النجم), later latinized to "Al Negim", "Al Najm" and "Negim" is the Pleiades cluster in the IAU constellation Taurus:

- "al-Najm" and "Nujūm al-Thurayyā" are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This appeared in the poetry of Muhalhil (d. 531 C.E.).
- John Hill listed it in his *Urania* in 1754
- R. H. Allen lists "Al Najm" in his *Star Names* in 1899.
- NOTE: In the Quran, chapter (surah) 50, verse 53, "Al Najm" is used for Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This Anglo-Saxon asterism "Stjarna" is the Pleiades cluster in the IAU constellation Taurus (Bender 2020). While in the singular, the word is used to refer to a cluster of stars and was first listed by Magnussen in 1828. In 1874 Cleasby and Vigfusson noted that sailors called "the load-star Polaris" simply "the star".

This G/wi star "//xona" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Alcock 2014). It is also known as "Star of Stars" (see below).

This Taíno star "Koeia" is HIP 12961 in the IAU constellation Eridanus and was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Aumatex: Aumatex was their God of the winds

This Turkish star "yıldız", "Yildun", or "Vildiur" is Delta (δ) Ursae Minoris:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Yildun" and claims that it is "miscopied from Hyde's notes on Ulugh Beigh for Yilduz, the star in Turkish.".
- The *Century Dictionary* of 1889 lists "Gildun".
- In 2016 the IAU approved the name Yildun for Delta (δ) Ursae Minoris.
- NOTE: The name "Yilduz" or "Yilduz Shemali" is sometimes used for Alpha (α) Ursae Minoris (Hafez 2010).

This Cherokee star "Noquisi" (ᏃᎧᏊ,) is the red dwarf star GJ 436 in the IAU constellation Leo. It received this name in the IAU's NameExoWorlds competition in 2022. This is the Cherokee name for "star". It has an exoplanet, GJ 436b, "Awohali" (ᎠᏬᏐᏁ,) which means "eagle".

This **telescopic** Zoque star "Matza" is the A2V type star HIP 65426 in the IAU constellation Centaurus (magnitude 10.67). It received this name in the IAU's NameExoWorlds competition in 2022. The name means "star in the sky" or "someone who shines within". It has an exoplanet HIP 65426b "Najsakopajk", which means "Mother Earth".

This **telescopic** asterism Do Dz 8 is a lopsided 5-pointed star in the IAU constellation Hercules. It includes the stars HIP 85335 and 85304.

Star Blanket:

This Ininew (Cree) asterism "Atchakos Ahkoop" is the Pleiades cluster in the IAU constellation Taurus (Buck 2016). They also call it "Pakone Kisik" (see Hole in the Sky, above).

Star Boy:

This Blackfoot star is unidentified at present (Chamberlain 2019). It is also known as Mistake Morning Star (see above) as it is near the Morning Star (see above).

Star Brothers:

This Palawa asterism is the stars Alpha (α) Carinae (Canopus) and Alpha (α) Canis Majoris (Sirius) in the IAU constellations Carina and Canis Major. One brother, "Droemerdeenne", is Sirius, and the other brother, "Moinee", is Canopus. They are the sons of the Sun and Moon.

Star Chain:

There are two **telescopic** star chain asterisms:

- One is Sánta 88, listed in 2007 by Hungarian astronomer Sánta Gábor, is a line of 10^{th} – 13^{th} magnitude stars in the IAU constellation Taurus including the star HD 281600. Gábor describes it as a "chain of stars".
- One is Sánta 156, listed in 2015 by Hungarian astronomer Sánta Gábor, is a line of 8 – 10^{th} magnitude stars in the IAU constellation Hercules. Gábor describes it as "a very long cascade of stars".

Star Cluster:

This Babylonian and Seleucid asterism "The Stars" or "The Star Cluster" is the Pleiades cluster in the IAU constellation Taurus.

Star Deer Crocodile:

When the Mayan asterism "Xibalbá Be" ("Path to the Underworld") is perpendicular to the horizon, it becomes the open jaws of "Way Pat Ahin" ("Star Deer Crocodile"). This is the Milky Way between the IAU constellations Scorpius and Cygnus, running through Sagittarius and Aquila.

Star Faced of Hydra:

This **telescopic** asterism "Astrópus Hýdrae" is the barred spiral galaxy NGC 2642 in the IAU constellation Hydra. It was discovered in 1830 by John Herschel who listed it as h 519 and later as GC 1686 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name in reference to "the three foreground stars on the face of this galaxy".

Star for Placing Shrimp:

This Hawaiian star “Hoku-kau'opae” ("Star for placing shrimp"), is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as “A’a” (‘burning brightly”), “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

Star Gazer Fish:

This English asterism “Uranoscopus” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens.* It is made up of stars in the IAU constellations Auriga and Gemini:

- One side starts at Pi (π) Geminorum and runs through 66 Aurigae, and Psi (ψ) 7 and 5 Aurigae to Psi (ψ) 4 Aurigae, and
- The other side starts at Pi (π) Geminorum and runs through Omicron (ο) Geminorum, 65 Aurigae, 63 Aurigae, and Psi (ψ) 2 Aurigae to Psi (ψ) 4 Aurigae.

Compare this to the asterism Herschel’s Telescope (above).

Star Gun:

This **telescopic** asterism in the IAU constellation Monoceros is Stratton 1 on the asterism list of Troy Stratton of the Salt Lake Astronomical Society and Observing Program Coordinator of the Astronomical League:

- A line of stars from HIP 35712 through HIP 35436, 24 Monocerotis, and 23 Monocerotis, ending at 21 Monocerotis forms the “gun” with the star Delta (δ) Monocerotis as the “front sight”.
- The “butt” of this “gun” is the line of stars HIP 35751, 35576 and 35395.

Star in the Bull Towards the North:

This Babylonian star “Shur-narkabti-sha-iltanu” is Beta (β) Tauri in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

Star in the Bull Towards the South:

This Akkadian star “Shurnarkabti-sha-shūtū” (“the star in the bull towards the south” or “the southern star towards the chariot”') is Zeta (ζ) Tauri in the IAU constellation Tauri as listed in R. H. Allen’s *Star Names* in 1899.

Star in the Cloud on the Horse’s Back:

This is what Ptolemy (c.100 – c.170) called globular cluster NGC 5139 (Caldwell 80), Omega Centauri (“Quae est in principio scapulae”).

Star in the Chair:

This “Star in the Chayre” is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia as it appeared in the Middle Ages and as listed by R. H. Allen in his *Star Names* in 1899.

Star in the Middle of the Sky:

This Dene star “zheetl’an dha’aii” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cannon 2021).

Star is Strong:

This Ahtna star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cannon 2021).

Star Island:

This Dakelh asterism “Səmiłnu” is the Pleaides cluster in the IAU constellation Taurus (Cannon 2021).

Star Lizard:

This **telescopic** asterism, also known as the Lizard Cluster or Drunken Lizard Cluster, is the open cluster NGC 7209 in the IAU constellation Lacerta. It was discovered by William Herschel in 1787 who listed it as “VII 53”. It is GC 4755 in the *General Catalogue* of 1864.

Star Man of Fire:

This Euphratian star “Kakkab Mulu-izi” is Epsilon (ε) Virginis in the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899.

Star Moves Up:

This Ahtna star “Son’kadghildzak” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Cannon 2021).

Star Mist Cluster:

This **telescopic** asterism is the open cluster NGC 7789 in the IAU constellation Cassiopeia. It was discovered in 1783 by English astronomer Caroline Herschel. John Herschel listed it as “”VI 30”. John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864.. It is also known as Caroline’s Rose, the White Rose, the Herschel’s Spiral Cluster, the Ghost Cluster, and the Screaming Skull Cluster.

Star of Abundance:

This Babylonian asterism “HÉ.GÁL-a-a” or “kakkab nushi” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 and identified as part of the IAU constellation Coma Berenices.

Star of Autumn:

This Greek star “Ὀπωρινός” or “ ” is Alpha (α) Canis Majoris in the IAU constellation Canis Major as listed by Homer in the *Iliad* (8th century B.C.E.).

Star of Ascent:

See Red One, above.

Star of Cleonaeus:

This Latin asterism “Cleonaeum Sidus” is the IAU constellation Hercules. It is named for Cleonae, the town near where Hercules killed the Nemean lion. Compare this to “Cleonaeus” (above).

Star of Elam:

This Chaldean star “mul min.ma” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified. It also appears on this list as “kur.nim.ma[ki]” (“twelve stars of Elam”). Elam was an ancient civilization centered in the far west and southwest of modern-day Iran. Belmonte Esteve (2018) writes that this is an attribute of Nergal, a God associated with the planet Mars.

Star of Eridu:

This Babylonian star “Nun-ki” from the catalogue BM 78161 (Liechty 1988) is Lambda (λ) Velorum in the IAU constellation Vela which is one corner of their asterism Harrow (see above). Compare this to Hand of Nunki, above.

This Chaldean star “mul nunki” from the Great Star List (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. It was listed as “NUN-ki” in the *Three Stars Each* catalogue.

This Seleucid star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

This star is Sigma (σ) Sagittarii in the IAU constellation Sagittarius. R.H Allen identified this as a Babylonian name in his *Star Names* in 1899. The name “NUN-ki” does appear in the *Three Stars Each* catalogue but is connected to the star Alpha (α) Carinae. The IAU approved the name Nunki for the star Sigma (σ) Sagittarii Aa.

Star of Fire:

This ancient Egyptian star “Seba en Sar” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Star of Gladness:

This Hawaiian star Hokule’a (“star of gladness” or “clear star”) is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. This is the “zenith star” of Hawaii: It is directly overhead if you are at the latitude of the Hawaiian Islands.

Star of Hyantis:

This Latin asterism “Sidus Hyantis” is the Hyades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. This is named for Hyas, who was the brother of the Hyades.

Star of Magellan:

This Portuguese star “Estrela de Magalhães” is Alpha (α) Crucis (Acrux) in the IAU constellation Crux.

Star of Mighty Destiny:

This Sumerian star “mulu-zal-la” is Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015). Boutet (2014) lists it as “Great Star or Giant”.

This Akkadian star “kak-kab na-ma-ri” is Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015).

This Persian asterism “Kakkab Nammaχ” is Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius as listed in R. H. Allen’s *Star Names* in 1899.

Star of Osiris:

This Egyptian star is star Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in R. H. Allen's *Star Names* in 1899.

Star of Piercing Brightness:

This Arabic star "At-tariq" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and appears in chapter (surah) 86 of the Quran.

Star of Power:

This Hungarian asterism "Köqelat Csillag" is the IAU constellation Triangulum. The celestial map of Hungarian uranographer Sandor Nagy (1915) places this label next to a triangle which almost certainly represents Triangulum. The label may read "kogeset Csillag" ("death star"). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky.

Star of Saint Catherine:

This Eastern Orthodox star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in R. H. Allen's *Star Names.* He writes that it was in use from the 6th century by pilgrims.

Star of Sigui:

This Dogon star "Sigu Tolo" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). Sigui is a key Dogon festival held every 60 years and this star is seen as a source of life. NOTE: French anthropologist Marcel Griaule wrote in the 50s that the Dogon (who didn't have telescopes and were far removed from the scientific community at that time) believed that this was a binary star system (which it is), but later analysis of Giraule's interviews of his four informants and modern interviews of Dogon elders suggests that Giraule (who was aware of the discovery of Sirius being a binary system) mis-interpreted his informant's information.

Star of Solitary Lono:

This Hawaiian star "Hiki-kau-lono-meha" ("Star of solitary Lono"), is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as "A'a" ('burning brightly"), "Hiki-kau-[e]-lia" or "Hiki-kau-e-lono" ("The-small-booby-bird-of-Lono") "[Hiki] kaulana-o-meha" or "Kau-ano-meha" ("Standing alone and sacred"), "Hoku-kau'opae" ("Star for placing shrimp"), "Hoku-ho'okele-wa'a" ("Canoe-guiding star"), "Kaulu-lena" or "Kaulua-lena" ("Yellow star"), or "Kaulua[-i-ha'i-mohai]" or "[-a-ha'i-mohai]" ("Flower of the heavens").

Star of Stars:

This Nyae Nyae !Kung star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

This G/wi star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Alcock 2014). It is also known simply as "Star" (see above).

Star of the Crossing of the Water Dog:

This Persian asterism "Kakkab Paldara", "Pallika", or "Palura" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed by R. H. Allen in his *Star Names* in 1899.

Star of the Hero:

This Babylonian star “Kakkab Dan-nu” is Gamma (γ) Virginis in the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899.

Star of the Horse:

This Kazakh star “Am Zhuldyzy” is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus.

Star of the Insane Lion:

This Latin star “Stella Vesani Leonis” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed by the Roman poet Horace and in R. H. Allen’s *Star Names* in 1899.

Star of the Mushrooms:

This Italian star “Este`la Bulera” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. The heliacal rising of Sirius coincides roughly with the period of the search for bo¨le` (mushrooms) in the summertime.

Star of the North:

This Arabic star “Al Kaukab al Shamāliyy” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Al Kaukab-al-shemálí, the Northern Star”.

This Lacandón star “Sämän Ek’” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

This Yucatec star “Xaman Ek” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. They also called it “Guide of the Merchants” or “Chimal Ek” (see Shield Star, above).

Star of the Poor:

This “Arabic” asterism with the latinized name “Kashi Deruishan” is the IAU constellation Corona Borealis as listed in John Hill’s *Urania* in 1754. Hill gives the Latin translation as “Stella Pauperum” (“star of the poor”). The Arabic asterism is actually called Bowl of the Poor (see above). Compare this to the Bedouin asterism “as qaṣʿat al-masākīn” (Dish of the Poor People, above).

Star of the Priest:

This Carib asterism “Asitjaniyman” represents a priest who fled into the sky after a shaman defeated him. Its present location is unknown (Magaña, and Jara, 1982).

Star of the Sailing Canoe:

This Hawaiian star “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe") is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Hokupa’a” (“Fixed Star”), “Noho-loa” ("Eternal"), “Kumau” ("Standing Perpendicularly"), “Kio-pa'a” or “Kio-pa” ("Fixed projection"), or “Kia-pa'akai” (Biblical: "Pillar of salt").

Star of the Sea:

This English star “Stella Maris” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. It was given this name by English Franciscan monk Bartholomeus Anglicus around 1270. English Admiral Henry William Smyth lists “Stella Maris” in his *Bedford Catalogue* in 1844.

Star of the Spaniards:

This Carib star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Magaña, and Jara, 1982). It is believed to cause hurricanes. It is also known as Malirubana (see above).

Star of the Tail Tip:

This Babylonian asterism is the stars Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), and Gamma (γ) Librae in the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899. Allen writes that this may have been part of a "Hydra of Chaldaea" and "early Afr of Arabia".

Star of the Torch of the Sucker Catfish:

This Carib star "Pakamu turi-rï" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Magaña, and Jara, 1982).

Star of the Two Equal Parts:

"Coscotoca Ch'aska" is an unidentified Quechua zenith star (Urton 1981).

Star of the Westland:

This is an Assyrian name for the IAU constellation Aries listed by the diviner Rašil (Belmonte Esteve 2018). It appears elsewhere as a name for Saturn.

Star of Vezdiv:

This Hungarian asterism "Vezdiv csillag" appears to be made up of stars of the IAU constellation Cepheus. It may be a specific reference to the 2.46 magnitude star Alpha (α) Cephei (Alderamin). The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a woman walking with a basket in her right hand.

Star on Top:

This Diné star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Childrey 2008).

Star Pole:

There are two Belarussian "star pole" asterisms:

- One, "Stazhar'e" or "Stazhar", is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Avilin 2009), which is part of their asterism "Small Cart" (see above). These are sticks on which the haystack is supported, so this star is a support.
- One, "Starhar'e" is the IAU constellation Ursa Major (Avilin 2009).

Star Queen:

This **telescopic** asterism is the nebula Messier 16 (NGC 6611, IC 4703, SH 2-49, RCW 165, LBN 67, Cr 375, Mel 198, Ced 159).in the IAU constellation Sagittarius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745 — 6 and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4400. English astronomer Isaac Roberts records of it resulted in it becoming IC 4703 in the *Index Catalogue*. This is listed as the "Star Queen and Her Throne" by Robert Burnham in his *Burnham's Celestial Handbook* in 1978. It is also known as the Pillars of Creation.

Star Snake:

This Barasana asterism “Nyoko Anya” is stars near the IAU constellation Corona Australis (Hugh-Jones 2006): Corona Australis is their asterism Poisonous Snake (see above).

Star Star:

This Babylonian asterism from the MUL.APIN tablets **“**MUL.MUL” (which literally translates as “star star” but probably means “many stars”) is the Pleiades cluster in the IAU constellation Taurus and also appears in Assyrian star lore (Hunger 1992, Bartel van der Waerden 1974, Anthony 1996, Belmonte Esteve 2018). The Ura = hubulla XXII tablet lists the Akkadian name as MIN, ka-li-tum, or za-ap-pu (Yigal, Block, Horowitz 2015) and it appears on the K 8538 planisphere as “mulmul” (Koch 1989).

Star Striking Falcon:

This Persian asterism is the IAU constellation Aquila as described by the Persian astronomer Nasir al-Din al-Tusi.

Star That Does Not Move:

This Iroquois star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above). Compare this to the Pawnee asterism “Star That Does Not Walk” (see below) and Lakota asterism “Star that Stands Still” (see below).

Star That Does Not Walk:

This Pawnee star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above). Compare this to the Apache asterism “Not Walking Star” (see above) and the Lakota asterism “Star That Stands Still” (see below).

Star that Rises After the Sun:

This Sahtúotine star “sak’énaáɔa” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Cannon 2021) during it’s morning appearance after the Winter Solstice.

Star That Stands Still:

This Lakota star “Wichapi Owanjila” or “Wičháȟpi owáŋžila” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above). Compare this to the Pawnee asterism “Star That Does Not Walk” (see above) and the Apache asterism “Not Walking Star” (see above).

Star the Priestess of Brave Heart:

This Tahitian star “Anâ-tahu'a-vahine-o-toa-te-manava” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor.

Star Thing:

See Star Woman (below).

Star Trek A:

See Ship (above).

Star Which has Come Up:

This Dëne Suhne star “tthén xáį ɔą” is unidentified at present (Cannon 2021).

Star Which is Already High:

This Quechua star “Alto piña ch’aska” is an unidentified Quechua zenith star (Urton 1981).

Star Woman:

This Barasana asterism “Nyokoaro” (“star woman” or “star thing”) is the Pleiades cluster in the IAU constellation Taurus (Hugh-Jones 2006, Urton 2016). It represents a wax gourd (“werea koa”) used by the first female shaman, Romi Kumu. This is a very important asterism, leader of the “New Star Path” of the Milky Way. It is also called Star Thing as it is in opposition to the leader of the “Old Star Path” (see Old Star Thing, above). An alternate Barasana name is Romi Kumu (see Woman Shaman, below).

Star Wreath:

This Hawaiian star Hokulei is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Starbrow of Canes Venatici:

This **telescopic** asterism “Stéllifrons Cánum Venaticórum” is the galaxy NGC 4861 (Arp 266) in the IAU constellation Canes Venatici. It was discovered in 1785 by William Herschel who listed it as “IV 30”. It became GC 3340 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “This plume-like galaxy has one enormous star formation region at the front end.” NOTE: The morphology of this galaxy is problematic. Its mass, size, and rotational velocity are consistent with it being classified as a spiral, but its highly irregular shape means it is also often classified as a dwarf irregular galaxy.

Starburst Galaxy:

This **telescopic** asterism IC 10 (LBN 591, PGC 1305, UGC 192) is an irregular galaxy in the IAU constellation Cassiopeia. It was discovered by American astronomer Lewis Swift in 1887. It is also known as the “Fist Sized of Cassiopeia” (see above).

Starfighter:

This **telescopic** asterism also known as the Headhunter, is the open cluster NGC 2269 in the IAU constellation Monoceros. It was discovered by English astronomer William Herschel in 1784 who listed it as “VI 3” in his catalogue. It is GC 1444 in the *General Catalogue* of 1864. This is obviously a reference to the Headhunter type of Starfighter in the Star Wars series franchise created by George Lucas in 1977: We don’t know who chose this name at present.

Starfish:

Johann Bayer’s *Uranometria* (1603) lists “Stella Maris“ (“starfish”) as a name for Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

This Latin star “Marinus Aster” is Beta (β) Orionis (Rigel) in the IAU constellation Orion as listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844.

This Hungarian asterism “Haldcsillag” is depicted as the tail of a fish caught in a fisherman’s net (see Fisherman, above) on the celestial map of Hungarian uranographer Sandor Nagy (1915) NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to

match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

There are eight **telescopic** "starfish" asterisms:

- One, also known as the Oblique Cross (see above) is the open cluster Messier 38 (NGC 1912), discovered by Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Auriga. This was listed in the *General Catalogue* of 1864 as GC 1119. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* that cluster's brightest stars form what is known as the Letter Pi Cluster, as they resemble the Greek letter π.
- One is the open cluster NGC 1245 in the IAU constellation Perseus. It was discovered by English astronomer William Herschel in 1786 and listed as "VI 25" in his catalogue. It is GC 658 in the *General Catalogue* of 1864. It has been named Patrick Starfish, a character from the animated television comedy series *SpongeBob SquarePants*, which started in May 1999. It is located 3 degrees southwest of the star Alpha (α) Persei (Mirfak).
- One is the globular cluster NGC 6544 in the IAU constellation Sagittarius. It was discovered by the English astronomer William Herschel in 1784 who listed it as "II 197". It is GC 4374 in the *General Catalogue* of 1864.
- One is the globular cluster NGC 6752 (Caldwell 93) in the IAU constellation Pavo. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3778 and later as GC 4467 in the *General Catalogue* of 1864. New Zealand astronomer Marilyn Head describes it in the DOCdb database as "nicknamed the Starfish". It is also known as the Windmill (see below) and the Cartwheel (see above).
- One is the open cluster King 12 in the IAU constellation Cassiopeia. Size 3' X 3'. René Merting describes it on the *Faint Fuzzies* website: "At 72X evident, a nebulous patch west of two brighter stars standing close together- at 144X the cluster blooms, it appears irregular, and some arcs allow associations with a starfish."
- One is the open cluster Messier 93 (NGC 2447) in the IAU constellation Puppis. It was discovered in 1781 by French astronomer Charles Messier. It is listed in the 1864 General Catalogue as GC 1571 and in John Herschel's catalogue as h 3098. English astronomer Thomas William Webb described it as "a neat group of star fish shape" in his *Webb's Celestial Objects for Common Telescopes* in 1893, attributing this quote to "Admiral Smythe": This would be English astronomer William Henry Smyth (1788 – 1865).
- One is the "Little Starfish", the peculiar galaxy NGC 7569 in the IAU constellation Pegasus. American astronomer Jimi Lowrey lists this name in the *Deep Sky Forum* in October 2020.

Starfish and Triggerfish:

This Tahitian asterism is the dark nebula of the Milky Way between the Coal Sack Nebula (see Coal Sack, above) and the galactic bulge near the IAU constellation Scorpius. The Tahitians saw them as eating the dark mist.

Starfish Galaxy:

This **telescopic** asterism is the irregular galaxy NGC 6240 in the IAU constellation Ophiuchus. It was discovered by Édouard Stephan in 1871. It became GC 5833 in the *General Catalogue* of 1864. Astronomer Greg Crinklaw refers to it as the "Rumpled Starfish" in the Skyhound archive

(https://observing.skyhound.com/archives/jun/NGC_6240.html). It is also known as the "Cylon Spaceship of Ophiuchus".

Stargate:

There are two **telescopic** "stargate" asterisms:

- One, Canali 1, is found in the IAU constellation Corvus, 1 degree southwest of the Sombrero Galaxy, Messier 104. This is a triangle within a triangle with blue/white stars varying between magnitude 6.6 to 11. The outer triangle includes the stars HIP 61486 and the double star HIP 61449. The inner triangle includes the double star HIP 61466. Size 8' X 8'. It was first catalogued by Frederick Georg Wilhelm von Struve (1793 – 1864) as STF 1659 in his double/multiple star catalogue. This is Harrington 20 on the asterism list of American astronomer Phil Harrington. German astronomer Robert Zebahl lists it as Canali 1 on his *Faint Fuzzies* website. Jeffrey Corder lists it as Corder 2381.
- One is the open cluster NGC 6416 in the IAU constellation Scorpius. It was discovered by Scottish astronomer James Dunlop in 1827. John Herschel listed it as h 3702 and later as GC 4323 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt.

Note: The first "stargate" appeared in the 1970's *Buck Rogers* TV series, so the name can't predate this. Stargate later became the name of a military science fiction franchise created by Roland Emmerich and Dean Devlin and first appeared as a film in October 1994.

Starry Night:

This **telescopic** Dutch star "Sterrennacht" is HAT-P-6 in the IAU constellation Andromeda (magnitude 10.47). It was given this name in the IAU NameExoWorlds campaign. It honors Vincent van Gogh's painting *The Starry Night.* It has an exoplanet named Nachtwacht ("night watch"), which is a famous painting by Rembrandt.

Starry One and Lightful One:

This Latin asterism "Astor and Polyleukes" is the IAU constellation Gemini as listed by R. H. Allen in his *Star Names* in 1899. Allen attributes this name to "Welke".

Starry Veil of Camelopardalis:

This **telescopic** asterism "Stellivelátus Camelopardális" is the intermediate spiral galaxy IC 342 (Caldwell 5) in the IAU constellation Camelopardalis. It was discovered by British astronomer William Frederick Denning in 1892. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "it is difficult to observe because it is hidden behind a veil of Milky Way stars." It is also known as the "Hidden Galaxy".

Stars:

This Egyptian asterism is the IAU constellation Scorpius as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003). The *Cairo Calendar* passage reads: "Going forth of the stars, bitterly and openly". Leitz (1994) relates this to the Sethian decan and Locher (1981) as the middle decan of a large boat asterism containing Alpha (α) Scorpii (Antares). Davis (1985) also places the constellation of the boat in this part of the sky.

This Latin asterism “Astrya” (“stars”) is the IAU constellation Virgo as listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638)

This Japanese sei shuku or lunar station “Hotohori Boshi” is a bent line of stars in the IAU constellation Hydra. The line starts with Iota (ι) Hydrae and runs through Tau (τ) 1 and 2 Hydrae, Alpha (α) Hydrae (Alphard), and 27 Hydrae, ending at 26 Hydrae.

This Arabic asterism “Al Auʾā” is some stars below Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius as listed by Persian lexicographer Fairūzābādī (فیروزآبادی), also known as el-Fīrūz Abādī”, “al-Fayrūzabādī (الفيروزآبادي) and “Firuzbadi” (1329–1414) in his *al-Qamous* (القاموس) dictionary. R. H. Allen lists this in his *Star Names*.in 1899

This Polish asterism “Asterion” (Αστερίων) is part of the IAU constellation Canes Venatici. Polish astronomer Johannes Hevelius (1611 – 1687) created this constellation in his *Prodromus Astronomiae* (1690), which depicts two hunting dogs on leashes next to Boötes: Asterion corresponding to the star Alpha (α) Canum Venaticorum and Chara corresponding to the star Beta (β) Venaticorum. Hevelius was the first to list Canes Venatici as a separate constellation (see Canes Venatici, above, and Northern and Southern Dogs, above). Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this as the name of one of two “jagdhunde” on leashes held by Boötes. Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Asterion” it in his *Celestial Atlas* in 1822. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 writes that “Hevelius had already made this the lucida of Chara’s collar”. The name Chara has now been assigned to Beta (β) Canum Venaticorum by the IAU, but the name Asterion is also used for this star. Alpha (α) Canum Venaticorum became “Cor Caroli” (see Charles’ Heart, above).

This **telescopic** U’wa star “Uúba” is the G type star LTT 9779 in the IAU constellation Sculptor (magnitude 10.55). It received this name in the IAU’s NameExoWorlds competition in 2022. Uúba is the U’wa word for “stars”, “seeds”, and “eyes”. It has an exoplanet LLT 9779b, “Cuancoá”, which is a reference to the morning star.

Stars Coming Out at Dawn:

This Basuto asterism “Ma-gakgala” was the stars Beta (β) Orionis (Rigel) and Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion, Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major, and Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Holbrook and Baleisis 2007, Slotegraaf 2013). When these stars were visible in the early evening it was time to harvest the corn. Other peoples who used this same asterism include:

- Lobedu: “Mahakala”,
- Northern Sotho: “Magakgala”, and
- Tswana: “Magakgala”.

Star’s Neighbor of Aries:

This **telescopic** asterism “Astrogíton Aríetis” is the elliptical galaxy NGC 821 in the IAU constellation Aries. It was discovered in 1786 by English astronomer William Herschel who listed it as “I 152”. It became GC 487 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). This name refers to the galaxy appearing near the 9.2 magnitude star HIP 9964.

Stars of Abundant Rain:

This Arabic asterism is three stars in the IAU constellation Gemini: Eta (η), Mu (μ), and Nu (ν) Geminorum.

Stars of Hope:

This Finnish asterism "Toivon Tähdet" is the Big Dipper asterism in the IAU constellation Ursa Major.

Stars of Phoebus:

This Latin asterism "Phoebi Sidus" is the IAU constellation Gemini as listed by 1st century Roman poet Marcus Manilius. The twins Castor and Pollux are called this as they are under Apollo's protection.

This Namaqua KhoiKhoi asterism is the Pleiades cluster in the IAU constellation Taurus (Slotegraaf 2013).

Stars of Summer:

This asterism is in the IAU constellation Sagittarius. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this as a "splendidly rich region around Sagittarius. This is probably a reference to the Scutum, and Sagittarius Star Clouds in this area of the sky.

Stars of the Cane:

This Estonian asterism "Sauatähde" is a line of three stars in the IAU constellation Orion (Kuperjanov 2006): Kappa (κ) Orionis, Alpha (α) Orionis (Betelguese), and Gamma (γ) Orionis (Bellatrix).

Stars of the Flock:

There are two Arabic asterisms with this name "al-kawākib al-firḳ":

- One is the stars Alpha (α) Cephei (Alderamin), Beta (β) Cephei (Alfirk), and Eta (η) Cephei in the IAU constellation Cepheus as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- One, latinized to "Kabalfird" is the star Eta (η) Cephei in the IAU constellation Cepheus.

Stars of the North Pole:

This Japanese asterism "Hokkyoku" " is depicted on the ceiling of the 17th or 18th century Takamatsuzuka (Miyajima 2014).

Stars of the Shepherd:

This Romanian asterism is the Pleiades cluster in the IAU constellation Taurus (Ottescu 2009).

Stars of the Year:

This Carib asterism "Siritjo" is the Pleiades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982).

Stars of Tištriia:

This Zoroastrian asterism "Tištriiaēinī" is the IAU constellation Canis Minor (Panaino 1999). Panaino notes that this was probably "a deformation, after paoiriiaēinī-, of an earlier (patronimic) stem like *tištriianī-, "the wives/daughters of Tištriia", "the stars who belong to Tištriia"".

Stars of the Three Maidens:

This Lithuanian asterism “Trejų mergelių žvaigždės” is the belt of Orion asterism in the IAU constellation Orion.

Stars of Three Kings:

This Lithuanian asterism “Trijų karalių žvaigždės” is the belt of Orion asterism in the IAU constellation Orion.

Stars of Water:

This ancient Egyptian asterism “Sebau nu mu” is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and Ethnoastronomers give two different versions of this ancient Egyptian asterism:

- One version is a quadrilateral of the stars 35 Cancri and HIP 42673, 42628A, and 42201 in the IAU constellation Cancer adjacent to Messier 44, the Beehive Cluster (see Beehive, above).
- The other version is Messier 44, the Beehive Cluster (see Beehive, above).

Star’s Queen:

This Romanian star “Regina Stelelor” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Ottescu 2009).

Start of Dry Season:

This Anindilyakwa asterism is the stars Lambda (λ) Scorpii and Upsilon (υ) Scorpii in the IAU constellation Scorpius (Clarke 2009, Hamacher and Norris 2011). We know that it marked the beginning of the dry season, but Hamacher et al did not have a precise name for it.

Station of Boötes:

This **telescopic** asterism “Státio Boótis” is the barred spiral galaxy NGC 5544 (Arp 199) in the IAU constellation Boötes. William Herschel listed it as “II 419”. John Herschel listed it as h 1771 and later as GC 3833 in his *General Catalogue* in 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “NGC 5544 has a remarkable quiet aspect, although it is approached by its companion NGC 5545. This approach could be seen as the arrival of a train at a station.” It is also known as the “Exclamation Mark”.

Station of Descent:

This Coptic lunar mansion “Termelia” (“Station of Descent” or “Station of Influence”) is stars in the IAU constellation Cancer as listed by W.B. Yeats in *A Vision* in 1917, taking this from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, where Kircher described it as “statio discensus seu influentiae”. The degree values for location listed by Kircher were invalid, so it is difficult to say which stars this was meant to be.

Station of Horus:

This Coptic lunar mansion “Ôrias” is the Pleaides cluster in the IAU constellation Taurus as listed by English author W.B. Yates in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher describes as “statio Hori”

("station of Horus") and "the hen of the skies with her daughters/chicks". John Hill lists it as "Orias" and describes it as the entire constellation Taurus in his *Urania* in 1754.

Station of Love:

This Coptic asterism "Asphulia" is the stars Beta (β) Leonis (Denebola) and Theta (θ) Leonis in the IAU constellation Leo. R. H. Allen translates this as "perhaps tail" in his *Star Names* in 1899. Allen writes that German scholar Athanasius Kircher listed "Ἀσπολια" ("Áspolia") as a Coptic asterism in Virgo. W.B. Yeats lists it as "Mansion of Love" in *A Vision* in 1917, which George Yeats derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, where Kircher listed it as "Statio Amoris" ("station of love"). It appears in the *Astronomica* of 1st century Roman poet Marcus Manilius, specifically an English translation by Edward Sherburne in 1675 as "Aspholia" and, is listed in John Hill's *Urania* in 1754 and by R. H. Allen in his *Star Names* in 1899.

Station of the Atonement:

This Coptic asterism "Chambalia" is made up of stars in the IAU constellation Libra. W.B. Yeats listed it as "Mansion of Propitiation" in *A Vision* in 1917, derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as "Statio Propitationis" ("Atonement Station"). John Hill lists it as "Λαμβαδία" ("Lamvadía" or "Lambadia") in his *Urania* in 1754.

Station of Isis:

This asterism "Ἰσιας" ("Isias") or "Statio Isidis" is the IAU constellation Scorpius as described by German Jesuit scholar and polymath Athanasius Kircher (1602 – 1680) and listed in R. H. Allen in his *Star Names* in 1899.

Stationary of Draco:

This **telescopic** asterism "Stásimus Dracónis" is the barred Magellanic spiral galaxy NGC 4236 (Caldwell 3) in the IAU constellation Draco. William Herschel listed this as "V 51". John Herschel listed it as h 1163 and later as GC 2825 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "the redshift of this galaxy is zero (within the accuracy of measurement).

Statue of Liberty Nebula:

This **telescopic** asterism is HII region NGC 3576 in the IAU constellation Carina. It was discovered by English astronomer John Herschel in 1847 who listed it as h 3324 in his catalogue. It is GC 2333 in the *General Catalogue* of 1864. Dr. Steve Mazlin of the Star Shadows Remote Observatory gave it this name in 2009. It is also known as the Torch Bearer Nebula (see below) and the Little Tarantula (see above).

Stažary:

Variants of this Belarussian name is used for several asterisms (Avilin 2018):

- "Stožar", "Stažary", "Stažarje", and "Sažór" are all used for the IAU constellation Ursa Major,
- "Stažary", "Stažerka", "Stazherka", and "Stažarja" are used for the Pleiades cluster in the IAU constellation Taurus.

NOTE: There is an Estonian variant of this name used for the IAU constellation Corona Borealis (Avilin 2018).

Steadfast of Virgo:

This **telescopic** asterism "Fírmus Vírginis" is the edge-on galaxy NGC 5775 in the IAU constellation Virgo. William Herschel listed this as "III 554". John Herschel listed it as h 1885 and later as GC 4004 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy forms a physical pair with NGC 5774 but is surprisingly not deformed". NOTE: Astronomer William Parsons, 3rd Earl of Rosse first recorded NGC 5774 (GC 4003).

Stealth Bomber:

This **telescopic** asterism is LeDrew 7 in the IAU constellation Ophiuchus. German astronomer René Merting lists it on the *Faint Fuzzies* website. Its size is 40' X 40'. Merting describes this asterism as resembling "an American stealth bomber flying north – the five brightest stars from a relatively equiangular south-opening triangle- within the triangle are three fainter stars tracing from NE to SW."

Stealthy of Virgo:

This **telescopic** asterism "Furtíva Vírginis" is the elliptical galaxy NGC 4261 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 139". It became GC 2842 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its unexpected radio and x-ray activity.

Steel Star:

This Sardinian star is Alpha (α) Canis Majoris in the IAU constellation Canis Major (Lite, Lodina, and Ignat 2018).

Steenbok:

The /Xam see the Magellanic Clouds as steenbok, one male, and one female (Alcock 2014). Other San tribes view the IAU constellation Pavo or the star Alpha (α) Pavonis as a female steenbok.

Steenbok Hunter:

This G/wi asterism "khwe g=ei/ui" ("man who shoots steenbok") is the IAU constellation Orion (Alcock 2014).

Steenboks:

This G/wi asterism is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Alcock 2014). Altair is the Female Steenbok (see above) and Vega the Male Steenbok (see above).

Steering Star:

This English star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed in R. H. Allen's *Star Names* in 1899. Allen attributed this to "early English navigators".

Stepanian's Star:

This **telescopic** 14th magnitude flare star is LX Serpentis in the IAU constellation Serpens. It is named after Jivan A. Stepanian.

Stephan's Quintet:

This **telescopic** asterism is a quintet of galaxies in the IAU constellation Pegasus:

- Spiral galaxy NGC 7320,
- Distorted barred spiral galaxy NGC 7319,
- A pair of colliding galaxies, NGC 7318a and 7318 b, and
- Elliptical galaxy NGC 7317.

It is named for French astronomer Édouard Stephan who discovered it in 1877. It is also listed as Hickson 92 and Arp 319. NOTE: NGC 7319 appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Stephánicus Pégasi" ("belonging to Stephan") and NGC 7320 appears as "Pseudostephánicus Pégasi" ("apparently belonging to Stephan"), this latter name a reference to this galaxy being in front of the group.

Stephan's Test:

This **telescopic** asterism is in the IAU constellation Pegasus. It is a jagged line of faint stars (the faintest being magnitude 14.7) located 17 arcminutes NE of the compact galaxy group Stephan's Quintet (NGC 7320, 7319, 7318 (a & b), NGC 7317). It was used by French astronomer Édouard Jean-Marie Stephan (1837 – 1923) to test transparency.

Stephen:

This German asterism "Stephen" or "Saint Stephen the Martyr" is the IAU constellation Cepheus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Stephanus Al Cepheus". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Steps in a Snowbank:

This Inuit asterism is the three stars of the belt of Orion in the IAU constellation Orion (MacDonald 1998). It is also known as "Runners" (see above).

Sterrennacht:

See Starry Night, above.

Stetson:

One is in the IAU constellation Horologium and is Ennis 59 on the observing list of Canadian astronomer Charles Ennis. Size 45' X 25'. The "brim" of the hat is the line of 8th to 9th magnitude stars including Gaia DR3 4745000948597002368, HIP 11702, HIP 11732, HD 15774, SAO 232797 and HIP 11661. The "top" of the hat is a curve stars including HD 15911, SAO 232810, HD 16135, HIP 11963 and the double star HIP 11877A. This includes stars of Corder 395 on Jeffrey Corder's list.

Stetsonus:

This American asterism is the IAU constellation Libra and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is depicted as a Stetson cowboy hat.

Stick:

This Finnish asterism "Korento" is the Belt of Orion asterism in the IAU constellation Orion.

Stick Man:

This asterism is in the IAU constellation Carina and is Corder 1664 on the observing list of American astronomer Jeffrey Corder. Size 300' X 120'. The "head" is Epsilon (ε) Carinae, the hands the double stars HIP 42134A and 42129A. The "body" is HIP 42568. The "feet" are HIP 43783 and the double stars HIP 43937 and 441343.

There are four **telescopic** "stick man" asterisms:

- One is listed in the in the *Midnight Ramblings* 1A logbook of Edmonton RASC member Randy Pakan in August 1989. It is in the middle of one of the clusters that form part of the Double Cluster: Open cluster NGC 884 (the other half being open cluster NGC 869). A group of stars between magnitude 7 and 9 form a stick man figure with a semicircular "crown" of stars above his head.
- One is "Maas 3" from the asterism list of American astronomer Steve Mass in the IAU constellation Scorpius. Its size is 8'. The brightest star is HD 157486 (magnitude 6.14). This is listed on the SOCO (Sentinel of the Caprock Observatory) list.
- One is in the IAU constellation Centaurus and is Ennis 75 on the observing list of Canadian astronomer Charles Ennis. Size 15'. The "head" is the double star HIP 68575A and the "body" is the star HIP 68598. From this last star four lines form the "arms" and "legs": His "left hand" is Gaia DR3 6089291348211410176. His "left leg" is HD 122357 and HD 122377. His Right "knee" is HD 122295. Fainter stars form his right "arm". Jeffrey Corder lists these stars as a "y" shape, Corder 2589 (see "Y" below).
- One is Ennis 22 on the observing list of Canadian astronomer Charles Ennis and is in the IAU constellation Pegasus:
    - The stick man's "head" is a triangle formed by the double stars Alpha (α) Andromedae (Alpheratz) and HIP 544 and the star HIP 540.
    - The "neck" is HIP 540 and 502,
    - One "arm" runs from HIP 502 to HIP 778,
    - The other "arm" runs from HIP 502 to HIP 121
    - The stick man's "hips" are represented by the star HIP 410. From this star one "leg" runs out to a "foot" at the double star HIP 399 and the other to a "foot" at the double star 85 Pegasi.

Sticks:

This Sardinian asterism "sos bacheddos" is the belt and sword of Orion in the IAU constellation Orion. Compare to the Sardinian asterism Three Marias (see below) which is the belt of Orion in the IAU constellation Orion.

Sticky Ones:

This Finnish asterism “Keppiset” is the Belt of Orion asterism in the IAU constellation Orion.

Sting:

This Arabic star “al-Lasʿah” (اللسعة) is Upsilon (υ) Scorpii in the IAU constellation Scorpius:

- This was later latinized to “Lesath”, “Lesuth”, and “Alascha”.
- German astronomer Johann Bayer (1572-1625) lists “Leschat”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists “Lessa Elaakrab”.
- “Alascha” is listed on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius.
- Robert Hues lists “Leschat” and “Lesath” in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Lesath”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Lesath” in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Lesath”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- The IAU approved the name Lesath for Upsilon (υ) Scorpii.

This Coptic lunar station “Minamref” is the stars Lambda (λ) and Upsilon (υ) Scorpii in the IAU constellation Scorpius as listed by R. H. Allen in his *Star Names* in 1899.

This Babylonian asterism “dSAR.UR” or “MUL.SAR.UR” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the star Lambda (λ) Scorpii in the IAU constellation Scorpius. It appears in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul.sar-ru” (Koch-Westenholz 1995). NOTE: This is also translated by Koch-Westenholz as “liar”.

This Babylonian asterism “SHAR.UR” ” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is described as “Lambda [λ] or Upsilon [λ] Scorpii [in the IAU constellation Scorpius]”.

This Seleucid star “Sharur” is Lambda (λ) Scorpii in the IAU constellation Scorpius. Compare this to the Akkadian asterism Sharuru, below and the Chaldean asterism Sarur, above.

This Akkadian star “Sharuru” or “Sarur” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Lambda (λ) Scorpii in the IAU constellation Scorpius. Compare this to the Seleucid asterism Sharur, above and the Chaldean asterism Sarur, above.

This Chaldean star “mul sar.ur” or “dSAR.UR” (Hunger 1992) from the *Great Star List* (Koch-Westenholz 1995) or “Sarur” of the Neo-Babylonian (Chaldean) period is Lambda (λ) Scorpii in the IAU constellation Scorpius. Compare this to the Seleucid asterism Sharur, below, and the Akkadian asterism Sharuru, below.

This Persian star “SAR.UR” from the list of Masu Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is Lambda (λ) Scorpii in the IAU constellation Scorpius (Boll 1918, Jeremias 1929). Ernst Weidner lists it as “sar-ur” in his *Fixsterne* in 1971.

Sting of Pisces:

This **telescopic** asterism “Acúleus Píscium” is the galaxy NGC 100 in the IAU constellation Pisces. It was discovered by American astronomer Lewis Smith in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Ghostly Streak”.

Sting of the Scorpion:

This Babylonian asterism “ziqit GÍR.TAB” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is Lambda (λ) and Upsilon (υ) Scorpii.

There are two Arabic asterisms with the name “ibrat al-‘aqrab” (“sting of the scorpion”) or simply “al-ibra” (الإبرة “the sting”):

- One is the stars Lambda (λ) Scorpii and Upsilon (υ) Scorpii in the IAU constellation Scorpius:
    - “al-Ibra” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010): Hafez translates this as “needle”.
- Dorn (1829) lists this as “Sting of the Scorpion’s Tail” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- One is the open cluster Messier 7 (NGC 6475) in the IAU constellation Scorpius. It was translated by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) as “the nebulous star to the rear of the sting” in his *Book of the Fixed Stars* in 964 as (Hafez 2010).

Stinger:

This Sumerian star “Sargas” is Theta (θ) Scorpii in the IAU constellation Scorpius. The meaning of this name is unknown. The IAU approved the name Sargas for Theta (θ) Scorpii A in 2016. Compare this to Sargaz, below.

This Babylonian star “MUL.SAR.GAZ” or “dSAR.GAZ” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Nu (ν) Scorpii in the IAU constellation Scorpius. This star appears in later Seleucid sky lore.

This Chaldean star “mul sar.gaz” from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) and “dSAR.GAZ” or “MUL.SAR.GAZ” from the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is Upsilon (υ) Scorpii in the IAU constellation Scorpius.

This Babylonian star “SHAR.GAZ” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is listed by Anthony as “Lambda [λ] or Upsilon [υ] Scorpii [in the IAU constellation Scorpius]”.

This Assyrian asterism “Sargaz” (Hunger 1992) from the *Astrological Reports to the Assyrian Kings* is Upsilon (υ) Scorpii in the IAU constellation Scorpius.

This Akkadian star “Shargaz” or “Sargaz” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Upsilon (υ) Scorpii in the IAU constellation Scorpius. This star appears in later Seleucid sky lore.

This Persian star “SAR.GAZ” from the list of Masu Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is Upsilon (υ) Scorpii in the IAU constellation Scorpius (Boll 1918). Compare this to Sargas, above.

This Zoroastrian star “Vanant” is Iota (ι) 2 Scorpii in the IAU constellation Scorpius. Note: There have been a lot of early opinions on the identity of this star. R. H. Allen writes in his *Star Names* in 1899 that “Vanant” is a Persian name for Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and cites “Mr. J. F. Hewitt’s Essays on the Ruling Races of Prehistoric Times”: This is English essayist J. F. Hewitt (1805 – 1938). Elsewhere in *Star Names* Allen gives it as a name for the IAU constellation Corvus, again citing Hewitt. Elsewhere Allen writes that the American astronomer William L. Elkin (1855 – 1933) lists “Vanand” as a Persian name for either the star Alpha (α) Canis Minoris (Procyon) or Alpha (α) Canis Majoris (Sirius). Still further on Allen suggests it may be a name for Theta (θ) Scorpii and then says that these names are “generally used for our Regulus [Alpha (α) Leonis]”. Basically, in Allen’s day they had no idea which star it referred to. Panaino (1999) lists it as Alpha (α) Lyrae (Vega) and translates “Vanant” as “the winner”. It is currently listed on Stellarium as Iota (ι) 2 Scorpii.

Stinging Scorpion:

See Scorpion, above.

Stingray:

This Kedahan and Mah Meri asterism, “Pari”, also known as “Muyang Pari” or “Ancestor of the Stingray” (Orang Asli) is the stars of the Southern Cross asterism in the IAU constellation Crux (Jaafar and Khairuddin 2019). This is related to a story of a boy born as a stingray to a poor family because he was originally a fairy prince. He later married a fairy princess, and they moved up into the sky.

This Sasak and Yolgnu asterism is the stars of the Southern Cross asterism in the IAU constellation Crux (see Southern Cross, above).

This Palawa asterism is the Coal Sack nebula in the IAU constellation Crux (see Coal Sack, above).

This Sama asterism “Mamahi Pagi” is the stars of the Southern Cross asterism in the IAU constellation Crux (Ambrosio 2008).

This Nuenone asterism “Larder” is the Coal Sack Nebula (Gantevoort 2015).

This Pyemmairrerener asterism “Pyerdreemme” or “Tonenermuckkellenner” is the Coal Sack Nebula (Gantevoort 2015).

This Paredarerme asterism “Larner” is the Coal Sack Nebula (Gantevoort 2015).

The stars of this Apinajé asterism “Bience d” or “Bieneyéd” are unidentified at present (Lima and De M. Figueirôa, 2007).

There are six **telescopic** “stingray” asterisms:

- One is the open cluster NGC 1342 in the IAU constellation Perseus. It was discovered by William Herschel in 1799 and listed in his catalogue as “VIII 88”. It is GC 717 in the *General Catalogue* of 1864. It is located almost halfway between Beta (β) Persei (Algol) and Zeta (ζ) Persei. It is also known as the Scorpion or the Sea Robin.
- Another is planetary nebula Hen 3-1357 in the IAU constellation Ara. It appeared in the 1980s. It was recorded by American astronomer, space scientist and astronaut Karl Gordon Henize in 1967.
- One is Ennis 10 in the IAU constellation Cetus, listed by Canadian astronomer Charles Ennis. It is the cluster Simonic 114. This is centered on HIP 10444, which forms the base of the “tail”, a line

of four 12th – 13th magnitude stars. The "body" is a pentagon of 9th – 10th magnitude stars including HIP 10444, SAO 148288, and Gaia DR3 5150317046680641280 with several 11th – 12th magnitude stars inside.

- One is in the IAU constellations Cassiopeia and Cepheus and is Ennis 30 on the observing list of Canadian astronomer Charles Ennis. The "body" is outlined by a parallelogram of stars: HIP 9568, double stars 47 and 49 Cassiopeiae and HIP 9494A, HIP 9147, HIP 8082, HIP 7557, HIP 6914, double star HIP 6661A, HIP 6347, HIP 6378, HIP 6379, HIP 6261, HIP 6718, double star HIP 7846, and HIP 8908. The "tail" runs from the double star HIP 5950 through 5070 to the "tip" formed by 23 and 21 Cassiopeiae.
- One is in the IAU constellation Taurus next to the Pleiades cluster and is Ennis 38 on the observing list of Canadian astronomer Charles Ennis. The "body" is the four stars HIP 18046, HIP 18106, HIP 18201, and the double star HIP 17954A. A curving line of six stars starting at HD 24152 and running through HD 24178, HD 24205, HIP 18163, and HIP 18230 to HIP 18330 forms the "tail". This includes stars of Corder 596.
- One, "Dasyátis Úrsae Majóris" ("Stingray of Ursa Major") is the merging galaxy UGC 5101 in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this remarkable complex with its long straight tail and square body resembles a stingray."

Stirrer Up of Rain:

This Arabic star "al-mijdah" or "al-Mujdah" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. It sets about a week after the Pleiades, marking the beginning of another rainy period. In the older rain star calendar of Qushayr it is listed as an indicator of a period of summer heat. "al-Mijdah" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Stomach:

This Chinese xiù (lunar mansion) "Wèixiù" (胃宿) is a triangle of stars in the IAU constellation Aries: 41, 39, and 35 Arietis. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Wèi" was associated to matters concerning the Xuzhou territory. This xiù appears in the Tang Dynasty as "Wèi" (胃) and is compared to the Vedic nakshatra Bharani (Kotyk 2017, see Bearer, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. The Koreans call this "Stomach of Tiger" (see below).

This Chinese Chenzhuo xing guan "Wèixiù" is a line of two stars in the IAU constellation Aries: 35, 39 and 41 Arietis.

This Japanese sei shuku or lunar station "Ekie Boshi" is a triangle of stars in the IAU constellation Aries: 35, 41 and 39 Arietis.

Stomach of Tiger:

This Korean lunar mansion "Wii" is identical to the Chinese xing guan "Stomach" (see above).

Stone of Destiny:

This Irish asterism is the IAU constellation Cepheus. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). This is a reference to the Lia Fáil, a coronation stone on the Hill of Tara in County Meath.

Stone of the Digging Stick:

See Digging Stick, above.

Stones Thrown at Birds:

This Gond asterism "Mogari", "Mongari", "Kutpari", "Thengari" or "Mundari", is the Pleiades cluster in the IAU constellation Taurus (Vahia 2014).

Stopping Place:

This Japanese moon station "Subaru" (昴) or "Subaru Boshi", sometimes translated as "united" or "getting together", is the Pleiades cluster in the IAU constellation Taurus (Renshaw and Ihara 2001).

Storage for Lady:

This Korean asterism "Sugnyeoleul Wihan Jeojang" (숙녀를 위한 저장) is a triangle of stars in the IAU constellations Aquila and Aquarius: 69, 70, and 71 Aquilae and 1 Aquarii.

Storage from the Puna:

This Quechua asterism "Puna Piura" is the Large Magellanic Cloud (Ciancia 2018)

Storage from the Valleys:

This Quechua asterism "Valli Piura" is the Small Magellanic Cloud (Ciancia 2018).

Store of Millet:

This Korean asterism "Gijang Gage" (기장 가게) is a line of four stars in the IAU constellation Taurus: Omicron (o), Xi (ξ), 4, and 5 Tauri.

Stored Water:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star 43 Persei in the IAU constellation Perseus.

This Chinese xing guan "Jīshuǐ" (积水) is the star Lambda (λ) Persei in the IAU constellation Perseus.

This Chinese Chenzhuo xing guan is the star Lambda (λ) Persei in the IAU constellation Perseus.

Storehouse:

There are three Quechua asterisms by this name:

- One Inca and Quechua asterism "Colla", "Collca", or "Qollqa" is the Pleiades cluster in the IAU constellation Taurus (Gamarra & Gamarra 2009, Brosseder 2010). They also called it "Oncoy" (see Disease, above), "Larilla", "Fur", and "Pugllaiguaico". They considered the Pleiades to be the mother of all stars and used this cluster as a signal regarding their maize harvest. Urton (1981) lists a version found in Misminay as "Collca".

- One Quechua asterism “Collca” from Quispihuara is the tail of the IAU constellation Scorpius (Urton 1981).
- One Quechua asterism “Collca” from Sonqo and Yucay is the Hyades cluster in the IAU constellation Taurus (Urton 1981).

Storehouse for Cereals:

This Korean asterism “Gogmul Chang-go” (곡물 창고) is a curve of stars in the IAU constellations Cetus, Pisces, and Taurus. The line starts at the star Lambda (λ) Ceti and runs through Mu (μ), Xi (ξ) 1 and 2 Ceti, HIP 9926 and 9576, Alpha (α) Piscium (Alrescha), and 60 Ceti, 66 Ceti, 75 Ceti, Delta (δ) Ceti, Gamma (γ) Ceti, Alpha (α) Ceti (Menkar), and Kappa (κ) 1 Ceti, ending at 10 Tauri.

Storehouse of Rain:

This Kongo asterism “za lunda emvula” (“storehouse or gathering place of rain”) is the Pleiades cluster in the IAU constellation Taurus.

Storehouse of Sky:

This Korean asterism “Haneul-ui Chang-go” (하늘의 창고) is a bending line of stars in the IAU constellation Cetus: Iota (ι), Eta (η), Theta (θ), Zeta (ζ), Tau (τ), and Upsilon (υ) Ceti.

Stork:

This Latin asterism “Ciconia” is the IAU constellation Ophiuchus as listed in the 1551 edition of the *Almagest*. Johann Bayer’s *Uranometria* (1603) lists “Ciconia Serpenti” (“serpent stork”) as an alternative name for this constellation. John Hill lists “Ciconia” as “one of the Arabian constellations” in his *Urania* in 1754. Hill claims that it was given this name as “they were not permitted by their law to draw human figures.” R. H. Allen lists it in his *Star Names* in 1899, but not as Arabic.

This Egyptian asterism “Pelargos” is one of the paranatellonta of the decans of Sagittarius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Cygnus.

This German asterism is the IAU constellation Grus as named by German poet Philipp von Zesen (1619 – 1689).

This Carib asterism “Iaboura” formed by three unidentified stars near the IAU constellation Ursa Major (Magaña, and Jara, 1982).

Storm Bird:

This Akkadian asterism “Urakhga” is the IAU constellation Lyra as listed by R. H. Allen in his *Star Names* in 1899.

Stormy Clouds:

This **telescopic** asterism is the HII regions LBN 20, LBN 21, and LBN 22 in the IAU constellation Ophiuchus.

Storm of Canes Venatici:

This **telescopic** asterism “Thyélla Cánum Venaticórum” is the dwarf galaxy NGC 5195 (Messier 51b) in the IAU constellation Canes Venatici which is interacting with NGC 5194 (Messier 51). It was discovered

by French astronomer Charles Messier in October 1773. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this companion of NGC 5194 is in a state of turbulence because of the perturbations caused by its giant neighbour".

Stormy of Cetus:

This **telescopic** asterism "Procellósus Céti" is the spiral galaxy NGC 578 in the IAU constellation Cetus. This was discovered by John Herschel in 1835, who listed it in his catalogue as "2418". It became GC 339 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it resembles "a giant hurricane".

Straight Arm of Andromeda:

This **telescopic** asterism "Ithýdromus Andrómedae" is the spiral galaxies NGC 90 and 93 (Arp 065) in the IAU constellation Andromeda. It was discovered by R. J. Mitchell, an assistant to the 3rd Earl of Rosse, in 1854. These are listed in the General Catalogue of 1864 as GC 40 and GC 42. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the remarkable straight arm caused by tidal interaction".

Straight Gate:

This Chinese Chenzhuo xing guan "Zhimen" is the star 27 Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Purple Forbidden West Wall.

Straight Line:

This asterism is in the IAU constellation Cetus and is Corder 143 on the observing list of American astronomer Jeffrey Corder. Size 240' X 40'. This is Phi (ϕ) 1, 2, 3, and 4 Ceti.

There are twenty-four **telescopic** "straight line" asterisms:

- One is Sánta 148, listed in 2009 by Hungarian astronomer Sánta Gábor, which is a straight line of 9th – 12th magnitude stars in the IAU constellation Gemini including HD 250813. Gábor describes it as "next to 1 [Geminorum], very nice straight line of 6… NS".
- One is Sánta 45, listed in 2009 by Hungarian astronomer Sánta Gábor, which is a straight line of nine 8th – 12th magnitude stars in the IAU constellation Cancer.
- One is Sánta 151, listed in 2009 by Hungarian astronomer Sánta Gábor, which is a straight line of eight stars in the IAU constellation Draco. At one end of the line is 5th magnitude star HIP 89981 and at the other end of the line is 6.35 magnitude star HIP 89943.
- One is Cseh 35, listed by Hungarian astronomer Viktor Cseh, which is in the IAU constellation Pictor. Cseh describes it as a "very nice star group with 5 bright members, size 8' X 4', small line of stars in NE – SW direction". Jeffrey Corder lists this as Corder 1137.
- One is Lorenzin 3 on American astronomer Tom Lorenzin's asterism list and is in the IAU constellation Sagittarius. Size 30' X 2'. One end of the line is HIP 89410.
- One is "1-C-2" in the IAU constellation Hydra and is Corder 1604 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes this to John Raymond. Size 35'. This is 1, 2, and C Hydrae.

- One is in the IAU constellation Triangulum and is Corder 254 on the observing list of American astronomer Jeffrey Corder. Size 40' X 30'. Corder describes this as a "chain that includes at least 12 stars between magnitude 7.5 and 11. There is a 7th magnitude star at each end of the chain": These are HIP 7374 and 6786. The chain also includes HIP 7356, 7245, 7090, 7003, and 6950.
- One is in the IAU constellation Camelopardalis and is Corder 625 on the observing list of American astronomer Jeffrey Corder. Size 60' X 15'. This is five stars in a line with the 5th magnitude HIP 19018 in the middle and the optical double HIP 18880 and 18871 at one end and an optical double (7.90/8.80 magnitude) at the other end.
- One is in the IAU constellation Cancer and is Corder 1588 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 9th magnitude stars including HIP 41130.
- One is in the IAU constellation Ursa Major and is Corder 2183 on the observing list of American astronomer Jeffrey Corder. Size 40' X 30'. This is five 7th – 10th magnitude stars including HIP 55803 and the double star HIP 56063.
- One is in the IAU constellation Columba and is Corder 1020 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is four 6th – 9th magnitude stars including HIP 29217 and 28838 and the double star Pi (π) 1 and 2 Columbae.
- One is in the IAU constellation Pyxis and is Corder 1771 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is five 8th magnitude stars including HIP 45083.
- One is in the IAU constellation Antlia and is Corder 1913 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 7th – 9th magnitude stars including the double star HIP 48105.
- One is in the IAU constellation Vela and is Corder 2013 on the observing list of American astronomer Jeffrey Corder. Size 100' X 35'. This is four 4th – 6th magnitude stars including HIP 50799, 50903, 51014, and 51077.
- One is in the IAU constellation Sagitta and is Corder 4079 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is four 8th – 9th magnitude stars including HIP 99494.
- One is in the IAU constellation Capricornus and is Corder 4268 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is four 7th – 8th magnitude stars including HIP 103224, 103166, and 103114.
- One is in the IAU constellation Vulpecula and is Corder 4284 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is six 7th – 9th magnitude stars.
- One is in the IAU constellation Aquarius and is Corder 4335 on the observing list of American astronomer Jeffrey Corder. Size 125' X 20'. This is seven 6th – 8th magnitude stars including HIP 104395, 104774, 104869, and 104939, and the double stars HIP 104294 and 104657A.
- One is in the IAU constellation Pegasus and is Corder 4351 on the observing list of American astronomer Jeffrey Corder. Size 60' X 20'. This is seven 8th – 9th magnitude stars including HIP 104853 and the double star HIP 104748A.
- One is in the IAU constellation Pavo and is Corder 4379 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 10th magnitude stars including HIP 105297.
- One is in the IAU constellation Pegasus and is Corder 4661 on the observing list of American astronomer Jeffrey Corder. Size 40' X 15'. This is six 8th – 9th magnitude stars including HIP 110623.
- One is in the IAU constellation Lacerta and is Corder 4677 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 7th – 8th magnitude stars including HIP 110931.

- One, “Lineáta Dracónis” (“Straight line of Draco”), is the lenticular galaxy NGC 5866 (Messier 102) in the IAU constellation Draco. This was originally discovered by French astronomer Pierre Méchain in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the “conspicuous sharp, dark dust lane”. It is also known as the “Spindle” (see above) and the Fool’s Gold Galaxy” (see above).

Straining:

This Zulu star “iNtsantsa”, or “Insansa” (“straining” or “pulling”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holbrook and Baleisis 2007).

Strange:

This Chaldean star “mul a-hu-u” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Stranger:

This star is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia as listed by R. H. Allen in his *Star Names* in 1899. Allen does not identify the culture that this name originates from.

Stratero:

This German asterism is the IAU constellation Piscis Austrinus as listed on the charts of the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Straw Hat:

This **telescopic** asterism is the open cluster NGC 1528 in the IAU constellation Perseus. It was discovered by the English astronomer William Herschel in 1790 and listed in his catalogue as “VII 61”. It is GC 820 in the *General Catalogue* of 1864. It is one of the side-by-side clusters known as the M & M Double Cluster (see above), the other being NGC 1545. This is the name given to NGC 1528 by American astronomer Wayne Schmidt, who describes it as a straw hat 17 arcminutes across. Astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as O’Meara 23, but doesn’t reference it to any name.

Strawberry Nebula:

This **telescopic** asterism is planetary nebula NGC 1535 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as “IV 26” in his catalogue. It is GC 826 in the *General Catalogue* of 1864. It is also known as the “Celestial Jellyfish”, “Cleopatra’s Eye”, and the “Ghost of Neptune Nebula”. American science fiction writer Jeff Medkeff (1968 – 2008) wrote in the DOCdb that “I later learned that this pn is often called the ‘Strawberry Nebula’ because of its strong red colour”. NOTE: This is interesting since all of the other observers whose observations I’ve read indicate its bluish colour.

Streak Nebula:

This **telescopic** asterism is NGC 2736, a part of the Vela Supernova Remnant in the IAU constellation Vela. This was discovered by English astronomer John Herschel in March 1835 and listed it as h 3145. It is GC 1745 in the *General Catalogue* of 1864. Herschel described it as “an extraordinary long narrow ray

of excessively feeble light" It is also known as the Pencil Nebula (see below) and the Herschel's Ray (see above).

Stream:

This asterism is the asterism Pouring Forth of Water (see above).

Strength of Charles:

This star "Eta Roboris Caroli" or "Robur Caroli" is Eta (η) Carinae in the IAU constellation Carina. Scottish astronomer James Dunlop referred to this star by this name in his observations of 1827, attributing the name to German astronomer Johann Elert Bode (1747 – 1826).

Stretched Net:

This Japanese sei shuku or lunar station "Chiriko Boshi" is a bent line of stars in the IAU constellation Hydra. It starts at the star Psi (ψ) Hydrae, takes a bend at Mu (μ) Hydrae, another bend at Lambda (λ) Hydrae, yet another at 39 Hydrae, and ends at Kappa (κ) Hydrae.

Stretched Out of Puppis:

This **telescopic** asterism "Exténtus Púppis" is the spiral galaxy IC 2375 in the IAU constellation Puppis. This was first recorded by American astronomer Herbert Alonzo Howe (1858 – 1926). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this remarkable double Markarian object looks like two distant torches in the sky".

Stretcher:

This Pawnee asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Stribor:

This Croatian star is HIP 43674 (HD 75898) in the IAU constellation Lynx and was given this name in the IAU NameExoWorlds campaign. It is named for Stribog, the God of Winds. It has an exoplanet named Veles, who was their God of Earth, waters, and the underworld.

Stride:

This Japanese sei shuku or lunar station "Tokaki Boshi" ("stride" or "foot") is a ragged oblong of stars of the IAU constellations Andromeda and Pisces:

- One side starts at 35 Andromedae, running down through Mu (μ) and Beta (β) Andromedae (Mirach), 82 Piscium, Tau (τ) Piscium, Upsilon (υ) Piscium, and Phi (ϕ) Piscium, ending with 84 Piscium.
- The other side runs down from 35 Andromedae through 29, Delta (δ), Epsilon (ε), Zeta (ζ), and Eta (η) Andromedae, ending with 84 Piscium.

Striking Both Sides Stars:

This Japanese asterism "Kanatsuki no Ryowaki Boshi", also known as "Waki Boshi" ("Two Wooden Blocks") or "Hyoushigi" ("Wooden Blocks") is the IAU constellation Orion:

- The stars Alpha (α) Orionis (Betelgeuse), Zeta (ζ) Orionis (Alnitak) and Kappa (κ) Orionis (Saiph) form one block, and
- The stars Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), and Beta (β) Orionis (Rigel) form the other.

String:

See String of Pearls, below.

String of Beads:

There are two Arabic asterisms by this name:

- One is the star "an-nazm", "an-Niżm" (النّظم), or "al-Nazhm" is the star Epsilon (ε) Orionis in the IAU constellation Orion and is the star in the middle of the three stars forming the "belt" of the IAU constellation Orion.
    - "al-Nazm","Nazm al-Jauzā'", and "al-Nizām" are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name for the Belt of Orion (Hafez 2010).
    - NOTE: There is an Arabic asterism "String of Pearls" ("Salasil Min Alluwlu" (سلاسل من اللؤلؤ) above) which includes the star Alnilam.
    - The modern name Alnilam is probably a mistranslation by Latin translators in the 12th century, mistaking it for "al-nilam" ("sapphire" النيلم).
    - A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) simply labels this star "Orion".
    - This was later latinized to "Alnilam", which R. H. Allen lists it as "Al Niṯhām, or "Al Naṯhm" in his *Star Names* in 1899.
    - Variations include "Anilam", "Ainilam", and "Alnihan".
    - English Admiral Henry William Smyth's Prolegomena of 1844 lists "Alnilam" and his *Bedford Catalogue* in 1844 lists this as "Al-Nidhám, or Nizám, the string of pearls", which is confusing this with the Arabic asterism "Salasil Min Alluwlu" (see String of Pearls below).
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alnilam".
    - The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alnilam" for this star.
    - The IAU approved the name Alnilam for the star Epsilon (ε) Orionis.
- One is the asterism "al-niẓām" or "Al Niṯhām", later latinized to Alnitham (I, II, II and IV), which is the stars Phi (ϕ) 1, 2, 3, and 4 Ceti in the IAU constellation Cetus.

Compare this to String of Pearls, below.

String of Fishes:

This Tongan asterism "Tuinga Ika" is Orion's sword in the IAU constellation Orion.

String of Jewels:

This Japanese asterism "Sumaru no Tama" or "Sumaru" is the Pleiades cluster in the IAU constellation Taurus (Renshaw and Ihara 2001). These jewels decorated trees around the deities dancing to lure the solar Goddess Amaterasu from her cave.

String of Pearls:

This Arabic asterism "Salasil Min Alluwlu" (سلاسل من اللؤلؤ) is the belt of Orion in the IAU constellation Orion. This is also known simply as "The String". Arabic poet Dhu r-Rumma (d. 735 C.E.) listed this name. It is also known as the Belt of Al Jawza' (see above) or the Jeweled Belt of Al Jawza' (see above) or the String of Beads (see above).

There are two **telescopic** "String of Pearls" asterisms:

- One is Alessi 11 from the lists of Brazilian astronomer Bruno Alessi is listed by René Merting on the *Faint Fuzzies* website and is in the IAU constellation Delphinus. Merting writes "at 20X I see a string of pearls, which is not dissimilar to the Arp 322 galaxy pearl necklace" (see Pearl Necklace, above).
- One is the galaxy NGC 55 (Caldwell 72) in the IAU constellation Sculptor. It was discovered by Scottish astronomer James Dunlop in 1827. It is GC 27 in John Herschel's 1864 *General Catalogue*. John Dreyer describes it in the *New General Catalogue* of 1888 as "trinuclear". The Latin form of this name, "Bacatus Sculptoris", appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). They cite Carolyn Shoemaker as the creator of this name, which was subsequently used by O'Meara in 2002. It is also known as the Pencil (see above).

String of Shells:

This Kiribati asterism "Itua ni bure" is the IAU constellation Coma Berenices (Trussel and Groves 1978). They also called it "Joyous Glittering" (see above).

Strings of Pearl:

There are three **telescopic** "Strings of Pearl" asterisms:

- One, also known as the Hoopskirt, is the open cluster IC 2488 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1752. It ended up on the Index Catalogue after being recorded by American astronomer Solon Irving Bailey (1854 – 1931). It is located 30 arcminutes west of N Velorum, a 3rd magnitude star located near the False Cross asterism (see False Cross above).
- Dorn (1829) describes an Arabic asterism by the name "Strings of Pearl" as being "at the extremity of the Archer's cap… a spot in the heavens where there is an obscure star, not easy to be observed, and surrounded by six small dull stars". Dorn describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). It is clearly in the IAU constellation Sagittarius, but it is uncertain which stars he is referring to.
- One is the open cluster NGC 6124 (Caldwell 75) in the IAU constellation Scorpius. It was discovered by French astronomer Abbe Nicolas Louis de Lacaille (1713 – 1762) who listed it as Lac I 9. It is GC 4184 in the *General Catalogue* of 1864. South African astronomer Carol Botha (2010) describes it as "Opulence in abundance: the globular seems to be draped in strings of pearls". It is also known as "Two Stacked Saucers" (see below).

Stripe Eye:

This Belarussian asterism "Polosozar" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009).

Striped Dress of Coma Berenices:

This **telescopic** asterism "Trabeáta Cómae Bereníces" is the double barred lenticular galaxy NGC 4340 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as II 85". It became GC 2891 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to the conspicuous bar of this galaxy.

Stroller:

This **telescopic** asterism is in the IAU constellation Cassiopeia and is Ennis 27 on the observing list of Canadian astronomer Charles Ennis. The "basket" of the stroller is formed by the variable star Kappa (κ) Cassiopeiae, the double stars HIP 2716A, HIP 2717 and, HIP 2656A. The "wheels" are the two stars HIP 2756 and an 8.20 magnitude star. The "handle" runs from HIP 2717 through HIP 2409 to HIP 2320. The wedge shaped "basket" is Corder 110 on the observing list of American astronomer Jeffrey Corder.

Strong Arm of Pegasus:

This **telescopic** asterism "Fortibrachiátus Pégasi" is the spiral galaxy NGC 7678 (Arp 28) in the IAU constellation Pegasus. This was discovered by John Herschel in 1830: Herschel listed it as 2522 in his catalogue and later in the *General Catalogue* of 1864 as GC 4971. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "well developed southern arm".

Strong Arms of Eridanus:

This **telescopic** asterism "Lacertósus Erídani" is the barred spiral galaxy NGC 1300 in the IAU constellation Eridanus. It was discovered in 1835 by John Herschel who listed it as h 2522 and later as GC 689 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "two strong arms spring from the ends of the bar of this galaxy".

Strong Man:

This Murrawarri asterism "Jadi Jadi" is the IAU constellation Orion (Fuller et al 2014). He is a strong man wearing a belt, carrying a shield, and a stone club. His name can also be translated as "cyclone".

Strong One:

This Arabic asterism "Al Babādur" is the IAU constellation Orion. Adjectives used to describe Orion include "Audax" ("bold"), "Bellator" ("male warrior"), "Bellatrix" ("female warrior, which is the name given to the star Gamma (γ) Orionis), "Fortis" ("strong"), "Fortissimus" ("very strong"), "Furiosus" ("crazy man"), and "Sublimatus":

- Johann Bayer's *Uranometria* (1603) lists the name "Bellator Fortissimus".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Bellator".
- Both "Bellator" and "Bellatrix" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- "Al Babādur" is listed in R. H. Allen's *Star Names* in 1899.

Strong Snake:

This asterism “Coluber Fortis” is the IAU constellation Hydra. This name is listed in Johann Bayer’s *Uranometria* (1603).

Struggling:

This Latin asterism “Nixus” is the IAU constellation Hercules:

- Johann Bayer’s *Uranometria* (1603) lists “Nixus” and “Nisus” for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Nisus sive Nixus” as alternate names for Hercules.
- “Nixus” is listed in John Hill’s *Urania* in 1754.

Strung Together:

This Hopi asterism is the Belt of Orion in the IAU constellation Orion.

Struve’s Lost Nebula:

This **telescopic** asterism “Struve’s Nebula” or “Struve’s Lost Nebula” is the reflection nebula NGC 1554 (LBN 817, Ced 32a) in the IAU constellation Taurus. It was discovered by German Russian astronomer Otto Wilhelm von Struve (1819 – 1905). It is listed in the General Catalogue of 1864 as GC 839. NOTE: Some relate this to Hind’s Variable Nebula, NGC 1555, as at the original coordinates there is no nebula. However, there is a 14th magnitude star: It is possible that Struve discovered a variable star that occasionally flares on a long cycle.

Stung of Virgo:

This **telescopic** asterism “Mórsus Vírginis” is the spiral galaxy NGC 5054 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “II 513”. It became GC 3473 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the thin edge-on galaxy MCG-3-34-40 is situated at the top of the northern spiral arm of NGC 5054.”

Stupid:

This Lower German star “Dumke” is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

SU:

This Akkadian asterism “ŠU”, “dSal-bat-a-nu”, or “bi-ib-bi” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian names are “[mu]lueriduki” or “muludu-til”.

Sualocin:

This star is Alpha (α) Delphini in the IAU constellation Delphinus. It first appeared in Giuseppe Piazzi’s *Palermo Star Catalogue*. When it was first published in 1814, this was the name associated with this star. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Svalocin” as a “barbaric epithet” and comments that he was unable to find any authority that “enables one to form any rational conjecture as to the misreading, mis-writing, or mis-application, in which so strange a metamorphosis could have originated”. British astronomer Rev. Thomas Webb (1807 – 1885) later figured out that Piazzi’s assistant was Niccolò Cacciatore (the surname translating as “Nicolas Hunter” in English and

"Nicolas Venator" in Latin): This Latin given name, reversed, gives Sualocin. Webb notes this in the third edition of his *Celestial Objects for Common Telescopes* in 1873:

- American uranographer Elijah Burritt (1794 – 1838) listed it as "Scalovin".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Sualocin".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this star as "Sulaocin".

The IAU approved the name Sualocin for Alpha (α) Delphini Aa.

Sublimated Snake:

This Latin asterism "Coluber Sublimatus" is the IAU constellation Hydra. Johann Bayer's *Uranometria* (1603) lists "Coluber Sublimatus".

Subra:

See Mane, above.

Suburbs of Virgo:

This **telescopic** asterism "Suburbána Vírginis" is the elliptical galaxy NGC 4564 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 68". It became GC 3105 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is located near the outer edge of the Virgo Cluster".

Succubae of Pavo:

This **telescopic** asterism "Súccuba Pavónis" is the interacting intermediate spiral galaxy NGC 6769 in the IAU constellation Pavo. It was discovered in 1836 by John Herschel who listed it as h 3783 and later as GC 4476 in his *General Catalogue* of 1864. This galaxy is interacting with NGC 6770. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is one of the "eyes" of the Devil's Mask (see above).

Sucker Catfish:

This Carib asterism "Pakamuyuman" is the IAU constellation Scorpius, though some versions apparently include stars of Virgo or Boötes (Magaña, and Jara, 1982).

Sudrstri:

This Buddhist star Sudṛṣṭi is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. This first emerged in the late Tang Dynasty in China (Kotyk 2017).

Suga:

This Samoan asterism is the globular cluster Messier 4 in the IAU constellation Scorpius (Fitisemanu 2022).Pae and Suga are a pair of hunters pursuing Toloa (see Wild Duck, below and Suga, below).

Sugano's Star:

This name has been associated with two **telescopic** variable stars in the IAU constellation Orion:

- One is V369 Orionis, and
- The other is V1143 Orionis.

Sugar Pile:

This **telescopic** asterism is the open cluster NGC 2360 (Caldwell 58) in the IAU constellation Canis Major. This was discovered by English astronomer Caroline Herschel in 1785. Her brother William Herschel listed it in his catalogue as "VII 12". It is GC 1512 in the *General Catalogue* of 1864. South African astronomer Magda Streicher (2005) described this as a "sugar-pile cluster". It is also known as Caroline's Cluster (see above).

Sugar Pops Nebula:

See Jewel Bug Nebula, above.

Sugia:

This asterism "Sugia" or "Asugia" is the IAU constellation Orion:

- R. H. Allen writes in his *Star Names* in 1899 that these names were thought by French scholar Joseph Justus Scaliger (1540 – 1609) to be corruptions of the Arabic "'ash-Shujaā'" (see Sea Serpent, above) which is their name for the star Beta (β) Draconis (Rastaban) in the IAU constellation Draco. Allen further suggests that these names might have been used to indicate that Orion was a strong man as many adjectives of this sort had been used to describe Orion (see Strong Man, above).
- John Chilmead in his *A Learned Treatise on Globes*, 1889, lists "Asugia" and translates it as "madman".

Suhail:

See Glorious, above.

Suhail of the South:

See Glorious, above.

Suhail of the Weight:

This Persian star "Al Suhail al Wazn", later latinized to "Alsuhail", is Lambda (λ) Velorum in the IAU constellation Vela as described by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986). Compare this to their asterism "Al-Wazn" (see Weight, below). In his *Star Names* in 1899 R. H. Allen describes this star as "one of the Muḥlīfaïn", but those are three different stars (see 'Al-Muḥlifayn, above).

Suhayl Balqayn:

This Arabic star is Tau (τ) Puppis in the IAU constellation Puppis.

Suhayl Hadari:

This Arabic star is Zeta (ζ) Puppis in the IAU constellation Puppis.

Suhayl Raqashi:

This Arabic star is Lambda (λ) Velorum in the IAU constellation Vela.

Suitable for Altar:

This Latin asterism “Apta Altaria” is the IAU constellation Ara.

Suitor on the Left Hand:

This Xhosa star “Isoka lasekohlo” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Suitor of the Right Hand:

This Xhosa star “Isoka lasekunene” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

SUKKAL dA-nu-ni-tum:

This Akkadian asterism “SUKKAL dA-nu-ni-tum” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is related to Anunitu (see above) but the stars are unidentified currently. The Sumerian name is “[mule-tu-r]a-am-me.

Sulacsus:

This Celtic (Gaulish) star “Sulacsus” or “Eulacsus” (“wisdom”) is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major (Boutet 2014). Compare this to the Vedic asterism Pulaha (see above). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

Sulafat:

See Tortoise, below.

Sulev and his Children:

This Estonian asterism “Sulev” is the stars Xi (ξ) Tauri, Omicron (ο) Tauri, and stars nearby in the IAU constellation Taurus. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique. This is a reference to Sulev, the ancestor of a race of heroes in Estonian mythology.

Sulfur-Crested Cockatoos:

The Kamilaroi asterism “Muraay” and the Euahlayi asterism “Muyaay”, “Murai” (Ridley 1875), or “Murrai” is the Pointer stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) as listed by Stanbridge (1857), Morieson (1999), Hamacher and Frew (2010), and Fuller et al (2014). The Kamilaroi and Euahlayi believe these birds ended up in the IAU constellation Crux when their tree, the Yarran (see below), was dragged into the sky by Yowee, the Spirit of Death, with the first man to die (see Spirit of Death above). Compare to White Cockatoo, below.

Sullat:

This star “mul dsullat” in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus and is part of the “foot” of their constellation Numushda (see above). Compare this to the Seleucid star Shullat, below. It is listed as “dsullat” in the Babylonian star catalogue BM 78161 (Leichty 1988) but identified as the star Epsilon (ε) Centauri.

This Persian (Achaemenid Period 539 – 331 B.C.E.) star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus as listed in Ernst Weidner's *Fixsterne* in 1971.

Sümbille:

This Kazakh star "Sümbille" or "Sumbule" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Summer:

This Sesotho asterism "Lehlabula" is either the Large Magellanic Cloud or the Coal Sack Nebula (see Coal Sack, above). It is unsure what the seasonal association is here.

Summer Beehive:

See Beehive, above.

Summer Egret:

This Barasana asterism "Kuma Yehe" is the stars surrounding Beta (β) Persei (Algol) in the IAU constellation Perseus (Hugh-Jones 2006).

Summer Rose Star:

This **telescopic** asterism is the globular cluster Messier 55 in the IAU constellation Sagittarius. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752. French astronomer Charles Messier catalogued it in 1788. It is listed in John Herschel's General Catalogue of 1864 as GC 4503

Summer Thunderbird:

This Ininew (Cree) asterism "Nipin Pinisew" is the IAU constellation Cygnus (Buck 2016). **"**Nipinesis Meskinaw" ("Summer Bird's Path") is the Milky Way.

Summer's Things:

This /Xam asterism is the Pleiades cluster in the IAU constellation Taurus (Slotegraaf 2013, Alcock 2014).

Summer Triangle:

This asterism consists of stars from three different IAU constellations: Alpha (α) Cygni (Deneb- 19th brightest star) in the IAU constellation Cygnus, Alpha (α) Aquilae (Altair- 12th brightest star) in the IAU constellation Aquila, and Alpha (α) Lyrae (Vega- 5th brightest star) in the IAU constellation Lyra. These three stars are the first stars to appear in the Northern hemisphere summer skies at sunset, as they are all of 1st magnitude or greater. The summer triangle appears in the Sequani Calendar of the ancient Celtic peoples, recovered from 2nd century bronze tablets found in a well at the headwaters of the Seine in Coligny in 1897. All three of the stars were PRIN ("guiding stars") in the Sequani calendar (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs above). Lithuanian archaeologist Marija Gimbutas (1996) identifies the summer triangle as three birds sacred to a Sky Goddess: the swan (Cygnus), the eagle (Altair), and the vulture (which is the ancient Roman view of this constellation, Aquila Cadens- see Vulture, below). This is related to the Norse asterism the Swan Maidens (see below). This asterism shows up as the Navigator's Triangle (see above) in Hawaiian star lore. Oswald Thomas (1882 – 1963), a well-known amateur astronomer in Austria, promoted the Summer Triangle, and it appears that Jesuit astronomer Christoph Scheiner (1575 – 1650) may also have recorded it. English astronomer Patrick Moore (1923 – 2012), popularized this asterism under this

name starting in the 1950s. Jeffrey Corder lists it as Corder 4014. The Halifax Centre of the RASC calls this “DAVe” (“Deneb, Altair, Vega”), a name attributed to Chris Young (Dave Chapman 2023).

Sun:

This **telescopic** Bribri star “Dìwö” is WASP 17 in the IAU constellation Scorpius (magnitude 11.6). It was given the name Dìwö in the IAU NameExoWorlds campaign. It has an exoplanet named Ditsö, which is the name the God Sibö gave to the first Bribri people.

This **telescopic** Slovakian star “Chasoň” is HAT-P-5 in the IAU constellation Lyra (magnitude 11.95). It was given this name in the IAU NameExoWorlds Campaign. This is an ancient Slovak name for “Sun”. It has an exoplanet named Králomoc, which is an ancient Slovak name for Jupiter.

This **telescopic** Waorani star “Nenque” is HIP 5054 (HD 6434) in the IAU constellation Phoenix (magnitude 7.71). It was given this name in the IAU NameExoWorlds campaign. This has an exoplanet named Eyeke (“near”).

Sun Border:

This Elvish asterism **“**Anarríma” is a constellation set in the heavens by Varda to enlighten the awakening of the elves in the works of J.R.R. Tolkien (1892 – 1973). The name seems to be a combination of “anar” (“sun”) and “ríma” (“edge, hem, border”). There is no definite asterism associated with this: some suggest the IAU constellation Corona Borealis, some the Great Square of Pegasus, and others Gemini. I think that Corona Borealis is a better fit for Durin’s Crown (see above). Pegasus and Gemini are both about the same distance from the ecliptic, but Gemini’s stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) are brighter stars and there are almost twice as many asterisms associated with Gemini compared to Corona Borealis, so I’m going with Gemini for this one.

Sun in the Sky:

This is an alternate Dane-zaa name, “Tsááyaa” for their asterism “Yèshta” (see Traveler, below (Cannon 2021)).

Sun Maiden:

This Vedic star ‘‘Sūryā” or “Sāvitrī” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus in the Atharva Veda (Ivanković 2021). This is the daughter of Savitur, Savitar, or Savitr, who is a Vedic solar God.

Sun Star:

This Finnish star “Aurinkontähti” is Alpha (α) Boötis in the IAU constellation Boötes.

Sunburst Galaxy:

This **telescopic** asterism is a gravitationally lensed galaxy behind the galaxy cluster PSZ1 G311.65-18.48 in the IAU constellation Apus.

Sundial:

This Scottish asterism “Solarium” is the IAU constellation Reticulum. Reticulum was created by French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762, see Reticulum, above). Scottish schoolmaster Alexander Jamieson replaced de Lacaille’s Reticulum with Solarium, the sundial.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) includes “Solarium the Sundial” and depicts it as a sundial.

This asterism was included in the works of American astronomical writer Hannah M. Bouvier (1811 – 1870).

Šûndre:

This Chakavian asterism is the IAU constellation Sagittarius.

Sunflower:

There are three **telescopic** sunflower asterisms:

- One is the planetary nebula NGC 6543 (Caldwell 6) in the IAU constellation Draco. It was discovered by English astronomer William Herschel in 1786 who listed it as IV 37”. It is GC 4373 in the *General Catalogue* of 1864. It is also known as the Cat’s Eye Nebula or the Snail Nebula. Size 0.3’ X 0.3’.
- One is the planetary nebula NGC 7293 (Caldwell 63) in the IAU constellation Aquarius. It was discovered by German astronomer Karl Ludwig Harding before 1824. It is GC 4795 in the *General Catalogue* of 1864. It is also known as the Helix Nebula or the Helical Nebula.
- One is Messier 63 (NGC 5055), a spiral galaxy in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1774. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham’s Celestial Handbook* that this galaxy “has received the popular name sunflower.” It is listed in the 1864 General Catalogue as GC 3474 and in John Herschel’s catalogue as h 1570. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply describes this as a “Canes Venatici Cluster”. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Heliánthus Cánum Venaticórum” (“sunflower of Canes Venatici”).

Sunset of Canes Venatici:

This **telescopic** asterism “Occásus Cánum Venaticórum” is the edge-on spiral galaxy NGC 4217 in the IAU constellation Canes Venatici. William Herschel listed this as “II 748”. John Herschel listed it as h 1149 and later as GC 2807 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the small bulge of this galaxy, hidden behind the thick dust layer, puts in mind a sunset.”

Superantennae Galaxy:

This **telescopic** asterism PGC 84913 is a galaxy in the IAU constellation Pavo.

Superb:

This Italian star “La Superba” is Gamma (γ) Canes Venaticorum in the IAU constellation Canes Venatici and was named by the Italian astronomer and priest Angelo Secchi (1818 – 1878). The IAU approved the name La Superba for Gamma (γ) Canes Venaticorum.

Superman Galaxy:

This **telescopic** asterism NGC 7479 (Caldwell 44) is a barred spiral galaxy in the IAU constellation Pegasus. It's "S" shape resembles the Superman logo. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 55". It is GC 4892 in the *General Catalogue* of 1864. It is also known as the Propeller Galaxy (see above) and the Lawn Sprinkler (see above). It probably acquired this name due to its "S" shape.

Superposed Ones of Hydra:

This **telescopic** asterism "Superpósiti Hýdrae" is the barred spiral galaxy NGC 3313 in the IAU constellation Hydra. It was discovered by Ormond Stone in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "a spiral galaxy is projected centrally against an earlier-type background galaxy".

Superwind Galaxy:

This **telescopic** asterism NGC 4666 is a spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in February 1784. It has this name due to its unusual stream of outflowing gas.

Supreme Judge:

This Chinese star "Sikou" from the 3 Kingdoms and Ming Dynasty Period is HIP 44504 in the IAU constellation Ursa Major and is part of their xing guan Administrative Center (see above).

Supreme One:

This Chinese Chenzhuo xing guan "Taiyi" is the star 4 Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden West Wall.

Supreme Palace Enclosure:

"Tàiwēiyuán" (太微垣) is one of the three enclosures in Chinese sky culture, the others being Heavenly Market Enclosure and Purple Forbidden Enclosure (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs above).

Two asterisms mark the boundaries of this enclosure in the Yixiangkaocheng of the 18th century:

Supreme Palace Left Wall:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of five stars in the IAU constellations Coma Berenices and Virgo, each having a name:

- 42 Comae Berenices: "Dongshangjiang" ("Great Eastern General"),
- Epsilon (ε) Virginis: "Dongcijiang" ("Second Eastern General"),
- Delta (δ) Virginis: "Dongcixiang" ("Second Eastern Premier"),
- Gamma (γ) Virginis: "Dongshangxiang" ("Great Eastern Premier"), and
- Eta (η) Virginis: "Zuozhifa" ("Left Law Administrator").

This Chinese xing guan "Tàiwēizuǒyuán" (太微左垣) is a line of stars in the IAU constellations Coma Berenices and Virgo: Alpha (α) Comae Berenices (Alphecca), and Epsilon (ε), Delta (δ), Gamma (γ), and Eta (η) Virginis.

Supreme Palace Right Wall:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of five stars in the IAU constellations Leo and Virgo, each having a name:

- Delta (δ) Leonis: "Xishangxiang" ("Great Western Premier"),
- Theta (θ) Leonis: "Xicixiang" ("Second Western Premier"),
- Iota (ι) Leonis: "Xicijiang" ("Second Western General"),
- Sigma (σ) Leonis: "Xishangjiang" ("Great Western General"), and
- Beta (β) Virginis (Zavijava): "Youzhifa" ("Right Law Administrator").

This Chinese xing guan "Tàiwēiyòuyuán" (太微右垣) is a wavy line made up of stars of the IAU constellations Leo and Virgo: Delta (δ), Theta (θ), Iota (ι), and Sigma (σ) Leonis and Beta (β) Virginis (Zavijava).

In Chinese Chenzhuo skies the Supreme Palace (Taiwei (太微) consists of two asterisms marking the boundaries of this enclosure:

- **Supreme Palace Left Wall**: This is a curving line of stars in the IAU constellations Coma Berenices and Virgo: Alpha (α) Comae Berenices (Diadem), Epsilon (ε) Virginis, Delta (δ) Virginis, Gamma (γ) Virginis, and Eta (η) Virginis, and
- **Supreme Palace Right Wall**: This is a curving line of stars in the IAU constellations Leo and Virgo: Delta (δ) Leonis, Theta (θ) Leonis, Iota (ι) Leonis, Sigma (σ) Leonis, and Beta (β) Virginis (Zavijava).

Supreme Ruler:

This Hawaiian star "Mo'ikeha" is Alpha (α) Arietis (Hamal) in the IAU constellation Aries. Mo'ikeha is a famous ruler and navigator from Hawaiian legend.

Supreme Wife and Mother:

This Arami asterism "Kiimia" is the Pleiades cluster in the IAU constellation Taurus. Kiimia is the supreme wife and mother and her return in September marked the end of the dry season (Jellicoe, Puja, and Sombi 1967).

Surfboard:

This **telescopic** asterism is Messier 108 (NGC 3556), a barred spiral galaxy in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781 or 1782. English astronomer William Herschel listed it as "V 46" in his catalogue. It is GC 2318 in the *General Catalogue* of 1864. It is also known as the "Owl's Neighbour" (see above).

Suri:

This Atacameño asterism One is dark nebulosity in the Milky Way stretching from its "head" in the Coal Sack Nebula (see Coal Sack Nebula, above), with the "body" extending to the IAU constellation Scorpius and the legs reaching the IAU constellation Sagittarius (Moyano 2011). This is their name for the Andean ostrich. Compare this to Rhea (above).

Surrounded by Dust:

This **telescopic** asterism "Conizónus Andrómedae" is the edge-on spiral galaxy NGC 891 (Caldwell 23) in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1784. It interacts with NGC 876. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to its "conspicuous dust lane". It is also known as the Outer Limits Galaxy, the Silver Sliver, and the Silver Needle.

Surrounded of Volans:

This **telescopic** asterism "Ampechómenus Volántis" is the edge-on spiral galaxy NGC 2788A in the IAU constellation Volans. It was discovered in 1835 by John Herschel who listed it as h 3150 and later as GC 1782 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "the fact that the central region of this dusty edge-on galaxy is surrounded by a conspicuous dust belt".

Sururu Brothers:

This Xerénte asterism is the Pleiades cluster in the IAU constellation Taurus (Dechend 1975). It is related to their asterism Asare (see above).

Suspended:

This Hawaiian star "Kaulia" ("suspended" or "hanging") is Gamma (γ) Crucis (Gacrux) in the IAU constellation Crux**.**

Suspended Blossom:

This Hawaiian star "Puana-kau" is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Suspended Burden:

This Polynesian asterism from the island of Futuna, "Kau-amonga", is the IAU constellation Aquila. The "burden" that is suspended is "Amonga", the belt and sword in the IAU constellation Orion (see Burden, above).

Suur Look:

This Estonian asterism is the IAU constellation Hydra and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Suyuntuy:

This Inca star is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion (Gamarra & Gamarra 2009).

Swallow:

This Babylonian asterism "SIM.MAH" or "shinunutu" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is described as the "western fish of [the IAU constellation] Pisces". This would be the triangle of stars Phi (ϕ), Upsilon (υ), and Sigma (σ) Piscium. Compare this to the Babylonian asterism Great Swallow, above.

This Seleucid asterism "KUN" or "SE IM ?" from the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the stars of the IAU constellation Pisces (Foxvog 1993). Hunger and Pingree in their *Astral Science in Mesopotamia* in 1999 describe this in much more detail. This asterism is made up of stars of the IAU constellations Pegasus and Pisces and is different than the

original Babylonian asterism “Great Swallow” (see above) which was made up of stars of the IAU constellations Aries, Cetus, and Pisces. This Seleucid asterism is made up of these stars:

- The “head” is a triangle of stars: Omega (ω), 32, and 26 Piscium,
- The “body” is a line of three stars: Omega (ω), Iota (ι), and Theta (θ) Piscium,
- The “wings” originate at Iota (ι) Piscium:
    - One “wing” runs through 77 Pegasi to 70 Pegasi, and
    - One wing runs through Lambda (λ) Piscium to 14 Piscium, and
- The “tail” originates at Theta (θ) Piscium and is two lines:
    - One line running out to Beta (β) Piscium (Fumalsamakah), and
    - One line running out through 59 Pegasi to 55 Pegasi.

Swallower:

There are two Arabic asterisms with this name:

- One is the Arabic star “al-Bāliʿ” (البالع), which is the star Epsilon (ε) Aquarii in the IAU constellation Aquarius:
    - This was later latinized to “Albali”.
    - R. H. Allen lists “Al Bali” in his second edition of *Star Names* in 1963.
    - The IAU approved the name Albali for the star Epsilon (ε) Aquarii.
- One is the Arabic asterism “al-bāliʿ”, later latinized to “Albulan”, is the stars Epsilon (ε), Mu (μ), and Nu (ν) Aquarii in the IAU constellation Aquarius.

Swan:

This Greek asterism “Κύκνος” (“Kýknos”) is the IAU constellation Cygnus as named by Eratosthenes (d.194 B.C.E.).

This German asterism “Schwan” is the IAU constellation Cygnus as depicted in Johann Elert Bode’s *Vorstellung Der Gestirne* (1782): Bode lists this constellation as ”Der Schwan” and depicts it as a swan in flight as viewed from below. The *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826) also lists this constellation as the “Schwan”.

This Norse asterism is the IAU constellation Cygnus and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006).

This Irish asterism is the IAU constellation Cygnus. This asterism is found in Julie Ormonde’s *Constellation Stories of Ancient Ireland* (2015). This is probably a reference to Derbforgaill, the lover of Cu-Chulainn.

This Persian asterism “Ghau” is the IAU constellation Taurus as listed in John Hill’s *Urania* in 1754. Edward Sherburne lists it as the IAU constellation Apus in his *Sphere of Marcus Manilius* in 1675, which makes more sense.

This Estonian asterism “Luik” is the IAU constellation Cygnus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Swan Lace:

This **telescopic** asterism is the supernova remnant NGC 6992 (C 33, Ced 182b) in the East Veil Nebula in the IAU constellation Cygnus. William Herschel recorded this as "V 14". John Herschel listed it as h 2092 and later as GC 4616 in his *General Catalogue* in 1864. This name appeared in photos by French astrophotographer Irwing Airborne on the *ZWO Astrophotography* Facebook page on 11 and 25 August 2025. Also known as the Owl (see above), and the East Veil Nebula (see above).

Swan Maidens:

This Norse asterism consists of stars from three different IAU constellations: Alpha (α) Cygni in the IAU constellation Cygnus, Alpha (α) Aquilae in the IAU constellation Aquila, and Alpha (α) Lyrae in the IAU constellation Lyra. These three stars are the Summer Triangle (see above), the first stars to appear in Northern hemisphere summer skies at sunset, as they are all of 1st magnitude or greater. This relates to Norse stories of the Swan Maidens (Johnsen 2024).

Swan Nebula:

This asterism is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel's 1864 *General Catalogue* as GC 4403. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* gave it this name, writing "It requires only the slightest use of the imagination to transform this pattern into the graceful figure of a celestial swan floating on a pool of stars". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this both as the "Omega Nebula" and the "Swan Nebula". It is also known as the Checkmark Nebula, Omega Nebula, Lobster Nebula, and Horseshoe Nebula.

Swan Progeny:

This Latin asterism "Cycno Generati" is the IAU constellation Gemini. This relates to her seduction by the Greek God Zeus, who came to her as a swan.

Swarm:

This Mordovian asterism "Vele" ("swarm" or "village") is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Swarm of Bees:

This Lithuanian asterism "Bičių spiečius" is the Pleiades open cluster in the IAU constellation Taurus.

Swarm of Gnomes:

This Hungarian asterism "Túnderök sordulöja" is possibly the IAU constellation Cancer, including the open cluster Messier 44. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a circle of people with their arms raised skyward.

Swastika:

This Mithraic asterism is made up of the stars of the IAU constellations Draco and Ursa Minor (Reza Assasi 2013) and is the centerpiece of a larger proposed asterism, the Celestial Quadriga (see above). It is a clockwise swastika with its center being the star Zeta (ζ) Draconis and it consists of four wings:

- A line running through 15 Draconis to a bend at Gamma (γ) Ursae Minoris (Pherkad) and ending at Zeta (ζ) Ursae Minoris
- A line running through Eta (η) Draconis (Athebyne) to a bend at Theta (θ) Draconis, ending at Iota (ι) Draconis (Edasich).
- A line running through 26 Draconis to a bend at Xi (ξ) Draconis (Grumium) and ending at Beta (β) Draconis (Rastaban).
- A line running through Omega (ω) Draconis and Phi (ϕ) Draconis to a bend at Upsilon (υ) Draconis, ending at Delta (δ) Draconis (Altais).

This Hindu asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Bhagwath 2019). Every 8 hours it turns a quarter of the way around the pole star and forms one arm of this "swastika".

Sweat Lodge:

This Ojibwe asterism "Madoodiswan" is the IAU constellation Corona Borealis (Lee et al 2014).

This Anishinaabe asterism "Madoodiswun" is the IAU constellation Corona Borealis (Lee et al 2014).

This Ininew (Cree) asterism "Matootsan" or "Matootisan" is the IAU constellation Corona Borealis (Buck 2016).

Sweat of Ophiuchi:

The Latin name of this **telescopic** asterism "Sudor Ophiuchi" means "Sweat of Ophiuchi" and it is listed as Lorenzin 2. The name is misleading because its stars are in the constellations Hercules and Ophiuchus. It is made up of eight stars in a curve resembling a mathematic integral sign (∫). One end is HIP 84036 and it runs through 60 Herculis, the double star 34 Ophiuchi, 32 Ophiuchi, HIP 83435, and HIP 83308 to HIP 83083. Size 180'. Jeffrey Corder lists this as Corder 3195.

Sweating Stones:

This Ojibwe asterism "Madoo'asinik" is the Pleiades cluster in the IAU constellation Taurus (Lee et al 2014). This is a reference to the heated stones for a sweat lodge.

This Ininew (Cree) asterism "Mahtootisan Assiniuk" is the Pleiades cluster in the IAU constellation Taurus (Buck 2016). This is a reference to the heated stones for a sweat lodge.

Swedish Bear:

This Estonian asterism is the Big Dipper asterism in the IAU constellation Ursa Minor (Kuperjanov 2006).

Swedish Horse:

This Estonian asterism "Rootsi Hobu" is the Little Dipper asterism in the IAU constellation Ursa Minor (Kuperjanov 2006).

Sweeper of Draco:

This **telescopic** asterism "Scopárius Dracónis" is the spiral galaxy NGC 6015 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "III 739". It became GC 4149 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sweet Potato:

This Palawan asterism “Camote” is the belt of Orion in the IAU constellation Orion.

Sweetheart of Fornax:

This **telescopic** asterism “Delíciae Fornácis” is the lenticular galaxy NGC 1326 in the IAU constellation Fornax. It was discovered in 1837 by John Herschel who listed it as 2535 in his catalogue and later as GC 705 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sweetheart Star:

This Shona and Ntshuna star “Ndemara” is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Slotegraaf 2013). To these people its appearance is a warning to lovers to part before their parents discovered them.

Swelling of Leo:

This **telescopic** asterism “Oedésis Leónis” is the elliptical galaxy NGC 3640 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “II 33”. It became GC 2386 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the “asymmetric form of this elliptical galaxy with a swelling at its western side and a small extension at the eastern side”.

Swelling Spiral:

This **telescopic** asterism is Messier 61 (NGC 4303), an intermediate barred spiral galaxy in the IAU constellation Virgo. It was discovered by Italian astronomer Barnaba Oriani in May 1779, six days before French astronomer Charles Messier recorded it. English astronomer William Herschel listed it as “I 139”. It is GC 2878 in the *General Catalogue* of 1864. It is also known as the “Hexagonal of Virgo” (see above).

Swiftest:

This Vedic nakshatra (lunar mansion) “Shravishthā”, “Shravista”, or “Sravishtāh” (as listed in the *Taittirīya Brāhmana)* is in the IAU constellation Delphinus and is the stars Alpha (α) Delphini (Sualocin) and Delta (δ) Delphini (Ivanković 2021). It is also known as Dhanishtha (see Most Famous, above).

Swift’s Polar Ring:

This **telescopic** asterism “Conspicábilis Vírginis” is the lenticular polar ring galaxy NGC 5122 in the IAU constellation Virgo. It was discovered by American astronomer Lewis Swift in 1887. This name was posted on the *Deep Sky Forum* by German astronomer Uwe Glahn in May 2017. It is also known as Deserving to be Seen of Virgo.

Swimming Alligator:

This **telescopic** asterism is the open cluster NGC 7160 in the IAU constellation Cepheus. It was discovered by William Herschel in 1789 who listed it as “VIII 67”. It is GC 4719 in the *General Catalogue* of 1864. It is also known as the Bruce Lee Cluster.

Swimming Ducks:

This Pawnee asterism is the IAU constellation Scorpius.

Swine:

This Macedonian asterism “Svinji” or “Sviŋi” (“the Swine” or “the Pigs”) is three stars in the Hyades cluster (see above) in the IAU constellation Taurus: Gamma (γ) Tauri, Delta (δ) 1 and 2 Tauri, and Epsilon (ε) Tauri (Cenev 2004 & 2014). The star Alpha (α) Tauri (Aldebaran) is either the fox hunting the pigs (See Fox, above) or it is the Swineherd (see below).

This Greek lunar mansion is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). The stars have not been identified.

This Romanian asterism “Porcii” is the Hyades cluster in the IAU constellation Taurus (Ottescu 2009).

Swineherd:

This Macedonian star, “Svinjar”, is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Cenev 2014). This is related to their asterism Svinji (see Swine, above). It is also known as “Lisica” (see Fox, above).

This Romanian star “Porcarul” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Ottescu 2009). It is called this as the swine awake and start to grunt when it rises, signalling that day is approaching.

Swollen Eye of Virgo:

This **telescopic** asterism “Pachyblephária Vírginis” is the intermediate spiral galaxy NGC 4958 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it in his catalogue as I 130. It is GC 3397 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “resembles a swollen eye”.

Swollen Heart:

See Heart, above.

Swoosh:

This **telescopic** asterism from the Saguaro Astronomy Club asterism database is made up of the stars of the IAU constellations Aquila and Scutum: 14, 15, Gamma (γ), and 12 Aquilae and Eta (η) Scuti form a curved chain of stars that point at Messier 11 (NGC 6705). This was discovered by Steve Coe of the SAC Size 240’. This is listed on Bruno Alessi’s BDCC 7.6 list and is Corder 3740 on Jeffrey Corder’s list.

Sword:

This German star “Gladius” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as listed by German astronomer Johann Bayer (1572-1625).

This Latin star “Ensis” is Eta (η) Orionis (Saiph) in the IAU constellation Orion as listed by Cicero (106 – 43 B.C.E.) and in R. H. Allen’s *Star Names* in 1899.

This Celtic (Gaulish) star “Smertus” is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus (Boutet 2017).

There are three **telescopic** “sword” asterisms:

- One, Leiter 5 from the list of American astronomer Frank Leiter, is a line of stars in the IAU constellation Aquila. Size 12’ X 4’. Robert Zebahl lists it on his *Faint Fuzzies* website and notes

that it “was discovered by Klaus Spruck and Stefan Schuchardt” and René Merting notes that “at 85X the entire sword shimmers delicately but is still quite faintly visible- the pommel is easy to see and consists of three directly visible stars… at 160X the shimmer is preserved and… 6 stars stand out more clearly on the crossguard.”

- One is Vastagh 3, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Gemini. Its size is 1° 06’ X 21’. Vastagh describes it thus: “Sword-shaped asterism… The number of members of the star association is approx. 20 pcs. The point of the sword is the 6.43 magnitude, HR 2692 star designates. The 7.75 mag HD 54127 is located at the junction of the handle and the blade. This is where the "hand guard" crosses the long axis of the sword. The hand guard is a double member. The grip is made up of faint objects.”
- This **telescopic** asterism is Corder 3536 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 50’ X 30’. The “sword” is the line of stars from HIP 89943 through a line of 8th to 9th magnitude stars to HIP 89981. An 8th magnitude star and a 9th magnitude star form the “crosspiece” on the “hilt”. This is also known as the Cross of Draco (see above).

Sword Hand of Perseus:

This asterism is the Double Cluster (see above) plus the stars 4, 9, Theta (θ) and Upsilon (υ) Persei in the IAU constellation Perseus as listed in the third edition of Rev. Thomas William Webb’s *Celestial Objects for Common Telescopes* in 1873 and in in R. H. Allen’s *Star Names* in 1899.

Sword Handle:

This is a name for the Double Cluster, NGC 869 and 884, in the IAU constellation Perseus. This is listed in *Burnham’s Celestial Handbook* in 1978. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the “Sword Handle”. Compare this to “Gyre in the Hilt of the Sword” (above).

Sword of Draco:

This **telescopic** asterism “Gládius Dracónis” is the barred Magellanic spiral galaxy NGC 4256 in the IAU constellation Draco. It was discovered in 1784 by William Herschel who listed it as “II 846”. It became GC 2839 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Sword of Heaven:

This Chaldean asterism “mul.gir.an.na” or from the Great Star List (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Scorpius (Koch-Westenholz 1995).

Sword of Orion:

This asterism is made up of stars and nebulae of the IAU constellation Orion: It begins with the Coal Car Cluster (NGC 1981) and runs through the Great Orion Nebula (M 42) to the Lost Jewel of Orion (NGC 1980).

Sword of the Giant:

There are three Arabic asterisms with the name “sayf al-jabbār” (سيف الجبار), “Saif al Jabbar”, or “as-Sayf” (السيف):

- One is the star Kappa (κ) Orionis in the IAU constellation Orion, later latinized to “Saiph”:
    - NOTE: This star is not in what most would describe as the “sword” but is usually viewed in the West as one of the “feet” of Orion, the other “foot” being the star Beta (β) Orionis (Rigel).
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Saiph”.
    - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Saiph”.
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Saiph”.
    - The IAU approved the name Saiph for Kappa (κ) Orionis.
- One, “Saif al-Jabbār”, is the Sword of Orion asterism in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- One, is the star Eta (η) Orionis in the IAU constellation Orion: This star earlier bore this name, which later was transferred to the Sword of Orion asterism:
    - “Saif al Jabbar” and Algjebbah” are listed in R. H. Allen’s *Star Names* in 1899.

Swordfish:

This Greek asterism “Oxirinque”, “Oxyrhynque”, or “Oxyrhyncus” is the IAU constellation Capricornus as listed by R. H. Allen in his *Star Names* in 1899.

This German asterism “Xiphias” is the IAU constellation Dorado. It was German astronomer Johannes Kepler’s edition of Danish astronomer Tycho Brahe’s star list in the *Tabulae Rudolphinae* of 1627 that identified it as a “swordfish”, which he called Xiphias. English astronomers Edmund Halley (1656 – 1742) and John Flamsteed (1646 – 1719) used this name for the constellation. The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, list this constellation as “Xiphias”. John Hill lists the names “Xiphias” and “Xyphias” in his *Urania* in 1754 as well as a Latin name “Serra Piscis”. It appeared on Stieler’s planisphere as “Schwedtfisch”.

There are two **telescopic** “swordfish” asterisms:

- One, “Swertfish” (“swordfish”), is listed by René Merting on the *Faint Fuzzies* website and is in the IAU constellation Andromeda. Merting describes it thus: “the star arrangement looks like a swordfish swimming to the west - two different star brightnesses can be seen in the pattern - multiple jagged star arrangement.” This includes HIP 11812, 12218, 12057, and 11682.
- One is O’Neal 1 in the IAU constellation Equuleus. Its size is 42’ X 13’. German astronomer René Merting lists it on the *Faint Fuzzies* web site and describes it as a “swordfish swimming northwest- a total of eight stars make up the pattern, two stars make up the south-pointing dorsal fin, three fainter stars make up the sword.” The “nose” of the swordfish is HIP 105399A. The “belly” is a line from HIP 105399A through HIP 105466 and HIP 105548 to HIP 105608. The “fin” is the stars HIP 105433 and HIP 105438A.

Swords of the Elector of Saxony:

This Saxon asterism "Gladii Electorales Saxonici" or "Kurfürstliches Schwert" was created from the stars between the IAU constellations Boötes, Serpens, Libra, and Virgo: Alpha (α) Boötis (Arcturus), Alpha (α) Serpentis, Beta (β) Librae (Zubeneschamali), Mu (μ) Virginis and Tau (τ) Virginis. It was created by German astronomer Gottfried Kirch in 1684 to win the patronage of Johann Georg III, Elector of Saxony.

Swordtail of Ursa Major:

This **telescopic** asterism "Xiphóphorus Úrsae Majóris" is the dwarf barred spiral galaxy NGC 4605 in the IAU constellation Ursa Major. It was discovered by English astronomer William Herschel in 1790 who listed it as "I 254". It is GC 3142 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "apparent resemblance to the popular aquarium fish xiphophorus, swordtail". It is also known as the Frankenstein Galaxy (see above) and the "Fabergé Egg" (see above).

Sycamine Tree:

This German asterism "Συκάμινος" or "Sykáminos" is the IAU constellation Canis Minor as listed by German astronomer Johann Bayer (1572-1625), who also lists the name "Morus" as an Arabic name for this tree in his Uranometria (1603). The actual Arabic name is Al Jummaizā.

Sylvester:

This Latin asterism "Sylvester" or "St. Sylvester" is the IAU constellation Boötes:

- Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and attributes it to German uranographer Julius Schiller (c. 1580 – 1627).
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Silvester al Bootes".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "St. Sylvester" and attributes this to the "Mosaicists".
- In his *Star Names* in 1899 R. H. Allen writes that this was used by "early Catholics".

Symmetry of Ursa Major:

This **telescopic** asterism "Symmetría Úrsae Majóris" is the edge-on barred lenticular galaxy NGC 4026 in the IAU constellation Ursa Major. William Herschel listed it as "I 223". John Herschel listed it as h 1047 and later as GC in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Syphon:

This **telescopic** asterism is PGC 40012, a galaxy in the IAU constellation Centaurus.

Syrian Sign:

This Arabic star "aš-ši'ra aš-šamiyah" (الشامية شعرى) or Ulugh Beg Mirza's "Al Shi'rā al Shāmiyyah" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor.:

- This was later latinized to "Al Shāmiyyah", or "Al Shira".

- 14th century Greek geographer and astronomer Georgius Chrysococcas listed it in Greek as "Σιαὴρ Σιαμὴ" ("Siaír Siamí")
- The *Alfonsine Tables* of 1521 list this as "Aschere", "Aschemie", and "Algomeysa" and the 1545 edition as "Prochion" and "Algomeyla".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Siaunder".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Algomeysa", "Algomyso", and "Sycomorus vel sicus Sylvestrus".
- John Hill lists this as "Shiri Al Shamiya" and "Shira" in his *Urania* in 1754.

Syrian String:

This Arabic asterism appears in the IAU constellation Hercules. Dorn 1829) describes it as "near the left arm, extended across the breast" as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). This appears to be the stars Eta (η) Herculis, c Herculis, HIP 83494, d Herculis and 53 Herculis.

Syrma:

See Train of a Garment, below. NOTE: John Raymond uses this name for the group of stars that he classifies as an asterism around the star Iota (ι) Virginis (Syrma).

T:

There are twelve **telescopic** "T" asterisms:

- One is Dunlop 545 in the IAU constellation Grus, listed by Scottish astronomer James Dunlop in his catalogue of 1828. A slightly curving line of four stars forms the upright of the "T" and a line of three stars with HIP 112059 in the middle forms the top.
- One is in the IAU constellation Musca and is Corder 2264 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 6th – 8th magnitude stars including HIP 57940, and 57963, and the double star HIP 57851A.
- One is in the IAU constellation Hydra and is Corder 2479 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven 8th – 9th magnitude stars including HIP 64966, and 64912, and the double star HIP 64970A.
- One is in the IAU constellation Centaurus and is Corder 2498 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is five 7th – 9th magnitude stars including HIP 65394, 65488, and 65425.
- One is in the IAU constellation Corona Borealis and is Corder 3020 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven 7th – 8th magnitude stars including HIP 79701, and 79845 and the double star HIP 79677.
- One is in the IAU constellation Corona Australis and is Corder 3490 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 9th magnitude stars including HIP 89274.
- One is in the IAU constellation Cygnus and is Corder 4070 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is ten 7th – 9th magnitude stars including HIP 99439 and 99420.

- One is in the IAU constellation Pegasus and is Corder 4368 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 6th – 8th magnitude stars including HIP 105141, 105179, 105254, and 105192.
- One is in the IAU constellation Aquarius and is Corder 4718 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 8th – 9th magnitude stars including HIP 111596 and 111697.
- One is in the IAU constellation Grus and is Corder 4734 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 9th – 11th magnitude stars including HIP 112059.
- One is in the IAU constellation Aquarius and is Corder 4820 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is seven 7th – 9th magnitude stars including HIP 113744 and the double star HIP 113792A.
- One is open cluster NGC 2547 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as Lac III 2 in his catalogue. It is GC 1636 in the *General Catalogue* of 1864. Lacaille described it in his 1755 catalogue as "five small stars, under the figure of a T, surrounded by nebulosity." It is also known as the Golden Earring (see above), Saint Peter's Cross (see above), the Malus Cluster (see above). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 40.
- One is Llano 1 in the IAU constellation Virgo. René Merting describes it on the Faint Fuzzies website: "At 45x, a striking star line, only minimally curved - five stars form this line - at 144x, six stars are visible, the brightest are at the ends, in the center three fainter stars are slightly closer together". The line of stars that forms the top of the "T" has the star HD 111852 at one end.

Taba Bloom:

This Kiribati star "Kataba" or "Na Kataba" is an unidentified star in the IAU constellation Auriga (Trussel and Groves 1978).

Tabby's Star:

See Boyajian's Star (above).

Tabio:

This Kiribati asterism "Tabio" is three stars in the "tail" of the IAU constellation Scorpius (Trussel and Groves 1978), which would probably make them Lambda (λ), Iota (ι) 1, and Theta (θ) Scorpii.

Tabit:

See Endurer, above.

Table:

This Lithuanian asterism "Stalas" is the Great Square asterism in the IAU constellations Andromeda and Pegasus.

Table of Scorpius:

This **telescopic** asterism, also known as the False Comet, the Northern Jewel Box, and the Crocodile, is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius. It is located a half a degree north of Zeta (ζ) Scorpii. It was discovered by Giovanni Battista Hodierna before 1654, who called it

"Luminosae" (Italian for "bright"). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. Jeffrey Corder lists it as Corder 3156.

Tabuteora:

This Kiribati star "Tabuteora" is currently unidentified (Trussel and Groves 1978).

Tabutora:

This Kiribati star "Tabutora" is currently unidentified (Trussel and Groves 1978).

Tabwakum:

This Melanesian asterism from the Muyuw Trobriands (Woodlark Islands) is the Coal Sack Nebula (see Coal Sack, above).

Tadjeri:

This Kulin asterism "Tadjeri" or "Tarnung" is 2 stars in Sagittarius (Hamacher 2011).

Tadpole:

This Belarussian asterism "Apalonichak" is the IAU constellation Ursa Major (Avilin 2009).

There are four **telescopic** "Tadpole" asterisms:

- One is the globular cluster NGC 6642 in the IAU constellation Sagittarius. This was discovered by English astronomer William Herschel in 1784 who listed it as "II 205". It is GC 4414 in the *General Catalogue* of 1864.
- One is PGC 57129 (UGC 10214, Arp 188), a barred spiral galaxy in the IAU constellation Draco. It has this name as it has a long trail of stars 280,000 light years long. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Gyrínus Dracónis" ("Tadpole of Draco").
- One is in the IAU constellation Lynx and is Ennis 47 on the observing list of Canadian astronomer Charles Ennis. Size 12' X 2'. The globular cluster NGC 2419 forms the tadpole's "head" and a line of three 7^{th} – 9^{th} magnitude stars the "tail": HIP 37133, the double star HIP 37102, and Gaia DR3 899275205853066624. This is listed as Corder 1382 on the observing list of American astronomer Jeffrey Corder: Corder just describes this as an "attractive asterism".
- One is in the IAU constellation Delphinus. This is twelve 8^{th} – 11^{th} magnitude stars. This "mushroom" is next to the galaxy NGC 7025. South African astronomer Magda Streicher mentions this on the DOCdb database. Size 8 X 10'.

Tadpoles:

This **telescopic** asterism is IC 410 (SH 2-236, LBN 807, Ced 43) and NGC 1893 in the IAU constellation Auriga. NGC 1893 is GC 1101 in the *General Catalogue* of 1864. IC 410 was first recorded by German astronomer Max Wolf (1863 – 1932).

Taffy Galaxies:

This **telescopic** asterism is UGC 12914 and 12915, a pair of colliding galaxies in the IAU constellation Pegasus. It is also known as the "Dancing of Pegasus" (see above).

Tagai:

This Meriam Mir and Kala Lagaw Ya "Tagai" is their creator God and involves the IAU constellations Centaurus, Crux, Corvus, Lupus, and Scorpius (Hamacher et al 2017):

- Tagai's "canoe" is the IAU constellation Scorpius,
- Tagai's "body" is the IAU constellations Lupus and Centaurus,
- Tagai's "left hand" is holding a spear which is the IAU constellation Crux,
- Tagai's "right hand" is holding a Eugina or Kupa fruit which is the IAU constellation Corvus, and
- The water that Tagai's "boat" is sailing in is the Milky Way.

Compare to the Mabuiag asterism Theogay (see below).

Tagai's Crew:

This Meriam Mir and Kala Lagaw Ya asterism "Zugubals" relates to their creator God Tagai (see Tagai, above), who got so upset with his boat crew that he turned them into stars in the IAU constellations Taurus and Orion (Hamacher et al 2017). Thus, this has two parts:

- The first asterism, "Usual", is the Pleiades cluster in the IAU constellation Taurus, and
- The second asterism "Utimal" or "Seg", is the belt and sword of Orion.

Tagai's First Mate:

This Meriam Mir and Kala Lagaw Ya star "Kareg" relates to their creator God Tagai (see Tagai, above) and is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Hamacher et al 2017).

Tahi-ari'i:

This Tahitian star "Tahi'ari'I" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Tahi-ari'i is the wife of Fa'a-nui (Auriga).

Tahiri's Club

This Rapanui star "Ko Para Tahiri" is probably Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). The Edwards list alternate translations as "Para's Fan" or "Decayed Fan".

Tail:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of stars with a fork at one end in the IAU constellation Scorpius, each star having a name:

- Epsilon (ε) Scorpii: "Hou" ("Empress Consort"),
- Mu (μ) 1 Scorpii (determinative star): "Fei" ("Imperial Consort),
- Zeta (ζ) 1 and 2 Scorpii: "Fei" ("Imperial Consort),
- Eta (η) Scorpii: "Fei" ("Imperial Consort),
- Theta (θ) Scorpii: "Pin" ("Imperial Concubine"),
- Iota (ι) 2 Scorpii: "Pin" ("Imperial Concubine"),
- Kappa (κ) Scorpii: "Pin" ("Imperial Concubine"),
- Lambda (λ) Scorpii: "Qie" ("Minor Concubine"), and
- Upsilon (υ) Scorpii: "Qie" ("Minor Concubine").

This Chinese xiù (lunar mansion) "Wěixiù" (尾宿) is a curve of stars in the "tail" of the IAU constellation Scorpius: Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι), Theta (θ), Eta (η), Zeta (ζ), Mu (μ), and Epsilon (ε) Scorpii. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. This xiù was

associated to matters concerning the Youzhou territory. This appears in the Tang Dynasty (618 – 907 C.E.) as "Wěi" (尾) and was compared to the Vedic nakshatra Mula (Kotyk 2017, see Root, above).

This Chinese Chenzhuo xing guan "Wěi" is a curving line of stars with a "fork" at one end in the IAU constellation Scorpius: Starting at Epsilon (ε) Scorpii, it runs through Mu (μ) 1 & 2 Scorpii, Zeta (ζ) 1 & 2 Scorpii, Eta (η) Scorpii, Theta (θ) Scorpii, and Iota (ι) 1 & 2 Scorpii to Kappa (κ) Scorpii, where two lines split off: One to Lambda (λ) Scorpii, and the other to Nu (ν) Scorpii.

This Japanese sei shuku or lunar station "Ashitare Boshi" is a curving line of stars in the IAU constellation Scorpius. This is basically the "tail" of Scorpius; Epsilon (ε), Mu (μ) 1, Zeta (ζ) 1 and 2, Eta (η), Theta (θ), Iota (ι) 1, Kappa (κ), Lambda (λ), and Upsilon (υ) Scorpii.

There are three Arabic asterisms with the name "að-ðayl" (الذيل), meaning "tail" or "train of a garment":

- One, later latinized to "Al Dhail" or "Adhil" is the star Xi (ξ) Andromedae in the IAU constellation Andromeda:
    - In his *Star Names* in 1899 R. H. Allen reports that "Adhil" first appeared in a 1515 edition of the *Almagest*.
    - The IAU approved the name Adhil for Xi (ξ) Andromedae in 2016.
- One, "al-dhail", later latinized to "Thail", is the star 49 Andromedae in the IAU constellation Andromeda, which is close to Xi (ξ) Andromedae. English astronomer Francis Baily (1774 – 1844) thought that this star was the better location for this name according to R. H. Allen in his *Star Names* in 1899.
- One is the star Gamma (γ) Gruis in the IAU constellation Grus. 16th century Arabic astronomer Al Tizini saw this as the "tail" of nearby Piscis Austrinus.

This Greek star "Ἀλκαία" ("Alkaía") is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

Tail Hair:

This Arabic asterism "al-hulba" (الهلبة) is the IAU constellation Coma Berenices (Adams 2016). There is a scattering of stars next to Gamma (γ) Comae Berenices as well as globular clusters Messier 3 and 53 that give the impression of a tuft of hair.

Tail Hair Strikes:

This Arabic asterism "darb al-asad bi hulbatihi" (ضرب الأسد بهلبته) is a group of stars in the IAU constellation Ursa Major: Xi (ξ), Mu (μ), Nu (ν), and Lambda (λ) Ursae Majoris (Adams 2016). This is seen as a place on the ground struck by the tail of their asterism "al-asad" (see Lion, above).

Tail of the Bellows:

This Ikoots star "Miwiil Roob" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Tail of the Dolphin:

This Arabic star "Dhanab al-dulfīn" is Epsilon (ε) Delphini in the IAU constellation Delphinus:

- This was listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Dheneb el dulfin, the Dolphin's tail".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Deneb al Delphin": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

Tail of the Eagle:

This Arabic asterism "ðanab al-ʿuqāb" (ذنب العقاب), later latinized to "Deneb al Okab" or "al Dhanab al ʻʿOḳāb", is the stars Zeta (ζ) and Epsilon (ε) Aquilae in the IAU constellation Aquila.

This Persian star "ðanab aṭ-ṭā'ir" (ذنب الطائر), later latinized to "Dzeneb al Tair", is Zeta (ζ) Aquilae in the IAU constellation Aquila as listed in the *Calendarium* of Al Achsasi Al Mouakket in 1650.

This Latin star "Cauda Volantis" or "Cauda Vulturis" is Zeta (ζ) Aquilae in the IAU constellation Aquila.

Tail of the Goat:

This Arabic star "Dhanab ul-Jady" (ذنب الجدي) or Ulugh Beg Mirza's "Al Dhanab al Jady" is Delta (δ) Capricorni in the IAU constellation Capricornus:

- "Dhanab al-Jadī" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as "Dhanab al-jadī" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- This was later latinized to "Deneb Algedi", "Deneb Algedi", or "Deneb al Giedi".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "dhanab al-jady".
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Libedeneb" and the Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Denebalgedi" (Dekker 2000).
- The *Alfonsine Tables* of 1521 listed "Denebalschedi", which later appeared as "Scheddi": Kunitzsch (1986) lists this *Alfonsine Table* entry as "Denebalchedi".
- Johann Bayer's *Uranometria* (1603) lists "Deneb Algedi" for this star.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Deneb Algedi".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Denedbalgedi" and "Dhanbol-gaedi".
- Robert Hues lists it as "Denob Algedi" in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Deneb Algedi".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Deneb Algedi" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Deneb el dschaldi": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Deneb Algedi".
- Ferdinand Reuter's star map in 1874 listed "Deneb Algethi".

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Deneb Algiedi".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Deneb Algiedi" for this star.
- The IAU approved the name Deneb Algedi for the star Delta (δ) Capricorni Aa.
- NOTE: German astronomer Johann Bayer (1572-1625) incorrectly listed Gamma (γ) Capricorni as "Deneb Algethi".

Tail of the Hen:

This Arabic star "Dhanab ud-Dajājah" (ذنب الدجاجة) is Alpha (α) Cygni in the IAU constellation Cygnus:

- "Dhanab al-Dajāja" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as "Dhanab al-dajālah" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992): Savage-Smith translates this as "tail of the bird".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "dhanab al-dajāja" and the Hebrew name "zenav ha-tarnegolet".
- This was later latinized to "Denebadigege" in the Alfonsine Tables (Kunitzsch 1986), "Denebedigege", "Deneb Adige", and "Deneb".
- The 14th century astrolabe #456o from Christian Spain lists the abbreviated form "DNP" for "Denep" and the name "RADF" (King 2002).
- Johann Bayer's *Uranometria* (1603) lists the names "Deneb Adigege" and "Denebedegige" for this star.
- "Deneb adigegi", "Dhanbod digageti", and "Denebelezid" are listed as names of this star in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues lists it as "Deneb Adigege" in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Deneb".
- American uranographer William Croswell (1760 – 1834) lists this star as "Deneb" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Deneb" in his *Celestial Atlas* in 1822.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Deneb".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Deneb".
- Deneb is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Deneb" and his *Bedford Catalogue* in 1844 lists "Deneb… from dheneb ed dajájeh, hen's tail."
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Deneb".
- In his *Star Names* in 1899 R. H. Allen suggests that this name was derived from Al Dhanab al 'Okab, but this is their asterism "ðanab al-ʿuqāb" (see Tail of the Eagle, above).

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Arided" and "Deneb Adiga".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Deneb".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Arided", "Deneb", and "Deneb Adige" for Alpha (α) Cygni, but his 14th edition (1959) lists "Deneb" as a name for both Alpha (α) Cygni and Beta (β) Leonis, the latter being a reference to the name "Denebola".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Deneb" for this star.
- The IAU has approved the name Deneb for Alpha (α) Cygni.

Tail of the Lion:

This Arabic star "Dhanab ul-Asad" (ذنب الاسد), "Al Dhanab al Asad", or "Dhanab al-Asad/al-Layth" (ذنب الاسد/الليث) is Beta (β) Leonis in the IAU constellation Leo:

- "Dhanab al-Asad" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Hebrew name "zenav ha-ari" and the Arabic name "dhanab al-asad al sarfā".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-sarfa" (see Weather Change, below) and the Hebrew name "zenav ha-aryeh".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-sarfa".
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-sarfa" (see Weather Change, below) and the Hebrew name "zenav ha-aryeh".
- NOTE: Dorn (1829) describes two stars "under the tail of the Bear" (Ursa Major) labelled "tail of the lion" on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- This was later latinized to "Denebola". Other variations include "Nebulasit", and "Alesit". It appears as "Denebalezeth" in the 15th century *Alfonsine Tables* (Kunitzsch 1986).
- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as "Denebalecid".
- German astronomer Johann Bayer (1572-1625) listed it as "Denebalecid", "Denebaleced", "Denebola", and "Nebolasit" in his *Uranometria* (1603).
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as "Dhanbol-asadi".
- Robert Hues (1659) in his *A Learned Treatise on Globes* listed it as "Deneb Alased". Hues also listed the name "Asampha".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) omitted the first syllable and listed it as "Nebolellesed" and "Nebollassid" and claimed it was a "Nubian" name, also giving the name "Alazet" and attributing this to "Azophi" (which would be Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986)).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Denebola".
- American uranographer William Croswell (1760 – 1834) lists this star as "Deneb" on his *Mercator Map of the Starry Heavens* in 1810.

- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as Denebola.
- Scottish uranographer Alexander Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists Denebola.
- Denebola is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Denebola" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Denebola" and his *Bedford Catalogue* in 1844 lists "Denebola, from the Arabian dhanab al asad, the lion's tail".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Denebola".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Deneb Aleet", "Denebola", and "Deneb".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Denebola".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Denebola" and describes it as the "Tail of the lion".
- John Chilmead (1899) in his *A Learned Treatise on Globes* listed it as "Deneb Alased".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Denebola".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the names "Deneb", "Deneb Aleet", and "Denebola" for this star, but his 14th edition (1959) lists both "Deneb" and "Denebola" for this star.
- The IAU approved the name Denebola for Beta (β) Leonis.

This Latin star "Cauda Leonis" ("tail of the lion") is Beta (β) Leonis in the IAU constellation Leo:

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Caudaleonis" (Dekker 2000).
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Cauda Leonis".
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists this star as "CAVDA LEONES".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this star as "Cauda Leonis".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cauda Leonis" and "Cor Leonis".
- "Cauda Leonis" and "Cor Leonis" are listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- *The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678* by English uranographer James Clerk lists "Cauda Leonis".

- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as “Cauda Leonis”.

Tail of the Raven:

This Babylonian and Sumerian star “tail of uga” is Alpha (α) Crateris (Alkes) in the IAU constellation Crater as listed in the star catalogue BM 78161 (Liechty 1988) and the K 8538 planisphere (Koch 1989).

Tail of the Sea Monster:

This Arabic star “dhanab qaytus” is Iota (ι) Ceti in the IAU constellation Cetus as listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003). Compare to Southern Tail of the Sea Monster and Northern Tail of the Sea Monster.

Tail of the Southern Fish:

This Arabic star “al-dhanab” (الذنب), later latinized to “Aldhanab” or “Al Dhanab” is Gamma (γ) Gruis in the IAU constellation Grus. The IAU Working Group on Star names approved the name Aldhanab for Gamma (γ) Gruis.

Tail of the Three Fire Lords:

This K’iche’ asterism is the belt of Orion in the IAU constellation Orion (Milbrath 1999).

Tailed:

This Turkish asterism “Koirūghi” is the IAU constellation Scorpius as listed in R. H. Allen’s *Star Names* in 1899. An alternate Turkish name is “Uzun Koirūghi” (“long-tailed”).

Tails:

This Babylonian asterism from the MU.APIN tablets, “MUL.KUN”, “KUN”, “MUL.ZIB”, “KUN.MES” (Parpola 1993), “Zibbatimesh” (Bartel van der Waerden 1974) or “ZIB” (literally “Ribbon of the Fishes”) is in the IAU constellation Pisces and is a precursor of that constellation (Boutet 2014). The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) list it as “KUN.MES”. It consists of a long “V” shaped “tail” of stars with a triangle and a quadrilateral at one end:

- The “tail” starts at 31 Piscium and runs through 41, Delta (δ), Epsilon (ε), and Mu (μ) Piscium, takes a bend at the binary star Alpha (α) Piscium (Alrescha), and then continues through Omicron (ο) and Eta (η) Piscium and ends at Chi (χ) Piscium.
- At Chi (χ) Piscium there are two attachments:
- The triangle of stars Chi (χ), 64, and 72 Piscium, and
- The quadrilateral of Chi (χ), Phi (φ), Upsilon (υ), 68, Zeta (ζ), and Eta (η) Piscium.

NOTE: English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 frequently refers to a “kheït, or ribbon, connecting the two fishes”.

This Babylonian ziqpu “mulDIL”, “edu-sa KUN”, or “zibbati-su” from cuneiform text AO 6478 (Schaumberger 1952) is Beta (β) Leonis (Denebola) in the IAU constellation Leo.

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is "Zibbati" (Parpola 1993), "Zibbātu" or "Zibbāt Sinūnūtu". R. H. Allen lists it as "Zibbat A" in his *Star Names* in 1899.

This Persian asterism from the list of Zodiacal Signs in VAT 4956 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is "zib" (Bartel van der Waerden 1974).

This asterism later appears in Seleucid sky lore.

Taiyangshou:

See Guard of the Sun, above.

Tak-sa-a-tu:

This Babylonian and Sumerian ziqpu from the BM 78161 tablet is Delta (δ) Herculis in the IAU constellation Hercules and is the 5th ziqpu on this list (Liechty 1988, Leitz 2019).

Taking Away:

This Vedic asterism "Apabháranī" is in the IAU constellation Aries and is the stars 35, 39, and 41 Arietis as listed in the *Taittiriya Samhita* and *Taittiriya Brahmana* (Ivanković 2021). This is an older name for their nakshatra "Bharani" (see Bearer, above).

NOTE: The name "Bharani" was assigned to the star 41 Arietis by the IAU Working Group on Star Names and Barani is the name given to the stars 33 Arietis (Barani I) and 35 Arietis (Barani II).

Takulua-Alofi:

This is the Tongan name for Alpha (α) Geminorum (Castor) in the constellation Gemini.

Takalua-Tua-Fanua:

This is the Tongan name for Beta (β) Geminorum (Pollux) in the constellation Gemini.

Takurua:

This Māori and Polynesian star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Talitha:

See Third Leap of a Gazelle, below.

Tall One:

This Zulu asterism "oNdwenjana" ("tall object/man/tree/lily") or "iNdwendweni" is the sword of Orion in the IAU constellation Orion (Slotegraaf 2013, Holt and Slotegraaf 2022).

Talons:

There are two Arabic stars with the name"al-'aẓfār", "al-'Uẓfūr" (الأظفار), or "Al Aṭhfār" as listed by 13th century Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) in his *Wonders of the Creation and Unique of the Existence*:

- One is the star Mu (μ) Lyrae in the IAU constellation Lyra, whose name was later latinized to "Al Athfar" or "Alathfar". The IAU is considering the name Alathfar for this star.

- One is the star Eta (η) Lyrae in the IAU constellation Lyra, whose name was later latinized to "Aladfar". The IAU approved the name Aladfar for Eta (η) Lyrae Aa.

Tamborine:

This Quechua asterism "Sonaja" ("tambourine" or "rattle") is probably the IAU constellation Corona Borealis (Urton 1981).

Tammech:

This asterism is the IAU constellation Gemini as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671), who identified this as a "Chaldaean [sic]" name.

Tanager Bird:

This Karajá asterism "Xiau" is the belt of Orion and the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion (De Freita Mourão 2009).

Tanga's Breastplate:

This Rapanui star "Rei a Tanga" or "Ko Pu Tui" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Edwards and Edwards 2016, Edwards et al 2018). Tanga is wife and mother of men of Tautoru (the belt of Orion, see Three Handsome Ones, below). NOTE: The Edwards list this in both papers but in their 2010 paper they identify this star as Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and mention this again in their 2016 paper.

Tanggong:

This Tawi-Tawi and Sama Mapun asterism is the stars of the belt of Orion (Margiza 2022). The three stars are three characters, Tongh, Masikila, and Mayuyu. Masikila and Mayuyu are the wives of Tohng. The Tawi-Tawi have two stories related to the origins of rice planting, each having Mayuyu being careless, meddlesome, or lazy, resulting in the three of them becoming stars.

Tangra:

This **telescopic** Bulgarian star is WASP 21 in the IAU constellation Pegasus (magnitude 10.085). It received this name in the IAU NameExoWorlds campaign. Tangra is a deity worshipped by the early Bulgars. It has an exoplanet named Bendida after the Great Mother Goddess of the Thracians.

Tania Australis:

See South Side of Second Leap of a Gazelle, above.

Tania Borealis:

See North Side of Second Leap of a Gazelle, above.

Tank Tracks:

This Western **telescopic** asterism is emission nebula NGC 2024 (SH 2-277, LBN 953, Ced 55p) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 28" in his catalogue. It is GC 1227 in the *General Catalogue* of 1864. Size 30' X 30'. It is also known as the Maple Leaf (see below) and the Flame Nebula (see above).

Tannipi:

This Chinese phonetic translation of “Dhanus” from the Vedic *Candragarbha-parivarta* in 566 is the IAU constellation Sagittarius (Kotyk 2017).

Tanuma:

This Polynesian asterism from the island of Futuna is the IAU constellation Corona Australis.

Tapecue:

See Eternal Path, above.

Tapir:

This Tupi Guarani asterism, “Tapi’i” is also known as “Anta do Norte”. This is made up of the stars of the IAU constellations Cepheus, Cygnus, and Cassiopeia:

- The tapir’s “nose” is the star Alpha (α) Cygni (Deneb), and the “hind quarters” are the stars Beta (β) Cassiopeiae (Caph), Alpha (α) Cassiopeiae (Schedar), and Gamma (γ) Cassiopeiae (Navi),
- The tapir’s “ears” are tipped by the stars 72 and Tau (τ) Cygni,
- The “feet” are the stars Alpha (α) Cephei (Alderamin) and Iota (ι) Cephei and 32 and Delta (δ) Cassiopeiae, and
- The tip of the “tail” is Eta (η) Cassiopeiae.

The Kalinago see the Pleiades cluster in the IAU constellation Taurus as a woman who cuts off her husband’s leg, which is the belt and sword of Orion and runs away with a tapir, which is the Hyades cluster (Urton 2016).

This Karajá asterism “A-onidurarú” is the IAU constellation Taurus (De Freita Mourão 2009). It is being chased by the hunter “Doró botó” (see above). Some Karajá see the star Alpha (α) Tauri (Aldebaran) as the Tapir’s eye, while others see it as the tip of his teeth.

Urton (2016) writes that “certain tribes of Guiana” (he doesn’t specifically identify which ones) see dark spots in the Milky Way as representing a jaguar chasing a tapir chasing a dog.

This Kiribati star “Teba” or “Nei Teba” is an unidentified star near the IAU constellation Crux (Trussel and Groves 1978). Teba is the wife of Kama.

Tapir’s Eye:

This Karajá star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (De Freita Mourão 2009) and is part of their asterism “A-onidurarú” (see Tapir, above). NOTE: Some Karajá see this as the tip of the tapir’s teeth.

Tapir’s Head:

This Carib asterism “Maipuriyuman” or “Maipuri” is the Hyades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982). Wawaiya is the wife of Serikoai. Wawaiya ran off with a tapir. Serikoia chased them caught the tapir and ate all of it except its head. Wawaiya and the tapir’s head (the Hyades) ran up into the sky where Serikoai chases them.

Tapster:

This English asterism “Skinker” is the IAU constellation Aquarius. This name appears in William Cock’s *Meteorologia, or The True Way of Foreseeing and Judging the Inclination of the Air and Alteration of the Weather* in 1703 and is listed in R. H. Allen’s *Star Names* in 1899. This is an old slang term for a bartender or tapster.

Taqiyah:

This **telescopic** Tunisian star “Chechia” is HIP 99894 (HD 192699) in the IAU constellation Aquila (magnitude 6.45). Chechia was approved as a name in the IAU NameExoWorlds campaign. A Chechia is a traditional red wool tat which is their national headdress, a form of taqiyah or araqchin. It has an exoplanet named Khomsa, which is the name of a palm shaped amulet popular in Tunisia.

Tarandus:

See Reindeer, above.

Taranis:

This Celtic (Gaulish) asterism is the big dipper asterism in the IAU constellation Ursa Major (Boutet 2017). Taranis was a God of thunder associated with the wheel.

Tarantula Nebula:

This **telescopic** asterism is the open cluster and HII region NGC 2070 (Caldwell 103) in the IAU constellation Dorado. This was discovered by French astronomer Nicolas Louis de Lacaille in 1755. Shapley and Lindsay, in *A Catalogue of Clusters in the Large Magellanic Cloud*, Irish Astronomical Journal, Vol. 6, 1963, refer to this asterism as the “Tarantula nebula”. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., list this as the “Tarantula Nebula”. It is also known as the Great Looped Nebula, the True Lover’s Knot, and the 30 Dorado Cluster or 30 Dorado Association.

Tarazed:

See Beam of the Scale, above.

Tariao:

This Māori star, “Tariao”, is an unidentified star in the Milky Way (Thompson 2019).

Tarung:

This Palawan asterism “Tarung” is the IAU constellation Delphinus (Santos et al 2019).

Tarvos:

This Celtic (Gaulish) asterism may be the IAU constellation Taurus. Tarvos Trigaranus or Taruos Trigaranos, whose name means “bull”, is a God who appears on a relief panel of the Pillar of the Boatmen as a bull with three cranes on his back (Mosenkis, date N/K).

Tascheter:

This Persian star “Tascheter” (“watcher of the east) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is part of their asterism Four Guardians of Heaven (see above). Compare to the Zoroastrian star “Tištar” (see General of the East, above).

Tassel:

This Chinese xing guan is the Pleiades cluster in the IAU constellation Taurus and appears in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.).

This Arabic asterism “Al Halbah” (“tassel”) or “hulbat al-asad” (“Hair of the Tail of the Lion”) is a loop of stars that forms the end of the “tail” of their asterism “Lion” (see above). It starts at Gamma (γ) Comae Berenices and runs around through 14, 16, 17, 21, 23, 8, 7, and 4 Comae Berenices, HIP 59364, HIP 59489, and HIP 59923:

- “al-Halba” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- “Al-dhu’āba is listed as a name for Gamma (γ) Comae Berenices in the star list of Abraham Bar Hiyya in 1104, who also gives the Hebrew names “me’ir beyn zenav ha-ari” and “veha-nitmakh kokhav” (Goldstein 1985).
- An anonymous Hebrew star list from 1392 (Goldstein 1985) gives the Arabic name “al-munīr” and the Hebrew name “ha-me’ir” to Gamma (γ) Comae Berenices.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Daphira, from al dafirah, the tuft of hair at the tail’s extreme”: This is confusing it with the Arabic asterism “aḍ-Ḍafiyrah” (See Braid, above).
- NOTE: Astronomer Stephen James O’Meara claims that “a long time ago” that “Arabian astronomers knew it as the “tuft” and part of “Leo the Lion’s Tail” and identifies it as “Melotte 111”.

Tara:

This Hindu star is Zeta (ζ) Draconis in the IAU constellation Draco. Tara is a Goddess married to Lord Brhaspati, the planet Jupiter.

Tarf:

See Eyes, above.

Target of Fornax:

This **telescopic** asterism “Scópus Fornácis” is the intermediate barred spiral galaxy NGC 1288 in the IAU constellation Fornax. It was discovered by John Herschel who listed it in his catalogue as 2520 and later in his *General Catalogue* of 1864 as GC 683. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it the name as it “bears some resemblance to a shooting target”.

Taro:

This Anutan asterism, which represents the Taro plant, is in the IAU constellation Scorpius, with Alpha (α) Scorpii (Antares), which the Anutan call “Te Kau” the stem. “Ona Rau” (the leaves) are formed by several stars:

- One “leaf” is the stars Beta (β) 1 Scorpii (Acrab), Delta (δ) Scorpii and the double star Rho (ρ) Ophiuchi, and
- One “leaf” is the stars Eta (η) Scorpii, Rho (ρ) Scorpii, and d Scorpii.

Tartar:

This asterism “Tartar” was created from the stars of the IAU constellation Caelum by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It depicts an owl bearing a shield with yellow, white, and red bands.

Tātai o Matariki:

This Māori asterism, also known as “Matariki” (“chief’s eyes”, “small face” or “small eyes”), “Ao-Kai”, “Hoko-kumara” or “Huihui o Matariki” (“the assembly of Matariki”) is the Pleiades cluster in the IAU constellation Taurus.

Tatars:

This Huntarian asterism “Tatárdülas” is probably Mel 111 in Coma Berenices. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a troop of soldiers marching with three mounted cavalry men in Tatar dress accompanying them. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky.

Tattoo on the Wrist:

This Arabic asterism “washm al-mi’sam” is the double cluster NGC 869 and 884 in the IAU constellation Perseus (see Double Cluster, above). It is part of their asterism Little Abundant One (see above).

Tau:

This **telescopic** asterism is in the IAU constellation Leo and was listed as Corder 2189 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. Size 55’ X 30’.This resembles the Greek letter Tau (τ). Corder describes this as starting “at 80 [Leonis] and travels south to [HIP 55769], then 83 [Leonis] before ending near… Tau (τ) [Leonis]”.

Taubukinikarawa:

This Kiribati star “Taubukinikarawa” is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Trussel and Groves 1978). NOTE: This term also refers to the zenith.

Taumata-kuku:

This Māori star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Tauros Asterion:

The Uppsala Archaeoastronomical Project proposed the IAU constellation Taurus as the Minoan asterism “Tauros Asterion”. This asterism was passed on to me by Dana Corby of Ariadne’s Tribe in Tacoma, Washington in November 2023.

Taurus:

Taurus houses two of the brightest stars: Alpha (α) Tauri (Aldebaran- 14th brightest) and Beta (β) Tauri (Elnath- 27th brightest). The stars of Taurus show up in 1160 asterisms in this handbook.

This IAU constellation (IAU abbreviation Tau) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and became one of Ptolemy's 48 original constellations in the 2nd century, which Ptolemy listed as "Ταῦρος" ("Tavros"- see Bull, above) in his *Almagest*. This bull was typically described as white, which explains the Latin name "Candidus Taurus" ("white Taurus"). Other adjectives used to describe Taurus include "πεπτηώς" ("peptiós" or "crouching") and "Κεραόν" ("Keraón" or "horned"), by Aratus, "Cornus" ("horned), by the Roman poet Ovid (b. 43 B.C.E.), "inflexoque genu" ("on bended knee") by Cicero (106 – 43 B.C.E.), "nixus" ("striving") by 1st century Roman poet Marcus Manilius.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Taurus as an entire bull running (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as the front half of a bull facing right, as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

The French call it "le Taureau and the Italians "il Toro".

Indian astrologer and polymath Varāhamihira (c. 505 – c. 587) called it "Taouri", and Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – 1048) translated this later as "Tāmbiru". It originated in the Babylonian asterism Bull of Heaven (see above). It appears as the Egyptian asterism "Tauros", which is one of the paranatellonta of the decans of Scorpius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k).

Taurus appears in the Leiden *Aratea* (816) as the front half of a bull facing to our left.

Taurus appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Paris BN n.a. 1614, St Gall 250, St Gall 902, Gottweig 7 (146), Siena L. IV. 25.) Taurus is shown as the front half of a bull,
- In the Prague IC C 6 edition Taurus is a half bull lying down,
- In the Munich 560 edition Taurus is shown as an entire bull.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176, Munich 210, Vienna ÖNB 387 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Taurus as an entire bull lying down.

The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") lists "Thaurus". The Oxford Laud 644, Padua 27, Laon 422, and Venice VIII 22 manuscripts of *De signis caeli* depict half a bull. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Taurus with his right leg tucked under him and his left leg extended. The Paris BN 5239, Paris BN 5543 and Vat lat 643 manuscripts depict a peculiar "X" on the face of the bull. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts the entire bull with his tail curled between his legs.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts both left and right profile views of Taurus, who is depicted as the front half of a bull.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Taurus as the front half of a bull.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Taurus as the front half of a bull running to our right.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form "TAVR" for "TAVRVS" (Dekker 2007).

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Taurus as the front half of a bull running to our right.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Taurus as the front half of a bull moving to our right.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Taurus as the front half of a bull running to our right.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Taurus" as the front half of a bull facing to our right.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Taurus as the front half of a bull facing to our right.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Taurus as the front half of a bull running to our left.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Taurus as the front half of a bull, running to our left, looking over its left shoulder.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Taurus" as an entire bull, walking to our left, looking down as if grazing.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Taurus as the front half of a bull running to our left.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts Taurus as the front half of a bull emerging from a cloud.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts "Tharus" as the front half of a bull charging to our right out of a cloud.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "THAVRUS" as a bull emerging to our right from a cloud.

Taurus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as the front half of a bull emerging to our left from a cloud and labelled with the astrological sign for Taurus.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Taurus as the front half of a bull charging to our right. It is not labelled. Real Academia de Historia, manuscript D-97, f.104v – 105r depicts this reversed, with Taurus charging to our left.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts "Taurus" as the front half of a charging bull emerging to our right from a cloud.

This is listed as "Thaurus" on the *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Taurus" as the front half of a charging bull emerging to our right from a cloud.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Taurus" as the front half of a bull charging to our right.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Taurus as the front half of a bull facing to our right.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Taurus as the front half of a bull emerging from a cloud. It is moving to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Taurus as they do.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Bull".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Taurus as the front half of a bull charging to our right out of a cloud.

Jesuit German mathematician Christopher Clavius (1538 – 1612) listed in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts Taurus as the front half of a bull emerging from a cloud: He is facing to our right.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Tauro". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Taurus as the front half of a bull charging out of a cloud towards our right.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Taurus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Taurus as the front half of a bull emerging from a cloud: He is facing to our right and is only labeled with the astrological symbol for Taurus.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Taurus" as the front half of a bull emerging to our right from a cloud.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "le Taureau" as the front half of a bull emerging to our right from a cloud.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Taurus" as the front half of a bull emerging from clouds, facing to our left.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Taurus" as a bull charging to our right out of a cloud.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Taurus" as a bull emerging from a cloud to our right.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Taurus" as the front half of a bull emerging from clouds: He is running to our right.

Taurus is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts Taurus as the front half of a bull emerging from clouds in his *Uranometria* in 1603. Bayer lists these names for Taurus: "Taurus, Bubulum Caput, Io, Isis, Bos, Portitor Europae, Stier, Ataur, Altor".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Taurus" as the front half of a bull facing to our right emerging from a cloud.

"Taurus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as the front half of a bull emerging from a cloud moving to our left.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Tauro" as the front half of a bull emerging from a cloud. The bull is facing to our right.

Taurus is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Taurus" for this constellation.

"Taurus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as the front half of a bull emerging from a cloud.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Taurus" as a bull charging to our right out of a cloud.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Taurus as a bull charging to our left out of a cloud.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "TAVRVS Alior" and depicted as the front half of a bull.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Taurus as the front half of a bull.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Taurus" as the front half of a bull emerging from clouds.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Taurus" as the front half of a bull emerging from clouds facing to our right.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Taurus" as the front half of a bull emerging to our right from a cloud.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Taureau", "Taurus", and "Ταῦρος" and depicts it as the front half of a bull emerging from a cloud and charging to our right.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Taurus" as the front half of a bull.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Taurus as the front half of a bull emerging from a cloud.

Taurus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as the front half of a bull.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Taurus".

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Taurus" as the front half of a bull facing left, emerging from a cloud on the right.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Taurus as the front half of a bull emerging from a cloud. It is flying to our left.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Taureau" as the front half of a bull emerging from a cloud.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Taurus" as the front half of a bull facing right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Taureau" as the front half of a bull emerging to our left from clouds, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der Stier".

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Toro" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Taurus" as the front half of a bull emerging from a cloud.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Taurus" as the front half of a bull facing right.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) and in various editions of his *Jahrbuch* lists this constellation as the "Stier" and depicts it as the front half of a bull.

American uranographer William Croswell (1760 – 1834) depicts "Taurus the Bull" on his *Mercator Map of the Starry Heavens* in 1810 as the front half of a bull.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Taurus in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as the front half of a bull.

"Taurus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as the front half of a bull emerging from a cloud on the right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Taurus" as the front half of a bull emerging from clouds to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts Taurus as the front half of a bull.

Taurus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. Only the front half of the bull is depicted.

"Taurus" is listed in the *Atlas Coelestis* catalogue (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as the front half of a bull moving to our left.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star on its charts as the "Bull" but in the text describes it as "Taurus consists of the head and shoulders of a *bull*, which is represented in the act of charging at Orion."

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Taurus, The Bull" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Taurus, the Bull".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Taurus" in his *Star Atlas* (1893) and describes it as "The Bull".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Taurus" and describes it as a "Bull".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Taurus" as "the Bull".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) radically redesigned the lines of Taurus in his book *The Stars - A New Way to See Them* (1952). Standard IAU charts show this constellation with the Hyades cluster as the "head" and four star lines running out to Zeta (ζ) Tauri and Beta (β) Tauri (Elnath) to form "horns" and lines running out to the Pleiades and Omicron (o) Tauri to form the front half of a bull. Rey gives us an entire bull:

- His "head" is a large, roughly triangular shape formed by the stars Gamma (γ) Tauri, Alpha (α) Tauri (Aldebaran), Zeta (ζ) Tauri, Tau (τ) Tauri, Upsilon (υ) Tauri, Epsilon (ε) Tauri, and Delta (δ) 1 Tauri, which places the Hyades in one corner of this triangle,
- One "horn" runs from Tau (τ) Tauri to Beta (β) Tauri (Elnath),
- One "horn" runs from Upsilon (υ) Tauri to the Pleiades cluster,
- The "body" is the line of stars from Gamma (γ) Tauri through Lambda (λ) Tauri, to Xi (ξ) and Omicron (o) Tauri,
- His "tail" runs from Xi (ξ) Tauri to 5 Tauri,
- Two "back legs" are lines running out from Omicron (o) Tauri:
    - One runs to Nu (ν) Tauri, and
    - One runs to 10 Tauri,
- Two "front legs" are lines running out from Gamma (γ) Tauri:
    - One runs to Mu (μ) Tauri, and
    - One runs to a "knee" at 90 Tauri and ends at 88 Tauri.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Taurus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as simply the Hyades cluster as the "head" of the bull and two lines forming horns:

- One from Alpha (α) Tauri (Aldebaran) to Zeta (ζ) Tauri, and
- One from Epsilon (ε) Tauri to Beta (β) Tauri (Elnath).

Sky and Telescope Magazine, founded in 1941, depicts Taurus in their magazine and publications with the triangular Hyades cluster as the "head" with three lines running out of it and one beside this constellation:

- One "horn" runs from Alpha (α) Tauri (Aldebaran) to Zeta (ζ) Tauri,
- One "horn" runs from Epsilon (ε) Tauri to Beta (β) Tauri (Elnath),
- One runs from Gamma (γ) Tauri through Lambda (λ) and Xi (ξ) Tauri to Nu (ν) Tauri,
- One disconnected line runs from Omicron (o) to 10 Tauri.

Taurus Dark Cloud:

This **telescopic** asterism is Barnard 22 in the IAU constellation Taurus. It is also known as the Taurus Molecular Cloud or TMC-1.

Taurus Poniatovii:

See Poniatovski's Bull, above.

Taurus Poniatovii Cluster:

This **telescopic** asterism, the "Taurus Poniatovii Cluster" or the "Poniatowski's Bull Cluster" is the open cluster Collinder 359 (Melotte 186) in the IAU constellation Ophiuchus. It received this name as it is part of the obsolete constellation Taurus Poniatovii (see Poniatowski's Bull, above).

Tautanga-ufi:

See O-nga-tangata above.

Tavern:

This Sami asterism "Niallar" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899. Allen calls this a "Lapland" asterism.

Tawaret:

This Egyptian Dendera asterism made up of stars in the IAU constellation Boötes, Corona Borealis, and Draco (Hoffman 2017): The star Alpha (α) Boötis (Arcturus) is referred to as "the Guard". Tawaret is a protective hippo Goddess who here is guarding the celestial pole and the nearby asterism Ox Thigh.

Taygeta:

This Greek star is 19 Tauri in the Pleiades cluster in the IAU constellation Taurus. Taygeta is one of the Pleiades sisters in Greek mythology:

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Taigaeta" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Taigoeta": The author is unknown, but it is based on Jamieson's *Celestial Atlas.*
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Taygeta" for this star.
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Taygeta",
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Taygeta".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Taygete".
- The IAU approved the name Taygeta for the star 19 Tauri Aa.

Te Kokota:

This Māori asterism is the Hyades cluster in the IAU constellation Taurus. It has also been used as a term for the Magellanic Clouds.

Te pou o te rangi:

This Rapanui star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Edwards 2016).

Te Purangi:

This Māori asterism “Te Purangi” is the Magellanic Clouds (Orchiston 2017).

Te Putea iti a Reti:

This Māori asterism is the Southern Cross in the IAU constellation Crux.

Te Rua ō Māahu:

This Māori asterism is the Coal Sack Nebula (see Coal Sack Nebula, above).

Te Rua-patiki:

This Māori asterism is the Coal Sack Nebula (see Coal Sack Nebula, above).

Te Uru-o-tiki:

This Polynesian asterism (Tuamotu Archipelago) is the IAU constellation Delphinus.

Te Wale-o-Awitu:

This Polynesian (Cook Islands) asterism is the IAU constellation Corona Borealis.

Te Whai-atitipa:

This Māori asterism is the Coal Sack Nebula (see Coal Sack Nebula, above).

Tea Tree:

This Ngiyampaa asterism “Nguu” or “Zuu” is the IAU constellation Crux (Fuller et al 2014). Compare to the Kamilaroi asterism “Minggah” (see Spirit Tree, above).

This Weilwan asterism “Nguu” is the IAU constellation Crux (Clarke 2014).

Teacher:

This Ininew (Cree) asterism “Wesakayckak” is the IAU constellation Orion (Buck 2016). He is also known as “Mistapiw” (see Giant above). The three stars of Orion’s belt are the “Three Chiefs” (see below).

This Anishinaabe asterism “Nanabush Anung”, “Nanaboozhoo”, or “Misabe” (see Giant, above) is the IAU constellation Orion (Lee et al 2014). Nanaboozhoo is a shapeshifter and trickster God, a great hunter who often takes the form of a rabbit.

Teacup:

This **telescopic** asterism is the open cluster NGC 6664 in the IAU constellation Scutum. This was discovered by English astronomer William Herschel in 1784 who listed it as “VIII 12”. It is GC 4426 in the *General Catalogue* of 1864 . It was given this name by American astronomer Wayne Schmidt. It is also known as Santa’s Sleigh (see above), and the Figure Outline (see above).

Teapot:

This asterism is made up of the eight brightest stars in the IAU constellation Sagittarius:

- The main body of the “teapot” is made up of the four stars Phi (ϕ) Sagittarii (Namalsadirah I), Delta (δ) Sagittarii (Kaus Media, Kaus Meridionalis, Media or Kaus Medius), Epsilon (ε) Sagitarii (Kaus Australis- 38th brightest star), and Zeta (ζ) Sagitarii (Ascella).
- The “lid” is topped by the star Lambda (λ) Sagitarii (Kaus Borealis or Al Thalimain).
- The “spout” is tipped by the star Gamma (γ) Sagitarii (Alnasl) and the Milky Way appears as "steam" coming from this “spout”.

- The “handle” is formed by the two stars Sigma (σ) Sagitarii (Nunki or Sadira- 53rd brightest star) and Tau (τ) Sagitarii (Namalsadirah II).

The Norwegian name for the Teapot above is Tekannen. Jeffrey Corder lists it as Corder 3616.

There is a smaller **telescopic** teapot, Markov 1 on the list of asterisms created by Paul Markov of the Toronto Centre of the RASC, found in the IAU constellation Hercules just north northwest of Xi (ξ) Herculis. It is made up of nine 9th to 10th magnitude stars with HIP 87917 on the “handle” side and the double star HIP 87838 at the tip of the “spout” on the other side. Size 19’ X 8’.

Teardrop:

There are two telescopic “Teardrop” asterisms:

- One is in the IAU constellation Cepheus and is Corder 4877 on the observing list of American astronomer Jeffrey Corder. Size 70’ X 45’. This is ten 7th – 9th magnitude stars including HIP 115262, 114833, and 115202.
- One is the molecular cloud IC 423 (LBN 913, Ced 52) in the IAU constellation Orion.

Tearful Shi’ra:

See Teary-Eyed Woman, below.

Teary-Eyed Woman:

This Arabic star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. This is also known as the “Southern Shi’ra” and the “Tearful Shi’ra”. Compare this to their star “Bleary-Eyed Woman” (see above). NOTE: This asterism and the asterism Teary-Eyed Woman (see below) are the “sisters” of Suhayl (see Glorious, above) who was the fiancé of Al Jawza (see Al Jawza, above). The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic names as “al-shi’rā” and “al-‘abūr” and the Hebrew name as “’over ha-afudda” (“one who crosses the belt”) which is a reference to the story of Suhayl and the sisters.

This Bedouin (Northern Arabian Peninsula) star “Al-Shi’la” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This Turkish star “Rumeysa” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Teaspoon:

This asterism is found in the IAU constellation Sagittarius and is made up of Rho (ρ) 1 Sagittarii, 43 Sagittarii, Pi (π), Omega (ω) Sagittarii, and Xi (ξ) 1 and 2 Sagittarii. It is in the SAC database and is listed by Jeffrey Corder as Corder 3774. Size 480’ X 140’.

Teddy Bear Lollipop:

This **telescopic** asterism is Vastagh 10, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Delphinus. Its size is 20.5’ X 12.5’. Vastagh describes it as a “Lollipop-shaped [asterism] with animal figures. If we look closely, we can see a teddy bear with outstretched arms, perched on top of a long stick. The exciting association consists of 16 members, and when observed, it appears to be leaning on its side... [It is] next to GH NGC7006.”

Teegarden's Star:

This **telescopic** 15th magnitude M-type red dwarf, (SO J025300.5+165258, 2MASS J02530084+1652532, LSPM J0253+1652) is in the IAU constellation Aries and is only 12 light years from earth. It was discovered in 2003 from NASA's Near Earth Asteroid Tracking program data. It is named in honor of American astrophysicist Bonnard J. Teegarden (b. 1940), who led the discovery team.

Teenagers and Little Ones:

This Wardaman asterism "Murabibi" is the Pleiades cluster in the IAU constellation Taurus (Cairns 1999). The Wardaman believe them to be the children of the sky god Nardi and Earth-Mother Doungdung and assign each star a gender, age, and name:

- Kagili, young woman,
- Ingaba, brother,
- Jabakka, eldest,
- Mungali, 11 years,
- Whadik, 12 years, and
- Marinyan, young woman.

Tegmine:

See Cocoon, above.

Teikui:

This Mabuiag asterism is the Small Magellanic Cloud.

Tejat:

This Arabic asterism "tiḥyāt" (an old Arabic word whose meaning is currently unknown) is stars in the IAU constellation Gemini: Eta (η), Mu (μ), Gamma (γ), Nu (ν), and Xi (ξ) Geminorum (Kunitzsch 2006).

Two stars from this Asterism now bear variations on this Arabic name:

- Eta (η) Geminorum: Tejat Prior.
- Mu (μ) Geminorum: Tejat, Tejat Posterior:
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Tejat post, from Tahyáh".
    - The IAU approved the name Tejat for Mu (μ) Geminorum Aa in 2017

Tejat Posterior:

This Arabic star is the Mu (μ) Geminorum in the IAU constellation Gemini and part of their asterism Tejat (see above).

Tejat Prior:

This Arabic star is Eta (η) Geminorum in the IAU constellation Gemini and part of their asterism Tejat (see above).

Telephone Receiver:

This **telescopic** asterism is the spiral galaxies NGC 5278 and NGC 5279 (Arp 239) in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "II 798". It became GC 3639 in the *General Catalogue* of 1864. This is also known as the "Wrestler" and the "Little Wrestler".

Telescopium:

None of the stars of Telescopium are brighter than 4th magnitude and the stars of this constellation only show up in 36 asterisms in this handbook.

This IAU constellation (IAU abbreviation Tel) was created in 1751 by French astronomer Abbé Nicolas Louis de Lacaille, who called it "le Telescope": He did this to honor instruments which to him symbolized the Age of Enlightenment. It appears on his *Planisphère des Étoiles Ausralea* (1756) as a long thin telescope suspended from a pulley on a tall pole. In 1763 de Lacaille latinized his original name to the current one.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Telescope" as a refractor telescope mounted on a pole.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Astronomische Fernrohr". Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Telescop" on his charts and depicts it as a refractor mounted on a pole.

English astronomer Francis Baily (1774 – 1844) and American astronomer Benjamin Gould later reduced the size of Telescopium to its current size, repurposing Beta (β) Telescopii as Eta (η) Sagittarii, Gould repurposing Gamma (γ) Telescopii as G Scorpii, Theta (θ) Telescopii became d Ophiuchi, and Sigma (σ) Telescopii being moved to Corona Australis where it is now known as HR 6875.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Telescopium" in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Telescopium the Telescope" as a refractor telescope on a pole mount.

"Telescopium" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Telescopium" as a refractor telescope pointing to our left.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Telescopium, The Telescope" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Telescopium" and describes it as the "Telescope".

Standard IAU charts depict Telescopium as a line from Alpha (α) Telescopii to Zeta (ζ) Telescopii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Telescopium in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as the oval of stars Alpha (α), Zeta (ζ), Gamma (γ), Xi (ξ), and Iota (ι) Telescopii with an additional line running from Alpha (α) Telescopii to Epsilon (ε) Telescopii.

Sky and Telescope Magazine, founded in 1941, depicts Telescopium in their magazine and publications as a bent line of three stars: Epsilon (ε), Alpha (α), and Zeta (ζ) Telescopii.

Tell Me a Picture:

This Hungarian asterism "Kep Asszon" is the IAU constellation Virgo. Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a woman in a long dress with a basket on her left forearm looking at a star (Spica) in her right hand.

Tempel's Nebula:

See Merope Nebula (above).

Temple:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Aquarius: Kappa (κ) Aquarii (the determinative star), HIP 111170, HIP 110532, and 44 Aquarii.

This Chinese xing guan "Xūliáng" (虛梁) is a line of four stars in the IAU constellation Aquarius: 44, 51, and Kappa (κ) Aquarii and HIP 113345.

This Chinese Chenzhuo xing guan is a curving line of four stars in the IAU constellation Aquarius: HIP 111170, HIP 110532, Rho (ρ) Aquarii, and HIP 110009.

This Latin asterism "Templum" is the IAU constellation Ara:

- "Templum" is listed in the 15th century *Alfonsine Tables*.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Templum".

This Hindu asterism is the Hyades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Temple of the World:

This Latin asterism "Mundi Templum" is the IAU constellation Ara as listed by 1st century Roman poet Marcus Manilius.

Ten Sheaves:

This Belarussian asterism "Kuchki" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009).

Tennis Racket:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Aquila 3 degrees east of the star 42 Aquilae. Size 45'. Jeffrey Corder lists this as Corder 3965. This is how it is made up:

- Six magnitude 8 – 10.6 stars form an oval "racket",
- Two 8th magnitude stars form a "handle" with HIP 97492 at the base, and
- The bright blue star HIP 97655 is the "ball".

Tent:

There are two Arabic asterisms with this name:

- One, “al-Khibā’” (الخباء) is the star Alpha (α) Corvi in the IAU constellation Corvus. This star is part of their asterism Southern Tent (see above):
    - This was later latinized to “Alchibah”, “Alchiba”, “Alchita”, or “Al Chiba”.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al Khibá, the tent”.
    - English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Alchiba”.
    - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists both “Alchiba” and “Al-khiba” for this star, but the 14th edition (1959) only lists “Alchiba”.
    - R. H. Allen lists “Al Chiba” in the second edition of his *Star Names* in 1963.
    - In 2016 the IAU Working Group on Star Names chose the name Alchiba for Alpha (α) Corvi.
- One, “Al Ḥibā‘” (ألحباع), later latinized to “Alhiba” (I, II & III), is the stars Mu (μ), Lambda (λ), and Rho (ρ) Aurigae in the IAU constellation Auriga as listed in 13th century Persian astronomer Zakariyya’ al-Qazwini’s *Wonders of the Creation and Unique of the Existence*.

Tents:

This Arabic asterism “al-Akẖbiya” (الأخبية) is the stars Zeta (ζ), Gamma (γ), Pi (π), and Eta (η) Aquarii in the IAU constellation Aquarius as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449) and 13th century Persian astronomer Zakariya al-Qazwini.

Tentus Majoris:

This American asterism is the teapot asterism in the IAU constellation Sagittarius and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is depicted as a large tent.

Tentus Minoris:

This American asterism appears to be made up of stars of the IAU constellation Grus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is a small triangle of four stars.

Ṭepā-Kenmut:

This Egyptian decan “Ṭepā-Kenmut” was in the IAU constellation Cancer. In later Hellenistic texts it was named “ϹΙΤ” (“Seta”). In the Testament of Solomon, it became “Katanikotael”, Aristobulus of Paneas (2nd century B.C.E.) called it “Catarno”, in Greek Hermeticism it became “Ouphisit”, in Latin Hermeticism “Somachalmais”, 4th century Roman astrologer Julius Firmicus Maternus called it “Sith”, Cosmas of Maiuma (d. 760) called it “Herakles”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Syth” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ЄΚϠΤΗ” (“Hecate”). It has been depicted as a woman with an avian body.

Ṭepā-khentet:

This Egyptian decan “Ṭepā-khentet” was in the IAU constellation Libra. In later Hellenistic texts it was named “ΤΠΗΧΟΝΤΙ” (“Tpa-χont”). In the Testament of Solomon, it became “Nathotho” or “Marderô”, Aristobulus of Paneas (2nd century B.C.E.) called it “Baham”, in Greek Hermeticism it became

"Nephthimes", in Latin Hermeticism "Chusthisis", 4th century Roman astrologer Julius Firmicus Maternus called it "Sepisent" or "Atebenus", Cosmas of Maiuma (d. 760) called it "Kairos", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Aterechini" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ѻнфђ" ("Omphta"). Variations include "Nephthimes". It has been depicted as a man wrapped from chest to ankles, holding a flask and standing on a fountain with four streams.

Ṭepā-semṭ:

This Egyptian decan "Ṭepā-semṭ" was in the IAU constellation Capricornus. In later Hellenistic texts it was named "Srat". In the Testament of Solomon, it became "Anoster", Aristobulus of Paneas (2nd century B.C.E.) called it "Salac", it Greek Hermeticism it became "Epitek", in Latin Hermeticism "Manethois", 4th century Roman astrologer Julius Firmicus Maternus called it "Epiemu" or "Epimen", Cosmas of Maiuma (d. 760) called it "Hygieia", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Epima" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ріроγфђ" ("Riruphta").It has been depicted as a man with a pig's head with a flask in his right hand and a sword in his left.

Terebellum:

See "Snail" and "Drill", above.

Teresa:

This Belarussian asterism "Teresa" or "Saint Teresa" is the IAU constellation Cygnus (Avilin 2009).

Termite Hole:

This **telescopic** asterism is the open cluster NGC 2477 (Caldwell 71) in the IAU constellation Puppis. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751. It is GC 1593 in the *General Catalogue* of 1864. It is also known as the Electric Guitar (see above).

Terrestrial:

This Latin asterism "Terrestris" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. Johann Bayer's *Uranometria* (1603) lists the name "Terrestris" for this star.

Territory of Dog:

This Chinese xing guan "Gǒuguó" (狗国) is a diamond of stars in the IAU constellation Sagittarius: Omega (ω), 59, 62, and 60 Sagittarii. Their xing guan "Dog" (see above) is nearby. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Gǒuguó" is a diamond of four stars in the IAU constellation Sagittarius: 60, Omega (ω), 59, and 62 Sagittarii.

Test:

This Arabic star "Al Ṣadāk" ("the test" or "our riddle") is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by Fairūzābādī (فیروزآبادی), also known as el-Fīrūz Abādī", "al-Fayrūzabādī (الفيروزآبادي) and "Firuzbadi" (1329–1414) whose al-Qamous (القاموس) dictionary was in use for five centuries. It is called this because it was a test of the acuity of a person's vision.

Tethered Aviator:

This American asterism is made up of stars of the IAU constellation Aquila and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). This is depicted as a diamond of the stars Alpha (α) Aquilae (Altair), Zeta (ζ) Aquilae, Delta (δ) Aquilae, and Theta (θ) Aquilae, with a "tether" being the line between Delta () Aquilae and Lambda (λ) Aquilae.

Tethered Camels:

This Arabic asterism "al-sharāsīf", is a long line of stars in the IAU constellations Corvus, Hydra and Libra: Upsilon (υ) Librae, Sigma (σ) Librae, Pi (π) Hydrae, Gamma (γ) Hydrae, Beta (β) Corvi, Epsilon (ε) Corvi, Nu (ν) Hydrae, and Lambda (λ) Hydrae. It was described by 16th century Arabic astronomer Al Tizini. Midway along this line is their asterism Southern Tent (see above):

- The name was later latinized to "Al Sharasif".
- The name al Sharasif I has been assigned to Kappa (κ) Hydrae.
- The name Al Sharasif or Al Sharasif II has been assigned to Beta (β) Crateris (Kraz).
- Dorn (1829) lists this as "Ribs" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- In his *Star Names* in 1899 R. H. Allen translates this Arabic name as "the ribs" and attributes it to 'Abd al-Rahman al-Sufi (903 – 986).
- NOTE: The actual Arabic ribs asterism is "al-kharāt" (see Two Small Ribs, below).

Tevel:

See Universe, below.

Textile Ruler:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hercules: 96 Herculis (the determinative star) and 101 Herculis.

This Chinese xing guan "Bódù" (帛度) is a line of two stars in the IAU constellation Hercules: 95 and 102 Herculis.

This Chinese Chenzhuo xing guan "Bódù" is two stars in the IAU constellation Hercules: 95 and 102 Herculis.

Tezcatlipoca:

This Aztec and Nahuatl asterism is the Big Dipper asterism in the IAU constellation Ursa Major. Tezcatlipoca, whose name means "Smoking Mirror", was a warrior God. He is usually depicted as missing his left foot, and the handle of the Big Dipper disappearing beneath the horizon at their latitude is a metaphor for this (Krupp 1983). NOTE: There is a similar figure in Mayan folklore, Ah Bocon Dzacab, who like Tezcatlipoca, is missing a foot (Krupp 1983).

Tha:

This Arabic asterism "al-Tahātī", "al-Tahiyat", or "al-Tahia" is Lambda (λ) Orionis (Meissa), and Phi (φ) 1 and 2 Orionis in the IAU constellation Orion. It is called this as it resembles the Arabic letter Tha (ث).

These are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Thaadoi:

This Mursi star is Beta (β) Crucis (Mimosa) in the IAU constellation Crux. They used it as part of a system to tell when the local Omo River would flood.

Thaba:

This Meitei asterism "Thaba" is the IAU constellation Musca.

Thamyris:

This Greek asterism "Thamyris" is the IAU constellation Hercules. In Greek mythology Thamyris was a Thracian singer who challenged the Nine Muses to a competition and lost:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Thamyris" as an alternate name for Hercules.
- "Thamyris" is listed as a name for Hercules in R. H. Allen's *Star Names* in 1899.

Thank You:

This Zambian star "Natasha" is HIP 48235 (HD 85390) in the IAU constellation Vela and was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Madalitso ("blessings").

Thara:

This Kulin Nations star "Thara" is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Massola 1968, Hamacher 2011).

That Which Drives the Cattle:

Zulu star "iQhubankomo" or "iQubankomo" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

That Which Follows the Sting:

This Arabic asterism "Tāli' al Shaulah" is open cluster Messier 7 (NGC 6475) in the IAU constellation Scorpius. It is given this name due to its location near the "stinger" of Scorpius:

- "Tāli' al Shaulah is listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-tāir li-(?)".
- This was later translated into the Latin "Stella nebulosa quae sequitur aculeum Scorpionis" ("The misty star that follows the sting of Scorpio").

That Which is Behind Eridanus:

This **telescopic** asterism "Postícus Erídani" is the barred spiral galaxy IC 1953 in the IAU constellation Eridanus. It was discovered by DeLisle Stewart in 1899. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy is situated almost behind the 4th magnitude star 19 Eridani."

That Which is Revolving:

This Koyukon asterism “Naagheltaale” or “Nosekgheltaale” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below). It is also known as “Ghededzuyhdle” (“those multiple objects which are moving along”) and “K’etetaalkkaanee” (“the one who paddled among things”). The whole asterism contains “body parts” in 18 different IAU constellations, with the principal constellations being Boötes, Canes Venatici, Leo, Lynx, Ursa Major, and Ursa Minor (Cannon 2021). These are the stars that make up Naagheltaale:

- His ”head” (betlee’) is 31 Lyncis,
- His “torso” (bedoghone’) is the stars bounded by Alpha (α) Ursae Majoris (Dubhe), Omicron (o) Ursae Majoris, Alpha (α) Lyncis, and Psi (ψ) Ursae Majoris,
- His “belly” (betsokk’e) is the stars bounded by Delta (δ) Ursae Majoris, Alpha (α) Ursae Majoris (Dubhe), Psi Ursae Majoris, and Chi (χ) Ursae Majoris,
- His “left arm” (tl’eghests’ene’ betl’eele’) is Alpha (α) Lyncis, Epsilon (ε) Leonis, and Gamma (γ) Leonis,
- His ”left hand” (tl’eghests’ene’ belo’) is Gamma (γ) Leonis and Alpha (α) Leonis (Regulus),
- His “right arm” (nelneyhts’ene’ betl’eele’) is Omicron (o) Ursae Majoris, HIP 47193, and Alpha (α) Ursae Minoris (Polaris),
- His “right hand” (nełneyhts’ene’ belo’) is Alpha (α) Ursae Minoris (Polaris),
- His “left leg” (tl’eghests’ene’ betl’ene’) is Chi (χ) Ursae Majoris, Beta (β) Canum Venaticorum (Chara), and Alpha (α) Canum Venaticorum (Cor Caroli),
- His “left foot” (tl’eghests’ene’ bekaa’) is Alpha (α) Canum Venaticorum (Cor Caroli),
- His “right leg” (nełneyhts’ene’ betl’ene) is Eta (η) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Epsilon (ε) Ursae Majoris
- His “right foot” (nełneyhts’ene’ bekaa’) is Eta (η) Ursae Majoris and Theta (θ) Boötis,
- His “buttocks” (bebet) are stars not yet identified,
- His “backbone” (benene’) are stars not yet identified,

NOTE: Some Kokukon view what is listed above as the “right leg” of Naagheltaale as his “tail”. Another version of this asterism recorded by Jules Jetté in 1905 (Cannon 2021) lists these parts:

- His “head” (metlee) is Eta (η) Ursae Majoris
- His “buttocks” (melt’o’) is Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak),
- His “hand” (melo’) is Alpha (α) Ursae Minoris (Polaris),
- The area “between his shoulders” (meggontekk’et) or “crooked/humped” (k’ehudetlgets) is Zeta (ζ) Ursae Majoris.

That Which Moves Back and Forth:

Upper Kuskokwim asterism “Noghiltale” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)).

That Which Moves Following Us:

This Tanacross asterism “Neek’e’elteen” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below (Cannon 2021)). It is also known as “Yaamaagh Telch’eegh” (see One Who Went Angrily Around the Sky, above) and “Tuumaagh Telch’eegh” (see One Who Went Angrily Around the Edge of the Water).

That Which Moves in a Circle Over Us:

This is an alternate Ahtna name, “Nek’e Nekeghaltaexi”, for their asterism “Nek’eltaeni” (see That Which Moves Over Us, below).

That Which Moves Over the Earth:

This is an alternate Ahtna name, “Nen’keltaeni”, for their asterism “Nek’eltaeni” (see That Which Moves Over Us, below).

That Which Moves Over Us:

This Ahtna asterism “Nek’eltaeni” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below). Before this figure went into the sky, he was known as “Yabaaghe Tezyaann” (“the one who went around the edge of the world”), “Yabaaghe Tuu Teeshyaay” (“the one who went around the edge of the water/ocean”), “Netseh Telyaanen” (“the one who leads us ahead”) or “Ciil Hywaa” (“smart young man”). Like the Gwich'in asterism known as "Yahdii" this asterism spans more than 130 degrees across the sky from nose to foot and is viewed as being in a crouched position with his arms embracing the sky. The whole asterism contains “body parts” in 18 different IAU constellations, with the principal constellations being Auriga, Boötes, Cassiopeia, Camelopardalis, Cancer, Draco, Gemini, Hydra, Leo, Lynx, Taurus, Ursa Major, Ursa Minor, and Virgo (Cannon 2021). He is also known as “Nek’e Nekeghaltaexi” (That [human] which moves over us”), “Nen’keltaeni” (“that which moves over the earth”), “Nek’e Nekeghaltaexi” (“that which moves in a circle following us”), or “Nekeghaltaexi”. The early dawn light is his wife “U’aa Uk’etayall” (“his wife will walk after him”). Here are the various parts of Nek’eltaeni:

- His “tail” (uce’) is the Big Dipper asterism,
- His “left arm” (tl’aghests’en uggaan’) is 31 Lyncis, Kappa (κ) Leonis, and Lambda (λ) Leonis,
- His “left hand” (tl’aghests’en ula’) is Alpha (α) Leonis (Regulus) and Omicron (ο) Leonis,
- His “right arm” (kuzuun ts’ene uggaan’) is Delta (δ) Aurigae, 2 Lyncis, Beta (β) Camelopardalis, HIP 17884, and Epsilon (ε) Cassiopeia,
- His “right hand” (kuzuun ts’ene ula’) is two unidentified stars in Cassiopeia,
- His “left leg” (tl’aghests’en uts’ene’) is Psi (ψ) Ursae Majoris, Nu (ν) Ursae Majoris, and Xi (ξ) Ursae Majoris,
- His “left foot” (tl’aghests’en uke’) is a “left heel” (uketatl’) of Beta (β) Leonis (Denebola) and “left toes” (ukelaghose’) of Delta (δ) Leonis and Theta (θ) Leonis,
- His “right leg” (kuzuun ts’ene uts’ene’) is Lambda (λ) Draconis, Kappa (κ) Draconis, Beta (β) Ursae Minoris (Kochab), Gamma (γ) Ursae Minoris and Zeta (ζ) Ursae Minoris,
- His “right foot” (kuzuun ts’ene uke’) is Beta (β) Draconis (Rastaban) and Gamma (γ) Draconis,
- His “left ear” (tl’aghests’en udzaghe’) is Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux),
- His “right ear” (kuzzun ts’ene udzaghe’) is Alpha (α) Aurigae (Capella) and Beta (β) Aurigae (Menkalinan),
- His “nose” (bentsiis) is the Pleiades cluster,
- His “eyes” (unaegge’) is Iota (ι) Aurigae and Beta (β) Tauri (Elnath),

- His “abdomen” (utsaadle’) is 15 Lyncis, Omicron (ο) Ursae Majoris, 23 Ursae Majoris, 36 Ursae Majoris, Theta (θ) Ursae Majoris, Iota (ι) Ursae Majoris, Kappa (κ) Ursae Majoris, and 31 Lyncis,
- His “kidney” (udzedze’) is an unidentified star near the “cup” of the Big Dipper,
- His “heart” (uciz’aani) is 27 Lyncis,
- His “walking stick” (utedze’) is Beta (β) Cancri (Tarf), Epsilon (ε) Hydrae, Zeta (ζ) Hydrae, Alpha (α) Cancri (Acubens), 31 Leonis, Rho (ρ) Leonis, Sigma (σ) Leonis, and Beta (β) Virginis (Zavijava), and
- His “backpack” (ughaele’) is Beta (β) Ursae Majoris (Merak), Psi (ψ) Ursae Majoris, Mu (μ) Ursae Majoris, Alpha (α) Lyncis, and 31 Lyncis.

NOTE: The Traveler shows up in many other First Nations cultures. To the Upper Tanana he is “Neek’e’eltiin” or “Yihdaa” (see Traveler, below), to the Tanacross he is “Neek’e’elteen” (see That Which Moves Following us, above), to the Lower Tanana he is “Nogheyoli” (see One Who Continuously Walks, above), to the Koyukon he is “Naagheltaale” or “Nosekgheltaale” (see That Which is Revolving, above), and to the Upper Kuskokwim he is “Noghiltale” (see That Which Moves Back and Forth, above). Modern day members of these nations often use these names just to describe the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021). Compare to the Gwich’in asterism “Traveller” (below). Nek’eltaeni is described as “nen’k’eltaen” (“the leans with the world”), “ne’el teltaen” (“he leans with us”), “nen’ts’e’ c’udelnesi k’e (“he reaches/holds the earth”), and “necehw nelnes” (“he’s reaching around people”). He is also known as (That [human] which moves over us”), “Nek’e Nekeghaltaexi” (“that which moves in a circle following us”).

That Which Strikes Hard:

This Sotho and Tswana asterism “Morotlwa” is the IAU constellation Crux. This seems to be a relatively modern name.

Theano:

This Greek asterism is the IAU constellation Pegasus as listed by 5th century Greek poet Nonnus. “Theno” is listed in Johann Bayer’s *Uranometria* (1603) and attributed to Nonnus. “Theano” is listed in R. H. Allen’s *Star Names* in 1899. In Greek mythology Theano was the wife of the king of Icaria, who demanded that she bear him children or leave the kingdom. She presented the children of Melanippe (see above) as her own. Melanippe was later turned into a horse in the sky.

Thein:

This Myanmar yathi (zodiac constellation) “Thein” (သိဟ်) is the IAU constellation Leo.

Their Appearance in the Sky Marks the Time of New Yams:

This Erromanga (Sie) asterism “Owonian omontai narvin” is the Pleiades cluster in the IAU constellation Taurus (Ramík 2019).

This Olal (north Ambrym) asterism “Uaiu” is the Pleiades cluster in the IAU constellation Taurus (Ramík 2019).

Their Appearance in the Sky Marks the Time of Planting Yams:

This Sesivi (Daakaka) asterism “Véviép mbwéiagiag” is the Pleiades cluster in the IAU constellation Taurus (Ramík 2019).

Theemin:

See Bend in the River, above.

Themat-hert:

This Egyptian decan “Themat-hert” was in the IAU constellation Virgo. In later Hellenistic texts it was named “ⲧⲱⲙ” (“Tom”). In the Testament of Solomon, it became “Katrax” or “Atrax”, Aristobulus of Paneas (2nd century B.C.E.) called it “Angaf”, in Greek Hermeticism it became “Althoum”, in Latin Hermeticism “Zamendres”. 4th century Roman astrologer Julius Firmicus Maternus called it “Thumis” or “Thinnis”. Cosmas of Maiuma (d. 760) called it “Themis”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Thumi”, and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲓⲥⲓⲥ” (“Isis”). “Themis” is listed for this constellation in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Variations include “Athoum”. It has been depicted as a dog-faced man with a hot red body standing on a pedestal.

Themat-Khert:

This Egyptian decan “Themat-Khert” was in the IAU constellation Virgo. In later Hellenistic texts it was named “ⲟⲩⲉⲥⲧⲉ—ⲃⲓⲕⲱⲧⲓ” (“Uste-bikot”). In the Testament of Solomon, it became “Jeropa” or “Ieropaêl”, Aristobulus of Paneas (2nd century B.C.E.) called it “Bethapen”, in Greek Hermeticism it became “Brysous”, in Latin Hermeticism “Magois”, 4th century Roman astrologer Julius Firmicus Maternus called it “Tophicus” or “Tropicus”, Cosmas of Maiuma (d. 760) called it “Moirai”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Thopitus”, and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲡⲓⲟⲥⲓⲣⲓⲥ” (“Piosiris”). Variations include “Brusous”. It has been depicted as a goat headed man with a scepter in his right hand and a flask in his left.

Theme Camp:

This American asterism is made up of stars of the IAU constellation Ophiuchus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). The oval of stars of Ophiuchus is depicted as a geodesic dome.

Themes-en-khentet:

This Egyptian decan “Themes-en-khentet” was in the IAU constellation Scorpius. In later Hellenistic texts it was named “Sesme”. In the Testament of Solomon, it became “Nefthada”, Aristobulus of Paneas (2nd century B.C.E.) called it “Nacy”, in Greek Hermeticism it became “Oustichos”, in Latin Hermeticism “Turmantis”, 4th century Roman astrologer Julius Firmicus Maternus called it “Tepsisen” or “Asentatir”, Cosmas of Maiuma (d. 760) called it “Leto”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Tepiseuth” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲙⲉⲣⲱϯ” (“Merota”). Variations include “Oustikhos”. It has been depicted as a man in a robe standing on a scorpion.

Theogay:

This Mabuiag asterism "Theogay" is their creator God and involves the IAU constellations Centaurus, Crux, Corvus, Lupus, and Scorpius (Hamacher et al 2017):

- Theogay's "canoe" is the IAU constellation Scorpius,
- Theogay's "body" is the IAU constellations Lupus and Centaurus,
- Theogay's "left hand" is holding a spear which is the IAU constellation Crux,
- Theogay's "right hand" is holding a Eugina or Kupa fruit which is the IAU constellation Corvus, and
- The water that Theogay's "boat" is sailing in is the Milky Way.

Compare to the Meriam Mir and Kala Lagaw Ya asterism Tagai (see above).

Theogay's Crew:

This Mabuiag asterism "Zugubals" relates to their creator God Theogay (see Theogay, above), who got so upset with his boat crew that he turned them into stars in the IAU constellations Taurus and Orion (Hamacher et al 2017). Thus, this has two parts:

- The first asterism, "Usual", is the Pleiades cluster in the IAU constellation Taurus, and
- The second asterism "Utimal" or "Seg", is the belt and sword of Orion.

Compare to the Meriam Mir and Kala Lagaw Ya asterism Tagai's Crew (above).

Theogay's First Mate:

This Mabuiag star "Kang" relates to their creator God Theogay (see Theogay, above) and is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Hamacher et al 2017). Compare to the Meriam Mir and Kala Lagaw Ya asterism Kareg (see Tagai's First Mate, above).

Theoretician's Nebula:

See Lemon Slice Nebula, above.

Theseus:

This Latin asterism is the IAU constellation Hercules. Theseus was the king and founder of Athens and slayer of the Minotaur:

- Johann Bayer's *Uranometria* (1603) lists "Theseus" for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Theseus" as an alternate name for Hercules.
- "Theseus" is listed in R. H. Allen's *Star Names* in 1899 as a name for Hercules.

Theseus and Pirithoüs:

This Greek asterism is the IAU constellation Gemini. Theseus was the king and founder of Athens and slayer of the Minotaur. Pirithoüs was his best friend.

Thespia:

This Greek asterism "Thespia" or "Thesbia" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Thespia is the daughter of the river God Asopus.

Thessaly Arrow:

This Latin asterism “Thessalica Sagitta” is the IAU constellation Sagittarius as listed by 1st century Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.). Thessaly is the mythical birthplace of the Centaurs. Johann Bayer’s *Uranometria* (1603) lists “Thessalicae Sagittae”.

Theta:

One is Pothier 4 in the IAU constellation Cepheus. René Merting describes it on the Faint Fuzzies website: “At 45x, an elaborately curved chain of stars can be seen, like the Greek letter Theta (?), only without the curl - a good eight stars form the pattern, which could also be seen as a mirror-inverted question mark - one star in the east of the pattern shines slightly orange-pink”.

Thetas:

This **telescopic** asterism is made up of a pair of stars of the IAU constellation Taurus: Theta (θ) 1, and 2 Tauri. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels these the “Thetas”.

They Go Inside:

This T’atsaol’ine and Wiidiideh star “wezhìı nàgede” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021).

They Rose Far Up:

This Gwich’in asterism “Yeedàak Gahàajil” is Delta (δ) Boötis, Epsilon (ε) Boötis, and Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021). They also call this “It is Naming the Morning” (see above) and “They Rose Straight Up” (see below).

They Rose Straight Up:

This Gwich’in asterism “K’iidàk Gahàajil” is Delta (δ) Boötis, Epsilon (ε) Boötis, and Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021). They also call this “It is Naming the Morning” (see above) and “They Rose Far Up” (see above).

They Sit Together:

This T’atsaol’ine and Wiidiideh asterism “łą wedzà” or “ełexè whela” is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021).

Thiazi’s Eyes:

This Icelandic asterism “Þjass auga” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Cleasby and Vigfusson 1874, Allen 1963). Thiazi (Thjazi, Tjasse, Thiazzi, Thiassi, Old Norse “Þjazi”) was the son of the giant Ölvaldi, brother of giants Iði and Gangr, and the father of Skaði. Thiazi kidnapped the goddess Iðunn. Odin punished him by throwing his eyes into the sky. Bender (2020) speculates that the Anglo-Saxons may have named Pollux “right eye” or “riht éage” and Castor “left eye” or ”left éage” or “lyft éage”. In Norse that would make Pollux “réttr auga” and Castor “vinstri auga” (Cleasby and Vigfusson 1874, Hall 1916).

This Anglo-Saxon asterism “ge Twisan” ” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Bender 2020).

This Saxon asterism ”Thiazis Augen” is the stars Alpha (α) Bootis (Castor) and Beta (β) Bootis (Pollux) in the IAU constellation Boötes as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Thick Arms of Puppis:

This **telescopic** asterism “Crassibrachiátus Púppis” is the barred spiral galaxy NGC 2525 in the IAU constellation Puppis. It was discovered in 1791 by William Herschel who listed it as “III 877. It became GC 1623 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Thick Fingered of Lupus:

This **telescopic** asterism “Pachydáctylus Lúpi” is the intermediate spiral galaxy IC 4444 in the IAU constellation Lupus. First recorded by American astronomer DeLisle Stewart (1870 – 1941). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “its thick flocky spiral arms, to be compared with fat fingers”.

Thick Nucleus of Cetus:

This **telescopic** asterism “Pachynúcleus Céti” is the galaxy NGC 210 in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as II 452. It is GC 107 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has a “bright nucleus”. It appears to be becoming a ring galaxy.

Thief Bird:

This Sotho asterism “Ma-selatheko” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. This is the fork-tailed Drongo (Dicrurus adsimilis).

Thieves:

This Macedonian asterism “Aramii” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). They are called “the Thieves” because they circle Alpha (α) Ursae Minoris (Polaris) like thieves around a house “and never sleep” (Cenev 2004 & 2014). The star 80 Ursae Majoris (Alcor) is the “Small Thief”. Compare this to the Basque asterism Seven Thieves (see above). Cenev writes that this appears in parts of Bulgaria, Greece, Serbia and Boznia and Herzegovina and variations include Ajduci or Hajduci.

Thieves’ Crosses:

This Tzotzil (of Zinacantán) asterism is two crosses of stars (Milbrath 1999):

- One cross is the False Cross in the IAU constellations Carina and Vela (see False Cross, above)
- The other cross is made up of stars of the IAU constellation Lepus.

This K’iche’ (of Quetzaltenango and Momostenango) and Kaqchikel asterism has three parts (Milbrath 1999):

- One cross is the IAU constellation Crux,

- One is a cross made up of stars of the IAU constellation Sagittarius with Delta (δ) Sagittarii in the middle and the end stars being Epsilon (ε), Sigma (σ), Lambda (λ) and Gamma (γ) Sagittarii.
- The location of the third cross is uncertain.

Thieves' Dagger:

The Kaqchikel of Chinautla send their boys out at the age of six or seven to fight for the stars of a cross constellation. It is uncertain whether this is the Southern Cross (see Southern Cross, above) or the Northern Cross (see Northern Cross, above). Since some Mayan cultures recognize asterisms which they call Thieves' Crosses (see above), I'm listing it as the IAU constellation Crux.

Thigh:

This Arabic star "(al-)Fakhidh" (فخذ) or "Al Faẖdh" is Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major:

- This was later latinized to "Phad", "Phecda", "Phacd", 'Phachd", "Phaed", "Phekda", "Phegda" or "Phekda" (Hafez 2010).
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Phad".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Phecda" and his *Bedford Catalogue* in 1844 lists "Phecda, from the Arabian Fekháh al dub al akbar, the thigh of the Great Bear".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Phecda".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Phachd": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Phecda".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Phecda" and describes it as the "Thigh".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Phecda" and "Phekha" but the 14th edition (1959) lists this star as "Phecda".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the names "Phecda" and "Phekda" for this star.
- The IAU approved the name Phecda for the star Gamma (γ) Ursae Majoris Aa.

This Naron star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

Thill Horse:

This star is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major as listed English Admiral Henry William Smyth's *Bedford Catalogue* in 1844. A "thill" is a shaft and a "thill horse" is one that draws a wagon, in this case, as Smyth makes clear, "Charles' Wain", the Big Dipper asterism.

Thin Body of Draco:

This **telescopic** asterism "Leptosómus Dracónis" is the spiral galaxy NGC 6643 in the IAU constellation Draco. It became GC 4415 in the *General Catalogue* of 1864. It was discovered by German astronomer Eduard Schönfeld in 1858. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "its small nucleus and thin spiral arms".

Thin Stars:

This Nuer asterism "QuelYuk" is the Pleiades cluster in the IAU constellation Taurus. To the Nuer, their watery appearance is associated with the rain that does not come until they disappear over the horizon for the season.

Third Donkey Colt:

This Latin star "Asellus Tertius" is Kappa (κ) Boötis in the IAU constellation Boötes and is part of their asterism Donkey Colts (see above). Compare this to the Arabic asterism Whelps of the Hyenas (see below). German astronomer Johann Bayer (1572-1625) listed it under this name. The IAU approved the name Asellus Tertius for Kappa (κ) Boötis.

Third Ibex:

- This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is made up of stars from the IAU constellation Cepheus. The central star is HIP 105898, from which three lines of stars emerge: One runs through HIP 105193 to HIP 102216,
- One runs to HIP 106227, and
- One runs to HIP 103359.

Third Leap of a Gazelle:

There are three Arabic asterisms with the name "al-Qafzat uth-Thālathah" or "al-qafza al-thālitha" (القفزة الثّالثة):

- One is the stars Iota (ι) and Kappa (κ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Leaps of a Gazelle. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al Phikra Al Thálitha, perhaps for Al Kafzah al thálithah, the third spring, or leap of the ghazal", attributing this to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- One is the star Chi (χ) Ursae Majoris in the IAU constellation Ursa Major, whose name was later latinized to "Al Kaphrah" or "Alkafzah".
- One is the star Iota (ι) Ursae Majoris in the IAU constellation Ursa Major, whose name was latinized to "Talitha", "Talita", or "Talitha Borealis":
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Iota (ι) Ursae Majoris as "Talitha".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Talitha" and "Talita" for Iota (ι) Ursae Majoris, but the 14th edition (1959) only lists "Talitha" for this star.
    - The IAU has approved the name Talitha for Iota (ι) Ursae Majoris Aa.

NOTE: English astronomer William Henry Smyth (1788 – 1865) claimed that Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed the name "Al Phikra al Thalitha" and translated that as "third vertebrae".

Third of the Virgins:

This Arabic star "taalit al-aðārii" (تالت ألعذاري) in the *Calendarium* of Al Achsasi Al Mouakket in 1650, its name later latinized to "Thalath al Adzari" or "Udra" is the star Omicron (ο) 1 Canis Majoris in the IAU constellation Canis Major.

This Latin star Tertia Virginum, is Omicron (ο) 1 Canis Majoris in the IAU constellation Canis Major.

Third of Warida:

This Persian star Thalith al Waridah" or "Thalath al Waridah" is Epsilon (ε) Sagittarii in the IAU constellation Sagittarius and was listed in the *Calendarium* of Al Achsasi al Mouakket in 1650. This is part of the asterism Going Ostriches (see above).

Third Returning Ostrich:

This Arabic star "Thalath al Sadirah", later latinized to "Tertia τού al Sadirah" is listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 and is Zeta (ζ) Sagittarii in the IAU constellation Sagittarius.

Thirsty Camels:

This Arabic asterism "Al Ḥawāʾim" is the stars Theta (θ), Zeta (ζ), and Nu (ν) Pegasi in the IAU constellation Pegasus as listed in R. H. Allen's *Star Names* in 1899. Allen writes that this appears on the Dresden Globe of 1259.

Thirteenth Pearl Nebula:

This **telescopic** asterism is reflection nebula NGC 1999 (vdB 46, LBN 979, Ced 55i) in the IAU constellation Orion. This was discovered by English astronomer William Herschel in 1785: Herschel described it as "a star with milky chevelure or vB nucleus with milky nebulosity" and listed it as "IV 33" in his catalogue. It is GC 1202 in the *General Catalogue* of 1864. The Helwan Observatory Bulletin No. 21 of 1920 describes it as a "dense glove with an absolutely dark triangular hole cutting into it." It is also known as the Black Eye Nebula (see above), the Rubber Stamp Nebula (see above), the Keyhole Nebula (see above) and "Africa" (see above).

This is a Blessing:

This asterism "Afeic hius" is the IAU constellation Ophiuchus. This name is listed in Johann Bayer's *Uranometria* (1603).

Thisbe's Veil:

This asterism is the Coma Berenices Cluster, Melotte 111. It is a reference to the ancient Greek myth of the lovers Thisbe and Pyramus.

Thomas:

This German asterism "Thomas" or "Saint Thomas the Apostle" is the IAU constellation Leo and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Thomas Al Leo". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Thommes' Nebula:

This **telescopic** asterism is the reflection nebula LBN 1022 in the IAU constellation Monoceros. It was discovered in an image taken by American astrophotographer Jim Thommes in November 2009. It surrounds the star V900 Monocerotis.

Thong:

This Tawi-Tawi star is Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion and represents one of the brothers in their asterism Tanggong (see above).

Thorn:

This Arabic star "aš-šawkat" (الشوكة) is 31 Lyncis in the IAU constellation Lynx:

- This was later latinized to "Alsciaukat" and "Al Shaukah", and as "Masbuthat", and "Mabsūṭah" by translator Giuseppe Simone Assemani (1687 – 1768).
- The IAU Working Group on Star Names approved Alsciaukat as a name for 31 Lyncis in 2017.
- NOTE: Hafez (2010) gives "Alsciaukat" as a name for 35 Ursae Majoris.

Thorn of Puppis:

This **telescopic** asterism "Spína Púppis" is the edge-on lenticular galaxy NGC 2310 in the IAU constellation Puppis. It was discovered in 1835 by English astronomer John Herschel who listed it as 3069 and later as GC 1472 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its interaction with NGC 2292.

Thorn Puller of Leo:

This **telescopic** asterism "Spinárius Leónis" is the intermediate spiral galaxy NGC 3368 in the IAU constellation Leo. John Herschel listed it as h 749 and later as GC 2194 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "a distant edge-on galaxy at the northeastern edge of NGC 3368 looks like a thorn" and "the curved spiral arm extending to this side brings to mind the curved posture and legs of the famous Hellenistic bronze sculpture of a boy pulling a thorn from his foot".

Thorn Stars:

This Namaqua KhoiKhoi asterism is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014).

Thorny Devil Lizard:

This Kokatha and Ngalea asterism "Kunggara" or "Yugarilya" was listed by Leaman and Hamacher in 2014 and is part of the larger asterism "Nyeeruna Nyiruna" ("hunter of the seven thorny devil sisters"), which is the IAU constellation Orion (see Hunter of the Seven Sisters, above). This asterism is the Pleiades cluster in the IAU constellation Taurus. The other part is "Yugarilya" or "Kambugudha", which is the Hyades cluster (see Eldest Mingarri Sister, above).

Thor's Helmet:

This **telescopic** asterism is HII region NGC 2359 (SH 2-298. RCW 5, LBN 1041, Ced 94b) in the IAU constellation Canis Major surrounding the Wolf Rayet star WR7. Size 10' X 15'. It was discovered by

English astronomer William Herschel in 1785 who listed it as “V 21” in his catalogue. It is GC 1511 in the *General Catalogue* of 1864. It is also known as the “Duck Nebula”, the “Duck Head Nebula”, the “Flying Eye Nebula”, the “Bust Silhouette”, the “Fan”, “M”, or the “Whistle Nebula”.

Thor’s Lightning:

This **telescopic** asterism is alongside the dark nebula Barnard 11 in the IAU constellation Camelopardalis. It is listed under this name by astrophotographer Justin Tolboe.

Thor’s Mjolnir:

This **telescopic** asterism is in the IAU constellation Cassiopeia and is Ennis 29 on the observing list of Canadian astronomer Charles Ennis. It resembles the hammer of the Norse God Thor and includes stars of Corder 206 from Jeffrey Corder’s list.

- The “hammer head” is a rectangle formed by HD 236678, HIP 5863, double star HIP 5829, HIP 5768, and HIP 5882, and
- The “handle is formed by Gaia DR3 510417525536676864, Gaia DR3 510416426025078144, and HD 7010.

Thor’s Wagon:

This Swedish asterism “Karlwagen” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) and is related to the God Thórr, who is described in old chronicles as “Thor statt naken som ett barn, siu stjernor i handen och Karlewagn” (“Thor stepping into his chariot holds the seven stars in his hand”) (Teutonic Mythology ch. 22). Thor had the heiti (synonym or nickname) “Karl” (“man”) as he was sometimes referred to as “Karla-Þórr” (“Old Man Thórr”). R. H. Allen notes this connection in his *Star Names* in 1899.

Those Born of Feet:

This Inca asterism “Chuchuqoyllor” is the IAU constellation Gemini (Gamarra & Gamarra 2009).

Those Multiple Objects Which Are Moving Along:

This is an alternate Koyukon name, “Ghededzuyhdle” for their asterism “Naagheltaale” (see That Which is Revolving, above (Cannon 2021)).

Those That Are Following Something:

This Koyukon asterism “K’enodele” is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Those Who Stand Together:

This Namaqua KhoiKhoi asterism “/Khunuseti” or “/Khũseti” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014). They were the daughters of Tsui //Goab, the Sky God. Another version of this story has Kunuseti being the wives of Tsui //Goab (the star Aldebaran). Tsui //Goab goes out with bow and arrow (Pi (π) 1 to 6 Orionis) to shoot three zebras (the belt of Orion, see Three Zebras, below). His sandals (“//haron”) are Epsilon (ε) and Delta (δ) Orionis. Unfortunately, he misses, his arrow lying on the ground (sword of Orion). He doesn’t retrieve it as a lion (the star Betelgeuse) is waiting in ambush. Alternate translations include “those who stand together like fingers” and “those who are heaped together”, and “those who cluster together”.

Thoth:

This proposed Egyptian asterism “wnt” or “Unet” (which is the name of their rabbit Goddess) from the Old Kingdom (3100 B.C.E.) is related to the nome (district) by that name, to the solar God “ḫpri” worshipped in the capital Heliopolis and related to Thoth and the IAU constellation Lepus (Berio 2014).

This Egyptian star is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis as listed in the 19th dynasty Cairo Calendar (Hardy 2003).

Thoth’s Baboon:

This Egyptian Dendera asterism is made up of stars of the IAU constellations Camelopardalis and Perseus (Hoffman 2017). Thoth was an Ibis or Baboon headed Egyptian God of the Moon, wisdom, writing, art, and judgment. Thoth is depicted at Dendera in his baboon aspect. This is an irregular hexagon of the stars Alpha (α) Persei (Mirfak), Delta (δ) Persei, Mu (μ) Persei, Beta (β) Camelopardalis, Alpha (α) Camelopardalis, and Gamma (γ) Persei. From Gamma (γ) Persei a line runs out to a bend at Eta (η) Persei and on to Theta (θ) Persei. From Mur Persei a line runs out through Xi (ξ) Persei to Zeta (ζ) Persei.

Thousand Ruby Galaxy:

This **telescopic** asterism is Messier 83 (NGC 5236), a barred spiral galaxy in the IAU constellation Hydra. French astronomer Charles Messier added it to his catalogue in 1781, but it was first observed by French astronomer Nicolas Louis de Lacaille in February 1752 who listed it as Lac I6. It is GC 3606 in the *General Catalogue* of 1864. It is also known as the Southern Pinwheel, its name coming from its resemblance to the Pinwheel Galaxy, Messier 101.

Thousands:

This ancient Egyptian asterism is the Pleiades cluster in the IAU constellation Taurus. It appears on star tables on coffin lids c. 2000 B.C.E.

Thread Bearer of Cetus:

This **telescopic** asterism “Filifera Céti” is the spiral galaxy NGC 309 in the IAU constellation Cetus. It was discovered by Wilhelm Tempel in 1876. This is GC 309 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its “characteristic threadlike arms”.

Thread Straw:

This Korean asterism “Sil Ppaldae” (실 빨대) is the IAU constellation Corona Borealis.

Thread Suspender of Aquarius:

This **telescopic** asterism “Mitocremástus Aquárii” is the galaxy PGC 72139 (MCG-01-60-22, Arp 295) in the IAU constellation Aquarius. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy is located at the northeastern end of a long narrow thread like bridge that connects MGC 1-60-22 with MGC 1-60-21”.

Threading Coins:

This Korean asterism “Seuleding Dongjeon” (스레딩 동전) is an oval of stars in the IAU constellation Aquarius: 41, 47, and 49 Aquarii and HIP 109375, 109737, 109990, and 110746. Ancient Korean coins had holes in the middle so that they could be threaded together on a string.

Three:

This Tongan (Pukapuka Islands) asterism “Tolu” is three stars in the IAU constellation Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain), and Gamma (γ) Aquilae.

This Finnish asterism “Kolmonen” is the Belt of Orion asterism in the IAU constellation Orion. It is also known as “Kolmoset” (The threes) or “Kolmioiset” (The triangle ones).

Three Arms of Antlia:

This **telescopic** asterism “Tribrachiátus Ántliae” is the barred spiral galaxy NGC 3095 in the IAU constellation Antlia. It was discovered in 1836 by John Herschel who listed it as h 3216 and later as GC 1993 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Three Babies:

This Yakut asterism is the Belt of Orion in the IAU constellation Orion.

Three Balls:

This Romanian asterism “Trei Bile” or “Deșteptătorul”, also known as the “Alarm Clock” (see above) is the Hyades cluster (see above) in the IAU constellation Taurus (Ottescu 2009, Lite, Lodina, and Ignat 2018). Ottescu associates this name with the star Alpha (α) Tauri (Aldebaran) and not the whole cluster. It is called this as its rising the cockerels start crowing to announce the start of day.

Three Brother Star:

This Malay asterism “Bintang Tiga Beradik” is the IAU constellation Orion.

Three Brothers:

This Wiradjuri asterism “Gibirgang” is the belt of Orion in the IAU constellation Orion. They chase the “Malandyang” (see Seven Sisters, above). Compare this to the Yolgnu asterism Berai Berai (see Seven Young Men, above) or the Kamilaroi/Euahlayi asterism “Birray Birray” (see Uninitiated Boys, below).Matthews listed it as “Gibabang” in 1904.

This Tsilhqot’in asterism is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Three Brothers and Three Sisters Pursuing an Elk:

This Yukaghir asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

Three Canoe Paddlers:

This Tongan asterism “Alutolu” (“three oared boat” or “three canoe paddlers”) is the belt of Orion in the IAU constellation Orion.

Three Castles with the Golden Vellere:

This German asterism “tria Castella cum Aureo Vellere” was created from the stars of the IAU constellation Leo by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new

system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Spain and is depicted by three round castle towers and a golden fleece.

Three Chiefs:

This Ininew (Cree) asterism is part of their asterism "Mistapiw" (see Giant above) which is their name for the IAU constellation Orion (Buck 2016). He is also known as "Wesakayckak" (see Teacher, above). The three stars of Orion's belt are the "Three Chiefs".

Three Daughters:

In Nama sky lore the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus represents the husband of the daughters of the sky god. The three daughters are the Pleiades cluster in the IAU constellation Taurus. When the husband shot his arrow (Orion's sword) at three zebras (the belt of Orion) it fell short. He didn't recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching.

Three Deer:

This Pawnee asterism is the belt of Orion in the IAU constellation Orion.

This Teleut asterism is the belt of Orion in the IAU constellation Orion (Kuperjanov 2006). They are being hunted by Sirius (see Hunter, above).

This Kazakh asterism "Üshar Qartazy", "Usharhar Taraza", or "Ush argali Tarazi" is the IAU constellation Orion.

Three Deities:

This Japanese asterism "Sumiyoshi Boshi" is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

Three Dog Children Brothers:

This Dakelh asterism is the IAU constellation Orion (Cannon 2021).

Three Dogs:

This Tswana asterism "Dintsa le Dikolobe" ("the three dogs are chasing the three pigs"), "Dikolobe", or "Mikolobe" is the belt of Orion's in the IAU constellation Orion (Holbrook and Baleisis 2007, Slotegraaf 2013). These dogs chase three pigs (Orion's belt- see Three Pigs, below).

This Sotho asterism "Dintshwa" is identical to the Tswana asterism "Dintsa le Dikolobe" (Slotegraaf 2013).

Three Excellencies:

This Chinese star "Sansong" from the Three Kingdoms to the Ming Dynasty is the star Iota (ι) Geminorum: "Sangong" in the IAU constellation Gemini and is part of their xing guan Five Feudal Kings (see above).

There are two Chinese Chenzhuo xing guans by the name "Sansong":

- The Gan school xing guan is a triangle of stars in the IAU constellation Canes Venatici: 21 and 24 Canum Venaticorum and HIP 65550.

- The Wuxian school xing guan is a triangle of stars in the IAU constellation Ursa Major: 38 Ursae Majoris, HIP 50933, and HIP 51448.

Three Excellencies (in Purple Forbidden Enclosure):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Sāngōng" (三公) is a triangle of three stars in the IAU constellation Canes Venatici: 21 and 24 Canum Venaticorum and HIP 65550. It is located within their xing guan Purple Forbidden Enclosure (see above).

This Chinese xing guan "Sāngōng" (三公) despite the name, is a line of two stars in the IAU constellation Canes Venatici: 21 and 24 Canum Venaticorum. It is located within their xing guan Purple Forbidden Enclosure (see above).

Three Excellencies (in Supreme Palace Enclosure):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Sāngōng" (三公) is a triangle of three stars in the IAU constellation Virgo: 17 and FW Virginis and HIP 61103. It is located within their xing guan Supreme Palace Left Wall (see above).

This Chinese xing guan "Sāngōng" (三公), despite the name, is a line of two stars in the IAU constellation Virgo: 31 and 35 Virginis. It is located within their xing guan Supreme Palace Left Wall (see above).

Three Female Tortoises (Hung on a Stick):

This /Xam asterism is the sword of Orion in the IAU constellation Orion (Slotegraaf 2013, Alcock 2014).

Three Fishermen:

This Old Norwegian asterism is the belt of Orion in the IAU constellation Orion.

This Polynesian (Gilbert Island) asterism is the belt of Orion in the IAU constellation Orion.

Three Guides:

This asterism is three stars in the IAU constellations Andromeda, Cassiopeia, and Pegasus: Beta (β) Cassiopeiae (Caph), Alpha (α) Andromedae (Alpheratz), and Gamma (γ) Pegasi. It was listed in R. H. Allen's *Star Names* in 1899.

Three Hairlocks of Sextans:

This **telescopic** asterism "Tricrinítus Sextántis" is the spiral galaxy IC 609 (Arp 44) in the IAU constellation Sextans. It was discovered by French astronomer Stéphane Javelle in 1893. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the three curved arms extending from the northern part of this galaxy."

Three Handsome Ones:

This Māori, Tahitian, and Rapanui asterism "Tautoru" is the belt of Orion (Edwards and Edwards 2010, Edwards 2015, Edwards and Edwards 2016, Edwards et al 2018).

Three Headed Anaconda:

This Palikur asterism "Awahwi" is stars in the region of the IAU constellation Perseus (Green and Green 2011).

Three Hearthstones:

This Mayan asterism from their creation story Popol Vul is three stars in the IAU constellation Orion: Zeta (ζ) Orionis (Alnitak), Kappa (κ) Orionis (Saiph), and Beta (β) Orionis (Rigel). They surround the Primordial Fire, **"**Oxib' Xk'ub'" (see Primordial Fire, above). The K'iche' still recognize this asterism (Milbrath 1999). In the Madrid Codex these are referred to as the "three stones of creation" and in classical period inscriptions at Palenque and Quiriguá these are referred to as the "three stone place".

Three Hunters:

This /Xam asterism is the belt of Orion in the IAU constellation Orion (Alcock 2014). They are three hunters waiting in ambush for springbok which another hunter is sending in their direction.

This Dëne Suhne asterism "Názée Dëné" is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Three Jointed Arrow:

This Hindu asterism "Iṣus Trikāṇḍā" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Three Kings:

This German asterism is the IAU constellation Hercules as listed by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Tres Reges". Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as the "Three Kings of soothsayers."

This French asterism "les trois Rois" is the belt of Orion in the IAU constellation Orion and appears in the French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719)This Italian asterism "Tre Re" is the belt of Orion in the IAU constellation Orion.

This Belarussian asterism "Try Karali" is the belt of Orion in the IAU constellation Orion. It is also known as "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Grabli" (see Rake, above), "Kastsy" (see Mowers, above), "Kasar" (see Mower, above), "Karomyselko" (see Small Yoke, above), "Tri Siostry" (see Three Sisters, below), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Traiko" (see Three Times, below), "Asilki" (see above), "Matawila" (see Wheel, below), "Kosy" (see Scythes, above), "Kigachi ragachy" (see Shaft of a Plough, above), Kryzhe (see Cross, above), "Lisa" (see Fox, above), and "Trohkutnaia" (see With Three Corners, below).

This Tzeltal asterism "Oktu Rey" is the belt of Orion in the IAU constellation Orion (Milbrath 1999).

This Romanian asterism "Cei Trei Crai" is the belt of Orion in the IAU constellation Orion (Ottescu 2009). Their names are Saul, David, and Solomon.

Three Leaps of a Gazelle:

This Arabic asterism "Kafazāt al-Zibā" ("leaps of a gazelle") is made up of three pairs of stars roughly equally spaced stars that look like the footprints of a leaping animal in the IAU constellation Ursa Major:

- "First Leap" or "(al-Qafzat) ul-Ūla'" (القفزة الأولى) is the stars Nu (ν) and Xi (ξ) Ursae Majoris

- "Second Leap" or "al-Qafzat uth-Thāniyah" (لقفزة الثّانية) is the stars Lambda (λ) and Mu (μ) Ursae Majoris,
- "Third Leap" "al-Qafzat uth-Thālathah" (القفزة الثّالثة) is the stars Iota (ι) and Kappa (κ) Ursae Majoris.

This appears in several places:

- Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010) lists them as:
    - "al-Kafza al-Ūla" ("first leap"),
    - "al-Kafza al-Thānīa" ("second leap"), and
    - "al-Kafza al-Thālitha" ("third leap").
- This asterism appears on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al dhibá, the antelopes" for this asterism but elsewhere in the catalogue lists "Kafzát al dhibá, springs of a gazelle".
- In his *Star Names* in 1899 R. H. Allen lists "Ḳafzah al Ṭhibā".
- NOTE: This is also known as "Gazelle Tracks" (see above).

Three Lilies:

This German asterism "Lilia tria" was created from the stars of the IAU constellation Auriga by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. On Weigel's chart it is labeled "Gallia" and represents France, being depicted as a triple fleur de lys.

Three Luritja Sisters:

This Luritja asterism is the stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii in the IAU constellation Scorpius (Maegraith 1932). They are from a camp in the far west, below the horizon.

Three Magi:

This German asterism is the IAU constellation Hercules and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). It later appears in John Hill's *Urania* in 1754 as "Magi".

Three Male Tortoises (Hung on a Stick):

This /Xam asterism is the belt of Orion in the IAU constellation Orion (Slotegraaf 2013, Alcock 2014).

Three Marias:

This Sardinian asterism "sas tres marias" is the belt of Orion in the IAU constellation Orion. They also call it "Sticks" (see above).

This Piemontese asterism from the Chaco region of Argentina is the belt of Orion in the IAU constellation Orion (Mudrik 2011). Mudrik writes that each star in the belt was given a name, but that

only two were obtained: “la niña” and “la pinta”, which are of course the names of two of the ships of the explorer Columbus.

This Mocoví, Abipones, Spanish and Latin American asterism “Tres Marias” is the belt of Orion in the IAU constellation Orion (Mudrik 2011). They also call it “Sticks” (see above).

This Tagalog asterism “Tatlong Maria” is the belt of Orion in the IAU constellation Orion (Santos et al 2019).

This Itbayaten asterism “Trismariiya” is the belt of Orion in the IAU constellation Orion.

This Ch’orti’ and Tzotzil (of Zinacantán) asterism is the belt of Orion in the IAU constellation Orion (Milbrath 1999). They combine this with the sword of Orion to create the asterism “Seven Marias” (see above).

Three Men and a Cot:

This Kolam asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Vahia et al 2014). One person is from the Kolam people, one from the Gond, and one is a “Pardhan” or “chief”. They are rising from the cot.

Three Men Deciding About Weather:

This Erromanga (Sie) asterism “Umbrit Mime” is the belt of Orion in the IAU constellation Orion (Ramík 2019).

Three Men Following:

This Kolam asterism is the Little Dipper asterism in the IAU constellation Ursa Major (Vahia et al 2014). One person is from the Kolam people, one from the Gond, and one is a “Pardhan” or “chief”. Compare this to the Gond asterism Three Thieves Following (see below).

Three Ministers:

There are two Korean asterisms with this name (“Se Myeong-ui Jang-gwan” (세 명의 장관)):

- One is a triangle of stars in the IAU constellation Virgo: 32, 33, and Rho (ρ) Virginis.
- One is a triangle of stars in the IAU constellation Ursa Major: 38 and ET Ursae Majoris and HIP 51448.

Three Old Men Pursued by Lonesome Widows:

This Maasai asterism is the belt of Orion (the old men) and the sword of Orion (the widows) in the IAU constellation Orion (Slotegraaf 2013).

Three Packages of Salmon:

This Dakelh asterism is the sword of Orion in the IAU constellation Orion (Cannon 2021).

Three Patriarchs:

This German asterism is the IAU constellation Triangulum Minor and was created by German poet and author Philippus Caesius (Philipp von Zesen, 1619 – 1689) to represent Abraham, Isaac, and Jacob (with the star Alpha (α) Trianguli Australis (Atria) as Abraham and the other two stars being Beta (β) and Gamma (γ) Trianguli Australis. Size 480’. Jeffrey Corder lists this as Corder 2957.

Three People Walking:

This Belarussian asterism is the belt of Orion in the IAU constellation Orion (Avilin 2009). These stars are described as “three chavaleks (“people”) walking.

Three Pigs:

This Tswana asterism “Dikolobe” is the belt of Orion in the IAU constellation Orion (Slotegraaf 2013). Warthogs or bush pigs usually have their litters while Orion is prominent in the sky, and typically have litters of three. Three dogs (see Three Dogs above) are chasing them (Orion’s sword). NOTE: This is bushpigs or bosvark (Potamochoerus larvatus).

This Sotho asterism “Makolobe” is identical to the Tswana asterism “Dikolobe” above (Slotegraaf 2013). A hunting dog, the star Sirius, is chasing them (see Hunting Dog, above).

This Karanga asterism “Nguruve” is identical to the Tswana asterism “Dikolobe” above (Slotegraaf 2013).

Three Plumes of Virgo:

This **telescopic** asterism “Triplúmus Vírginis” is the spiral galaxy NGC 4580 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “I 124”. It became GC 3122 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “three faint, diffuse outer arms”.

Three Pointed:

This Greek asterism “Tricuspis” is the IAU constellation Triangulum. Johann Bayer’s *Uranometria* (1603) lists the name “Tricuspis” for this constellation.

Three Pole Stand:

This Japanese asterism “Haza no Ma” is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

Three Prong Spear:

This Japanese asterism “Kanatsuki” is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

This Sama star “Sahapang”” is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Ambrosio 2008).

Three Reapers:

This Old High German asterism is the belt of Orion in the IAU constellation Orion. Compare this to the Italian and Belarussian asterism “Mowers” (see above).

Three Saints:

This Romanian asterism “Trei Sfinți” or “Trisfetitele”, also known as “the Great Auger” (see above), is Orion’s belt in the IAU constellation Orion (Ottescu 2009, Lite, Lodina, and Ignat 2018). There names are Vasile, Grigore, and Ioan.

Three Sisters:

This Kaykavian asterism “Tri Séstre” is the IAU constellation Triangulum.

This Belarussian asterism “Tri Siostry” is the IAU constellation Orion (Avilin 2009). This relates to a myth of three cursed sisters who became three stars in the sky when they died. It is also known as “Karomyselko” (see Small Yoke, above), “Grabli” (see Rake, above), “Kastsy” (see Mowers, above), “Try Karali” (see Three Kings, above), “Kasar” (see Mower, above), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, above), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Traiko” (see Three Times, below), “Asilki” (see above), “Matawila” (see Wheel, below), “Kosy” (see Scythes, above), “Kigachi ragachy” (see Shaft of a Plough, above), Kryzhe (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, below).

This Basque asterism “Hiru Ahizpak” is the IAU constellation Andromeda (Knörr 1999, Frank 2021).

Three Snowballs:

This **telescopic** asterism is the three Strömgren spheres IC 2162 (Sharpless 257), Sharpless 254 and Sharpless 255 in the IAU constellation Orion. These were named by German astronomer Reiner Vogel, who posted about it in the *Deep Sky Forum* in January 2013.

Three Spinning Sisters:

This Lithuanian asterism “Trys seselės verpėjos” is the belt of Orion asterism in the IAU constellation Orion.

Three Stacked Plates:

This **telescopic** asterism is the open cluster Messier 23 (NGC 6494) in the IAU constellation Sagittarius. It was discovered by Charles Messier in 1764. It is listed in the *General Catalogue* of 1864 as GC 5886. It was given this name by American astronomer Wayne Schmidt, who describes it as three plates stacked upside down.

Three Stacked Pots:

This Kolam asterism “Kavadi Kunde” or “Kavedi Koda” is the IAU constellation Cygnus (Vahia 2014).

Three Stags:

This Mongolian asterism “Gurvan Maral Od” is the Summer Triangle asterism (see Summer Triangle below) which includes stars of the IAU constellations Aquila, Cygnus, and Lyra (Lagain & Rousseau 2015).

Three Star:

This Tzeltal asterism “Oxkot-ek” is the belt of Orion in the IAU constellation Orion (Milbrath 1999).

Three Stars:

This Chinese xiù (lunar mansion) “Shēnxiù” (参宿) is the three stars of the “belt of Orion” in the IAU constellation Orion. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Shēn” was associated to matters concerning the Yizhou territory. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is the Belt of Orion asterism in the IAU constellation Orion: Zeta (ζ) Orionis, Epsilon (ε) Orionis, and Delta (δ) Orionis. This is also known as “Scales”.

This Korean lunar mansion “Saam” is identical to the Chinese lunar mansion “Shēnxiù” (above).

This Xhosa asterism “Amakroza” or “amaRoza” (“three stars in a row” or “those in a queue”) is the belt of Orion in the IAU constellation Orion (Holbrook and Baleisis 2007, Slotegraaf 2013, Lock and Slotegraaf 2022). The lowest star is graves where all ancestors rest peacefully, the middle star is the starry heavens, and the top star is where their God Qamata dwells.

This Japanese asterism “Mitsu Boshi” is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

This Italian asterism “Tre Facelle” is three stars in the IAU constellations Carina, Eridanus, and Piscis Austrinus: Alpha (α) Piscis Austrini (Fomalhaut), Alpha (α) Carinae Canopus), and Alpha (α) Eridani (Achernar). This was created by Italian poet Dante Alighieri in his *Divine Comedy*: Alighieri described these stars as “lighting up the sky”.

This Temuan asterism “Bintang Tiga” is the belt of Orion in the IAU constellation Orion (Jaafar and Khairuddin 2014).

Three Stars of the South:

The stars of this Piemontese asterism “Las Tres Estrellas del Sur” from the Chaco region of Argentina have not been identified at present (Mudrik 2011).

Three Stars the Same:

This Inca asterism “Orqorara” is the belt of Orion in the IAU constellation Orion (Gamarra & Gamarra 2009).

Three Steps:

This Chinese xing guan “Sāntái” (三台) is a line of stars in the IAU constellation Ursa Major. It starts with Iota (ι) Ursae Majoris and Kappa (κ) Ursae Majoris (“Upper Step”, Lambda (λ) Ursae Majoris and Mu (μ) Ursae Majoris (“Middle Step”), and Nu (ν) Ursae Majoris and Xi (ξ) Ursae Majoris (“Lower Step”). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Santai” (三台） is made up of stars of the IAU constellation Ursa Major:

- The Lower Step is the stars Xi (ξ) and Nu (ν) Ursae Majoris,
- The Middle Step is the stars Mu (μ), and Lambda (λ) Ursae Majoris, and
- The Upper Step is the stars Kappa (κ) and Iota (ι) Ursae Majoris.

It is also known as the “Heavenly Steps”.

This Korean asterism “Se Dangye” (세 단계) is identical with the Chinese xing guan “Sāntái” (above).

Three Stone Place:

See Three Hearthstones, above.

Three Stone Support:

This Arabic asterism is three stars in the IAU constellation Draco: Delta (δ), Epsilon (ε) and Chi (χ) Draconis. Compare this to Trivet Stones (below) and Tripods (below).

Three Stones of Creation:

See Three Hearthstones, above.

Three Strings of Horologium:

This **telescopic** asterism "Trichórdis Horológii" is the barred spiral galaxy IC 1954 in the IAU constellation Horologium. It was discovered by Scottish astronomer Robert Innes in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its three spiral arms.

Three Swedish Crowns:

This German asterism "Suecia" is the IAU constellation Boötes as described by German astronomer Erhard Weigel (1625 – 99) who his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted by three crowns. This is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and listed in R. H. Allen's *Star Names* in 1899.

Three Thieves:

This Basque asterism "Hiru Iapurrak" is the belt of Orion in the IAU constellation Orion (Frank 2021).

Three Thieves Following:

This Gond asterism is the Little Dipper asterism in the IAU constellation Ursa Major (Vahia et al 2014). Compare this to the Kolam asterism Three Men Following (see above).

Three Times:

This Belarussian asterism "Traiko" is the constellation Orion (Avilin 2009). It is also known as "Karomyselko" (see Small Yoke, above), "Grabli" (see Rake, above), "Kastsy" (see Mowers, above), "Try Karali" (see Three Kings, above), "Kasar" (see Mower, above), "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Tri Siostry" (see Three Sisters, above), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Asilki" (see above), "Matawila" (see Wheel, below), "Kosy" (see Scythes, above), "Kigachi ragachy" (see Shaft of a Plough, above), "Kryzhe" (see Cross, above), "Lisa" (see Fox, above), and "Trohkutnaia" (see With Three Corners, below).

Three Together:

This Tzotzil (Zinacantán) asterism is the belt of Orion in the IAU constellation Orion (Milbrath 1999).

Three Top Instructors:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Ursa Major: ET Ursae Majoris (the determinative star), 38 Ursae Majoris, and HIP 51448.

This Chinese xing guan "Sānshī" (三师) is a small triangle of stars in the IAU constellation Ursa Major: Rho (ρ) and Sigma (σ) 1 and 2 Ursae Majoris.

Three Travelers:

This Lozi asterism is the belt of Orion in the IAU constellation Orion (Slotegraaf 2013).

Three Vertebrae:

This Apache asterism is the Belt of Orion in the IAU constellation Orion.

Three Women:

This Arrernte asterism is the stars Alpha (α) Scorpii (Antares), Tau (τ) Scorpii, and Sigma (σ) Scorpii in the IAU constellation Scorpius. The Arrernte see Antares as a woman covered in red ochre, with two female companions (see Red Ochre Woman, above). Maegraith listed this in 1932 with the suggestion that the stars were the Hyades cluster.

Three World Horses:

This Hittite asterism is the IAU constellation Scorpius (Boutet 2014). This consisted of a white horse, a red horse, and a black horse.

Three Zebras:

This San (Jū/Wãsi and Nyae Nyae !Kung) asterism is the Belt of Orion in the IAU constellation Orion (Slotegraaf 2013, Alcock 2014). Some San peoples describe this as a male zebra flanked by two females. Others describe the middle star as female with the others male. Still other San tribes describe the first star of the three to rise, Delta (δ) Orionis (Mintaka), as a male and the two following, Epsilon (ε) Orionis (Alnilam) and Zeta (ζ) Orionis (Alnitak) as female. They call Orion "//kahnosi".

In Jū/Wãsi and Nama sky lore the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus is the Sky God Gao ǂN!a (Old Gao, see above). When the Gao ǂN!a shot his arrow (Orion's sword) at three zebras (the belt of Orion) it fell short, and he did not recover his arrow.

This Naron asterism is the Belt of Orion in the IAU constellation Orion (Alcock 2014). The Naron describe the first star of the three to rise, Delta (δ) Orionis (Mintaka), as a male and the two following, Epsilon (ε) Orionis (Alnilam) and Zeta (ζ) Orionis (Alnitak) as female.

This G/wi asterism is the Belt of Orion in the IAU constellation Orion. The middle star, Epsilon (ε) Orionis (Alnilam) is a male zebra and the two stars flanking it female.

This KhoiKhoi asterism "!goregu" is the Belt of Orion in the IAU constellation Orion.

Threshing Floor:

This Phoenician asterism is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda. The stars around it are the Gleaners and the Wheat Field, whose precise stars are unknown.

This Macedonian asterism "Gumno" or "Goumno" is the Andromeda Galaxy (Messier 31) in the IAU constellation Andromeda (Cenev 2004 & 2014).

This Hungarian asterism "Széro" is made up of stars of the IAU constellation Leo: Epsilon (ε) Leonis, Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) 1 Leonis, and Eta (η) Leonis. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a hut with a conical roof.

Threshing Oxen:

This Latin asterism "Teriones" is the Big Dipper asterism in the IAU constellation Ursa Major as listed by Roman poet Marcus Valerius Martialis (Martial, 40 104 C.E.) and R. H. Allen in his *Star Names* in 1899. Martial also called them "Teriones Parrhasii" and "Teriones Odrysii", a reference to a region in southern Arcadia. Compare this to his asterism Parrhasian Yoke, above.

Threshing Pole:

This Kolam star “Met” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Vahia 2014). It represents a pole to which a bull is tethered as it moves around a circular threshing floor or “Kalave” to separate husks from rice.

Threshers:

This Siberian asterism “Kichigi” is the belt and sword of Orion in the IAU constellation Orion (Svjatskij 2007).

This Lithuanian asterism “Kūlėjai” is the belt of Orion asterism in the IAU constellation Orion.

Throne:

The Latin names “Sedes”, “Sedes Regia”, “Thronus”, “Sella” and “Solium” are all the IAU constellation Cassiopeia.

- Johann Bayer’s *Uranometria* (1603) lists “Sella” (“chair”), “Sedes Regalis”, and “Solijm” for this constellation.
- John Hill lists “Sedes”, “Sedes Regia”, and “Thronus” in his *Urania* in 1754.
- “Solium” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

This Belarussian asterism “трон” is the IAU constellation Orion.

This Sardinian asterism “sa trona” is the “W” asterism in the IAU constellation Cassiopeia (see W below).

Throne of God:

This **telescopic** asterism is the Cone Nebula (see above) in the open cluster NGC 2264 in the IAU constellation Monoceros, which was discovered by English astronomer William Herschel in 1784 who listed it as “V 27” and “VII 5” in his catalogue. It is GC 1440 in the *General Catalogue* of 1864. American astronomer Sherburne Wesley Burnham (1838 – 1921) gave it this name in his *Burnham’s Celestial Handbook.*

Throne of Jawzā':

There are two Arabic asterisms with the name “ʿarsh al-jawzā” or “Al ʿArsh al Jauzah”, later latinized to “Arsh al-Jawzā”:

- One is a quadrilateral of stars in the IAU constellation Lepus: Alpha (α) , Beta (β), Gamma (γ), and Delta (δ) Leporis. This is also known as the “Hindmost Chair of Jawzā'” (see above) or “Camels Quenching their Thirst” (see above). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Kursa, from Kursá-l-jaúzá, or Arsh-al-jaúzá, the giant’s throne, and describes it as “β, γ, and δ [Leporis], named Kursa”.
- One is the star Delta (δ) Leporis in the IAU constellation Lepus, whose name was latinized to “Arsh al Jauzah”.

Throne of the Daughters of Na’sh:

This Arabic asterism “Sarīr Banāt al-Na'sh” is made up of stars of the IAU constellation Ursa Major: Tau (τ), Upsilon (υ), Theta (θ), 15, 18, and 23 Ursae Majoris. An Na’ash was a mythical Arabic hero:

- "Sarīr Banat Na'sh" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- R. H. Allen names this "Throne of the Mourners" in his *Star Names* in 1899.
- Compare this to their asterism Daughters of Na'sh, above.
- The IAU is considering the name Sarir for Theta (θ) Ursae Majoris.

Throne of the Unarmed One:

This Arabic asterism "Al 'Arsh al Simāk al 'Azal", translated as "Throne of the Unarmed One" or "Throne of the Sky Raiser", is the stars Beta (β), Gamma (γ), Delta (δ), and Eta (η) Corvi in the IAU constellation Corvus. It is related to their star "ʾAs-Simāk" (see Unarmed High One, below):

- Dorn (1829) lists this as "Throne of the Simak" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "'Arsh al simák al a'zal, the throne of Spica".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "As Simák al a'zal, the unarmed or defenceless Simák" which is related to the asterism Unarmed High One (see below).
- R. H. Allen lists this as "Arsk al Simak" in his *Star Names* in 1899 as an Arabic name for the IAU constellation Corvus.

Throne of Thor:

This Danish and Icelandic asterism is the IAU constellation Ursa Minor as listed by Cleasby and Vigfusson in 1874 and in R. H. Allen's *Star Names* in 1899.

Throwing Stick:

This is an alternate translation of the Babylonian asterism "Gamlu" from the MUL.APIN tablets "Crook" (see above).

This Boorong asterism is the Pointer stars in the IAU constellation Centaurus: Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar): See Pointers, above. This is the throwing stick of Warepil (see Wedge Tailed Eagle, above).

Thuban:

See Snake, above.

Thumb:

See Offramp, above.

Thunder and Lightning:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a jagged line of stars in the IAU constellation Pegasus: 77 Pegasi, 70 Pegasi, 58 Pegasi, 55 Pegasi, 52 Pegasi, and Sigma (σ) Pegasi (the determinative star).

This Chinese xing guan "Léidiàn" (雷电) is a bending line of stars in the IAU constellation Pegasus. It starts at Zeta (ζ) Pegasi and winds through Xi (ξ), Sigma (σ), 55, and 66 Pegasi, ending at 70 Pegasi.

This Chinese Chenzhuo xing guan “Léidiàn” is a forked line of six stars in the IAU constellation Pegasus:

- The central line is the stars 55 Pegasi and HIP 113445. From each end two lines run out:
    - From 55 Pegasi one runs to 58 Pegasi and the other to 57 Pegasi, and
    - From HIP 113445 one runs to Sigma (σ) Pegasi and the other to Rho (ρ) Pegasi.

Thunderbird:

This Anishinaabe asterism “Animikii Binesii” is the IAU constellation Cygnus (Lee et al 2014).

This Dakota/Lakota/Nakota asterism “Wakinyan” is made up of the stars of the IAU constellations Draco and Ursa Minor:

- The “body” is the line of stars Tau (τ), Zeta (ζ), Eta (η), and Theta (θ) Draconis,
- One “wing” runs from Tau (τ) Draconis to Gamma (γ) Ursae Minoris, and
- The other “wing” runs from Tau (τ) Draconis to Epsilon (ε) Draconis and then down to Delta (δ) and Beta (β) Draconis (Rastaban).

This Diné asterism “Ii’ni” is made up of the stars of the IAU constellations Andromeda, Auriga, Gemini, Leo, and Pegasus (Childrey 2008):

- The “body” is the Square of Pegasus (see Square of Pegasus, above), and
- A large “feather” precedes the “body”, and this is a line of six stars: Beta (β) Andromedae (Mirach), Alpha (α) Persei (Mirfak), Alpha (α) Aurigae (Capella), Beta (β) Geminorum (Pollux), Alpha (α) Geminorum (Castor), and Alpha (α) Leonis (Regulus).

Thunderbolt:

This Chinese xing guan “Pīlì” (霹雳) is made up of five stars in the IAU constellation Pisces: Omega (ω), Iota (ι), Theta (θ), Gamma (γ), and Beta (β) Piscium (Fumalsamakah). The Koreans call this Thunderbolts (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Pīlì” is a bent line of five stars in the IAU constellation Pisces: Omega (ω) Piscium, Iota (ι) Piscium, Theta (θ) Piscium, 7 Piscium, and Beta (β) Piscium (Fumalsamakah).

Thunderbolts:

This Korean asterism “Byeolag” (벼락) is made up of five stars in the IAU constellation Pisces: Omega (ω), Iota (ι), Theta (θ), Gamma (γ), and Beta (β) Piscium (Fumalsamakah). The Chinese call this Thunderbolt (see above).

Thunder’s Goat:

This ancient Baltic star “Perkūno Ožka” or “Tikutis” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Thyrsus:

This Greek asterism is the stars near one “hand” of Ptolemy’s asterism the Centaur (see above). It would be a line of stars running out of the “hand” of this centaur, the star n Centauri (HIP 62896) in the IAU constellation Centaurus: l Centauri, HIP 61498, u Centauri, and HIP 60463, with a quadrilateral of the stars HIP 59607, 59353, 59055 and 59035 at the end. A thyrsus is a wand or staff of giant fennel covered

with ivy vines and leaves, sometimes topped with a pinecone or bunch of vine leaves and grapes or berries which was carried during Hellenic festivals and religious ceremonies. Hipparchus (190 – 120 B.C.E.) called it “θυρσόλογκος” (“thyrsólonkos”) and Pliny the Elder (24 – 79) “θύρσος” (“thýrsos”).

Tia ni Kaure:

This Kiribati star “Tia ni Kaure” is Gamma (γ) Orionis in the IAU constellation Orion (Trussel and Groves 1978).

Tia Uota te Inai:

This Kiribati star “Uota” or “Tia Uota te Inai” is an unidentified small star in the IAU constellation Orion (Trussel and Groves 1978).

Tiaki:

This Tuamotu star “Tiaki” is Beta (β) Gruis in the IAU constellation Grus. In 2017 the IAU approved this name for this star.

Tiamat:

This Chaldean asterism “dmin.ti.amat”, or “dis-ha-ra” from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian period is the IAU constellation Scorpius.

Tianguan:

See Celestial Gate, above.

Tiara:

This **telescopic** asterism is Harrington 17 on the asterism list of American astronomer Phil Harrington, an incomplete circle of stars in the IAU constellation Ursa Major. One end of the broken ring starts at 36 Ursae Majoris and runs through 37, 39, 43, and 44 UMa, ending at HIP 52136. This is also known as the Broken Engagement Ring (see above). Size 17’.

Tiaroaroa:

This Kiribati asterism “Tiaroaroa” is the IAU constellation Scorpius (Trussel and Groves 1978).

Tick Nebula:

This **telescopic** HII region is SH 2-123 (LBN 414) in the IAU constellation Cygnus. It is also known as the Flea Nebula (see above).

Tidgett Umanar:

This Ayt Xebbac star (Arabic: Elmarzem) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Souag 2019).

TIE Fighter:

There are four **telescopic** “TIE Fighter” asterisms:

- One is planetary nebula NGC 6369 in the IAU constellation Ophiuchus. It got this name from RASC member Chris Vaughan in 2023. It was discovered by English astronomer William Herschel in 1784 who listed it as “IV 11”. It is GC 4302 in the *General Catalogue* of 1864. It is also known

as the Ghost of Mars Nebula (see above) and the Little Ghost Nebula (see above). The TIE fighter was created for George Lucas' Star Wars movies by Colin Cantwell in 1977 and consists of a ball shaped cockpit between two hexagonal panels.

- One, "Dimvenátor Pégasi" is the galaxy NGC 7741 in the IAU constellation Pegasus. It was discovered in 1784 by English astronomer William Herschel who listed it as "II 208". It became GC 5004 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the resemblance to the TIE-fighter from Star Wars. TIE is an abbreviation for "Twin Ion Engine" which they translated as "Duobus Ionicis Motoribus" (DIM) and combined with the latin word "venator" ("hunter").
- One is the galaxy PGC 2513233 in the IAU constellation Cassiopeia.
- One is the galaxy NGC 4725 (UGC 7989) in the IAU constellation Coma Berenices. This name was posted by American astronomer Bertrand Laville on the *Deep Sky Forum* in May 2022.

Tied Camels:

This Arabic asterism is a long line of stars in the IAU constellations Corvus, Hydra and Libra: Upsilon (υ) Librae, Sigma (σ) Librae, Pi (π) Hydrae, Gamma (γ) Hydrae, Beta (β) Corvi, Epsilon (ε) Corvi, Nu (ν) Hydrae, and Lambda (λ) Hydrae. Midway along this line is their asterism Southern Tent (see above).

Tiger:

This Latin asterism "Tigris" is the IAU constellation Lynx as originally listed by Polish astronomer Johannes Hevelius (1611 – 1687) who also created the constellation- (see Lynx, above). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as an alternate name for Lynx.

Tiger's Eye:

This **telescopic** asterism NGC 2841 is an intermediate (Sb) spiral galaxy in the IAU constellation Ursa Major. It was discovered in March 1788 by English astronomer William Herschel who listed it as "I 205". It became GC 1823 in the *General Catalogue* of 1864. It is also called the "Radiant of Ursa Major" (see above). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 49 without these names.

Tigris:

This Babylonian asterism "MUL.ID.IDIG-NA" (Hunger 1992) from the A*strological Reports to Assyrian Kings* and "mul. ididigna" in the Neo-Babylonian (Chaldean) *Great Star List* (Koch-Westenholz 1995) is the IAU constellation Sagitta. Anthony Hope lists it as "IDIGNA" or "Idiglat" in his *A Guide to Ancient Near Eastern Astronomy* in 1996.

This Assyrian asterism "Idiglat" (Hunger 1992) from the A*strological Reports to Assyrian Kings* is the IAU constellation Sagitta.

This Armenian and Persian asterism is the IAU constellation Sagitta as listed by R. H. Allen in his *Star Names* in 1899.

Tikatakata:

This Māori asterism is the Small Magellanic Cloud (Orchiston 2017).

Tilted Tent:

This **telescopic** asterism is in the IAU constellation Cygnus and is Corder 3936 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8^{th} – 9^{th} magnitude stars.

Tim Horton's Constellation:

This Canadian asterism is the IAU constellation Lyra. This name has been used since 2021 by Charles Ennis of the Sunshine Coast Centre of the Royal Astronomical Society of Canada. Halifax Centre RASC member Quinn Smith also independently came up with this name, although the date that he created it is uncertain. Tim Horton's is a coffee and donut chain which is popular in Canada. This constellation is called this because at one end you have the asterism "Double Double", which is the side-by-side double stars Epsilon (ε) 1 Lyrae and Epsilon (ε) 2 Lyrae (see Double Double, above): One of the coffee drinks at Tim's is referred to as the "Double Double". At the other end of this constellation you have the planetary nebula Messier 57 (NGC 6720) commonly known as the Ring Nebula, which looks like a donut. Tim's is known for its donuts.

Timir:

See Darkness, above.

Tinamou:

There are three versions of this Quechua asterism "Yutu", "Lluthu", or "Yuthu" (Urton 1980 & 1981, Urton 2016, Urton 2022, Gamarra & Gamarra 2009), meaning "tinamou" or "ground partridge":

- One found in Misminay and Sonqo is the Coal Sack Nebula in the IAU constellation Crux (see Coal Sack Nebula, above). Compare to their asterism "Yutucruz" (see Partridge Cross, above).
- One found in Yucay and Lucre is dark nebulosity in the "tail" of the IAU constellation Scorpius.
- One found in Quispihuara is dark nebulosity near the IAU constellation Scutum.

Tinker Bell Triplet:

See Bird.

Tinted Hand:

This Arabic asterism "Yad Mulawana" (يد ملونة) which means "tinted hand" or "henna dyed hand" is made up of the stars of the IAU constellations Cassiopeia and Perseus and either represents a woman's hand dyed red with henna, or the bloodied hand of Muhammad's daughter Fatima. It is called this as one of the end stars is an orange colour like dried henna. This is how it is made up:

- The "hand" is made up of the stars Alpha (α) Cassiopeiae (Shedar), Beta (β) Cassiopeiae (Caph), Gamma (γ) Cassiopeiae, Delta (δ) Cassiopeiae, Epsilon (ε) Cassiopeiae and Eta (η) Cassiopeiae.
- The "arm" is made up of the stars Alpha (α) Persei (Mirfak), Gamma (γ) Persei, Delta (δ) Persei, Epsilon (ε) Persei, Eta (η) Persei, and Nu (ν) Persei.

Compare with the asterism "Palm", above.

Tintin of Horologium:

This **telescopic** asterism "Titínus Horológii" is the barred spiral galaxy NGC 1249 in the IAU constellation Horologium. It was discovered in 1834 by English astronomer John Herschel and became 2514 in his

catalogue and later GC 662 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as "the one extending arm at the upper (northern) side is reminiscent of the typical hair style of the French cartoon hero of Hergé, called Tintin". Hergé is the pen name of Belgian cartoonist Georges Remi. The Adventures of Tintin first appeared in 1929.

Tiny Plough:

This Romanian asterism "Pluguşorul" is the IAU constellation Ursa Minor (Ottescu 2009).

Tiny Southern Cross:

This **telescopic** asterism, Streicher 6 from by South African astronomer Magda Streicher's lists of telescopic asterisms is in the IAU constellation Carina 2˚ south of open cluster and resembles the Southern Cross (see Southern Cross, above): It includes the stars HIP 38521A and 38568. Size 10'.

Tioreore:

This Māori asterism is the Large Magellanic Cloud (Orchiston 2017).

Tip of the Bow:

This Arabic star "Al-rāmī huwa taraf al-qaws" ("the […] of the archer; it is the tip of the bow") is Mu (μ) Sagittarii in the IAU constellation Sagittarius as listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

Tip of the Elbow:

This Arabic star "ibrat al-mirfaq" (إبرة المرفق) is Psi (ψ) and Sigma (σ) Persei in the IAU constellation Perseus and is part of their asterism Al-Thurayya (see above).

Tip of the Nose:

This Arabic and Bedouin manzil "Al-Nuthrah", "Al-Nathrah" (النثرة), or "ʾAn-Nathrah" (ٱلنَّثْرَة), translated as "tip of the nose" or "nostrils" is in the IAU constellation Cancer and is the stars Gamma (γ) Cancri and Delta (δ) Cancri and the open cluster Messier 44 as listed by Ibn Qutayba. There are two ways of translating this, as the related verb "nathara" means "to scatter" or "to disperse", which leads to some Arabs calling Messier 44 "the Sneeze" and the two stars "al-mankhiran", the Two Nostrils (see below):

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-nathra".
- John Hill lists it as "Alnetara" in his *Urania* in 1754: Hill describes it as "the large star in the constellation Cancer, commonly called Præsepe", which indicates that this is a reference to the Greek asterism "Praesepe" ("manger") or "Asselli and Praesepe", which is a reference to the adjacent Arabic asterism Nostrils of the Lion (Messier 44).
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Elnatret".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al nathrah, the fissure between the Lion's whiskers".
- W. Brennand lists it as "Al-Nethra" in his *Hindu Astronomy* in 1896 and translates it as "the lion's mouth".

This Yemeni manzil “Nathra” is Epsilon (ε) Cancri, Gamma (γ) Cancri and Delta (δ) Cancri in the IAU constellation Cancer (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Tiripura:

This Māori asterism “Tiripura” is one of the Magellanic Clouds (Orchiston 2017).

Tiritiripua:

This Māori asterism “Tiritiripua” is one of the Magellanic Clouds (Orchiston 2017).

Tishtar:

This Persian and Zoroastrian star “Tishtar”, “Tishtriya”, or “Tir” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is named for their rain making deity. Compare this to the Vedic asterism Tishya (see Chieftain’s Star, above).

Tishtrya:

This Iranian star “Tishtrya” or “Tištriia” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holberg 2007). Compare this to the Vedic asterism Tishya (see Chieftain’s Star, above) and Tistrya (below).

Tislit:

This **telescopic** Moroccan star “Tislit” (“bride”) is WASP-161 in the IAU constellation Puppis (magnitude 11.08). It received this name in the IAU NameExoWorlds Campaign. This is the name of a lake in the Atlas Mountains which is associated with a legend of a broken-hearted girl. It has an exoplanet named Isli (“groom”) which is the name of another lake in these mountains associated with a legend of a heartbroken boy.

Tistrya:

This Zoroastrian star from the *Yasˇt 8* of Avesta “Tistrya”, “Ištrya”, “Tishtriya”, “Tisˇtrya”, or “Tištriia” (Panaino 1999) is Alpha (α) Canis Majoris (Sirius). Their *Avesta* devotes a lengthy hymn, Tishtar Yasht to Tishtrya, whom they identified as a deity who controlled rains. Compare this to the Vedic asterism Tishya (see Chieftain’s Star, above) and Tishtrya (above). Panaino (1999) writes that it was derived from “*tri-str-(o-m)” (“group of three stars”) which may have originally related to the belt of Orion.

Titune:

This Kiribati asterism “Titune” is made up of stars of the IAU constellation Hydra (Trussel and Groves 1978). Titune is the name of a type of spirit and is also a name used for a small crab or sea lice.

Tiwatin:

This Moroccan star is Upsilon (υ) Andromedae A and was named after the UNESCO World Heritage Site Tétouan by the IAU in 2015. It has three exoplanets named for Muslim astronomers: Saffar, Samh, and Majriti.

Ṭ'leh:

This Hebrew asterism is the IAU constellation Aries as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud*.

To Sail Around:

This Hawaiian star "Holopuni" ("to sail around" or "to circle") is Beta (β) Ursae Minoris (Kochab). This is a new Hawaiian name, as the old one was lost. It is also known as "Hoku-Mau" ("constant Mau" or "always Mau") in honor of Mau Piailug, the Satawalese navigator that assisted the Polynesian Voyaging Society to recover their use of stellar navigation.

To the Star:

This Basque asterism "Izarrora" is the IAU constellation Canis Major ((Knörr 1999, Frank 2021).

To War:

This Hungarian asterism "Hadhajtá" is probably the stars of the IAU constellation Cygnus. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as three warriors riding on galloping horses. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. Compare this to the Arabic asterism "Knights" (see above).

Toad:

This Mayan asterism "Uo" is made up of a triangle of stars in the IAU constellations Hydra and Corvus: Beta (β) Corvi (Kraz), Delta (δ) Corvi, Epsilon (ε) Corvi, and Gamma (γ) Hydrae.

There are three versions of this Quechua asterism "Hamp'atu" or "Hanp'atu" (Urton 1981 & 2022):

- One, from Misminay and Sonqo is a dark nebula southwest of Crux, the Southern Cross. Another dark spot near Crux is their asterism Partridge (see above). This is listed in ancient Inca skies.
- One from Yucay and Lucre is the Coal Sack Nebula,
- One from Quispihuara is a dark nebula within the "tail" of the IAU constellation Scorpius.

This English asterism "Bufo" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens***.** It is made up of the stars of the IAU constellations Hydra and Libra:

- The "body" is an irregular quadrilateral of the stars Sigma (σ) Librae, 12 Librae, HIP 72210, HIP 70469, 51 Hydrae, and 56 Hydrae,
- One "leg" runs from 56 Hydrae to a "knee" at 58 Hydrae and a "foot" at 59 Hydrae, and
- Another "leg" runs from 51 Hydrae to 52 Hydrae.

Compare this to the asterism Solitary Thrush, above.

Toadstool:

This **telescopic** asterism, French 1 on the asterism list of American astronomer Sue French, is found in the IAU constellation Delphinus. It is also listed as Alessi J2107.5+1619, is listed on the SAC database, and is listed by Jeffrey Corder as Corder4326. Its size is 13' X 13' and it consists of these stars:

- Six magnitude 8 – 11 stars, HD 201117, HD 201095, Gaia DR3 1703765398556563712, HD 200984, and Gaia DR3 1703763268272794368, form the "stem" to the northeast, and

- Seven magnitude 8 – 10 stars, Gaia DR3 1703769826666359552, HD 201195, Gaia DR3 1703771445870748032, Gaia DR3 1703771205352576384, Gaia DR3 1703767490204153088, and Gaia DR3 1703766669867101056, form the "cap" to the southwest. The spiral galaxy NGC 7205 is at the top of the "cap".

The toadstool is also known as Dolphin's Diamonds and is listed in the book *Asterisms: Small Star Patterns for Telescopes and Binoculars*, by Dutch astronomer Demelza Ramakers in 2011. René Merting lists this on the *Faint Fuzzies* website. NOTE: This asterism is located right next to the galaxy 7025, which Merting and his colleague Robert Zebahl call the "Athlete's Foot Galaxy".

Tobacco Container:

This Kogi asterism "Tami" is the Hyades cluster in the IAU constellation Taurus.

Tobacco Pipe:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Cepheus with a "stem" of eight stars and a "bowl" of five stars (HIP 111314A, 111064, 111018, 111325A, and 111521). Size 100' X 45'. Jeffrey Corder lists it as Corder 4689.

Tobit's Dog:

This is the IAU constellation Canis Major as listed by Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?). The Book of Tobit is a 3rd or early 2nd century B.C.E Jewish work describing how God tests the faithful. It is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Toby Jug:

This **telescopic** asterism is the reflection nebula IC 2220 in the IAU constellation Carina. This was first recorded by American astronomer DeLisle Stewart (1870 – 1941). This is also known as the Butterfly (see above). NOTE: A Toby Jug, also known as a Fillpot or Philpot, is a pottery jug in the form of a seated person.

Tohôrje:

This Chakavian asterism is the IAU constellation Ursa Minor.

Toilet:

This Chinese xing guan "Cè" (厠) is made up of four stars in the IAU constellation Lepus: Alpha (α) Leporis (Arneb), Beta (β) Leporis, Gamma (γ) Leporis, and Delta (δ) Leporis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Cè" is four stars in the IAU constellation Lepus: Alpha (α) Leporis (Arneb), Beta (β) Leporis, Gamma (γ) Leporis, and Delta (δ) Leporis.

This Korean asterism "Hwajangsil" (화장실) is identical to the Chinese xing guan "Cè" (above).

Toilet of Sky:

This Korean asterism "Haneul-ui Hwajangsil" (하늘의 화장실) is a quadrilateral of five stars in the IAU constellations Cetus and Pisces: 89 Piscium and 20, 13, 25, and 39 Ceti.

Tojil:

This **telescopic** Guatemalan star Tojil is WASP-22 in the IAU constellation Eridanus (magnitude 10.318). It was named in the IAU NameExoWorlds Campaign. It has an exoplanet named Koyopa', which in the K'iche language means "lightning".

Tokia:

This Kiribati star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Trussel and Groves 1978). Rebua is the name of one of two legendary waves, the other being Tokia. Rigil Kentaurus and Hadar are known to them as "Tokia ma Rebua" (see Tokia and Rebua below).

Tokia and Rebua:

This Kiribati asterism "Tokia ma Rebua" is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Trussel and Groves 1978). Rebua and Tokia are the names of two legendary waves.

Tokitaba:

This Kiribati star "Tokitaba" is currently unidentified (Trussel and Groves 1978).

Toliman:

See Two Ostriches, below.

Tom Thumb Cluster:

This **telescopic** asterism is the open cluster NGC 6451 in the IAU constellation Sagittarius. It was discovered in 1784 by English astronomer William Herschel who listed it as "VI 13". It became GC 4335 in the *General Catalogue* of 1864. This is a reference to the Tom Thumb fairy tales which appeared in English folklore in 1621.

≠Toma:

This Nyae Nyae !Kung star is the Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Alcock 2014) and is part of their asterism Kalidi (see above).

Tomb:

This Chinese xing guan "Fénmù" (坟墓(附危宿)), whose full name is "Tomb, Vassal of Rooftop", is three lines of stars radiating out of the central star Zeta (ζ) Aquarii in the IAU constellation Aquarius. It is attached at this star to the xing guan "Rooftop" (see above):

- One line goes to the star Gamma (γ) Aquarii,
- One line goes to the star Eta (η) Aquarii, and
- One line goes to the star 52 Aquarii.

This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Korean asterism "Mudeom" (무덤) is identical to the Chinese xing guan "Fénmù" (above).

Tomb (Adjunct to Wei):

This Chinese Chenzhuo xing guan is four stars in the IAU constellation Aquarius: A line runs from Pi (π) Aquarii to Zeta (ζ) 1 Aquarii, where it splits into two lines:

- One runs to Eta (η) Aquarii, and

- The other runs to Gamma (γ) Aquarii.

Tomb of Sky:

This Korean asterism “Haneul-ui Mudeom” (하늘의 무덤) in the IAU constellations Antlia, Hydra, and Pyxis is an irregular shape made up of the stars Lambda (λ), Theta (θ), Kappa (κ), and Epsilon (ε) Pyxidis, HIP 46578, 48559, 48584, and 46880, Theta (θ) Antliae, and G and I Hydra.

Tombaugh's Star:

This 12th magnitude variable dwarf nova star is TV Corvi in the IAU constellation Corvus. It was discovered by accident on a photographic plate by American astronomer Clyde Tombaugh in 1932 but was confirmed as a dwarf nova by Canadian astronomer David Levy in 1990.

Tomcat:

This **telescopic** asterism is the open cluster Messier 39 in the IAU constellation Cygnus. This was posted by American astronomer “Echolight” on *Cloudy Nights* in February 2022. The name is a reference to the F-14 fighter jet.

Tonatiuh:

This is HIP 58952 (HD 104985) in the IAU constellation Camelopardalis (magnitude 5.80). This name was approved for the star by the IAU in 2015. Tonatiuh is the Aztec God of the Sun. This has an exoplanet named Meztli, which is the Aztec God of the Moon.

Tongs:

This Macedonian asterism “Mashi” or “Maʃy” is next to their asterism “Pirustija” (see Trivet below). This is a triangle of stars in the IAU constellation Lyra: Theta (θ) Lyrae, and HIP 94685 and 95673 (Cenev 2004 & 2014).

This Anutan asterism, “Te Angaanga” is the Hyades cluster in the IAU constellation Taurus.

This Samoan asterism, “I‘ofi” includes the Hyades cluster in the IAU constellation Taurus (Fitisemanu 2022). The Hyades is the base of the “tongs” with the two sides extending out to the stars Beta (β) Tauri (Elnath) and Zeta (ζ) Tauri.

Tongue of Virgo:

This **telescopic** asterism “Lingulátus Vírginis” is the edge-on spiral galaxy NGC 4771 in the IAU constellation Virgo. It was discovered in 1786 by English astronomer William Herschel who listed it as II 535. It became GC 3283 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Tool of the Sharp Point:

This Latin star “Ferramentum Spiculi” is Gamma (γ) Sagittarii in the IAU constellation Sagittarius and is listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675. Compare this to the asterism Pointed (see above).

Toomre’s of Cetus:

This **telescopic** asterism "Toómrius Céti" is the galaxy PGC 1224 (Arp 256, VV 352) in the IAU constellation Cetus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called to honour Alar and Juri Toomre, who conducted the first computer simulations of galactic mergers.

Tooth:

American astronomer John A. Chiravalle gives this name to Pakan's 3 (see "3" above).

Tooth Shell:

This English asterism "Dentalium" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens***.** It is a curving, tapering horn-shaped group of stars in the IAU constellations Aquila and Aquarius:

- A line between 71 and 69 Aquilae forms one end,
- From 71 Aquilae one side runs through 11 and 15 Aquarii to an end at 21 Aquarii, and
- From 69 Aquilae the other side runs through 4 and 12 Aquarii to the end at 21 Aquarii.

Topsy Turvy Galaxy:

This **telescopic** asterism is NGC 1313, a field barred spiral galaxy in the IAU constellation Reticulum. It was discovered by Scottish astronomer James Dunlop in September 1826. It is listed in the *General Catalogue* of 1864 at GC 695. NOTE: Topsy turvy is a term dating back to the 16th century and there are many theories about its origin. This is also known as the "Destroyed of Reticulum" (see above).

Torch:

This Latin star "Lampadias" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. "Lampadias" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and in John Hill's *Urania* in 1754.

This Greek lunar mansion is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as "Boötes with Arcturus".

This Lokono (Arawak) star "Alêti" is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Rybka 2018). Alêti is the torch bearing companion of Yokhârhin (see Hunter, above).

Torch Bearer:

This Anglo-Saxon star "Bryne-bringan" or "Baeran-bringan" is Alpha (α) Canis Minoris (Procyon) as listed by Bender in 2020. In 1934 O. S. Reuter listed it under the German name "Fackelbringer" or "Fackel Bringer" on his *Nördliche Sternhimmel* sky map.

This Greek asterism "Λαμπαδίας" ("Lampadías") is the Hyades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen adds that the 5th century Greek philosopher Proclus Lycius (Proclus) called it "Λαμπαύρας" ("Lampávras"). The 15th century *Alfonsine Tables* list this as "Lampadas".

This Egyptian asterism "Cynocephalus" is one of the paranatellonta of the first decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). It is made up of stars of the IAU constellation Camelopardalis.

This Old Icelandic star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor.

Torch Bearer Nebula:

See Statue of Liberty Nebula, above.

Torch Dragon:

This **telescopic** asterism “Zhúlóng” is the most distant spiral galaxy known to date, discovered by an international team lead by the University of Geneva in 2025. It existed on billion years after the Big Bang. “Zhúlóng is a powerful red solar dragon that creates day and night by opening and closing its eyes, symbolizing light and cosmic time," says Dr. Mengyuan Xiao, postdoctoral researcher at the Department of Astronomy of the Faculty of Science of UNIGE and lead author of the study. It is located at a redshift distance of z = 5.2 (12.8 Gly).

Torches of Camelopardalis:

This **telescopic** asterism “Fáces Camelopardális” is the pair of interacting galaxies IC 2184 in the IAU constellation Camelopardalis. It was discovered by French astronomer Guillaume Bigourdan in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this remarkable double Markarian object looks like two distant torches in the sky”.

Torcular:

See Northern Press, above.

Toriba ni Maiaki:

This Kiribati asterism “toriba ni Maiaki” is a horseshoe shaped group of stars in the IAU constellation Eridanus (Trussel and Groves 1978). They are also known as “Ma ni kataenako” (see Fish Trap, above).

Toriba ni meang:

This Kiribati asterism “Toriba ni meang” is the curve of stars at the front end of the IAU constellation Leo from the star Epsilon (ε) Leonis to the star Alpha (α) Leonis (Regulus), resembling a mirror-image question mark (Trussel and Groves 1978).

Torn in Pieces of Sagittarius:

This telescopic **asterism** “Divúlsus Sagittárii” is the elliptical loop-shaped satellite Sagittarius Dwarf Spheroidal Galaxy or SagDEG, and was discovered in 1994 by Ibata, Gilmore, and Irwin. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Torque of Cetus:

This **telescopic** asterism “Tórques Céti” is the interacting pair of ring galaxies IC 298 (Arp 147) in the IAU constellation Cetus. It was discovered by French astronomer Stéphane Javelle in 1893. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its ring system, which they describe as “resembling a torques, a Celtic necklace”.

Torrents of Cygnus:

This **telescopic** asterism is the HII region including LBN 252, 264, 278, 298, 301, 303, and 310 in the IAU constellation Cygnus. It is listed under this name on Astrobin by astronomer Steven DeGroot.

Tortoise:

The Tortoise appears as a constellation on Babylonian stones, cylinder seals and gems preserved at the British Museum (Massoume 2001). The precise stars involved are not described.

This Arabic star "as-Sulḥafāh" (السلحفاة) or "Sulaḥfāt" is Gamma (γ) Lyrae in the IAU constellation Lyra:

- "Al-Sulahfāt" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010) as a name for Lyra.
- This was later latinized to "Sulafat", " Sulaphat", and Chilmead's "Schaliaf".
- The 15th century *Alfonsine Tables* list "Azulafe" and "Zuliaca".
- Robert Hues lists "Schaliaf" as a name for the constellation Lyra in his *A Learned Treatise of Globes* in 1659.
- John Hill lists the name "Sulaphat" in his *Urania* in 1754 and incorrectly identifies it as a name of both the constellation and the star Alpha (α) Lyrae (Vega).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al sulhafat, the tortoise".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Sulaphat".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Sulaphat".
- The IAU approved the name Sulafat for Gamma (γ) Lyrae.

This Arabic asterism "Al Kubbah", later latinized to "Kubba" is the IAU constellation Corona Australis as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986):

- "Al Kubba" is listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675: Sherburne translates this as "Testitudo vel Tabernaculum, propter circularem formam" ("testimony or tabernacle, because of its circular form").
- "Kubba" is listed in John Hill's *Urania* in 1754.
- "Al Kubbah" is listed in R. H. Allen's *Star Names* in 1899.

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars in the IAU constellation Ara: Alpha (α) Arae (the determinative star), Lambda (λ) Arae, Sigma (σ) Arae, HIP 84720A and HIP 84105.

This Chinese xing guan "Guī" (龟) in the IAU constellation Ara is made up of five stars: Zeta (ζ), Eta (η), Delta (δ), Gamma (γ), and Epsilon (ε) Arae.

This Chinese Chenzhuo xing guan "Guī" is a pentacle of stars in the IAU constellations Ara and Telescopium: Theta (θ) Arae, Epsilon (ε) Telescopii, HIP 87846, Sigma (σ) Arae, and Lambda (λ) Arae.

This /Xam star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Alcock 2014).

This Shipibo asterism is the IAU constellation Corona Borealis (Kemp et al 2022).

Tortoise Shell:

This Greek asterism “Χέλυς ὀλίγη” (“Chélys olígi”) is the IAU constellation Lyra as described by Aratus (315 – 240 B.C.E.) in his *Phaenomena*. This relates to the mythical origin of the Lyre from a tortoise shell cast up on the beach strung with dried tendons by the God Hermes. This was later latinized to Chelys. “Chelys” is listed as a name for Lyra in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Tortoises:

This San asterism in the IAU constellation Orion is the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph).

Totero:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Touching of Draco:

This **telescopic** asterism “Tangentes Dracónis” is the interacting galaxies UGC 10770 (Arp 32) in the IAU constellation Draco. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the two galaxies of this system are touching one another”.

Tovorÿtje:

This Chakavian asterism is the IAU constellation Cancer.

Towards Red of Virgo:

This **telescopic** asterism “Erythrónde Vírginis” is the galaxy 3C 273 in the IAU constellation Virgo. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this “is the first quasar of which the redshift was determined when Maarten Schmidt of Hale Observatories interpreted the optical emission lines of this radio source as redshifted hydrogen Balmer lines in 1963”.

Tower in Market:

This Korean asterism “Sijang-ui Tab” (시장의 탑) is an angular “figure eight” of stars in the IAU constellations Ophiuchus and Serpens: Mu (μ) Ophiuchi, HIP 85922, 47 Ophiuchi, Nu (ν) Serpentis, and HIP 84402 and 83962.

Tower of Gad:

This American asterism is the IAU constellation Capricornus as listed by American astronomer Elijah Burritt (1794 – 1838).

Tower of Teddus:

This Welsh asterism “Twr Tewdws is the Pleiades cluster in the IAU constellation Taurus as listed in Marie Trevelyan’s *Folk-lore and Folk-stories of Wales* (1909).

Tower of Zeus:

This Greek asterism is the IAU constellation Cepheus as listed by Mosenkis in his *Mycenaean Oecumene* (date n/k).

Town:

This Arabic asterism "al-balda" (البلدة) or "bálda" (بلدة), originally referred to the entire IAU constellation Sagittarius, but later was assigned to the triple star Pi (π) Sagittarii in the IAU constellation Sagittarius. The IAU lists the translation as "the Town":

- This was later latinized to "Al Baldah" or "Albaldah".
- The 17th century astronomer Al Achsasi al Mouakket called it "nayyir al-baldah" (نير البلدة), or "brightest in the town", later latinized to "Nir al Beldat" in his *Calendarium*.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al beldah, quod urbem oppidumbe denotat ("Which denotes a city or a town")".
- The IAU approved the name Albaldah for Pi Sagittarii A in 2017. Compare this to their asterism "ʾAl-Baldah" (ٱلْبَلْدَة) – see Empty Place, above.
- NOTE: R. H. Allen translates "Al Baldah" as "the Fox's Kennel" in his *Star Names* in 1899 and attributes it to "Al Bīrūnī'" (Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni, 973 – c.1050), describing it as "a starless region towards Pisces… for whose stellar connection I find no explanation". This is actually the Arabic asterism Empty Place of the Fox (see above).

Track of Eaglehawk:

This Kokatha and Ngalea asterism "Waljajinna" is the IAU constellation Crux.

Tracks of a Panunga Man and Parula Woman:

This Arrernte asterism is made up of stars in the IAU constellations Ara, Scorpius, and Sagittarius (Maegraith 1932). This asterism has several parts:

- A line from Kappa(κ) Scorpii to Beta (β) Sagittarii (Arkab) is a spear carried by a Panunga hunters also armed with boomerangs.
- The Panunga hunters are Kappa(κ) and Iota (ι) Scorpii.
- Lambda (λ) Scorpii is a Panunga man and Upsilon (υ) Scorpii a Parula woman that these hunters are pursuing.
- Eta (η) and Zeta (ζ) Scorpii are the tracks of the man and woman being pursued and marks the place where they were overtaken and slain.
- Theta (θ) Scorpii, Alpha (α) Arae and Beta (β) Arae represent the yam stick used to dig a grave for these two.

Tracks of Men Pursuing an Emu:

This Luritja and Arrernte asterism is made up of stars of the IAU constellations Aquila, Cygnus, Hercules, and Lyra (Maegraith 1932):

- The two men are Alpha (α) Aquilae (Altair), who is the right-handed brother, and Beta (β) Aquilae (Alshain), who is the left-handed brother.
- The emu's tracks are Alpha (α) Lyrae (Vega), Eta (η) Herculis, and Pi (π) Herculis.
- Beta (β) Cygni (Albireo) and Delta (δ) Cygni are the tracks of two Knaria men, brother and uncle of the left-handed and right-handed brothers.

- The small stars surrounding Aquila, Hercules, Lyra, and Ophiuchus are considered to be the tracks of the hunters, who keep having to go hunting again as every time they cook the emu they caught, a mamu (creek spirit) steals it.

Compare this to the Kokatha and Ngalea asterisms Left-handed Brother and Right-handed Brother, above.

Trailing Robe of Hydra:

This **telescopic** asterism "Helcesípepla Hýdrae" is the lenticular galaxy NGC 2876 in the IAU constellation Hydra. It was discovered by Édouard Stephan in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "it is trailing a long tail at its western side".

Train of a Garment:

This Arabic star "sirmā" (تطريز) later latinized to "Syrma" is Iota (ι) Virginis in the IAU constellation Virgo. In 2016 the IAU approved the name Syrma for Iota (ι) Virginis.

Trainwreck Galaxies:

This **telescopic** asterism is the galaxies NGC 4449 (UGC 7592, PGC 4093, MGC 7-26-9, Caldwell 21) and NGC 4449B (UGC 7577, PGC 40904, MCG 7-26-6) in the IAU constellation Canes Venatici. This name was posted on the *Deep Sky Forum* in March 2015 by American astronomer Mark Friedman.

Trajan's Bitch:

This Romanian star is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). Ottescu writes that the Slavic term "Paloșchiţa" ("Little Bitch" see above) is also used. The legend says that the Emperor Trajan put slaves he'd conquered from Dacia in the Great Chariot (see above) and their chiefs in the Little Chariot (see above).

Tranne-nociw:

This Ainu Nociw ("asterism") is the Pleiades cluster in the IAU constellation Taurus.

Transparent of Cassiopeia:

This **telescopic** asterism "Diáphanes Cassiopéiae" is the dwarf spheroidal galaxy NGC 147 (Caldwell 17) in the IAU constellation Cassiopeia, and is a satellite galaxy of the Andromeda Galaxy, M 31. It was discovered by John Herschel in 1829 and is GC 72 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it "transparent" as it is free of dust.

Transporting Star:

This Palikur star is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Green and Green 2011). It is part of their asterism Kusuvwi the Younger Brother (see above).

Trap:

This Kiribati asterism "Kabaru" or "kai ni kabaru" is made up of four stars at the "hind part" of the IAU constellation Canis Major (Trussel and Groves 1978). Trussel and Groves are not specific as to the stars.

Trapezium:

There are two telescopic “Trapezium” asterisms:

- One is the star Theta (θ) 1 Orionis in the IAU constellation Orion: This is four stars identified as A, B, C, and D, with Theta (θ) 1 Orionis C being the brightest. This cluster has a total of eight stars. It was discovered by Italian astronomer Galileo Galilei in 1617:
    - William Herschel observed it in 1776, and described it as “quadruple”, which is where this name originated.
    - William Denning’s *Telescopic Work for Starlight Evenings* (1891) lists these stars as the “Trapezium”.
    - German astronomer Hermann Joseph Klein (1844 – 1914) lists the “celebrated Trapezium” in his *Star Atlas* (1893).
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “the Famous Trapezium”.
    - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list the Trapezium.
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists these stars as the “Trapezium”.
- One is TPK 1 located 1.1 degrees north northwest of the star Lambda (λ) Andromedae in the IAU constellation Andromeda.

Trapezoid:

This asterism is made up of four stars in the IAU constellation Boötes: Gamma (γ) Boötis, Beta (β) Boötis (Nekkar), Mu (μ) 1 Boötis, and Delta (δ) Boötis.

There are two **telescopic** “trapezoid” asterisms:

- One is Patchick 56 on the asterisms list of astronomer Dana Patchick is in the IAU constellation Cygnus. It is a trapezoid of 9th to 11th magnitude stars not far from the star Gamma (γ) Cygni (Sadr). One corner star is HIP 100660 and a star in the middle of the other side is the double star HIP 100583.
- One is in the IAU constellation Mensa and is Corder 869 on the observing list of American astronomer Jeffrey Corder. Size 15’. This is located in the Large Magellanic Cloud. It is four 8th magnitude stars including HIP 25780, 25690, and the double star HIP 25811A.

Traveler:

This huge Gwich'in asterism known as "Yahdii" for Alaskan Gwich’in people and “Yuhdii” or “Yuhdyee” for Canadian Gwich’in peoples is an animal-like "tailed man" that spans more than 130 degrees across the sky from nose to foot and is viewed as being in a crouched position with arms embracing the sky. The whole asterism contains “body parts” in 18 different IAU constellations, with the principal constellations being Auriga, Boötes, Coma Berenices, Cygnus, Gemini, Hydra, Leo, Lynx, Orion, Taurus, Ursa Major, and Ursa Minor (Cannon 2021):

- His “tail” (vitsi’) is the bucket of the Big Dipper asterism (see Big Dipper, above).
- His “head” (viki’) consists of:
    - His “left ear” (tl̀ ǫhts’aii vidzee) is Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux),

    - His “right ear” (shreets’aii vidzee) is Alpha (α) Aurigae (Capella) and Beta (β) Aurigae (Menkalinan),
    - His “snout” (vanhtral), vanch’àl) or “nose” (vantsih) is the Pleiades cluster,
    - His “eyes” (vendee or vindee) are Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in one version and Beta (β) Tauri (Elnath) and Iota (ι) Aurigae (Hassaleh) in the IAU constellations Auriga and Taurus in another version.
- His “body” (vizhin) or “flesh” (vatthai) is 15 Lyncis, Omicron (ο) Ursae Majoris, 23 Ursae Majoris, 36 Ursae Majoris, Theta (θ) Ursae Majoris, Iota (ι) Ursae Majoris, Kappa (κ) Ursae Majoris, and 31 Lyncis,
- His “right arm” (shreets’aii vigin) or “right hand” (shreets’aii vanli’) is Gamma (γ) Andromedae and Beta (β) Trianguli,
- His “left arm” (tl’ohts’aii vigin) or “left hand” (tì ǫhts’aii vanli’) is Alpha (α) Leonis (Regulus) and Omicron (ο) Leonis,
- His “left leg” (tì ǫhts’aii vatth’ an’) is the stars of Coma Berenices and his “left foot” (tì ǫhts’aii vakwai’) is Alpha (α) Boötis (Arcturus) and Eta (η) Boötis,
- His “right leg” (shreets’aii vatth’an’) is a line of stars through Alpha (α) Ursae Minoris (Polaris) and his “right foot” (shreets’aii vakwai’) is Alpha (α) Cygni (Deneb) and Gamma (γ) Cygni (Sadr),
- His “heart” (Vidrii) is 27 Lyncis,
- He has a “crooked knife” (vigwiisii) consisting of the Sickle (see Sickle of Leo, above),
- His “cane” (vatòo) is Eta (η) Leonis, Gamma (γ) Leonis, Zeta (ζ) Leonis, Mu (μ) Leonis, Epsilon (ε) Leonis, Omicron (ο) Leonis, and Alpha (α) Hydrae (Alphard),
- His “bag” (va’ohtsùu) is 63 Ursae Majoris, Psi (ψ) Ursae Majoris, Mu (μ) Ursae Majoris, and Lambda (λ) Ursae Majoris, and
- The Milky Way is referred to as "Yahdii's Trail".

This Sahtúotine asterism “Yíhda” or “Yámoréya” (“the one who went around the world” or “one who departed to go around the world”) is cognate with the Gwich’in asterism Yahdii (Cannon 2021). He is viewed as standing in a defensive posture brandishing his staff. Cannon writes that some elders call him the “Sky Keeper”. He is made up of the stars of the IAU constellations Canes Venatici, Leo, Leo Minor, Lynx, and Ursa Major. Here are the various parts of “Yíhda” or “Yámoréya”:

- His “head” (bekwi) is Theta (θ) Ursae Majoris, Phi (ϕ) Ursae Majoris, Nu (ν) Ursae Majoris, 23 Ursae Majoris, Tau (τ) Ursae Majoris, 4 Ursae Majoris, Omicron (ο) Ursae Majoris, and 15 Ursae Majoris,
- His “torso” (bezhı̨ ́ or bezhıne) is Psi (ψ) Ursae Majoris, Nu (ν) Ursae Majoris, 37 Leonis Minoris, 21 Leonis Minoris, and HIP 47029,
- His “heart” (ɔedzə́) is Lambda (λ) Ursae Majoris (NOTE: this is a “spiritual heart”, not a physical one),
- His “left arm” (ɔ́hts’ę́ begwóné) is Iota (ι) Ursae Majoris, Kappa (κ) Ursae Majoris, 10 Ursae Majoris, HIP 44700, 38 Lyncis and Alpha (α) Lyncis,
- His “left hand” (ɔ́hts’ę́ belá) is 17 and 24 Leonis,
- His “right arm” (są́ą begwóné) is Psi (ψ) Ursae Majoris, Chi (χ) Ursae Majoris, and 5 Canum Venaticorum,
- His “right hand” (są́ą belá) is Zeta (ζ) Ursae Majoris (Mizar),
- His “left leg” (ɔ́hts’ę́ bekw’oné) is Zeta (ζ) Leonis, 41 Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus),
- His “left foot” (ɔ́hts’ę́ bekə) is Alpha (α) Leonis (Regulus) and Omicron (ο) Leonis,

- His “right leg” (sąą bekw’oné) is Nu (ν) Ursae Majoris, Xi (ξ) Ursae Majoris, 72 Leonis, Delta (δ) Leonis, and Theta (θ) Leonis,
- His “right foot” (sąą bekə) is Theta (θ) Leonis and Beta (β) Leonis (Denebola),
- His “ladle” (lıbóchá) is the Big Dipper asterism. NOTE: This has also been called a “kettle”. Compare this to the Dane-zaa asterism Sky Keeper’s Kettle (above).

This Upper Tanana asterism “Yihdaa” or “Neek’e’eltiin” is cognate with the Gwich’in asterism Yahdii (Cannon 2021). Some elders refer to him as “great sky man, “K’oh dindeh” (“cloud man”), or “Yaak’oh” (“sky neck”). He is made up of the stars of the IAU constellations Boötes, Cassiopeia, Draco, Gemini, Leo, Lynx, Taurus, and Ursa Major. Here are the various parts of “Yíhdaa” or “Neek’e’eltiin”:

- His “tail” (uche’) is the Big Dipper asterism,
- His “head” (utthi’) is:
    - His “neck” (uk’oh) is stars in the area of 31 Lyncis, 15 Lyncis, Alpha (α) Geminorum (Castor), and Beta (β) Geminorum (Pollux),
    - His “nose” (mjįtsįj) is the Pleiades cluster,
    - His “eyes” (unaagn’) are Beta (β) Tauri (Elnath) and Iota (ι) Aurigae,
    - His “left ear” (tł’ahts’ąy udzagn’) is Beta (β) Geminorum (Pollux) and his “left inner ear/hearing” (tł’ahts’ąy udziit) is Alpha (α) Geminorum (Castor),
    - His “right ear” (hǫǫsǫǫ ts’ąy udzagn’) is Alpha (α) Aurigae (Capella) and his “right inner ear/hearing” (hǫǫsǫǫ ts’ąy udziit) is Beta (β) Aurigae (Menkalinan),
- His “torso” (usak) is 15 Lyncis, Omicron (ο) Ursae Majoris, 23 Ursae Majoris, 36 Ursae Majoris, Theta (θ) Ursae Majoris, Iota (ι) Ursae Majoris, Kappa (κ) Ursae Majoris, and 31 Lyncis,
- His “heart” (udzeey) is 27 Lyncis,
- His “left arm” (tł’ahts’ąy ugaan’) is an unidentified region of stars, and his “left hand” (tł’ahts’ąy uła’) is Alpha (α) Leonis (Regulus) and Omicron (ο) Leonis,
- His “right arm” (hǫǫsǫǫ ts’ąy ugaan’) is an unidentified region of stars, and his “right hand” (hǫǫsǫǫ ts’ąy uła’) is Alpha (α) Cassiopeiae (Shedar) and Beta (β) Cassiopeiae (Caph),
- His “left leg” (tł’ahts’ąy uxol’) is an unidentified region of stars
- There are two versions of his “left foot” (tł’ahts’ąy uke’):
    - One is Alpha (α) Boötis (Arcturus) and Eta (η) Boötis,
    - One is Delta (δ) Leonis and Beta (β) Leonis (Denebola),
- His “right leg” (hǫǫsǫǫ ts’ąy uxol’) is an unidentified region of stars, and his “right foot” (hǫǫsǫǫ ts’ąy uke’) is Gamma (γ) Draconis and Beta (β) Draconis (Rastaban), and
- His “knee” (ugot) is an unidentified star.

NOTE: The Lower Tanana call the Traveler “Yambaa Teeshyaay” (“the one who went around the edge of the sky” and see this asterism as part of the “Che’ T’iin” (“tailed people”).

This T’atsaol’ine asterism “Yèhdaa”, Wiidiideh asterism “Yida” or “Yehdaa” is cognate with the Gwich’in asterism Yahdii (Cannon 2021). He is made up of the stars of the IAU constellations Boötes, Corona Borealis, and Ursa Major. Yida is a trickster here who was shot with a arrow when caught pilfering rabbits from snares and fled into the sky. Here are the various parts of “Yèhdaa”, “Yida”, or “Yehdaa:

- His “head” (betthí) is Nu (ν) Ursae Majoris
- His “arms” (begáné) are:
    - “Right Arm”: Alpha (α) Ursae Majoris (Dubhe), Eta (η) Ursae Majoris, and Tau (τ) Ursae Majoris,
    - “Left Arm”: Beta (β) Ursae Majoris (Merak) and Theta (θ) Ursae Majoris.

- His “hands” (belá) are:
    - “Right Hand”: Omicron (ο) Ursae Majoris,
    - “Left Hand”: Iota (ι) and Kappa (κ) Ursae Majoris,
- His “torso” (bezíé) is Alpha (α) Ursae Majoris (Dubhe), Beta (β) Ursae Majoris (Merak), Gamma (γ) Ursae Majoris, and Delta (δ) Ursae Majoris,
- His “back” (bet’ás or benéné) is Delta (δ) Ursae Majoris, Epsilon (ε) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Gamma (γ) Ursae Majoris,
- His “buttocks” (betł’á) is Eta (η) Ursae Majoris,
- His “feet” are:
    - “Right foot”: Alpha (α) Corona Borealis (Alphecca) or Beta (β) Boötis (Nekkar),
    - “Left Foot”: Epsilon (ε) Boötis or Gamma (γ) Boötis,
- Place where he was hit by an arrow (bek’arełka) is 80 Ursae Majoris (Alcor), and
- His “quiver” (k’á nąłchéth) is Theta (θ) Bootis.

There is a Wiidiideh variation of this asterism made up of stars of Leo, Leo Minor, and Ursa Major:

- His “arms” (wegǫ̀ǫ̀)
    - “Right Arm”: Eta (η) Ursae Majoris, Zeta (ζ) Ursae Majoris, Epsilon (ε) Ursae Majoris and Delta (δ) Ursae Majoris,
    - “Left Arm”: Alpha (α) Ursae Majoris (Dubhe), 23 Ursae Majoris, and Omicron (ο) Ursae Majoris,
- His “body” (wedzìwì) is Delta (δ) Ursae Majoris, Gamma (γ) Ursae Majoris, Chi (χ) Ursae Majoris, Psi (ψ) Ursae Majoris, Beta (β) Ursae Majoris (Merak), and Alpha (α) Ursae Majoris (Dubhe).
- His “legs” (wekw’ǫ̀) are:
    - “Right Leg”: Nu (ν) Ursae Majoris, Xi (ξ) Ursae Majoris, 72 Leonis, Delta (δ) Leonis, Theta (θ) Leonis, Iota (ι) Leonis,
    - “Left Leg”: 46 Leo Minoris, Zeta (ζ) Leonis, Gamma (γ) 1 Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus).

This Dëne Suhne asterism “Yéhda”, “Yétaa”, or “Yeda” is cognate with the Gwich’in asterism “Yahdii” (above (Cannon 2021)). It is also known as “Hochol” or “Hochok” (“the Big One”). His “tail” (Yétaa-tché or Yehda-tchè) is the belt of Orion to some of the Dëne Suhne and the Big Dipper to others. His “backbone” (Yíhda hinéw’éné’) is the handle of the Big Dipper.

This Dena’ina asterism “Yuq’eltani” (“One Over the Sky”), “K’uzaghalen” or “Naq’eltaeni” is cognate with the Gwich’in asterism “Yahdii” (above). He is made up of the stars of the IAU constellation Ursa Major and other as yet unidentified constellations. His “tail” (bekala) is the Big Dipper asterism, also known as “our cavity tail” (naq’a kala). Unidentified stars include his “palm” (belaq’a), “one on the palm” (belaq’a q’edi), “saliva” (hayq’a), “arm” (ugguna), “one on top of the head” (k’tsikiq’edi), “sled”, and “pack”.

This Dane-zaa asterism “Yèshta” is cognate with the Gwich’in asterism “Yahdii” (above (Cannon 20021)). It is also known as “Yaak’ih Sadę” (see Sky Keeper, above), or “Tsááyaa” (Sun in the Sky). He came to the world to make the world right after a malevolent being came there trying to imitate him.

This Deh Gah Got’ine asterism “Zhída” is cognate with the Gwich’in asterism “Yahdii” (above (Cannon 2021)). It is also known as “Zhihda”. His “tail” (Zhihdache) is the Big Dipper asterism in the IAU constellation Ursa Major.

NOTE: The Traveler shows up in many other Dene First Nations cultures: “Yihjah” (Han), “Yidha” (Tse’khene), “Yidha” (Tłı̨chǫ), “Yïhda” (Wet’suwet’en), “Yihta” (Dakelh), “Yéhtai” or “Yitai” (Tsilhqot’in), “Yidhā” (Kaska), “Yehda’” (Talhtan), “Yèda” (Southern Tutchone), “Zhéhde” (Northern Tutchone), “Yax’t’e” (Tagish), and “Yaxhté” (Tlingit). Modern day members of these nations often use these names just to describe the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021). Compare to the Ahtna asterism “That Which Moves Over Us” (above).

The A:shiwi had an asterism that spanned the sky as well, The Chief of the Night, however, the precise stars of this asterism have not yet been identified.

Travelers Upon the Sky:

This Koyukon asterism “Yokk’e Tok’enodele” is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Trays of Balance:

This Arabic asterism “Al Kiffatān” is the IAU constellation Libra.

Treacherous Star:

This Chinese Chenzhuo xing guan “Jianzing” is the star HIP 52425 in the IAU constellation Ursa Major. It is part of their xing guan Purple Forbidden West Wall.

Treasure Chest:

This Romanian star “Comoara” is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Ottescu 2009). Compare this to “Yahweh’s Treasure Chest” (below).

Tree:

This proposed Egyptian asterism “Min” (an Egyptian God) or “mnw” (“tree”) from the Old Kingdom (3100 B.C.E.) is related to their nome (district) of that name where both Min and the hero Perseus were worshipped (Berio 2014). It is related to the IAU constellation Perseus and to the Egyptian asterism Persea Tree (see above).

This Inca asterism “Mallki” is made up of stars of the IAU constellation Aries (Gamarra & Gamarra 2009).

This **telescopic** asterism is Messier 41. Although it is best viewed with a telescope, it was first described by Aristotle around 325 B.C.E. with unaided eye observations and “rediscovered” by Giovanni Battista Hodierna in 1654. It is found in the IAU constellation Canis Major. It was given this name by American astronome r Wayne Schmidt, who describes it as a 30-arcminute long tree.

Tree of Life:

This Zulu and Bantu asterism is the IAU constellation Crux.

Trefoil:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Tresses:

This Latin asterism “Trica” is the IAU constellation Coma Berenices as listed in the 1515 edition of the *Almagest*. German astronomer Johannes Schöner listed it in 1515 and geographer Gerardus Mercator (1512 – 1594) listed it as one of the names of this constellation on some of his globes. German astronomer Johann Bayer (1572-1625) listed this as “Tricas”, “Tericas”, and “Triquetras”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Trica”. In his *Star Names* in 1899 R. H. Allen writes that these are all derived from the Greek “τρίχες” (“tríches”- “hairs”).

Trethon:

This Greek asterism is the IAU constellation Auriga.

Triad of Moons:

This Samoan asterism “Tolugāmāuli” is the belt of Orion in the IAU constellation Orion (Fitisemanu 2022) and is part of their asterism “Amoga” (see Carrying Pole, above). This star line indicates a “star course” to sail from Manu’a to Pukapuka.

Trial:

This Greek asterism “Δίκη” (“Díki”) is the IAU constellation Libra, as it was seen as the scales of justice.

This Greek asterism “Δίκη” (“Díki”) is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899.

This Arabic star “Saidac” is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009).

Trials:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellations Hydra and Libra: HIP 70469 (the determinative star) and 51 Hydrae.

This Chinese xing guan “Dùnwán” (顿顽) is a line of two stars in the IAU constellation Lupus: Phi (φ) and 1 Lupi.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Hydra: 58 and 56 Hydrae.

Triangle:

This Greek asterism “Trigonon” (Τρίγωνος) is the IAU constellation Triangulum as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as originally described in the 2nd century in Ptolemy’s *Almagest*: a triangle of the stars Alpha (α) Trianguli, Beta (β) Trianguli, and the last corner being the stars Delta (δ) and Gamma (γ) Trianguli. This name was latinized later to “Trigonum”.

This Serbian asterism “Trougao” is probably the IAU constellation Triangulum.

This Chinese xing guan “Sānjiǎoxíng” (三角形) is the IAU constellation Triangulum Australe.

This Arabic asterism “Almuthalath” (المثلث) is the IAU constellation Triangulum. “Al-Muthallath” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Welsh asterism is probably the IAU constellation Triangulum as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). Freer (2004) lists this as the “Triangle”.

This Estonian asterism “Kolmnurk” is the IAU constellation Triangulum and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

There are ten **telescopic** “triangle” asterisms:

- One is Sánta 123, listed in 2008 by Hungarian astronomer Sánta Gábor, which is a ring of stars in the IAU constellation Camelopardalis. Gábor describes it as “an oval star ring + some faint stars form a triangle”.
- One is Sánta 75, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “curve of 6 plus 3 other forms a triangle, nice asterism” in the IAU constellation Monoceros.
- One, Thompson 1 (discovered by Canadian amateur astronomer Bill Thompson in 1986) is formed of thirteen stars with one corner pointed south-southwest in the IAU constellation Delphinus.
- One is in the constellation Hydra and consists of five 11^{th} and 12^{th} magnitude stars plus one 9^{th} magnitude star.
- One is in the constellation Andromeda and is a triangular cluster of stars. One corner is the star HIP 8423, another corner has the double star HIP 9001 and the star HIP 8930, and the last corner is the open cluster NGC 752 (Caldwell 28).
- One is in the IAU constellation Monoceros and is Corder 1402 on the observing list of American astronomer Jeffrey Corder. Size 25’ X 20’. This is five 7^{th} – 8^{th} magnitude stars and has wide binocular doubles at two corners. This includes HIP 37493 and 37413.
- One is the open cluster NGC 659 in the IAU constellation Cassiopeia. It was discovered by Caroline Herschel in 1783, and her brother William Herschel listed it as “VIII 65”. It is GC 389 in the *General Catalogue* of 1864. A group of lighter stars on one side creates the coma-shaped light side of the Yin-Yang symbol, and the dimmer stars on the other side the darker side. Astronomer Stephen James O’Meara’s Hidden Treasures Catalogue (2007) lists this as O’Meara 7 and states “that the cluster has an interesting and unique triangular shape. It is also known as the “Yin-Yang” (see below).
- One is Renou 25 in the IAU constellation Corona Borealis. René Merting describes it on the Faint Fuzzies website: “A compact triangle of stars can be seen, formed by three faint stars – the area within the triangle appears slightly brightened.”
- One is the open cluster Dolidze-Dzimselejsvili 1 (DoDz 1) in the IAU constellation Aries. René Merting describes it on the Faint Fuzzies website: “At 29 x, a star triangle is visible, in which four fainter stars sparkle”. The tips of the triangle are the stars SAO 93109, HIP 13014, and HIP 13023.
- One is three stars in the IAU constellation Leo. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes Epsilon (ε) Leonis and tells us “you will find near it two seventh-magnitude companions [HIP 48023 and HIP 47853], making a beautiful little triangle”.
- One is three stars in the IAU constellation Lyra. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this as “two fain stars close to Vega on the east make a beautiful little triangle with it.” This is the stars Alpha (α) Lyrae (Vega), HD 172149, and HD 171872.

Triangles:

There are two asterisms with the name “Triangles”:

- One is the American asterism is the stars Alpha (α) Cygni (Deneb), Epsilon (ε) Cygni, Gamma (γ) Cygni, and Delta (δ) Cygni in the IAU constellation Cygnus. R. H. Allen attributes this asterism to American astronomer “Royal Hill” (George William Hill, 1838 – 1914). NOTE: Hill got the name “Royal Hill” as he was awarded the Royal Society’s Copley Medal.
- One is the asterism “Triangula” (“triangles”) which is the IAU constellation Triangulum:
  - “Triangula” was a name created by English astronomer Richard Anthony Proctor in 1873 as he believed that shortening the name would make more room on astronomical charts. English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Triangula, The (Northern) Triangles” as an official constellation “recognized in the catalogue of the British Association”.
  - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists “the Triangles” as a constellation.
  - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists Triangulum as “Triangula”.

Triangular:

This Latin asterism “Triquetrum” is the IAU constellation Triangulum.

Triangular Spoon:

This Arabic asterism “Al Mijdaḥ” is the Hyades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Triangulum:

None of the stars in Triangulum is brighter than 2nd magnitude, but its stars do appear in 77 of the asterisms listed in this handbook.

This IAU constellation “the Triangle” (IAU abbreviation Tri) became one of Ptolemy’s 48 original constellations in the 2nd century, appearing in the *Almagest* as Τρίγωνος or Τρίγωνον (“Trigonon” – “triangle”) a name he got from Hipparchus (190 – 120 B.C.E.): This was later latinized as “Trigonum” and “Trigonus”: It originated in the Babylonian asterism “Epinnu” (see Plough above). Its original Greek name was “Deltoton” (Δελτωτόν) as the constellation resembled the upper-case Greek letter, Delta (Δ). Roman astronomers later Latinized this to “Deltotum” and “Delta”. Other names used to describe it include “Tricuspis” (“three-pointed”) and “Triquetrum” (“triangular”).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a triangle.

Triangulum appears in the Leiden *Aratea* (816) as a single triangle.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Triangulum as a single triangle (two triangles appear on this page, but this is because they are showing it as viewed from the earth and from the sky).

Several editions of the Revised Arataus Latinus (Dresden DC 183, Paris BN 12597, St Gall 250, St Gall 902, Gottweig 7 (146), Siena L. IV. 25) have Triangulum decorated with wavy lines but in the Prague IX C 6 and Vat Reg lat 1324 editions these wavy lines are absent.

The *Tabulae Rudolphinae* lists this constellation as “Triangulus”.

The Munich 210, Los Angeles Getty Ludwig XII 5, and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* list this constellation as “Triangulus” and depict it upside down.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa’id al-Wazzan and his son Mohammad, depicts Triangulum as a single triangle.

The 11th century *De signis caeli (“of the signs of heaven*”) lists this constellation as “Triangulus”.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Triangulum as a single triangle.

Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) depicts Triangulum as a triangle.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels the constellation “Triangulus” and depicts a single triangle.

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Triangulum as a single triangle.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Triangulum as a single triangle formed by four stars.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Triangulum as a single triangle but does not label it.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Triangulum as a single triangle and is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Triangulum as a single triangle. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Triangulum as a single triangle.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Triangulum as a single triangle.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Triangulum as a single triangle.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Triangulus (sic)” as a single triangle.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Triangulum as a single triangle. It is not labelled. The Real Academia de Historia, manuscript D-97, f.104v – 105r depicts the same thing.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, labels this constellation “Delton (sic)” and depicts it as a single triangle.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Triangulus” as a single triangle.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del Triangolo”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Triangle”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Triangulum as a single triangle.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Triangulum siue Deltoton” as a single triangle.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Triangle” as a single triangle.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Triangulum as a single triangle but does not label it.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Trianguls (sic)” as a single triangle.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Triangulum as two triangles.

German astronomer Johann Bayer (1572-1625) called it “Triplicitas” (“triplet”) and later “Orbis Terrarum Tripertitus” (“the world is divided into three parts”) in his *Uranometria* in 1603, this representing Europe, Africa, and Asia. Bayer depicts it as a single triangle. Bayer lists these other names for Triangulum: “Triangulum, Deltoton, Triangulus Septentrionalis, Nili donum, Tricuspis, Nilus, Mutlathum”.

Johannes Kepler’s *Stella Nova in Pede Serpentarii* (1606) lists this constellation as “Trigonus”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Triangulum” as a single triangle and gives the alternate name “Triangulus Septentriones”.

Triangulum is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Trigonus” on one chart and as “Triangulum” on a polar chart and depicted as a single triangle in each case.

“Triangulum” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who also gives the name “Deltoton”.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Deltoton o Triangulo" and depicts it as a single triangle.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Triangulus" and "Deltoton" for this constellation.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Triangulu (sic)" as a single triangle.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Triangulum as a single triangle.

Triangulum is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: It is depicted as a single triangle.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Triangulum as a single triangle.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Triangulum" as a single triangle.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Triangulum" as a single triangle.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, renames this constellation "Triangulum Majus" after borrowing stars to create "Triangulum Minus" (see below).

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Triangle Bor", "Triangulum Bor", and "Τρίγωνον" ("Trigonon") and depicts it as a single triangle.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this "Le Triangle Bor", "Triangulum Bor", and "Trigonon" and depicts it as a pair of overlapping triangles.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Triangulum as two triangles which do not overlap.

Triangulum is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a pair of overlapping triangles.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Triangulum as two triangles, one slightly larger than the other.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Triangle Septentrional" as a single triangle.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Triangula" as a pair of triangles.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Le Triangle" as a triangle next to "le petit Triangle" on the

northern hemisphere chart, but on a later close-up chart these two triangles are shown as overlapping and simply labelled “le Triangle” and yet another closeup chart it is labelled “les Triangles” and shows two triangles overlapping. The 1778 edition depicts “Le Triangle” as two overlapping triangles.

Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists this constellation as “Die Triangle“.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as “Triangula” it in his *Celestial Atlas* in 1822 and depicts it as two overlapping triangles Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists it as “Triangulua” and depicts it the same way.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Triangulum” as a single triangle.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Triangulum” as a pair of triangles.

American uranographer William Croswell (1760 – 1834) “Triangulum, the Triangle” on his *Mercator Map of the Starry Heavens* in 1810 as a single triangle.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as the “Triangel” and depicts it as a single triangle. However, Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Die Triangel“ and depicts it as a double triangle.

English Admiral Henry William Smyth lists “Trigonus” in his *Bedford Catalogue* in 1844.

“Triangulum” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a single triangle.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Triangulum” as a single triangle.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Triangula” as a pair of overlapping triangles.

This is listed as “Triangula” in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

“Triangulum” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a single triangle.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes “a line drawn from Almach to Arietis will pass through a beautiful figure of three stars called “The Triangles”. Steele is mistakenly referring to the star Hamal here as “Arietis”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Triangulum” in his *Star Atlas* (1893) and describes it as “The Triangle”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Triangulum” and describes it as a “Triangle”.

Marie Trevelyan's *Folk-Lore and Folk-Stories of Wales* (1909) lists this constellation as "the Triangle".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists this constellation as "Triangula" and describes it as a single triangle.

Triangulum is depicted on standard IAU charts as the triangle of stars Alpha (α) Trianguli (Mothallah), Beta (β) Trianguli (Mizan), and Gamma (γ) Trianguli.

The Germans called it "Dreieck" and the Italians "Triangolo".

Triangulum Antarcticus:

See Triangulum Australe.

Triangulum Australe:

The brightest star of Triangulum Australe, 2nd magnitude Alpha (α) Trianguli Australis (Atria), is the 42nd brightest star on the list of 90 brightest stars. The stars of this constellation only show up in 30 of the asterisms in this handbook.

This IAU constellation "the southern triangle" (IAU abbreviation TrA) was first described by Italian navigator Amerigo Vespucci in the 16th century and published by Lorenzo di Pierfrancesco de' Medici in *Mundus Novus* in 1504.

Dutch navigator Frederick de Houtman (1571 – 1627) listed it as "Den Zuyder Trianghel" ("the southern triangle").

Flemish astronomer and uranographer Petrus Plancius included it in his *Orbis terrarium typus de integro multis in locis emedatus* (1594): He depicts it as a single triangle with no label. Plancius also included it on his globe in 1589 as "Triangulum Antarcticus".

Dutch historian Paulus Merula (1558 – 1607) lists this as "Triangulus Australis".

Flemish cartographer Jodocus Hondius (1563 – 1612) and German uranographer Johann Bayer (1572-1625) changed its name to the current one.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Triangulum Austrinum" as a single triangle.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this as "Triangulum Australe" and depicts it as a single triangle. It is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a single triangle with no label.

German astronomer and uranographer Johann Bayer (1572-1625) lists "Triangulum Australe" in his *Uranometria* in 1603 and depicts it as a single triangle.

"Triangulum Australe" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, who gives the alternate name "Trigonus Notius".

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Triangulum Australe" for this constellation.

This constellation is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) with the abbreviated title “Triang Aust” and depicted as a single triangle.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Trangulum Austr (sic)” as a single triangle.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label “Triangulum Aust.”

Edward Sherburne lists it both as “Triangulum Australe” and “Trigonum Notius sive Deltoton” in his *Sphere of Marcus Manilius* in 1675.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

German poet Philipp von Zesen (1619 – 1689) listed this constellation as “Almutabet Algenubi”.

English astronomer Edward Sherburne also lists “Almutabet Algenubi” in his *Sphere of Marcus Manilius* (1675).

Triangulum Australe is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted on his charts as a single triangle.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, labels this constellation “Triangulum” on one page and “Triang. Australe” on another, in both cases illustrating it as a single triangle. Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts “Triangulum Australe” as a triangle of the stars Alpha (α) Trianguli Australis (Atria), Beta (β) Trianguli Australis, and Gamma (γ) Trianguli Australis.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Triangulum Australe” as a single triangle.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, labels this constellation with the abbreviated “Triangl Aus” and depicts it as a single triangle.

This constellation is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729 as “Triangulum”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Triangulum Aust” as a single triangle.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Triangulum Australe” as a single triangle.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) labels this constellation with the abbreviated title “Triang” and depicts it as a single triangle.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Triangulum Australe as a single triangle.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "Triangle Austral" as a single triangle.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts Le Triangle Meridional" as a single triangle.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts the "Triangle Austral" as a single triangle on the southern hemisphere chart. On a later closeup chart it is labelled "Triangle Austral Niveau".

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer give this the abbreviated label "Triangulum Aust" and depicts it as a single triangle.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) labels this constellation as "Sūdliche Triangel" on some charts and as "Sūdl Triangel" on other charts and depicts it as a single triangle.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Triangulum Aust" as a single triangle.

Triangulum Australe is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Drei Hoek" ("three corner"): It is depicted as a single triangle.

American uranographer William Croswell (1760 – 1834) depicts "Triangulum Australe the Southern Triangle" on his *Mercator Map of the Starry Heavens* in 1810 as a single triangle.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed this constellation as "Triangulum" in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) lists the "Southern Triangle" as a single triangle.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) under the shortened title "Triangulum": He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Triangula Aust" as a single triangle.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on the chart simply as "Triangle".

English astronomer Richard Anthony Proctor (1837 – 1888) shortened the name to "Triangula, The (Southern) Triangle" in his campaign to shorten names to create more room on star charts, renaming the IAU constellation Triangulum to "Triangula". "Triangulum" is listed Proctor's *A New Star Atlas* (1887) as an official name for the constellation Triangulum Australe "recognized in the catalogue of the British Association". NOTE: "Triangula" is a plural Latin term for "triangles" and not a single triangle.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Triangulum Australe" and describes it as the "Southern triangle".

Triangulum Australe is depicted on standard IAU charts as a triangle made up of four stars: Alpha (α) Trianguli Australis (Atria), Beta (β) Trianguli Australis, Epsilon (ε) Trianguli Australis, and Gamma (γ) Trianguli Australis.

Triangulum Boreale:

This is an alternate name for Triangulum ("the northern triangle"), used to differentiate it from the constellation Triangulum Australe (see above).

Triangulum Galaxy:

This asterism is Messier 33 (NGC 598), a spiral galaxy in the IAU constellation Triangulum: It is the third largest member of the Local Group of galaxies. It is one of the most distant objects that can be viewed with the unaided eye. This was discovered by English astronomer William Herschel in 1784. William Herschel listed it as "V 17" in his catalogue, and it is GC 352 in the *General Catalogue* of 1864. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this galaxy as the "Triangulum Spiral". This name appears as "Moliníllum Triánguli" in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

NOTE: Some have referred to this as the Pinwheel Galaxy, though this name is normally used for Messier 101 (see Pinwheel Galaxy, above).

Triangulum Majus:

See Triangulum Minus, below.

Triangulum Minor:

See Triangulum Minus, below.

Triangulum Minus:

This asterism was created by Polish astronomer Johannes Hevelius (1611 – 1687) by taking a triangle of three fainter stars from the IAU constellation Triangulum: 6, 10, and 12 Trianguli. It is often included on modern **telescopic** asterism charts under the incorrect name Triangulum Minor. Hevelius renamed the remaining stars in the original constellation "Triangulum Majus" (see above). Hevelius depicts "Triangulum Majus" and "Triangulum Minus" in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Triangulum Majus" and "Triangulum Minus". English astronomer John Ellard Gore (1845 – 1910) listed it as "Triangula" on his planisphere. English astronomer Richard Anthony Proctor (1837 – 1888) included it as part of his constellation "Triangula" in his *A New Star Atlas* (1887).

Tribble Nebula:

This **telescopic** asterism is the open cluster NGC 1624 (SH 2-212, LBN 722, Cr53, Ced 37) in the IAU constellation Perseus. It was discovered in 1790 by English astronomer William Herschel who listed it as "V 49". It became GC 879 in the *General Catalogue* of 1864. Tribbles are fictional aliens conceived by screenwriter David Gerold in 1967 for the *Star Trek* series.

Trickster:

This Ininew (Cree) asterism “Wesakayckak” or “Wesakidjak” is the IAU constellation Orion (Buck 2016). He is also known as “Mistapiw” (see Giant above). The three stars of Orion’s belt are the “Three Chiefs” (see below).

This Gwich’in asterism “Vasaddihdzak” is the IAU constellation Orion (Cannon 2021). Cannon notes that this name is also used as an alternate name for their asterism Yahdii (see Traveler, above).

Trident of Ursa Major:

This **telescopic** asterism “Trídens Úrsae Majóris” is the intermediate spiral galaxy NGC 4051 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as “IV 56”. It became GC 2680 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the “three extending arms at the northern side of this galaxy”.

Trifid Nebula:

This **telescopic** asterism “three-lobe nebula” is the HII region and open cluster Messier 20 (NGC 6514, SH 2-30, RCW 146, LBN 127, Cr 360, Ced 151) in the IAU constellation Sagittarius. It was listed by French astronomer Charles Messier in 1764, but American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham’s Celestial Handbook* that it was “probably first seen by Le Gentil in 1747”: This would be French astronomer Guillaume Le Gentil (1725 – 1792). English astronomer John Herschel listed it as h 1991 and 3718 and in his General Catalogue of 1864 as GC 4355 and gave it the name Trifid Nebula, describing it as “consisting of three bright and irregularly formed nebulous masses, graduating away insensibly externally, but coming up to a great intensity of light at their interior edges where they enclose and surround a sort of 3-forked rift or vacant area”:

- William Denning’s *Telescopic Work for Starlight Evenings* (1891) lists it as the “Trifid Nebula”.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as the “Famous Trifid”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists this as the “Trifid Nebula”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this nebula as the “Trifid Nebula”.
- This is also known as the “Cauliflower”.

Triggerfish:

This Samoan asterism “Sumu” is the IAU constellation Crux (Fitisemanu 2022). It is associated to the legend of Filo and Mea (see above) who are fishing for the triggerfish. Compare this to the Tongan Giant Triggerfish (see above).

Trigonon:

See Triangle, above.

Trigonum:

See Triangle, above.

Trinity:

This Gallic asterism “Trion” is made up of stars of the IAU constellation Aquila. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. This is the three stars Gamma (γ) Aquilae, Alpha (α) Aquilae (Altair) and Beta (β) Aquilae (Alshain).

This German asterism is the IAU constellation Triangulum as listed by German astronomer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists it as “Emblem of the Blessed Trinity” in his *Sphere of Marcus Manilius* in 1675.

Trinity of Puppis:

This **telescopic** asterism “Trínitas Púppis” is the galaxy ESO 255-7 (PGC 19078) in the IAU constellation Puppis. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

TRINOVX SAMO:

This Celtic asterism from the Sequani calendar is the stars Alpha (α) Canis Majoris (Sirius) and Alpha (α) Canis Minoris (Procyon), whose rising marked the beginning of the dark half of the lunar cycle of Samonius (see Beginning of Light Guiding Stars, above).

Trio:

This Tzotzil (of Zinacantán) asterism is the belt of Orion in the IAU constellation Orion.

Trio of Robbers:

This Tzotzil (of Zinacantán) asterism is the sword of Orion in the IAU constellation Orion (Milbrath 1999).

Triopas:

This Greek asterism is the IAU constellation Ophiuchus. Triopas was the 7th king of Argos, often depicted as having three eyes (as the meaning of his name suggests) and possibly an Argive Zeus. Compare this to Carnabon (above) and Phorbas (above).

Tripater:

This Greek asterism “τρίπατρος” (“trípatros”), later latinized to “Tripater”, is the IAU constellation Orion. It is a reference to Orion’s birth: His father Hyrieus was childless, so the three Gods Poseidon, Zeus, and Hermes gifted him a son (see Hyrieus, above).

Triple Cave:

See Barnard’s E, above.

Triple Crash:

This American **telescopic** asterism is the merging galaxies IC 1015 in the IAU constellation Boötes. It was discovered by Stephane Javell in 1892. This name was posted on the *Deep Sky Forum* in July 2019 by Jimi Lowrey.

Triple Ringed of Libra:

This **telescopic** asterism “Trivalláta Líbrae” is the barred spiral galaxy NGC 5728 in the IAU constellation Libra. It was discovered in 1787 by William Herschel who listed it as “I 184”. It became GC 3977 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has “one smooth spiral arm”.

Triplet:

This German asterism “Triplicitas” is the IAU constellation Triangulum and was so named by German astronomer Johann Bayer in 1603 in his *Uranometria*.

Triplet of Eridanus:

This **telescopic** asterism “Trigémina Erídani” is the lenticular galaxy NGC 1725 in the IAU constellation Eridanus. It was discovered by American astronomer Edward Emerson Barnard in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is in a group with NGC 1728 and 1721.

Tripod:

This Persian asterism “Dik Paye” is the stars Alpha (α) Lyrae (Vega), Epsilon (ε) Lyrae, and Zeta (ζ) Lyrae in the IAU constellation Lyra as listed by Persian polymath and astronomer Nasr al-Din al-Tusi (1201 – 1274).

Tripod of the Zhou:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Boötes: 6 Boötis (the determinative star), 2 Boötis, and 1 Boötis.

This Chinese xing guan “Zhōudǐng” (周鼎) is a triangle of stars in the IAU constellation Coma Berenices: Beta (β), 37, and 41 Comae Berenices.

This Chinese Chenzhuo xing guan “Zhōudǐng” is a triangle of stars in the IAU constellation Boötes: 1, 2, and 6 Boötis.

Tripods:

This Arabic star “aṣ-Ṣaāfiyy”, “Asw-Swaafiyy”, “aṣ-Ṣāfiyy”, or “As-Ssaafiyy” (الصافيّ) is the three stars Upsilon (υ), Tau (τ), Sigma (σ) Draconis in the IAU constellation Draco. It is part of their asterism Mother Camels (see above). Compare this to their asterism Three Stone Support (above) and Trivet Stones (see below):

- This was later latinized to “Alsafi” and “Uthfiyyah”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al atháfi, the tripod”.
- The IAU approved the name Alsafi for Sigma (σ) Draconis.

Triptolemus and Jasion:

This Greek asterism is the IAU constellation Gemini. This alternate name for Gemini is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. It is also listed in John Hill’s *Urania* in 1754. Triptolemus is a demigod of the Eleusinian mysteries who presides over the sowing and milling of wheat.

Triskeles of Canes Venatici:

This **telescopic** asterism "Trísceles Cánum Venaticorum" is the Magellanic spiral galaxy IC 4182 in the IAU constellation Canes Venatici. It was discovered by Max Wolf in 1904. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the three broad arms make this galaxy look like a triskeles… an ancient symbol of three interlocked spirals or running legs".

Triton:

This Latin asterism is the IAU constellation Delphinus.

Triton's Dog:

This Latin asterism "Canes Tritonis" is the IAU constellation Cetus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Triumphal Arch:

This **telescopic** asterism is Vastagh 5, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Auriga. Its apparent diameter is 24'. Vastagh notes that "its brighter stars can be found at the base of the gate. The 'U' shape is emphasized by the arrangement of several objects along the arc. It gives the impression of not just a single chain, but a powerful wall, a triumphal arch."

Trivet:

This Macedonian asterism "Pirustija" or "Pirustiya" is close to their asterism "Mashi" (see Tongs above) and is made up of stars from the IAU constellation Lyra: Alpha (α) Lyrae (Vega), Beta (β) Lyrae (Sheliak), Gamma (γ) Lyrae, and Eta (η) Lyrae (Cenev 2004 & 2014). This is a three-legged support for pans and kettles in the fireplace.

Trivet Stones:

There are four Arabic asterisms with this name:

- One, "al-athāfī", later latinized to Athafi I & II, is the stars Upsilon (υ) Draconis (Athafi I), Sigma (σ) Draconis, and Tau (τ) Draconis (Athafi II) in the IAU constellation Draco.
- One, "al-athāfī al-qidr" is the stars Alpha (α) Lyrae (Vega), Epsilon (ε) 1 and 2 Lyrae, and Zeta (ζ) 1 Lyrae in the IAU constellation Lyra
    - "al-Qidr" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - This was later Latinized to "Alsafi".
- One, "al-athāfī", is the stars Lambda (λ) and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion:
    - "Al Athāfī" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- One, "al-athāfī", is the stars 35, 39, and 41 Arietis in the IAU constellation Aries (Adams 2018).

Compare this to their asterisms Tripods (see above) and Three Stone Support (see above).

Trochilus:

This French asterism “Trochilus” is the IAU constellation Auriga as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). Some Greek myths have Trochilus as the inventor of the chariot.

Troi Rois:

This Caribbean asterism is made up of the stars of the IAU constellations Orion and Canis Major: The belt of Orion is Troi Rois, the star Beta (β) Orionis (Rigel) is his severed leg, and the star Alpha (α) Canis Majoris (Sirius) is the maiden Bihi who wielded the cutlass that cut his leg off.

Trojan:

This French asterism with the Greek name “Troicus” is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

This Latin asterism “Iliacus” is the IAU constellation Aquarius and is listed in R. H. Allen’s *Star Names.* He attributes it to Publius Ovidius Naso (Ovid, b. 43 B.C.E.).

Trojan Horse:

This **telescopic** asterism Ferrero 36 from the asterisms list of French astronomer Laurent Ferrero, is in the IAU constellation Reticulum:

- The “head” of the horse is a curve of three stars including HIP 16693,
- The “back” of the horse is the two stars HIP 16682 and 16589,
- The “front leg” is two 9th magnitude stars, and
- The “back hoof” is star HIP 16634.

Trónuš:

This Kaykavian asterism is the IAU constellation Cassiopeia.

Troops of Sky:

This Korean asterism “Haneul-ui Gundae” (하늘의 군대) is a maze of star lines in the IAU constellations Aquarius, Cetus, and Pisces: One long line seems to connect the entire asterism together, starting at 29 Piscium at one end and running through 33 Piscium, AD Ceti and 3 Ceti, HIP 117567, Omega (ω) 2 Aquarii, HIP 116591, Omega (ω) 3 Aquarii, 94B Aquarii, Tau (τ) Aquarii, 66 Aquarii, 88 Aquarii, and 89 Aquarii, ending at 86 Aquarii. All along this weaving star line other star lines branch off:

- From 29 Piscium two lines branch off to 5 Ceti and 27 Piscium,
- From 33 Piscium two lines branch off to HIP 840 and 30 Piscium,
- From 3 Ceti a twisting line runs through 6 and 2 Ceti, and HIP 983 to 7 Ceti,
- From Omega (ω) 2 Aquarii a curving line runs through HIP 116957, and 104, 106, and 107 Aquarii to 108 Aquarii,
- From HIP 116591 a twisting line runs through HIP 116853A and 117314 to 117541,
- From Omega (ω) 3 Aquarii a twisting line runs through Omega (ω) 1 and 2 Aquarii, and Chi (χ) Aquarii to Phi (ϕ) Aquarii, where two lines branch off to 96 Aquarii on one side and 83 Aquarii on the other, and
- From 94B Aquarii a curving line runs off through 97, 98, and 99 Aquarii to 101 Aquarii.

Tropic Crab:

This asterism is the IAU constellation Cancer as named by English poet John Milton (1608 – 1674).

Trotting Camel:

See Dancer, above.

Troubles of Arcturus:

This Greek star "δεινοῦ Ἀρκτοῦροιο" or "deinoú Arktoúroio" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as described by Aratus (315 – 240 B.C.E). It was used by navigators and farmers as an indicator of the star of a season of stormy weather.

Troublesome:

The stars of this Kiribati asterism "Kameio" are currently unidentified (Trussel and Groves 1978).

Trough:

This Arabic asterism is a curve of stars in the IAU constellation Crater: Eta (η), Zeta (ζ), Gamma (γ), Delta (δ), Epsilon (ε), and Theta (θ) Crateris.

Troydi:

This Chakavian asterism is the IAU constellation Triangulum.

True Lover's Knot:

This **telescopic** asterism is the nebula and open cluster NGC 2070 (Caldwell 103) in the IAU constellation Dorado. It was discovered by Abbe Nicolas Louis de Lacaille in 1755. R. H. Allen writes in his *Star Names* in 1899 that this was named by English astronomer William Henry Smyth (1788 – 1865). It is also known as the Tarantula Nebula (see above),the Great Looped Nebula, and the 30 Dorado Cluster or 30 Dorado Association

True Shepherd of Anu:

This Babylonian asterism from the MUL.APIN tablets "MUL.SIPA.ZI.AN.NA" (Parpola 1993), "SIPA.AN.NA" or "SIPAZI.AN.NA" which translates as "the true shepherd of heaven" or "True Shepherd of the God Anu", is made up of stars of the IAU constellations Gemini and Orion (Bartel van der Waerden 1974, Boutet 2014). It is listed on the K 8538 planisphere as "mulSipa-zi-an-na" (Koch 1989).This is described as follows:

- His "head" is the triangle of stars Phi (ϕ) 1 and 2 Orionis and Lambda (λ) Orionis,
- His "shoulders" are Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis,
- His "belt" is Zeta (ζ), Epsilon (ε), and Delta (δ) Orionis,
- His "feet" are Kappa (κ) and Beta (β) Orionis (Rigel),
- One arm runs from Gamma (γ) Orionis to Pi (π) 5 Orionis,
- One arm runs from Betelgeuse to Mu (μ) Orionis,
- From Mu (μ) Orionis three lines run out to form a "shepherd's crook":
    - One goes to HIP 28413.
    - One goes to Mu (μ) Geminorum, and
    - One goes to Eta (η) Geminorum.

In later Seleucid sky lore, the "shepherd's crook" of their version of the True Shepherd of Anu is described slightly differently. The lower part of the "crook" is the same, but the upper part runs from Mu (μ) Orionis to Chi (χ) 1 Orionis and then curves through Chi (χ) 2 Orionis, 68 Orionis, and 71 Orionis, ending at 69 Orionis. They also had another asterism "True Shepherds of Anu" (see below) that included Gemini.

This Babylonian or Sumerian asterism "sipa-zi-an-na" is from the star catalogue BM 78161 (5^{th} – 7^{th} century B.C.E.) and is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Liechty 1988).

This Babylonian asterism "SIPA.ZI.AN.NA" or "shidallu" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Orion.

This Sumerian asterism "mulsipa-zi-an-na".listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Orion.

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and from the list of Lumasi stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is "Šitaddaru" (Parpola 1993), "Šidallu", "ši-da-al-lu-u", "Sitaddallu" or "Sitaddalu" (Boll 1918) and from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is "mul sipa.zi.an.na" (Koch-Westenholz 1995). It appears in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) as "ši-da-al-lu-u".

This Assyrian asterism "SIBA.ZI.AN.NA" is identical to the Babylonian asterism "SIPA.AN.NA" (above).

This Persian asterism "SIB.ZI.AN.NA" or "sipa-zi-an-na" from the list of Lumasi and Tikpi Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Orion (Jeremias 1929, Weidner 1971). They also had a version of the asterism True Shepherd of Anu (see above) which was only slightly different from the earlier Babylonian one which only include stars of Orion.

True Shepherds of Anu:

This Seleucid asterism "SIPA u MAS.MAS" ("true shepherds of Anu" or "true shepherds of heaven") or "a-me-lu" ("men") from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is stars of the IAU constellations Orion and Gemini (Foxvog 1993).

Truffle of Eridanus:

This **telescopic** asterism "Túber Erídani" is the spiral galaxy NGC 1084 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as "I 64". It became GC 604 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Trumpeter Bird:

This Carib asterism "Akamiyuman" or "Akami" represented several birds standing in a row. Its rising coincides with the mating season of the wood trumpeters (Psophidae). Its location is unknown at present.

Trustworthy Turtle:

This Chinese Chenzhuo xing guan “Xingui” is the star HIP 25110 in the IAU constellation Camelopardalis. It is part of their xing guan Purple Forbidden West Wall.

Tsui //Goab:

This Nama and KhoiKhoi star “aob” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is part of their asterism Three Zebras (see below). Tsui //Goab is their sky God and husband of Khunuseti (see Stars of Spring, below)

Tu:

This Myanmar yathi (zodiac constellation) “Tu” (တု) is the IAU constellation Libra.

Tu'amu sa ina mihrit Sitaddali izzazu:

This Persian (Achaemenid Period 539 – 331 B.C.E.) asterism “Tu'amu sa ina mihrit Sitaddali izzazu” from the K 250 and VAT 9418 lists as listed in Franz Boll’s *Ancient Observations of Coloured Stars* in 1918 is Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis in the IAU constellation Orion. This is part of their asterism True Shepherd of Heaven (see below) and is a reference to a star in this asterism that is near their asterism Tu’amu (see Twins, below).

Tub:

This German asterism is the Great Square of Pegasus in the IAU constellation Pisces (see Great Square of Pegasus, above). It relates to the story of Antenteh, who only owned a tub and a cabin and who met two magical fish (see Magical Fish, above) that granted her wishes.

Tuber:

This Latin asterism “Fistulater” is the IAU constellation Hercules as listed in John Hill’s *Urania* in 1754.

Tucana:

None of the stars of Tucana are brighter than 3rd magnitude and show up in 98 of the asterisms in this handbook, principally because the Small Magellanic Cloud is located here.

This IAU constellation “the Toucan” (IAU abbreviation Tuc) is one of twelve constellations created by Flemish astronomer Petrus Plancius in 1597 based on the observations of the Dutch navigators Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627). It first appeared on one of Plancius’ globes published in 1598 as “Toucan” by Flemish cartographer Jodocus Hondius (1563 – 1612). De Houtman included it in his catalogue as “Den Indiaenschen Exter, op Indies Lang ghenaemt” (“the Indian magpie, named Lang in the Indies”), a reference to a hornbill: Dutch uranographer Willem Blaeu (1571 – 1638) also calls it the Indian magpie. Dutch historian Paulus Merula (1558 – 1607) lists it as “Pica Brasilica” and “Toucan”.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists “Toucan” and depicts it as a toucan with a leafy twig in its beak, as do gores of his 1598 globe..

German uranographer Johann Bayer lists “Tucana” in his *Uranometria* in 1603 and depicted it as a toucan with a leafy branch in its beak.

In the 17th century this constellation was listed by the English as “Brazilian Pye”:

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Toucan" as a toucan facing to our left with a leafy twig in its beak.

"Toucan" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627, listed this constellation as "Toucan" and "Anser Americanus".

Tucana is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) as "Toucan" and depicted as a toucan with a leafy twig in its beak.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Toucan" as a toucan facing to our left with a leafy branch in its mouth. It is standing on the back of Hydrus with its right foot in a similar fashion to Corvus on the back of Hydra.

Robert Hues listed it as "Brazilian Pye" and "Toucan" in his *A Learned Treatise of Globes* in 1659.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Toucan".

Edward Sherburne lists it as "Toucan" in his Sphere of Marcus Manilius in 1675, also including the names "American Goose", "Ramphestes" ("creepers") and "Pica Brasilica seu Indica" ("Brazilian or Indian Magpie").

English astronomer Edmund Halley's chart of 1678 depicts "Toucan" as a toucan.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

German poet Philipp von Zesen (1619 – 1689) called it "Pica Indica"

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Toucan" as a toucan facing to our left with a twig in its beak. Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Toucan" as a toucan with a leafy twig in its beak. The central star is Gamma (γ) Tucanae, from which three lines run out:

- One to Alpha (α) Tucanae,
- One to Zeta (ζ) Tucanae, and
- One to Beta (β) 1 Tucanae.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Toucan", "Toucan", and "ΤΟΥΚΑΝΟΣ" and depicts it as a toucan walking to our left with a leafy branch in its mouth. It is depicted standing on its left foot on the back of Hydrus.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Toucan al Pica Indica" as a toucan carrying a leaf in its beak.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Toucan" and depicts it as a toucan with a branch in its beak.

This constellation is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729 as "Toucan".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Toucan" as a toucan walking to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Toucan" as a toucan walking to our right with a branch in its beak with the subtitle "Anser Americanus".

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts "Toucan" as a toucan.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Tucana as a toucan walking to our right with a leafy branch in its beak.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "le Toucan" as a toucan with a leafy twig and a berry in its beak.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Toucan" as a toucan with a leafy twig in its mouth.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Toucan" as a toucan facing to our left with a branch in its mouth.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Toucan" as a toucan with a branch in its beak, as does the 1778 edition.

American uranographer Elijah Burritt (1794 – 1838) listed it as "Toucana" and "Touchan".

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Toucan" and depicts it as a toucan facing to our right with a branch in its beak.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Toucan" as a toucan with a leafy twig in its mouth, standing on the back of Hydrus.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts Tucana as a toucan walking to our left with a branch in its mouth but does not label this constellation.

Tucana is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Toucan": It is depicted as a toucan with a branch in its beak.

American uranographer William Croswell (1760 – 1834) depicts "Tucana the Toucan" on his *Mercator Map of the Starry Heavens* in 1810.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it as "Touchan" in his *Celestial Atlas* in 1822 as a toucan walking.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) labels this constellation the "American Goose".

Tucana is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as “Toucan”: He indicates the borders of this constellation on the chart but offers no illustration of it.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation simply as “Toucan” on the charts.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Toucan” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Tucana” and describes it as a “Toucan”, incorrectly attributing it to Bayer.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Tucana in his book *The Stars - A New Way to See Them* (1952). The standard version on IAU charts is three lines originating out of the star Gamma (γ) Tucanae, one to Alpha (α) Tucanae, one to Beta (β) 1 Tucanae, and one to Zeta (ζ) Tucanae. Rey’s version also has Gamma (γ) Tucanae with a line running to Alpha (α) Tucanae but has a roughly triangular part consisting of Alpha (α) Tucanae, Beta (β) 1 Tucanae, Zeta (ζ) Tucanae, and Epsilon (ε) Tucanae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Tucana in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as an oval made up of the stars Alpha (α), Delta (δ), Epsilon (ε), Zeta (ζ), Beta (β) 1 and 2, and Gamma (γ) Tucanae. *Sky and Telescope Magazine*, founded in 1941, depicts Tucana in their magazine and publications in the same manner as Hlad et al.

The Chinese called it “Bird’s Beak” (see above), the Italians “Toucano”, the French “Toucan”, and the Germans “Tukan”.

Tuft in the Tail of the Dog:

This **telescopic** asterism is the open cluster Collinder 140 in the IAU constellation Canis Majoris. The name is obviously a reference to the “dog” Canis Major. This is on the SAC observing list and Corder 1333 on Jeffrey Corder’s observing list.

Tuiren:

This **telescopic** Irish star is HAT-P-36 in the IAU constellation Canes Venatici (magnitude 12.26). It was given this name in the IAU NameExoWorlds campaign. Tuiren was the aunt of the warrior Fionn mac Cumhaill, who was turned into a hound by a jealous fairy Uchtdealbh. This has an exoplanet named Bran. Bran was a hound who was Tuiren’s son and Fionn’s cousin.

Tulip:

This **telescopic** asterism the Tulip Nebula is Sharpless SH 2-101 (LBN 168, Ced 173) in the IAU constellation Cygnus. Size 16’ X 9’. It is also known as the Cygnus Star Cloud.

Tulip of Hydra:

This **telescopic** asterism “Túlipa Hýdrae” is the barred spiral galaxy NGC 3421 in the IAU constellation Hydra. It was discovered by English astronomer Andrew Ainslie Common in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “the profile of this edge-on galaxy puts in mind a ship’s shape”.

Tuminkar:

This Kalina star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus and is part of their asterism Twins (see below).

Tumwur:

This Micronesian asterism is the IAU constellation Scorpius.

Tuning Fork:

This **telescopic** asterism is in the IAU constellation Cancer. South African astronomer Auke Slotegraaf describes this: "In the center of this [is a] region of brighter stars [on the south and south eastern part of the cluster] lies a wobbly square of stars, one of which is Eta Cancri. West of Eta lies a nice double star [HIP 41978A]. This double, together with the wobbly square, look like a short-handled tuning-fork lying southwest to northeast, with the prongs pointing northeast".

Tunggal Bahangi:

This Sama navigational star has not yet been identified (Ambrosio 2008).

Tupã:

This **telescopic** Guarani star is HIP 60644 (HD 108147) in the IAU constellation Crux (magnitude 6.99). It was given this name in the IAU NameExoWorlds campaign. It is the name of their God that created the universe. It has an exoplanet named Tumearandu: Tume Arandu is the son of Rupavê and Sypavê, the original man and woman. He is known as the Father of Wisdom.

Tupi:

This **telescopic** Brazilian star "Tupi" is HIP 17096 (HD 23079) in the IAU constellation Reticulum (magnitude 7.11). It was given this name in the IAU NameExoWorlds campaign to honor the Tupi people. It has an exoplanet named Guarani, which is the name of the most populous indigenous people of Southern Brazil, parts of Argentina, Paraguay, and Uruguay.

Tupu-a-nuku:

This Māori star, "Tupu-a-nuku", is in their asterism "Matariki" (See Chief's Eyes, above) which is the Pleiades cluster in the IAU constellation Taurus (Harris et al 2013).

Tupu-a-rangi:

This Māori star, "Tupu-a-rangi", is in their asterism "Matariki" (See Chief's Eyes, above) which is the Pleiades cluster in the IAU constellation Taurus (Harris et al 2013).

Tuputuputu:

This Māori asterism "Tuputuputu" is one of the Magellanic Clouds (Orchiston 2017).

Tura ni Kama:

This Kiribati asterism is made up of the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus plus the IAU constellation Crux (Trussel and Groves 1978).

Tureis:

See Small Shield, above.

Turkish Coat of Arms:

This asterism "Turca" was made up of the stars of the obsolete constellation "Argo Navis" (see Argo's Ship, above) by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Turkey and is depicted as a crescent moon face.

Turn:

This Greek asterism "Τρόπος" ("Trópos"), later latinized to "Tropus" is Eta (η) Geminorum in the IAU constellation Gemini as listed by 1st century Roman author Gaius Julius Hyginus and Junius Bassus Theotecnius (317 – 359). They called it this as it was an apparent turning point in the Sun's course at the summer solstice.

Turned Away of Coma Berenices:

This **telescopic** asterism "Avérsus Cómae Bereníces" is the edge-on spiral galaxy NGC 4302 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "II 112". It became GC 2877 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "it is inclined away from us".

Turned Toward of Coma Berenices:

This **telescopic** asterism "Advérsus Cómae Bereníces" is the flocculent spiral galaxy NGC 4298 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as "II 111". It became GC 2874 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "it is inclined toward us".

Turning of Hydra:

This **telescopic** asterism "Tornatúra Hýdrae" is the barred spiral galaxy NGC 3673 in the IAU constellation Hydra. It was discovered in 1836 by John Herschel who listed it as h 3341 and later as GC 2412 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Turnip of Crater:

This **telescopic** asterism "Góngylis Cratéris" is the elliptical galaxy NGC 3962 in the IAU constellation Crater. It was discovered by in 1785 British astronomer William Herschel who listed it as "I 67". It became GC 2616 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Turquoise Orb:

See Blue Racquetball, above.

Turtle:

This Latin asterism “Testudo” is the IAU constellation Lyra and relates to their myth concerning Mercury creating the first Lyre from a turtle or tortoise shell.

- Variations include “Testudo Lutaria” (“mud inhabiting turtle”) and “Testudo Marina” (“sea turtle”).
- The 15th century *Alfonsine Tables* list the Spanish word “Galapago” and illustrate Lyra as a turtle.
- The 1551 edition of the *Almagest* lists “Lyrae Testudo”.
- Johann Bayer’s *Uranometria* (1603) lists the names “Testudo” and “Testudo Lutaria” for Lyra.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Testudo” as a name for this constellation.

This English asterism “Testudo” was created in the 19th century by English astronomer Admiral William Henry Smyth. It is a reference to the Roman “Turtle”, a roofed screen on wheels used by centurions to protect them during siege operations. It is made up of stars of the IAU constellations Cetus and Pisces:

- The center is a quadrilateral formed by the stars 20 Ceti, 14 Ceti, 13 Ceti, and 29 Piscium,
- At one end a line runs out from 20 Ceti to 42 Ceti, and
- At the other end a line runs out from 29 Piscium to 27 Piscium.

This Arabic asterism “as-sulaḥfāh” (السلحفاة), later latinized to “Alsulhufa” is the IAU constellation Lyra. This is a translation of the Greek name Turtle Shell (see below).

This Mayan asterism “Aak” or “Ac Ek” (“turtle star”) from the Paris Codex (Carlson 2005, Milbrath 2014) consists of a triangle of stars in the IAU constellation Orion: Beta (β) Orionis (Rigel), Kappa (κ) Orionis (Saiph), and Zeta (ζ) Orionis (Alnitak). A “tail” is the stars of Orion’s belt. Some versions only incorporate the belt of Orion. Compare this to the Tzotzil asterism “Vuku Pat” (see Bent-Back Turtle, above). Some Yucatec see Orion as the turtle. The *Paris Codex* lists Orion as a turtle and Gemini as a bird (possibly an owl) and the *Dresden Codex* also identifies Orion with a turtle or tortoise. A celestial turtle with three stars on its back appears in the sky band of the Nunnery façade at Chichén Itzá, as do the Bonampak murals.

This Yucatec asterism “ac” is the IAU constellation Orion (Milbrath 1999).

This Yucatec Maya (of Chan Kom) and Lacandón asterism is the IAU constellation Gemini (Milbrath 1999). A line of three stars in the middle are its intestines, but it is uncertain which stars these are: This would likely be the stars Lambda (λ), Zeta (ζ), and Epsilon (ε) Geminorum.

NOTE: The Mayan word “Ac” in early dictionaries is applied to both the turtle and the peccary, which leads to some confusion. Further confusion is created by some 16th century star charts which combined stars in Orion, Gemini, and Taurus. The 16th century *Motul* dictionary claims that “Ac Ek” is a constellation formed by stars in Gemini, which might explain why some Maya groups associate the turtle with Gemini.

This Dakota/Lakota/Nakota asterism “Keya” is the Great Square of Pegasus (see Great Square, above).

This Ininew (Cree) asterism “Makinak” is made up of the stars of the IAU constellation Cepheus (Buck 2016).

This Tukano asterism “Yurara”, also called “Tartaruga” (see Otter, above), is the IAU constellation Crux (Cardoso 2007).

This Ticuna asterism “Baweta” is made up of the stars of the IAU constellations Taurus and Perseus. Its “eyes” are the stars Omicron (ο) Persei and Zeta (ζ) Persei and its “tail” is the Pleiades cluster.

This Carib asterism “Wayamuyuman” or “Wayamu” represents the turtle (Testudo tabulate). It rises in the rainy season, but its present location is unknown (Magaña, and Jara, 1982).

There are two **telescopic** “Turtle” asterisms:

- One is in the IAU constellation Lynx and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 1713. Size 100’ X 75’. This is an oval group of stars between magnitude 6.5 and 8.5 and includes HIP 43685, 43719A, 43695, and 43426A.
- One is made up of stars of the IAU constellation Cygnus. It was posted on *Cloudy Nights* by American astronomer Fiske Miles in September 2022. Fiske describes it as “surrounding the deeply red RS Cygni, a component of the double star BLL 47, a strikingly red and blue duo. To me the asterism looks like a turtle.”

Turtle Beak:

This Chinese xiù (lunar mansion) “Zīxiù” (觜宿) is a triangle of stars in the IAU constellation Orion: Lambda (λ) and Phi (ϕ) 1 and 2 Orionis. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Zi Xi” (觜觿） was associated to matters concerning the Yizhou territory. It appears in the Tang Dynasty (618 – 907 C.E.) as Zi (觜) and was compared to the Vedic nakshatra Mrigashira (Kotyk 2017, See Deer’s Head, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Turtle Boy:

This Polynesian (Tuamotus) asterism is the belt of Orion in the IAU constellation Orion.

Turtle Dove:

This Romanian asterism “Porumbiţa” is the IAU constellation Columba (Ottescu 2009, Lite 2018).

Turtle Nebula:

This **telescopic** asterism is the planetary nebula NGC 6210 in the IAU constellation Hercules. It was discovered by American astronomer Otto Struve (1897 – 1963). John Herschel listed it as h 1970 and later as GC 4234 in the *General Catalogue* of 1864. Size 0.5’ X 0.5’. This is listed in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Turtle Snout:

This Japanese sei shuku or lunar station “Toroki Boshi”, sometimes interpreted as “tuft on the owl’s head” is a triangle of three stars: Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), and Delta (δ) Orionis (Mintaka) in the IAU constellation Orion.

Turtle Star:

This Ininew (Cree) star “Mininak” is the star Alpha (α) Aurigae in the IAU constellation Auriga (Buck 2016).

This Anishinaabe star “Mininaw” is the star Alpha (α) Aurigae in the IAU constellation Auriga (Lee et al 2014).

This Thai asterism “DaoTao” is made up of stars of the IAU constellation Orion (Nitiyanant 2015). The “legs” are Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis, Kappa (κ) Orionis, and Beta (β) Orionis (Rigel). The “head” is Lambda (λ) Orionis and Phi (ϕ) Orionis.

Tu’ulalupe:

This Tongan asterism is the Hyades cluster in the IAU constellation Taurus.

Tuulirmp:

This Marra and Moporr asterism is the Pointer stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Dawson 1881, Hamacher 2011).

Tuwi:

This Carib star represents a girl who was kidnapped by the King Vulture (see above). Its present location is unknown (Magaña, and Jara, 1982).

Tweedledee:

The **telescopic** asterism Tweedledee is the nearby open cluster IC 4756/Mel 210. It was discovered by American astronomer Solon Irving Bailey (1854 – 1931) in 1908. Tweedledee and Tweedledum are characters in an English nursery rhyme from Lewis Carroll’s 1871 book *Through the Looking-Glass and What Alice Found There*. Astronomer Steven James O’Meara gave it this name in *Deep Sky Companions*, who wrote: “In honor of Carroll's two chubby twins, I dubbed NGC 6633 and IC 4756, Tweedledum and Tweedledee, respectively.” It is also known as the Secret Garden Cluster and the Royal Council of Stars.

Tweedledum:

The **telescopic** asterism Tweedledum is the open cluster NGC 6633, discovered by Swiss astronomer Jean-Philippe Loys de Chéseaux in 1745-6 in the IAU constellation Ophiuchus. English astronomer Caroline Herschel rediscovered it in 1783 and her brother William Herschel listed it as VIII 72. It is GC 4410 in the *General Catalogue* of 1864. Tweedledum and Tweedelee are characters in an English nursery rhyme from Lewis Carroll’s 1871 book *Through the Looking-Glass and What Alice Found There*. Astronomer Steven James O’Meara gave it this name in *Deep Sky Companions*, who wrote: “In honor of Carroll's two chubby twins, I dubbed NGC 6633 and IC 4756, Tweedledum and Tweedledee, respectively.” It is also known as the Captain Hook Cluster (see above), “Kermit the Tadpole” (see above), the Wasp Waist Cluster (see below), and the Otter and Ball (see above).

Tweezers:

This **telescopic** asterism is NGC 4945 (Caldwell 83), a galaxy in the IAU constellation Centaurus. This was discovered by Scottish astronomer James Dunlop in 1827. This is listed as GC 3386 in John Herschel’s General Catalogue of 1864. This is also known as the Cigar Galaxy (see above), and the Golden Coin (see above).

Twelve O’Clock Stars:

This Lithuanian asterism “Dvylikinė žvaigždė” is the Pleiades open cluster in the IAU constellation Taurus.

Twelve States:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shí'èrguó” (十二国) is a set of 12 asterisms in the IAU constellations Capricornus, Microscopium, and Piscis Austrinus. Four of them are lines of two stars:

- “Dài”, is the stars Iota (ι) and Phi (ϕ) Capricorni, and
- “Qín”, is the stars Theta (θ) and Eta (η) Capricorni,
- “Zhào”, which is the smallest, is Psi (ψ) and Omega (ω) Capricorni,
- “Zhōu”, is 19 and 17 Capricorni.

The rest are stars in a nearby cluster of stars:

- “Chu” is the star HIP 103777,
- “Dai” is the star 3 Piscis Austrini,
- “Han” is the star 35 Capricorni,
- “Jin” is the star Epsilon (ε) Microscopii,
- “Qi” is the star Alpha (α) Microscopii, and
- “Wei” is the star 24 Capricorni,
- “Yan” is the star 2 Piscis Austrini,
- “Yue” is the star HIP 101014.
- “Zheng” is the star Gamma (γ) Microscopii.

This Chinese xing guan “Shí'èrguó” (十二国) is a set of 12 asterisms in the IAU constellation Capricornus. Four of them are lines of two stars:

- “Dài”, is the stars Iota (ι) and 37 Capricorni, and
- “Qín”, is the stars Theta (θ) and 30 Capricorni,
- “Zhào”, which is the smallest, is 26 and 27 Capricorni,
- “Zhōu”, is 21 and Eta (η) Capricorni.

The rest are stars in a nearby cluster of stars:

- “Chu” is the star 28 Capricorni,
- “Dai” is the star 41 Capricorni,
- “Han” is the star 35 Capricorni,
- “Jin” is the star 36 Capricorni,
- “Qi” is the star Chi (χ) Capricorni, and
- “Wei” is the star 33 Capricorni,
- “Yan” is the star Zeta (ζ) Capricorni,
- “Yue” is the star 19 Capricorni.

This Chinese Chenzhuo xing guan is twelve asterisms in the IAU constellations Capricornus, Microscopium, and Piscis Austrinus:

- Qín State is the two stars Iota (ι) Capricorni and Phi (ϕ) Capricorni.
- Zhōu State is the two stars Theta (θ) and Eta (η) Capricorni.
- Zhào State is the two stars Omega (ω) and Psi (ψ) Capricorni.
- Dài State is the two stars Epsilon (ε) Microscopii and 2 Piscis Austrini.
- Yue State is the star 19 Capricorni.
- Zheng State is the star 17 Capricorni.
- Wei State is the star 24 Capricorni.

- Yan State is the star HIP 103777 in Capricornus.
- Chu State is the star HIP 103389 in Capricornus.
- Han State is the star Delta (δ) Microscopii.
- Jin State is the star Gamma (γ) Microscopii.
- Qi State is the star Alpha (α) Microscopii.

Twelve Titans:

This Greek asterism was the constellations south of the IAU constellation Scorpius as listed by Hesiod (Mosenkis, date n/k): Grus, Microscopium, Indus, Telescopium, Pavo, Triangulum Australe, Apus, Musca, and Crux. Mosenkis notes that these would have become invisible to the Greeks during the 3rd – 2nd millennia B.C.E.

Twice as Large of Centaurus:

This **telescopic** asterism "Dúplus Centaúri" is the edge-on spiral galaxy NGC 3749 in the IAU constellation Centaurus. It was discovered in 1835 by John Herschel who listed it as h 3351 and later as GC 2452 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this it is twice as large as its neighbour NGC 3742.

Twice Circumvallated of Hydra:

This **telescopic** asterism "Bivalláta Hýdrae" is the lenticular galaxy NGC 2962 in the IAU constellation Hydra. It was discovered by Albert Marth in 1864. This became GC 5504 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "inner and outer ring".

Twice Flashing of Leo:

This **telescopic** asterism "Bifúlgida Leónis" is the spiral galaxy NGC 3190 in the IAU constellation Leo. William Herschel listed this as "II 44" and his son John Herschel as h 692 and later as GC 2058 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to two almost simultaneous supernova that were observed in this galaxy (SN2002bo and SN2002cv). This galaxy is part of the Leo Quartet (see above).

Twice Striped of Boötes:

This **telescopic** asterism "Bilineátus Boótis" is the lenticular galaxy NGC 5689 in the IAU constellation Boötes. William Herschel listed this as "I 188". John Herschel listed this as h 1848 and later as GC 3942 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "two dark streaks can be seen in the disk of this galaxy."

Twilight:

This Hawaiian star "Mulehu" is Gamma (γ) Cassiopeiae (Navi) in the IAU constellation Cassiopeia.

Twin Brother of Virgo:

There are two **telescopic** "Twin Brother of Virgo" asterisms:

- One, "Dídymus Vírginis" is the interacting spiral galaxy NGC 5257 (Arp 240) in the IAU constellation Virgo. William Herschel listed this as "II 895". John Herschel listed this as h 1654 and later as GC 3624 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 5257 and NGC 5258 are so much alike that they could be considered twin brothers." "Dídymus" is Greek for twin.
- One**,** "Géminus Vírginis" is the interacting spiral galaxy NGC 5258 (Arp 240) in the IAU constellation Virgo. William Herschel listed this as "II 896". John Herschel listed this as h 1655 and later as GC 3625 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 5257 and NGC 5258 are so much alike that they could be considered twin brothers." "Géminus" is Roman for twin.

Twin Fish:

This Latin asterism "Gemellus Piscis" is the IAU constellation Pisces.:

- Johann Bayer's *Uranometria* (1603) lists "Gemellus".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Gemellus Piscis".
- "Piscis Gemellus" or "Gemini Pisces" are listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844
- "Piscis Gemellus" or "Gemini Pisces" are listed in R. H. Allen's *Star Names* in 1899.

Twin Gate:

This Korean asterism "Teuwin Geiteu" (트윈 게이트) is a line of two stars in the IAU constellations Monoceros and Puppis: Delta (δ) Monocerotis and 13 Puppis.

Twin Stars (opposite Orion):

This Persian asterism "Tu'amu sa ina mihrit SIB.ZI.AN.NA izzazu" from the list of Masu Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is listed as the stars Gamma (γ) and Tau (τ) Geminorum in the IAU constellation Gemini and is related to their asterism Little Twins (see above).

This Persian asterism "Tu'amu sa ina mihrit Sitaddali izzazu" from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion.

Twinkling Brilliance:

This Chinese star "Yaoguang" from the Three Kingdoms to the Ming Dynasty is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Yaoguang" is the star Eta (η) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Twinkling Comet Cluster:

This **asterism** is the open cluster NGC 2420 in the IAU constellation Gemini. This was discovered by English astronomer William Herschel in 1785 who listed it as "VI 1" in his catalogue. It is GC 1549 in the *General Catalogue* of 1864. The principal stars are in an oval with a couple of stars as a "tail". A group of stars inside is known as a "Mini Corona Borealis" (see above).

Twinkling Indicator:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Zhaoyao" is the star A Boötis in the IAU constellation Boötes.

This Chinese xing guan "Zhāoyáo" (招摇) is the star Gamma (γ) Boötis in the IAU constellation Boötes.

This Chinese Chenzhuo xing guan "Zhāoyáo" is the star Gamma (γ) Boötis in the IAU constellation Boötes.

Twin Jet Nebula:

See Minkowski's Butterfly Nebula, above.

Twin Quasar of Ursa Major:

This **telescopic** asterism "Bíquasar Úrsae Majóris" is the galaxy 8C 0985+561 in the IAU constellation Ursa Major. It was the first known gravitational lens, discovered in 1979. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because gravitational lensing make it look like two objects.

Twin Sons of Rebecca:

This German asterism is the IAU constellation Gemini as listed by German poet Philipp von Zesen (1619 – 1689).

Twin Star:

This Latin asterism "Geminum Astrum" is the IAU constellation Gemini.

Twins:

This Babylonian asterism "MUL.MAS.TAB.BA" listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is the IAU constellation Gemini. The Neo-Babylonian (Chaldean) Great Star List (636 – 539 B.C.E.) lists this as "mul mas.tab.ba sa ina igi-it mul sipa.zi.an.na gub-zu", which means "The Twins which stand in front of the True Shepherd of Anu" (Koch-Westenholz 1995).

This Babylonian ziqpu "mulMAS.TAB.BA" from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini.

This Akkadian asterism "Tu'amu" listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is the IAU constellation Gemini.

This ancient Egyptian asterism "Ushaty Bektay" is the IAU constellation Crux. This is also known as Two Ladies.

This Greek asterism "Δίδυμοι" ("Dídymoi")is the IAU constellation Gemini as described in Aratus' poem *Phaenomena* (270 B.C.E.) and as described in Ptolemy's *Almagest* (2nd century). Ptolemy's version is

basically identical to the modern representation on star charts, except that it includes the “heads of both twins:

- Castor’s “head” is the quadrilateral of stars Alpha (α) Geminorum (Castor) and HIP 36896A, 37339, and 37179.
- Pollux’s “head” is the quadrilateral of stars Beta (β) Geminorum (Pollux) and Sigma (σ) Geminorum, HIP 38363 and 38228.

The “Twins” appear in several places:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed Gemini as “Didymi” and this was latinized to “Dioscuri”.
- NOTE: On the *Daressy Zodiac* of the Roman Imperial Period this Greek asterism is depicted as a man and a woman (as they appear in the Dendera temple) who appear next to a serpent.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Twins” many times as an alternate name for Gemini.

This Gaulish asterism “Semiuisoni Prinnios” or “Simiuisoni Prinnios” is the IAU constellation Gemini and appears in the Coligny Calendar (Boutet 2001, 2014). Compare to their asterism Half the Course of the Sun Guiding Star (see above).

This Belarussian asterism “Blizniuki” is the IAU constellation Gemini (Avilin 2009). The stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) symbolized the Great Lithuanian Princedom and the Polish Kingdom. It is also known as “Litwa” (“Gem”) or “Korona” (“Crown”).

This Lithuanian asterism “Dwynaytey” or “Dvynaitiai” is the IAU constellation Gemini (Vairkünas 1999).

This Estonian asterism is the IAU constellation Gemini (Kuperjanov 2006).

This Sardinian asterism “Sa loba”or “sos isteddos lobaos” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

This Hawaiian asterism “Na Mahoe”, “Mahau”, “Mahana”, “Na Hoku-Mahana”, or Na-lalani-a-Pili-lua (“the lines of the clinging ones”) is two stars in the IAU constellation Gemini:

- “Nanamua” (“First Star” or “Look Forward”): the star Alpha (α) Geminorum (Castor) and
- “Nanahope” (“Last Star” or “Looking Back”): the star Beta (β) Geminorum (Pollux).

The Hawaiians gave these two stars these names because “Nanamua” is the first of the pair of stars to appear in the sky as “Na Mohe” rises, and “Nanahope” always follows.

This Arabic asterism “Taw'aman” (توأمان) is the IAU constellation Gemini:

- This was later Latinized to “Al Tauʾamān”.
- “al-Tawāmān” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

This Hebrew asterism “Teōmīm” or “Teonim” is the IAU constellation Gemini and is related to their month Sivan.

This Seleucid asterism is the IAU constellation Gemini.

This Tongan asterism “otu Ma’afu” is related to their asterism “Humu” (see Giant Triggerfish, above) and is the Magellanic Clouds. The twins were part lizard sons of a chief named Ma’afu who took a lizard as a wife: Ma’afulele and Ma’afutoka. He conspired to have them killed by a big wild duck

Toloalahi (see Big Wild Duck, above) and a Humu but they killed the animals he sent and then they climbed to the stars with their prizes. Toloalahi became the Southern Cross, Humu became the Coal Sack Nebula (see Coal Sack Nebula, above), and the twins became the Magellanic Clouds:

- Ma'afulele**:** Large Magellanic Cloud.
- Ma'afutoka**:** Small Magellanic Cloud.

NOTE: The Tongans also used the name Ma'afulele for the star Alpha (α) Canis Majoris (Sirius) and the name Ma'afutoka for the star Alpha (α) Carinae (Canopus).

This Rapanui asterism is the Hyades cluster in the IAU constellation Taurus (Edwards 2016). It is also known as "the Sprout from Hiva" (Hiva being the Rapanui homeland) or "the Weak".

This Kalina asterism is the Pointer Stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus. They are the sons of the Sun. Compare this to the (Arawak) asterisms First Son of the Sun (see above) and Second Son of the Sun (see above). The younger son was Duid (see above) and the older son Tuminkar.

This Yokuts asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux).

This Anglo-Saxon asterism "Ge Twisan" is the IAU constellation Gemini.

This Italian asterism "Gemelli" is the IAU constellation Gemini.

German astronomer Johann Bayer (1572-1625) lists Gemini as "Zwilling" ("twin"). See Gemini, above.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Zwillinge, Castor und Pollux".

This Persian asterism "Du Paikar" is the IAU constellation Gemini.

This Sogdian lunar station "Marezānā" is the stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Eta (η) Orionis, and Lambda (λ) Orionis in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

This Korasmian lunar station "Ikhma" is the stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Eta (η) Orionis, and Lambda (λ) Orionis in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

This Hebrew asterism "Teonim" is the IAU constellation Gemini as listed in their list of constellations of the zodiac (mazzaroth) in their Talmud.

This Carib asterism "Pio-kanamo" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Mimosa) in the IAU constellation Centaurus (Magaña, and Jara, 1982). The twins Pia and Kanaima are hunting the curassow bird, Wokoyuman.

Twin's Star Near the Shepherd:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MAS-MAS sa SIPA" is Gamma (γ) Geminorum in the IAU constellation Gemini (Hunger and Sachs 1988) and is part of their asterism Twins (see above).

Twist:

This Greek asterism “Συστροφή” or “Systrofí” (‘whirling cloud” or “twist”) is open cluster Messier 44 in the IAU constellation Cancer.

Twisted Braid:

This **telescopic** asterism is the open cluster NGC 7193 in the IAU constellation Pegasus. René Merting describes it on the Faint Fuzzies website: ”…at 144x, …an elongated star trail (larger than 5') is visible, which is formed by groups of two and three stars - the star trail runs east-west with a slight bend to the northwest, it looks like a twisted braid.”

Twisted Foot:

This Aztec asterism “Xonecuilli” is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above). It is related to their crippled God “Nanahuatzin”, who sacrificed himself to become “Tonatiuh”, their Sun God.

This Tzotzil, Mixe, Totonac, and Nahua asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Twisted of Antlia:

This **telescopic** asterism “Tórta Ántliae” is the lenticular galaxy NGC 3100 in the IAU constellation Antlia. It was discovered in 1836 by John Herschel who listed it as h 3218 and later as GC 1997 in *the General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Twisted of Eridanus:

This **telescopic** asterism “Tortuósa Erídani” is the barred spiral galaxy NGC 782 in the IAU constellation Eridanus. This was discovered in 1834 by John Herschel and became 2454 on his list. It became GC 473 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its distinctive arms.

Twisted of Virgo:

This **telescopic** asterism “Tórtus Vírginis” is the spiral galaxy NGC 4845 (4910) in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “II 536” and as “V3”. John Herschel listed it as h 1491 and later as GC 3330 and GC 3363 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the small inclination between the dark dust belts in the inner region and the main disk account for the slightly twisted appearance of this galaxy”.

Twister:

This asterism is the IAU constellation Ursa Major as listed in R. H. Allen’s *Star Names* in 1899. Allen writes that it is derived from the Greek asterism Helical (see above).

Twister of Pavo:

This **telescopic** asterism “Stróphis Pavónis” is the spiral galaxy IC 4901 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1901. This name appears in *The Catalogue of One Thousand*

Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the open spiral arms make this galaxy look like a rotating fountain."

Twisting of Lupus:

This **telescopic** asterism "Tórquens Lúpi" is the intermediate barred spiral galaxy NGC 5643 in the IAU constellation Lupus. It was discovered by James Dunlop in 1826. John Herschel listed this as h 3572 and later as GC 3909 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Twisting of Virgo:

This **telescopic** asterism "Stróphus Virginis" is the spiral galaxy NGC 4487 in the IAU constellation Virgo. It was discovered in 1789 by William Herschel who listed it as "II 776". It became GC 3036 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the twisted shape".

Two Ancestors:

This Alawa asterism is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009). The ancestors reached the sky by climbing a large northern stringy-bark tree. Compare this to Waigungari (below and Man Throwing Spears into the Sky (above).

This Jardwadjali asterism is the IAU constellation Crux and the adjacent Coal Sack Nebula (see Southern Cross and Coal Sack Nebula, above). These two ancestors were trapped in the sky when the tree they climbed broke beneath them.

Two Armbands:

This Wardaman asterism is two stars in the IAU constellation Musca: Delta (δ) and Gamma (γ) Muscae. It is right next to their asterism Ceremonial Headband (see above).

Two Arrays:

This Arabic star "an-Nasaqān" (النسقان) is Beta (β) Coronae Borealis in the IAU constellation Corona Borealis, later latinized to "Masākīn" and "Nusakan". The IAU approved the name Nusakan for the star Beta (β) Coronae Borealis A.

Two Asses:

This Arabic asterism "Al Ḥimārain" is the stars Gamma (γ) Cancri and Delta (δ) Cancri in the IAU constellation Cancer. Compare this to the Greek asterism Praesepe (see Manger, above):

- The *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus calls these stars "the Asses".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al himáraïn, the two asses".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), refers to these stars as "the Aselli, or the Ass's Colts".
- R. H. Allen lists "Al Ḥimārain" in his *Star Names* in 1899.

This Latin asterism “Duo Asini” (“two asses”) appears in the 15th century *Alfonsine Tables* and the 1515 edition of the *Almagest*. English poet Philip James Bailey (1816 – 1902) called these stars “Aselline Starlets”. Compare this to Donkey Colts, above.

Two Beautiful Firebrands:

This Rapanui asterism “Ko Tau Erua Ehu” or “Tau a Aru Ahu” is two stars near Canis Major (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). The Edwards describe it as possibly Delta (δ) and Epsilon (ε) Canis Majoris in the IAU constellation Canis Major or Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. The Edwards believe that the former pair may be zenithal stars for these people, so I’m listing the stars in Canis Major.

Two Black Birds:

See Two Wolves, below.

Two Black Bulls:

This Arabic asterism “al-ʿawhaqān” or “Al ʿAuhaḳān”, later latinized to “Alahakan”, is the stars Psi (ψ) and Chi (χ) Draconis in the IAU constellation Draco.

Two Brilliant Ones:

This Mayan asterism is made up of two stars from the IAU constellation Gemini: Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux). These two stars were also called the Peccaries (see above).

Two Brothers:

The asterism “Diofrari” is the IAU constellation Gemini as listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

This Belarussian asterism “Dva Braty” is the IAU constellation Lyra (Avilin 2009). It is also known as “Niavesta” (see Bride, above) and “Sapernik” (see Rival, above).

The stars of this Upper Kuskokwim asterism “Nelungha” are unidentified at present (Cannon 2021).

Two Brothers Pursuing Their Sister:

This Dena’ina asterism is Alpha (α) Ursae Majoris (Dubhe) and Gamma (γ) Ursae Majoris (Cannon 2021).

Two Calves:

This Arabic asterism “Al Farḳadain” listed by al-Fayrūzabādī or “Firuzbadi” (1329–1414) and on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283) is two stars in the IAU constellation Ursa Major:

- Dimmer of the Two Calves (see above): Zeta (ζ) Ursae Majoris, and
- Brighter of the Two Calves (see above): Eta (η) Ursae Majoris.

NOTE: It is believed that in earlier times this referred to a pair of Ibex. Compare this to their asterism Two Oryx Calves, below.

Two Carriers:

This Tongan asterism “Fatanalua” is the IAU constellation Coma Berenices.

Two Chariots:

This Vedic nakshatra (lunar mansion) “Yamakaue”, also known as “Punarvasu” (see “Two Restorers of Goods” below) is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. “Yamakau” appears on the nakshatra list of the scholar Varahamihir (Leitz 2019).

Two Claws:

This Sogdian lunar station “Ghanwand” is the star Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen’s *Star Names* in 1899.

This Khorasmian lunar station “Ighnuna” is the star Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen’s *Star Names* in 1899.

This Coptic lunar station “Prititthi” is the star Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen’s *Star Names* in 1899. This is Allen’s translation of the name. It was listed by W.B. Yeats in *A Vision* in 1917 with no name, George Yeats having derived this from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as consisting of stars of “Libra and Scorpio” without listing any known name.

Two Companions:

This Arabic asterism “al-anīsān”, is the stars Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) in the IAU constellation Aries.

Two Compartments of Tucana:

This **telescopic** asterism “Bicamerátus Túcanae” is the barred spiral galaxy NGC 7733 in the IAU constellation Tucana. It was discovered in 1834 by John Herschel who listed it as h 4001 and later as GC 5001 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy is divided into two compartments by a big bar”.

Two Dogs:

This Arabic asterism “al-kalbān”, later latinized to “Al Kalbain” and “Alkalbain”, is the stars Kappa (κ) 1 and 2, Upsilon (υ), Phi (ϕ), and Chi (χ) Tauri in the IAU constellation Taurus (Alkalbain I, II, III, IV, & V):

- “al-Kalbain” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Al Anisan” or “Alanisan”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists it as “Al Kelbeïn”.
- It is associated with their asterism the Camel Herder (see above). Compare this to Dog of Al Dabaran (above).

This Cherokee asterism is the stars Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. They guard the path to the land of souls (Milky Way). You must feed them both or you will be trapped between them.

Two Dog Children Brothers:

The stars of this Dena'ina asterism are unidentified at present (Cannon 2021).

Two Dog Children Brothers and Their Mother:

This Tse'khene asterism is the belt of Orion in the IAU constellation Orion (Cannon 2021).

Two Doves:

This Arabic asterism is a line of two stars in the IAU constellation Grus: Alpha (α) and Beta (β) Gruis.

Two Ducks:

This Pawnee asterism is made up of stars of the IAU constellation Scorpius.

Two Eyes:

This KhoiKhoi asterism "Mura" is the Pointers, Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Alcock 2014). They see these as the eyes of some great celestial beast (Holt and Slotegraaf 2022).

Two Falcons:

This is a Wardaman name for the Pointers, Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Cairns 1999).

This is an alternate name for the Two Wolves (see below).

Two Feet of Al Jawza:

This Arabic asterism "rijla al-jawza'" is the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph) in the IAU constellation Orion and is part of the larger asterism Al Jawza (see above).

Two Figures:

This Persian asterism "Do Patkar" is the IAU constellation Gemini.

This Khorasmian asterism "Adhupakarik" is the IAU constellation Gemini.

Two First Ones:

This Arabic asterism al-Awwalaan (الأولان) is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major as listed by Arabic navigator Ibn Majid (d. ~1500) and is still used by Red Sea fishermen (Khalid AlAjaji).

Two Fish:

This Arabic asterism "as-samakatan" (السمكتان), later latinized to "Al Samakatain" consisted of two asterisms:

- "al-hut" or "as-samaka al-'azima al-hut" (see Great Fish, above) which includes "batn al-hut" (see Belly of the Fish, above).
- "as-samaka as sughra" (see Smaller Fish, above).

This asterism appears in several places:

- The names “al-Samakatān” and “al-Hūt” are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Robert Hues (1659) and John Chilmead (1889) listed it as “Alsemcha”.
- German astronomer Johann Bayer (1572-1625) listed “Sameh”.
- R. H. Allen lists this as “Al Samakah” in his *Star Names* in 1899 and identifies it as the constellation Pisces: This is partially correct as the Great Fish does include stars from Pisces and Andromeda. Allen writes that they also used the plural “Al Samakatain” and later writes that “The Arabs also likened the constellation [Ursa Minor] to a fish, but I’ve not been able to find any other sources that support this.

Two Fishes:

This Egyptian Dendera asterism is the IAU constellation Pisces (Hoffman 2017).

There are two Hebrew asterisms with this name:

- One, “Dagaïm” or “Dagaim” is the IAU constellation Delphinus as listed in John Hill’s *Urania* in 1754. Hill translates this as “sea fish”. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as “Dagiotho”.
- One, “Dagaïm” or “Dagaim” is the IAU constellation Pisces as listed in R. H. Allen’s Star Names in 1899.

This Latin asterism “Imbrifer Duo Pisces” is the IAU constellation Pisces as listed in R. H. Allen’s *Star Names* in 1899.

Two Fishes in the Gospel:

This German asterism is the IAU constellation Pisces as listed by German uranographer Wilhelm Schickard (1592 – 1635). This appears in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

Two Fishing Boats:

This Ainu Nociw (“asterism”) “Yasya Noka nociw” is the “W” asterism of the IAU constellation Cassiopeia: Beta (β) Cassiopeiae (Caph), Alpha (α) Cassiopeiae (Schedar), Gamma (γ) Cassiopeiae, Delta (δ) Cassiopeiae, and Epsilon (ε) Cassiopeiae.

Two Flails:

This Northern Estonian asterism has two parts. The first “flail” is the line of three stars in the IAU constellation Orion (Kuperjanov 2006): Kappa (κ) Orionis, Alpha (α) Orionis (Betelguese), and Gamma (γ) Orionis (Bellatrix): This is also recognized in Southern Estonia as a flail (see Flail, above). The second is the line of stars Beta (β) Orionis (Rigel), Zeta (ζ) Orionis, Epsilon (ε) Orionis, and Delta (δ) Orionis.

Two Forearms:

This Arabic asterism “adh-dhira’an” (الذراعان) has two parts:

- Extended Forearm: “adh-dhira’ al-matsuba”, the stars Beta (β) Geminorum (Pollux) and Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (see Extended Forearm, above).
- Clenched Forearm: “adh-dhira’a al-maqbuda” is Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Ursa Minor (see Clenched Forearm, above).

Two Forelegs:

This is a part of the Arabic asterism Lamb (see above).

Two Forks of Camelopardalis:

This **telescopic** asterism "Bifúrca Camelopardális" is the barred spiral galaxy NGC 2523 (Arp 6) in the IAU constellation Camelopardalis. It was discovered by Edward Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to the "bifurcated arm emerging from the northern side of the ring".

Two Front Ones:

This Arabic asterism is two stars in their asterism Daughter of Na'ash (see above) in the IAU constellation Ursa Major: Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak).

Two Gods of Sparta:

This Greek asterism is the IAU constellation Gemini as listed by Cicero (106 – 43 B.C.E.).

Two Guards:

This Bedouin asterism "al-Ḥuwaiğzain" (الحويجزين) is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor. They tell a story of how Al-Jady or al-Ğady (Polaris) killed the father of the Daughters of Na'sh (see above) who then asked these two for protection. It is also known as The Two Refugees (see below) or the Family of Aba Bzay (see above).

This Arabic asterism is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor. It is also known simply as Guards (see above).

Two Handles of Grus:

This **telescopic** asterism "Biansátus Grúis" is the barred spiral galaxy NGC 7410 in the IAU constellation Grus. This was discovered by James Dunlop in 1826. John Herschel listed it as h 3960 and later as GC 4860 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "of the two ansae ["handles"] visible in the inner region of the disk.

Two Hands:

This two-part Arabic asterism "yad al-jawza'" or "yada al-jawza'" (يدا الجوزاء) is part of the larger asterism Al Jawza and is the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix). "Yad al-Jauzā'" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Two Haunches:

This Arabic asterism "al-warikan" (الوركان) is in the IAU constellation Virgo and is the stars Beta (β) Virginis (Zavijava), Eta (η) Virginis (Zaniah), Gamma (γ) Virginis (Porrima), Delta (δ) Virginis and Epsilon (ε) Virginis (Vindemiatrix). It is identical to their asterism Howling Dogs (see above). It resembles a medial Arabic letter kaf or an English capital L, which has led to some translating this as "the turn", "the bend".

Two Hearted:

This **telescopic** asterism is made up of stars of the IAU constellation Cygnus. It was posted by "Davedlec" on *Cloudy Nights* in June 2022. The brightest star is magnitude 6.1 HIP 96724 which forms the apex of one of the "hearts".

Two Hearts of Boötes:

This **telescopic** asterism "Dicárdia Boótis" is the galaxy Z 221-50 (Mrk 848) in the IAU constellation Boötes. It was discovered by Cuno Hoffmeister in 1929 but originally thought to be a variable star. John Schmitt identified it as a radio source in 1968. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "two long, highly curved arms emerge from the central region with two cores".

Two Horned of Camelopardalis:

This **telescopic** asterism "Bicórniger Camelopardális" is the spiral galaxy NGC 1961 (IC 2133/Arp 184) in the IAU constellation Camelopardalis-. NGC 1961 was discovered in 1788 by William Herschel who listed it as "III 747". It became GC 1167 in the *General Catalogue* of 1864. French astronomer Guillaume Bigourdan (1851 – 1932) later recorded it as IC 2133. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Two Horned of Virgo:

This **telescopic** asterism "Díceros Vírginis" is the spiral galaxy NGC 5247 in the IAU constellation Virgo. William Herschel listed this as "II 297". John Herschel listed this as h 1649 and later as GC 3614 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the bifurcated spiral arms".

Two Hunters:

This Wotjobaluk asterism is the stars of the IAU constellations Auriga and Gemini and a star cluster in the IAU constellation Cancer:

- The first hunter is "Turree" (Alpha (α) Geminorum (Castor): See Fan Tailed Cockatoo, above.
- The second hunter is "Wanjel" (Beta (β) Geminorum (Pollux): See Eastern Long Necked Turtle, above.
- The smoke from their cookfire "Coomartoorung" (see Campfire Smoke, above) was Messier 44 (the Beehive Cluster, see Beehive, above), and
- The red kangaroo "Purra" that they were cooking (see Red Kangaroo, above) is Alpha (α) Aurigae (Capella).

The Boorong had a similar asterism with the hunters being "Yurree" and "Wanjel".

Two Hyenas:

This Arabic asterism "'adh-Dhi'bayn" ("two hyenas" الذّئبين) is the stars are Eta (η) and Zeta (ζ) Draconis and is part of their asterism Mother Camels (see above), later latinized to "Aldhibain", "Al Dhibain", "Adib", "Addib", "Eddib", "Adid", "Adive", or "Dhibain". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Al dhibain, the two jackals". It is also known as Two Wolves (see below).

Two Jackals:

See Two Wolves.

Two Jaguars:

This Palikur asterism is two dark clouds in the Milky Way near the IAU constellation Scorpius (Green and Green 2011). They are hunting a deer, whose horns ("Gituw") appear in the tail of Scorpius. Some Palikur refer to these jaguars as "Kayeb's Pets".

Two-Handed Pot:

This English asterism is the IAU constellation Crater. This relates directly to the description of Ptolemy's original constellation.

Two Headed Anaconda:

This Palikur asterism "Kayeb" is stars in the region of the IAU constellation Scorpius plus the Pointer Stars (Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar)) plus the IAU constellation Crux and the dark clouds of the Milky Way (Green and Green 2011). This is an asterism of the first rain. Crux is seen as Kayeb's "hand" by some Palikur, while others see the Pointer stars as his "hands", or as his two "heads". Some Palikur see the "tail" of Scorpius as Kayeb's "head" and the dark clouds in the Milky Way as his "body". Kayeb is seen as both an anaconda and a shape-shifting shaman.

Two in Front:

This Inuit asterism "Sivulliik" ("two in front" or "those [two] in front") is made up of two stars in the IAU constellation Boötes: Alpha (α) Boötis (Arcturus), which they call "the Old Man") and Eta (η) Boötis, which they call "The Little Orphan Boy" (MacDonald 1998). It is related to their asterism "The One Behind" (see above).

Two in the Ankles:

This Arabic asterism "Al Tawābiʿ al ʿAyyūḳ" is the stars Beta (β) Tauri (Elnath) and Iota (ι) Aurigae (Hassaleh) in the IAU constellations Auriga and Taurus as listed by Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). These stars are close to one another, and Elnath forms a corner of the hexagon of Auriga. Iota (ι) Aurigae was also known to the Arabs as kaʿb ðīl-ʿinān" (العنان) or "Ankle of the Rein Holder" (see above) which probably influenced al Qazwini's choice of this name.

Two Jaws:

This ancient Egyptian asterism "Aryt" is the "W" of the IAU constellation Cassiopeia (see W below).

Two Ladies:

See the Egyptian asterism Twins, above.

Two Lame Ones:

This Arabic asterism is the stars Gamma (γ) and Delta (δ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Daughters of Na'sh (see above).

Two Lights of Antlia:

This **telescopic** asterism “Bilýchnis Ántliae” is the spiral galaxy IC 2560 in the IAU constellation Antlia. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “two bright reddish spots can be observed at both sides of the nucleus on the inner disk of this galaxy”.

Two Lines:

This Arabic asterism is made up of a northern line of stars from the IAU constellations Hercules, Lyra, and Serpens, and a southern line of stars from the constellations Ophiuchi and Serpens.

- Northern Line of al-Nasaqān: This asterism, “al-Nasaq al-Sha'āmī”, later latinized to “Nasaḳ Shāmiyy” or “Nasak Shamiya”, runs through Beta (β) Serpentis (Nasak Shamiya I), Gamma (γ) Serpentis (Nasak Shamiya II), Kappa (κ) Herculis, Gamma (γ) Herculis (Nasak Shamiya III), Beta (β) Herculis (Kornephoros), Delta (δ) Herculis, Lambda (λ) Herculis, Mu (μ) Herculis, and Xi (ξ) Herculis, ending at Beta (β) Lyrae (Sheliak).
- Southern Line of al-Nasaqān: This Arabic asterism “al-Nasaq al-Yamānī” runs through Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (ε) Herculis, Delta (δ) Ophiuchi, Epsilon (ε) Ophiuchi, Upsilon (υ) Ophiuchi, Zeta (ζ) Ophiuchi, and Eta (η) Ophiuchi, ending at Xi (ξ) Ophiuchi. This was later latinized to “Nasak Yamani”, “Nasaḳ Yamāniyy”, or “Nasaḳ Yamaniyyah” and the name assigned to two stars in Serpens:
    - Delta (δ) Serpentis (Nasak Yamani I), and
    - Epsilon (ε) Serpentis (Nasak Yamani II).

The area between these lines is known as the Desert Garden and the Goats and the star Alpha (α) Ophiuchi in this area is the (Southern) Shepherd.

NOTE: R. H. Allen in his *Star Names* in 1899 lists these as Northern Boundary of the Pasture and Southern Boundary of the Pasture, calling the Two Lines asterism “the Pasture, Al Rauḍah”.Dorn (1829) lists the Southern Line of al-Nasaqān as “the Yemen or Southern String” as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Nasak Yemáni, or southern boundary” and “Nasak shámi” as the Northern Boundary.

Two Little Dogs:

This Bedouin (central Arabia) asterism “al-Klaibain” (الكليبين) is the stars Delta (α) Canis Majoris and Epsilon (α) Canis Majoris in the IAU constellation Canis Major. Compare this to the Arabic asterisms Greater Dog (see above) and Lesser Dog (see above). It was used in a similar manor to the Arabic manzil “Al-Hanaah” (see Bend in the Neck of the Camel, above).

Two Little Ones:

This Latin asterism “Duo Pauones” is the IAU constellation Gemini. Johann Bayer’s *Uranometria* (1603) lists “Duo Pauones. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Duo Pauones”.

Two Loons:

This Pawnee asterism is made up of stars of the IAU constellation Scorpius.

Two Male Ostriches:

This Arabic asterism is a line of two stars in the IAU constellation Cetus and Piscis Austrinus: Alpha (α) Piscis Austrini and Beta (β) Ceti.

Two Marks:

The Bedouin manzil "Al-Shartain", "Al-Šarṭain" (الشرطين),"'Ash-Sharatayn" (ٱلشَّرَطَيْن), or "'An-Nath" (ٱلنّطح) is in the IAU constellation Aries and is the stars Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) 2 Arietis (Mesarthim). Ibn Qutayba (d. 879 C.E.) listed this manzil. It is also known as "Two Signs" (see below). Dorn (1829) lists this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). This is part of their asterism Mosque of Al Thurayya (see above).

Two Men:

This Tongan asterism "Lua Tangata" or "Lua a Tangata" is their name for the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

This Samoan asterism "Luatagata" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Fitisemanu 2022). It is associated with the legend of Sumu (see Triggerfish, above). The names of these men are Filo and Mea and they are fishing for the triggerfish.

This Palawa asterism "Lua Tangata" is their name for the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. One of the "star men", who brought fire to earth, is named Pormpenner, Pardedarpedder, or Parpedder, depending on the region. The name of the other is lost.

This Kokatha and Ngalea asterism "Wati Kutjera" is the IAU constellation Gemini as listed by Leaman and Hamacher (2014).

Two Men and Two Women:

This Palawan asterism is the IAU constellation Crux (Gantevoort 2015). They also call this the "Cross of Fire" (see above). These two men, Una and Bura, bring fire to earth (thunder and lightning).

Two Nostrils:

This Arabic asterism "al-mankhiran" (المنخران) is in the IAU constellation Cancer and is the stars Gamma (γ) Cancri and Delta (δ) Cancri. This is identical to the Arabic manzil "Al-Nuthrah" or "Al-Nathrah (see Tip of the Nose, above) and Messier 44 (see Sneeze, above) and is part of the Arabic asterism Lion (see above).

Two Oryx Calves:

This Arabic asterism is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor. Robert Hues lists this as "Alferhathas" in his *A Learned Treatise on Globes* in 1659.

Two Ostriches:

There are two Arabic asterisms with the name "ẓalīmān" (ظليمان) or "al-thalīmain" ("two male ostriches"):

- One, later latinized to “Al Thalimain” and “Althalimain” is the stars Iota (ι) and Lambda (λ) Aquilae in the IAU constellation Aquila:
    - “Al Thalimain” and “Althalimain” are listed by German astronomer Christian Ludwig Ideler (1776 – 1846).
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “el dhalimaīn, the two ostriches” as appearing on the Borgian globe. The first is probably the Borgian globe of 1225.
    - In his *Star Names* in 1899 R. H. Allen notes that the four stars Delta (δ), Theta (θ), Kappa (κ), and Lambda (λ) Aquilae in the IAU constellation Aquila are depicted on two Arabic globes as the Two Ostriches. Allen writes that one globe is dated 1225 and the other 1289 but doesn’t identify the globes.
- One, latinized to “Toliman” is the star Alpha (α) Centauri B in the IAU constellation Centaurus. The IAU approved the name Toliman for Alpha (α) Centauri B.

Two Parallel Lines:

This **telescopic** asterism Sánta 186, listed in 2007 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Hercules. It is two parallel lines of 9^{th} – 12^{th} magnitude stars.

Two Parts of Sextans:

This **telescopic** asterism “Bifária Sextántis” is the edge-on spiral galaxy IC 575 (Arp 292) in the IAU constellation Sextans. They were discovered by French astronomer Stephane Javelle in 1893. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “seems to be divided in two parts by its flat dust-rich disk”.

Two Placed Far Apart:

This Inuit asterism “Akkuttujuuk**”** (“two placed far apart” or “those [two] apart”) is the two stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion (MacDonald 1998).

This Inuit (Greenlandic) asterism “Akuttut**”** (“two placed far apart” or “those [two] apart”) is the two stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion.

Two Poles:

This ancient Egyptian asterism is made up of stars of the IAU constellations Cepheus, Draco, and Ursa Minor. This is two arrows side by side pointing in the same direction:

- The first “arrowhead” has the star Alpha (α) Draconis (Thuban) at the “tip” and Gamma (γ) and Beta (β) Ursae Minoris (Kochab) at the base, with a “shaft” running out to Kappa (κ) Cephei, and
- The second “arrowhead” is 12 Draconis, with the stars Theta (θ), Eta (η), and Zeta (ζ) Draconis forming one side of a triangle and the “shaft” running out to the star Delta (δ) Draconis.

NOTE: Thuban was the northern pole star between the 4^{th} and 2^{nd} millennia B.C.E.

Two Proceeding to the Water:

This Arabic asterism is two stars in their asterism Pond (see above) in the IAU constellation Ursa Major: Upsilon (υ) and 23 Ursae Majoris.

Two Pronged Forks of Serpens:

This **telescopic** asterism “Bidentátus Serpéntis” is the grand design galaxy NGC 6118 in the IAU constellation Serpens. It was discovered in 1785 by William Herschel who listed it as “II 402”. It became GC 4180 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy has two spiral arms… fragmenting in the outer disk”. It is also known as the “Blinking Galaxy” (see above).

Two Refugees:

This Bedouin asterism “al-Diḫīlain” (الدخيلين) is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor. It is also known as Two Guards (see above) and the Family of Aba Bzay (see above). These are two who sought protection from Al-Jady (Polaris) after killing the father of the Daughters of Na’sh (see above).

Two Restorers of Goods:

This Vedic nakshatra (lunar mansion) “Punarvasu” appears in the *Atharveda* on the nakshatra list of the scholar Varahamihir (Leitz 2019) and is also known as “Yamakau” (see Two Chariots, above), is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. It is related to their deity Aditi, the all-mother. The ancient *Brhad Samhita* text lists five stars. Ivanković (2021) lists it as “Púnarvasū” and translates it as “restoring goods”. W. Brennand lists this as “Punarvasu” in his *Hindu Astronomy* in 1896 and translates this as “a house”. Bhagwath (2019) lists its symbols as a bow and quiver.

This Myanmar nekkhat (lunar mansion) “Ponnahpukshu” (ပုဏ္ဏဖုသ္သ) is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

This Tibetan gyukar (lunar house) “Nab So”, “Nabso Gyaltö” or “Möndru” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Johnson-Groh 2013).

Two Rings of Fornax:

This **telescopic** asterism “Dicýclus Fornácis” is the barred grand-design spiral galaxy NGC 1079 in the IAU constellation Fornax. It was discovered in 1835 by John Herschel who listed it as 2494 in his catalogue and later listed it as GC 603 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is the best-defined example of a R1R2' morphology in the sky, i.e. a galaxy with a distinct closed ring and a strong pseudoring made of spiral arms breaking from the R1 ring”.

Two Rivers:

This Arabic asterism “Al Nahrān” is made up of stars of the IAU constellations Leo and Virgo. This is the stars Beta (β) Virginis (Zavijava), Eta (η) Virginis, Gamma (γ) Virginis, Delta (δ) Virginis, Epsilon (ε) Virginis, and Beta (β) Leonis (Denebola):

- It is listed by el-Fīrūz Abādī”, also known as “al-Fayrūzabādī (الفيروزآبادي) and “Firuzbadi” (1329–1414) whose *al-Qamous* (القاموس) dictionary was in use for five centuries.

- . English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al anharán, the two rivers".
- It is listed in R. H. Allen's *Star Names* in 1899.
- Compare this to Howling Dogs (above).

This Persian asterism "Mashaha" is identical to the Arabic asterism "Al Nahrān" above and is listed in R. H. Allen's *Star Names* in 1899.

This Sogdian asterism "Fastashat" is identical to the Arabic asterism "Al Nahrān" above and is listed in R. H. Allen's *Star Names* in 1899.

This Khorasmian asterism "Afsasat" is identical to the Arabic asterism "Al Nahrān" above and is listed in R. H. Allen's *Star Names* in 1899.

Two Salutations:

This Samoan star "Ta'ulua" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Fitisemanu 2022). It refers to the time of year when this star is visible at both sunrise and sunset, thus it is "greeted twice" in the same day. It is also known as "Telegese" (see Slow Moving, above), and "Fētūsolonu'u" (see Gliding Star, above).

Two Salutations Eastward:

This Samoan star "Ta'uluatuāfanua" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Fitisemanu 2022). This is Sirius as seen as sunrise (see Two Salutations, above).

Two Salutations Westward:

This Samoan star "Ta'uluaalofi" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Fitisemanu 2022). This is Sirius as seen as sunset (see Two Salutations, above).

Two Seats of Fire of Camelopardalis:

This **telescopic** asterism "Bifóculus Camelopardális" is the Magellanic barred irregular dwarf galaxy NGC 2366 in the IAU constellation Camelopardalis. William Herschel listed this as "III 748". It became GC 1515 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Two Separated Stars:

This Arabic asterism is two stars in the IAU constellation Cepheus called "Two Separated Stars" or "Two Stars of Separation": Alpha (α) Cephei (Alderamin) and Beta (β) Cephei (Alfirk).

Two Shanks:

This Arabic asterism "as-saqan" (الساقان) is two stars:

- One is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (see Unarmed High One, above).
- One is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes and.

Compare this to the Arabic asterism Two Sky Raisers, below.

Two Shiny Ones:

This K'iche' asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Milbrath 1999).

Two Shi'ra Sisters:

This Arabic asterism "ash-shi'rayan" is made up of two stars and appeared in the poetry of Muhalhil (d. 531 C.E.):

- The Teary-Eyed Woman or Southern Shi'ra: Alpha (α) Canis Majoris (Sirius): See Teary-Eyed Woman, above. She was also called "ash-shi'ra al-'abur" or "The Shi'ra Who Crossed Over"
- The Bleary-Eyed Woman: Alpha (α) Canis Minoris (Procyon): See Bleary-Eyed Woman, above. She was also called "ash-shi'ra al-ghumaysa'" or the "Little Bleary-Eyed Shi'ra".

Two Shrikes:

This Arabic asterism is a line of two stars in the IAU constellations Indus and Pavo: Alpha (α) Pavonis and Alpha (α) Indi.

Two Sickles of Canes Venatici:

This **telescopic** asterism "Bifalcátus Cánum Venaticórum" is the barred spiral galaxy NGC 5383 in the IAU constellation Canes Venatici. It was discovered in 1787 by William Herschel who listed it as "I 181". It became GC 3723 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the two sickle-shaped outer arms of this galaxy."

Two Signs:

There are two Arabic asterisms by this name:

- One is the Arabic and Bedouin manzil "Al-Shartain", "Al-Šarṭain" (الشرطين),"'Ash-Sharatayn" (ٱلشَّرَطَيْن), or "'An-Nath" (ٱلنَّطح) is in the IAU constellation Aries and is the stars Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) 2 Arietis (Mesarthim): This is part of their asterism the "Lamb" (see above). Compare this to the Arabic asterism ash-sharat (see Sign, above) and al-ashrat (see Signs, above):
    - Ibn Qutayba (d. 879 C.E.) listed this manzil:
    - It is listed on a 14th century Christian Spanish astrolabe #4560 as "al saratān". It is also known as "Two Marks" (see below).
    - Qutrub (d. 821 C.E.) listed this as their third manzil, which matches their rains star calendar, but Ibn Qutayba (d. 889 C. E.) listed it as the location of the vernal equinox and the first manzil.
    - W. Brennand lists this as "Al Sheratau" in his *Hindu Astronomy* in 1896 and attributes this to by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- One is the Arabic star "ash-Sharāṭān" (الشرطان) is Beta (β) Arietis in the IAU constellation Aries:
    - This was later latinized to "Ash-Sharatan", "Al Saraṭān", "Al Sharatain", "Sheratan", and "Sharatan".
    - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-shamāli min al-nath" and the Hebrew name "ha-qeren ha-semoli meha-menagge'h".

- German astronomer Johann Bayer (1572-1625) listed it as “Sartai” (see Servants above).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Sheratan or Sharataïn”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Sheratan”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Sheratan”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Sheratan” and “Sharatain” for this star, but the 14th edition (1959) lists this star as “Sheratan”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Sheratan”.
- The IAU approved the name Sheratan for the star Beta (β) Arietis A.

This Yemeni manzil “Sharaţān” is made up of stars of the IAU constellation Aries (Varisco 1995): Beta (β) Arietis (Sheratan) and Gamma (γ) Arietis. Compare this to Sign (above) and Signs (above). This appears in the *Kitāb al-Tabşira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Two Sisters:

This Japanese asterism is the belt and sword of Orion in the IAU constellation Orion. They were chased into the sky by an ogre that bit the leg off one of them, and that one carries a bamboo pole (see Bamboo Joints above), and her remaining leg is the sword of Orion.

Two Sky Raisers:

See Uplifted Ones, below.

Two Sparks:

This K’iche’ asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Milbrath 1999).

Two Small Ribs:

This Arabic asterism “al-kharāt” or “al-khurt” (small rib”), “ʾAl-Kharātān” (ٱلْخرَاتَان), or “Al Ḥarātān” (“two small ribs”) is the stars Theta (θ) and Delta (δ) Leonis in the IAU constellation Leo:

- In the *Century Cyclopedia* of 1894 this was Latinized as “Chort”.
- Other variations include “Chertan”, “Chortan”, or “Khurt”.
- R. H. Allen lists “Chertan” in his *Star Names* in 1899.
- The name Chertan was approved for Theta (θ) Leonis by the IAU.

Two Spouts:

This Arabic asterism “al-farghan” is made up of two smaller asterisms which are part of the Arabic asterism Well Bucket (see below):

- “al-fargh al-awal”: See First Spout, above. This is also known as the Front Bucket Mouth.
- “al-fargh ath-thani: See Second Spout, above. This is also known as the Rear Bucket Mouth.

Two Stacked Saucers:

This **telescopic** asterism is the open cluster NGC 6124 (Caldwell 75) in the IAU constellation Scorpius. It was discovered by French astronomer Abbe Nicolas Louis de Lacaille (1713 – 1762) who listed it as Lac I 9. It is GC 4184 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as two stacked saucers 20 arcminutes in diameter. It is also known as Strings of Pearl (see above).

Two Stars:

This Ikoot asterism "Ihkiaw Okas" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

This Persian asterism "Taraha" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed in R. H. Allen's *Star Names* in 1899.

This Sogdian asterism "Ghamb" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed in R. H. Allen's *Star Names* in 1899.

This Khorasmian asterism "Jiray" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed in R. H. Allen's *Star Names* in 1899.

This French asterism is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

Two Stars in the Rump of the Eagle:

This Babylonian and Sumerian ziqpu "two stars in the rump of ur-a" is Delta (δ) and Theta (θ) Leonis in the IAU constellation Leo and is listed as ziqpu 23 in the star catalogue BM 78161 (Liechty 1988).

Two Stars of Separation:

See Two Separated Stars, above.

Two Stars of the Head of the Eagle:

This Babylonian and Sumerian ziqpu "two stars of the head of ur-a" is Mu (μ) and Epsilon (ε) Leonis in the IAU constellation Leo and is listed as ziqpu 21 in the star catalogue BM 78161 (Liechty 1988).

Two Stars that Go Together:

This K'iche' asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Milbrath 1999).

Two Stretchers, with Medicine man, Wife, Errand Man, and Dog:

This Pawnee asterism is made up of the stars of the IAU constellations Ursa Major and Ursa Minor. The stars of these constellations represent two stretchers bearing deceased persons surrounded with mourners with the star 80 Ursae Majoris (Alcor) as the "dog". Compare this to the Musquakie (Iroquois) asterism Hold Tight (see above).

Two Sunbeams:

This Inuit asterism "Aagjuuk" ("indistinct" or "two sunbeams") is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila (MacDonald 1998). Sometimes the star Beta (β) Aquilae (Alshain) is included. The rising of these stars indicated the arrival of the winter solstice.

This Inuit (Greenlandic) asterism “Aassutit” or “Aassuutit” is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila. Compare this to the Inuit asterism “Aagjuuk” (above).

Two Swallowers:

This Arabic asterism “al-bulaʿān” (ألبولعان), later latinized to “Albulan” (I and II) or “Albulaan”, is the stars Mu (μ) and Nu (ν) Aquarii in the IAU constellation Aquarius.

Two Tails of Eridanus:

This **telescopic** asterism “Bicódulus Erídani” is the spiral galaxy IC 382 in the IAU constellation Eridanus. This was first observed by French astronomer Stéphane Javelle (1864 – 1917) This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the two extending outer arms”.

Two Teenaged Boys:

This Boorong asterism “Kulkanbulla” is in the IAU constellation Orion and has two parts:

- One “boy” is the upper part of Orion:
    - The belt of Orion being “his shoulders”,
    - His “hands” the stars Sigma (σ) and 31 Orionis,
    - His “waist” is the star HIP 26762,
    - His “legs” are two lines of stars from HIP 26762:
        - One runs through 51 Orionis and HIP 26870 to a “foot” formed by HIP 26795 and Omega (ω) Orionis, and
        - One runs through HIP 27253 to a “foot” formed by HIP 27588 and 56 Orionis.
- The other “boy” is the lower part of Orion:
    - The sword of Orion is his “body”,
    - His “hands” are the stars 49 and 36 Orionis, and
    - One “foot” is Eta (η) Orionis, and
    - The other “foot” is the stars HIP 26713 and 26820A

Two Toothed of Puppis:

This **telescopic** asterism “Bídens Púppis” is the barred spiral galaxy NGC 2559 in the IAU constellation Puppis. It was discovered in 1837 by John Herschel who listed it as h 3118 and later as GC 1643 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because “Two hooky arms extend like teeth from this galaxy…”.

Two Tortoises:

This ancient Egyptian asterism “Shetui” is the stars Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Minor and appeared from the New Kingdom (16^{th} — 11^{th} century B.C.E.) onward.

Two Triangles:

This **telescopic** asterism is Tóth 1, listed by Hungarian astronomer János Tóth, which is in the IAU constellation Taurus. Tóth describes this as: “Object diameter 30’. The bright stars form two triangles, the view is much more beautiful in a telescope…”

Two Vultures:

This Arabic asterism “an nasran” is found on the rain star calendar of Qushayr and is made up of two smaller asterisms, the Flying Vulture (see above) and the Alighting Vulture (see above). They marked the rainy season of fruit harvest.

Two Wings:

This asterism “Duae Alae” was created by German astronomer Petrus Apianus in 1533 in his *Horoscopion Apiani General*. It is a ring of stars representing “feathers” tucked under the “right wing” of the IAU constellation Cygnus surrounding the star 19 Cygni.

Two Wings of Fornax:

This **telescopic** asterism “Dípterus Fornácis” is the edge-on galaxy NGC 1365 in the IAU constellation fornax. It was discovered by English astronomer John Herschel in 1837.It is GC 731 on the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the wide symmetric arms of this splendid galaxy put in mind the two wings of a propeller”. It is also known as the Great Barred Spiral Galaxy (see above), the “Fornax Propeller” or simply the “Propeller” (see above), and “Z” (see below).

Two Wolves:

There are two asterisms with the name “two wolves”:

- One, “Adzh-Dzhi'bayn” or “Adzh-Dzhi'ebayn”, is the stars are Eta (η) and Zeta (ζ) Draconis and is part of their asterism Mother Camels (see above). It is also known as “Two Hyenas” (see above), “Two Black Birds” (see above), and Two Falcons (see above). This was later latinized to “Athebyne”. Johann Bayer’s Uranometria (1603) lists “Douque Lupi” and attributes it to “Azophi Arabi”. The name Athebyne was approved for Eta (η) Draconis A by the IAU’s Working Group on Star Names in 2017.
- One, “adh-Dhi'ban” or “Al Dhībain” (“two wolves” or “two jackals” الذئبان), is the double star Psi (ψ) Draconis in the IAU constellation Draco, later latinized to “Dziban” or “Dsiban”. Dziban has been approved as a name for Psi (ψ) Draconis A by the IAU. The star Phi (ϕ) 1 Draconis B has the unofficial name “Dziban II”. Compare this to the asterism Two Hyenas, above.

NOTE: R. H. Allen lists this asterism as “Female Wolves, or, perhaps, Hyaenas” in his *Star Names* in 1899, giving the name “Al Dhi’bah”. Allen is confusing this with the two stars with the Arabic name “al-dhi’b” (see Wolf, below). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al dhibá, the antelopes”. There aren’t any Arabic asterisms called “The Antelopes” and claims that this is stars in Ursa Major including Sigma (σ) Ursae Majoris: What he has done is confused this with the Arabic asterism Three Leaps of a Gazelle (see above).

Two Wooden Blocks:

This Japanese asterism “Waki Boshi”, “Hyoushigi” (“Wooden Blocks”) or “Kanatsuki no Ryowaki Boshi” (“Striking Both Sides Stars”) is the IAU constellation Orion:

- The stars Alpha (α) Orionis (Betelgeuse), Zeta (ζ) Orionis (Alnitak) and Kappa (κ) Orionis (Saiph) form one block, and
- The stars Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), and Beta (β) Orionis (Rigel) form the other.

Two Young He Goats:

This Arabic asterism “Al Jadyain” is the is the Haedi asterism (see Kids above). John Hill lists “Giedyan” in his *Urania* in 1754.

Tyberone:

This star “Tyberone” and “Tuberoni Regia” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo:

- Johann Bayer’s *Uranometria* (1603) lists “Regia Tuberoni” and “Tyberone” as an alternate names for Leo.
- R. H. Allen’s *Star Names* in 1899 lists“Tyberone“ and “Tuberoni Regia“ and points out that this name was listed by “[Johann] Bayer and others” and that it was a “a misconception of Pliny the Elder's ‘Stella Regia appellata Tuberoni in pectore Leonis” (which translates as “the star called by Tubero the Royal One in the Lion's breast”) in his *Naturalis Historia* in the 1st century C.E. This was a reference to Lucius Tubero, a literary friend of Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.).

Tyche:

This Greek asterism “Τύχη” (“Týchi”) is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. Tyche was the Greek Goddess of luck.

Tycho’s Supernova:

This **telescopic** asterism is supernova remnant Tycho’s Supernova or Tycho’s Nova SN 1572 is B Cassiopeiae in the IAU constellation Cassiopeia. It is the remains of a type 1a supernova which was recorded by Danish astronomer Tycho Brahe in 1572.

Tyl:

This star is Epsilon (ε) Draconis in the IAU constellation Draco.

Tyndarians:

This Latin asterism “Pueri Tyndarii”, “Tyndarides”,”Tyndaridae”, and Horace's “clarum Tyndaridae Sidus” is the IAU constellation Gemini. King Tyndareus was the wife of Leda, who was the mother of Castor and Pollux. Johann Bayer’s *Uranometria* (1603) lists “Tyndaridae”. “Tyndaridae” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638). This constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Tyndaridae”.

Typhan:

This asterism is the IAU constellation Scorpius as listed in an “Ancient Zodiac of Egypt” in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration “from the Barberini

Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a male mermaid holding a lightning bolt in each hand with clouds streaming out of his lips. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. In ancient Egyptian skies Scorpius was their asterism "Prow" (see above) and in Seleucid skies it had become the Scorpion. Typhon was a marine monster in ancient Greek mythology, not Egyptian. Typhon is a name for the Egyptian asterism "Kher-khept-Kenumt" (see below) in the IAU constellation Leo assigned by German Jesuit astronomer Athanasius Kircher (1602 – 1680).

Typhon:

This Greek asterism is the IAU constellation Hydra as listed by Hesiod and Mosenkis in his *Mycenaean Oecumene* (date n/k). Typhon was a marine monster in Greek mythology.

Typhon of Canes Venatici:

This **telescopic** asterism "Týphon Cánum Venaticórum" is the pair of interacting galaxies Messier 51 (NGC 5194, Arp 85), in the IAU constellation Canes Venatici. It was discovered by French astronomer Charles Messier in October 1773. Irish astronomer Lord Rosse first recorded its spiral structure in 1845. Dreyer describes it in the 1888 New General Catalogue as the "Great Spiral Nebula". It is listed in the 1864 General Catalogue as GC 3572 and in John Herschel's catalogue as h 1623. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Typhon ("whirlwind") in Greek mythology was the God of all winds who wanted to replace Zeus as the principal God. It is also known as the "Whirlpool" (see below), the "Question Mark" (see above), and the "Vortex" (see below).

Tyrant of the Water:

This Latin asterism "Tyrannus aquae" is the IAU constellation Aquarius.

- Johann Bayer's *Uranometria* (1603) lists "Aquae Tyrannus" as a name for Aquarius.
- R. H. Allen's *Star Names* (1899) lists „Tyrannus Aquae" and attributes it to 1st century B.C.E. Roman poet Quintus Horatius Flaccus (Horace (65 – 8 B.C.E.)).

Tyrant:

This star "Tyrannus" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. In his Uranometria (1603) German astronomer Johann Bayer (1572-1625) listed "Tyrannus" for this star: Bayer interpreted the original Greek name "star "Ἀντάρης" ("Antáris" or "Rival to Ares"), probably influenced by Hesychius of Alexandria, who had called it "Ἄνταρτης" ("Ántartis" or "rebel"). See Rival to Ares, below. "Tyrannus" is listed for this star in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Tyre:

This Latin asterism "Tyrius" is the IAU constellation Taurus by Roman poet Marcus Valerius Martialis (Martial) and refers to the birthplace of Europa, who was seduced by Zeus, who appeared to her in the form of a bull.

Tyrolean Hat:

This **telescopic** asterism is in the IAU constellation Perseus and is Ennis 37 on the observing list of Canadian astronomer Charles Ennis. This curving line starts at the double star HIP 18370A and runs through the double star HIP 18366, then HIP 18167, HIP 17963, the double star HIP 17877A, HIP 17800, HIP 17675, HIP 17718, HIP 17807, HIP 17905, HIP 17869, HIP 17827, ending at the double star HIP 17772. A row of three stars of increasing magnitude HIP 17869, 17827, and 17772 are a "feather" in this cap. This is Corder 588 on the list of Jeffrey Corder, who describes it as a "curved chain".

Ty's Oil Can:

This **telescopic** asterism is in the IAU constellation Virgo close to the Sombrero Galaxy, Messier 104. Two 8th magnitude stars and a double star (HIP 61654 and 61656) form the bottom of the "oil can". A curve of six 10th magnitude stars forms the curved "spout" of the "oil can" and one magnitude 9.4 star and three 11th – 12th magnitude stars form the "handle". It is also known as "Jaws" (see above). Size 15'.

U:

This asterism is Corder 1247 in the IAU constellation Puppis and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 300'. This includes HIP 34922, 35020, 34670, 33357, 32918, 32765, and 61, 71 and 72 Puppis.

There are seventeen **telescopic** "U" asterisms:

- One is Corder 494 in the IAU constellation Perseus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder describes this as an "obvious group of 8 stars that are magnitudes 7 to 9. The group forms a nearly 'U' shaped asterism that is open to the NW." Size 30'. I think that it almost exactly matches the shape of the Greek letter Nu (ν). It includes HIP 14892, 14946, 14923, and 14871. Size 30'.
- One is Corder 991 in the IAU constellation Auriga and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 8'. It includes the stars 34 Camelopardalis and HIP 28589. NOTE: 34 Camelopardalis is now within the boundaries of Auriga.
- One is Corder 1096 in the IAU constellation Gemini and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20'. This is a group of 10 8th to 11th magnitude stars including the star HIP 30723. NOTE: Two faint lines of stars ending at HIP 30771 make this into a "Droplet" (see above).
- One is Corder 2671 in the IAU constellation Boötes and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 120'. This includes the stars 33 Boötis, HIP 71568, 71466, 71206A, 71008, and 70844. I personally think this looks more like a Greek letter Nu (ν).
- One is Corder 3079 in the IAU constellation Norma and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 15'. This includes the stars HIP 81434, 81096, and 81458.
- One is Corder 3996 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45'. This includes the stars HIP 97989, 97978, and 98256.

- One is Corder 4159 in the IAU constellation Aquila and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20'. This is 5 stars between 7th and 9th magnitude and includes HIP 100296.
- One is Corder 4257 in the IAU constellation Delphinus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 40'. This is 8th – 9th magnitude stars that include HIP 102929.
- One is in the IAU constellation Taurus and is Corder 607 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is 8 stars of magnitude 8 to 11 including HIP 18228.
- One is in the IAU constellations Orion and Taurus and is Corder 904 on the observing list of American astronomer Jeffrey Corder. Size 100' X 25'. This is made up of ten stars of between 7th and 9th magnitude including HIP 26590, 26647, 26807, 27022, and 26930.
- One is in the IAU constellation Orion and is Corder 1058 on the observing list of American astronomer Jeffrey Corder. Size 60'. This is twelve 8th – 9th magnitude stars including HIP 30026, 30030, and HIP 29813.
- One is in the IAU constellation Scorpius and is Corder 3381 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is ten 8th – 10th magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3628 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is eight 10th – 11th magnitude stars.
- One is in the IAU constellation Vulpecula and is Corder 4241 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 7th – 9th magnitude stars including HIP 102620 and 102461.
- One is in the IAU constellation Cygnus and is Corder 4415 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 8th – 9th magnitude stars including HIP 105874 and 105739 and the double star HIP 105813.
- One is in the IAU constellation Pegasus and is Corder 4423 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 9th – 10th magnitude stars including the double star HIP 105996A.
- One is in the IAU constellation Grus and is Corder 4782 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 11th magnitude stars including HIP 113126 and 113209.
- One is in the IAU constellation Andromeda and is Corder 4875 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 8th – 9th magnitude stars including HIP 115134 and 115106.
- One is the open cluster NGC 6819 in the IAU constellation Cygnus. This was discovered by English astronomer Caroline Herschel in 1784. It is GC 4511 in the *General Catalogue* of 1864. Size 5' X 5'. It is also known as the Octopus (see above), or the Fox Head (see above) and has also been described as a letter "K", or "X".
- One is open cluster NGC 3293 in the IAU constellation Carina. It was discovered by Nicolas Louis de Lacaille in 1751. Lacaille described it in his 1755 catalogue as a "small heap of 4 small stars forming a lozenge." It is GC 2144 in the *General Catalogue* of 1864. It is also known as the Spider Spit Cluster (see above), the Hubbly Bubbly Pipe (see above), the Little Jewel Box (see above), and the Gem Cluster (see above). South African astronomer Carol Botha described it in 2016 as a "'U' or horseshoe shape".

U-Mnqamlezo wase zantsi:

This Xhosa asterism (eastern cape, 1903) is the constellation Crux Australis, which is now the IAU constellation Crux (Alcock 2014).

U-Pondo 'lunye:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Monoceros (Alcock 2014).

Ueros:

This Celtic (Gaulish) star "Ueros" ("overly") is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014). Compare to the Vedic Vashishtha (see below). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

Uesos:

This Celtic (Gaulish) star "Uesos" ("knower") is Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014). Compare this to the Vedic Marīci (see above). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

UFO:

This **telescopic** asterism is NGC 2683, a field spiral galaxy in the IAU constellation Lynx. It was discovered by English astronomer William Herschel in February 1788 who listed it as "I 200" in his catalogue. It is GC 1713 in the *General Catalogue* of 1864. It was given this name by the Astronaut Memorial Planetarium and Observatory at Eastern Florida State College. It is also known as the "Cloud of Dust of Lynx" (see above). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 47 but does not list a name.

UFO of Draco:

This **telescopic** asterism "Óvi Dracónis" is the edge-on spiral galaxy NGC 5908 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "II 760". It became GC 4085 and GC 4088 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ughlak:

This Turkish asterism "Ughlak" is the IAU constellation Capricornus as listed in R. H. Allen's *Star Names* in 1899.

Uindonos:

This Celtic (Gaulish) star "Uindonos" ("dazzling") is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014). Compare this to the Vedic asterism Atri (see above). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

Uirionos:

This Celtic (Gaulish) star "Uirionos" ("truth") is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Boutet 2014). Compare this to the Vedic asterism Kratu (see above). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

Ukdah:

See Knot, above.

Uklun:

See We, below.

Ulgher:

This Turkish asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen does not supply a translation.

Umbillicus of the Llama:

This Quechua asterism "Ombiligo de la Llama" is a narrow, curving dark streak from Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus to Theta (θ) Scorpii in the IAU constellation Scorpius (Urton 1981).

Umbrella:

There are six **telescopic** "umbrella" asterisms:

- One is NGC 4651, a spiral galaxy in the IAU constellation Coma Berenices. This was discovered in 1783 by English astronomer William Herschel who listed it as "II 12". It became GC 3184 in the *General Catalogue* of 1864. It is called this as a stellar stream forming a "handle" is stretching out to one side. Size 4' X 2.7'.
- One, from *Pattern Asterisms* by American astronomer John A. Chiravalle, is found in the IAU constellation Hydra. One edge of the curved "umbrella" is the brightest star 6 Hydrae, with the other stars in the curve being the stars HIP 42444, 42336, and 42309. The base of the "handle" is a blue/white star, HIP 42348. Size 75' X 45'. Jeffrey Corder lists it as Corder 1658 and describes it as "hook-shaped".
- One is the "Umbrella Cluster", Alessi 2 from the lists of Brazilian astronomer Bruno Alessi, which is in the IAU constellation Camelopardalis. René Merting describes it on the *Faint Fuzzies* website: "I can make out the open umbrella with averted vision".
- One is in the IAU constellation Taurus and is Corder 889 on the observing list of American astronomer Jeffrey Corder. The "handle" of the umbrella starts at 126 Tauri and runs through 122 Tauri, the double star HIP 25950A, and 117 Tauri to the "tip" of the umbrella at 111 Tauri. The "umbrella" runs from 120 Tauri through 119 Tauri (see Ruby Star, above), 115, Tauri, 111 Tauri, 110 Tauri, 113 Tauri, and 116 Tauri, to HIP 25790.
- One is in the IAU constellation Camelopardalis and is Ennis 43 on the observing list of Canadian astronomer Charles Ennis. The top of the "umbrella" is the curved line of stars starting at HIP 26814 and running through HIP 26988, 23 Camelopardalis, and HIP 26899 to 21 Camelopardalis. The "shaft" runs from 23 Camelopardalis through HIP 26890 through a line of 8^{th} – 9^{th} magnitude stars ending at a "handle" of the two stars HIP 26371 and 26350. Size 75' X 50'. NOTE: This includes stars of Corder 900.
- One is in the IAU constellation Columba and is Corder 1112 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is twelve 7^{th} – 10^{th} magnitude stars including HIP 30962, 30884, and 30896.

Umhabi:

Credo Vusamazulu Mutwa, a South African diviner, claims that "Umhabi'" is the name of a Ndebele asterism (but not specific as to which group of Ndebele) which is the part of the IAU constellation

Orion, possibly the “shield” or “lion’s skin”. This is a line of six stars in a curved line west of Bellatrix: Pi (π) 1 to 6 Orionis.

uMushi wenkhosatana:

This Swazi asterism “uMushi wenkhosatana” is the IAU constellation Crux.

Unadorned of Sculptor:

This **telescopic** asterism “Inornáta Sculptóris” is the lenticular galaxy NGC 439 in the IAU constellation Sculptor. It was discovered by English astronomer John Herschel in 1834. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its simple shape.

Unarmed High One:

This Arabic and Bedouin manzil “ʾAs-Simāk” (ٱلسِّمَاك), “as-simak al-a’zal” (السماك الأعزل), “Al-Smak al-ʿazal” (السماك الأعزل), or “ʾAs-Simāku ʾl-Aʿzil” (ٱلسِّمَاكُ ٱلأَعْزِل), translated as “unarmed high one” or “unarmed sky raiser” is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo This is part of the Arabic asterism “as-saqan” (see Uplifted Ones, below):

- “al-Simāk al-A’zal” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as “Simāk a’zal” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- This was later latinized to “Al Simāk al Aʿzal”, “Al-Simak”, or “Azimech”.
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name of this star as “simāk a’zal” and the Hebrew name as “nitmakh lo’ mezuyyan”.
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “al-simāk al ‘azāl” and the Hebrew name “ha-gibbor belo’ romah”.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “al-simāk al-a’zal”.
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “Simak al-a’zal” and the Hebrew name “nismakh lo’ mezuyyan”.
- Dorn (1829) lists this as “unarmed Spearman” and describes it as appearing on on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The 15th century *Alfonsine Tables* list “Inermis Asimec”, “Acimon”, “Alaraph”, “Almucedie”, and “Alacel”, and the 1515 edition of the *Almagest* lists “Aschimech inermis”.
- German astronomer Johann Bayer (1572-1625) lists “Alaazel”, “Alazel”, “Azimon”, “Alzimon”, and “Hazimet Alazel” as well as “Alacast”, “Alcalst”, “Alaraph”, and “Almucedie” for Epsilon (ε) Virginis (see Custom, above). Bayer also lists “Alazel”, “Alaazel”, and “Hazimet Alazel” as alternate names for Alpha (α) Virginis (Spica).
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists “Eleazalet”, “Eltsamecti” and “Eltsamach”.
- French scholar Joseph Justus Scaliger (1540 – 1609) lists “Hazimeth Alhacel”, as did Robert Hues in his *A Learned Treatise of Globes* in 1659: Hues translates this as “a handful of corne”.
- German astronomer Wilhelm Schickard (1592 – 1635) lists “Huzimethon”.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Asimam" and "Asimech".
- "Azimech" and "Huzimethon" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- John Hill lists this as "Simak Al Azal" in his *Urania* in 1754.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Azimech" for this star.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "As Simák al a'zal, the unarmed or defenceless one", which is a reference to the asterism Throne of the Unarmed One (see above).
- W. Brennand lists this as "Sinak-Al-Azal" in his *Hindu Star Names* in 1896 and translates this as "the spike of Virgo".
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists this as "Alchimec" (Dekker 2000).
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists this as "AChIMEC" (Dekker 2000).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Eleazelet" as a name for this star and attributes it to Riccioli.
- In his *Star Names* in 1899 R. H. Allen lists "Alhaiseth" as a name used by "alchemists" and lists the name "Al Haris Al Simāk" which Allen translates as "Keeper of Simak".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Azimech" for this star.

This Yemeni manzil "Simāk" is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Uncombed One of Apus:

This **telescopic** asterism "Actenísta Ápodis" is the spiral galaxy IC 4633 in the IAU constellation Apus. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the sloppy appearance of this late type spiral galaxy".

Uncombed One of Triangulum:

This **telescopic** asterism "Incómptus Triánguli" is the barred spiral galaxy NGC 925 in the IAU constellation Triangulum. It was discovered in 1784 by English astronomer William Herschel who listed it as "III 177". It became GC 542 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave this name due to the "rather advanced state of dissociation of this late-type galaxy".

Uncombed One of Virgo:

This **telescopic** asterism "Impéxus Vírginis" is the barred spiral galaxy NGC 4781 in the IAU constellation Virgo. It was discovered in 1786 by English astronomer William Herschel who listed it as "I 134". It became GC 3292 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One*

Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of the "disorganized shape of the disk".

Under Chi of Ursa Major:

This **telescopic** asterism "Hypóchius Úrsae Majóris" is the spiral galaxy NGC 3877 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "I 201". It became GC 2545 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because It is located below the magnitude 3.7 star Chi (χ) Ursae Majoris.

Under Tunic:

This Latin asterism "Subuculae" is a group of stars in the IAU constellation Taurus listed in the 11th century *De signis caeli ("of the signs of heaven*"): This is possibly the Pleiades cluster. A subuculae is an under tunic worn by either gender: Some believe it can be translated as "sacrificial cake".

Underside of a Shark:

This Kiribati star "Batuaro" or "bæ/tuáro" is currently unidentified (Trussel and Groves 1978). This is their name for the underside and front portion of a shark.

Unharmed of Ursa Major:

This **telescopic** asterism "Illibáta Úrsae Majóris" is the lenticular galaxy NGC 3995 (Arp 313) in the IAU constellation Ursa Major. It was discovered by Prussian astronomer Heinrich d'Arrest. It became GC 5596 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its "perfect, unharmed shape".

Unicorn of Virgo:

This **telescopic** asterism "Unicórnis Vírginis" is the spiral galaxy NGC 4378 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "I 123". It became GC 2915 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because the galaxy has "only one spiral arm, winding at least one and a half times around the nucleus".

Unicorn's Horn:

See "Arrowhead" above.

Uninitiated Boys:

This Kamilaroi/Euahlayi asterism "Birray Birray" or "Beraiberai" represents a group of uninitiated boys who are in love with the seven young women (sisters), Miyay Miyay (see Seven Young Women above), who make up the Pleiades star cluster (Fuller et al 2014). Birray means "boy" and Birray Birray means "several boys". The Birray Birray chased the Miyay Miyay, who prayed for deliverance. Bhaiami and Turramulan heard them and lifted them up into the sky, and the uninitiated boys were placed in the IAU constellation Orion, as the three stars that make up the belt of Orion The star Beta (β) Orionis (Rigel) is their campfire, and the sword of Orion is their fire poker. They are kept from the Miyay Miyay by the Wiringin, Old Dthillar (see above), who is the star Alpha (α) Tauri (Aldebaran). Compare this to Dthanes, above.

Union of Ursa Major:

This **telescopic** asterism "Concórdia Úrsae Majóris" is the interacting galaxy NGC 5256 in the IAU constellation Ursa Major. It was discovered in 1787 by William Herschel who listed it as "III 673". It became GC 3623 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the whole system is somewhat heart-shaped."

Unique Sovereign:

This Polynesian star "Tahi-anii" from the Society Islands is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Universe:

This **telescopic** Hebrew star "Tevel" ("world" or "universe") is HAT-P-9 in the IAU constellation Auriga (magnitude 12.35). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Alef, which is the first letter in the Hebrew alphabet and also means "bull".

Unorganized Sculptor:

This **telescopic** asterism "Inordinatus Sculptóris" is the spiral galaxy NGC 24 in the IAU constellation Sculptor. It was discovered by William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has a rather disordered structure.

Untying:

This Vedic asterism "Vicrtau" is an alternate name for their nakshatra "Mula" (see Root, above) which appears in the *Taittirīya Samhitā* and the *Atharveda* and is the stars Epsilon (ε), Xi (ξ), Eta (η), Theta (θ), Iota (ι), Kappa (κ), Lambda (λ), Mu (μ), and Nu (ν) Scorpii in the IAU constellation Scorpius (Ivanković 2021).

Unukalhai:

See Neck of the Snake, above.

Unurgunite:

See Jacky Lizard, above.

Uocomarcos:

This Celtic (Gaulish) star "Uocomarcos" ("research") is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014). Compare this to the Vedic asterism Angiras (see above). This is the name of one of Seven Sages who are part of their asterism by that name (see Seven Sages, above).

Uplifted Ones:

This Arabic asterism "as-simakan" (السماكان) or "as-saqan", translated as "Uplifted Ones" or "Two Sky Raisers" is two stars:

- One, “As-simak” or “Unarmed High One” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (see Unarmed High One, above).
- One, “Al Ḥāmil Luzz”, “Armed One” or “Spear Bearer” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

“Two Sky Raisers” is the name used by Dhu Ar-Rumma (735 C.E.). These were part of the rain stars of the calendar of Qushayr. Compare this to the Arabic asterism Two Shanks, above.

Uplifted One of the Lancer:

This Arabic star “as-simāk ar-rāmiħ” (السماك الرامح), translated as “Uplifted One of the Lancer” or “Spear Bearing Sky Raiser” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo and is part of their asterism Uplifted One (see above):

- “al-Simāk al-Rāmih” and “al-Rāmih” are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name “simāk al-rāmih” and the Hebrew name “Ha nitmakh ha-rome’h” but identifies it as Alpha (α) Boötis (Arcturus).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “al-simāk al-rāmih” and the Hebrew name “ha-gibbor belo’ romah”. NOTE: Ibn Ezra lists the Arabic name “al simāk al-rāmih” and the Hebrew name “ha-gibbor ba’al romah” for Alpha (α) Bootis (Arcturus).
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “Simak al-rawmih” and the Hebrew name “nismakh ha-romah” but associates it with Alpha (α) Boötis (Arcturus).
- 14th century Greek geographer and astronomer Georgius Chrysococcas called it “μικρὸς Κονταράτος” (“mikrós Kontarátos” or “little lance bearer”).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Ascimech Arramech”.
- It appeared as “Al Simak Al Ramih” in the *Calendarium* of Al Achsasi Al Mouakket in 1650.
- This is listed as “[Al-] Simāk al-rāmih” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992): Savage-Smith translates this as “the armed simāk”.
- This was later latinized to “Al Simak Lanceator” (“al simak lance”), “Aramec”, “Aramech”, “Ariamech”, “Al Ramec”, “Aremeah”, “Ascimec”, “Azimeth”, “Aramakh”, and “Azimech”.
- English author Geoffrey Chaucer (c.1340s – 1400) lists it in his *A Treatise on the Astrolabe* as “Alramih”.
- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists “Azimeth”.
- Johann Bayer’s *Uranometria* (1603) lists: “Aramech, Alramech, Azimech seu Azimeth,… Alkameluz”.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Arabibus Aramech, rectius Arramicho” and “Arcturi Lanceator” but places it in Boötes.
- John Hill lists it as “Simak Al Ramih” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists the name “little lance bearer”, attributing this to 13th century astronomer Georgius Chrysococcas Smyth’s *Bedford*

Catalogue in 1844 lists “Simák al rámih, the prop or leg of the lancer” as a name for both Alpha (α) Boötis (Arcturus) and Alpha (α) Virginis (Spica) and “al rámih, the lancer” for Boötes.

- John Chilmead lists it as “Somech haramach” in his *A Learned Treatise on Globes*, 1889, which was a translation of the Latin work by English geographer and mathematician Robert Hues (1553 – 1632), although Hues also calls it “the Launce bearer” and gives the names “Alramech” and “Alsamech” in that treatise and lists it as Arcturus.
- R. H. Allen lists it as Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes in his *Star Names* in 1899 and Dorn (1829) lists the name “Essimak Erramih”, which he writes“ has passed over into the Alphonsine tables in the words “Ascimech arameah” as the star Alpha (α) Boötis (Arcturus) and translates this as “Ear with a Spear” and “Javelin” (citing Georgius Chrysococcas) and describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul , based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The Arabic asterism Uplifted One contained stars of both Boötes and Virgo, which may have led to this assumption. Smyth also lists “Aramech” and “Azimech”, and notes that Italian astronomer Giovanni Battista Riccioli (1598 – 1671) called it “Kolauza”.

Upper Arm:

There are two Arabic stars with the name “as-Sāʿid” (الساعد):

- One is the star Beta (β) Pegasi in the IAU constellation Pegasus:
  - This is listed on the 14th century astrolabe #4560 from Christian Spain as “OMER9I”, the “9” representing a hard “C” sound, making it “Omerci” or “Omerqi” (King 2002), which is probably an abbreviation of the Latin “Omer Equi” (“shoulder of a horse”) which is a more common name for Alpha (α) Pegasi (see Shoulder of a Horse, above).
  - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “mankib al-faras” (“shoulder of a horse”) and the Hebrew name “shekhem ha-sus”.
  - The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “Bedalferaz” (Dekker 2000).
  - The rete of the 14th century Spanish astrolabe NMM AST0570 lists “Alferaz” (Dekker 2000).
  - Austrian astronomer John of Gmunden (d. 1442) lists this as “Scheat Alferaz id est crus equi” (“Scheat Alferaz is the horse's leg”- Kunitzsch 1986).
  - Variations listed in editions of the *Alfonsine Tables* include “Menekeb Alferach” and “Mekebalferaz” and other editions list “Bedalferaz” and “Mentichel” (Kunitzsch 1986). One edition lists “sceath ide es crus” (“sceath that's your leg”) and associates it to Delta (δ) Aquarii (Kunitzsch 1986) and yet another edition spells this “sceach” (Kunitzsch 1986).
  - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this star as “Scheat”.
  - Danish astronomer Tycho Brahe (1546 – 1601) listed it as “Scheat”.
  - This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Scheat Alferaz”.
  - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Scheat Edeleu” and “Scheat Alpheraz”.
  - German astronomer Johann Bayer (1572-1625) listed it as “Seat Alpheras” in his *Uranometria* (1603).
  - Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this star “Scheat Alferas”.

- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Scheat".
- The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Scheat" but incorrectly labels it "D" instead of "B" for Beta.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Scheat".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Scheat".
- John Chilmead listed it as "Seat Alfaras" in his *A Learned Treatise of Globes* in 1889, as does Robert Hues (1659).
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as "Saidol-pharazi".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Scheat".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Scheat".
- American uranographer William Croswell (1760 – 1834) lists this star as "Scheat" on his *Mercator Map of the Starry Heavens* in 1810.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Scheat".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Scheat".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Scheat".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Scheat".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Scheat" and describes it as "foreleg".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Scheat" for this star.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Scheat" and "Sheat" for this star, but the 14th edition (1959) only lists this star as "Scheat".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Scheat" for this star.
- The IAU approved the name Scheat for Beta (β) Pegasi.
- NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Scheat… a corruption of said, an arm, or cubit". This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Scheat". Burnham (1978) lists "Al Sa'id" and "Sa'd" and translates it as "upper part of the arm" or "foreleg".

- One is the star Xi (ξ) Persei in the IAU constellation Perseus and is part of their asterism Al-Thurayya (see Little Abundant One, above).

The name "Scheat" is also used for Delta (δ) Aquarii in the IAU constellation Aquarius.

- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Sceath" for this star.
- "Scheat" is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius for this star.
- Johann Bayer's *Uranometria* (1603) list "Scheat" as a name for this star.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Scheat" for Delta (δ) Aquarii.
- "Scheat" is listed as a name for Delta (δ) Aquarii in the IAU constellation Aquarius in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists the name "Scheat" for this star.
- "Scheat" is listed as a name for Delta (δ) Aquarii i in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).

Upper Arm of al-Thurayyā:

This Arabic asterism "al-aḍdud al-thurayyā" or "Al-Adud" (العضد) is the stars Delta (δ), Epsilon (ε), and Nu (ν) Persei in the IAU constellation Perseus and is part of their asterism Al Thurayya (see Little Abundant One, above).

Upper Part of the Back:

See Mane, above.

Upper Star of the Head of the Scorpion:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL e sa SAG GIR-TAB" is Beta (β) Scorpii (Acrab) in the IAU constellation Scorpius (Hunger and Sachs 1988).

Upper Step:

This Chinese xing guan is a line of two stars in the IAU constellation Ursa Major and is part of their xing guan "Sāntái" (see Three Steps, above): Iota (ι) Ursae Majoris and Kappa (κ) Ursae Majoris.

Upsilon:

This **telescopic** asterism is in the IAU constellation Cetus and was listed as Corder 315 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. It is a group of 4 stars including Upsilon (υ) Ceti, 57 Ceti, and HIP 9249. Size 30'. Size 20'.

Upsilons:

This **telescopic** asterism is the double star Upsilon (υ) Tauri in the IAU constellation Taurus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels these the "Upsilons" but incorrectly describes this as "two Upsilons, forming a wider pair above [Kappa (κ) 1, and 2 Tauri]' which Serviss calls "the Kappas". In fact, the double star Upsilon (υ) Tauri is a tight double, and the star which Serviss is describing as "Upsilon 2" is actually the star 72 Tauri.

Ura-pane Lopatin:

This Palawa asterism is the IAU constellation Crux (Gantevoort et al 2016).

Urania:

There are two Greek asterisms with the name "Οὐρανία" ("Ouranía") which means "heavens":

- One is the IAU constellation Pisces as listed in R. H. Allen's *Star Names* in 1899. Urania is the muse of astronomy, but Allen lists her as "the Sarmatian Aphrodite", linking this to the asterism Venus and Cupid (see below).
- One is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899.

Urania's Sextant:

This asterism "Sextants Uraniae" was created by Polish astronomer Johannes Hevelius (1611 – 1687) and is the IAU constellation Sextans.

Uraniscus:

This asterism is the IAU constellation Corona Australis as listed in John Hill's *Urania* in 1754.

Uray-nociw:

This Ainu Nociw ("asterism") is the IAU constellation Taurus.

Urayumari:

This Carib star is currently unidentified (Magaña, and Jara, 1982).

Urdur:

This Norse star "Urdur" or "Urðr" (Old Norse "fate") is Alpha (α) Librae (Zubenelgenubi) in the IAU constellation Libra and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Urðr is one of the three Norns in Norse mythology.

Urdarbrunnur:

This Norse asterism "Urdarbrunnur" or "Urðarbrunnr" (Old Norse for the "Well of Urðr") is made up of stars of the IAU constellation Scutum and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Urðarbrunnr is a well in Norse mythology that is situated beneath the world tree Yggdrasil.

Urger of the Star:

This Arabic star "hadi an-najm" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus:

- "hadi an-najm" is listed by Umayyad poet Dhu r-Rumma (d. 735 C.E.), as this star appeared to him to be driving "an-Najm" ("the Star"), which is an Arabic name for the Pleiades cluster (see Star, below).
- "Hadī al-Najm" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Compare to the Bedouin asterism Driver of Al Thurayya (above).

Urgulu Demon:

This Babylonian asterism from the MUL.APIN tablets and the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) "MUL.UR.MAH" (Hunger 1992), or "MUL.UR.GU.LA" (Hunger 1992, Parpola 1993), "UR.GU.LA" (Bartel van der Waerden 1974, Anthony 1996) or "UR.MAH" is the IAU

constellation Leo. It appears in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mu lur.gu.la” (Koch-Westenholz 1995) and in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) as “mulUR.GU.LA. The star Alpha (α) Leonis (Regulus) is known to the ancient Babylonians as the “Star of the King”. This demon was depicted as a winged lion, which may have been what influenced the Greeks to later describe it as a lion.

This Akkadian asterism “Urgulû” or “Urgulu” (Hunger 1992) or “Nēšu” or “Nesu” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (Parpola 1993) is the IAU constellation Leo.

This Seleucid asterism from as “UR” or “UR.MAH” (“lion”) from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Leo (Foxvog 1993).

This Sumerian asterism “mulur-gu-la” as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Leo. ”. It is listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) as “la-ta-rak” and “[mul…] x-am-me”.

This Persian asterism “UR.GU.LA”, “Urgu[lu]” from the K 250 and VAT 9418 lists, “UR.A” from the list of Zodiacal Signs in VAT 4956 (Bartel van der Waerden 1974), and from the list of Tikpi Stars from the K 250 and VAT 4918 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) as listed by Franz Boll in his *Ancient Observations of Coloured Stars* in 1918 and Alfred Jeremias in his *Handbuch der Altorientalischen Geisteskultur* in 1929 is identical to the Babylonian asterism “MUL.UR.GU.LA” above. Ernst Weidner lists it as “ur-gu-[la]” in his *Fixsterne* in 1971.

Uri ni kareke:

This Kiribati asterism is stars surrounding Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Trussel and Groves 1978), which they called “Batere” (see above).

Urn:

This Latin asterism “Urna” is the IAU constellation Crater.

- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this as “Urnus”.
- Johann Bayer’s *Uranometria* (1603) lists “Urna”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Urna”.

Ursa Major:

The stars of Ursa Major appear in 949 asterisms of the world’s sky cultures.

The IAU constellation Ursa Major (IAU abbreviation UMa) appears in Homer’s *Iliad and Odyssey* (8th century B.C.E.) and in Hesiod’s poem *Works and Days* (late 8th century B.C.E.) It was mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) both as a bear and as a wain. It was described in Hipparchus’ *Star Catalogue* (Gysembergh et al 2022). It became one of Ptolemy’s 48 original constellations in the 2nd century, which Ptolemy called “άρκτος μεγάλη” (“Arktos Megale”- “big bear”). Homer (8th century B.C.E.) gave it the names “Ἄρκτος” (“Árktos” or “bear”) and “Ἅμαξα” (“Ámaxa” or “cart”) in the *Iliad and the Odyssey*. Roman poet Sextus Propertius (55 – 15 B.C.E.) called Ursa Major and Ursa Minor “Geminae Ursae” (“twin bears”) while 1st century B.C.E. Roman poets Quintus Horatius Flaccus (Horace), 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil, 70 – 19 B.C.E.), and the Roman poet Publius

Ovidius Naso (Ovid, b. 43 B.C.E.) all called them “Gelidae Arcti” (“ice cold bears”). Variations include “Arctoi” and “Arctoe”. The Roman general Germanicus (15 B.C.E. – 19 C.E.) used the masculine terms “Ursus Major” and “Arctus” to describe it.

Its Latin name Ursa Major translates as “greater she-bear”: This shows up in the Belarussian asterism “Viadmedzitsa” (see She-Bear, above). An older Greek name “χελική” (“chelikí”) is “helical” or “turning”, which refers to its revolution around the pole star. in the 8th century B.C.E. Greek author Homer first refers to it as “the wain” which influenced people elsewhere to also use this image. It is one of the few constellations mentioned in the *Bible* (Job 9:9; 38:32). The Greeks came up with a myth that has Zeus throwing Callisto and her son into the sky, where they became bears that had their tails stretched by the force of the throw. English Mathematician Thomas Hood (1556 – 1620) , writing on the astrolabe in 1590, said “Imagine that Jupiter, fearing to come to night unto her teeth, layde holde on her tayle, and thereby drewe her up into the heaven; so that shee of herself being very weightie, and the distance from the earth to the heavens very great, there was a great likelihood that her taile must stretch”. It has been suggested that an early influence for this constellation may have been the Egyptian asterism Crocodile (see below) which of course does have a long tail.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as what looks more like a dog than a bear.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts this constellation as a hairy bear.

Ursa Major appears in the Leiden *Aratea* (816) as the dark silhouette of a bear (Katzenstein & Savage-Smith, 1988).

Ursa Major appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Ursa Major is facing to the left,
- In two editions (St Gall 250, St Gall 902) the bear’s tongue is hanging out,
- In the Cologne 83 II edition Ursa Major and Ursa Minor are facing in different directions.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Ursa Major as a long-tailed bear walking to our left.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Ursa Major as a long-tailed bear walking to our left.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts Ursa Major as a long-tailed bear running to our left but does not label it. Ursa Minor is labeled.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscripts CLM 14583, ff.70v-71r and 71r-72v depict Ursa Major as a bear with a long tail. Neither chart is labelled as these charts seem to be intended to illustrate primarily the asterisms of the zodiac.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Ursa Major as a *short-tailed* bear walking to our left. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Ursa Major as a *short-tailed bear* walking to our right.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Ursa Major as a short-tailed bear walking in a counterclockwise direction around the north celestial pole.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Ursa Major as a long-tailed bear walking to our left.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Ursa Major as a short-tailed bear.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Ursa Major as a short-tailed bear.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts Ursa Major as a bear with a long tail.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Ursa Major vel Arctur" as a long-tailed bear.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Ursa Major as a long-tailed bear running to our right. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Ursa Major" as a bear with a long tail walking to our left.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists "Vrsa Major" and depicts it as a bear with a long tail walking to our left.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Ursa Maior" as a long-tailed bear walking to our right.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Ursa Major as a long-tailed bear running to our left.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Ursa Major as a long-tailed bear walking to our right.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Ursa Major as a bear with a long tail walking to our left.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Ursa Major" as a long-tailed bear walking to our left and lists the alternate name "Plaustrum".

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this as “L’Orsa Maggiore”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Dipper” and “Ursa Major”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Ursa Major as a long-tailed bear walking to our left.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Ursa Major” as a bear with a long tail walking to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “Le Grande Ourse” as a long-tailed bear walking to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Ursa Maj” as a long-tailed bear walking to our left.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Ursa Major” as a long-tailed bear walking to our left.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts “Ursa Major” as a long-tailed bear walking to our left.

Johann Bayer (1572 – 1625) depicted this in his *Uranometria* in 1603 as a bear with a long tail and lists the names “Cynosuris, Plaustriluca, Licaonia, Parrhasis, Maenalis, Erymathis, Nonacrina, Septentrio, Arctos Major, Maxima Hyginio, Magna Ouidio, Plaustrum seu Plostrum Maius, Germanis honvagen, Helice, Callisto, Megistor, Elix, Arcturus, Dubhelacbar, in tabulis Elkeid”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) as “Ursa Major” and depicted as a long-tailed bear walking to our left.

“Ursa Major” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a long-tailed bear walking to our right.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts Ursa Major and Ursa Minor (labeled the “Arctoe”) as bears with short tails.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) depicts “Ursa Mayor LLamada Helize” (“Ursa Major called Helice”) as a long-tailed bear walking to our left. For “Helice” see “Helical” (above).

“Ursa Major” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a long-tailed bear.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this constellation “Ursa Maior”, “Helice”, and “Casto” and depicts it as a long-tailed bear walking to our left.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Ursa Major as a long-tailed bear walking to our right.

Ursa Major is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Ursa Maior" with the subtitle "Calisto" and depicts it as a bear with a long tail.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Ursa Major" as a bear with a long tail.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Ursa Major" as a bear with a long tail.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Ursa Major" as a long-tailed bear walking to our right.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Ursa Major" as a long-tailed bear walking to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Ursa Major as a long-tailed bear.

Ursa Major is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a bear with a long tail.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Ursa Major as a bear with a long tail walking to our right.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts Ursa Major as a bear with a long tail walking to our right.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Ursa Major as a bear with a long tail.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Ursa Major as a bear with a long tail.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "La Grande Ourse" as a bear with a long tail.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Ursa Mayor" as a long tailed bear walking to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "La G. de Ourie" ("the Great Bear") as a bear with a long tail walking to our right. The 1778 edition is identical.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Grand Orsa" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Ursa Major de Groote Beer" as a long-tailed bear.

William Herschel's *Catalogue of 500 New Nebulae, nebulous stars, planetary Nabulae, and Clusters of Stars; with Remarks on the Construction of the Heavens* (1802) lists the abbreviation "Ursae" for "Ursa Major" and "Ursae Min" for Ursa Minor.

American uranographer William Croswell (1760 – 1834) depicts "Ursa Majora vel Helice the Great Bear" on his *Mercator Map of the Starry Heavens* in 1810 as a bear with a long tail.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Grosse Baer". Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Grosse Bär" and depicts it as a long-tailed bear running to our right.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Ursa Major" as a long-tailed bear walking to our left.

Ursa Major is listed in Scottish uranographer Alexander Jamieson's Celestial Atlas and on his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) which depict it as a bear with a long tail.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Ursa Major the Greater Bear" as a long-tailed bear.

"Ursa Major" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a long-tailed bear walking to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Ursa Major" as a long tailed bear walking to our left.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Ursa Major" as a bear with a long tail.

Ursa Major is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. It is depicted as a bear with a long tail facing to our right.

"Ursa Major" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a long-tailed bear walking to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation both as "Ursa Major" in the text and the "Great Bear" on a chart.

English astronomer Richard A. Proctor (1837 -1888), a major advocate of shortening constellation names to make more room on star charts, recommended shortening the name of this constellation to "Ursa". "Ursa, The Bear" appears for this constellation in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Ursa Major, the Greater Bear".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Ursa Major" in his *Star Atlas* (1893) and describes it as "The Great Bear".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Ursa Major" and describes it as the "Greater Bear".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists this constellation as "Ursa Major… the Great Bear".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the constellation lines for Ursa Major in his book *The Stars - A New Way to See Them* (1952), turning the "bear" around 180 degrees:

- The bear's "head" is formed by the stars Psi (ψ) Ursae Majoris, Chi (χ) Ursae Majoris, 3 Canum Venaticorum, 21 Canum Venaticorum, Eta (η) Ursae Majoris, Zeta (ζ) Ursae Majoris, Epsilon (ε) Ursae Majoris, and Delta (δ) Ursae Majoris,
- The bear's "back" runs from Delta (δ) Ursae Majoris to 23 Ursae Majoris where Rey describes a "rump" consisting of 23 Ursae Majoris, Omicron (ο) Ursae Majoris, to Iota (ι) Ursae Majoris,
- The "front paw" is Xi (ξ) and Nu (ν) Ursae Majoris, and
- The "back paw" is Mu (μ) and Lambda (λ) Ursae Majoris.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) redesign Ursa Major in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- The "head" is a roughly triangular pattern formed by the stars 23, 24, Rho (ρ), Pi (π) 2 and Omicron (ο) Ursae Majoris,
- The "body" is a roughly rectangular pattern formed by the stars 23, Theta (θ), Psi (ψ), Chi (χ), Gamma (γ), Delta (δ), and Alpha (α) Ursae Majoris (Dubhe),
- A line of the four stars Delta (δ), Epsilon (ε), Zeta (ζ), and Eta (η) Ursae Majoris form the "tail",
- Two lines running out from Psi (ψ) Ursae Majoris form the "back legs":
    - One running to Lambda (λ) Ursae Majoris, and
    - One running to Mu (μ) Ursae Majoris,
- Two lines running out from Theta (θ) Ursae Majoris form the "front legs":
    - One running to Iota (ι) Ursae Majoris, and
    - One running to Kappa (κ) Ursae Majoris.

The Italians call this constellation "Orsa Maggiore", and the Germans "Grosse Bär".

The French call this constellation "Grande Ourse" ("big bear").

NOTE: Prior to the European navigators of the 15th and 16th centuries recording the southern skies they viewed, astronomers in the Classical world such as 1st century Roman poet Marcus Manilius believed that the sky around the southern celestial pole must have constellations resembling Ursa Major and Ursa Minor and Draco. The 15th century *Anglo Saxon Manual of Astronomy* mentions such possible duplicate constellations. English alchemist and translator Richard Eden (c.1520 -1576), quoting "Aloysius Cadamustus" (Alvise Cadamosto, a 15th century Venetian explorer and slave trader) mentions a "chariotte or wayne of the south".

Ursa Major Cluster:

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., describes the "Ursa Major Cluster" as "an open cluster containing over 100 stars that are scattered over an area of sky more than 1000 minutes of arc in diameter." Made up of stars of the IAU constellations Auriga (Beta (β) Aurigae), Canis Major (Alpha (α) Canis Majoris (Sirius)), Corona Borealis (Gamma (γ) Coronae Borealis), Eridanus (Beta (β) Eridani (Cursa)), Leo (Zeta (ζ) Leonis), Ursa Major (Beta (β) Ursae Majoris (Merak), Gamma (γ), Delta (δ), Epsilon (ε), and Zeta (ζ) Ursae Majoris),

Ursa Minor:

Stars of Ursa Minor appear in 402 asterisms of the sky cultures of the world.

The IAU constellation Ursa Minor (IAU abbreviation UMi) was first mentioned in the works of Eudoxus (408 – 355 B.C.E.), who used the name "ArktoB Mikrά" (Little Bear). Aratus (315 – 240 B.C.E) called it "Κυνόσουρα" or "Kynósoura" (see Dog's Tail, above) in his poem *Phaenomena* (270 B.C.E.). It was described in Hipparchus' *Star Catalogue* (Gysembergh et al 2022). It became one of Ptolemy's 48 original constellations in the 2nd century, which he listed as "Μικρή ᾽Αρκτος" (see Small Bear, above) in his *Almagest*. The ancient Greeks called this the Phoenician Bear "Φοινίκη" ("Foiníki"), later latinized to "Ursa Phoenicia", influenced by the Phoenician navigators using it. The Phoenicians called it the "Wagon of Heaven" (see below).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as more of a dog than a bear. The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts a hairy bear.

Ursa Minor appears in the Leiden *Aratea* (816) as the dark silhouette of a bear (Katzenstein & Savage-Smith, 1988).

This constellation appears in the 8th century Revised Aratus Latinus:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) the bear is facing left,
- In the Cologne 83 II edition the bear is facing left but looking backwards,
- In the Paris BN n.a. 1614 edition the bear is facing right,
- In two editions (St Gall 250, St Gall 902) the bear's tongue is hanging out.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Ursa Minor as a long-tailed bear.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depicts Ursa Minor crouched, front legs spread apart, roaring at something over its right shoulder.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Ursa Minor as a long-tailed bear walking to our right.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Ursa Minor as a long-tailed bear walking to our right and labels it "sūrat al-dubh al-asghar" ("picture of the smaller bear").

The Paris manuscript of al-Sufi's Book of Fixed Stars (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg's library (c 1430 – 1440) depicts Ursa Minor as a long-tailed bear.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Ursa Minor as a long-tailed bear walking to our right.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Ursa Minor" as a long-tailed bear running to our left.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscripts CLM 14583, ff.70v-71r and 71r-72v depict Ursa Minor as a small bear with a long tail. Neither chart is labelled as these charts seem to be intended to illustrate primarily the asterisms of the zodiac. It is very poorly drawn and looks more like a lizard on both charts.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, does not depict Ursa Minor: The central rivet obscures it.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Ursa Minor as a *short-tailed bear* walking to our left.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Ursa Minor as a short-tailed bear walking in a counterclockwise direction around the north celestial pole.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Ursa Minor as a short-tailed bear.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Ursa Minor as a short-tailed bear.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts Ursa Minor as a bear with a long tail.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Ursa Minor aut Cinosura" as a small bear with a long tail.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Ursa Minor as a long-tailed bear walking to our left. It is not labelled.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Ursa Minor" as a bear with a long tail walking to our left.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists this as "Vrsa minor" and depicts it as a bear with a long tail walking to our left.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Ursa Minor" as a long tailed bear walking to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Ursa Minor as a long-tailed bear walking to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Ursa Minor in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Ursa Minor" as a long-tailed bear walking to our left.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists "L'Orsa Minore". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Cynosura" and "Ursa Minor".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Ursa Minor as a long-tailed bear walking to our left.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Ursa Minor sive Cynosura" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Ursa Minor" as a bear with a long tail walking to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a small, long-tailed bear walking to our right. It is not labelled.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Ursa Mi" as a long-tailed bear walking to our left.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Ursa Minor" as a long tailed bear walking to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts Ursa Major and Ursa Minor (labeled the "Arctoe") as bears with short tails.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Ursa Minor" and a long-tailed bear.

German astronomer Johann Bayer (1572 – 1625) depicted it as a bear with a long tail in his *Uranometria* in 1603 and listed the following names: Septentrio, Arctos Minor, Cynosura, Phaenice, Plostrum Seu Plostrum Minus, Eruccabah, and Ezra. I am not sure where this last name Ezra comes from: A reference to astronomer Abraham Ibn Ezra?

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Ursa Minor" as a long tailed bear walking to our left.

"Ursa Minor" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and is depicted as a long-tailed bear.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Ursa Menor" as a long-tailed bear walking to our left.

"Ursa Minor" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a long-tailed bear.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Ursa Minor" as a long-tailed bear walking to our left.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Ursa Minor as a long-tailed bear walking to our right.

Ursa Minor is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Ursa Minor as a bear with a long tail.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Ursa Minor" as a bear with a long tail.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Ursa Minor" as a bear with a long tail.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Ursa Minor" as a long-tailed bear walking to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts this as a long-tailed bear walking to our left. The labels are blurred and unintelligible.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Ursa Mi" as a long tailed bear walking to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Ursa Minor as a long-tailed bear.

Ursa Minor is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: it is depicted as a bear with a long tail.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Ursa Minor as a bear with a long tail walking to our right.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts Ursa Minor as a bear with a long tail walking to our right.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Ursa Minor as a bear with a long tail.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Ursa Minor as a bear with a long tail.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "La Petite Ourse" as a bear with a long tail.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Ursa Mi” as a long tailed bear walking to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “La Petite Ourse” as a bear with a long tail walking to our right.

Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists this constellation as “der Kleine Bär” and depicts it as a long-tailed bear walking to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Orsa Minor” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Ursa Minor” as a long-tailed bear.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Ursa Minor” as a long tailed bear walking to our left.

William Herschel’s *Catalogue of 500 New Nebulae, nebulous stars, planetary Nabulae, and Clusters of Stars; with Remarks on the Construction of the Heavens* (1802) lists the abbreviation “Ursae” for “Ursa Major” and “Ursae Min” for Ursa Minor.

Ursa Minor is listed in Scottish uranographer Alexander Jamieson’s Celestial Atlas in 1822: it is depicted as a long-tailed bear. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts Ursa Minor as a bear with a long tail but it is not labelled.

American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) depicts “Ursa Minor the Lesser Bear” as a long-tailed bear.

“Ursa Minor” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a long-tailed bear walking to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Ursa Minor” as a bear with a long tail: It is partially hidden behind the cross bars of this instrument.

Ursa Minor is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation with the abbreviated label “Kl Baer”.

“Ursa Minor” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a long-tailed bear walking to our right.

English astronomer Richard A. Proctor (1837 – 1888), a major advocate of shortening constellation names to make more room on star charts, recommended changing the name of this constellation to “Minor”. However, Proctor’s *A New Star Atlas* (1887) lists “Ursa Minor” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Ursa Minor, the Lesser Bear".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Ursa Minor" in his *Star Atlas* (1893) and describes it as "The Little Bear".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Ursa Minor" and describes it as the "Lesser Bear".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists the name "Ursa Minor" for this constellation.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Ursa Minor".

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Ursa Minor in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* simply as the Little Dipper asterism.

The Italians call it "Orsa Minore" and the French "Petite Ourse".

Ursa Minor includes two of the 90 brightest stars in the sky. One possible influence for this constellation is the ancient Egyptian constellation Hippopotamus (see below).

Note: In Babylonian times the star Beta (β) Ursae Minoris (Kochab) was actually closer to the celestial pole than Alpha (α) Ursae Minoris (Polaris), so these ancient navigators used the entire constellation to indicate North. It was not until Medieval times that it became convenient to use Polaris as the North Star, even though it is still not exactly at celestial North. The name Polaris (originally Stella Polaris) is relatively modern.

NOTE: The Chinese have a "little dipper" xing guan in the southern IAU constellation Chamaeleon (see Little Dipper below).

Uruk:

This telescopic Iraqi star is HIP 96078 (HD 231701) in the IAU constellation Sagitta (magnitude 8.97). This name was given to this star in the IAU NameExoWorlds campaign. Uruk was an ancient city of the Sumer and Babylonian civilizations. It has an exoplanet named Babylonia.

Ururangi:

This Māori star, "Ururangi", is in their asterism "Matariki" (See Chief's Eyes, above) which is the Pleiades cluster in the IAU constellation Taurus (Harris et al 2013).

Usa:

This Vedic star "Uṣā" is Zeta (ζ) Orionis (Alnitak) in the belt of Orion in the IAU constellation Orion.

Ushas:

This Vedic asterism "Usaṣ" or "Ushas" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in the Rig-Veda (Ivanković 2021). Ushas, whose name means "dawn", is the daughter of the God Prajapati. In one version of the story Ushas transforms herself into an antelope to escape the attentions of her father Prajapati (see below) who transforms himself into a male antelope to pursue her (Vahia 2014). There is another version of this story where they turn themselves into Deer (see Deer, below).

Usher to the Court:

This Chinese xing guan “Yèzhě” (谒者) is the star 16 Virginis in the IAU constellation Virgo. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Yezhe” is the star 16 Virginis in the IAU constellation Virgo.

Usthȧ:

This Egyptian decan “Usthȧ” was in the IAU constellation Virgo. In later Hellenistic texts it was named “ⲁϕⲟⲥⲟ” (“Aposot”). In the Testament of Solomon, it became “Modobel” or “Buldumêch”, Aristobulus of Paneas (2nd century B.C.E.) called it “Baroche”, in Greek Hermeticism it became “Amphatham”, in Latin Hermeticism “Michulais”, 4th century Roman astrologer Julius Firmicus Maternus called it “Afut” or “Asuth”, Cosmas of Maiuma (d. 760) called it “Hestia”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Aphut” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲕⲣⲟⲛⲟⲥ” (“Cronus”). It has been depicted as a man wrapped from chest to feet with a hat on his head and a scepter in both hands.

Utdjungon’s Cave:

This Wardaman asterism is the Coal Sack Nebula in the IAU constellation Crux (see Coal Sack Nebula, above), which they see as a cave where the monster Utdjungon lives. Utdjungon punishes those who break traditional law.

V:

There are thirty-five **telescopic** V-shaped asterisms:

- One is Messier 73, discovered by Charles Messier in 1780 in the IAU constellation Aquarius. Messier described it as a cluster of four stars with some nebulosity: It is these four stars that form the “V”. John Herschel lists it in his General Catalogue of 1864 as GC 4617. M 73 was originally thought to be an open cluster but determined to be an asterism in 2002. Size 2.8’ X 2.8’.
- One is the Coma Star Cluster in the IAU constellation Coma Berenices (Melotte 111).
- One is Sánta 64, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “V-shape asterism [of] 6 stars, 8.5 – 11 [magnitude]” in the IAU constellation Puppis.
- One is Sánta 4, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “63 [Geminorum] group V-shaped binocular asterism of 5 stars, brightest 63 Geminorum” in the IAU constellation Gemini.
- One is Sánta 169, listed in 2015 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a “V-shaped asterism of 9.5 – 12 [magnitude] stars” in the IAU constellation Cygnus.
- One is Vastagh 1, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Monoceros. Vastagh describes is as “in the immediate vicinity of NGC 2324, an asterism consisting of 8 stars outward curving legs and forming the letter “V” can be seen… Its brightest star is 9.1 [magnitude], the total apparent brightness of the system is 7.5 [magnitude]. It stands out from its surroundings and has a diameter of 8’…It is an ideal target for spotters with low magnification binoculars”.
- One is Vastagh 23, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cepheus near NGC 7129. Its apparent diameter is 14’. Vastagh describes it as “Five

loosely spaced members with a light order of 9-10 form an open letter V. Near the top or from that to D, further faint members form a rectangular shape thickening. These stars are difficult to distinguish from each other…It consists of 10 stars…Its brightest member is the leader of the flying wild goose formation, the 8.9 mag SAO19559."

- One is Corder 4736 in the IAU constellation Cepheus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 45'. This is 5 stars of magnitude 8 to 9, including HIP 112373 and 112114.
- One is in the IAU constellation Taurus and is Corder 671 on the observing list of American astronomer Jeffrey Corder. Size 90' X 50'. This is six stars between 5th and 8th magnitude including 66 Tauri, HIP 20447, the double star HIP 20457, and HIP 20458.
- One is in the IAU constellation Auriga and is Corder 878 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is six stars of 9th – 10th magnitude with the "V" opening to the NNE.
- One is in the IAU constellation Orion and is Corder 967 on the observing list of American astronomer Jeffrey Corder. Size 220' X 180'. This is the double star 59 Orionis, the stars HIP 28232, 60 Orionis, and HIP 27939, and the double star 56 Orionis.
- One is in the IAU constellation Gemini and is Corder 1415 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is stars of 9th – 10th magnitude including HIP 37783.
- One is in the IAU constellation Leo Minor and is Corder 2031 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is nine 9th – 10th magnitude stars and one 7th magnitude star including HIP 51616, 51460, and 51457.
- One is in the IAU constellation Vela and is Corder 1705 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is nine 7th – 11th magnitude stars including HIP 43484.
- One is in the IAU constellation Vela and is Corder 1764 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 9th magnitude stars.
- One is in the IAU constellation Vela and is Corder 1786 on the observing list of American astronomer Jeffrey Corder. Size 120' X 60'. This includes HIP 45544, 45439, 45448, 45623, 45814, and 46075, and the double star HIP 45386A.
- One is in the IAU constellation Vela and is Corder 1847 on the observing list of American astronomer Jeffrey Corder. Size 210' X 120'. This is a large asterism of 5th – 10th magnitude stars including HIP 47267, 47082, 46996, 46881, 46630, 46615, 46194, and the double stars HIP 47202, 46319, and 46535.
- One is in the IAU constellation Draco and is Corder 3177 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 6th – 8th magnitude stars including HIP 83305, 83160, and 83168.
- One is in the IAU constellation Hercules and is Corder 3235 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is six 7th – 9th magnitude stars including HIP 84631, 84623, and 84488. Corder describes this as a "'U' or 'V'".
- One is in the IAU constellation Sagittarius and is Corder 3440 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 8th – 9th magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3958 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven 6th – 10th magnitude stars including HIP 97401, 97405, and the double star HIP 97515.

- One is in the IAU constellation Cygnus and is Corder 4055 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is six 9^{th} – 10^{th} magnitude stars including HIP 99052.
- One is in the IAU constellation Cygnus and is Corder 4118 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is twelve 8^{th} – 10^{th} magnitude stars including HIP 100218.
- One is in the IAU constellation Aquarius and is Corder 4228 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 8^{th} – 9^{th} magnitude stars including HIP 102055.
- One is in the IAU constellation Vulpecula and is Corder 4244 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is fifteen 7^{th} – 10^{th} magnitude stars including HIP 102640 and the double star HIP 102650A.
- One is in the IAU constellation Equuleus and is Corder 4288 on the observing list of American astronomer Jeffrey Corder. Size 65'. This is twelve 6^{th} – 9^{th} magnitude stars including HIP 103686 and the double stars HIP 103483 and 103652A.
- One is in the IAU constellation Grus and is Corder 4544 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 7^{th} – 9^{th} magnitude stars including HIP 108199 and 108267.
- One is in the IAU constellation Cepheus and is Corder 4986 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 6^{th} – 8^{th} magnitude stars including HIP 117681 and 117973.
- One is in the IAU constellation Ophiuchus and was brought to our attention by Halifax Centre RASC member David Chapman: We don't know who gave it this name at present. This is eight 10^{th} – 13^{th} magnitude stars.
- One is NGC 7479 (Caldwell 44), a barred spiral galaxy in the IAU constellation Pegasus. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 55". It is GC 4892 in the *General Catalogue* of 1864. It is also known as the Superman Galaxy (see above), the Lawn Sprinkler (see above) and the Propeller (see above). American astronomer and meteorologist Todd Gross (1999) wrote "I was able to make out one of the two spiral arms shooting off the (west) tip of the main bar. It was unusual that it came out at an acute angle, to the north, making a 'V' with the bar".
- One is the open cluster NGC 3228 in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "II 7" in his catalogue. It is GC 2090 in the *General Catalogue* of 1864. It is also known as the Queen's Cache (see above) and the Little Flower Cluster (see above). South African astronomer Auke Slotegraaf (1998) describes it as a "knot of stars… mainly in an east-pointing V configuration". Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this without a name.
- One is the open cluster Messier 11 (NGC 6705) in the IAU constellation Scutum. It was discovered by German astronomer Gottfried Kirch in 1681. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4437. The 14^{th} edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) describes it as "fan shaped". American astronomer Phil Harrington describes it as a "blunt V" as does American astronomer Steve Coe. It is also known as the Wild Duck Cluster (see below), the July Salt and Pepper Cluster, the Scutum Salt and Pepper Cluster (see Salt and Pepper, below), the Cluster of the Shield of Sobieski (see below), and the Arrowhead (see above).
- One is the Hyades cluster (Caldwell 41, Collinder 50, Melotte 25, see above) in the IAU constellation Taurus. This is an ancient Roman asterism.

- One is Raymond 18 in the IAU constellation Aquila. René Merting describes it on the Faint Fuzzies website: “Up to 45x, southwest of a medium-bright star, about 10 relatively equally faint stars are visible, forming a V in groups of two or three - the brightest stars are on the southwest flank - at 103x, some fainter stars are added within the V - the star formation is conspicuous in the surroundings.”
- One is made up of stars of the IAU constellation Cygnus. It was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in July 2024: 60 Cygni, HIP 103949, 63 Cygni, 59 Cygni, and HIP 103312.
- One is made up of stars of the IAU constellation Cygnus. It was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in July 2024: HIP 102585, 55 Cygni, HIP 102827, HIP 102530, HIP 102430, and HIP 102306.
- One is made up of stars of the IAU constellation Cygnus. It was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in July 2024: 56 Cygni, 57 Cygni, HIP 103144, HIP 103322, HIP 103519, HIP 103371 and HIP 103094.
- One is made up of stars of the IAU constellation Cygnus. It was posted on *Cloudy Nights* by Spanish astronomer “Takuan” in July 2024: HIP 99813, HD 192819, HIP 99968, HIP 100069A, and HD 193633.
- One is made up of stars of the IAU constellation Perseus. It is Dezsi 6 on the list of Hungarian astronomer Attila Dezsi. This includes the stars HD 236967, Gaia DR3 457772187240678912, and HIP 11782.

Vacuum Cleaner:

There are two **telescopic** “vacuum cleaner” asterisms:

- One is Messier 109 (NGC 3992) which is a barred spiral galaxy in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781. English astronomer William Herschel listed it as “IV 61”. It is GC 2635 in the *General Catalogue* of 1864. It is also known as the “Well Formed of Ursa Major” (see below).
- One is in the IAU constellation Hydra and is listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 2070. Size 65’ X 50’. The “handle” of the vacuum starts at HIP 53022 and runs through HIP 52990 to 52804. The “vacuum” is HIP 52804, 52800, and 52693.

Vagabond:

This Hawaiian star “Paikauhale” is Tau (τ) Scorpii in the IAU constellation Scorpius. The IAU approved the name Paikauhale for the star Tau (τ) Scorpii A in 2018.

Vague One of Triangulum:

This **telescopic** asterism “Ásaphes Triánguli” is the barred spiral galaxy NGC 784 in the IAU constellation Triangulum. It was discovered by Prussian astronomer Heinrich d’Arrest and became GC 5207 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as they describe it as a “rather inconspicuous object”.

Vahik:

This Zoroastrian asterism is the IAU constellation Aquarius as listed in R. H. Allen's *Star Names* in 1899. Allen describes it as being in the "Bundehesh", which is the *Bundahishn*, a collection of cosmogony and cosmology in the Zoroastrian *Book Pahlavi*. Later in his book Allen lists "Vahik" as a Persian name for Capricornus.

Väinämöinen's Belt:

This Finnish asterism "Väinämöisen vyö" is the belt of Orion, named after their mythical hero Väinämöinen, a principal character in Carl Axel Gottlund's classic *The Kalevala*.

Väinämöinen's Scythe:

This Finnish asterism "Väinämöisen Viikate" is the belt and sword of Orion, named after their mythical hero Väinämöinen, a principal character in Carl Axel Gottlund's classic *The Kalevala*.

Väinämöinen's Shoes:

This Finnish asterism "Väinämöisen virsut" is Pleiades cluster in the IAU constellation Taurus, named after their mythical hero Väinämöinen, a principal character in Carl Axel Gottlund's classic *The Kalevala*.

Väinö's Belt:

This Finnish asterism "Väinön vyö" is the Belt of Orion asterism in the IAU constellation Orion.

Väinö's Scythe:

This Finnish asterism "Väinön viikate" is the Belt of Orion asterism in the IAU constellation Orion.

Valentine Nebula:

This **telescopic** asterism is the nebula and open cluster IC 1805 (SH 2-190, LBN 654, Mel 15, Ced 7) in the IAU constellation Cassiopeia. It was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). This is also known as the Heart Nebula (see above) and the Running Man (see above).

Valentine Rose Nebula:

This **telescopic** asterism is the planetary nebula SH 2-174 (LBN 598, PK 120+18.1, PN G120.3+18.3) in the IAU constellation Cepheus. American astronomer Stewart Sharpless discovered it in 1959.

Van Biesbroeck's Star:

This **telescopic** red dwarf star is VB 10 in the IAU constellation Aquila (magnitude 17.3). It was discovered by Belgian American astronomer George Van Biesbroeck in 1944: At that time, it was the smallest and faintest star known.

Van Maanen's Star:

This **telescopic** star, Van Maanen 2, is HIP 3829 in the IAU constellation Pisces (magnitude 12.38). This is the closest known solitary white dwarf to Earth. It was discovered in 1917 by Dutch-American astronomer Adriaan van Maanen. This was the second white dwarf ever discovered.

Vanishing Galaxy:

This **telescopic** asterism is NGC 3628, a spiral galaxy with a prominent dust lane in the IAU constellation Leo. This was discovered by English astronomer William Herschel in 1784 who listed it as "V 8" in his

catalogue. It is GC 2378 in the *General Catalogue* of 1864. It is also known as Sarah's Galaxy (see above), the Hamburger Galaxy (see above), and the King Hamlet's Ghost (see above).

Vānrājā:

This Vedic star "Vānrājā" or "Vanraja" is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Varak:

This Zoroastrian asterism is the IAU constellation Aquarius as listed in R. H. Allen's *Star Names* in 1899. Allen describes it as being in the "Parsi Bundehesh", which is the *Bundahishn*, a collection of cosmogony and cosmology in the Zoroastrian *Book Pahlavi*.

Vârdice:

This Chakavian asterism is the IAU constellation Gemini.

Variabilis Coronae:

This eruptive variable star is R Coronae Borealis (HIP 77442, HD 141527) in the IAU constellation Corona Borealis (magnitude 5.71). It was given this name in 1797 by English astronomer Edward Pigott and antiquarian Henry Charles Englefield.

Variable of Lacerta:

This **telescopic** asterism "Poécile Lacértae" is the blazar LB Lac (QSO 220+420) in the IAU constellation Lacerta. It was discovered by Cuno Hoffmeister in 1929 but originally thought to be a variable star. John Schmitt identified it as a radio source in 1968. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Varsayanti:

This Vedic star from the *Taittiriya Brahmana* is 28 Tauri (Pleione) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, above).

Vase of Virgo:

This **telescopic** asterism "Alabáster Vírginis" is the spiral galaxy NGC 4527 in the IAU constellation Virgo. William Herschel listed this as "II 37". John Herschel listed this as h 1330 and later as GC 3076 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the general appearance of this galaxy… puts in mind an alabaster, a Greek vase for body oil or perfumes".

Vashishṭha:

This Vedic star "Vashishṭha", "Vaśisṭha" "Vasishtha", "Vasistha", "Vaśisṭha" is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major (Boutet 2014, Bhagwath 2019). It was listed in R. H. Allen's *Star Names* in 1899. This is an aspect of Brahma, whose sons are the other stars in the Big Dipper asterism (see Seven Sages, below).

Vassal of Northern Dipper:

See "Assistant of Northern Dipper" above.

Vast Amount:

This Kaykavian asterism “Vóleki’ is the IAU constellation Lyra.

This Chakavian asterism “Volÿtje” is the IAU constellation Lyra.

Vast Four Legged:

This Latin asterism “Quadripes Vasta” (“Vast Four Legged”) is the IAU constellation Lupus as listed by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.).

Vector of Arion:

This Latin asterism “Vector Arionis” is the IAU constellation Delphinus and relates to the rescue of Arion by dolphins on his voyage to Corinth. Johann Bayer’s *Uranometria* (1603) lists “Vector Arionis” for this constellation. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Vector Arionis” as an alternate name for Delphinus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this name.

Vedurfolnir:

This Norse star “Vedurfolnir” or “Veðrfölnir” (Old Norse “storm pale," "wind bleached", or "wind-witherer") is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Veðrfölnir is a hawk sitting between the eyes of an unnamed eagle that is perched on top of the world tree Yggdrasil. Jónsson depicts this as a hawk sitting on the head of this eagle, which is represented by Aquila.

Vega:

See Alighting Vulture, above.

Veil:

This Arabic star “ʾizār” (إزار), later latinized to “Izar”, is Epsilon (ε) Boötis in the IAU constellation Boötes. In 2016 the IAU Working Group on Star Names approved the name Izar for Epsilon (ε) Boötis A.

Vehement of Antlia:

This **telescopic** asterism “Saévus Ántliae” is the spiral galaxy IC 2522 in the IAU constellation Antlia. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the name is appropriate for this rather disordered vehemently looking galaxy”.

Veil Nebula:

There are two **telescopic** “Veil” asterisms:

- One is SH 2-103 (NGC 6960, 6992, 6995) is a supernova remnant also known as the Cygnus Loop, which contains the Eastern Veil Nebula, the Western Veil Nebula, Pickering’s Triangle, and several other nebulae in the IAU constellation Cygnus. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this “Veil Nebula”.

- One is SH 2-91, a supernova remnant in the IAU constellation Cygnus roughly between ϕ Cygni and 91 Cygni. It is often referred to as the "other Veil" and is much dimmer than SH 2-103.

Veil of Veronica:

This Czech asterism "Sudarium Veronicae" or "Sudarium of Veronica" was created by Czech astronomer, optician, and friar Antoine Marie Schyrle de Rheita in 1643. It is a rectangle of stars with the corners being Rho (ρ) and Omicron (ο) Leonis, Beta (β) Sextantis, and Iota (ι) Hydrae. De Rehita writes "Sudarium Veronicae sive faciem Domini maxima similitudine in astris expressum" ("The shroud of Veronica, or the face of the Lord, expressed in the greatest similitude in the stars"). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this "napkin of S. Veronica". Compare to Face of the Lord, above.

Veil of Virgo:

This **telescopic** asterism "Vélans Vírginis" is the elliptical galaxy NGC 5846 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "I 128". It became GC 4045 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the outer envelope of this elliptical galaxy is veiling another elliptical galaxy, NGC 5846A".

Veiled of Vela:

This **telescopic** asterism "Velátus Velórum" is the barred spiral galaxy NGC 3261 in the IAU constellation Vela. It was discovered in 1836 by John Herschel who listed it as h 3258 and later as GC 2119 in his *General Catalogue* of 1864 This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this because it is "seen behind a veil of foreground stars."

Veins of the Heart:

This Arabic asterism is the stars Sigma (σ) and Tau (τ) Scorpii in the IAU constellation Scorpius and is part of their asterism the "Scorpion" (see above). It is called this because theses stars are either side of Alpha (α) Scorpii (Antares) which the Arabs called the Heart of the Scorpion (see above).

Vela:

Vela's brightest stars are 2nd magnitude Gamma (γ) Velorum (Regor) which is the 30th brightest star in the sky and Delta (δ) Velorum (Alsephina) which is the 45th brightest star in the sky and its stars appear in 138 asterisms in this handbook.

The IAU constellation Vela (IAU abbreviation Vel) was once part of the larger and older constellation Argo Navis (see Argo's Ship, above). As this was such a large and unwieldy group of stars, in 1763 French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) divided it into three constellations now recognized by the IAU: Carina (the hull or keel), Puppis (the poop deck), and Vela (the sails). NOTE: Lacaille did not rename the stars, keeping the Greek letters of the Bayer star classifications for Argo Navis, so Carina has stars in the first part of the Greek alphabet, Vela has the middle letters, and Puppis has the end of the alphabet.

"Vela" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it. NOTE: On another chart in this atlas Argelander depicts "Argo".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Vela, The Sails" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Vela" and describes it as the "Sails (of Ship Argo)".

Vela is depicted on standard IAU charts as the oval of stars Gamma (γ), Omicron (ο), Delta (δ), Kappa (κ), Mu (μ), p, q, Psi (ψ), and Lamba (λ) Velorum.

Veletÿćі:

This Chakavian asterism is the IAU constellation Aquila.

Velisazar:

This Belarussian asterism is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009). It relates to the ancient Slavic God Veles, the God of cattle and ruler of the underworld. It is believed to have originated in the Russian word "Vlasezhelische" ("kingdom of Veles"). It appears elsewhere in eastern Europe as "Volosozhary".

Velitoa Hahake:

This Tongan star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Velitoa Hififo:

This Tongan star is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Vena:

This Polynesian (Cook Islands) star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed by R. H. Allen in his *Star Names* in 1899. Allen describes it as "their goddess". Allen lists this as the "Hervey Islands" which is the former name given to the southern part of the Cook Islands by Captain James Cook in the 18th century.

Venant:

This Persian star "Venant" ("watcher of the north") is Alpha (α) Leonis (Regulus) in the IAU constellation Leo and is part of their asterism Four Guardians of Heaven (see above). Compare this to the Zoroastrian star "Wanand" (see General of the West, above). R. H. Allen translates this as "Watcher of the North" in his *Star Names* in 1899.

Venerable Star King:

"Sonjō-Ō"(尊星王) meaning "Venerable Star King", also known as "Sonshō-Ō" or "Sonsei-Ō" is an alternate name for the Japanese asterism Myōken (see above).

Ventral:

This Latin star "Ventrale" ("ventral") is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda. Compare this to Waist Cloth, below.

Venice:

This asterism "Venise" was created from stars of the IAU constellation Hydra by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681

and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Venice and is depicted as a book being read by a lion.

Venus of the Northern Sky:

This Quechua star "Pachapacariq Ch'aska" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Urton 1981).

Venus' Mirror:

This Western asterism is in the IAU constellation Orion. The "handle" of this square "mirror" is the "sword" of Orion, with Orion's "belt" forming one top edge and a line from Delta (δ) Orionis (Mintaka) to Eta (η) Orionis the other top edge.

Venus and Cupid:

This asterism is the IAU constellation Gemini, which John Hill lists as an asterism of the "old astronomers" in his *Urania* in 1754. Venus is a Roman Goddess of love (cognate with the Greek Aphrodite) and Cupid is a Roman God of desire (cognate with the Greek Eros) that is Aphrodite's son.

This Latin asterism "Venus et Cupido", "Venus Syria cum Cupidine" ("Venus Syria with Cupid"), "Venus cum Adone" ("Venus with Adone"), and "Veneris Mater" is the IAU constellation Pisces.

- Johann Bayer's *Uranometria* (1603) lists "Veneris Mater" and "Venus and Cupido".
- "Venus et Cupido", "Venus Syria cum Cupidine", "Venus cum Adone", and "Veneris Mater" are all listed in R. H. Allen's *Star Names* in 1899. Allen explains that the Greeks "confounded Ἀφροδίτη [Afrodíti] (Venus) with… Astarte" and this led to a myth describing Venus and "her son Ἔρως [Éros] (Cupid)", turning themselves into fishes in the Euphrates to escape the monster Typhon.

Verdandi:

This Norse star "Verdandi" or "Verðandi" is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Verðandi is a Norse Goddess of Fate and one of the three Norns encountered during The Word of Fate.

Veritate:

See Where There is Truth, below.

Verrucose:

This asterism "Vereux" is the IAU constellation Aries. This name is listed in Johann Bayer's *Uranometria* (1603).

Vertebrae in al Jauzah's Back:

This Arabic asterism "Faḳār al Jauzah" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Very Beautiful of Dorado:

This **telescopic** asterism “Bellíssimus Dorádus” is the intermediate spiral galaxy NGC 1566 in the IAU constellation Dorado. It was discovered by Scottish astronomer James Dunlop in 1826. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Spanish Dancer” (see above).

Very Elegant of Virgo:

This **telescopic** asterism “Elegantíssimus Vírginis” is the spiral galaxy NGC 4567 in the IAU constellation Virgo which is colliding with NGC 4568. These were discovered by English astronomer William Herschel in 1784 who listed them as “IV 8” and “IV 9”. His son John Herschel listed them as “1358” and “1359” in his catalogue. They are GC 3108 and GC 3109 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “H. L. d’Arrest… called this pair ‘elegantissimum et permirum phaenomenon'. (Les Etoiles, 1882, p.377)”. They are also known as the Butterfly Galaxies (see above), the Fish and Chips Galaxies (see above), and the “Siamese Twins” (see above).

Very Flat of Virgo:

This **telescopic** asterism “Planíssima Vírginis” is the edge-on elliptical galaxy NGC 4623 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 149”. It became GC 3157 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Very Good:

This Vedic nakshatra (lunar mansion) “Swati”, “Svati”, “Svāti”, or “Swāti” (Devanagari स्वाति), “Svāti”, “Svāti̍” or “Su-Ati” (“great goer” or “very good”) is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. Ivanković (2021) lists it as “Svati’, translates this as “self-going” or “independent”, and relates it to Vayu, the God of winds and breath, who is the wind that turns the stars. Ivanković also gives the alternate name “Nistyā” (see Alien, above). R. H. Allen lists it as “Svati” in his *Star Names* in 1899. It appears as “Svati” in the *Atharveda* and as “Swati” on the nakshatra lists of the maharshis Varahamihir and Parasara (Leitz 2019). W. Brennand lists this as “Swati” in his *Hindu Astronomy* in 1896 and translates this as “a piece of coral”. Bhagwath (2019) lists its symbols as a shoot of a plant or coral.

This Myanmar nekkhat (lunar mansion) “Thwati” (သွာတီ) is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

This Tibetan gyukar (lunar house) “Sa Ri” “or “Sari” is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Johnson-Groh 2013).

Very Handsome Man:

This Selk’nam star “Kosórenk” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Very Strong:

This Kiribati asterism “Katikikora” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Trussel and Groves 1978).

Very Whirling of Pisces:

This **telescopic** asterism “Verticósus Píscium” is the spiral galaxy Messier 74 (NGC 628) in the IAU constellation Pisces. This was discovered by Pierre Méchain in 1780. It was listed in the General Catalogue of 1864 as GC 327, and in John He rschel’s catalogue as h 142. It became GC 372 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it this due to its “marked whirling appearance”. It is also known as the “Phantom Galaxy” (see above) and the “Perfect Spiral Galaxy” (see above).

Very Wonderful of Virgo:

This **telescopic** asterism “Perimus Vírginis” is the spiral galaxy NGC 4568 in the IAU constellation Virgo which is colliding with NGC 4567. These were discovered by English astronomer William Herschel in 1784 who listed them as “IV 8” and “IV 9”. His son John Herschel listed them as “1358” and “1359” in his catalogue. They are GC 3108 and GC 3109 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “H. L. d’Arrest… called this pair ‘elegantissimum et permirum phaenomenon'. (Les Etoiles, 1882, p.377)”. They are also known as the Butterfly Galaxies (see above), the Fish and Chips Galaxies (see above), and the “Siamese Twins” (see above).

Vessel:

This Latin asterism “Vas” or “Vas Aquarium” is the IAU constellation Crater as listed in the 15th century *Alfonsine Tables*. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Vas” as an alternate name for Crater.

Vesta:

This Latin asterism “Vesta” is the IAU constellation Ara. Vesta was the Roman Goddess of hearth and home.

Victim of a Centaur:

This Latin asterism “Victima Centauri” (“victim of a centaur”) is the IAU constellation Lupus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671): Lupus is right next to the IAU constellation Centaurus, so could be seen as the centaur’s prey.

Victims in the Temple:

This asterism is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen does not specify the source but writes that it represented “later victims in the Jewish temple”.

Victor of the Gorgon Monster:

This Latin asterism “Victor Gorgonei Monstri” is the IAU constellation Perseus as listed in R. H. Allen’s *Star Names* in 1899.

Victorious:

This Vedic nakshatra (lunar mansion) “Abhijit” is in the IAU constellation Lyra and is the stars Alpha (α) Lyrae (Vega), Zeta (ζ) Lyrae and Epsilon (ε) Lyrae. It is related to their deity Brahma in some texts. Ivanković (2021) lists this as just the star Vega with no deity associated to it. It appears on the nakshatra list of the maharshis Varahamihir and Parasara, while the *Atharvaveda Parisistha* and *Brhat Samhita* list only one star (Leitz 2019). It does not appear in the *Taittirīya Samhitā*.

This Myanmar nekkhat (lunar mansion) “Abizi” (အဘိဇိ) is in the IAU constellation Lyra and is the stars Alpha (α) Lyrae (Vega), Zeta (ζ) Lyrae, and Epsilon (ε) Lyrae.

This Tibetan gyukar “Drozhin” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Johnson-Groh 2013).

Vigorous of Ursa Major:

This **telescopic** asterism “Strénuus Úrsae Majóris” is the barred spiral galaxy NGC 3198 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as “I 199”. It became GC 2066 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “two strong, well-developed arms”.

Village:

This Chinese Chenzhuo xing guan “Xiang” is the star Iota (ι) Aurigae in the IAU constellation Auriga. It is part of their xing guan Five Chariots.

Village of Sky:

This Korean asterism “Haneul-ui Ma-eulis” (하늘의 마을) is a line of three stars in the IAU constellation Taurus: Upsilon (υ), Omega (ω) and 53 Tauri.

Vindemiatrix:

See Female Grape Gatherer, above.

Vine:

This German asterism is the IAU constellation Boötes as depicted on one the globes of German Jesuit scholar Athanasius Kircher (1602 – 1680).

Vine Branch:

This early Arabic asterism “Al Ḳaḍb al Karm” is made up of stars in the IAU constellation Centaurus and Lupus. Compare this to their asterism Palm Branches, above.

Vine Ladder:

This Barasana asterism is an unidentified line of stars near the IAU constellation Delphinus (Hugh-Jones 2006): The Barasana call Delphinus the Corpse Bundle (see above).

Vines:

This asterism “Vergiliae” is the Pleiades cluster in the IAU constellation Taurus:

- The *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus lists the northern end of the Pleiades as ”Vergiliae”
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists the Pleiades as “Vergiliae”

Vinyl LP:

This **telescopic** asterism is NGC 4699, an intermediate spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as “I 129”. It is GC 3229 in the *General Catalogue* of 1864. This was given this name by Astronomy Magazine contributing editor Stephen James O’Meara. It is also known as the Mealie (see above). This name was Latinized in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): “Longísonans Vírginis” (“long playing of Virgo”). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this galaxy.

Violet of Leo:

This **telescopic** asterism “Vióleus Leónis” is the spiral galaxy NGC 3686 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “II 160” and “III 28”. John Herschel listed it as h 894 and later as GC 2423 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its resemblance to a violet.

Virgil’s Star:

This Latin asterism “Vergilae” or “Sidus Vergiliarum” (“Virgil’s Star”) is the Pleiades cluster in the IAU constellation Taurus:

- “Vergilae” and “Sidus Vergilarum” are listed in *De Natura Rerum Liber (“book on the nature of things*”) by Isidori Hisapensis (Isidore of Seville, ca 560 – 636 C.E.).
- This appears in editions of the 8th century *Revised Aratus Latinus* as “Virgiliae”.
- The 11th century *De signis caeli (“of the signs of heaven*”) lists “Virgiliae”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Vergiliae”.
- This appears as “Vergilae” or “Sidus Vergiliarum” in Robert Hues’ *A Learned Treatise of Globes* in 1659.
- This appears as “Vergilae” or “Sidus Vergiliarum in R. H. Allen’s *Star Names* in 1899: Allen translates this as “stars of spring”. Variations include “Virgilia”. Allen notes that one translation *Naturalis Historia* of Pliny by the Elder (23 -79) translates this as “garment hanging out at a Broker’s shop”.

Virgin:

This German asterism “Jungfrau” is the IAU constellation Virgo. “die Jungfrau” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. “Jungfrau” is listed in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Die Jungfrau“. See Virgo, below.

This Romanian asterism “Fecioara” is the IAU constellation Virgo (Ottescu 2009, Lite, Lodina, and Ignat 2018).

There are three Arabic asterisms by this name:

- One, “al-ʻAdhārā” (“virgin” or “nymph” العذارى) is Epsilon (ε) Canis Majoris in the IAU constellation Canis Major:
  - This was later latinized to “Adhara”, “Adara, “Adard”, “Udara”, or “Udra”.
  - It was also called “al-ʻAdhāriy” (“first of the virgins/nymphs” الْعَذَارِي) and the star Omicron (o) Canis Majoris was the Second of the Virgins (see below). This is part of their asterism Virgins (see below).
  - English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Adara” and his *Bedford Catalogue* in 1844 lists “Adara, from al’adhára, the virgins” which is a reference to the asterism Virgins (see below).
  - The 1st edition (1910) and 14th edition (1959) of British schoolmaster Arthur P. Norton’s *A Star Atlas* lists this star as “Adara”.
  - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed. Lists “Adhara” for this star.
  - The IAU approved the name Adhara for Epsilon (ε) Canis Majoris A.
- One,“al-ʻUdhrah” or “al-adhraa” (العذرة) is the IAU constellation Virgo.
  - “Al-‘Adhrā” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - Englis Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Adhrá nedhifah, the pure virgin” as a name for Virgo.
- One is the star Eta (η) Canis Majoris in the IAU constellation Canis Major and later latinized to “Aludra”:
  - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists Aludra, from the Arabian al’adhrá, which is the singular of al’adhara”.
  - The IAU approved the name Aludra for Eta (η) Canis Majoris.

This Hebrew asterism “Betulah” is the IAU constellation Virgo as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud* and is related to their month Elul.

This Egyptian asterism “Aludra” from the Old Kingdom (3100 B.C.E.) is the IAU constellation Virgo (Berio 2014). Compare this to the Arabic asterism Virginity (see above).

Virgin in Maiden Neatness:

This Persian asterism “Secdeidos de Darzama” is the IAU constellation Virgo.

- Johann Bayer’s *Uranometria* (1603) lists “Seclenidos de Darzama“ as a name for Virgo.
- R. H. Allen’s *Star Names* in 1899 lists “Secdeidos de Darzama”.

Virgin Mary:

This German asterism “Virgo Maria” is the IAU constellation Virgo. This name is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Virgin Mary Assumed Heaven:

This Italian asterism “Virgo Maria Asumpta in Coelum” is the IAU constellation Virgo as depicted on the 1710 globe of Italian monk and uranographer Amantius Moroncelli (Stevenson 1921).

Virgin of Guadalupe:

This Quechua asterism “Guadalupe” is the Hyades cluster in the IAU constellation Taurus (Ciancia 2018).

Virgin of Nonacris:

This Latin asterism “Virgo Nonacrina” is the IAU constellation Ursa Major and refers to the Arcadian town Nonacris. Johann Bayer’s *Uranometria* (1603) lists “Nonacrina” as a name for Ursa Major.

Virgin of Parrhasia:

This Latin asterism “Parrhasis” or “Parrhasia Virgo” is the IAU constellation Ursa Major and is a reference to a region in southern Arcadia.

Virgin of Tegea:

This Latin asterism “Tegeaea Virgo” is the IAU constellation Ursa Major and refers to the Arcadian town of Tegea.

Virgin Stars:

This Greek asterism is the Pleiades cluster as listed by the Greek poet Hesiod and by R. H. Allen in his *Star Names* in 1899.

Virgins:

This Arabic asterism “Al ʿAdhārā” (العذاري) is made up of stars in the IAU constellation Canis Major:

- “First of the Virgins”: Epsilon (ε) Canis Majoris
- “Second of the Virgins”: Omicron (o) 2 Canis Majoris
- “Weight”: Delta (δ) Canis Majoris (Wezen)
- “Virgin”: Eta (η) Canis Majoris (Aludra)
- “Third of the Virgins”: Omicron (o) 1 Canis Majoris (Thalath al Adzari)

Al ʿAdhārā is found in several places:

- It appears on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (Dorn 1829).
- It is listed in the 17th-century *Calendarium* of Al Achsasi al Mouakket.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al’adhára, the virgins” and “El Zára, the virgins”, though this is a mistranslation of “Maidens” (see Maidens, above

Virgin’s Girdle:

This Babylonian star “Sa-Sha-Shirū” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Virgin’s Spike:

This English star is the is Alpha (α) Virginis in the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Allen vaguely describes this as originating in "Old England" but does indicate that English astronomer John Flamsteed (1646 – 1719) listed it under this name. It is a corruption of the Latin name "Spika Virginis" (see Ear of Grain, above).

Virgo:

Virgo's brightest star is 1st magnitude Alpha (α) Virginis (Spica), whichis the 16th brightest star in the sky and its stars appear in 478 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Vir) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and became one of Ptolemy's 48 original constellations in the 2nd century, appearing in the *Almagest* as "Παρθένος" or "Parthenos" (see Maiden, above). It originated in the Babylonian asterism "Furrow" (see above). One of Virgo's ancient Greek names is "Παρθένος Δίος" ("Parthénos Díos" or "virgin goddess").

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Virgo as a figure facing to our left holding something in its hands. (Bullinger 1882, Seiss 1882).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Virgo as winged and holding something in her right hand.

Libra and Virgo are merged in editions of the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Virgo is dressed in a long gown holding the scales of Libra in her outstretched left hand and a sheaf of grain in her right hand,
- In the Cologne 83 II edition Virgo is depicted as winged wearing a gown which exposes her shoulder with the scales beside her,
- In several editions (St. Gall 250, Vat Reg lat 1234) Virgo has wings.

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) depict Virgo with wings holding a plant in her left hand and raising her right hand in benediction. The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Virgo without wings. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Virgo holding scales in her left hand and a plant in her right, except in the Austin manuscript, which omits the plant. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Virgo with scales in her left hand and a palm frond in her right hand. The Los Angeles, Getty Ludwig XII, 5 and Paris BN lat 8663 manuscripts of the *De ordine ac positione stellarum in signis* depict Virgo holding a plant and scales.

This constellation appears in a 10th century copy of the Leiden *Aratea* (Boulogne-sur-Mer, Bibliotèque municipal MS 188) but is missing from the 9th century edition.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Virgo as a long-haired female wearing ankle-length robes. No wings are depicted. She is wearing earrings and bracelets. On one page she is looking to our

left, with her empty right hand at her side and gesturing with her left hand. On the other page she is looking to our right, gesturing with her right hand and her empty left hand is at her side.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Virgo" and "Lusticia" (see Justice, above). The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depicts Virgo with wings holding a plant in her right hand. The Dijon 448 manuscript of *De signis caeli* depicts her with wings raised, holding a branch in her left hand and making a sign of benediction with her right hand. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Germanicus Aberyswyth 735C, Hyginus Leiden 8° 15, and Zwettl 296 manuscripts of *De signis caeli* depict Virgo holding a branch in one hand and a balance in the other. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Montecassino 3, and Zwettl 296 manuscripts of *De signis caeli* depict depict her with wings downward holding the balance in her left hand and a plant in her right. In the Paris BN 5543 and Vat lat 643 manuscripts she is flying. In the Vat Lat 643 and Zwettl 296 manuscripts the scales are labelled "Libra" at the bottom of the page. The Laon 422 and Rouen 26 manuscripts of *De signis caeli* depict Virgo with wings raised and a plant in her right hand. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts her holding a wand in one hand and making a benediction gesture with the other.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Virgo as winged, holding the scales in her right hand and a palm frond in her left hand.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Virgo as a winged female facing us in ankle length robes holding up either a feather or a leaf in her left hand.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Virgo as a winged female facing us holding up an ear of grain in her left hand.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Virgo as a female with multi-coloured wings in an ankle length robe. Her hands are open (and empty) to either side.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists "VIRGO" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Virgo as a wingless female in calf length robes who is looking downward and gesturing downward with both hands.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Virgo" as a winged female in a full-length robe as viewed from the rear. Her head is turned to her right and her right hand appears to be gesturing someone to approach. Her left arm is not visible.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Virgo" as a winged female in a full-length robe as viewed from the rear. Her head is turned to her right and her right hand appears to be gesturing someone to approach. Her left hand down by her side.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Virgo as a winged female in an ankle length robe. She is pointing skyward with her left hand and her right hand is at her side.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Virgo as a winged female in full-length robes with a crown on her head. In her left hand she holds a caduceus, and in her right hand she is holding what a leafy branch. Another illustration is similar, but in her right hand she appears to be holding a long lock of hair.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Virgo" as a winged female. She wears a full-length skirt but is naked from the waist up. In her right hand she holds a sheaf of grain and in her left hand she holds a caduceus. Scot (1175 – c.1232) depicts Virgo holding a sceptre in her right hand. Scot explains that Virgo is in the house of Mercury, who gave her that caduceus.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts Virgo as winged and wearing long robes. She has a sprig of foliage in her right hand and a trident with two rings at the top in her left hand.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Virgo as a winged, robed female with arms outstretched and holding an ear of grain in her right hand.

Virgo appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a winged female in a long robe facing us holding a stalk of grain in her left hand and pointing towards the sky with her right hand.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Virgo" as a winged female in a full-length robe facing away from us. She is looking to her right and holds a sceptre in her right hand with a banner that reads "Justitia terras reliquit, guia victa jacet pietas" ("Justice has left the land, piety lies defeated in the path."). She holds a stalk of grain in her left hand.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Virgo" as a winged female viewed from behind. She is looking to her right and pointing at her face with her right hand. She is holding a stalk of grain at her side in her left hand.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Virgo" as a winged female viewed from behind. She is looking to her right and pointing at her face with her right hand. She is holding a stalk of grain at her side in her left hand.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Virgo" as a winged female in long robes as viewed from behind. Her hands are at her sides and she is holding an ear of grain in her left hand.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Virgo as a winged robed female facing away from us, looking over her right shoulder.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Virgo as a female in full length robes with no wings. Her hands are in front of her holding a stalk of grain.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Virgo in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Virgo" as a winged, robed female viewed from the rear. She is holding a stalk of grain in her left hand and waving at someone in front of her with her right hand.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del la Vergine". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Virgin".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Virgo as a winged female in full-length robes as viewed from behind. She is looking to her right and appears to be pointing towards her face with her right hand.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Virgo in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss German artist Jost Amman (1539 – 1591) depicts Virgo as a winged female in a long robe pointing to the north with her left hand and holding a sheaf of grain in her left hand: This constellation is labelled only with the astrological sign for Virgo.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Virgo" as a winged female in an ankle length robe holding a sheaf of grain in her right hand.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "la Vierge" as a winged female in a long robe. She is facing us with her right hand raised and holds a sheaf of grain at her side in her left hand.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts "Virgo" as a winged female in full-length robes as viewed from behind. She is holding up a stalk of grain in her right hand. Her left arm is not visible, being off the edge of the chart.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Virgo" as a winged female in a full-length robe as viewed from behind. She is looking over her right shoulder at us, pointing at the sky with her right hand and holding a stalk of grain in her left hand.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Virgo" as a winged female in a long robe holding a caduceus in her left hand which is resting on her left shoulder and an ear of grain in her right hand.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Virgo" as a winged woman in long robes viewed from behind. Her right hand is raised with her finger

pointing upwards and there is a golden circle formed by the tail of Leo in the background surrounding her hand. Her left hand is holding an ear of grain at her side.

Virgo is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer Johann Bayer (1572-1625) listed it as "Junckfraw" in his Uranometria in 1603 and depicts it as a winged woman holding a stalk of grain. Bayer lists these names for Virgo: "Virgo, Astrea, Erigone, Atargatis, Fortuna, Ceres, Auieno Isis, Pax, Panda vel Pantica, Iusta, rectius Iustitia, Spicifera Dea, Virgo Sicea, Jungfrau, Eladari, Sunbala, Adrenedesa Album, Seclenious de Darzama".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Virgo" as a winged female in a long robe viewed from the rear. She is holding up a leafy branch in her right hand (which is encircled by the tail of Leo) and holding a stalk of grain at her side in her left hand.

Virgo is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

"Virgo" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a winged woman in a long robe holding up a scythe in her right hand and holding a stalk of grain in her left hand.

Virgo is depicted by German astronomer Johann Bayer (1572-1625) in his Uranometria in 1603 as a winged woman in ankle length robes: She is holding aloft a branch in her right hand and holding an ear of grain at her side in her left hand.

"Virgo" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a winged woman in a long robe. She is facing us holding an ear of grain in her left hand by her side and her right hand is holding something out but the chart is faded and it is hard to make out what it is.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Virgo" for this constellation.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Virgo: as a winged female in full-length robes facing away from us. Her left hand is at her side holding a stalk of grain and her right hand is raised skyward.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts only part of Virgo, her lower parts obscured below the edge of the dome. She is a winged female in long robes facing away from us. She is holding aloft a branch in her left hand. Her left arm is out of sight.

Virgo is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as a winged woman holding aloft a sheaf of grain in her right hand.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Virgo as a robed winged female viewed from behind holding aloft a branch in her right hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Virgo” as a winged female with her left hand raised.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Virgo” as a winged female in a long robe holding a sheaf of grain in her left hand.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Virgo” as a winged female in a long robe as viewed from behind, pointing at something above her with her right hand and holding a sheaf of grain in her right hand.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “La Vierge”, “Virgo”, and “Παρθένος” and depicts her as a seated, winged female holding a sheaf of grain at her side in her right hand and holding aloft a leafy branch in her left hand.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Virgo as a winged female in a long pink robe who is facing away from us and pointing at something with her left hand.

Virgo is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: She is depicted as a winged woman in a long robe holding a frond in her right hand and a sheaf of grain in her left hand.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as “Virgo”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Virgo” as a winged female. It is hard to make out details as it is situated across the hinge that separates the two halves of the globe.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Virgo: as a winged, robed female as viewed from the rear. She is gesturing aloft with her left hand and her right hand is holding a sheaf of grain.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Virgo as a winged, robed female facing away from us with her right hand raised.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Virgo as a winged female in ankle length robes. She is holding up a branch in her right hand and is holding a stalk of grain at her side in her left hand.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Vierge” as a winged female in a long robe holding a leafy branch in her left hand.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Vierge” as a winged woman in a long robe holding a ear of grain in her left hand and gesturing to her right with her empty right hand in the Northern hemisphere chart. On a later closeup chart she is depicted as a winged woman in a long robe holding a ear of grain in her left hand and a large quill pen in her right hand. The French 1778 edition of the *Atlas Céleste* depicts a winged woman in a long robe holding a frond in her right hand and a sheaf of grain in her left hand.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Jungfrau" and depicts it as a winged female viewed from the rear. This name also appears in the various editions of Bode's *Jahrbuch*. Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Jungfrau" and depicts it as a robed and winged female holding a frond in her right hand and an ear of grain in her left hand.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Vergine" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Virgo" as a winged female in a long robe viewed from behind: She is holding a stalk of wheat in her left hand and pointing at something in front of her with her right hand.

Virgo is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Maagd" ("virgin"): She is depicted as a winged female in a long robe facing us holding a stalk of grain in her left hand.

American uranographer William Croswell (1760 – 1834) depicts "Virgo the Virgin" on his *Mercator Map of the Starry Heavens* in 1810 as a winged woman in a long robe holding a leafy twig in her right hand and gesturing with her left hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Virgo in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): She is depicted as a winged woman with a laurel wreath on her head with a frond in her right hand and a sheaf of wheat in her left hand.

"Virgo" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and is depicted as a winged woman facing us wearing a long robe holding a stalk of grain in her left hand.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Virgo" as a winged female in long robes holding a sheaf of grain in front of her in her right hand and having her left arm by her side.

Virgo is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. Virgo is depicted winged, wearing a long robe and sandals , holding a frond upright in her right hand and a sheaf of grain in her left hand.

"Virgo" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): She is depicted as a winged female facing us in a long robe holding up a stalk of grain in her right hand and another stalk in her left hand by her side.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Virgin" on the charts and "Virgo" in the text and describes it as "a beautiful maiden with folded wings, bearing in her left hand an ear of corn."

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Virgo, The Virgin" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Virgo, the Virgin".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Virgo" in his *Star Atlas* (1893) and describes it as "The Virgin".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Virgo" and describes it as the "Virgin".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Virgo".

Virgo is depicted on standard IAU charts with a quadrilateral of the stars Alpha (α) Virginis (Spica), Zeta (ζ) Virginis, Delta (δ) Virginis, and Gamma (γ) Virginis as her "body" with lines running out from each corner to form "arms" and "legs".

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Virgo in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- Her "head" is the star Epsilon (ε) Virginis, with a line running through Delta (δ) Virginis to Gamma (γ) Virginis forming the "body",
- Two lines running from Delta (δ) Virginis form "arms":
    - One running to Zeta (ζ) Virginis, and
    - One running to Omicron (ο) Virginis, and
- Two lines running from Gamma (γ) Virginis form "legs":
    - One running through Theta (θ) Virginis to Alpha (α) Virginis (Spica), and
    - One running through Eta (η) Virginis to Beta (β) Virginis (Zavijava).

Sky and Telescope Magazine, founded in 1941, depicts Virgo in their magazine and publications like this:

- Her "head" is the quadrilateral of stars Eta (η) Virginis, Beta (β) Virginis (Zabijava), Nu (ν) Virginis, and Omicron (ο) Virginis,
- A line running from Eta (η) Virginis to Gamma (γ) Virginis is her "neck" and this line continues to Zeta (ζ) Virginis to form her "body",
- Two "arms" run out from Gamma (γ) Virginis:
- One through Theta (θ) Virginis to Alpha (α) Virginis (Spica), and
- One through Delta (δ) Virginis to Epsilon (ε) Virginis,
- Two "legs" run out from Zeta (ζ) Virginis:
- One through Tau (τ) to 109 Virginis, and
- One through Iota (ι) to Mu (μ) Virginis.

The French call this constellation "Vierge". An early influence for this constellation may have been the Egyptian asterism Aludra (see Virgins, above).

Virgo Cluster:

This is a cluster of galaxies in the IAU constellation Virgo. Its center is 53.8 million light years away and it extends out to 8° of the cluster's center. Its brightest member is the elliptical galaxy Messier 49. It is part of the Virgo Supercluster, which is 110,000,000 light years across. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), refers to this cluster as the Field of the Nebulae.

Virgo Cluster Pinwheel:

This **telescopic** asterism is Messier 99 (NGC 4254), a grand design spiral galaxy in the IAU constellation Coma Berenices. French astronomer Pierre Méchain discovered it in March 1781. It is listed in the General Catalogue of 1864 as GC 2838 and in John Herschel's catalogue as h 1173. Dreyer lists it in the New General Catalogue of 1888 as "3 branched spiral". It is also known as St. Catherine's Wheel (see below), Rosse's of Coma Berenices (see above), and the Coma Pinwheel (see above).

Virgo Trio:

This **telescopic** asterism is the galaxies NGC 4206, 4216, and 4222 in the IAU constellation Virgo. These were discovered by William Herschel in 1784. These are part of O'Meara 60 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where he lists them as the "Virgo Trio" and as the "Stairway to Heaven".

Virtue:

This Korean asterism "Deog" (덕) is a line of two stars in the IAU constellation Ursa Minor: RR Ursae Minoris and HIP 74605.

Visazhar:

This Belarussian asterism is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009). The etymology of this name is uncertain: It may have come from the archaic Russian word "viss" which was a plant from which a valuable stain for fabrics was obtained. Compare this to Velisazar (below).

Viscera of the Lion:

This Arabic star "Al Aḳtāb al Asad" is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed by Persian astronomer Zakariya al-Qazwini (1203 – 1283) and in R. H. Allen's *Star Names* in 1899. Compare this to Liver of the Lion (above).

Vishnu:

This Vedic star "Vishnu" is Delta (δ) Orionis (Mintaka) in the IAU constellation Orion (Vahia 2014). Vishnu is part of a Hindu trinity with the Gods Shiva and Brahma. The God Vishnu is the preserver and sustainer of life.

Visožary:

This Belarussian name "Visožary", "Visyžár", "Visažár", "Visažór", "Wosożary", "Wosozhary", "Vysažar", "Vesežar", "Olosozar", and "Vysožar" is used for:

- The Pleiades cluster in the IAU constellation Taurus (Avilin2009, 2018).
- Rarely, the IAU constellation Ursa Major (Avilin 2018).
- Rarely, the name Vyshezar is used for the IAU constellation Ursa Minor (Avilin 2009).

NOTE: This name has many meanings depending on the region, including “tall man”, “high tree”, and even “name of a bird”.

Vizier of the God Baba:

This Babylonian star “Lamassatu” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Vlahÿtje:

This Chakavian asterism is the Pleiades cluster in the IAU constellation Taurus.

Vlasiežjełišči:

This Slavonic asterism “Vlasiežjełišči”, “Vlasožjelišti”, “Vlasožjelca”, “Vlasožjelci”, “Vlasožjelcъ”, “Vlasožlć”, “Vlasožileščˇ”, “Vlasožilišči”, “Vlasie”, or “Vlasiežjeliščiis” the Pleiades cluster in the IAU constellation Taurus (Avilin 2018). The meaning of this word is uncertain.

Voice of Joy:

This Hawaiian asterism “Me’e” is a “box” of four stars (which is the four stars of the IAU constellation Corvus) in the Hawaiian star line “Ka Iwikuamo’o” (see Bone Back Lizard above): Beta (β) Corvi (Kraz), Delta (δ) Corvi, Gamma (γ) Corvi and Epsilon (ε) Corvi. The name is borrowed from the Marquesas Islands: The Polynesians call this “Mere”, “Meremere”, or “Melemele”.

This Micronesian asterism “Serepwen”, “Soropuel”, or “Sarapori” is identical to the Hawaiian asterism Me’e (above).

This Rapanui asterism “Mere” is possibly the same as the Hawaiian asterism above or possibly the star Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Edwards and Edwards 2016, Edwards 2018).

This Tahitian asterism “Mere” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Edwards 2015).

Void:

This Chinese xing guan “xu” (虛） was mentioned in the *Shangshuyaodian* (尚书尧典 *Canon of Yao* of the Book of Documents- 2300 B.C.E.), a collection of political documents from the legendary Emperor Yao. It is the stars Alpha (α) Aquarii (Sadalmelik) and Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius.

Volans:

None of the stars of Volans are brighter than 4th magnitude and its stars only show up in 21 asterisms in this handbook.

This IAU constellation (IAU abbreviation Vol), the flying fish, was one of twelve constellations created by Flemish uranographer Petrus Plancius (1552 – 1627) from the observations of the Dutch navigators Peiter Dirkszoon Keyser (1540 – 1596) and Frederick de Houtman (1571 – 1627). De Houtman called it “de Vlieghende Visch” (“the flying fish”) later Latinized to “Piscis Volans” and appearing in later German texts as “Fliegende Fisch”. A celestial globe (late 1597) of Flemish astronomer Petrus Plancius published by Amsterdam cartographer Jodocus Hondius the Elder depicts Volans.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists “Vlieghende Visch” for this constellation and depicts it as a fish in flight.

Dutch historian Paulus Merula (1558 – 1607) listed it as “Hirundo Marina” (“sea swallow”) and “Zeezwaluwe” (“swallowtail”).

Flemish cartographer Jodocus Hondius (1563 – 1612) listed it as “Vliegenden Vis” (“flying fish”) and “Vliedenden Visch”.

Petrus Plancius listed “Vliegenden Vis” on his globe in 1597.

Dutch uranographer Willem Blaeu (1571 – 1638) listed it as “Avis Volucris” (“bird of prey”).

German uranographer Johann Bayer (1572 – 1625) in listed this constellation in his *Uranometria* in 1603 as “Piscis Volans” (“flying fish”) and depicts it as a winged fish.

This constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Piscis Volans” and “Passer Marinus” (“sea sparrow”).

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Piscis Volans” and “Passer” for this constellation.

Robert Hues describes it as the “flying fish” in his *A Learned Treatise of Globes* in 1659.

Edward Sherburne lists it as “Piscis Volans”, “Volucris” or “Volatilis” (“flying”), “Passer Marinus” (“sea sparrow”), and “Hirundo Marina” or “Chelidon Thalassia” (“sea swallow”) in his *Sphere of Marcus Manilius* in 1675.

English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 lists this constellation as “Piscis Volans” and depicts it as a fish with wings.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Piscis Volans” as a flying fish swimming to our right. Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts “Piscis Volans” as a fish. This consists of two triangles of stars connected at the apex, this being the star Epsilon (ε) Volantis:

- One triangle is formed by the stars Alpha (α) and Beta (β) Volantis, and
- One triangle is formed by the stars Gamma (γ) 2 and Zeta (ζ) Volantis,
- One more star line runs out from Epsilon (ε) Volantis to a “tail” at Delta (δ) Volantis.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts Volans as a flying fish with its tail towards celestial south.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, labels this constellation “Piscis Volans” and depicts it as a fish with wings.

“Piscis Volans” is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Piscis Volans as a flying fish.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Piscis Volans” as a flying fish.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Volans as a flying fish.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts this constellation as a winged fish in flight but doesn't label it.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Poisson Volant" as a fish with wings.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Poisson Volant" as a fish with wings.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Fliegende Fisch" and depicts it as a flying fish.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) lists "Piscis Volans the Flying Fish" as a fish with wings.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as "Piscis Volans": He indicates the borders of this constellation on the chart but offers no illustration of it.

English astronomer John Herschel (1792 – 1871) suggested shortening the name to Volans in 1844, noting that Lacaille had abbreviated the name previously and in 1845 Francis Baily included it under this shortened name in his *British Association Catalogue*.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Volans, The Flying Fish" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Volans" and "Piscis Volans" and describes it as a "Flying fish".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Volans" and gives the "original form" as "Piscis Volans".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists the names "Volans" and "Piscis Volans" for this constellation.

Standard IAU charts depict Volans as two interconnected triangles with a line running out from the central star:

- The central star is Epsilon (ε) Volantis, which has a line running out to Delta (δ) Volantis,
- One triangular "wing" is Epsilon (ε), Gamma (γ) 2 and Zeta (ζ) Volantis, and
- One triangular "wing" is Epsilon (ε), Alpha (α) and Beta (β) Volantis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Volans in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a roughly triangular pattern of the stars Beta (β), Delta (δ), Gamma (γ) 2, Zeta (ζ), and Epsilon (ε) Volantis, with a line running out from Beta (β) Volantis to Alpha (α) Volantis.

Sky and Telescope Magazine, founded in 1941, depicts Volans in their magazine and publications as two interconnecting triangles that connect at the star Epsilon (ε) Volantis:

- One consists of the stars Epsilon (ε), Delta (δ), and Gamma (γ) 2 Volantis, and
- One consists of the stars Epsilon (ε), Alpha (α) and Beta (β) Volantis.

A French name for this constellation is “Poisson Volant”.

Volcanic Rock:

This Hawaiian asterism “Pu-lele-hua-kawaewae” is the Coal Sack nebula in the IAU constellation Crucis (see Coal Sack, above).

Volcanus:

This **telescopic** asterism “Volcánus Úrsae Majóris” is the barred spiral galaxy NGC 3079 in the IAU constellation Ursa Major. This was discovered by English astronomer William Herschel in 1790 who listed it as “V 47” in his catalogue. It is GC 1983 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “this edge on galaxy looks like a shield volcano”. Volcanus was a fire God who was the son of Jupiter and Juno. It is also known as the “Phantom Frisbee” (see above).

Volosožar:

This Belarussian asterism “Vołosozár”, “Vałasazar”,” Vałasažár”, “Vałasažary”, “Vałasažaryk”, and “Vielisazar” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Vołosynia:

This Russian name “Vołosynia” is used for:

- The IAU constellation Ursa Minor (Avilin 2018),
- The IAU constellation Ursa Major (Avilin 2018),
- The Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Voluyara:

This German asterism is the IAU constellation Auriga as described by Grimm, which he describes as “stars that ploughmen know” although the meaning is not known.

Vomiting Fire of Virgo:

This **telescopic** asterism “Ignívoma Vírginis” is the spiral galaxy NGC 4388 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 168”. John Herschel listed it as h 1244 and later as GC 2949 and GC 2956 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is the “mouth” of the “Great Galactic Face” (see above).

Voodoo Mask Nebula:

This **telescopic** asterism is the planetary nebula NGC 246 (Caldwell 56) in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. This is listed as GC 131 in the 1846 *General Catalogue*. It is also known as the Skull Nebula and the Soap Bubble Nebula.

Voracious Auspice:

This Arabic asterism from their list of Auspicious Asterisms "sa'd bul'" is called "Voracious Auspice" or "Lucky Stars of the Swallower". It later became the Arabic manzil "Saad Bulaa (see Lucky Stars of the Swallower, above). The Auspicious Asterism version is in the IAU constellation Aquarius and is the stars Mu (μ) Aquarii and Epsilon (ε) Aquarii (Albali). The later manzil adds the star Nu (ν) Aquarii. Dorn (1829) describes this as "Beneficent Star of the Devourer" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

Vortex Galaxy:

See Whirlpool Galaxy.

Vortex of Hydra:

This **telescopic** asterism "Vórtex Hýdrae" is the barred spiral galaxy NGC 5260 in the IAU constellation Hydra. It was discovered by Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Vortex of Ursa Major:

This **telescopic** asterism "Vértex Úrsae Majóris" is the spiral galaxy NGC 2742 in the IAU constellation Ursa Major. William Herschel listed this as "I 249". His son John Herschel listed it as h 550 and later as GC 1750 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Vrsabha:

This Vedic rashi "Vrsabha" or "Vrisab" from the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022) is the IAU constellation Taurus. W. Brennan lists it in his *Hindu Astronomy* in 1896 as "Vrisha".

Vrscika:

This Vedic rashi "Vrscika" or "Vrischik" as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022) is the IAU constellation Scorpius. W. Brennan lists it as "Vrishchica" in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists it as "Vrishchik" and writes that it represents the energy of the God Vishnu.

Vulcan's Star:

This Latin asterism "Vulcani Sidus" is the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899.

Vulpecula:

None of Vulpecula's stars are brighter than 4th magnitude and its stars only show up in 55 asterisms in this handbook.

This IAU constellation "little fox" (IAU abbreviation Vul) was created by the Polish astronomer Johannes Hevelius (1611 – 1687). Hevelius originally called it "Vulpecula cum Anser" or "Vulpecula et Anser" ("the little fox with the goose") in his *Firmamentum Sobescianum, sive Uranografia* (1690) and it was illustrated as a goose in the jaws of a fox.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Vulpecula" as a fox carrying "Anser" the goose in its jaws.

Vulpecula is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: This is depicted as a fox running to our right with a goose in its jaws, this goose representing the asterism Anser (see Goose, above).

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Vulpecula" as a fox running to our right with a goose in its mouth.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Vulpecula" as a fox running to our right with a goose ("Anser") in his mouth.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Vulpecula as a fox carrying a goose (see Goose, above).

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Vulpecula as a fox with a goose in its jaws running to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Le Rénard" ("the fox") as a fox with a goose in its jaws (this being the asterism Anser, see Goose, above): The goose is not labelled. The 1778 edition is the same.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "der Fuchs mit der Gans".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Vulpecula in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a fox with a goose in its jaws, this goose representing the asterism Anser (see Goose, above).

"Vulpecula" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and is depicted as a fox with a goose representing Anser (see Goose, above) but this goose is not labelled.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Vulpecula" as a fox walking to our left with a goose (Anser) in its mouth.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Vulpecula et Anser" as a fox running to our right with a goose in its mouth.

"Vulpecula and Anser" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as a goose in the jaws of a fox: The author is unknown, but it is based on Jamieson's *Celestial Atlas.*

This constellation is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a fox running with a goose (Anser, see Goose above) in its mouth, but only Vulpecula is labelled.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Vulpecula, The Fox" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Vulpecula, the Little Fox".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Vulpecula" in his *Star Atlas* (1893) and describes it as "The Little Fox".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Vulpecula (cum Anser" and describes it as a "Fox with Goose".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Vulpecula".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Vulpecula" and gives the "original form" as "Vulpecula cum Anser".

As you can see, the fox and goose were separated into the constellations Vulpecula and Anser (see Goose above), but they were merged again by the time the IAU accepted this constellation. The name of the "goose" is remembered in the name of Alpha (α) Vulpeculae: Anser.

Standard IAU charts depict Vulpecula as a line of the two stars Alpha (α) Vulpeculae (Anser) and 15 Vulpeculae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Vulpecula in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of the three stars Alpha (α) Vulpeculae (Anser), 15, and 31 Vulpeculae.

Sky and Telescope Magazine, founded in 1941, depicts Vulpecula in their magazine and publications as a line between Alpha (α) Vulpeculae and 13 Vulpeculae.

An Italian name for Vulpecula is "Volpetta".

Why create a constellation out of such dim stars at all? Centuries ago, medieval astronomers were interested in the "houses" in which the Sun rose or set as they indicated the month of the year. During the Middle Ages, the Sun rose and set in Vulpecula at the time of the Summer Solstice.

In the 1st century Egyptian Zodiac of Dendera a fox is depicted with the neck of a hawk (wearing the Pschent crown, a Sun symbol) above its head, with a long straight plow beneath: As Vulpecula is next to the straight shaft of the IAU constellation Sagitta, and has the IAU constellation Cygnus, the swan, on the other side.

Vultur Volans:

See Aquila, above.

Vulture:

This Greek lunar mansion is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). The stars have not been identified.

This Mayan asterism "Ch'oom" represents a bird, possibly a vulture, and is made up of stars of the IAU constellations Aries and Cetus: Alpha (α) Ceti (Menkar), Gamma (γ) Ceti, Nu (ν) Ceti, Mu (μ) Ceti, Xi (ξ) Ceti, and 31 Arietis.

This Barasana star "Yuka" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Hugh-Jones 2006). This star announced the raiding season.

This Latin asterism "Vultur" is the IAU constellation Aquila as listed in John Hill's *Urania* in 1754.

This Tupi asterism "Urubu" is the IAU constellation Corvus (De Freita Mourão 2009).

This **telescopic** asterism is in the IAU constellation Camelopardalis and was listed in *Pattern Asterisms* by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 609. One "wing" of it is the asterism Kemble's Cascade (see Cascade, above). The other "wing" is the line of stars from HIP 18505 through HIP 17891A, 17587, 17296, and 16789. Size 140' X 20'.

Vulture Head Nebula:

This **telescopic** asterism is the reflection nebula LBN 777 in the IAU constellation Taurus. It is also known as the Baby Eagle Nebula.

Vulture Head of Virgo:

This **telescopic** asterism "Gypódes Vírginis" is the spiral galaxy NGC 5254 in the IAU constellation Virgo. It was discovered in 1836 by John Herschel who listed it as h 3527 and later as GC 3621 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the southeastern arms extends like a hook, making the whole galaxy look like the head of a vulture, the hook being the beak, the nucleus being an eye."

Vultus Irrisorie:

See Smiley Face, above.

W:

The stars of the IAU constellation Cassiopeia form a bent letter "W" in the middle of the stream of the Milky Way which is used by amateur astronomers for star hopping. Left to right, the stars are Epsilon (ε) Cassiopeiae (Segin), Delta (δ) Cassiopeiae (Ruchbah, Ksora or Ruchar), Gamma (γ) Cassiopeiae (Navi or Cih- 89th brightest star), Alpha (α) Cassiopeiae (Shedar or Shedir- 70th brightest star) and Beta (β) Cassiopeiae (Caph or Al Sanam al Nakah- 73rd brightest star). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this asterism as "an inverted chair". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., tells us the five brightest stars of Cassiopeia "form a W-shape".

This asterism, "Little Cassiopeia", is Corder 4669 in the IAU constellation Lacerta and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes this asterism to John Raymond. Size 300' X 60'. This is the stars Beta (β), Alpha (α), 4, 5, and 2 Lacertae.

There are eleven **telescopic** "W" asterisms:

- One that is a miniature version of the "W" of the IAU constellation Cassiopeia, Kemble 2 in the asterism list of RASC member Father Lucien Kemble (1922 – 1999), is found in the IAU constellation Draco between the stars Mu (υ) and Chi (χ) Draconis. The stars are between magnitude 7 and 8 and the three middle stars are HIP 91121, 91163, and 91039. Size 30' X 30'. This is Harrington 25 on the asterism list of American astronomer Phil Harrington, who calls it "Little Queen". Jeffrey Corder lists it as Corder 3604.
- One "Little Cassiopeia" is between the constellations Vulpecula and Sagitta near the Poodle Cluster (see Poodle above). It is made up of the stars 12, 13, 14, 16, and 17 Vulpeculae.
- One is Sánta 23, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "pentagon of 5 stars, like Kemble 2 asterism, 8 – 9 [magnitude]" in the IAU

constellation Camelopardalis. This is Corder 1266 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20'. This includes HIP 34605, 34503, and 34472.

- One, "Little W", is Leiter 8 from the list of American astronomer Frank Leiter is in the IAU constellation Cassiopeia and includes HIP 4407, 4305, 4237A, and 4155. Its size is 35' X 15'.
- One is "little Cassiopeia", Alessi J0022.7+5417 in the IAU constellation Cassiopeia. This is listed on Bruno Alessi's BDCC 7.6 list. This is a group of five 8th – 9th magnitude stars. It is listed on the Irish Federation of Astronomical Societies site by Myck (2015), who notes that Finnish amateur astronomer Jaakko Saloranto (2013) believes that Johann Elert Bode listed it as Bode 2 in 1777 in his *Astronomisches Jahrbuch*. René Merting lists it on the *Faint Fuzzies* website as DS ES 42. Merting writes: "visible at 45x, but not distinctive because there are many stars of the same brightness in the vicinity - at 111x the celestial W becomes clearer, and the components of the DS ES 42 are clearly separated from each other."
- One is Corder 4978 in the IAU constellation Andromeda and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 55' X 45'. Includes HIP 117588 and 117582.
- One is the French asterism Ferrero 19 in the IAU constellation Taurus: This is beside 136 Tauri and includes HIP 27686, 27629, 27613, and 27605**.**
- One is in the IAU constellation Draco and is Corder 4046 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 11th magnitude stars.
- One is in the IAU constellation Pegasus and is Corder 4738 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is five 8th – 10th magnitude stars.
- One is open cluster NGC 225 in the IAU constellation Cassiopeia, which was discovered by English astronomer Caroline Herschel in 1784. It is GC 120 in John Herschel's 1864 *General Catalogue*. It was English astronomer Thomas William Webb that described it as "somewhat like the letter W" in the 5th edition of his *Webb's Celestial Objects for Common Telescopes* in 1893. American astronomer Tom Lorenzin also describes it as a "W" in his *1000 + The Amateur Astronomer's Field Guide to Deep Sky Observing*. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) also describes this as "somewhat W shaped".
- This is also known as the "Broken Heart" (see above), the Igloo (see above), and the "Sailboat" (see below).

Waagan:

This Wiradjuri star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Mathews 1904, Grant and Rudder 2000). Variations include "Wakend", "Wagan", and "Wahn".

Waar:

This Mursi star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers, above). They used it as part of a system to tell when the local Omo River would flood.

Waburri:

This Wardaman star is Mu (μ) 2 Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Wachmann's Flare Star:

This **telescopic** flare star is V371 Orionis in the IAU constellation Orion (magnitude 11.50). It is named after German astronomer Arno Arthur Wachmann (1902 – 1990).

Wagahn:

This Bundjalung star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Sharpe 1978).

Waggoner:

This English asterism is the IAU constellation Auriga as listed in Robert Hues' *A Learned Treatise of Globes* in 1659 and in John Hill's *Urania* in 1754. American uranographer William Croswell (1760 – 1834) depicts "Auriga the Waggoner" on his *Mercator Map of the Starry Heavens* in 1810 as a beaded male viewed from behind: He is wearing a turban, has a goat on his left shoulder, and holds reins in his right hand. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "waggoner" as a name for Auriga. Compare this to Carter, above.

This German asterism "Roh" is the IAU constellation Auriga as listed by German astronomer Johann Bayer (1572-1625).

Wagon:

This Babylonian asterism from the MUL.APIN tablets "MAR.GÍD.DA" (Anthony 1996), "Eriqqu" (Anthony 1996), or "Ereqqu" (Hunger and Pingree 1989) is the Big Dipper asterism in the IAU constellation Ursa Major, see Big Dipper, above. It appeared in later Seleucid star lore.

This Chaldean asterism "mul.mar.gid.da" (Koch-Westenholz 1995) from the Great Star List (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Sumerian asterism "mulmar-gíd-da" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Akkadian asterism "e-req-qu" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Assyrian asterism "MAR.GID.DA" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). It appears in the from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul mar.dig.da". Compare this to the Babylonian asterism "MULMAR.GÍD.DA.AN.NA" (see Wagon of Heaven, below).

This Greek asterism "Amaxa" ("Ἅμαξα" = "ama" = "together with" and "axa" = "axle") is the is the IAU constellation Ursa Major and is found in the 8th century B.C.E. poet Homer's *Iliad and Odyssey* (Guglielmino, Cipolla, and Giudice 2017). Homer writes of how Odysseus must sail "keeping the Bear on his left hand" to sail east, indicating that it was in use for navigation in his time:

- Aratus (315 – 240 B.C.E) called Ursa Major the "wain like bear".
- Robert Hues lists "Amaxa" as "wagon or chariot" in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne also lists "Aganna" for Ursa Major in his *Sphere of Marcus Manilius* in 1675, citing the French scholar Joseph Justus Scaliger (1540 – 1609), who was citing Hesychius of Alexandria (5th or 6th century).

- This constellation appears in John Hill's *Urania* in 1754 as "Amaxas", "Amaxa", and "Aganna" and Hill associates these names with Ursa Minor as well, describing these as "Arabic" names for this constellation. However, the source is actually Greek: 5th century grammarian Hesychius of Alexandria who called it "Ἄγαννα" ("Áganna"), an archaic form of "ἄγειν" ("ágein" or "to carry"), which is a reference to its being seen as a wagon or cart.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "the Waggon (sic)" as an alternate name for the Big Dipper asterism and describes the three stars of the handle of the Dipper as "three horses".
- R. H. Allen lists it in his *Star Names* in 1899 and while he mentions Hesychius' use of "Aganna", Allen also suggests that it is an Akkadian name for this asterism, which seems to be a reference to the Babylonian asterism "MULMAR.GÍD.DA.AN.NA" (see Wagon of Heaven, below).

This Hindu asterism is the Hyades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

This Hebrew asterism "Ajala" is the Big Dipper Asterism in the IAU constellation Ursa Major as described by Jewish scholar Abraham ibn Ezra (1089 – 1167) and as listed in R. H. Allen's *Star Names* in 1899.

This Italian asterism "Carro" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

This German asterism "Wagen" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Wagon of Heaven:

This asterism from the Babylonian MUL.APIN tablets "Margiddaanna" or "MULMAR.GÍD.DA.AN.NA" is the head of the IAU constellation Draco: Xi (ξ) Draconis, Gamma (γ) Draconis, Beta (β) Draconis (Rastaban), and 24 Draconis (Hunger and Pingree 1989). The "wagon yoke" is a line out to Delta (δ) Draconis. This appears in later Seleucid sky lore. Compare this to the Assyrian asterism "MAR.GID.DA" (see Wagon, above).

This Babylonian asterism "MAR.GÍD.DA.AN.NA" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Ursa Minor.

According to Diogenes Laërtius (180 240), citing Callimachus (3rd century B.C.E.), and Thales of Miletus (620 – 545 B.C.E.), this Phoenician asterism "Phoinikē" was the Little Dipper asterism in the IAU constellation Ursa Minor (Belmonte Esteve 2018). R.H. Allen lists this in his *Star Names* in 1899. As a result, the Greeks later named it the Phoenician Bear (see above).

Wagon of Parrhasis:

This Latin asterism is " is the Big Dipper Asterism in the IAU constellation Ursa Major as listed by the 5th century Gaulish poet and diplomat Sidonius Apollinaris and is a reference to a region in southern Arcadia. It is listed in R. H. Allen's *Star Names* in 1899.

Wagon Pole:

This Saxon asterism "Wænes Thīsl" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Wagon Star:

This Norse star “vagnstjarna” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Wagulin:

This Yaegl star is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion (Morelli 2012).

Waimariwi:

This Yolgnu star “Waimariwi” is a star in the Pleiades cluster in the IAU constellation Taurus (Fuller & Bursill 2021). Garangal is the older of a mythical pair of Wagalag or Wauwalak sisters, daughters of the Djanggawul (important ancestors) who got pregnant by the “wrong men” and were tracked down and punished by the serpent Julunggul by being placed in the sky. The other sister is Boaliri (see above).

Wain:

This Hobbit asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) and appears in *The Hobbit* and *The Fellowship of the Ring* by J. R. R. Tolkien (1892 – 1973).

Wainman:

This English asterism is the IAU constellation Auriga.

Waist Cloth:

There are two Arabic stars with the name “loin cloth” or “waist cloth”:

- One, “’al-Marāqq” (المراقّ), is the star Epsilon (ε) Boötis in the IAU constellation Boötes:
    - This was later latinized to “Mirak”, “Micar”, “Mirar”, “Merer”, “Meirer”, “Mezen”, “Mezer”, and “Merak”.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Mirár, Merer, and Meirer of the Alphonsine [sic] Tables, subsequently changed to Mirac and Micar”.
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Mirach”.
    - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Mirac” and “Mirach” for this star.
- One, “’al-Marāqq” (المراقّ), is the star Beta (β) Andromedae in the IAU constellation Andromeda, later latinized to “Mirach”:
    - The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists “Miracandro” which suggests this star, but the location given is for Alpha (α) Cassiopeiae (Schedar) in the IAU constellation Cassiopeia (Dekker 2000).
    - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Mirach”.
    - Johann Bayer’s *Uranometria* (1603) lists “Mirach” and “Mizar” for this star.
    - “Mirach” is listed for this star in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
    - A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) simply labels this star “Andromeda”.
    - The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) labels this star “Mirach”.

- John Hill gives it the names “Mizach”, “Mizaz”, and “Mizath” in his *Urania* in 1754.
- Variations include “Mirac, “Merach”, “Mirar”, “Mirath”, “Mirax”, and “mirat”, the latter coming from the *Alfonsine Tables* of 1521 which listed the name “super Mirat” which is from “super mizar” found in some translations of the *Almagest*.
- Johann Elert Bode‘s *Vorstellung Der Gestirne* (1782) lists this star as “Mirach“.
- English astronomer William Henry Smyth (1788 - 1865) listed the name “Mirae”, which R. H. Allen describes as “a typographical error” in Allen’s *Star Names* in 1899.
- Allen points out that the name “Mirae” for Beta (β) Ursae Majoris is used by John Chilmead in his *A Learned Treatise on Globes*, 1889, which was a translation of the Latin work by English geographer and mathematician Robert Hues (1553 – 1632): Actually, the name listed by Hues is “Mirach”.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Mirach”.
- American uranographer William Croswell (1760 – 1834) lists “Mirach” on his *Mercator Map of the Starry Heavens* in 1810.
- American uranographer William Croswell (1760 – 1834) lists this star as “Mirach” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Mirach” in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as “Al Mirach”.
- “Mirach” is listed in *Urania’s Mirror* in 1852.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Mirach, from the mantle or apron around her” and lists “Mirae” as a variation found in the *Alfonsine Tables*. Smyth also lists “Mizár, girdle” as a name given to this star by French scholar Joseph Justus Scaliger (1540 - 1609).
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as “Mirach”.
- This star is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Mirac”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. German astronomer
- Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Mirach”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Mirach” and “Mizar”. Elsewhere in this atlas Proctor gives the name “Mizar” as a name for Zeta (ζ) Ursae Majoris.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Mirach”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Mirach” and translates it as “Loins”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Mirac”, “Mirach”, and “Izar” for this star, but his 14th edition (1959) lists this star as “Mirach” and “Mizar”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Mirach”.
- The IAU approved the name Mirach for Beta (β) Andromedae in 2016.

- NOTE: In his *Urania* in 1754, John Hill gives the name “Mara” and “Al Mara” as an “Arabian name” of the IAU constellation Andromeda, which is clearly a reference to Mirach. Hill does not provide a translation.

This Greek star “ζώνη” or “Zóni” (“waistband”) is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda as described by Hipparchus (190 – 120 B.C.E.) and by R. H. Allen in *Star Names* in 1899.

Waitā:

This Māori star, “Waitā”, is in their asterism “Matariki” (See Chief’s Eyes, above) which is the Pleiades cluster in the IAU constellation Taurus (Harris et al 2013).

Waiti:

This Māori star, “Waiti”, is in their asterism “Matariki” (See Chief’s Eyes, above) which is the Pleiades cluster in the IAU constellation Taurus (Harris et al 2013).

Waiyungari:

This Ngarrindjeri asterism is made up of the stars of the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Tau (τ) Scorpii, and Sigma (σ) Scorpii. Waiyungari and his two wives escaped his brother Nepeli by climbing his spear into the sky (Hamacher 2017). Compare this to the Boorong asterism “Djuit” (see Red-Rumped Parrot, above). One version of the story (Clarke 2009) has Waiyungari and his brother throwing spears into the sky. Compare this to Two Ancestors, above.

Wake of the Fine Pickaxe:

This Rapanui asterism “Ko Toe Ko Peu Renga” is the stars Alpha (α) Aurigae (Capella) and Beta (β) Aurigae (Menkalinan) in the IAU constellation Auriga (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). The Edwards note that Renga is also translated as “energy” or “to paint something yellow or red (sacredness)”.

Walborn's Star:

This **telescopic** Wolf–Rayet star BAT99-6 in the Large Magellanic Cloud in the IAU constellation Dorado. It was named after Nolan R. Walborn. This binary system is a slash star and an O-type main sequence star.

Waling:

This Wardaman star is Upsilon (υ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Wall:

This Chinese xiù (lunar mansion) “Bìxiù” (壁宿) is a line of two stars in the IAU constellation Andromeda: Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Andromedae (the determinative star). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Dong Bi” was associated to matters concerning the Bingzhou territory. This appears in the Tang Dynasty (618 – 907 C.E.) as “Bì” (壁) and is compared to the Vedic nakshatra Uttara Bhadrapada (Kotyk 2017, see Second of the Blessed Feet, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Japanese sei shuku or lunar station “Naname Boshi” is a line of two stars forming one side of the Great Square of Pegasus in the IAU constellation Pegasus (see Great Square, above): Delta (δ) and Gamma (γ) Pegasi.

Wanderer of Leo Minor:

This **telescopic** asterism “Vágus Leónis Minóris” is the edge-on spiral galaxy NGC 3432 (Arp 206) in the IAU constellation Leo Minor. This was discovered by English astronomer William Herschel in 1787 who listed it as “I 172” in his catalogue. It is GC 2238 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its “rather irregular and loose shape”. It is also known as the “Knitting Needle” (see above).

Wandering Alone of Draco:

This **telescopic** asterism “Obvolúta Dracónis” is the field dwarf spiral galaxy NGC 6503 in the IAU constellation Draco. It was discovered by Arthur von Auwers in 1854. It is GC 4351 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because O’Meara had named it the Lost in Space Galaxy (see above).

Wang Liang:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Wangiang” is in the IAU constellation Cassiopeia. It is a fan of four star lines radiating out of the determinative star, Beta (β) Cassiopeiae (Caph), representing a charioteer, with the star at the end of each representing a “Tiansi” (“Celestial Horse”): Zeta (ζ) Cassiopeiae, 18 Cassiopeiae, Eta (η) Cassiopeiae, and Gamma (γ) Cassiopeiae. Nearby is their asterism “Ce” (see Whip, below).

This Chinese xing guan “Wángliáng” (王良) is a quadrilateral of stars in the IAU constellation Cassiopeia: Beta (β) Cassiopeiae (Caph), Kappa (κ) Cassiopeiae, Eta (η) Cassiopeiae, Alpha (α) Cassiopeiae (Shedar), and Lambda (λ) Cassiopeiae.

This Chinese Chenzhuo xing guan “Wángliáng” is made up of stars of the IAU constellation Cassiopeia: From a central star Beta (β) Cassiopeiae (Caph) four lines run out:

- One line runs to Gamma (γ) Cassiopeiae,
- One line runs to Eta (η) Cassiopeiae,
- One line runs to Alpha (α) Cassiopeiae (Shedar), and
- One line runs to Zeta (ζ) Cassiopeiae.

Wanggii:

This Euahlayi asterism is the stars Eta (η) and Sigma (σ) Ursae Majoris in the IAU constellation Ursa Major (Fuller et al 2014).

War and Peace Nebula:

See Lobster Nebula, above.

War Dance of Ursa Major:

This **telescopic** asterism "Pýrrhiche Úrsae Majóris" is the interacting spiral galaxies UGC 8335 (Arp 238) in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the spectacular scene of these two wildly interacting galaxies with their long tidal arms".

Waratwi Palms:

This Palikur asterism is the stars Alpha (α) Canis Majoris (Sirius) and Alpha (α) Carinae (Canopus) and represent the Waratwi (Tucumã) Palms.

Warbuck:

This Hungarian asterism "Hadabuka" is depicted as a buck deer walking on the celestial map of Hungarian uranographer Sandor Nagy (1915). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Wardens:

This asterism is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899. Allen does not identify the culture involved.

Warehouse of Sky:

This Korean lunar mansion "Wii" is a triangle of stars in the IAU constellations Aquarius and Pegasus: Theta (θ) and Epsilon (ε) Pegasi and 34 Aquarii.

Warinehn:

This Bundjalung asterism "Warinehn" or "Warinihygan" is the Pleiades cluster in the IAU constellation Taurus (Sharpe 1978).

Warrdirrg:

This Wardaman star is 27 Tauri in the Pleiades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Warrior:

This Chinese asterism "Shen" (参) appeared in the *Xia Xiao Zheng* (夏小正 *Small Calendar of the Xia Dynasty*) which dates to the 21st to 17th century B.C.E. and appears in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.) and is the IAU constellation Orion. It appears in the Tang Dynasty (618 – 907 C.E.) and is compared to the Vedic nakshatra Ardra (Kotyk 2017, see Moist One, above). Shen is a great hunter or warrior.

This Northern Andean asterism "Ana Jaramillo de Velasteguí" ("the warrior" or "the man with a spear" or "the dancer") is roughly a triangular shape made up of stars of the IAU constellations Cassiopeia and Cepheus (Quinatoa 2018): The corners are the stars Delta (δ) Cassiopeiae (Ruchbah), Iota (ι) Cephei, and Iota (ι) Cassiopeiae. He is holding the "arrow" Jorge Trujillo (see Arrow, above).

Warrior of the Sky:

This Elvish (Qenya) asterism “Telumehtar” is the IAU constellation Orion. Telumehtar is the “heavenly swordsman” from the works of J. R.R. Tolkien (1892 – 1973).

Wasat:

See Middle, above.

Wasp:

This asterism “Vespa” was created by German astronomer Jakob Bartsch (1600 – 1633) using the stars of the IAU constellation Aries: 33, 35, 39, and 41 Arietis: it appears in his *Planisphaerium Stellatum* (1613). It is also known as the Northern Fly (see above), or Apis (see Bee, above). Bartsch labelled it “Apes” and “Vespa Beelzebub, deum muscarum” (“Beelzebul, the god of flies”). Edward Sherburne lists this as “Vespa” or “Apes” in his *Sphere of Marcus Manilius* in 1675.

Wasp Nest:

This Tupi Guarani asterism “Vespeiro” is the Pleiades cluster in the IAU constellation Taurus. Compare this to their asterism Eixu (see Seven Bees, above).

Wasp Waist Cluster:

This **telescopic** asterism is the open cluster NGC 6633, discovered by Swiss astronomer Jean-Philippe Loys de Chéseaux in 1745-6 in the IAU constellation Ophiuchus. English astronomer Caroline Herschel rediscovered it in 1783 and her brother William Herschel listed it as VIII 72. It is GC 4410 in the *General Catalogue* of 1864. It is also known as the Captain Hook Cluster (see Captain Hook, above), the Otter and Ball (see above), the Tweedledum Cluster (see Tweedledum and Tweedledee, above), and “Kermit the Tadpole” (see above).

Wasteland:

See Empty Place, above.

Watcher:

This Arabic star “al-raqib” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. Compare this to Spear of the Spear Bearer (above). This appears in the calendar of Qushayr as it is positioned above the Unarmed High One (see below).

This Bedouin (Hayel region) star “al-Reqīb” (الرقيب) is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Watching Over Dorado:

This **telescopic** asterism “Ephorásis Dorádus” is the galaxy ESO 119-027 (PGC 16130) in the IAU constellation Dorado. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this galaxy “this system consists of a foreground spiral galaxy and an earlier type background galaxy [which give] the impression that the former is being watched over by the latter”.

Watchtower:

This Korean lunar mansion “Ru” is a line of three stars in the IAU constellation Aries: Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan), and Gamma (γ) 1 Arietis.

Water:

This Aztec asterism is made up of the stars of the IAU constellations Canis Minor, Orion, and Gemini.

This Greek star "Υδωρ" or "Hydor" is Lambda (λ) Aquarii in the IAU constellation Aquarius. In his *Star Names* in 1899 R. H. Allen claims that it received this name from Aratus (315 – 240 B.C.E) and the 5th century Greek philosopher Proclus.

This asterism is the part of the sky which includes Aquarius, Capricornus, Cetus, Delphinus, Eridanus, Hydra, Pisces, and Piscis Austrinus. In his *Star Names* in 1899 R. H. Allen wrote that "Euphratian astronomy" in this region referred to this part of the sky as "the Sea".

This asterism "Muau" or "Mũ", latinized to "Monius", is the IAU constellation Aquarius as described by Jewish scholar Abraham ibn Ezra (1089 – 1167) and listed in R. H. Allen's *Star Names* in 1899.

This Greek asterism "Aqua" is made up of stars in the IAU constellation Aquarius and was described by Aratus (315 – 240 B.C.E). In his *Star Names* in 1899 R. H. Allen reports that Aratus called this "the Water": It starts at Gamma (γ) Aquarii and runs through Zeta (ζ), Eta (η), Lambda (λ), Psi (ψ), and 94 Aquarii to 98 Aquarii and includes Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus and Beta (β) Ceti (Diphda) in the IAU constellation Cetus. This constellation is mentioned in the Leiden *Aratea* (816). "Aqua" is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius. Compare this to Pouring Forth of Water, above.

This Persian asterism "Vaht" is the stars Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Algenib) as listed by R. H. Allen in his *Star Names* in 1899. Allen vaguely translates this as "something pertaining to water".

This Sogdian asterism "Bath" is the stars Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Algenib) as listed by R. H. Allen in his *Star Names* in 1899. Allen vaguely translates this as "something pertaining to water".

This Khorasmian asterism "Farshat Bath" is the stars Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Algenib) as listed by R. H. Allen in his *Star Names* in 1899. Allen vaguely translates this as "something pertaining to water".

Water Animal:

This **telescopic** Nahuatl star "Axólotl" is HIP 118319 (HD 224693) in the IAU constellation Cetus (magnitude 8.22). It was given this name in the IAU NameExoWorlds Campaign. It has an exoplanet named Xólotl ("animal") and Aztec deity associated with the evening star.

Water Bearer:

This asterism is the IAU constellation Aquarius as listed in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus and in John Hill's *Urania* in 1754. Compare this to Water Carrier, below.

Water Boa:

There are three Carib "Suluiuyuman" or "Suluiu" (Water Boa) asterisms:

- One is made up of stars of the IAU constellations Ophiuchus and Scorpius (Magaña, and Jara, 1982). As its head rises in the east, Siritjo (the Pleiades) sets in the west.
- One is made up of stars of the IAU constellations Orion and Taurus. The Hyades cluster forms the "head". The "body" runs down through Pi (π) 1, 2, 3, 4, 5, and 6 Orionis. As its head rises in the east, Siritjo (in this case stars surrounding Alpha (α) Persei (Mirfak)) set in the west.
- One is made up of stars of the IAU constellations Andromeda, Auriga, Camelopardalis, Cassiopeia, Lacerta, Perseus, and Taurus: The "head" is the Hyades cluster in Taurus. The "body" runs through Auriga, Camelopardalis, and Cassiopeia, with the "tail" being Lacerta.

This Arawak asterism "Camudi" is made up of stars of the IAU constellations Ophiuchus and Scorpius (Magaña, and Jara, 1982).

Water Bringer:

This Greek star "Ὑδραγωγόν" or "Ydragogón" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by the Greek philosopher Plutarch (c.46 – 119).

Water Bucket:

This Greek asterism "Ὑδρεῖον" ("Ydreíon") or "Ἀργεῖον" ("Argeíon") is the IAU constellation Crater.

This Turkish asterism "Kugha" is the IAU constellation Aquarius as listed in R. H. Allen's *Star Names* in 1899.

Water Carrier:

This Greek asterism "῾Υδροχόος" ("῾Ydrochóos") is the IAU constellation Aquarius as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest* (2nd century). It appears on the Daressy Zodiac of the Roman Imperial Period as a water carrier next to an ibis.

This Hebrew asterism "D'li" or "Delī" is the IAU constellation Aquarius as listed in their list of constellations of the zodiac (mazzaroth) in their Talmud. John Hill lists this as "Deli" in his *Urania* in 1754, as does Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 and R. H. Allen in his *Star Names* in 1899. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Delle".

This Syrian asterism "Daulo" is the IAU constellation Aquarius as listed in John Hill's *Urania* in 1754 and Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

This Persian asterism "Dol", "Dūl", or "Dul" is the IAU constellation Aquarius as listed in John Hill's *Urania* in 1754 and R. H. Allen's *Star Names* in 1899.

This Saxon and German asterism "der Wassermann" is the IAU constellation Aquarius as listed in Johann Elert Bode's *Vorstellung Der Gestirne* (1782). "Der Wassermann" is also found in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Wassermann". See Aquarius, above.

This Italian asterism "Il Aquario" is the IAU constellation Aquarius.

This French asterism "le Verseau" is the IAU constellation Aquarius.

Water Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Aquarius as “Shuǐ qì zhī shén” (水器之神) or “water deity” (Kotyk 2017).

Water Droplet:

There are two **telescopic** “water droplet” asterisms:

- One is the open cluster Kronberger 36 in the IAU constellation Cygnus. Size 6’ X 6’. René Merting describes it on the *Faint Fuzzies* website: “At 72X stars are visible against a slightly milky background- at 160X there are a good 8 stars that seem to make up the cluster, with two brighter ones to the north and east- the cluster appears like a water droplet, tip to the east”.
- One is Ennis 16 in the IAU constellation Gemini listed by Canadian astronomer Charles Ennis. Size 25’. This starts at the star HIP 30723 and runs around through Gaia DR3 3376148829316130048, Gaia DR3 3376633655367374976, HIP 30723, HD 45209, HD 45323, HD 257564, Gaia DR3 3376433156151688704, Gaia DR3 3376150650382256896, and Gaia DR3 3376148279561590016. Part of the loop is Corder 1096 (see “U” below).

Water Drawer:

This Arabic asterism “Sakib al Ma” is the IAU constellation Aquarius:

- “Sākib al-Mā’” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name for Aquarius (Hafez 2010).
- “Sakib al Ma” is listed in John Hill’s *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Sákib el má, the water drawer”.

Water Drawer of Virgo:

This **telescopic** asterism “Haústor Vírginis” is the spiral galaxy NGC 5426 (Arp 271) in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “II 309”. It became GC 3750 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy and its neighbour NGC 5427 are connected with a bridge of material.” A Haustor is someone who draws water from a well.

Water Eyes:

This This Mapuche asterism “Menoko” is the Magellanic Clouds (Menares 2008, Catricheo 2022). It is also known as Water Wells (see below).

Water Flea of Crater:

This **telescopic** asterism “Longiróstris Cratéris” is the spiral galaxy IC 2627 in the IAU constellation Crater. It was discovered by Lewis Swift in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the long spiral arms at the western side of the galaxy”. They note that “the galaxy shows some apparent resemblance with the water flea Bosmina Longirostris”.

Water Goanna:

This Wardaman star “Gudja” is Kappa (K) Serpentis in the IAU constellation Serpens. This is a type of lizard. The IAU approved the name Gudja for Kappa (K) Serpentis.

Water Jar:

This German Y-shaped asterism “Uma”, “Urna”, or “Urn” in the IAU constellation Aquarius was created in 1596 by the German uranographer Zacharias Bornmann. It is made up of four stars, with Zeta (ζ) Aquarii (Sadaltager) at the center, the faintest, Pi (π) Aquarii (Seat) at the upper right of the "Y", Eta (η) Aquarii at the lower left and Gamma (γ) Aquarii (Sadachbia) is at the lower right. Urna is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Urna is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661. John Hill lists this asterism as “Urn” in his *Urania* in 1754 and R. H. Allen mentions it in his *Star Names*. English poet John Keats (1795 – 1821) mentions it in his *Endymion*. Jeffrey Corder lists it as Corder 4679. This name was listed in August 2021 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/). NOTE: “Urna” also appears as a name for the constellation Crater.

Water Jug:

This Norwegian asterism “Vannkannen” is in the IAU constellation Aquarius. It is the stars Lambda (λ), Eta (η), Kappa (κ), and Zeta (ζ) Aquarii.

Water Level:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of five stars in the IAU constellation Gemini: 68 Geminorum (the determinative star), 74 Geminorum, 81 Geminorum, HIP 38394 and 85 Geminorum.

This Chinese xing guan “Shuǐwèi” (水位) is a quadrilateral of stars in the IAU constellation Cancer: Zeta (ζ), 6, 8, and 11 Cancri.

This Chinese Chenzhuo xing guan “Shuǐwèi” is a line of five stars in the IAU constellations Cancer and Gemini: Mu (μ) Cancri, 85 Geminorum, HIP 38394, 81 Geminorum, and 74 Geminorum.

Water Lily Nebula:

This **telescopic** asterism is protoplanetary nebula IRAS 16594-4656 (PN G340.3-03.2) is in the IAU constellation Ara.

Water Pitcher:

This Vedic rashi “Kumbha” as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Bhagwath 2019) is the IAU constellation Aquarius. The Chinese phonetically translated “Kumbha” from the Vedic *Candragarbha-parivarta* in 566 as “Jiupan” (Kotyk 2017). W. Brennan lists it as “Cumbha” in his *Hindu Astronomy* in 1896. Bhagwath writes that it represents the energy of the God Pushya.

This Tibetan khyim “Bumba” is the IAU constellation Aquarius (Johnson-Groh 2013).

Water Pot:

This Suku Bali asterism “Kumba” is the IAU constellation Aquarius.

Water Pourer:

This Persian asterism “Al Sākib al Mā” is the IAU constellation Aquarius as listed by Zakariya al-Qazwini (1203 – 1283) and listed in R. H. Allen’s *Star Names* in 1899.

This Saxon asterism “se Waeter-gyt” is the IAU constellation Aquarius as described by English translator John of Trevisa in 1398 and listed in R. H. Allen’s *Star Names* in 1899. John wrote: “The Sygne Aquarius is the butlere of the goddes and yevyth them a water-potte.”

Water Serpent:

This asterism is the IAU constellation Hydra as listed in John Hill’s *Urania* in 1754. Compare this to Water Snake, below.

Water Slide:

This large Western asterism is a “river” of stars between magnitude 3 and 4 that runs roughly between the star Delta (δ) Aquilae (Almizan) in the IAU constellation Aquila to the area around the star Beta (β) Ophiuchus (Cebalrai) in the IAU constellation Ophiuchus.

Water Snake:

This German asterism “Wasserschlange” is the IAU constellation Hydra as depicted in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Wasserschlange” and depicts it as a snake with a forked tongue. “Wasserschlange” appears in the the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this as “Wasserschlange” and “Hydrus”.

Compare this to Water Serpent, above.

Water Star:

This !Xõ star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

Water Truck:

This American asterism is the IAU constellation Ursa Major and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). The “handle” of the Big Dipper asterism is the water coming off of the back of the truck and the “bowl” of the dipper plus the stars which make up the front of the “bear” have become the truck.

Water Wells:

This Mapuche asterism “Rüŋaŋko” or “Rügagko” is the Magellanic Clouds (Menares 2008, Catricheo 2022). This is also known as Water Eyes (see above).

Water Wheel Star:

This Yucatec asterism “Noria Ek” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Waterbug:

This **telescopic** asterism is NGC 5033, a spiral galaxy in the IAU constellation Canes Venatici. This was discovered by English astronomer William Herschel in 1785 who listed it as "I 97". It is GC 3459 in the *General Catalogue* of 1864.

Waterfall:

This **telescopic** asterism Sánta 119, listed in 2009 by Hungarian astronomer Sánta Gábor, is a 1.5-degree long cascade of stars in the IAU constellation Crater. It starts at HIP 55081 (HD 98046) near Phi (ϕ) Leonis and runs through a series of 9 – 10th magnitude stars. Gábor describes it as "HD 98046 cascade = waterfall/magic fountain, ast. Of 1.5 deg NE-SW, equal 10m, started from Phi (ϕ) Leo."

Waterfall Nebula:

This **telescopic** asterism is nebula is Herbig-Haro 222 (HH-222) in the Orion Molecular Cloud in the IAU constellation Orion. It is located within the Thirteenth Pearl Nebula (see above). This name is posted in the Deep Sky Forum by American astronomer Howard Banich in February 2022: Banich refers to an earlier post in 2013.

Waterholes:

This Mocoví asterism "Temal" or "Los Pozos" is the Magellanic Clouds (Lopez 2021).

Waters:

This Seleucid asterism "NAGAR" (see Crab, above) or "A.MES" ("waters"). in tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Cancer (Foxvog 1993).

This Hindu star "Āpa", or "Āpas" is Delta (δ) Virginis in the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899.

Watery:

This Greek asterism "Hydrochoüs" or "Hydrochous" is the IAU constellation Aquarius as listed by 1st century B.C.E. Roman consul Quintus Lutatius Catulus and appears in John Hill's *Urania* in 1754. The Roman general Germanicus (15 B.C.E. – 19 C.E.) named it "Hydrochoös". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Hydrochoos".

Watery Fish:

This Latin asterism "Piscis Aquosus" is the IAU constellation Piscis Austrinus as listed by the Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.).

Watery Trigon:

This astronomical asterism is the IAU constellations Cancer, Pisces, and Scorpius.

Wattle:

This Australian star "Wattle" is the G8V star WASP-19 in the IAU constellation Vela. It received this name in the IAU's NameExoWorlds competition in 2022. Wattle is a genus of approximately 1000 shrubs and trees in Australia. It has an exoplanet WASP-19b, "Banksia", which is a genus of Australian wildflower.

Waty Bekety:

This ancient Egyptian asterism is the IAU constellation Crux.

Waved Flag:

This **telescopic** asterism is Hahn 1 in the IAU constellation Canis Major. Christoph Hahn discovered this between Alpha (α) Canis Majoris (Sirius) and Messier 41. in February 2023 while searching for galaxy NGC 2283: It reminded him of a waved flag. Robert Zebahl describes it on his *Faint Fuzzies* website as "a short cascade of stars of 7th to 8th magnitude, complemented by a star of 9th magnitude, and to the west of it two more stars of 7th and 8th magnitude.

Waves of Heaven:

This French asterism is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899. Allen attributes it to "Carmarden, in his Rouen edition of 1515" and writes that he derived it from Anglican theological writer Edmund Becke's "Vaynes" ("heaven's wagon" c. 1550): This would likely be Richard Carmarden (d. 1603), a Surveyor of Customs for London, although Carmarden paid for a printing of the Bible in English in Rouen in 1566 and wrote *Caveat for the Quene* in 1570, which is much later than the date given by Allen.

Waving Gingerbread Man:

This Canadian **telescopic** asterism is made up of stars of the IAU constellation Boötes. Canadian astronomer Tommy Stam in Laval, Quebec recorded this asterism in the process of searching for carbon star TYC 3483-1327-1 on 15 June 2025. Here is his description:

- Head: HD 138302
- Neck: SAO 45564
- Chest: HD 138438
- Stomach: SAO 45577
- Carbon Star "belly button: TYC 3483-1327-1
- Left Side facing us:
    - Shoulder: HD 138213
    - Elbow: HD 137629
    - Hand: HD 137257
    - Upper leg: SAO 45582
    - Knee: SAO 45574
    - Foot: HD 138421
- Right side facing us:
    - Shoulder: HD 138556
    - Elbow: HD 138802
    - Wrist: GAIA DR3 1401787375916193792
    - Hand: GAIA DR3 1401037818223420160
    - Upper Leg: SAO 45587
    - Knee: HIP 76045
    - Foot: HD 138819

Wawaiya:

This Carib asterism is the Pleiades cluster in the IAU constellation Taurus (Magaña, and Jara, 1982). Wawaiya is the wife of Serikoai. Wawaiya ran off with a tapir. Serikoia chased them caught the tapir and ate all of it except its head. Wawaiya and the tapir's head (the Hyades) ran up into the sky where Serikoai chases them.

Way:

This stars of this Toba asterism "Tojo" are unidentified at present (Gómez 2011).

Wayakka:

This unidentified Kaurna asterism was listed by Hamacher in 2015.

Wazn:

See Weight, below.

We:

This **telescopic** Pitkern star "Uklun" ("we" or "us") is HIP 57291 (HD 102117) in the IAU constellation Centaurus (magnitude 7.45). This name was given to this star in the IAU NameExoWorlds campaign. It has an exoplanet named Lelsullun: Lekl Sullun means "child" in this language.

Weak:

This Rapanui asterism is the Hyades cluster in the IAU constellation Taurus (Edwards 2016). It is also known as "the Sprout from Hiva" (Hiva being the Rapanui homeland) or "the Twins".

Weakest:

This asterism "Debilissima" is described by R. H. Allen in his *Star Names* in 1899 as "three very much fainter [stars], two of which, of the 13th magnitude" between the stars known as the Double Double (see below), first listed by English astronomer John Herschel in 1823.

Wealth Restorer:

This Vedic moon station in the IAU constellation Gemini consists of the stars Alpha (α) Geminorum (Castor, who they call "Aditi") and Beta (β) Geminorum (Pollux- who they call "Diti").

Wealthiest:

This Vedic asterism is a circle of stars of the IAU constellation Delphinus: Beta (β) Delphini (Rotanev), Delta (δ) Delphini, Zeta (ζ) Delphini, 9 Delphini and 12 Delphini.

This Tibetan gyukar (lunar house) "Mon Gre" or "Möndre" (Johnson-Groh 2013) is in the IAU constellation Delphinus and is the star Beta (β) Delphini (Rotanev).

Wealthy:

This Vedic nakshatra (lunar mansion) "Revatī", "Revati", or "Rewati" is the star Zeta (ζ) Piscium in the IAU constellation Pisces. This has also been translated as "cause to thrive", "transcendent", or "wealthy" (Dillon 2018) and even "preposterous". Compare this to the Vedic asterisms Wealth Restorer (see below), and the Vedic and Myanmar asterisms Wealthiest (see below). Ivanković (2021) lists this as "Revatī" and relates it to the Vedic solar God Pusan or Pushan, who is the God of meeting, marriages, journeys, roads, and the feeding of cattle and was a psychopomp conducting souls to the

afterlife. Ivanković notes that some texts list the stars Alpha (α) Piscium (Alrescha) and Eta (η) Piscium for this asterism. In 2019 Leitz lists "Revati" as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies this as "the star Piscium": Of course, Piscium is a suffix which could apply to any star in Pisces. Later Leitz has the maharshi Parasara listing Alpha (α) Piscium (Alrescha) or Zeta (ζ) Piscium and the *Brhat Samita* listing 32 stars, while other texts only one. W. Brennand lists this as "Revati" in his *Hindu Astronomy* in 1896 and translates this as "a smaller sort of tabor". Bhagwath (2019) lists its symbols as either a pair of fish or a drum. In 2017 the IAU approved the name Revati for the star Zeta (ζ) Piscium A.

This Myanmar nekkhat (lunar mansion) "Yewati" (ဧရာဝတီ) is the star Zeta (ζ) Piscium in the IAU constellation Pisces.

This Tibetan gyukar (lunar house) "Nam Gru", "Namdru", or "Shesa" is the star Zeta (ζ) Piscium in the IAU constellation Pisces (Johnson-Groh 2013).

Weapon:

There are two Latin asterisms with the name "Telum":

- One is the IAU constellation Sagitta:
    - The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) lists "Telum" for this constellation and depicts it as an arrow with a double barbed head.
    - The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Telum" as an arrow in flight overlapping Aquila's right wing.
    - Jesuit German mathematician Christopher Clavius (1538 – 1612) lists "Sagitta sive Telum" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
    - In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Sagitta seu Telum" ("Sagitta or Telum") as a fletched arrow.
    - Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602) lists "Sagitta sive Telum" ("an arrow or a weapon") for this constellation. "Telum" is listed as an alternate name for Sagitta in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Telum" as a name for this constellation.
    - The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Sagitta sive Telum" for this constellation.
- One is the IAU constellation Sagittarius:
- 5th century polymath and writer Martianus Minneus Felix Capella lists "Telum" as a name for Sagittarius.
- Johann Bayer's *Uranometria* (1603) lists "Telum" as a name for Sagittarius and attributes it to Capella.

Wearing a Thin Belt of Cetus:

This **telescopic** asterism "Angusticlávia Céti" is the spiral galaxy NGC 1032 in the IAU constellation Cetus. It was discovered in 1783 by English astronomer William Herschel who listed it as "II 5". It became GC

581 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name as due to its thin dust lane.

Weasel:

The stars of this Kogi asterism "Hibixa" are currently unidentified (Kelley & Milone 2011).

Weather Change:

This Arabic manzil "Al-Ṣarfah" (الصرفة), "Al-Surfah", "ʾAṣ-Ṣarfah" (ٱلصَّرْفَة) or "As-Sarfa", translated as "change to colder weather", "weather change", or "star of weather change" is the star Beta (β) Leonis (Denebola) in the IAU constellation Leo:

- This asterism was listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050).
- "al-Sarfa" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "dhanab al-asad al sarfā" and the Hebrew name "zenav ha-ari" for this star.
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-sarfa" (see Weather Change, below) and the Hebrew name "zenav ha-aryeh".
- This asterism was listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449)
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-sarfa" (see Weather Change, below) and the Hebrew name "zenav ha-aryeh".
- This asterism was listed in the calendars of Qushayr and Qays, the morning setting of Weather Change marks the end of rainy spring weather and the beginning of summer.
- It is listed as "Sarfah" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- Dorn (1829) lists this as "the change" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- W. Brennand lists it as "Al-Serpha" in his *Hindu Astronomy* in 1896 and translates this as "the lion's tail".

This Yemeni manzil "Şarfa" is Beta (β) Leonis (Denebola) in the IAU constellation Leo (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Weaver:

This Korean asterism "Jiggong" (직공) is a triangle of stars in the IAU constellation Lyra: Alpha (α) Lyrae (Vega), Zeta (ζ) 1 Lyrae, and Epsilon (ε) 1 Lyrae. Compare this to the Chinese xing guan "Weaving Girl" (below).

Weaver's Shuttle:

This **telescopic** asterism is NGC 4216, an edge-on intermediate spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 35". It is GC

2806 in the *General Catalogue* of 1864. Admiral William Henry Smyth (1788 – 1865) described it as "a very curious object, in shape resembling a weaver's shuttle". It is also known as the "Spindle of Virgo" (see above), and the "Silver Streak" (see above). This is part of O'Meara 60 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where he lists it as the "Weavers Shuttle" and as part of the "Stairway to Heaven".

Weaving Girl:

This Chinese xing guan "Zhinǚ" (织女) first appeared in the *Xia Xiao Zheng* (夏小正 *Small Calendar of the Xia Dynasty*) which dates to the 21st to 17th century B.C.E.

In the *Yixiangkaocheng* it is a triangle of stars in the IAU constellation Lyra: Alpha (α) Lyrae (Vega), Epsilon (ε) 1 Lyrae, and Zeta (ζ) 1 Lyrae. Compare this to the Korean asterism "Weaver" (above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is a triangle of stars in the IAU constellation Lyra: Alpha (α) Lyrae (Vega), Zeta (ζ) 1 & 2 Lyrae, and Epsilon (ε) 1 & 2 Lyrae.

Weaving Princess Star:

This Japanese star "Orihime Boshi" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Renshaw and Ihara 2001).

Weaving Prongs Stars:

This Japanese asterism "Kase Boshi" is the belt of Orion in the IAU constellation Orion.

Webb's Cross:

This **telescopic** asterism is the open cluster Messier 21 (NGC 6531) in the IAU constellation Sagittarius. This was discovered by Charles Messier in 1764. This was listed in *Celestial Objects for Common Telescopes* by English astronomer and vicar Rev. Thomas William Webb in 1859. John Herschel's *General Catalogue* of 1864 lists it as GC 4367.

Webb's Wreath:

This **telescopic** asterism Webb 2 in the IAU constellation Hercules, also known as Ruby Ring, has golden 7th magnitude star HIP 88348 as the "ruby" on the east side, with a ring of 11th and 12th magnitude stars forming the wreath. This asterism is 2.7 degrees southwest of the star Xi (ξ) Herculis. Size 5' X 5'. This was originally catalogued by English astronomer and Vicar Rev. Thomas William Webb in 1881 in his *Celestial Objects for Common Telescopes*.

Wedded Wife:

There are two stars called "Shi" in the Chinese xiù (lunar mansion) "Dīxiù" (see Root, above) which is made up of stars of the IAU constellation Libra:

- One is the star Alpha (α) 2 Librae (Zubenelgenubi), and
- One is the star Beta (β) Librae (Zubeneschamali).

Wedge Tailed Eagle:

This Boorong asterism “Warepil” is the male wedge-tailed eagle or eaglehawk (Aquila audax) as listed by Stanbridge (1857), Morieson (1999), and Hamacher, Frew (2010), and Fuller et al (2014). It is made up of the stars of the IAU constellations Canis Major and Crux:

- The center star is Alpha (α) Canis Majoris (Sirius), with the “wingtips” being the stars Beta (β) Canis Majoris (Mirzam) and Gamma (γ) Canis Majoris,
- Its “footprint” is the Southern Cross (see Southern Cross, above), and
- Its “nest” is the Coal Sack Nebula (see Coal Sack, above).

This Wotjobaluk star “Warepil” is Alpha (α) Canis Majoris in the IAU constellation Canis Major (Hamacher 2011).

Warepil is the chief of the Nurrumbunguittias and brother to War (see Crow, above). For the female wedge-tailed eagle “Collowgulloric Warepil”, see Female Wedge-Tailed Eagle, above.

This Wardaman asterism “Bullian” is made up of the stars of the IAU constellations Canis Major and Crux (Cairns 1999).

This Wotjobaluk (Wergaia) and Gunditjmara (Marra) star “Warepil” is the star Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus. Hamacher (2011) lists the Wotjobaluk star as Beta (β) Orionis (Rigel) in the IAU constellation Orion.

This Kamilaroi, Euahlayi, Wiradjuri, and Murrawarri asterism “Maliyan” or “Mulliyan-ga” is in the IAU constellations Scorpius and Crux (Fuller et al 2014):

- The end of Scorpius where the star Alpha (α) Scorpii (Antares) is located is the “head”,
- The outstretched “legs” is the stars Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii.
- The IAU constellation Crux is the wings and tail.

NOTE: Ridley listed this as “Mullion” in 1875 and assigned it to Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

This Pirt-Kopan-noot and Kulin star “Gneeanggar" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. Her attendants were the Pleiades cluster (see Six Attendants, above).

This Koori star “Bunjil” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila. His wives are the stars Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (see Black Swans, above).

This Awabakal star “Bibiga” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and represents the wedge tailed eagle or eaglehawk (Needham 1981).

This Darkingjung star “Bibiga” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and represents the wedge tailed eagle or eaglehawk (Needham 1981).

This Kaurna asterism “Wilto” is the IAU constellation Crux (Hamacher 2015).

This Mara and Mopor asterism “Gneeanggar" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Dawson 1881).

This Kokatha asterism “Waljajinna” is the IAU constellation Crux (Leaman, Hamacher, and Carter 2016).

Weekurrk:

This Boorong star is Eta (η) Boötis (Murphrid) in the IAU constellation Bootes (Hamacher 2011). This is one of the children of Marpeankurrk (see Meat Ant, above), the other being Djuit (Alpha (α) Scorpii (Antares), see Red-Rumped Parrot, below).

Weep:

This Korean asterism "Ulda" (울다) is a line of two stars in the IAU constellations Aquarius and Capricornus: Xi (ξ) Aquarii and 46 Capricorni. Their asterism "Sob" is nearby (see above).

Weeping:

This Chinese xing guan "Qì" (泣) is a line of two stars in the IAU constellation Aquarius: Theta (θ) and Rho (ρ) Aquarii (the determinative star). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Qì" is a line of two stars in the IAU constellation Aquarius: Iota (ι) and 38 Aquarii.

Weeping Children:

This Taíno asterism is the Pleaides cluster in the IAU constellation Taurus. These children, abandoned by their mothers, became frogs in the sky. The setting of the Pleiades marked the start of planting of cassava.

Wèi:

This Chinese star "Wèi" from the 3 Kingdoms and Ming Dynasty Period is the star Delta (δ) Herculis in the IAU constellation Hercules and is and is part of their xing guan Heavenly Market East Wall (see above).

Weight:

There are three Arabic stars with this name:

- One, "al-Wazn". (الوزن) is the star Delta (δ) Canis Majoris in the IAU constellation Canis Major:
    - This was later latinized to "Wezen", "Alwazn", "Al Wazor", or "Wezea".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Wezen, al-wezn, weight".
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Wezen".
    - The IAU approved the name Wezen for Delta (δ) Canis Majoris Aa.
- One "al-Wazn" (الوزن) is the star Beta (β) Columbae in the IAU constellation Columba, later latinized to "Wezn" or "Wazn". The IAU has approved the name Wazn for Beta (β) Columbae.
- One, "al-Wazn" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010): He indicates that this is either Alpha (α) Centauri (Rigil Kentaurus) or Beta (β) Centauri (Hadar) in what is now the IAU constellation Centaurus but is not sure which.

This asterism with the Greek name "Στάτηρ" ("Státir") is the IAU constellation Libra as listed by German astronomer Johann Bayer (1572-1625). German astronomer Wilhelm Schickard (1592 – 1635) listed the Arabic name "Wazn" as a name for the IAU constellation Libra.

Weird Globular Cluster:

This **telescopic** asterism is NGC 6712 in the IAU constellation Scutum. It was discovered by English astronomer William Herschel in 1784 and designated H I-47. This name is listed in the *Deep Sky Forum* by American astronomer Mark Friedman in June 2015.

Welcome Mat:

This telescopic asterism is open cluster NGC 2451 in the IAU constellation Puppis. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654 and recorded by English astronomer John Herschel in 1835 who listed it as h 3099. It is GC 1573 in the *General Catalogue* of 1864. American astronomer Phil Harrington describes this on the DOCdb database as forming "a colorful welcome mat to the southern sky". It is also known as the Stinging Scorpion Cluster.

Well:

This Chinese xiù (lunar mansion) "Jǐngxiù" (井宿) is made up of stars of the IAU constellation Gemini. The center is a quadrilateral of stars: Gamma (γ), Zeta (ζ), Nu (ν), and 36 Geminorum. A line runs off each corner to the stars Xi (ξ), Lambda (λ), Epsilon (ε), and Mu (μ) Geminorum (this being the determinative star). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Dong Jing" was associated to matters concerning the Yongzhou territory. This xing guan appears as Jing (井) in the Tang Dynasty (618 – 907 C.E.) and was compared to the Vedic nakshatra Punarvasu (Kotyk 2017, see Two Restorers of Goods, above) and was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Japanese sei shuku or lunar station "Chichiri Boshi" is made up of the lower half of the IAU constellation Gemini. This has a quadrilateral of stars in the center, with the corner stars being Gamma (γ), 18, 36 and Zeta (ζ) Geminorum. From each corner a line protrudes, with the stars Mu (μ), Epsilon (ε), Lambda (λ), and Xi (ξ) Geminorum at the ends.

This Latin asterism "Puteus" ("well" or "pit") is the IAU constellation Ara:

- "Puteus" is listed in the 15th century *Alfonsine Tables*
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Puteus".
- "Puteus" is listed in John Hill's *Urania* in 1754.

This Ukrainian asterism "Krynytsya" (криниця) is the IAU constellation Lyra.

Well-Balanced of Fornax:

This **telescopic** asterism "Isórrhopus Fornácis" is the barred spiral galaxy NGC 986 in the IAU constellation Fornax. It was discovered by James Dunlop in 1826. It became GC 567 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name as it is "well formed".

Well Branched:

This Vedic asterism is a larger version of their nakshatra "Vishākhā" (see Forked, above) made up of stars of the IAU constellation Libra. The center is an irregular diamond of stars: Beta (β) Librae (Zubeneschamali), Alpha (α) Librae (Zubenelgenubi), Sigma (σ) Librae and Iota (ι) 1 Librae. Attached at

Beta (β) Librae is a quadrilateral of the stars Gamma (γ), Theta (θ), and 48 Librae. Attached at Sigma (σ) Librae is two stars which form a triangle: Upsilon (υ) and Tau (τ) Librae.

Well Bucket:

There are two Arabic asterisms with this name:

- One, "ad-dalw" (الدلو) or "Dilu Albir" (دلو البئر). is a quadrilateral of stars (see Great Square of Pegasus above) in the IAU constellations Andromeda and Pegasus and first appeared in the 6th century in the poems of 'Adi b. Zayd. These were leather buckets with crossbars that made their top opening square: "First Spout" or "Front Bucket Mouth": Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) and the "Second Spout" or "Rear Bucket Mouth": Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi.
    - A 14th century Christian Spanish astrolabe #4560 lists "al dalw" (King 2002). Robert Hues (1659) and John Chilmead (1899) list it as "Eldelis": Hues translates this as "bucket to draw water".
    - This is later latinized to "Edeleu" by German astronomer Johann Bayer (1572-1625).
    - R. H. Allen's *Star Names* in 1899 attributes the asterism Well Bucket to the Persian astronomer Ulugh Beg Mirza (1394 – 1449) and gives the name "Al Dalw":
- One, "al-Dalw" is the IAU constellation Aquarius:
    - "al-Dalw", was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name for Aquarius (Hafez 2010).
    - Johann Bayer's *Uranometria* (1603) lists "Edeleu" as a name for Aquarius.
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Edeleu" as an alternate name for Aquarius.

Well Bucket Rope:

There are five Arabic asterisms with the name "ar-Rishā'" (الرشاء), "Al-Rša" (الرشا), or "'Ar-Rashā'" (بَطْنُ):

- One is the star Alpha (α) Piscium in the IAU constellation Pisces and later latinized to "Alrescha", "Al Rescha", "Alrisha", "Alrisha", "Al Rischa", or "Risha":
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Al Rishà, the cord".
    - This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "er risha": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Alrescha".
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star on its chart as "Elrisha".
    - R. H. Allen lists "Al Rescha" in his *Star Names* in 1963.
    - Robert Burnham lists "Al Risha" and translates this as "the cord" in his *Burnham's Celestial Handbook* in 1978 and suggests that this was derived from the "Babylonian Riksu, which also means a cord".
    - The IAU approved the name Alrescha for Alpha (α) Piscium A.
- One is the Arabic or Bedouin manzil "Al-Risha" or "Buṭnu ʾl-Ḥūt" which is the star Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda. It is also known as Belly of the Fish

(see above) and Heart of the Fish (see above). W. Brennand lists this as “Al-Risha” in his *Hindu Astronomy* in 1896.

- Three are differing versions of the “rope” attached to the asterism “Well Bucket” involving a line of stars in the IAU constellations Andromeda and Pegasus running from their asterism Well Bucket (see above) to their asterism “Great Fish” (see above): Two of them run out to Beta (β) Andromedae (Mirach), which is known as the “Belly of the Whale” (see Belly of the Sea Monster, above):
    - One starts with a pair of stars called the “Bucket Rope Knot”: Upsilon (υ) Pegasi and Tau (τ) Pegasi. The line runs from Upsilon (υ) Pegasi through Delta (δ) Andromedae and HIP 4552 ending at” (Khalid Al Ajaji).
    - One includes Alpha (α) Andromedae (Alpheratz), Delta (δ) Andromedae, and Gamma (γ) Andromedae (Adams 2015).
    - Another possible second rope runs from Alpha (α) Andromedae through Pi (π), Mu (μ) and 51 Andromedae (Adams 2015).

Well Bucket Rope Knot:

This Arabic asterism “Saʿd al Naʿamah” is the stars Upsilon (υ) and Tau (τ) Pegasi in the IAU constellation Pegasus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986):

- “Sa’d al Na’amah” is listed in R. H. Allen in *Star Names* in 1899. Allen writes that English astronomer Edward Ball Knobel believed this should be “Al Naʿāim, the Cross-bars over a well” but Allen points out that they were part of the Arabic asterism Well Bucket Rope (see above).

Well for Military:

This Korean asterism “Gundaee Jal” (군대에 잘) in the IAU constellation Lepus is a quadrilateral of stars: Iota (ι), Kappa (κ), Lambda (λ), and Nu (ν) Leporis.

Well Formed Bar of Virgo:

This **telescopic** asterism “Eúdocus Vírginis” is the barred spiral galaxy NGC 5850 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as “II 543”. It became GC 4047 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Well Formed of Lynx:

This **telescopic** asterism “Formósus Lýncis” is the barred spiral galaxy NGC 2326 in the IAU constellation Lynx. This was discovered in 1788 by William Herschel who listed it as “II 734”. It became GC 1486 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Well Formed of Ursa Major:

This **telescopic** asterism “Callimórphus Úrsae Majóris” is the barred spiral galaxy NGC 3992 (Messier 109) in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781. English astronomer William Herschel listed it as “IV 61”. It is GC 2635 in the *General Catalogue* of

1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Vacuum Cleaner" (see above).

Well of Virgo:

This **telescopic** asterism "Púteus Vírginis" is the spiral galaxy NGC 5427 (Arp 271) in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as GC II 310". It became GC 3751 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy and its neighbour NGC 5426 are connected with a bridge of material."

Well Walled of Centaurus:

This **telescopic** asterism "Euteiches Centaúri" is the barred spiral galaxy IC 4214 in the IAU constellation Centaurus. This was first recorded by American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "with an inner ring and an outer pseudo-ring this galaxy can be said to be shielded well".

Well With a Drain:

This Romanian asterism "Perete cu Scurgere", or "Puţul cu Jgheab" is made up of stars of the IAU constellations Andromeda and Pegasus (Lite, Lodina, and Ignat 2018). The "drain" is the Great Square of Pegasus (see Great Square, above). The "stream of water" running into it is the line of stars Gamma (γ) Andromedae (Almaak), Beta (β) Andromedae (Mirach), Delta (δ) Andromedae, and Alpha (α) Andromedae (Alpheratz). Compare to Drain of the Well (see above).

Weluwitraw:

This Mapuche asterism "Weluwitraw", "Welu Wixaw", or "Welu Wixan" is the belt and sword of Orion in the IAU constellation Orion (Menares 2008, Catricheo 2022). Weluwitraw is a traditional Mapuche tug of war sport involving two men with a rope tied to their necks pulling in opposite directions.

West Road:

This Korean asterism "Seojjog Dolo" (서쪽 도로) is a line of four stars in the IAU constellations Libra and Scorpius: Theta (θ) and 48 Librae and Xi (ξ) and Psi (ψ) Scorpii. This shares some stars with the Chinese xing guan "Western Door" (see below).

West Veil Nebula:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as "V 15". It is GC 4600 in the *General Catalogue* of 1864. This is also known as the Filamentary Nebula, Cirrus Nebula, the Orc, or Witch's Broom Nebula.

Westbrook Nebula:

This **telescopic** asterism is protoplanetary nebula CRL 618 in the IAU constellation Auriga. It is named for American astronomer William E. Westbrook (d. 1975).

Western Cross:

This is an alternate Quechua (Misminay) name for their asterism “Calvario Cruz” (see Calvary Cross, above (Urton 1980)).

Western:

This Belarussian asterism “Zahodnia” is one of the stars in the belt of Orion asterism in the IAU constellation Orion (Avilin 2009). The other two stars are known as “Svetovaia” (see World, below) and “Poznia” (see Late, above). I believe that this is Delta (δ) Orionis, which is the westernmost of the three stars.

Western Door:

This Chinese xing guan “Xīxián” (西咸) is a bent line of three stars in the IAU constellations Libra and Scorpius: Xi (ξ) Scorpii, Theta (θ) Librae, and Eta (η) Librae. This shares some stars with the Korean asterism “West Door” (see above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Xīxián” is a bending line of four stars in the IAU constellations Libra and Scorpius: Xi (ξ) Scorpii, 48 Librae, Theta (θ) Librae, and Kappa (κ) Librae.

Western of Sculptor:

This **telescopic** asterism “Occiduális Sculptóris” is the barred spiral galaxy NGC 7513 in the IAU constellation Sculptor. This was discovered by Albert Marth in 1864. This became GC 6131 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it looks “as if this galaxy were deformed by a westward wind, both spiral arms point westward, the northern arm because it extends directly to the west, the other one because it bends westward after an initial eastern orientation.”

Western One in the Tail of the Goat:

This Babylonian “ecliptic asterism” “Mahar sha hi-na Shahū” is the star Gamma (γ) Capricorni in the IAU constellation Capricornus as listed by R. H. Allen in his *Star Names* in 1899.

Westernmost of the Triad of Leo:

This **telescopic** asterism “Triadozephýrius Leónis” is the intermediate spiral galaxy NGC 3623 (Messier 65) in the IAU constellation Leo. It was discovered by Charles Messier in 1780. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is part of the Leo Triad (see above).

Wet Season:

The Quechua and Guaraní both view the rising and setting of the IAU constellation Scorpius as indicators of their wet season.

Wether:

This Latin asterism “Vervex” (“wether” (a castrated ram) or “mutton-head”) is the IAU constellation Aries.

Weyuyuman:

This Carib asterism “Weyyuyuman” or “Wayamaka” is the Southern Cross asterism in the IAU constellation Crux (Magaña, and Jara, 1982).

Wezen:

See Weight, above.

Whadik:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing a 12-year-old child and is part of their asterism “Murabibi” (see Teenagers and Little Ones, above).

Whakaahu:

This Māori asterism is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

Whakaruru-hau:

This Māori asterism “Whakaruru-hau” is the Magellanic Clouds (Orchiston 2017).

Whale:

This Arabic asterism “Alhwat” (الحوت) is the IAU constellation Pisces.

This Latin asterism “Balaena” is the IAU constellation Cetus as listed in the 1515 edition of the *Almagest* as well as the 15th century *Alfonsine Tables* and as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675. Robert Hues lists it as “whale” in his *A Learned Treatise of Globes* in 1659. 4th century Roman astrologer Julius Firmicus Maternus named it “Belua”.

This Dutch asterism “Walvis” is the IAU constellation Cetus and was depicted this way by uranographers Willem Blaeu (1570 – 1630) and Andreas Cellarius (1596 — 1665).

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists the IAU constellation Cetus as “Der Wallfisch“.

This German asterism “Wallfisch” is the IAU constellation Cetus as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Romanian asterism “Balenă” or “Chitul” is the IAU constellation Cetus (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Hawaiian asterism “Kohola” is the IAU constellation Cetus.

This French asterism Baleine is the IAU constellation Cetus.

This Italian asterism “Balena” is the IAU constellation Cetus.

This Kiribati asterism “Kua” or “Buki ni kua” is made up of stars of the IAU constellations Andromeda, Perseus, and Cassiopeia (Trussel and Groves 1978).

This Estonian asterism “Vaal” is the IAU constellation Cetus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

This **telescopic** asterism NGC 4631 (Caldwell 32, Arp 281) is an edge-on barred spiral galaxy in the IAU constellation Canes Venatici. This was discovered by English astronomer William Herschel in 1786 who listed it as "V 42". It is GC 3165 in the *General Catalogue* of 1864. It is also known as the Herring (see above). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Cétus Cánum Venaticórum" ("Whale of Canes Venatici").

Whale's Teeth:

The stars of this Kiribati asterism "Wi n ikura" are currently unidentified (Trussel and Groves 1978).

Whānui:

This Māori star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Wheat Field:

This Phoenician asterism is the stars surrounding the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda, which is their asterism Threshing Floor (see below).

Wheat Sheaf:

This asterism is the IAU constellation Virgo and is listed in John Hill's *Urania* in 1754. Hill describes the Arabs as turning the constellation Virgo into this because "they were forbidden to draw human figures". Compare this to the "ear of grain" which is part of the Greek and Seleucid asterism Maiden (see above).

This asterism is the IAU constellation Coma Berenices as illustrated in the 1488 edition of *De Astronomica* by 1st century Latin author Gaius Julius Hyginus. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists the stars around open cluster Melotte 111 in this constellation as "al huzmeh… a bundle of wood, or corn". Smyth attributes this to "Niebuhr" who "heard it" in Cairo: This is probably Danish German historian Barthold Georg Niebuhr (1776 – 1831).

Wheel:

There are two Egyptian asterisms that are paranatellonta with the name "Trokhos" as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k): One is of the decans of Capricornus and the other of the decans of Gemini and both are Corona Australis.

This French asterism "la Roue" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 –1807) and as listed in R. H. Allen's *Star Names* in 1899.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists the IAU constellation Corona Australis as "Corona Austrina quae et Rota" ("the Eastern Crown or the Wheel")in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

This Belarussian asterism "Matawila" or "Matawilo" ("wheel" or "reel") is either the constellation Perseus or the constellation Orion (Avilin 2009). It is also known as "Traiko" (see Three Times, above), "Karomyselko" (see Small Yoke, above), "Grabli" (see Rake, above), "Kastsy" (see Mowers, above), "Try Karali" (see Three Kings, above), "Kasar" (see Mower, above), "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Tri Siostry" (see Three Sisters, above), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Asilki" (see above), "Kosy" (see Scythes, above), "Kigachi ragachy" (see Shaft of a Plough,

above), “Kryzhe” (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, below).

Wheel of Canis Major:

This **telescopic** asterism “Róta Cánis Majóris” is the barred spiral galaxy NGC 2217 in the IAU constellation Canis Major. John Herschel listed this as 3041 and later as GC 1401 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it is colliding with the smaller IC 2163.

Wheels:

This Belarussian asterism “Kaliosy” is the IAU constellation Ursa Major (Avilin 2009).

This Estonian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006). It is from the island of Saaremaa.

Wheels of Perkūnas:

This Lithuanian asterism “Perkūno Ratai” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). Perkūnas is a Lithuanian God of Thunder.

Whelps of the Hyenas:

This Arabic asterism “awlād al-ḍibā” (أولاد الضّباع) or “Aulād al Dhi’bah” is a triangle of stars in the IAU constellation Boötes: Theta (θ) Boötis, Iota (ι) Boötis, Kappa (κ) 2 Boötis. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Aulád al-dhibá, the young of the hyena”.

Compare this to the asterism Hyenas and Their Youngsters, above.

NOTE: In his *Star Names* in 1899 R. H. Allen lists the stars as Kappa (κ), Lambda (λ), Beta (β), Gamma (γ), Delta (δ), and Mu (μ) Boötis, indicating that he is confusing this with the Arabic asterism Hyenas and Their Youngsters, above.

Where there is Truth:

This Latin star “Veritate” is 14 Andromedae A in the IAU constellation Andromeda and was assigned to this star by the IAU in 2015. It has an exoplanet with the Latin name “Spe” (“hope”)

Where Twins:

This Greek star “Πούς δίδυμων” (“Poús dídymo”) is Beta (β) Orionis (Rigel) in the IAU constellation Orion as listed by 14th century Greek geographer and astronomer Georgius Chrysococcas.

Whetstone:

This Chinese xing guan “Lìshí” (砺石) is a quadrilateral of stars in the IAU constellation Taurus: Phi (φ), Chi (χ), 44, and Psi (ψ) Tauri. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Korean asterism “Susdol” (숫돌) is a line of four stars in the IAU constellations Auriga and Perseus: 53 and 58 Persei and 1 and 2 Aurigae.

This Chinese Chenzhuo xing guan “Lìshí” (砺石) is a bent line of four stars in the IAU constellations Auriga and Perseus: Epsilon (ε) Aurigae, Eta (η) Aurigae, Zeta (ζ) Aurigae, and 58 Persei. The Whetstone was initially placed near the Five Chariots to assist it, aiming to make weapons sharp and achieve victory. After the Song dynasty, the Whetstone moved near the Rolled Tongue, diverging from its original intent.

Which Has Seven Signs:

This Zoroastrian asterism “Haptōiriŋga” is the Big Dipper asterism in the IAU constellation Ursa Major (Panaino 1999). R. H. Allen listed this as “Hapto-iringas” in his Star Names in 1899 and attributed it to English essayist J. F. Hewitt (1835 – 1908). Compare this to Greater Seven Bulls, above.

Whip:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Ce” is the star Kappa (κ) Cassiopeiae in the IAU constellation Cassiopeia.

This Chinese xing guan “Cè” (策) or “Cih” is the star Gamma (γ) Cassiopeiae in the IAU constellation Cassiopeia. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name “Cih” for this star.

This Chinese Chenzhuo xing guan “Cè” is the star Kappa (κ) Cassiopeiae in the IAU constellation Cassiopeia.

This Estonian asterijsm “Piits” is the IAU constellation Eridanus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Whip Bearer of Camelopardalis:

This **telescopic** asterism “Flagéllifer Camelopardális” is the barred spiral galaxy NGC 1530 in the IAU constellation Camelopardalis. It was discovered by German astronomer W. Tempel in 1876. It later became GC 5334 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name is a reference to its northern arms resembling a whip.

Whirligig:

This **telescopic** asterism is NGC 488, a face-on spiral galaxy in the IAU constellation Pisces. It was discovered by English astronomer William Herschel in December 1784, who listed it in his catalogue as “III 252”. It is GC 276 in the General Catalogue of 1864. It is also known as the “Golden Wings”.

Whirling Dervish Nebula:

This **telescopic** asterism is NGC 3247 in the IAU constellation Carina. John Herschel listed this as h 3250 and later as GC 2106 in his *General Catalogue* of 1864.

Whirling of Cetus:

This **telescopic** asterism “Vertigo Céti” is the spiral galaxy NGC 201 in the IAU constellation Cetus. It was discovered in 1790 by English astronomer William Herschel who listed it as III 873. It is GC 102 in the

General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Whirlpool:

This **telescopic** asterism is Messier 51 (NGC 5194), a pair of interacting galaxies in the IAU constellation Canes Venatici. It was discovered by French astronomer Charles Messier in October 1773. Irish astronomer William Parsons, the 3rd Lord Rosse, first recorded its spiral structure in 1845.

- Dreyer describes it in the 1888 New General Catalogue as the "Great Spiral Nebula". It is listed in the 1864 General Catalogue as GC 3572 and in John Herschel's catalogue as h 1623.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the "Spiral or Whirlpool Nebula".
- William Denning's *Telescopic Work for Starlight Evenings* (1891) refers to this asterism as the "Whirlpool" and as the "Spiral Nebula".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns describes it as the "Whirlpool Nebula of Lord Rosse" but also as a "question mark".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Whirlpool galaxy".
- It is also known as the Question Mark Galaxy (see above) and Rosse's Galaxy (due to the aforementioned observations). It is also known as the Vortex Galaxy (see above) and Typhon (see above).

Whirlpool of Aquarius:

This **telescopic** asterism "Díne Aquárii" is the spiral galaxy NGC 6962 in the IAU constellation Aquarius. It was discovered in 1785 by William Herschel who listed it as "II 426". It became GC 4601 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the whirling spiral structure of this galaxy contrasts conspicuously with its elliptical neighbour NGC 6964".

Whirlpool of Lynx:

This **telescopic** asterism "Strómbus Lýncis" is the intermediate spiral galaxy NGC 2776 in the IAU constellation Lynx. It was discovered in 1828 by John Herschel who listed it as h 563 and later as GC 1772 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as to them it resembled a whirlpool.

Whirlwind:

This **telescopic** Luo star "Kalausi" is HIP 47202 (HD 83443) in the IAU constellation Vela (magnitude 8.24). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Buru ("dust").

Whirlwind Spirit:

To the Kamilaroi “Warrawilbaarru”, “Wurrawiburu”, or “Wurrawiberoo” is the whirlwind spirits who live in the IAU constellation Scorpius (Fuller et al 2014). Their hero Byaame or Baayami normally keeps him from coming to Earth, but in September he comes out of one of three holes (dark nebulae) in Scorpius during September and doesn't go back until around March. Two of these “dark spots” in the sky are identified by the Kamilaroi as being either side of the star Alpha (α) Scorpii (Antares) and one inside of the loop of the “fishhook” of Scorpius next to the star Zeta (ζ) Scorpii. Barnard 41, 43, 44, and 45 are on one side of Antares but on the other side there are no dark nebulae, though the stars are sparser in this area. There are several small dark nebulae inside the “fishhook”, including Barnard 48, 58, and 263 and SL (Sandqvist and Lindroos) 26 and 28. During this time, Warrawilbaarru is on earth as the "willy willy" (whirlwinds or dust devils) and can be dangerous to children and uninitiated men.

This Euahlayi asterism “Wirrawilburro”, “Wirrawillburroo”, or “Wilbaarr” is identical to the Kamilaroi asterism above.

Whirly Arms of Cetus:

This **telescopic** asterism “Helicobrachiátus Céti” is the spiral galaxy NGC 895 in the IAU constellation Cetus. This was listed as “II 438” by William Herschel and became GC 518 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its appearance.

Whisper:

This Chinese Chenzhuo xing guan “Fù'ěr” is the star Sigma (σ) 2 Tauri in the IAU constellation Taurus. It is part of their xing guan “Net”.

Whisper (Vassal of Net):

This Chinese xing guan “Fù'ěr” (附耳(附毕宿)) is the double star Sigma (σ) 1 and 2 Tauri in the IAU constellation Taurus, attached to the end of the Chinese xiù (lunar mansion) Net (see above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Whistle Nebula:

This **telescopic** asterism is HII region NGC 2359 (SH 2-298. RCW 5, LBN 1041, Ced 94b) in the IAU constellation Canis Major surrounding the Wolf Rayet star WR7. Size 10’ X 15’. It was discovered by English astronomer William Herschel in 1785 who listed it as “V 21” in his catalogue. It is GC 1511 in the *General Catalogue* of 1864. American astronomer Mark Birkmann writes in the DOCdb database that “without a filter it was obvious how this object got the name the whistle. With the OIII filter the body of the whistle became the helmet”. It is also known as the “Duck Nebula”, the “Duck Head Nebula”, the “Flying Eye Nebula”, the “Bust Silhouette”, “M”, the “Fan”, or “Thor’s Helmet”.

White Armed of Antlia:

This **telescopic** asterism “Leucólena Ántliae” is the spiral galaxy NGC 3269 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3264 and later as GC 2128 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

White Bone Snake:

See Skeletal Snake, above.

White Bull:

This English asterism is the IAU constellation Taurus as listed by Geoffrey Chaucer (c.1340s – 1400) in *Troilus and Criseyde*. It is derived from the Latin name "Candidus Taurus" (see Taurus, above).

White Cockatoo:

This Wardaman star "Menggen" or "Menngen" is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Cairns and Harney 2003). The stars surrounding Fomalhaut are "Mulyan", the feathers of the bird and "Kalioba", the kapok tree in which the bird is sitting (Cairns 1999). Compare this to the Boorong asterism "Gellarlec" (see Rose Cockatoo, above).

White Cockatoos:

The Euahlayi asterism "Mouyi" or "Mooyi" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Clarke 2014). They are following the Minggah (see Spirit Tree, above) across the sky.

This Kamilaroi asterism "Mouyi" is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus. An alternate name is "Murai" (see Sulfur-Crested Cockatoos, above).

This Wiradjuri asterism "Mouyi" is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (McKeown 1938).

White Crane:

The stars of this Tupi Guarani asterism "Jaburú" are unidentified at this time (Lima and De M. Figueirôa, 2007).

White Emperor:

This Chinese star "Baidi" from the Three Kingdoms to Ming Dynasty is HIP 57320 in the IAU constellation Leo and is part of their xing guan Seats of the Five Emperors (see above).

White Eyed Pea Nebula:

This **telescopic** asterism is the planetary nebula IC 4593 in the IAU constellation Hercules. It got this name as it appears as a green disk with a white central star. This name was posted on the *Deep Sky Forum* in August 2018 by American astronomer Paul Aisling.

White Face of Lepus:

This **telescopic** asterism "Álbifrons Léporis" is the barred spiral galaxy NGC 1832 in the IAU constellation Lepus. It was discovered in 1785 by British astronomer William Herschel who listed it as "II 292". It became GC 1043 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of its "disordered shape".

White Fork:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

White-Grey Horse:

This Kazakh asterism “Aqbozat” is the star Beta (β) Ursae Minoris (Kochab) in the IAU constellation Ursa Minor. Aqbozat and Kökbozat (Kochab and Gamma (γ) Ursae Minoris) represent two horses constantly circling “Timir Qazyq” (“Iron Pole”) which is Polaris.

White Hawk:

This Shaawanwaki star is Alpha (α) Boötis in the IAU constellation Boötes and is the husband of the star Alpha (α) Coronae Borealis (Alphecca) which is one of their Celestial Sisters (see above).

White of the Eye:

- This Arabic star “Al Hawar” is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major: “Al Hawar” was listed by 16th century Arab astronomer Al Tizini.
- English orientalist Thomas Hyde (1636 – 1703) latinized this to “Al Haur”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al hawar, intensely bright”.
- “Al Hawar” was listed in R. H. Allen’s *Star Names* in 1899. Allen writes that Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed it as “Al Haun”.

White One:

This Arabic star is Alpha (α) Cephei (Alderamin) in the IAU constellation Cepheus.

White One of Heaven:

This Egyptian star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003). Compare to Neith (above).

White Owls:

This Kamilaroi asterism “Nungu” is the stars Eta (η) and Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major as listed by William Ridley in 1875.

05 23 -69 45

White Ox:

This is the Large Magellanic Cloud in the IAU constellation Dorado as listed by Persian astronomer Abd al Rahman al Sufi in 964.

White Patched Nearby:

This Chinese xing guan “Fùbái” (附白) is a line of two stars in the IAU constellation Hydrus: Gamma (γ) and Nu (ν) Hydri. Nearby is the xing guan “White Patches Attached” (see below).

White Patches Attached:

This Chinese xing guan “Jiābái” (夹白) is a line of three stars in the IAU constellation Reticulum: Alpha (α), Eta (η), and Theta (θ) Reticuli. Nearby is the xing guan “White Patched Nearby” (see above).

White Rose:

There are two **telescopic** "white rose" asterisms:

- One is PGC 6240, a galaxy in the IAU constellation Hydrus.
- One is open cluster NGC 7789, a **telescopic** asterism in the IAU constellation Cassiopeia. This is also known as Caroline's Rose for English astronomer Caroline Herschel, who discovered it in 1783 (see above). John Herschel listed it as ""VI 30". John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864. It's loops of stars and dark lanes look like rose petals. Size 16' X 16'. It is also known as the Ghost Cluster, Star Mist Cluster, Herschel's Spiral Cluster, the Crab Cluster, and the Screaming Skull Cluster. This is listed on Robert Zebahl's *Faint Fuzzies* website as the "White Rose".

White Sea Swallow:

This Hawaiian star "Pira'etea" is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus. This is a new name as the original was lost and was influenced by the Polynesian star Pira'etea (see below). This is one of the three stars of the Navigator's Triangle (see above).

This Polynesian (Society Islands) star "Pira'etea" is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus. They also call it "Ta'aurua-i-te-ha'apara'a-manu" ("festivity of the ascending bird"). In Polynesian mythology Pira'e was the pet bird of Ra'i-tupua, the Sky Builder.

White Star:

This Chaldean star "ul-babbar" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

This Skidi star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Krupp 1983). They considered it to be one of the four pillars of heaven.

White Tailed Bird:

This Kiribati star "Ngutu" or "Nei te Ngutu" is currently unidentified (Trussel and Groves 1978). It is related to their asterism Bonobonon Ne Ngutu (see above). This bird is Phaethon lepturus dorotheae.

White Throne:

This Welsh asterism is made up of the stars of the IAU constellation Hercules (Freer 2004).

White Winged Man:

The stars of this Ahtna asterism are unidentified at present (Cannon 2021).

Whiti-kaupeka:

This Māori star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

Who Can Be United of Eridanus:

This **telescopic** asterism "Sociábilis Erídani" is the spiral galaxy NGC 1241 (Arp 304) in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as "II 286". It became GC 654 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to it having a companion, NGC 1242. NGC 1242 was listed by William Herschel as "III 591" and became GC 655 in the *General Catalogue* of 1864

Who Has a Hundred Servants:

This Zoroastrian star “Satauuaēsa” is probably Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus (Panaino 1999). Panaino notes that formerly this was often identified as Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus.

Who Has Seven Horns:

This Zoroastrian asterism “Hapta.srū” is the Little Dipper asterism in the IAU constellation Ursa Minor (Panaino 1999).

Who Holds the Urn:

This Latin asterism “Urnam qui tenet” is the IAU constellation Aquarius and is listed in R. H. Allen’s *Star Names.* Allen attributes it to the Roman poet Decimus Magnus Ausonius (310 – 395).

Who Plays:

The stars of this Kiribati asterism “Na Karanga” (“who plays” or “who dances”) are unidentified at present (Trussel and Groves 1978).

Who Scribbled on my Galaxy?

This **telescopic** asterism is NGC 4753, a lenticular galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in February 1784 who listed it as “I 16”. It is GC 3273 in the *General Catalogue* of 1864. It is noted for the distinct dust lanes around its nucleus. Astronomer Rick Johnson was processing an image of this galaxy and exclaimed “Who Scribbled on my Galaxy?” The name stuck. It is also known as the Dust Devil.

Wichakihuyapa:

This Lakota asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Wicker Basket:

This Lithuanian asterism “Kašikutis” is the Pleiades open cluster in the IAU constellation Taurus.

Wide Lodging Area:

This Korean asterism “Neolb-eun Sugbag Myeonjeog” (넓은 숙박 면적) is a shallow curve of stars in the IAU constellations Cassiopeia and Cepheus: Eta (η) Cephei, Alpha (α) Cephei (Alderamin), Xi (ξ) Cephei, and Iota (ι) Cephei, HIP 113864, Omicron (ο) Cephei, and 50 Cassiopeiae.

Wide One of Dorado:

This **telescopic** asterism “Láta Dorádus” is the lenticular galaxy NGC 1553 in the IAU constellation Dorado. It was discovered in 1834 by John Herschel who listed it as 2630 and later as GC 838 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Widow:

This asterism is the IAU constellation Andromeda. She appears as “Andromada” in the works of Iranian astronomer Abu Rayhan Al Bīrūnī (973 – c.1050), described as “mulier qui non vidit maritum” (“woman who did not see her husband”). German astronomer Johann Bayer (1572 – 1625) lists this in his Uranometria (1603) as “Carens Omnino viro” (the modern translation of this being “completely unemployed man”). In his *Star Names* in 1899 R. H. Allen lists “Carens Omnino Viro” and attributes it to Bayer. She appears as “Asnade” in 10th century Arab astrologer Abū l-Ḥasan 'Alī ibn Abī l-Rijāl al-Shaybani (also known as Haly) commentaries on the *Tetrabilbos*. This appears in the *Berlin Codex* as “Ansnade et est mulier quae non habet vivum maritum” (“Ansnade is a woman who has no living husband”). This is later corrupted to “Alarmalah” (“the Widow”).

Widow Before Marriage:

This Bugis asterism “Bintoéng balu Mandara” (“Mandar widow-before marriage”) is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major.

Widowed Before Marriage:

This Bugis asterism “Bintoéng Balué” (“the widowed-before-marriage”) is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Widow’s Oven:

This Babylonian asterism “IM.SHU.RIN.NA” or “tinuru” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified.

This Chaldean asterism “mul im.su.rin.na.al.ma.nu.u” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Widow’s Web Cluster:

This asterism is the open cluster NGC 7790 in the IAU constellation Cassiopeia. This was discovered by English astronomer William Herschel in 1788 who listed it as “VII 56”. It is GC 5032 in the *General Catalogue* of 1864.

Wife of Bel:

This Babylonian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Wife of Centaurus:

This **telescopic** asterism “Gýne Centaúri” is the lenticular galaxy NGC 4373 in the IAU constellation Centaurus. It was discovered in 1834 by John Herschel who listed it as h 3391 and later as GC 2928 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because “this galaxy is the female partner (according to our gender rules) of the pair with IC 3290. They named IC 3290 “Small Husband of Centaurus” (see above).

Wife of Makali’i:

This Hawaiian asterism “Na Wahine-o-Makali’i”, also known simply as “Makali’i’” (“chief’s eyes” or “little eyes” or “little stars”) is the Pleiades cluster in the IAU constellation Taurus.

Wife of the Hunter:

This Chukchi asterism is made up of stars of the IAU constellation Leo (Berezkin 2005). It is related to their asterism Hunter (see above).

Wife of White Hawk:

This Shaawanwaki star is Alpha (α) Coronae Borealis (Alphecca) and is the wife of their hunter White Hawk (see below).

Wild:

This asterism "Fera" is the IAU constellation Lupus. the Roman general Germanicus (15 B.C.E. – 19 C.E.) called it "Fera" ("wild").

- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this constellation as "Fera" and depicts it as a wolf being speared by Centaurus.
- "Lupus" is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a wolf being speared by Centaurus with the subtitle "Fera".
- This constellation appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as "Fera" and is depicted as a wolf being speared by Centaurus.
- The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Fera as a beast speared in the mouth by Centaurus.
- The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Fera in the same manner as Dürer et al.
- Johann Bayer's *Uranometria* (1603) lists "Fera" for this constellation.
- Lupus is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch with the alternate names "Fera" and "Bestia".
- John Hill lists Fera" as a name for Lupus in his *Urania* in 1754 and translates it as "wild animal".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this constellation as "Fera Lupus".

Wild Asses:

This Arabic asterism is an oval of stars in the IAU constellations Aquarius, Cetus, and Pisces: Delta (δ) Aquarii, Omega (ω) 2 Aquarii, Iota (ι) Ceti, 27 Piscium, 20 Piscium, Lambda (λ) Aquarii, and Tau (τ) Aquarii.

Wild Beast:

This Arabic asterism "al-Sab" (السبع) is the IAU constellation Lupus:

- "al-Sab'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- John Hill lists this as "Sebu" in *Urania* in 1754.
- John Chilmead lists this as "Al Subahh" in his *A Learned Treatise on Globes* in 1889
- Compare to Wolf, below and Beast, above.

Wild Boar:

This Gaulish asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Ottescu 2009).

Wild Boar's Jaw:

This Suku Bali asterism is the Hyades cluster in the IAU constellation Taurus. The Suku Bali call Alpha (α) Tauri (Aldebaran) "Suda Malung" (See Eye of the Pig, above).

This Meratus Dayak asterism "Ra'ang Bayi", also known as "Baka" (Maguindanao, Tiruray, Teduray), "Jekat" (Semelai) is the Hyades cluster in the IAU constellation Taurus (Jaafar and Khairuddin 2019).

This Palawan asterism "Sangat at Bjak" is the Hyades cluster in the IAU constellation Taurus (Jaafar and Khairuddin 2019, Santos et al 2019).

Wild Cockerel:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Yeji" is the star Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major. It is in the middle of their xing guan Market for Soldiers (see above).

This Chinese xing guan "Yějī" (野鸡) is the star Nu (ν) 2 Canis Majoris in the IAU constellation Canis Major. In an earlier version of this xing guan, this star was a perimeter star of their xing guan Market for Soldiers.

This Chinese Chenzhuo xing guan "Yějī" is the star Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major.

Wild Duck:

This **telescopic** asterism is the open cluster Messier 11 (NGC 6705) in the IAU constellation Scutum. It was discovered by German astronomer Gottfried Kirch in 1681. It is listed in John Herschel's General Catalogue of 1864 as GC 4437. The name Wild Duck Cluster" came from retired British admiral and amateur astronomer William Henry Smyth (1788 – 1865), who wrote that this cluster "somewhat resembles a flight of wild ducks" as its brighter stars form a triangle which resemble a flight of birds in his *Bedford Catalogue* in 1844. R. H. Allen lists it under this name in his *Star Names* in 1899. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this cluster as the "Wild Duck". It is also known as the July Salt and Pepper Cluster, the Scutum Salt and Pepper Cluster (see Salt and Pepper, above), and the "Amas de l'Ecu Sobieski" ("Cluster of the Shield of Sobieski", above), Arrowhead (see above), and "V".

This Tongan asterism **"**Toloa" is the belt of Orion in the IAU constellation Orion.

This Polynesian (Pukapuka Islands) asterism "Te Toloa" is the IAU constellation Delphinus.

This Samoan asterism "Toloa" is the stars of the "head" of the IAU constellation Scorpius (Fitisemanu 2022):

- The central star of this "T" shaped asterism is Delta (δ) Scorpii. From this two lines run out to form "wings":
    - One to Beta (β) 1 Scorpii (Acrab) and
    - One through Pi (π) Scorpii to Rho (ρ) Scorpii.
- A line from Delta (δ) Scorpii to the "head" at Alpha (α) Scorpii (Antares) forms the body.

This "Wild Duck" is being hunted by Pae and Suga (see above). The wild duck's "head" (Antares) was used to sail from Pukapuka to 'Upolu when the star was low in the sky to the west.

Wild Goat:

This Belarussian asterism "Kaziarog" is the IAU constellation Capricornus (Avilin 2009).

Wild Turkey:

This Kaurna star "Wolta" is a star whose rising marks the beginning of the hot season, "Woltatti". Hamacher listed this in 2015 and is uncertain as to whether this is Antares, Arcturus, or Betelgeuse, which are all visibly red stars, which may be related to fire and the hot, dry season. Since the Ngiyampaa (Ngemba) see the IAU constellation Scorpius as the Bush Turkey (see above) and since Arcturus is the brightest of these stars at magnitude -0.05, I'm listing that as the star on the asterism table.

Wild of Virgo:

There are two telescopic "Wild of Virgo" asterisms:

- One, "Férus Vírginis" is the galaxy MCG 01-30-032 (Arp 248) in the IAU constellation Virgo. This is the most western galaxy in Wild's Triplet (see below).
- One, "Ágrius Vírginis" is the galaxy MCG 01-30-033 (Arp 248) in the IAU constellation Virgo. This is the middle galaxy in Wild's Triplet (see below).

These names appear in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Wildebeest Star:

This Zulu star "iNqonqoli" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Slotegraaf 2013).

Wildly:

This Chakavian asterism "Divÿce" is the IAU constellation Virgo.

Wild's Triplet:

This **telescopic** asterism is the trio of interacting galaxies PGC 36723, PGC 36733, and PGC 36742 (Arp 248) in the IAU constellation Virgo. It is named after British-Australian astronomer John Paul Wild (1923 – 2008), who studied it in the 1950s. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as "Wild's Trio". This is listed as "Wild's Triplet" on the Deep Sky Forum by American astronomer Steve Gottlieb.

Wilk's Cluster:

This asterism is the open cluster Melotte 71/Collinder 155 in the IAU constellation Puppis. It was named for Polish astronomer and comet hunter Antoni Wilk (1876 – 1940), who died during imprisonment during the German occupation of Poland in 1940. Size 40'.

Willo:

This unidentified Kaurna star was listed by Hamacher in 2015.Willo is one whose older brother Yunga has died.

Willow:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a hook shaped line of stars in the IAU constellation Hydra: Starting at Theta (θ) Hydrae it runs through Omega (ω) Hydrae, Zeta (ζ) Hydrae, Rho (ρ) Hydrae, Epsilon (ε) Hydrae, Delta (δ) Hydrae (the determinative star), Sigma (σ) Hydrae and Eta (η) Hydrae. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Liu" was associated to matters concerning the San He territory.

This Chinese xiù (lunar mansion) "Liǔxiù" (柳宿) is made up of stars in the IAU constellation Hydra. It resembles a two-pronged fork, with a "handle" starting at Theta (θ) Hydrae running up to Rho (ρ) Hydrae. At Rho (ρ) Hydrae two lines of stars form the "prongs": One running through Epsilon (ε) Hydrae to Delta (δ) Hydrae and the other running through Eta (η) Hydrae to Sigma (σ) Hydrae.

This Chinese Chenzhuo xing guan is a winding line of eight stars in the IAU constellation Hydra: Theta (θ) Hydrae, Omega (θ) Hydrae, Zeta (ζ) Hydrae, Rho (ρ) Hydrae, Epsilon (ε) Hydrae, Delta (δ) Hydrae, Sigma (σ) Hydrae, and Eta (η) Hydrae.

This Japanese sei shuku or lunar station "Nuriko Boshi" is made up of stars of the IAU constellation Hydra. It has a curve of stars starting at Theta (θ) Hydrae and running through Omega (ω), Zeta (ζ), and Epsilon (ε) Hydrae, ending with Delta (δ) Hydrae. The end of the line is a quadrilateral formed by the stars Delta (δ), Epsilon (ε), Sigma (σ), and Eta (η) Hydrae.

Willow Leaf of Tucana:

This **telescopic** asterism "Iteophýllus Túcanae" is the spiral galaxy NGC 360 in the IAU constellation Tucana. It was discovered in 1834 by English astronomer John Herschel in 1834 who listed it as 2372 on his list. It became GC 191 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its resemblance to a Willow Leaf.

Wilson's Object:

This **telescopic** asterism is the galaxies MAC 0148+2733 (MGC 6632, CGCG482-17) in the IAU constellation Triangulum. When astronomer Larry Mitchell was cataloguing his MAC catalogue he came across a small pair of edge on galaxies that were not previously charted. He decided to name this pair after his long-time friend and observing partner Barbara Wilson, who was one of the winners of the Texas Star Party Lone Star Gazer award.

Wind Chime:

This asterism is the IAU constellation Libra as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Wind Spinner:

This **telescopic** asterism is the globular cluster Messier 13 in the IAU constellation Hercules. This was discovered by English astronomer Edmund Halley in 1714. South African astronomer Carol Botha (2010) describes it as a "strings of stars that look like a wind toy".

Winding of Grus:

This **telescopic** asterism "Convólvens Grúis" is the intermediate spiral galaxy NGC 7418 in the IAU constellation Grus. This was discovered in 1834 by John Herschel who listed it as h 3963 and later as GC 4863 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)."

Winding of Hydra:

This **telescopic** asterism "Fléxus Hýdrae" is the barred spiral galaxy NGC 5135 in the IAU constellation Hydra. It was discovered by in 1834 John Herschel who listed it as h 3502 and later as GC 3528 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Windmill:

This **telescopic** asterism is the globular cluster NGC 6752 (Caldwell 93) in the IAU constellation Pavo. This was discovered by Scottish astronomer James Dunlop in 1827. John Herschel listed it as h 3778 and later as GC 4467 in the *General Catalogue* of 1864. The "base" of the windmill is the double star HIP 94198 on one side of the cluster. It is also known as the Starfish (see above) and the Cartwheel (see above).

Wind's Wing:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Windswept of Columba:

This **telescopic** asterism "Ventilátus Colúmbae" is the spiral galaxy NGC 2090 in the IAU constellation Columba. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as 2944 and later as GC 1288 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Windswept of Virgo:

This **telescopic** asterism "Diénemus Vírginis" is the spiral galaxy NGC 5221 (Arp 288) in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "III 86". It became GC 3595 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "The strange appearance of this galaxy with arms extending in different directions".

Windy of Cetus:

This **telescopic** asterism "Anemódes Céti" is the intermediate spiral galaxy NGC 864 in the IAU constellation Cetus. This was discovered in 1785 by William Herschel who listed it as "III 457". It became GC 510 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it has "the characteristics of a windswept cloud".

Wine Glass of Sky:

This Korean asterism “Haneul-ui Wain Jan” (하늘의 와인 잔) is a triangle of stars in the IAU constellation Gemini: Delta (δ), 68, and 81 Geminorum.

Wine Jug:

This Hungarian asterism “Borcuna” is the IAU constellation Cassiopeia. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a group of people in Hungarian costume seated at a table. The person at the right end of the table is drinking from a glass or beaker. There is a server standing behind them and behind that what appears to be some sort of inn or restaurant with the name “Borcuna” on it.

Wine Skin:

This Greek asterism is the IAU constellation Lupus as described by Eratosthenes (d.194 B.C.E.), who saw it as a wine skin that the centaur (the IAU constellation Centaurus next to Lupus) was pouring. Some later cartographers displayed both the wolf and the wine skin.

Wine Vessel:

This Arabic asterism “Al Bāṭiyah” or “Al Batinah” (as listed by Al Achsasi al Mouuaket) is the IAU constellation Crater:

- “al-Bātiya” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Robert Hues lists it as “Albatina” in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 also gives the “Arabic” name “Batiya”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Bátiyah” as an Arabic name and translates it as “a large cup”.

This Persian asterism “Badiya” or “Badiye” is the IAU constellation Crater and is listed under this name and identified as Persian by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. John Hill also lists this as the Persian name in his *Urania* in 1745.

Wineskin:

This Greek asterism is the IAU constellation Lupus, identified by Eratosthenes (d.194 B.C.E.) as a wineskin held by Centaurus.

Wing:

There are two Arabic stars with the name “al-Janāḥ” (الجناح) (“the wing”, later latinized to “Gienah” or “al Janah”):

- One is the star Gamma (γ) Corvi in the IAU constellation Corvus:
    - This was latinized as “Gienah”, “Gienah Corvi” or “Gienah Ghrurab”.
    - Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed it as “Al Janāḥ al Ghurāb al Ayman” (see Right Wing of the Raven, above).
    - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists the name of this star as “Alglari” (Dekker 2000).

    - The IAU approved the name Gienah for the star Gamma (γ) Corvi A.
- One is the star Epsilon (ε) Cygni in the IAU constellation Cygnus, also known as "Gienah Cygni", "Gienah" or "Aljanah". The IAU approved the name Aljanah for the star Epsilon (ε) Cygni Aa.

Wing Footed:

This Latin asterism "Pinnipes" is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899. This is a reference to the "talaria" ("winged feet") which Perseus was often depicted as having.

Wing of Red Bird:

This large Korean lunar mansion "Ik" is made up of stars in the IAU constellations Antlia, Crater, and Hydra:

The central portion is a quadrilateral of the stars Alpha (α) Crateris (Alkes), Beta (β), Gamma (γ), and Delta (δ) Crateris. From each of the four corners lines of stars run out:

- From Alpha (α) Crateris a line runs out to Nu (ν) Crateris,
- From Gamma (γ) Crateris a line runs out to Zeta (ζ) Crateris,
- From Delta (δ) Crateris a line runs out to Epsilon (ε) Crateris, where it forks and goes in one direction to Iota (ι) Crateris and in the other direction through Theta (θ) Crateris to HIP 58576, and
- From Beta (β) Crateris a line runs out to Chi (χ) 1 Hydrae, where it splits into two lines:
    - One line goes through 10 Crateris to 17 Crateris, and
    - One line runs through Alpha (α) and Iota (ι) Antliae, HIP 55588, 55756, and Omicron (o) Hydrae to Beta (β) Hydrae.

Wing of Tafahi:

This Tongan asterism, "Kapakau'o'tafahi", is the "W" asterism of the IAU constellation Cassiopeia (see W of Cassiopeia, above).

Wing of the Horse:

The Arabic star "Janāh al-Faras" is the star 2 Pegasi in the IAU constellation Pegasus:

- "Janāh al-Faras" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "janāh al-faras".
- NOTE: R. H. Allen writes in his *Star Names* in 1899 that some have incorrectly assumed that the name for Gamma (γ) Pegasi, "Algenib", originated in the Arabic "Al Janāḥ" ("the wing") as does Robert Burnham in his *Burnham's Celestial Handbook* in 1978. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 makes this error, claiming that "Algenib" is derived from "Jenáh-al-faras" which he translates as "the horse's wing".

Wing of the Raven:

This Persian star "Al Janāḥ al Ghurāb al Aiman" is Gamma (γ) Corvi in the IAU constellation Corvus:

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "janāh al-ghurāb".
- "Al Janāḥ al Ghurāb al Aiman" is listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).

- It is listed as “Janāh al-ghurāb” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- Compare this to the asterism al-Janāḥ (see Wing, above).

Winged Female:

A winged female appears as a constellation on Babylonian stones, cylinder seals and gems preserved at the British Museum (Massoume 2001). The precise stars involved are not described.

Winged Horse:

This **telescopic** asterism is the open cluster NGC 663 (Caldwell 10), located in the IAU constellation Cassiopeia. This was discovered by English astronomer William Herschel in 1787 who listed it as “VI 31”. It is GC 392 in the *General Catalogue* of 1864. This is the name given to it by American astronomer Wayne Schmidt, who describes it as a winged horse flying to the left.

Winged Owl of Draco:

This **telescopic** asterism “Pteróstrix Dracónis” is the interacting galaxy NGC 6090 in the IAU constellation Draco. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Wings:

This large and complex Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Crater, Hydra, and Sextans:

- A diamond of stars forms the “body”: Alpha (α) Crateris (the determinative star), Lambda (λ) Crateris, Zeta (ζ) Crateris, and Gamma (γ) Crateris,
- From Alpha (α) Crateris a line runs to Nu (ν) Crateris at one end, and from Zeta (ζ) Crateris to Eta (η) Crateris at the other,
- From Lambda (λ) Crateris a jagged line runs through Beta (β) Crateris, HIP 56078A, and Chi (χ) 1 and 2 Hydrae to 10 Crateris, from which two lines run out:
    - One through HIP 51979 to HIP 50066,
    - One through 17 Crateris to 29 Crateris.
- From Epsilon (ε) Crateris to lines run out:
    - One through Theta (θ) Crateris to HIP 57587, and
    - One through HIP 54029 to 41 Sextantis.

In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Yi” was associated to matters concerning the Jingzhou territory.

This large and complex Chinese xiù (lunar mansion) “Yìxiù” (翼宿) is made up of stars in the IAU constellation Crater:

- A shallow diamond shape at the center is the “body”: Zeta (ζ), Gamma (γ), Alpha (α), and Lambda (λ) Crateris,
- A line extends from Alpha (α) Crateris to 4 Crateris at one end and from Zeta (ζ) to Eta (η) Crateris at the other end,
- A triangle of Lambda (λ), Beta (β), and 9 Crateris, and HIP 56830 and 56245 forms one “wing”, and
- A triangle of Gamma (γ), Delta (δ), Epsilon (ε), Theta (θ), and Iota (ι) Crateris and HIP 54214 and 57587 forms the other “wing”.

This Chinese Chenzhuo xing guan “Yìxiù” is made up of stars in the IAU constellations Crater, Hydra, and Virgo:

- The central body is made up of a “box” of four stars: Delta (δ) Crateris, Alpha (α) Crateris (Alkes), Beta (β) Crateris, and Gamma (γ) Crateris.
- From Alpha (α) Crateris a line runs out to Nu (ν) Hydrae.
- From Gamma (γ) Crateris a line runs out to Zeta (ζ) Crateris.
- Delta (δ) Crateris one “wing” is formed by a line runs which out to HIP 54029, where it splits:
    - One line runs through HIP 52948 to 51933, and
    - One line runs to Epsilon (ε) Crateris where the line splits again:
        - One line runs to Iota (ι) Crateris.
        - One line runs through Theta (θ) Crateris to HIP 58576
- From Beta (β) Crateris a “wing” is formed by a line which runs to HIP 54703, where it splits:
    - One line runs through HIP 56293 to HIP 56830, and
    - One line runs to Chi (χ) 1 & 2 Hydrae, where it splits again:
        - One line runs to HIP 51979, and
        - One line runs through HIP 54477, 17 Crateris, and HIP 57001 to 29 Crateris.

This Japanese sei shuku or lunar station “Tasuki Boshi” is a pair of “wings” made up of stars in the IAU constellations Hydra and Crater:

- One “wing” starts at Nu (ν) Hydrae and runs through Alpha (α) Crateris (Alkes), Delta (δ) Crateris, Theta (θ) Crateris, and Epsilon (ε) Crateris, ending with the star HIP 54029, and
- The other “wing” starts at the star Gamma (γ) Crateris and runs through the stars Zeta (ζ) Crateris and Beta (β) Crateris, ending at the star 9 Crateris.

Wings of a Butterfly Nebula:

See Minkowski’s Butterfly Nebula, above.

Wings of Pegasus:

This **telescopic** asterism “Ptéra Pégasi” is the elliptical galaxy NGC 7720 in the IAU constellation Pegasus. This was discovered in 1784 by William Herschel who listed it as “III 146”. It became GC 4995 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “Radio observations of this galaxy show two giant jets, both bending in one direction like wings in the wind”.

Wings of Phoebus:

This asterism “Ales Phoebi” is the IAU constellation Corvus. This name is listed in Johann Bayer’s *Uranometria* (1603).

Winnow:

This Korean lunar mansion “Ki” is identical to the Chinese lunar mansion “Winnowing Basket” (see below).

Winnowing Basket:

This Chinese xiù (lunar mansion) “Jīxiù” (箕宿) is a quadrilateral of stars in the IAU constellation Sagittarius: Delta (δ) Sagittarii (the determinative star), Gamma (γ) Sagittarii, Eta (η) Sagittarii, and Epsilon (ε) Sagittarii. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Youzhou territory. It appears in the Tang Dynasty (618 – 907 C.E.) as “Jī” (箕): Kotyk (2017) lists it as “Qi” although he uses the same Chinese character for it (箕) and writes that they compared it to the Vedic nakshatra Purva Ashadha (see First of the Asadha, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Jīxiù” is a bent line of three stars in the IAU constellation Sagittarius: Delta (δ), Epsilon (ε), and Eta (η) Sagittarii.

Winter:

This Sesotho asterism “Mariha” is the Small Magellanic Cloud. They called it this as food was scarce when it was in the sky in winter.

This Venda asterism “tšefefo” is the Large Magellanic Cloud. Compare this to the Venda asterism “ndala” (see Famine, above).

This Māori star “Takarua” is Alpha (α) Canis Majoris in the IAU constellation Canis Major (Holberg 2007). Its appearance in the morning sky indicated the beginning of winter.

Winter Albireo:

This star is 145 Canis Majoris in the IAU constellation Canis Major. It is called this as it resembles the double star Albireo (see above).

Winter Circle:

This asterism consists of the Winter Triangle (see below) plus the stars Alpha (α) Aurigae (Capella) in the IAU constellation Auriga, Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus, Beta (β) Orionis (Rigel) in the IAU constellation Orion, and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini, with Alpha (α) Geminorum (Castor) on the periphery. It is also known as the Heavenly G. This name was listed in March 2024 in *EarthSky* (https://earthsky.org/astronomy-essentials/definition-what-is-a-constellation-asterism/). In the Southern Hemisphere, it is called the Summer Hexagon. It is also known as the “Winter Hexagon”.

Winter Hexagon:

This asterism consists of the Winter Triangle (see below) plus the stars Alpha (α) Aurigae (Capella) in the IAU constellation Auriga, Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus, Beta (β) Orionis (Rigel) in the IAU constellation Orion, and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini, with Alpha (α) Geminorum (Castor) on the periphery. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this as an “hexagon” under its chapter “The Stars of Winter”. It is also known as the Heavenly G. This name was listed in March 2016 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/). In the Southern Hemisphere, it is called the Summer Hexagon. It is also known as the “Winter Circle”.

Winter Sign:

This Latin asterism “Signum Hiemale” is the IAU constellation Capricornus.

Winter Star:

This Kaurna star “Kudlilla” is Beta (β) Orionis (Rigel) in the IAU constellation Orion. The rising of this star marks the winter season.

Winter Month Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the fifth month, Ogronios, is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. When Vega is rising, Coma Berenices is at the zenith, and Capella is setting (Benigni). Compare to their asterism Fishes (see above).

Winter Thunderbird:

This Ininew (Cree) asterism, “Pipon Pinisew” is made up of stars in the IAU constellations Libra, Ophiuchus, Serpens, Scorpius, and Scutum (Buck 2016):

- The right “wingtip” is defined by Beta (β) Librae (Zubeneschamali), the double star Alpha (α) Librae (Zubenelgenubi) and Sigma (σ) Librae,
- The left “wingtip” is defined by Beta (β) Scuti,
- The “neck” and “head” of the bird is the constellation Serpens, and
- The spread of the “tail feathers” is defined by the stars Alpha (α) Scorpii (Antares) and Eta (η) Ophiuchi.

Winter Triangle:

The Winter Triangle is formed by the first three stars to appear in the winter sky at sunset in the Northern Hemisphere and consists of the stars Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion, and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. These three stars also form part of what is known as the Winter Hexagon (see above). Some describe the Winter Triangle as the stars Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Beta (α) Orionis (Rigel) in the IAU constellation Orion, and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Wintermaker:

This Ojibwe asterism “Biboonkeonini” is based on the IAU constellation Orion but includes stars from the IAU constellations Taurus and Canis Minor (Lee et al 2014). The commonly known asterism of the seven bright stars of Orion is the body, but one long “arm” runs from Gamma (γ) Orionis (Bellatrix) to Alpha (α) Tauri (Aldebaran). The other long “arm” runs from Alpha (α) Orionis (Betelgeuse) to Alpha (α) Canis Minoris (Procyon).

Wise:

This Sogdian star “Wadha” is Delta (δ) Leonis in the IAU constellation Leo as listed by R. H. Allen in his *Star Names* in 1899.

Wise Man:

This Kamilaroi star “Werrinah”, “Wurunna” or “Wurrunnah” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Fuller et al 2014). Wurunna made off with one of the Mayi Mayi (see Seven Young Sisters, below). Compare with their asterism Old Wiringin (above). His “gunya” (“hut”) is the Hyades cluster (see Hut, above).

Wise Men:

This Chumash asterism is the Pleiades cluster in the IAU constellation Taurus.

Wise One:

This Kokatha and Ngalea star “Kuruka’di” is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Leaman and Hamacher 2014). It is part of their asterism “Wati Kutjera”, the other part being “Mumba” (see Lazy One, above).

Wish:

This Arabic star “Shi'at” (شئت) is the Delta (δ) Aquarii in the IAU constellation Aquarius and appears on some Arabic globes according to R. H. Allen in his *Star Names* in 1899. It was later latinized to “Skat”. NOTE: An alternate derivation of “Skat” is “Leg” (see above).

Wishbone:

This asterism from the asterisms list of American astronomer John Davis is made up of stars in the IAU constellation Orion. Omega (ω) Orionis is the base of the “wishbone” with two prongs of stars going out:

- One goes through Eta (η) 2 and 1 Orionis, Psi (ψ) Orionis, to 23 Orionis, and
- One goes through 32 Orionis to Gamma (γ) Orionis (Bellatrix).

This **telescopic** asterism is in the IAU constellation Lupus and is Corder 2969 on the observing list of American astronomer Jeffrey Corder. Size 40’. This is nine 7^{th} – 8^{th} magnitude stars including HIP 78711, 78641, and the double star HIP 78555.

Wishing Well:

This **telescopic** asterism is the open cluster NGC 3532 (Caldwell 91) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. English astronomer William Herschel (1738 – 1822) thought it to be one of the finest star clusters he’d seen. It is also known as the Football Cluster, the Black Arrow Cluster, the Fish Cluster, the Firefly Party, and the Pincushion. It is located between the constellation Crux and the False Cross asterism (see False Cross, above).

Witch Head Nebula:

This **telescopic** asterism is reflection nebula NGC 1909 (IC 2118, vdB 36, LBN 959) in the IAU constellation Eridanus. This was discovered by English astronomer William Herschel in 1786 who listed it as “V 38” in his catalogue. It is GC 1116 in the *General Catalogue* of 1864. Swedish astronomer Sven Cederblad (1946) noted that Wolf listed it as “the Witch Head Nebula” in 1905.

Witch’s Broom Nebula:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1786 who listed it as “V 15”. It is GC 4600 in the *General Catalogue* of 1864. This is also known as the West Veil Nebula, Filamentary Nebula, or Cirrus Nebula.

Witch’s Hat:

See Magician’s Hat, above.

With a Greedy Hand:

This Latin asterism “Manu Codiata” is the IAU constellation Apus as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675

With a Quasar of Taurus:

This **telescopic** asterism “Quasarátus Taúri” is the interacting galaxies PGC 14064 in the IAU constellation Taurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it contains the quasar QSO 0351+026.

With a Star of Centaurus:

This **telescopic** asterism “Stellátus Centaúri” is the intermediate spiral galaxy NGC 5488 in the IAU constellation Centaurus. It was discovered by John Herschel in 1837 who listed it as h 3558 and later as GC 3796 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the 8th magnitude star at the south end of the galaxy”.

With Horses:

This Vedic moon station is in the IAU constellation Aries: This is the star Alpha (α) Arietis (Hamal).

With Many Grains:

This **telescopic** asterism “Granósus Sculptóris” is the spiral galaxy NGC 300 (Caldwell 70) in the IAU constellation Sculptor. Scottish astronomer James Dunlop discovered this in 1827. It is GC 169 in the 1864 *General Catalogue*. John Dreyer described it in the New General Catalogue of 1888 as “a complex object with several nuclei”. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of the “granular nature of this galaxy”. It is also known as the Southern Pinwheel and the Sculptor Pinwheel.

With One Limb of Virgo:

This **telescopic** asterism “Monómeles Vírginis” is the asymmetric spiral galaxy NGC 5713 in the IAU constellation Virgo. William Herschel listed this as “I 182”. John Herschel listed it as h 1857 and later as GC 3964 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has “one smooth spiral arm”.

With Three Corners:

This Belarussian asterism “Trohkutnaia” is the constellation Orion (Avilin 2009). It is also known as “Lisa” (see Fox, above), “Kryzhe” (see Cross, above), “Kosy” (see Scythes, above), “Matawila” (see Wheel, above), “Traiko” (see Three Times, above), “Karomyselko” (see Small Yoke, above), “Grabli” (see Rake, above), “Kastsy” (see Mowers, above), “Try Karali” (see Three Kings, above), “Kasar” (see Mower, above), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, above), “Tri Siostry” (see Three Sisters, bove), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Asilki” (see above), and “Kigachi ragachy” (see Shaft of a Plough, above).

With Two Stars of Canes Venatici:

This **telescopic** asterism “Bistellátus Cánum Venaticórum” is the spiral galaxy NGC 5371 in the IAU constellation Canes Venatici. It was discovered in 1788 by William Herschel who listed it as “II 716”. It

became GC 3710 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the two stars of magnitude approximately 9 and 10 in the neighbourhood of this galaxy".

Withaka:

This Myanmar nekkhat (lunar mansion) "Withaka" (ဝိသာခါ) is the star Alpha (α) Librae

(Zubenelgenubi) in the IAU constellation Libra.

Withers of the Horse:

This Arabic star "Matn al-Faras" is 4 Pegasi in the IAU constellation Pegasus:

- "Matn al-Faras" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- NOTE: R. H. Allen lists Alpha (α) Pegasi (Markab) as "Matn al Faras" and "Mankib al Faras" in his *Star Names* in 1899.
- American astronomer Robert Burnham lists "Matn al Faras" in his *Burnham's Celestial Handbook* in 1978.

Without Neighbours of Aquarius:

This **telescopic** asterism "Agiton Aquárii" is the spiral galaxy NGC 7721 in the IAU constellation Aquarius. This was discovered in 1785 by William Herschel who listed it as "II 432". It became GC 4997 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is located in a rather empty region of Aquarius".

Wives:

This //Gana asterism is made up of stars in the IAU constellations Canis Major, Carina, Eridanus, and Taurus (Alcock 2014). It has the Pleiades cluster married to the stars Alpha (α) Carinae (Canopus) and Alpha (α) Canis Majoris (Sirius), whose brother is Alpha (α) Eridani (Achernar).

Wives of Butt Kuee Tuukuung:

This Mara and Moporr asterism is the stars Sigma (σ) and Tau (τ) Scorpii in the IAU constellation Scorpius (Dawson 1881, Clarke 2009, Hamacher 2011). Butt Kuee Tuukuung (see above) was a famous ancestor of these people and is represented by the star Alpha (α) Scorpii (Antares).

Wives of Gachari:

This Tangut asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005). See Gachari, below.

Wives of Djuit:

Two Boorong stars are listed as the wives of the Red Rumped Parrot "Djuit" (see Red Rumped Parrot, above) by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010):

- Tau (τ) Scorpii in the IAU constellation Scorpius, and
- Sigma (σ) Scorpii in the IAU constellation Scorpius

Wives of Totyarguil:

Two Boorong stars are listed as the wives of Totyarguil (see Purple Crowned Lorikeet, above) by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010):

- Beta (β) Aquilae (Alshain) in the IAU constellation Aquila, and
- Gamma (γ) Aquilae in the IAU constellation Aquila.

Two Kulin stars are listed as the wives of Totyarguil (see Purple Crowned Lorikeet, above) by Hamacher (2011), both under the name Kunnawarra:

- Beta (β) Aquilae (Alshain) in the IAU constellation Aquila, and
- Gamma (γ) Aquilae in the IAU constellation Aquila.

Wives of Unurgunite:

Two Boorong stars in the IAU constellation Canis Major are listed as the wives of Unurgunite (see Jacky Lizard, above) by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010):

- Epsilon (ε) Canis Majoris, and
- Delta (δ) Canis Majoris.

Wizard Nebula:

This **asterism** is the open cluster NGC 7380 (SH 2-142, LBN 511, Cr 452, Ced 206) in the IAU constellation Cepheus. It was discovered by English astronomer Caroline Herschel in 1787 and listed by her brother William Herschel as "VIII 77". It is GC 4842 in the *General Catalogue* of 1864. It is also known as Harry Potter and the Golden Snitch (see above).

Wodan's Wagon:

This Old High German, Anglo Saxon, and Old Norse asterism "Wodenswagen" or "Woutanswaggen" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). Compare this to the Dutch asterism Wotan's Wagon (see below).

Wolf:

This Babylonian star "MUL.UR.BAR.RA" (Hunger 1992, Sanders 2023) listed in the MUL.APIN and in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Gamma (γ) Cassiopeiae (Navi) in the IAU constellation Cassiopeia. They also call it the "plough's seeder" as this star is part of their asterism Plough (see above). It appears in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul.ur.bar.ra" (Koch-Westenholz 1995).

NOTE: R. H. Allen lists "Lik-bar-ra" or "Ur-bar-ra" as an "Euphratian" asterism, defines it as "hyena" and lists the stars Alpha (α) Pegasi (Markab), Gamma (γ) Pegasi, and Zeta (ζ) Pegasi in the IAU constellation Pegasus in his *Star Names* in 1899. Allen lists his source as English orientalist Robert Brown, Jr.

This Babylonian star "UR.BAR.RA" or "barbaru" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is Alpha (α) Trianguli (Mothallah) in the IAU constellation Triangulum.

This Akkadian star "Barbaru" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Gamma (γ) Cassiopeiae (Navi) in the IAU constellation Cassiopeia.

There are three Arabic stars bearing this name:

- One is the star "adh-Dhi'b" (الذئب), which is the star Alpha (α) Draconis (Thuban) in the IAU constellation Draco, later latinized to "Adib", "Addib", "Eddib", "Adive", and "el Dsib".
- One is the star "al-dhi'b" (الذئب), which is the star Zeta (ζ) Draconis in the IAU constellation Draco. This is the feminine form of this word, later latinized as "Al Dhi'bah" or "Aldibah":
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al dhikh, the wolf or hyaena" as Iota (ι) Draconis.
    - R.H. Allen mistranslates it as the plural form of "hyenas" in his *Star Names* in 1899 (which would be "al-ḍibāʿ" (الضباع)).
    - The IAU Working Group on Star Names approved Aldibah as the name of Zeta (ζ) Draconis A in 2017.
- One, "al-dhi'b" (الذئب), later latinized to "Aldhiba" or "Aldhibah", is the star Phi (ϕ) Draconis in the IAU constellation Draco. The IAU approved the name Aldhibah for Phi (ϕ) Draconis A.

This Chinese Chenzhuo xing guan "Lang" is the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This Latin star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. As early as the 8th century C.E. Sirius was often depicted as a wolf with bared fangs. It is depicted this way in the 9th century Codex Vossianus Latinus manuscript now in Leiden (Holberg 2007). This is probably related to a myth told by the Greek poet Oppian in the 2nd century C.E. of a fierce golden wolf who retreated to his lair when the star Sirius rose in the sky.

This Greek lunar mansion is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). The stars have not been identified.

This Anishinaabe asterism "Myeengun Anugn" is the IAU constellation Canis Major (Lee et al 2014).

This is an alternate name "Lang" for the Chinese xing guan "Tiānláng" (天狼) -see Celestial Wolf, above.

This early Celtic (Gaulish) asterism is the IAU constellation Aquarius as represented on the Gundestrup Cauldron (Boutet 2017).

This Skidi star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This Japanese star "Rō" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Miyajima 2014) as listed by Japanese astronomer Shibukawa Harumi (1639 – 1716).

In his *A Learned Treatise of Globes* in 1659, Robert Hues gives the "Arabic" name "Alsubahh" for the IAU constellation Lupus, which he translates as "Wolf". Compare to Wild Beast (above).

This Lithuanian asterism is the IAU constellation Leo (Vairkünas 1999).

This Romanian star "Lupul" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). The next two stars in the handle of the Big Dipper are the oxen pulling the Great Chariot (see below) and are frightened by the Wolf. Compare to Bear (above).

This Norse asterism is the IAU constellation Lupus and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006).

This Ainu Nociw (“asterism”) “Horkew Kamuy no Nociw” [ホロケウノ チゥ] is made up of stars of the IAU constellation Virgo. Alpha (α) Virginis (Spica) is the wolf’s eye, his back is a line running from Spica through Gamma (γ) Virginis, Eta (η) Virginis, and 7 Virginis to the tip of his tail at Nu (ν) Virginis. His “feet” are Zeta (ζ) Virginis and Delta (δ) Virginis.

Wolf Beside the Ox:

This Estonian star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major as recorded by Salomo Heinrich Westring in the 18th century (Kuperjanov 2006). It is part of their asterism Ox Wain (see above).

Wolf Brothers:

This Chinookan (Wasco) asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). They also call it “Coyote, Wolves, and Bears”. The three stars of the handle of the dipper (Eta (η) Ursae Majoris (Alkaid), the double star Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor), and Epsilon (ε) Ursae Majoris (Alioth)) and the two stars of the dipper near the handle (Delta (δ) Ursae Majoris (Megrez) and Gamma (γ) Ursae Majoris (Phecda)) are the wolves hunting the bears, which are the two stars on the front of the dipper (Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak)). Coyote allowed the wolves to reach the sky by shooting arrows to create a bridge.

Wolf Claws:

This Arabic asterism is the stars Omega (ω) and 27 Draconis in the IAU constellation Draco.

Wolf Lundmark Melotte Object:

This **telescopic** asterism is the dwarf irregular galaxy WLM (UCGA 444) in the IAU constellation Cetus. It was discovered by Max Wolf in 1909. It is also known as the “Roll of Cetus” (see above).

Wolf Pack:

This Romanian asterism “Lupăria” or “Haita de Lupi” is the IAU constellation Leo Minor (Ottescu 2009).

Wolf Star:

This Ininew star “Mahkan Atchakos” is Alpha (α) Ursae Minoris in the IAU constellation Ursa Minor (Buck 2016).

This Pawnee (Skidi) star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Wolf’s Cave Nebula:

This **telescopic** asterism is planetary nebula Ced 201 (vdB 152, Ced 201, LBN 531, Barnard 175, LDN 1217) in the IAU constellation Cepheus. It is also known as the Cave Nebula.

Wolf’s Nails:

This Arabic asterism “’Aẓfaāru ’dh-Dhi’b”, “Azw·faru ’dh-Dhi’b”, “’Aẓfaāru ’dh-Dhi’b”, or “Azz·faru ’dh-Dhi’b” (أظفار الذئب), translated as “wolf’s nails” or “fingerprints” and later latinized to “Azfar Adib”, is the stars 27 Draconis and Omega (ω) Draconis and is part of their asterism Mother Camels.

Wolves:

This Macedonian asterism “Volci” or “Voltsi” is the stars Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Cenev 2004 & 2014). They prowl the edge of the field where “Orach” (see Ploughman, above) and his oxen “Ralo so Volovi” (see Oxen above) are working.

There are two Arabic asterisms with the name “al-dhiʾbān”:

- One is three stars in the IAU constellation Boötes: Gamma (γ), Delta (δ), and Mu (μ) Boötis.
- One, latinized to “Thiba”, is the star Delta (δ) Boötis.

Woman:

This Japanese sei shuku or lunar station “Uruki Boshi” (“woman” or “waiting maid”) is a quadrilateral of stars in the IAU constellation Aquarius: Epsilon (ε), Kappa (κ), Mu (μ), and 5 Aquarii.

This Quechua asterism “Mamalita” (Ciancia 2018)) is dark nebulosity in the Milky Way stretching between the IAU constellations Centaurus and Scorpius. It is also known as “Llamita” (see Baby Llama, above).

Woman Cutting Off Leg:

This Kalinago asterism is made up of stars of the IAU constellations Taurus and Orion. The Kalinago see the Pleiades cluster as a woman who cuts off her husband’s leg, which is the belt and sword of Orion and runs away with a tapir, which is the Hyades cluster.

Woman in a Ship:

This Sinhalese asterism is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899.

Woman of the Throne:

This Latin asterism “Mulier Sedis” is the IAU constellation Cassiopeia:

- Johann Bayer’s *Uranometria* (1603) lists “Mulier Sedis” as an alternate name for Cassiopeia.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Mulier Sedis” as an alternate name for Cassiopeia.
- “Mulier Sedis” is listed in in John Hill’s *Urania* in 1754.
- “Mulier Sedis” is listed in R. H. Allen’s *Star Names* in 1899.

Woman Shaman:

This Barasana asterism “Romi Kumu” is the Pleiades cluster in the IAU constellation Taurus (Hugh-Jones 2006). Romi Kumu is the sky, the creatress, and first shaman. An alternate Barasana name is “Nyokoaro Bukura” (see Star Thing, above).

Woman with a Staff:

This Egyptian Dendera asterism is two crossing lines of stars in the IAU constellations Andromeda, Cepheus, and Cygnus (Hoffman 2017). It is depicted on the ceiling as a woman with a walking stick in one hand and a staff or wand in the other. One line runs from Zeta (ζ) Cephei through Alpha (α) Cygni (Deneb) to Gamma (γ) Cygni. The other runs from Alpha (μ) Cephei (Alderamin) to Omicron (ο) Andromedae.

Woman’s Bed:

This Chinese xing guan “Nǚchuáng” (女床) is a bent line of three stars in the IAU constellation Hercules: 67 Herculis (the determinative star), 69, and Rho (ρ) Herculis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Nǚchuáng” is a bent line of three stars in the IAU constellation Hercules: Pi (π) Herculis, 69 Herculis, and 75 Herculis.

Woman’s Spinning Wheel:

This Finnish asterism “Ämmänrukki” is the IAU constellation Orion.

Woman’s Wagon:

This Norse asterism **“**Kvennavagn” (“woman’s chariot” or “woman’s cart”) is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above). Compare this to the Old Icelandic asterism “Lady’s Wain” (see above).

Womb of Cetus:

This **telescopic** asterism “Mátrix Céti” is the barred spiral galaxy NGC 1022 in the IAU constellation Cetus. It was discovered in 1785 by William Herschel who listed it as (I 202”. It became GC 574 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name as it resembles ”a womb… the place of coming into being”.

Women:

This Polish asterism “Baby” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009, 2018).

This Belarussian and Polish asterism “Babki” (“women” or “old women”) is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009, 2018). This relates to women who carry meals out to the mowers (see Mowers, above).

This Chukchi asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005). It is related to their asterism Hunter (see above).

Wonder Star:

This star is Omicron (ο) Ceti in the IAU constellation Cetus as listed in *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns. Compare this to Wonderful, below.

Wonderful:

This Polish star “Mira” (Latin for “wonderful” or “astonishing”), “Mira Stella”, or “Mira Ceti” is Omicron (ο) Ceti in the IAU constellation Cetus. The variability of Mira was first recorded by German pastor David Fabricius in 1596.Polish astronomer Johannes Hevelius gave it this name in his *Historiola Mirae Stellae* in 1662. Compare this to Wonder Star, above:

- American uranographer William Croswell (1760 – 1834) lists this star as “Mira” on his *Mercator Map of the Starry Heavens* in 1810.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Mira”.

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Mini" in his *Celestial Atlas* in 1822.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Mira".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Mira": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists "Mira" for this star.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Mira".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Mira, the wonderful variable star".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Mira" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Mira" and translates it as "wonderful".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Mira".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Mira".
- The IAU approved the name Mira for the star Omicron (o) Ceti Aa.

Wonderful of Ursa Major:

This **telescopic** asterism "Mirífica Úrsae Majóris" is the lenticular or spiral galaxy NGC 3718 (Arp 214) in the IAU constellation Ursa Major. William Herschel listed this as "I 221" and his son John Herschel listed it as h 908 and later as GC 2443 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this "because of its beauty and strange structure".

Wood Falcon:

This Latin asterism "Falco Sylvestris" is the IAU constellation Lyra.

Wood Pigeon:

This Māori asterism "Kererū" is made up of stars of the IAU constellation Orion (Ridpath 1988). The three stars of the belt of Orion form a perch on which the wood pigeon, represented by the sword of Orion and the star Kappa (κ) Orionis (Saiph). The fruit that the wood pigeon is feeding on is the star "Puanga" or "Puanga-rua" is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Wooden Blocks:

This Japanese asterism "Hyoushigi", also known as "Kanatsuki no Ryowaki Boshi" ("Striking Both Sides Stars") or "Waki Boshi" ("Two Wooden Blocks"), is the IAU constellation Orion:

- The stars Alpha (α) Orionis (Betelgeuse), Zeta (ζ) Orionis (Alnitak) and Kappa (κ) Orionis (Saiph) form one block, and
- The stars Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), and Beta (β) Orionis (Rigel) form the other.

Wooden Cross:

This Quechua asterism “Linun Cruz” is described by Urton (1980 & 1981) as “the five stars in the head of Scorpio”: Alpha (α) Scorpii (Antares), Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, Pi (π) Scorpii, and Sigma (σ) Scorpii. Compare to Calvary Cross (above).

Wooden Stirring Rod:

This Arabic star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. The Hyades cluster of which this star is a corner is the “Young She Camels” (see below). It is also known as The Camel Herder (see above).

Wool Spindle:

This Bedouin asterism “al-Miġzal” (المغزل) from the town of Zulfi in Saudi Arabia is the Northern Cross (see Northern Cross, above) in the IAU constellation Cygnus: Alpha (α) Cygni (Deneb), Epsilon (ε) Cygni (Gienah), Gamma (γ) Cygni (Sadr), Delta (δ) Cygni, and Beta (β) 1 Cygni (Albireo).

Woolly:

This Latin asterism “Laniger” is the IAU constellation Aries.

Woolly of Virgo:

This **telescopic** asterism “Lániger Vírginis” is the intermediate barred spiral galaxy NGC 4579 (Messier 58) in the IAU constellation Virgo. It was discovered by Charles Messier in 1779. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the woolly aspect of the thick spiral arms”.

World is Divided into Three Parts:

This German asterism “Orbis Terrarum Tripertitus” is the IAU constellation Triangulum. German astronomer Johann Bayer (1572-1625) gave it this name, meaning for this to represent Europe, Africa, and Asia.

World:

This Belarussian asterism “Svetovaia” is one of the three stars of the belt of Orion asterism in the IAU constellation Orion (Avilin 2009). The other two stars are known as “Zahodnia” (see Western, above) and “Poznia” (see Late, above). I believe this to be Epsilon (ε) Orionis, the middle star.

World Nail:

This Old Icelandic star is currently Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. Around 800 C.E. it would have been 32 Camelopardalis. Compare this to the Estonian “North Nail” (see above), the Belarussian “Nail” (see above), and the Chukchi “Nail Star” (see above).

Worm:

This Babylonian star “MUL.tul-tum” as listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) and is unidentified.

This Assyrian star “Tultu” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) and as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is unidentified.

This **telescopic** asterism Sánta 62, listed in 2007 by Hungarian astronomer Sánta Gábor, is a line of six 10th – 12th magnitude stars in the IAU constellation Canis Major. Gábor describes it as "very tiny worm-like asterism".

Worms:

This Belarussian asterism "Charviaki" is the Hyades cluster in the IAU constellation Taurus (Avilin 2009). It is also known as "Dazhdzhaviki" (see Grass Snakes, above).

Wotan's Wagon:

This ancient Dutch asterism "Woonswaghen" or "Woenswaghen" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). This was found in the phrase "sevenstarre ofde Woenswagen" ("the seven stars of Wotan's wagon") as late as the 15th century. Compare this to Odin's Wagon (above) or Wodan's Wagon (above).

Wound Lodge:

This Korean asterism "Sangcheo Odumag" (상처 오두막) is a line of six stars in the IAU constellation Ursa Minor: Zeta (ζ) Ursae Minoris, Epsilon (ε) Ursae Minoris, Delta (δ) Ursae Minoris, Alpha (α) Ursae Minoris (Polaris), 2 Ursae Minoris and HIP 112519. Note: Their neighboring asterism, "North Pole", doesn't contain Alpha (α) Ursae Minoris (Polaris).

Wounded Heart:

This **telescopic** asterism is the open cluster NGC 2546 in the IAU constellation Puppis. It was discovered by French astronomer Abbé Lacaille in 1751 who listed it in his catalogue as Lac II 4. It is GC 1635 in the *General Catalogue* of 1864. It is known as the Heart and Dagger or Wounded Heart as there is a line of stars through its center. It is also known simply as the Heart Cluster. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 42 and he lists the names "Wounded Heart Cluster" and "Heart and Dagger Cluster".

Wounded Ibex:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. This is made up of stars of the IAU constellations Aquila, Cygnus, Delphinus, and Vulpecula:

- The "body" starts at a "nose" at the star HIP 101966 and runs up to the top of the "head" at 17 Delphini, then across the back of the "body" through Gamma (γ) 2 Delphini, and 29 Vulpeculae, to his "backside" at 41 Cygni, then down to his "back foot" at 15 Vulpeculae, then across his "belly" through QR Vulpeculae and HIP 100276 to his "front foot" at Rho (ρ) Aquilae, then to the "neck" at Zeta (ζ) Delphini and Beta (β) Delphini and back to his "nose" at HIP 101966,
- The middle of the "neck" is a diamond of stars: Beta (β) Delphini, Delta (δ) Delphini, Gamma (γ) 2 Delphini, and Alpha (α) Delphini (Sualocin), and
- The "horns" run from 17 Delphini through HIP 103635 to 33 Vulpeculae.

Wounded of Canes Venatici:

This **telescopic** asterism "Laésus Cánum Venaticórum" is the barred spiral galaxy NGC 5112 in the IAU constellation Hydra. It was discovered in 1787 by William Herschel who listed it as "II 646". It became GC

3511 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the spiral structure of this galaxy is symmetric in its southern parts, but somewhat perturbed in the northern part."

Wouri:

This **telescopic** Duala star is the K type star WASP-69 in the IAU constellation Aquarius (magnitude 10.93). It received this name in the IAU's NameExoWorlds competition in 2022. The Wouri is a major river in Cameroon. It has an exoplanet, WASP-69b, "Makombé", which is named after a tributary of the Wouri.

Woven Yoke:

"Uegeton Uedon" is a proposed early Celtic name for the IAU constellation Aquarius from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Wrapped of Draco:

This **telescopic** asterism "Obvolúta Dracónis" is the spiral galaxy NGC 6340 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "II 767". It became GC 4292 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the almost circular arms of this galaxy are extremely tightly wound around the nucleus."

Wreath:

This Gallic asterism "Stefadium" or "Symma" is the IAU constellation Corona Borealis. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. Stefadium is a Latin word for "Wreath". McKay (2020) suggests that "Symma" is possibly derived from the Gaulish term "simin" (rope or binding made of rushes).

This Lithuanian asterism "Vainykėlis" is the Pleiades open cluster in the IAU constellation Taurus.

Wreath of Flowers:

This asterism is the IAU constellation Corona Borealis and was inspired by the original Greek name of the constellation "Στέφανος" ("wreath" or "crown") and the Latin word "Corona" ("crown").

Wreath of the Erribra:

This Marshallese asterism is the IAU constellation Corona Australis (Kemp et al 2022). The Erribra are one of the clans of the Marshall Islands

Wreath of the Ijjirik:

This Marshallese asterism is the IAU constellation Corona Borealis (Kemp et al 2022). The Ijjirik are one of the clans of the Marshall Islands

Wreathed of Fornax:

This **telescopic** asterism "Perístephes Fornácis" is the spiral galaxy IC 1993 in the IAU constellation Fornax. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand*

Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the beautiful ring around this galaxy, formed by intertwining arms."

Wreathed of Hydra:

This **telescopic** asterism "Stephanítes Hýdrae" is the field spiral galaxy NGC 3621 in the IAU constellation Hydra. It was discovered by William Herschel in 1784. It was discovered in 1790 by English astronomer William Herschel who listed it as "I 241" in his catalogue. It is GC 2371 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Southern Cross Galaxy (see below) and as the "Wreath Wearer of Leo" (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 57 without a name.

Wreathed of Ursa Major:

This **telescopic** asterism "Stephanéphorus Úrsae Majóris" is the intermediate spiral galaxy NGC 4102 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed this as "I 225". It became GC 2717 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The "wreath" is the "inner zone of bright star formation".

Wrestler of Serpens:

This **telescopic** asterism "Palaéstes Serpéntis" is the barred spiral galaxy NGC 5996 (Arp 72) in the IAU constellation Serpens. It was discovered in 1784 by William Herschel who listed it as "II 97". It became GC 4139 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the inextricable shape of this system of interacting galaxies brings to mind the grappling of wrestlers". Its companion is NGC 5994, which was listed originally by English astronomer William Parsons, 3rd Earl of Rosse.

Wrestler of Ursa Major:

This **telescopic** asterism "Luctátor Úrsae Majóris" is the spiral galaxy NGC 5278 (Arp 239) in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "II 798". It became GC 3639 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 5278 and his partner NGC 5279 seem to be a wrestling pair".

Wrestlers of Cancer:

This **telescopic** asterism "Luctatóres Cáncri" is the interacting galaxy NGC 2623 (Arp 243) in the IAU constellation Cancer. It was discovered by Édouard Stephan in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "these two closely interacting galaxies seem to wrestle with each other".

Wrist:

There are four Arabic asterisms with this name:

- One, “al-Miʿasam uth-Thurayyā” (معصم الثّريّا) which means “wrist of al Thurayya”, is the star Lambda (λ) Herculis in the IAU constellation Hercules:
    - This was later latinized to “Maasym”, “Masym”, “Maasym”, “Maasim”, “Mazym”, “Mazim”, “Masini”, or “Masym”.
    - Johann Bayer’s *Uranometria* (1603) lists “Maasym” for this star.
    - Robert Hues lists it as “Mazim” and “Maasim” in his *A Learned Treatise of Globes* in 1659 and translates it as “strength”.
    - Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Maasym”.
    - Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Maasym” in his *Celestial Atlas* in 1822.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Masym… from the Arabic mi’sam, the wrist”.
    - This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Maasym”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
    - R. H. Allen lists it as “Miʿṣam al Thurayya” in his *Star Names* in 1899.
    - The *Century Cyclopedia* of 1894 incorrectly lists “Masym” as a name for Chi (χ) Herculis.
    - The IAU approved the name Maasym for Lambda (λ) Herculis.
- One “al-miʿşam” (المِعْصَم), later latinized to “Mahasim” is the star Theta (θ) Aurigae in the IAU constellation Auriga. The IAU chose the name Mahasim for the star Theta (θ) Aurigae A in 2017.
- One, “miʿşam” (مِعْصَم), later latinized to “Misam” is the star Kappa (κ) Persei in the IAU constellation Perseus. The IAU approved the name Misam for the star Kappa (κ) Persei Aa in 2017.

Written in the Middle of Leo Minor:

This **telescopic** asterism “Mesógraphus Leónis Minóris” is the barred spiral galaxy NGC 3504 in the IAU constellation Leo Minor. It was discovered in 1785 by William Herschel who listed it as “I 88”. It became GC 2287 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this as the “conspicuous dust lanes in the central region giving it the appearance of a disk painted with black ink in the middle”.

WTF Star:

See Boyajian's Star (above).

Wudba:

This Wardaman star is Gamma (γ) Tauri in the Hyades cluster in the IAU constellation Taurus (Cairns and Harney 2003). Compare this to their star Nailfish, above.

Wuja:

This Wardaman star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Cairns and Harney 2003).

Wurren:

This Wardaman star is Lambda (λ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Wurttemberg:

This asterism “Wurtemb” was created of stars of the IAU constellations Aquarius and Capricornus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This is depicted by a pair of decorated horns over a lion holding seven arrows in his right front paw.

Wurubilum:

This Butchulla, Badjala, and Wakka Wakka asterism is the Coal Sack Nebula in the IAU constellation Crux (see Coal Sack, above).

Wuun:

This Micronesian star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Wúyuè:

This Chinese star “Wúyuè” from the 3 Kingdoms and Ming Dynasty Period is the star Zeta (ζ) Aquilae in the IAU constellation Aquila and is and is part of their xing guan Heavenly Market East Wall (see above).

X:

There are thirteen **telescopic** “X” asterisms:

- One is Sánta 55, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a group of 9th – 13th magnitude stars in the IAU constellation Lepus including HD 40148.
- One, “X Marks the Spot”, is Harrington 8 on American astronomer Phil Harrington’s asterism list, which is in the IAU constellation Telescopium. One corner of the “X” is HIP 90848.
- One is Corder 4788 in the IAU constellation Cepheus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20’.
- One is in the IAU constellation Cancer and is Corder 1612 on the observing list of American astronomer Jeffrey Corder. Size 45’ X 30’. This is seven 7th – 8th magnitude stars including HIP 41550, 41569, 41532, and 41430.
- One is in the IAU constellation Boötes and is Corder 2749 on the observing list of American astronomer Jeffrey Corder. Size 80’ X 50’. This is seven 7th magnitude stars including HIP 73303, 73203, 73071, 73301, and 73080.
- One is in the IAU constellation Corona Australis and is Ennis 83 on the observing list of Canadian astronomer Charles Ennis. Size 80’ X 72’. This is thirteen 9th – 10th magnitude stars in two intersecting lines: One line runs from HIP 90545 through Gaia DR3 6723229143888396544, Gaia DR3 6723205676186415360, and Gaia DR3 6723252164913936512, to Gaia DR3 6723250446926996352. The other runs from Gaia DR3 6723224436604196992 through HD 169878, Gaia DR3 6723204503648478336, DR3 6723205676186415360, and Gaia DR3 6723229143888396544 to HIP 90545. Jeffrey Corder lists this as Corder 3576 and lists it as a “T” intersection of star lines.
- One is in the IAU constellation Pegasus and is Corder 4621 on the observing list of American astronomer Jeffrey Corder. Size 40’. This is six 9th – 10th magnitude stars.
- One is the open cluster NGC 6819 in the IAU constellation Cygnus. This was discovered by English astronomer Caroline Herschel in 1784. It is GC 4511 in the *General Catalogue* of 1864.

Size 5’ X 5’. It is also known as the Octopus (see above), or the Fox Head (see above) and has also been described as a letter “U” or “K”.

- One is the open cluster NGC 6830, found in the IAU constellation Vulpecula. This was discovered by English astronomer William Herschel in 1785 who listed it as “VII 9”. It is GC 4516 in the *General Catalogue* of 1864. It is also known as the Poodle (see above). Dutch astronomer Michael Geldorp (1999) describes it as “a cross in a cross”. South African astronomer Magda Streicher describes it both as a “distinctive cross shape” and in 2006 as a “letter ‘X’”.
- One is the open cluster NGC 1807 in the IAU constellation Taurus. It was discovered by English astronomer William Herschel in 1784 who listed it along with NGC 1817 in his catalogue as “VII 4”. It is GC 1020 in the *General Catalogue* of 1864. American astronomer Rick Raasch of the Texas Astronomical Society writes in The Focal Point, Vol. 6, No. 3 (1993) that “1807 is… about 20 stars in a box or X-shape”, as does astronomer Donald J. Ware. This is also known as the Rocket Ship (see above).
- One is the open cluster Dolidze-Dzimselejsvili 11 (DoDz 11) in the IAU constellation Cygnus. René Merting describes it on the Faint Fuzzies website: “At 32x, the SE-NW line of the X is conspicuous indirectly, the NE-SW line is not yet clear and is weakest in the SW - at 71x, the matter becomes clear, the X shows itself in all its glory, the four style stars are indirectly recognizable.”
- One is the open cluster NGC 7708 in the IAU constellation Cepheus. René Merting describes it on the Faint Fuzzies website: “At 40x, a bright star in the northwest is prominent. The next brightest members form two intersecting star chains like a flat X, with the brightest members at each end. There are also a few fainter ones all around.
- One is made up of stars in the IAU constellation Serpens. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this as “stars in the head of Serpens, several of which form a figure like a letter X”. This is the stars Beta (β) Serpentis (Chow), Gamma (γ) Serpentis, Kappa (κ) Serpentis, Iota (ι) Serpentis, and Rho (ρ) Serpentis.

Xamidimura:

See Eyes of the Lion, above.

Xi:

This **telescopic** asterism is in the IAU constellation Aries and was listed as Corder 315 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. It resembles a Greek letter Xi (ξ) and includes the stars HIP 11194, Xi (ξ) Arietis, HIP 11390, 24 Arietis, and HIP 11603A. Size 30’.

Xi Mu:

This Chinese asterism “Xi Mu” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Sagittarius (Kotyk 2017).

Xi Zhong:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a “Z” shaped line of four stars in the IAU constellation Cygnus: Kappa (κ) Cygni (the determinative star), Iota (ι) Cygni, HIP 96620, and 20 Cygni.

This Chinese xing guan “Xīzhòng” (奚仲) is a bent line of four stars in the IAU constellation Cygnus: Kappa (κ), Iota (ι), Theta (θ), and 16 Cygni.

This Chinese Chenzhuo xing guan “Xizhòng” is a bent line of four stars in the IAU constellation Cygnus: Kappa (κ) Cygni, Iota (ι) Cygni, Theta (θ) Cygni, and HIP 96014.

Xihe:

This Chinese star “Xihe” is HIP 91852 (HD 173416) in the IAU constellation Lyra (magnitude 6.04). It was given this name in the IAU NameExoWorlds campaign. Xihe is the Goddess of the Sun. It has an exoplanet named Wangshu, which is their Lunar Goddess.

Xing Ji:

This Chinese asterism “Xing Ji” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Capricornus (Kotyk 2017).

Xú:

This Chinese star “Xú” from the 3 Kingdoms and Ming Dynasty Period is the star Theta (θ) 1 Serpentis in the IAU constellation Serpens and is and is part of their xing guan Heavenly Market East Wall (see above).

Xuan Xiao:

This Chinese asterism from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Aquarius (Kotyk 2017).

Xuanyuan:

This large Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Xuānyuán” (轩辕) is a long, wavy line of stars in the IAU constellations Leo, Lynx, and Ursa Major, all having names.

- The line starts with a string of 12 stars labelled “Cifei” (“Minor Imperial Consort”): 10 Ursae Majoris, HIP 44700, 38 and Alpha (α) Lyncis, HIP 47168, 15 Leonis, Kappa (κ), Lambda (λ), Epsilon (ε), Mu (μ), and Zeta (ζ) Leonis
- The line continues with the stars:
    - Gamma (γ) 1 Leonis: “Fei” (“Imperial Consort”) or “Cijiang” (“Second General”)
- Eta (η) Leonis: “Furen” (“Highest Ranking Imperial Consort”) or “Shangjiang” (“Great General”)
    - Alpha (α) Leonis (Regulus): “Nüzhu” (“Empress”) the determinative star
- Three lines of stars branch out from Regulus:
    - One to the star to the stars Omicron (o) Leonis, “Damin” (“Patriarchal Clan of Empress Dowager”)
    - One to 31 Leonis, “Yunü” (“Maids in Waiting”), and
    - One to Rho (ρ) Leonis, “Shaomin” (“Patriarchal Clan of the Empress Consort”).

This large Chinese xing guan “Xuānyuán” (轩辕) is a long, wavy line of stars in the IAU constellations Leo, Lynx, and Ursa Major:

- The line starts with 10 Ursae Majoris and runs down through 38 and Alpha (α) Lyncis, 15 Leonis, Kappa (κ), Lambda (λ), Epsilon (ε), Mu (μ), Zeta (ζ), Gamma (γ), and Eta (η) Leonis, ending at Alpha (α) Leonis (Regulus), and

- Three lines of stars branch out from Regulus to the stars Omicron (ο), 31, and Rho (ρ) Leonis.

This large Chinese Chenzhuo xing guan "Xuānyuán" (轩辕) is a long, wavy line of stars in the IAU constellations Leo, Lynx, and Ursa Major. At the "tail end" one finds 10 Ursae Majoris and the line runs through HIP 44700, 38 Lyncis, Alpha (α) Lyncis, HIP 47168, 15 Leonis, 1 Leonis, Lambda (λ) Leonis, Epsilon (ε) Leonis, Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) 1 & 2 Leonis, and Eta (η) Leonis to a "head" at Alpha (α) Leonis (Regulus, "Nuzhu" ("Empress")). From Alpha (α) Leonis three lines run out:

- One to Rho (ρ) Leonis, "Patriarchal Clan of Empress Consort",
- One to 31 Leonis, "Maids in Waiting", and
- One to Omicron (ο) Leonis, "Patriarchal Clan of Empress Dowager.

"Y":

This asterism is Corder 2566 in the IAU constellation Centaurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 210' X 75'. It includes Phi (ϕ), Mu (μ), Nu (ν), and Chi (χ) Centauri and resembles a lower case "y".

This asterism in the IAU constellation Orion is Corder 871 on the observing list of American astronomer Jeffrey Corder. Size 240' X 100'. This includes 23, 25, Phi (ϕ) 2, 33, 38 and Omega (ω) Orionis.

There are 106 **telescopic** "Y" asterisms:

- One is found in the open cluster NGC 1893 in the IAU constellation Auriga. This is GC 1101 in the *General Catalogue* of 1864.
- One, Sánta 38, listed in 2007 by Hungarian astronomer Sánta Gábor, is a group of 9^{th} – 10^{th} magnitude stars in the IAU constellation Cassiopeia. It is described by Gábor as "Y-shaped group… next to King 1, binocular object".
- One, Sánta 37, listed in 2007 by Hungarian astronomer Sánta Gábor, is described by Gábor as a "Y-shaped chain" of stars in the IAU constellation Auriga.
- One, Sánta 149, listed in 2009 by Hungarian astronomer Sánta Gábor, is in the IAU constellation Monoceros. Gábor describes this as "very tiny Y shape asterism of 8, TYC 741 233, along NNE – SSW."
- One, Sánta 113, listed in 2009 by Hungarian astronomer Sánta Gábor, is a group of 8^{th} – 15^{th} magnitude stars in the IAU constellation Hydra. Gábor describes this as a "Y-shaped asterism of 7 – 8 stars, 8 [magnitude] HD 84081 brightest…very nice." Hungarian astronomer Gábor János Kernya includes this in his list as Kernya 57.
- One, Sánta 8, listed in 2007 by Hungarian astronomer Sánta Gábor, is in the IAU constellation Leo. Gábor describes this as "Part of Raymond 3, nice, dense, y-shape, 9 – 14 [stars]".
- One, Sánta 120, listed in 2008 by Hungarian astronomer Sánta Gábor, is a group of stars in the IAU constellation Corvus. Gábor describes it as a "Y-shaped group of 4, 11 [magnitude] stars."
- One, Sánta 154, listed in 2008 by Hungarian astronomer Sánta Gábor, is a group of stars between 10^{th} – 13^{th} magnitude in the IAU constellation Serpens.
- One is Kernya 70, listed by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Andromeda. Kernya reports that he originally discovered this with binoculars and described it thus: "six stars can be seen, four of which draw a very striking y-…shape in the sky. Just 0.5 degrees from the formation, the cigar-shaped… galaxy NGC 7640 can be seen even with a 10 cm telescope."

- One is the asterism Alessi 42A, listed by René Merting on the *Faint Fuzzies* website, and is in the IAU constellation Lacerta. Merting writes that it "looks like an inverted 'Y'". The star at the intersection of the three lines forming the "Y" is HIP 112478.
- One is in the IAU constellation Cetus and is listed as Corder 244 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. It is a group of 5 stars including HIP 7188 and HIP 7108. Size 30'.
- One is Corder 370 in the IAU constellation Aries and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. It includes the stars HIP 11237 and 11114. Size 60' X 30'.
- One is Corder 517 in the IAU constellation Reticulum and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This is HIP 15441, 15445, 15568, and 15719A. Size 25'.
- One is Corder 679 in the IAU constellation Taurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60'. The upright of the "y" is Kappa (κ) 1 and 2 Tauri. The left branch of the "Y" is Upsilon (υ) and 72 Tauri. The right branch of the "Y" is HIP 20580A and HIP 20513.
- One is Corder 784 in the IAU constellation Pictor and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45'. This includes Eta (η) 1 and 2 Pictoris and HIP 23487.
- One is Corder 1234 in the IAU constellation Gemini and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 20'. This includes HIP 34055, 33917, and 33748.
- One is Corder 1531 in the IAU constellation Canis Minor and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 50' X 20'. This is 5 8th magnitude stars including HIP 40117 and 40099.
- One is Corder 1667 in the IAU constellation Hydra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 5'. This is a lower case "y" of six 9th magnitude stars. It is nearly upright to the north and is 1.4° NNE of 6 Hydrae.
- One is Corder 2323 in the IAU constellation Virgo and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 50' X 40'. This includes the stars HIP 59676, 59787, 59849, and 59808A.
- One is Corder 2427 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 120' X 75'. Includes 7, 8, 9, and RY Draconis.
- One is Corder 2778 in the IAU constellation Boötes and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45'. The four 7th magnitude stars include HIP 74094, 73956, and 74019.
- One is Corder 2882 in the IAU constellation Libra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25'. Includes the stars HIP 76555 and 76410.
- One is Corder 2953 in the IAU constellation Scorpius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 50' X 20'. This includes the stars HIP 78129, 78123, and 78103.
- One is Corder 3279 in the IAU constellation Scorpius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45' X 35'. This includes the stars HIP 85531, 85482, and 85524.

- One is Corder 4197 in the IAU constellation Delphinus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 35'. This includes HIP 101796.
- One, "Pisces Y", is Corder 4949 in the IAU constellation Pisces and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes this to John Raymond. Size 25'. This looks like a lower case "y" and includes the star HIP 116816.
- One is in the IAU constellation Perseus and is Corder 417 on the observing list of American astronomer Jeffrey Corder. Size 25'. Corder describes this as "a 'Y' shaped asterism of five 9th magnitude stars, plus some fainter stars… There is a nice double star of magnitude 9.5/9.5 in the center."
- One is in the IAU constellation Horologium and is Corder 493 on the observing list of American astronomer Jeffrey Corder. Size 20'. Corder describes this as "a 'Y' shaped asterism of four 8th magnitude stars… just NW of the globular cluster NGC 1261." This includes HIP 14788, 14685, and 14799.
- One is in the IAU constellation Lepus and is Corder 815 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is made up of four 8th – 9th magnitude stars including the double star HIP 24250.
- One is in the IAU constellation Orion and is Corder 892 on the observing list of American astronomer Jeffrey Corder. Size 55' X 30'. Corder describes this as a "lower case 'y'". This includes the double star HIP 26246A, HIP 26541, and HIP 26446.
- One is in the IAU constellations Taurus and is Corder 907 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is four 7th magnitude stars including HIP 26839, 26761, 26691 and 26651.
- One is in the IAU constellation Camelopardalis and is Corder 913 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four stars, three 9th magnitude stars and one 6th magnitude star, HIP 27025. The middle star is double star HIP 26989A.
- One is in the IAU constellation Orion and is Corder 1002 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th magnitude stars including the double star HIP 28676A.
- One is in the IAU constellation Camelopardalis and is Corder 1052 on the observing list of American astronomer Jeffrey Corder. Size 25' X 10'. This is four 8th – 9th magnitude stars including HIP 29499 and the double star HIP 30166A.
- One is in the IAU constellations Camelopardalis and Lynx and is Corder 1067 on the observing list of American astronomer Jeffrey Corder. Size 180' X 75'. This is the star 2 and 5 Lyncis and 37 and 40 Camelopardalis.
- One is in the IAU constellation Gemini and is Corder 1120 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is seven stars of 7th – 9th magnitude including 19 Geminorum and the double star HIP 31164A.
- One is in the IAU constellation Gemini and is Corder 1511 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is seven stars between magnitude 6 and 9 and includes HIP 39719 and 39697.
- One is in the IAU constellation Cancer and is Corder 1690 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is nine 7th – 9th magnitude stars including HIP 43134.

- One is in the IAU constellation Cancer and is Corder 1790 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four stars including Pi (π) 2 Cancri, HIP 45474, HIP 45462, and HIP 45495.
- One is in the IAU constellation Hydra and is Corder 1876 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 7^{th} – 9^{th} magnitude stars including HIP 47220, and the double stars HIP 47237A and HIP 47292.
- One is in the IAU constellation Draco and is Corder 2055 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8^{th} – 9^{th} magnitude stars.
- One is in the IAU constellation Ursa Major and is Corder 2191 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 8^{th} – 9^{th} magnitude stars including HIP 58927 and the double star HIP 59007A.
- One is in the IAU constellation Vir and is Ennis 57 on the observing list of Canadian astronomer Charles Ennis. Size 35'. This is four stars including HIP 62070, Rho (ρ) Virginis, and the double stars 27 Virginis, and HIP 61950.
- One is in the IAU constellation Canes Venatici and is Ennis 58 on the observing list of Canadian astronomer Charles Ennis. Size 100' X 30'. This is the stars HIP 62748, HIP 62802, SAO 44374, SAO 44368, and SAO 44360.
- One is in the IAU constellation Eridanus and is Corder 743 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 9^{th} – 10^{th} magnitude stars.
- One is in the IAU constellation Eridanus and is Corder 745 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. This is four 8^{th} magnitude stars including HIP 22530, 22481, 22502, and 22482.
- One is in the IAU constellation Eridanus and is Corder 751 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 7^{th} – 9^{th} magnitude stars including HIP 22687, 22649, and 22644. Corder also describes this as a Greek letter Lambda (λ).
- One is in the IAU constellation Dorado and is Corder 753 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7^{th} – 9^{th} magnitude stars including HIP 22759 and 22660.
- One is in the IAU constellation Canis Major and is Corder 1044 on the observing list of American astronomer Jeffrey Corder. Size 50' X 35'. This resembles a lower case "y" and is four 6^{th} – 7^{th} magnitude stars including HIP 29466, 29546, and 29671 and the double star HIP 29619
- One is in the IAU constellation Canis Major and is Corder 1194 on the observing list of American astronomer Jeffrey Corder. Size 3'. This is four 10^{th} magnitude stars.
- One is in the IAU constellation Puppis and is Corder 1375 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7^{th} – 8^{th} magnitude stars including HIP 36932 and 36837 and the double star HIP 36892.
- One is in the IAU constellation Puppis and is Corder 1422 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 6^{th} – 8^{th} magnitude stars including HIP 37881, 37906, and 37896.
- One is in the IAU constellation Pyxis and is Corder 1748 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is five 7^{th} – 9^{th} magnitude stars in the form of a lower case "y" including the double stars HIP 44500 and 44460A.

- One is in the IAU constellation Antlia and is Corder 1868 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 6th – 7th magnitude stars including HIP 47224, 47147, 47129, and 47039.
- One is in the IAU constellation Vela and is Corder 1923 on the observing list of American astronomer Jeffrey Corder. Size 140' X 25'. This includes HIP 47963, 48348, 48374, 48287, and the double star HIP 48224.
- One is in the IAU constellation Antlia and is Corder 2021 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is four 8th magnitude stars including HIP 51143, 51101, and 51089.
- One is in the IAU constellation Centaurus and is Corder 2133 on the observing list of American astronomer Jeffrey Corder. Size 2'. This is four 10th magnitude stars.
- One is in the IAU constellation Hydra and is Corder 2161 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is four 6th – 7th magnitude stars including HIP 55164, 55063, and 55105.
- One is in the IAU constellation Carina and is Corder 2167 on the observing list of American astronomer Jeffrey Corder. Size 45' X 15'. This is eight 6th – 9th magnitude stars including HIP 55046, 54931, 55297 and the double star HIP 55140.
- One is in the IAU constellation Centaurus and is Corder 2185 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is five 7th – 9th magnitude stars including HIP 58712 and the double star HIP 58799A.
- One is in the IAU constellation Hydra and is Corder 2332 on the observing list of American astronomer Jeffrey Corder. Size 8' X 6'. Corder's asterism is a roughly rectangular group of about a dozen stars with a "Y" at one end made up of one 8th and three 9th magnitude stars including HIP 60227.
- One is in the IAU constellation Musca and is Corder 2386 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 10th magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2484 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is four 7th magnitude stars including HIP 65045 and 65033.
- One is in the IAU constellation Centaurus and is Corder 2572 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 11th magnitude stars including HIP 68008 and appears as a lower case "y".
- One is in the IAU constellation Centaurus and is Corder 2589 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is eight 8th – 10th magnitude stars including HIP 68598 and the double star HIP 68575A.
- One is in the IAU constellation Hydra and is Corder 2633 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2663 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is four 6th – 7th magnitude stars including HIP 70988 and 70966 and the double stars HIP 70933 and 70998.
- One is in the IAU constellation Libra and is Corder 2806 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th – 10th magnitude stars including HIP 74774.

- One is in the IAU constellation Triangulum Australe and is Corder 2857 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 7th – 9th magnitude stars including HIP 75865 and 75954.
- One is in the IAU constellation Apus and is Corder 2991 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 7th – 9th magnitude stars including HIP 79070, 79056, and 78815.
- One is in the IAU constellation Scorpius and is Corder 3013 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 9th – 10th magnitude stars.
- One is in the IAU constellation Ophiuchus and is Corder 3202 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is five 7th – 8th magnitude stars including HIP 83685.
- One is in the IAU constellation Ophiuchus and is Corder 3243 on the observing list of American astronomer Jeffrey Corder. Size 70' X 50'. This is four 6th – 7th magnitude stars including HIP 84780, 84600, and the double stars HIP 84500 and 84479.
- One is in the IAU constellation Hercules and is Corder 3292 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 10th magnitude stars including HIP 85646.
- One is in the IAU constellation Hercules and is Corder 3403 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 10th magnitude stars including HIP 87906.
- One is in the IAU constellation Corona Australis and is Corder 3656 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 7th – 8th magnitude stars including HIP 91956.
- One is in the IAU constellation Aquila and is Corder 3761 on the observing list of American astronomer Jeffrey Corder. Size 65' X 35'. This is eight 6th – 9th magnitude stars including HIP 93937, and 93833, and the double stars HIP 93822B and 93772A.
- One is in the IAU constellation Sagitta and is Corder 3779 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 94373, and 94313.
- One is in the IAU constellation Telescopium and is Corder 3839 on the observing list of American astronomer Jeffrey Corder. Size 12'. This is five 8th – 9th magnitude stars including HIP 95139.
- One is in the IAU constellation Sagitta and is Corder 3853 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 8th magnitude stars.
- One is in the IAU constellation Cygnus and is Corder 3875 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 95907, 95989, and 96062.
- One is in the IAU constellation Aquila and is Corder 3887 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 96205, 96166, and the double star HIP 96241A.
- One is in the IAU constellation Pavo and is Corder 3898 on the observing list of American astronomer Jeffrey Corder. Size 4'. This is five 10th – 11th magnitude stars including HIP 96385.
- One is in the IAU constellation Sagittarius and is Corder 3913 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is four 7th – 8th magnitude stars including HIP 96644.
- One is in the IAU constellation Aquila and is Corder 3923 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 96813.

- One is in the IAU constellation Pavo and is Corder 3967 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is five 8th – 9th magnitude stars including HIP 97656, and 97574.
- One is in the IAU constellation Sagitta and is Corder 3981 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 6th – 9th magnitude stars including HIP 97840, 97818, and 9 Sagittae.
- One is in the IAU constellation Vulpecula and is Corder 4108 on the observing list of American astronomer Jeffrey Corder. Size 125' X 90'. This is 22, 24, and 25 Vulpeculae and the double star HIP 99824A.
- One is in the IAU constellation Cygnus and is Corder 4145 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 9th magnitude stars including HIP 100688 and 100794.
- One is in the IAU constellation Sagitta and is Corder 4146 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is five 8th – 10th magnitude stars.
- One is in the IAU constellation Sagitta and is Corder 4157 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is five 8th magnitude stars including HIP 100917.
- One is in the IAU constellation Aquarius and is Corder 4247 on the observing list of American astronomer Jeffrey Corder. Size 50' X 35'. This is six 7th – 8th magnitude stars including HIP 102601, 102711, and the double star HIP 102689A.
- One is in the IAU constellation Microscopium and is Corder 4269 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is nine 7th – 9th magnitude stars including HIP 103136 and 103205.
- One is in the IAU constellation Pegasus and is Corder 4418 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 10th magnitude stars including HIP 105896.
- One is in the IAU constellation Capricornus and is Corder 4426 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 8th magnitude stars including the double star HIP 105946A.
- One is in the IAU constellation Pegasus and is Corder 4447 on the observing list of American astronomer Jeffrey Corder. Size 6'. This is five 8th – 9th magnitude stars including HIP 106239.
- One is in the IAU constellation Pegasus and is Corder 4448 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is seven 8th – 10th magnitude stars including HIP 106232.
- One is in the IAU constellation Aquarius and is Corder 4285 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 10th – 11th magnitude stars.
- One is in the IAU constellation Pegasus and is Corder 4500 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 8th – 9th magnitude stars including HIP 107371 and 107419. Corder describes this as a "'Y' or 'Lambda'".
- One is in the IAU constellation Piscis Austrinus and is Corder 4504 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is five 8th magnitude stars including HIP 107384.
- One is in the IAU constellation Aquarius and is Corder 4548 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is four 8th magnitude stars including HIP 108488 and 108428.

- One is in the IAU constellation Grus and is Corder 4712 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 7^{th} – 8^{th} magnitude stars including HIP 111439 and 111421, and the double star HIP 111501A.
- One is in the IAU constellation Grus and is Corder 4804 on the observing list of American astronomer Jeffrey Corder. Size 120' X 50'. This is three 6^{th} – 7^{th} magnitude stars star including HIP 113877, 113592, 113240, and one 5^{th} magnitude double star, HIP 113902.
- One is in the IAU constellation Pisces and is Corder 4891 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is five 9^{th} – 10^{th} magnitude stars including HIP 115589.
- One is in the IAU constellation Pisces and is Corder 4932 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is five 7^{th} – 10^{th} magnitude stars including HIP 116600.
- One is in the IAU constellation Cepheus and is Corder 4976 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is eight 8^{th} – 10^{th} magnitude stars including HIP 117546.
- One is the planetary nebula NGC 7048 in the IAU constellation Cygnus. It is also described as the Peek-a-Boo Nebula (see above). American astronomy author Alan M. MacRobert describes it as a "little Y-shaped asterism."

Yacht:

This **telescopic** "sailboat" asterism, also known as the Sailboat, from *Pattern Asterisms* by American astronomer John A. Chiravalle, is in the IAU constellation Cassiopeia two degrees north of 4 Cassiopeiae. 14 stars form the "hull", with two stars above forming the "cabin" and six stars in a triangle the "sail": HIP 115788, 115569, 116022, 115710, 114898, 115362, 115304, 114203, 115503, 115772, and 116161. Size 35' X 20'. This is Corder 4878 and 4899 on Jeffrey Corder's list.

Yahweh's Treasure Chest:

This Romanian star "Comoara lui Iov" is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Ottescu 2009). Compare this to "Treasure Chest" (above).

Yam Star:

This Mabuiag star "Kek" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Hamacher 2017).

Yam Stick:

This Arrernte asterism "Atneme" is probably the Hyades cluster in the IAU constellation Taurus (Clarke 2014).

Yámoréya's Cooking Vessel:

This Sahtúotine asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021) and is part of their asterism "Yámoréya" or "Yihda" (see Traveller, above).

Yān:

This Chinese star "Yān" from the 3 Kingdoms and Ming Dynasty Period is the star Nu (ν) Ophiuchi in the IAU constellation Ophiuchus and is and is part of their xing guan Heavenly Market East Wall (see above).

Yânce:

This Chakavian asterism is the IAU constellation Aries.

Yard:

See Golden Yard, above.

Yard for Empresses:

This Korean lunar mansion “Mi” is a curve of stars in the tail of the IAU constellation Scorpius: Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii.

Yard Stick:

This English asterism “Yard Stick”, “Yard Wand”, “L”, “Ell”, or “Ell and Yard” is the belt and sword of Orion in the IAU constellation Orion:

- American uranographer Elijah Burritt (1794 – 1838) listed the name “Ell” and Allen writes that this is because this line of stars "is once and a quarter the length of the yard."
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as the “Ell and Yard of tradesmen”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism as “the Yard” and claims that it received this name “because it forms a line 3° long, divided into equal parts by a star in the center. These divisions are useful for measuring the apparent distances of stars from one another”.
- R. H. Allen’s *Star Names* in 1899 lists this as the “Yard Stick” and lists the source as “tradesmen” but does attribute Scottish bishop Gavin Douglas (1474 - 1522) with the variation “Elwand”.

Yarlguj:

This Wardaman star is Sigma (σ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Yarn Baskets:

This Estonian asterism is the area of the Large Sagittarius Star Cloud in the Milky Way (Kuperjanov 2006).

Yarn Spinners:

This Belarussian asterism “Prahi” or “Papradki” is the IAU constellation Orion (Avilin 2009). This is related to a myth regarding three cursed sisters who became stars when they died. It is also known as “Karomyselko” (see Small Yoke, above), “Grabli” (see Rake, above), “Kastsy” (see Mowers, above), “Try Karali” (see Three Kings, above), “Kasar” (see Mower, above), “Kreselca Pana Jezusa” (see Lord Jesus’ Chair, above), “Tri Siostry” (see Three Sisters, above), “Traiko” (see Three Times, above), “Asilki” (see above), “Matawila” (see Wheel, above), “Kosy” (see Scythes, above), “Kigachi ragachy” (see Shaft of a Plough, above), Kryzhe (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, above).

Yayael:

This Taíno asterism is the IAU constellation Orion (Flaquer 2020). Yaya (“high spirit”) killed his son Yayael and hung his bones in a pumpkin inside his bohio (Taíno dwelling). The sea and fish were born from Yayael’s bones. The rising of this asterism in December marks the end of the rainy season and marks the time of year that the most important fish were caught at the mouths of rivers.

Year:

This Estonian asterism “Jäär” is the IAU constellation Aries and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Year Star:

This northern Polynesian star “Whetu o te tau” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Yed Post:

This is Eta (η) Ursae Minoris in the IAU constellation Ursa Minor. Yed is the Arabic word for “hand” and Post is the Latin word for “after”.

Yed Posterior:

See Back of the Snake Man’s Hand, above.

Yed Prior:

See Hand Before, above.

Yellow:

This Chaldean star “mul sig” or “ul.sig” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Yellow Animals:

This Sotho and Tswana asterism “Dipabe” is the Southern Cross asterism in the IAU constellation Crux (see Southern Cross, above).

Yellow Star:

This Hawaiian star “Kaulu-lena” or “Kaulua-lena” ("Yellow star"), is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as “A’a” (‘burning brightly”), “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-kau'opae” ("Star for placing shrimp"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), or “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” ("Flower of the heavens").

This Skidi star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Krupp 1983). They considered it to be one of the four pillars of heaven.

This Mara and Moporr star “Kuupartakil” is an unidentified star in the IAU constellation Orion (Hamacher 2011). Hamacher (2011) lists this as a Boorong name for a “yellow star in Orion”.

Yemeni:

This Arabic star “al-Yamāniya” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). This is a reference to the star being in the southern sky.

Yen:

This Chinese star “Yān” or “Yen” is Zeta (ζ) Capricorni in the IAU constellation Capricornus and represents an ancient Chinese state.

Yesterday’s Fish:

This Coptic asterism “Pikotorion” is the IAU constellation Pisces as listed in John Hill’s *Urania* in 1754. Hill translates this in Latin as “Cubitus Nili”, but this is actually one of the names for the constellation Leo (see Elbow of the Nile, above).

Yeyumari:

This Carib star is currently unidentified (Magaña, and Jara, 1982).

Yida’s Wife:

This T’atsaol’ine and Wiidiideh asterism “Yìda wets’ekeè” is the six brightest stars in the IAU constellation Cassiopeia (Cannon 2021): Alpha (α) Cassiopeiae (Shedar), Beta (β) Cassiopeiae (Caph), Eta (η) Cassiopeiae, Gamma (γ) Cassiopeiae, Delta (δ) Cassiopeiae, and Epsilon (ε) Cassiopeiae. This is related to their asterism Yida (see Traveller, above).

Yilange:

This “Turkish” asterism “Yilange” or “Alyinange” is the IAU constellation Serpens as listed in John Hill’s *Urania* in 1754.

Yildun:

See Star, above.

Yin-Yang:

This **telescopic** asterism is the open cluster NGC 659 in the IAU constellation Cassiopeia. It was discovered by Caroline Herschel in 1783 and her brother William Herschel listed it as “VIII 65”. It is GC 389 in the *General Catalogue* of 1864. A group of lighter stars on one side creates the coma-shaped light side of the Yin-Yang symbol, and the dimmer stars on the other side the darker side. Astronomer Stephen James O’Meara’s Hidden Treasures Catalogue (2007) lists this as O’Meara 7.

Yiyeng:

This Wardaman star is Rho (ρ) Scorpii in the IAU constellation Scorpius as listed by Cairns and Harney in 2003.

Yoke:

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “MUL.SUDUN”.(Hunger 1992) or “SHUDUN” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Boötes. It appears in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul.sudun” (Koch-Westenholz 1995).

This Babylonian ziqpu “mulSUDUN” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Boötis (Arcturus) and Eta (η) Boötis in the IAU constellation Boötes.

This Sumerian asterism“mulšudun”.listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Boötes.

This Akkadian asterism “Niru” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Boötes. It appears in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) as “ni-i-r[u]”.

The Latin asterism “Jugum” is the IAU constellation Lyra. It got this name from a misunderstanding of the 8th century B.C.E. poet Homer’s use of the term “Ζυγόν” (“Zygón”) and Hipparchus’ use of the term “Ζύγωμα” (“Zýgoma”) to describe the cross bar of the lyre. Johann Bayer’s *Uranometria* (1603) lists the name “Iugum” but seems to associate it with Gamma (γ) Lyrae. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Jugum”.

This Macedonian asterism “Jarem” or “Yarem” is a line of two stars in the IAU constellation Perseus: Beta (β) Persei (Algol) and Epsilon (ε) Persei (Cenev 2004 & 2014).

There are two Latin asterisms with the name “Jugum”:

- One is the star Gamma (γ) Lyrae in the IAU constellation Lyra.
- One is the IAU constellation Libra. It appears as “Jugo” in the 1551 edition of the Latin *Almagest*. John Hill lists “Jugum” in his *Urania* in 1754.

This Greek asterism “Ζυγόν” (“Zygón”), or “Ζυγός” (“Zygós”), later latinized to “Zichos” is the IAU constellation Libra as described by Hipparchus (190 – 120 B.C.E.) and 1st century B.C.E. astronomer and mathematician Geminus of Rhodes.

This Latin asterism “Jugulae” is the stars Delta (δ) Cancri (Asellus Borealis) and Gamma (γ) Cancri (Asellus Australis in the IAU constellation Cancer as listed by 1st century Roman poet Marcus Manilius and in John Hill’s *Urania* in 1754. Hill identified this as the “Aselli” and listed “Jugula” as a variation of the name.

This Greek asterism “Zygós” (ζυγός) is the IAU constellation Libra. John Hill listed it as “Zygus” in his *Urania* in 1754.

This Vedic asterism “Juga” or “Juka” is the IAU constellation Libra as listed by Indian astrologer Varāhamihira (c. 505 – c. 587).

This Belarussian asterism “Karomisla” is the IAU constellation Ursa Minor (Avilin 2009). Compare this to their asterism “Karomyselko” (see Small Yoke, above).

Yoke of the Enclosure:

This Babylonian asterism “Mu-sir-kes-da” is the IAU constellation Gemini as listed by R. H. Allen in his **Star Names** in 1899.

Yoke of the Sea:

This Akkadian asterism Gu-shi-rab-ba is the stars Pi (π), Zeta(ζ), and Sigma (σ) Sagittarii in the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899.

Yolk of Grus:

This **telescopic** asterism "Vitéllum Grúis" is the elliptical galaxy IC 1459 in the IAU constellation Grus. It was discovered by American astronomer Edward Emerson Barnard in 1892. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "shows some resemblance to the yolk of a bird's egg".

Yondorrin:

This Wardaman star is Iota (ι) 1 Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Yoonir:

This Serer and Cangin star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. They used it to forecast rainfall and determine when to plant seeds.

Yotaleño:

This Quechua star "Yotaleño" or "Yampareño" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Ciancia 2018).

Young Boy in a Canoe:

This star is Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion as listed by R. H. Allen in his Star Names in 1899. He only lists this as an "Amazon River myth" without naming the precise culture or source and goes on the say that Alpha (α) Orionis (which Allen calls Betelgeuze) is an old man "chasing the Peixi Boi, a dark spot in the sky near Orion".

Young Boys of Lapnuman:

This Netwar (Lenakel) asterism "Nowaswas Lapnuman" is the Pleiades cluster in the IAU constellation Taurus (Ramik 2019). It is alternatively known as "Neperawen Lapnuman" (Young Girls of Lapnuman, see below).

Young Camel:

This Arabic asterism is a quadrilateral of stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Delta (δ) Delphini, and Gamma (γ) Delphini.

Young Girls of Lapnuman:

This Netwar (Lenakel) asterism "Neperawen Lapnuman" (Ramik 2019) is an alternate name in Netwar (Lenakel) sky culture for the Pleiades (see Young Boys of Lapnuman, above).

Young Goat:

This Arabic asterism "Almaeiz Alsaghir" (الماعز الصغير) is the IAU constellation Capricornus.

Young Hens:

This Italian asterism is the Pleiades cluster in the IAU constellation Taurus.

Young Hunters:

This Kaurna asterism "Tinniinyaranna" or "Kukukurkurra" is the belt and sword of Orion in the IAU constellation Orion as listed by Hamacher in 2015. They are young boys hunting kangaroos, emus, and other game on the celestial plain.

Young Maids:

This Arabic asterism is the sword of Orion in the IAU constellation Orion.

Young Man of Leo Minor:

This **telescopic** asterism "Júvenis Leónis Minóris" is the lenticular galaxy NGC 3254 in the IAU constellation Leo Minor. It was discovered in 1785 by English astronomer William Herschel who listed it as "I 72". It became GC 2112 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They translate this as "who is the flower of his age" yet the simple Latin translation is "young man."

Young Marine:

This Latin asterism "Juvenis Aequoreus" is the IAU constellation Cepheus.

Young Men Dancing:

This Wotjobaluk asterism "Kulkunbulla" is the IAU constellation Orion. They are dancing to the music of the "Larnankurrk".

This Boorong asterism "Kuckan bulla" or "Kulkunbulla" is the belt and sword of Orion in the IAU constellation Orion (Stanbridge 1858, Hamacher 2011).

This Marra and Moporr asterism "Kuppiheear" is the belt of Orion in the IAU constellation Orion.

Young Morning Star:

This Blackfoot star is unidentified at present (Chamberlain 2019).

Young Mule:

This Latin asterism "Hinnulus" is the IAU constellation Equuleus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Young Ostriches:

There are twos Arabic asterisms with the name "Al Ri'āl":

- One, later latinized to "Alrial" (I,II, III, IV, and V) is the stars Beta (β), Gamma (γ), Kappa (κ), Mu (μ), and Nu (ν) Phoenicis in the IAU constellation Phoenix, as named by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986).
- One is four sets of lines of three stars in the IAU constellations Aquarius and Cetus:
  - One is the stars 7 Ceti, HIP 983, and 2 Ceti
  - One is the stars 104 Aquarii, 106 Aquarii, and 108 Aquarii
  - One is the stars 98 Aquarii, 99 Aquarii, and 101 Aquarii, and
  - One is the stars 88 Aquarii, 89 Aquarii, and 86 Aquarii.

Young She Camels:

This Arabic asterism "Al Ḳilāṣ," is a loop of stars enclosing the Hyades cluster in the IAU constellation Taurus. The star Alpha (α) Tauri (Aldebaran) in this cluster is known as either the Male Camel (see

above), or the Camel Herder (see above). The loop of stars includes Tau (τ) Tauri, Phi (ϕ) Tauri, 37 Tauri, HIP 19284A, 57 Tauri, Rho (ρ) Tauri, and Iota (ι) Tauri:

- "al-Qilās" and "Qilāsa" are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- 9th century astronomer Aben al Khethir of Fergana (Al Ferghani) listed it as "Ḳalāʾiṣ".
- "Al Ḳilāṣ," and "Ḳalāʾiṣ" are both listed by R. H. Allen in his *Star Names* in 1899 but translates it as "Little She Camels". Allen writes that "another author made the word Al Ḳallāṣ, the Boiling Sea", but doesn't identify the author.
- Compare this to Female Camel (above).

The Greeks and Romans described the Hyades with numerous "stormy" adjectives as it was used to predict the beginning of a rainy season and Allen suggests that the Arabs may have also done this.

Younger Brother:

This //Gana star is Alpha (α) Eridani (Achernar) who they believe to be the brother of the stars Canopus (see Big Star, above) and Sirius (see Husbands, above).

Youth Carrying Water:

This Latin asterism "Juvenis gerens aquam" is the IAU constellation Aquarius and is listed in R. H. Allen's *Star Names.* He attributes it to 1st century Roman poet Publius Ovidius Naso (Ovid).

Youthful:

This Latin asterism "Juvenis" or "Aequoreus Juvenis" is the IAU constellation Aquarius and is listed in R. H. Allen's *Star Names* in 1899*.* Allen attributes it to 1st century Roman poet Marcus Manilius.

Yuuki:

This Ngarrindjeri asterism is the IAU constellation Crux (Clarke 2009).

Yzdène:

This Chakavian asterism is the IAU constellation Centaurus.

Z:

There are nine **telescopic** "Z" asterisms:

- One is Sánta 5, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a group of 6.5 – 11 magnitude stars in the IAU constellation Hydra. Gábor describes this as an "inverted Z-shape asterism of 10 stars". This includes HIP 41992.
- One is Cseh 9, listed by Hungarian astronomer Viktor Cseh, which is a group of 10th – 11th magnitude stars in the IAU constellation Eridanus. Cseh describes these as forming "a small letter 'Z'".
- One is Berkeley 43 in the IAU constellation Aquila. Its size is 5' X 5'.
- One is in the IAU constellation Centaurus and is Corder 2325 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is nine 7th – 9th magnitude stars including HIP 59951, 59604 and the double stars HIP 59654A and 59392A.

- One is in the IAU constellation Centaurus and is Ennis 76 on the observing list of Canadian astronomer Charles Ennis. Size 10' X 15'. This is ten 8th – 9th magnitude stars including HD 125013, HD 124980, HD 124875, HD 124944, Gaia DR3 5892284776094030336, HIP 69980, HD 125036, HD 124981, HD 124945, and HD 124876. This includes stars of Corder 2630 on Jeffrey Corder's list.
- One is in the IAU constellation Telescopium and is Corder 3589 on the observing list of American astronomer Jeffrey Corder. Size 20. This is five 7th – 8th magnitude stars including HIP 90691 and 90731. NOTE: Corder describes this as "an 'L' shape", but it is a very clear 'Z'.
- One is in the IAU constellation Sagittarius and is Corder 3959 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 9th – 10th magnitude stars.
- One is in the IAU constellation Cepheus and is Corder 4542 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 7th – 10th magnitude stars including HIP 108333 and 108603 and the double stars HIP 108364, 107893A, and 108226A.
- One is NGC 1365, a double-barred spiral galaxy in the IAU constellation Fornax. It was discovered by English astronomer John Herschel in 1837.It is GC 731 on the *General Catalogue* of 1864. A Southern Galaxies from Australia posting by "amastro" in 2008 describes it as a "Z" and South African astronomer Auke Slotegraaf refers to it as a "casual Z" in his observations in 2009 from Sutherland.

Zababa:

This Babylonian asterism from the MUL.APIN tablets is named after the God Zababa and is made up of stars of the IAU constellation Ophiuchus:

- His five-sided "body" is made up of the stars Alpha (α) Ophiuchi (Rasalhague), Beta (β) Ophiuchi (Cebalrai), Kappa (κ) Ophiuchi, Eta (η) Ophiuchi, and Zeta (ζ) Ophiuchi,
- One "hand" is Nu (ν) Ophiuchi and the other Delta (δ) Ophiuchi, and
- His "feet" are the stars Theta (θ) and Psi (ψ) Ophiuchi.

This appears in later Seleucid sky lore.

This Babylonian and Sumerian asterism "za-ba-ba" as listed in the BM 78161 tablets (Liechty 1988) is made up of stars of the IAU constellations Aquila, Ophiuchus, and Serpens. His "eye" is Eta (η) Ophiuchi, Nu (ν) Ophiuchi is his "middle", one "knee" is Eta (η) Serpentis, and one "foot" is Lambda (λ) Aquilae. This appears in later Seleucid sky lore.

Zababa was a war God who was the tutelary deity of Kish in Mesopotamia.

Zaniah:

See Angle, above.

Zaofu:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars in the IAU constellation Cepheus. From the star HIP 113561 four lines run out to the stars:

- HIP 111795
- Epsilon (ε) Cephei,
- Zeta (ζ) Cephei, and
- Delta (δ) Cephei (the determinative star).

This Chinese xing guan “Zàofù” (造父) is a “W” of stars in the IAU constellation Cepheus: Delta (δ), Zeta (ζ), Gamma (γ), Mu (μ), and Nu (ν) Cephei.

This Chinese Chenzhuo xing guan is four lines radiating out from a central star in the IAU constellation Cepheus: The central star is Delta (δ) Cephei. From this star four lines run out:

- One to Epsilon (ε) Cephei,
- One to Zeta (ζ) Cephei,
- One to Lambda (λ) Cephei, and
- One to HIP 109592.

Zarje-Harvâtje:

This Chakavian asterism is a combination of the IAU constellations Andromeda and Pegasus. The central star is Alpha (α) Andromedae (Alpheratz).

Zaurak:

See Boat, above.

Zavijava:

See Angle of the Barking Dog, above.

Zembra:

This Tunisian star “Zembra” (زمبرة) is the K type star HATS-72 in the IAU constellation Virgo. It received this name in the IAU’s NameExoWorlds competition in 2022. Zembra is an island in the Gulf of Tunis which is a wildlife preserve. It has an exoplanet HATS-72b, “Zembretta” (زمبرتا), which is named for a islet of Zembra.

Zenith Star:

This English star is Gamma (γ) Draconis in the IAU constellation Draco. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as a name “obtained at Greenwich” and describes this name as “rather relative than real; of no star has yet been actually observed in the zenith of any observatory”.

Zernaizan:

This Persian asterism “Zernaizan” or “Zurnaizan” is the IAU constellation Hercules as listed in John Hill’s *Urania* in 1754.

Zeta:

This telescopic asterism is in the IAU constellation Cassiopeia and was listed as Corder 114 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. This resembles the Greek letter Zeta (ζ) and the base of the asterism is Zeta (ζ) Cassiopeiae. It includes 14 Cassiopeiae, HIP 2854, 2581, 2611, and 2901. Size 45’ X 25’.

Zeus:

This Egyptian asterism is one of the paranatellonta of the decans of Pisces as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Cepheus. Compare to Tower of Zeus (above).

Zhào:

This Chinese star "Zhào" from the 3 Kingdoms and Ming Dynasty Period is the star Lambda (λ) Herculis in the IAU constellation Hercules and is and is part of their xing guan Heavenly Market East Wall (see above).

Zhèng:

This Chinese star "Zhèng from the 3 Kingdoms and Ming Dynasty Period is the star Gamma (γ) Serpentis in the IAU constellation Serpens and is part of their xing guan Heavenly Market West Wall (see above).

Zhōngshān:

This Chinese star "Zhōngshān" from the 3 Kingdoms and Ming Dynasty Period is the star Omicron (ο) Herculis in the IAU constellation Hercules and is and is part of their xing guan Heavenly Market East Wall (see above).

Zhōu:

This Chinese star "Zhōu" from the 3 Kingdoms and Ming Dynasty Period is the star Beta (ε) Serpentis (Nasak Shamiya) in the IAU constellation Serpens and is part of their xing guan Heavenly Market West Wall (see above).

Zibal:

See Ostrich Chicks, above.

Zigzag:

This Zuni asterism is the "W" asterism in the IAU constellation Cassiopeia (see W of Cassiopeia, above).

There are twenty-eight **telescopic** "zigzag" asterisms:

- One, Harrington 7 from first appeared in *Touring the Universe Through Binoculars* by American astronomer Phil Harrington. It is in the IAU constellation Hercules and is made up of about twelve 8th to 9th magnitude stars. It is 2 degrees west of the star Omega (ω) Herculis and includes the stars HIP 79952, 79947, 79858, 79767, and 79695. Size 60' X 12'. Jeffrey Corder lists it as Corder 3023.
- One is Sánta 153, listed in 2015 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "zig-zag line with some connected stars, 9 – 13 [magnitude]" in the IAU constellation Serpens.
- One is Sánta 168, listed in 2015 by Hungarian astronomer Sánta Gábor, which is described by Gábor as an "asterism of 6 stars in a zig zag shape" in the IAU constellation Draco.
- One is in the IAU constellation Coma Berenices and was listed as Corder 2440 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 80' X 20'. This consists of 7th-8th magnitude stars including HIP 63692, 63632A, 63682, 63638, 63677, 63951, and 39 and 40 Comae Berenices.

- One is Corder 3023 in the IAU constellation Hercules and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size75' X 25'. This runs from HIP 79767 to 79952.
- One is in the IAU constellation Camelopardalis and is Ennis 34 on the observing list of Canadian astronomer Charles Ennis. This is three lines of stars: One starts at HIP 15595 and runs through a line of 8^{th} – 9^{th} magnitude stars with the 7.7 magnitude double star HIP 15855A in the middle. The next line of 8^{th} – 9^{th} magnitude stars begins at HIP 15765 and runs to the double star HIP 15482B. From here the third line is four 9^{th} magnitude stars with the 7.15 magnitude star HIP 16060 at the end. This includes the stars of Corder 520.
- One is in the IAU constellation Lynx and is Corder 1195 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four stars of 7^{th} – 8^{th} magnitude including HIP 33030.
- One is in the IAU constellation Hydrus and is Corder 287 on the observing list of American astronomer Jeffrey Corder. Size 90'. This is six 8^{th} – 10^{th} magnitude stars including HIP 8338, 8472, 8508, and 8623.
- One is in the IAU constellation Lepus and is Corder 763 on the observing list of American astronomer Jeffrey Corder. Size 100' X 45'. This is ten 7^{th} – 9^{th} magnitude stars including HIP 22963, 22905, and 22813. Corder describes this as "a stretched 'Z' shape."
- One is in the IAU constellation Lepus and is Corder 794 on the observing list of American astronomer Jeffrey Corder. Size 70' X 30'. This is four 7^{th} – 8^{th} magnitude stars including HIP 23698, HIP 23671, and the double star HIP 23620A.
- One is in the IAU constellation Canis Major and is Corder 1158 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is five 7^{th} – 8^{th} magnitude stars including HIP 32047 and 32028. NOTE: At the north end of this chain, it is extended by a row of 4 10^{th} magnitude stars.
- One is in the IAU constellation Hydra and is Corder 2101 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is four 7^{th} – 9^{th} magnitude stars including HIP 53696, 53617, and 53561.
- One is in the IAU constellation Ophiuchus and is Corder 3247 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 8^{th} – 10^{th} magnitude stars including HIP 84703 and 84693 and the double star HIP 84719.
- One is in the IAU constellation Ophiuchus and is Corder 3464 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is four 7^{th} magnitude stars including HIP 88822, 88764, and 88724.
- One is in the IAU constellation Pavo and is Corder 3515 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 7^{th} – 11^{th} magnitude stars including HIP 89382 and 89533.
- One is in the IAU constellation Sagittarius and is Corder 3728 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is six 8^{th} – 9^{th} magnitude stars including HIP 93289.
- One is in the IAU constellation Octans and is Corder 3759 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is six 9^{th} – 10^{th} magnitude stars including HIP 93475.

- One is in the IAU constellation Pavo and is Corder 4059 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 7th – 11th magnitude stars including the double star HIP 99162A.
- One is in the IAU constellation Cepheus and is Corder 4309 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 9th magnitude stars including HIP 103974 and the double star HIP 104020.
- One is in the IAU constellation Delphinus and is Corder 4317 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 10th magnitude stars including HIP 104179.
- One is in the IAU constellation Cygnus and is Corder 4381 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 8th – 10th magnitude stars including HIP 105299 and the double star HIP 105320A.
- One is in the IAU constellation Indus and is Corder 4438 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is seven 8th – 9th magnitude stars including HIP 105980, 106100, and 106207.
- One is in the IAU constellation Pegasus and is Corder 4629 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is six 7th – 9th magnitude stars including HIP 109837, 109910 and the double star HIP 109781.
- One is in the IAU constellation Grus and is Corder 4751 on the observing list of American astronomer Jeffrey Corder. Size 20' X 15'. This is five 8th – 10th magnitude stars including HIP 112423 and the double star HIP 112458A.
- One is in the IAU constellation Tucana and is Corder 4768 on the observing list of American astronomer Jeffrey Corder. Size 80' X 30'. This is six 7th – 8th magnitude stars including HIP 112569, 112726, 112848, 112869, 112791, and 112895.
- One is in the IAU constellation Cepheus and is Corder 4822 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is five 7th magnitude stars including HIP 113793, 113947, and 114070 and the double star HIP 113907A.
- One is in the IAU constellation Octans and is Corder 4835 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is four 9th – 10th magnitude stars including HIP 114397.
- One is in the IAU constellation Grus and is Corder 4873 on the observing list of American astronomer Jeffrey Corder. Size 75' X 50'. This is seven 5th – 9th magnitude stars including 11 Andromedae and the double stars 8 Andromedae, HIP 115128A, 115114A, and 115171. John Raymond lists this asterism as "8 & 11".

Zipper:

This **telescopic** asterism is the star cluster Collinder 15 (Trumpler 1) in the IAU constellation Cassiopeia and is found on the asterisms list of American astronomer John Davis.

Zmûli:

This Chakavian asterism is the IAU constellation Crater.

Žmÿni:

This Chakavian asterism is the IAU constellation Libra.

Zosma:

See Girdle, above.

Zubenelgenubi:

See Southern Claw of the Scorpion, above.

Zubeneschamali:

See Northern Claw of the Scorpion, above.

Zuzuecha: This Dakota/Lakota/Nakota asterism is made up of stars of the IAU constellations Canis Major, Columba, and Puppis: It runs from Runs from Rho (ρ) Puppis to Epsilon (ε) Columbae.

Zwicky's Necklace:

This **telescopic** asterism is 8 ZW 388, a group of galaxies in the IAU constellation Virgo. Fritz Zwicky published it in his *Eighth List of Compact Galaxies* in 1975. These are magnitude 17 and fainter.

Zwicky's Nonet:

This **telescopic** asterism is a group of nine galaxies in the IAU constellation Perseus. It is named after Swiss astronomer Fritz Zwicky (1898 – 1974).

Zwicky's of Ursa Major:

This **telescopic** asterism "Zwíckius Úrsae Majóris" is the dwarf starburst galaxy UGCA 166 (Mrk 116) in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor Fritz Zwicky (1898 – 1974) because it was in Zwicky's catalogue (#18).

Zwicky's Pierced Galaxy:

This **telescopic** asterism is the interacting galaxy NGC 7732 in the IAU constellation Pisces. It is interacting with NGC 7731. It is mentioned by this name in *Interstellarum*.

Zwicky's Triplet:

This telescopic asterism is a group of three galaxies in the IAU constellation Hercules: IC 3481, 3481A and 3483. IC 3481 and IC 3483 were discovered by American astronomer Royal Harwood Frost (1879 – 1950).

Zygote of Fornax:

This **telescopic** asterism "Zygóte Fornácis" is the lenticular galaxy NGC 1316 (Arp 154) in the IAU constellation Fornax. . It was discovered by James Dunlop and became 2527 on John Herschel's list and GC 697 in the *General Catalogue* of 1864. This is O'Meara 13 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to "the egg-shaped galaxy" resembling a "fertilized egg-cell". It is also known as "Fornax A".

Conclusion:

This handbook is a celebration of the sky cultures of the world. As I mentioned at the beginning, this is a living project.

I know that there are more asterisms out there. For one thing, in my research I found references to many asterisms which ethnoastronomers have found names and/or stories for, but no location in the sky. Continuing research will likely reveal some of those locations so that those can be added to the list. For another, the process of people identifying and naming new asterisms is ongoing around the world.

This is a massive undertaking and a work in progress as ethnoastronomers across the world continue to unearth new information and recover lost information. If a reader has corrections or additions, I welcome them. You can contact us at: worldasterismsproject@rasc.ca
