- In the Munich 560 edition he is nude,
- In the Paris BN n.a. 1614 edition he is holding a spear,
- In the Cologne 83 II edition he is a young man sitting resting his right elbow on an upturned urn pouring water beside a river.

Eridanus appears in the Leiden *Aratea* (816) as a reclining river God, with his left elbow resting on an overturned vase.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict a reclining river God leaning his right elbow on an urn and holding a reed in his left hand.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Eridanus in right and left profile as a winding stream.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Eridanus as a bearded river God in classical garb, seated beside a flowing urn and holding a frond in his right hand.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad depicts Eridanus as a river flowing from the feet of Orion.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Eridanus as a winding stream flowing from the right foot of Orion.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Eridanus as a river.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Eridanus as a stream running from the right foot of Orion.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict a horned Eridanus Mc Gurk, Patrick (1966).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Eridanus as a winding stream.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts Eridanus as a river flowing from the feet of Orion.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Eridanus as a stream running from the feet of Orion. It is poorly drawn and not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Eridanus as a zig zagging line running down from the left foot of Orion. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Eridanus as a curving stream running from the left foot of Orion.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Eridanus as a stream in which a nude river God is reclining on his left side

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Eridanus as a bearded nude male with spiky hair walking to our right. His left hand is holding an overturned amphora from which water is pouring and he is gesturing to one side with his right hand.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels the constellation both "Eridanus" and "Eridanus flume" and depicts it as a stream with a nude male laying on his side on one elbow in the water.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Eridanus as a horned nude male walking to the right. His upper body is turned towards us and he is pointing towards his left ear with his left hand and gesturing to the side with his right hand. Upside down in the air beside him is an overturned urn pouring water.

Eridanus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a stream flowing from the feet of Orion.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Fluvius gyon sive Nilus" as a river flowing from the feet of Orion.

The early 16th century Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Eridanus as a winding stream running from the left foot of Orion. It is not labelled.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Eridanus as a stream running from the feet of Orion.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts "Eridanus" as a stream running from the feet of Orion.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Eridanus Fluvius" as a stream running from the left foot of Orion.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "ERIDANVS" as a river flowing from the feet of Orion.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Eridanus in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Eridanus" as a river flowing from the feet of Orion. A nude woman is depicted swimming at the end of the river.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del fiume Eridano, o ver Nilo". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "River".

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Eridanus as a stream flowing from the feet of Orion with a nude female swimming downstream.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Fluvius, sive Eridanus, vel Nilus" ("the river, either Eridanus or the Nile") in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Eridanus" as a river running from the feet of Orion.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Fluuius sieu eridanus" as a winding river.

German astronomer and uranographer Johann Bayer (1572-1625) depicts Eridanus as a stream with grasses and rocks along each bank. Bayer lists the following names for this constellation: “Eridanus, Flumen, Fluvuius, Oceanus, Gyon vel Nilus, Padus, Nar, Nahar, Acharnar, Guad”.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “la fleuve Eridan” as a river flowing from the feet of Orion.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Eridanus as a stream flowing from the left hip of Orion but does not label it.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Flumen” as a river flowing from Orion’s left foot.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Eridanus” as a bearded male reclining in a stream and is leaning against a vessel on its side from which the stream of water is emerging. He is facing to our left, gesturing with his right hand and cradling a bullrush in his left arm.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists “Eridanus fluvius” and depicts it as a stream flowing from the feet of Orion.

Eridanus is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

Dutch navigator Frederick de Houtman’s catalogue of fixed stars (1603) lists this constellation as “Het Zuyder eyude van den Nyli”, which is a reference to the Nile River.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Fluvius Eridanus”.

“Eridanus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a stream running from the feet of Orion. On one of Bartsch’s charts it is labelled with the abbreviated “Eridan”.

Edward Sherburne also lists the Tuscan name “Botignon”, the Ligurian name “Botigum” and “Bodintum” in his Sphere of Marcus Manilius in 1675 and attributes these names to German astronomer Johann Bayer (1572-1625) and Julius Schiller (1580 - 1627).

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Eridanus” for this constellation.

“Eridanus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a stream running from the feet of Orion.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Fluvius Eridanus Alnahar” as a river flowing from the feet of Orion.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Eridanus” on some charts, “Fluvius Eridanus” on others, and also as “Eridanus Flu.” On others. It is depicted as a blue stream.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Fluvius Eridanus" and depicts it as a stream running from behind Orion.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Eridanus" as a river starting at Orion's waist.

Eridanus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted on his southern chart of 1678 as a sea monster with gaping jaws.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, labels Eridanus "Aqua" on one chart but "Eridanus" on another and depicts it as a river flowing from the feet of Orion.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Eridanus" with the subtitle "Nylus Orionis".

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts "Eridanus" as a stream running from the feet of Orion.

Eridanus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is indicated on his charts as a curving set of parallel lines.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts this constellation as a stream with grassy banks: On one chart it is labelled "Eridanus" and on another "Eridanus Fluvius".

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Fluvius Eridanus" and depicts it as a river running from the feet of Orion.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Eridanus as a stream with grassy banks flowing from the feet of Orion.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "L'Eridan" as a river running from the feet of Orion.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Fleuve Eridan" as a river flowing from Orion's feet.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Eridanus" as a river flowing from the feet of Orion.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Eridan" as a stream with grassy banks on the northern hemisphere charts, but on the southern hemisphere charts it is labeled "Fleuve Eridan".

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Eridanus Fluvius" as a river flowing from the feet of Orion.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Eridanus” as a river flowing from the feet of Orion.

Eridanus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Eridan” and depicted as a stream flowing from the feet of Orion.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Fluss Eridanus”. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Eridanus – Fluss“.

American uranographer William Croswell (1760 – 1834) depicts “Eridanus the River” on his *Mercator Map of the Starry Heavens* in 1810 as a river running from the feet of Orion.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this constellation as “Fluvius Eridanus” (“the river Eridanus”) in his *Celestial Atlas* in 1822.

“Eridanus” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a stream running from the feet of Orion.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Eridanus” as a river running from the feet of Orion.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Eridanus Fluvius” as a river flowing from Orion’s feet.

“Eridanus” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a stream running from the feet of Orion.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Eridanus, The River Eridanus” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Eridanus, the River Po”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Eridanus” in his *Star Atlas* (1893) and describes it as “The River Eridanus”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Eridanus” and describes it as the “River Po”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Eridanus” as the “flowing constellation of the classic River Po.”

This constellation is known to the French as “Eridan”, the Italians as “Eridano” and other variations include “Erydanus”. It has been associated with the Po River, the Biga Stream in Turkey (Alexander the Great’s Granicus), the Rhine (Rhenus), the Rhone (Rhodanus), the Nile (Nilus) by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675, the Radunia River (in Poland), and the Euphrates River.

The standard IAU charts show this constellation as a long winding line of these stars running from Phoenix to Orion: Alpha (α) Eridani (Achernar), Chi (χ) Eridani, Phi (ϕ) Eridani, Kappa (κ) Eridani, s Eridani, Iota (ι) Eridani, Theta (θ) 1 and 2 Eridani, e Eridani, y Eridani, f Eridani, g Eridani, Upsilon (υ) 3 and 4 Eridani, Upsilon (υ) 1 and 2 Eridani, Tau (τ) 8, 6, 5, 4, 3 2, and 1 Eridani, Eta (η) Eridani, Zeta (ζ)

Eridani, Epsilon (ε) Eridani, Delta (δ) Eridani, Nu (ν) Eridani, Mu (μ) Eridani, Omega (ω) Eridani, Beta (β) Eridani (Cursa), Lambda (λ) Eridani, and 53 Eridani.

Eridanus Loop:

One is HII region SH 2-245 (LBN 839) in the IAU constellation Taurus. It is also known as the Fishhook.

Erigonaeus:

This star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in some Latin manuscripts according to R. H. Allen's *Star Names* in 1899. This relates to the myth of Erigone's dog Maera, who was turned into this star. Erigone was the daughter of Icarius. Variations include Erigonius. Compare this to Icarus, below and Erigone, below.

Erigone:

This Greek asterism is the IAU constellation Virgo. Erigone appears in two Greek myths. In one she is the daughter of Icarius of Athens, in the other she is the daughter of Aegisthus and Clytemnestra, rulers of Mycenae. Compare this to Erigonaeus, above:

- Johann Bayer's *Uranometria* (1603) lists "Erigone" as a name for this constellation as well as an alternate name for Alpha (α) Virginis (Spica).
- "Erigone" is listed as a name for Virgo on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- "Erigone" is listed as a name for Virgo in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- "Erigone" is listed in John Hill's *Urania* in 1754.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Die Junggrau" and "der Erigone".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Erigone as a name for this constellation.
- "Erigone" is listed in R. H. Allen's *Star Names* in 1899.

Erotus:

This Greek asterism "Erotus" is the IAU constellation Sagittarius as listed by Hesiod and Mosenkis in his *Mycenaean Oecumene* (date n/k). The Erotes were a group of winged Gods associated with love and sexual desire and are depicted as shooting arrows of desire, becoming the Roman Cupid.

Erragal:

This Chaldean asterism "mul ir.ra.gal" in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is the two stars Eta (η) and Theta (θ) Lyrae from the IAU constellation Lyra. Compare this to the Babylonian asterism Nin-Sar u Erragal, below.

Errai:

See Shepherd, below.

Errand Man:

This Skidi (Pawnee) asterism is the central star in the IAU constellation Corona Borealis (Kemp et al 2002). and is part of their asterism Council of Chiefs (see above). The central star, Theta (θ) Coronae Borealis is seen as an errand man or a servant cooking (see below).

Erumum-pu:

This Ainu Nociw ("asterism") is the IAU constellation Cancer.

Erymanthian:

This Latin asterism "Erymanthis" is the IAU constellation Ursa Major and either refers to the Erymanthian boar slain by Hercules or the Erymanthian bear. Johann Bayer's *Uranometria* (1603) lists "Erymathis" as a name for Ursa Major.

Essertoo String:

See "S" below.

Establishment:

This Chinese xing guan "Jiàn" (建) is a curving line of stars in the IAU constellation Sagittarius: Upsilon (υ), Rho (ρ) 1, 43, 41, Omicron (ο), and Xi (ξ) 2 Sagittarii. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Esus:

This Gaulish star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Boutet 2001).

E.T.:

This **telescopic** asterism, also known as the Owl Cluster, Kachina Doll Cluster, Massed Jewels, and the Dragonfly Cluster, is the open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. Two bright stars (HIP 6229 & Phi (ϕ) Cassiopeiae) are the eyes. Astronomers who were fans of the 1982 Steven Spielberg movie *E.T. the Extra-Terrestrial* named it for the main character. American astronomy author Alan M. MacRobert referred to it as "E.T." This asterism appears in *Pattern Asterisms* by American astronomer John A. Chiravalle.

Eta:

This **telescopic** asterism is in the IAU constellation Cassiopeia and was listed as Corder 184 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond, who called it "Eta". It resembles the Greek letter Eta (η) and includes the stars Eta (η) 27, 28, and 30 Ceti and HIP 5169.

Eta Argus:

This star is Eta (η) Carinae in the IAU constellation Carina. It was called this as it originally belonged to the now obsolete constellation Argo's Ship (see above). Scottish astronomer Robert T.A. Innes (1861 – 1933), writing in 1914, also called it "Eta Argus" and "Eta Argo".

Etched Hourglass Nebula:

See Engraved Hourglass Nebula, above.

Eternal:

This Hawaiian star “Noho-loa” ("Eternal"), is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Hokupa’a” (“Fixed Star”), “Kumau” ("Standing Perpendicularly"), “Kio-pa'a” or “Kio-pa” ("Fixed projection"), “Kia-pa'akai” (Biblical: "Pillar of salt"), or “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe").

Eternal Path:

This **telescopic** Guarani star “Tapecue” is HD 63765 in the IAU constellation Carina (magnitude 8.10). This was a Bolivian name approved in the IAU NameExoWorlds campaign. This is their name for the Milky Way, which is the path the first inhabitants of Earth used to arrive and could return. It has an exoplanet named Yvaga, which means “paradise”.

Etinimeang:

This Kiribati star “Etinimeang” is currently unidentified (Trussel and Groves 1978).

ET’s Finger:

This **telescopic** asterism is Sh 2-86 (NGC 6823) in the IAU constellation Vulpecula. William Herschel listed it as “VII 18”. John Herschel listed it as h 2049 and later as GC 4512 in his *General Catalogue* of 1864. It is also known as the Cloud Sculpting Star Cluster.

Eturammi:

This Chaldean star “mul e-tu-ram-mi” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified. Eturammi is the attendant of the Mesopotamian underworld God Birtum.

Euclid’s Square:

This asterism with the Latin name “Quadra Euclidis” is the IAU constellation Norma as listed in R. H. Allen’s *Star Names* in 1899.

Eung:

This Korean star is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major.

Eunuch:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Ursa Major: FI Ursae Majoris (the determinative star) and HIP 55797, 57045, and 56510.

This Chinese xing guan “Shì” (勢) is a quadrilateral of stars in the IAU constellation Leo Minor: Omicron (o), 33, 34, and 42 Leonis Minoris.

This Chinese Chenzhuo xing guan “Shì” is a “box” of four stars in the IAU constellation Ursa Major: HIP 55086, HIP 56731, HIP 55044, and HIP 53706.

This Korean asterism “Naesi” (내시) is a line of five stars in the IAU constellations Hercules and Ophiuchus: 60 and 66 Herculis and 37, 34, and 32 Ophiuchi. Compare this to the Chinese xing guan “Eunuch Official” (see below).

Eunuch Official:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of stars in the IAU constellations Hercules and Ophiuchus: 60 Herculis (the determinative star), 34 Ophiuchi, 32 Ophiuchi, HIP 153882, and 54 Herculis.

This Chinese xing guan "Huànzhě" (宦者) is a line of stars in the IAU constellation Hercules and Ophiuchus: 32 and 37 Ophiuchi, and 60 Herculis. Compare this to the Korean asterism "Eunuch" (see above).

This Chinese Chenzhuo xing guan "Huànzhě" is a bent line of stars in the IAU constellation Hercules and Ophiuchus: HIP 82764, 54 Herculis, HIP 83308, 32 Ophiuchi, 34 Ophiuchi, and 60 Herculis.

Euphrates:

This Chaldean asterism "mul idburanun" or "idburanunki" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

This Babylonian asterism "BURANUN" or "Purattu" was listed by Hope Anthony in his *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified.

In 1612 Flemish astronomer Petrus Plancius introduced the constellatioin "Euphrates Fluvius" on a celestial globe published in Amsterdam by Pieter van der Keere. "Euphrates Flu" (short for Euphrates Fluvius or "Euphrates River") is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and shown as stars of the IAU constellation Vulpecula.

Europa's Ferryman:

This Latin asterism "Portitor Europae" or "Proditor Europae" is the IAU constellation Taurus. It was called this due to the myth of Europa being carried away by the God Zeus who came to her in the form of a bull and swam across the sea to Crete with her on his back. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Portitor Europae". Johann Bayer's *Uranometria* (1603) lists "Portitor Europae".

Eve:

This German asterism is a combination of the IAU constellations Apus, Chamaeleon, and Volans and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Eve al Apus, Indica, Apus, et Chameleon". It later appears in John Hill's *Urania* in 1754. NOTE: In his *Star Names* in 1899, R. H. Allen lists the constellations that Schiller used to create this asterism as "the Bird of Paradise" (which would be Apus), "Chamaeleon" and "Musca". Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 as "Camaleon & Piscis Volans".

This Italian asterism is the IAU constellation Cassiopeia as depicted on the 1710 globe of Italian monk and uranographer Amantius Moroncelli (Stevenson 1921).

Eve Hen:

This Danish asterism "Aften Hoehne" is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

Even Tempered of Draco:

This **telescopic** asterism "Aequánimus Dracónis" is the barred spiral galaxy NGC 5905 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "II 758". It became GC 4082 and GC 4084 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "well organized inner structure and a more chaotic outer one".

Evil:

This Chaldean star "mul hul" or "mul lu-um-nu" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Evil Eye Galaxy:

This **telescopic** asterism is Messier 64 (NGC 4826), a spiral galaxy with prominent dust lanes in the IAU constellation Coma Berenices. It is also known as the Black Eye Galaxy (see above) or Sleeping Beauty Galaxy (see below). This was discovered by English astronomer Edward Pigott in March 1779, observed by German astronomer Johann Elert Bode in April of the same year, and by French astronomer Charles Messier the following year. It is listed in the 1864 General Catalogue as GC 3321 and in John Herschel's catalogue as h 1486. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply lists this as a "Coma Berenices Nebula".

Evil President:

This American asterism is the "W" asterism of the IAU constellation Cassiopeia and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Evil Spirit:

This Latin asterism "κακοδαίμων" ("Cacodaemon") is the IAU constellation Perseus. Johann Bayer's *Uranometria* (1603) lists "Cacodaemonis" as a name for this constellation. R. H. Allen's *Star Names* in 1899 lists "Cacodaemon". Allen writes that it was a name used by astrologers and was a reference to the demon's head.

Ewe:

This Babylonian star "Lahru" is Alpha (α) Ursae Majoris (Dubhe) in the Big Dipper asterism in the IAU constellation Ursa Major (Hunger and Pingree, 1989) see Big Dipper above. This asterism appears in later Seleucid sky lore.

This Egyptian Dendera star is Beta (β) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Hoffmann 2017) and part of their asterism Ox Thigh (see below).

Example of Crater:

This **telescopic** asterism "Exémplum Cratéris" is the spiral galaxy NGC 3672 in the IAU constellation Crater. It was discovered in 1786 by William Herschel who listed it as "I 131". It became GC 2411 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to it being "a representative example of a late-type spiral galaxy".

Exastion:

This asterism is the Pleiades cluster in the IAU constellation Taurus and was listed in John Hill's *Urania* in 1754.

Exclamation Mark:

There are four **telescopic** "exclamation mark" asterisms:

- One is PGC 2345, an interacting galaxy in the IAU constellation Phoenix.
- One is an alternate name for the Box Nebula, NGC 6309 (see Box Nebula, above).
- One is the barred spiral galaxy NGC 5544 (Arp 199) in the IAU constellation Boötes. William Herschel listed it as "II 419". John Herschel listed it as h 1771 and later as GC 3833 in his *General Catalogue* in 1864. This name was posted on the *Deep Sky Forum* in June 2014 by Uwe Glahn. It is also known as the "Station of Boötes."
- One is is UGC 9618 (Arp 302), an interacting galaxy in the IAU constellation Boötes. It is also known as the Red Blue of Boötes (see below).

Excrement:

This Chinese xing guan "Shi" from the Three Kingdoms to the Ming Dynasty is the star Gamma (γ) Leporis in the IAU constellation Lepus. It is a corner star in their xing guan Toilet (see above).

This Chinese xing guan "Shǐ" (屎) is the star Mu (μ) Columbae in the IAU constellation Columba.

This Chinese Chenzhuo xing guan is the star Nu (ν) 1 & 2 Columbae in the IAU constellation Columba.

Executions:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellations Libra and Virgo: HIP 71295, HIP 70513B, 236 Virginis, HIP 69658, ET Virginis (the determinative star), HIP 68763, and 83 Virginis.

This Chinese xing guan "Zhéwēi" (折威) is a bent line of stars in the IAU constellations Libra and Hydra: 50 Hydrae and 3, 4, 12, and Sigma (σ) Librae.

This Chinese Chenzhuo xing guan "Zhéwēi" is a long bending line of stars in the IAU constellations Libra and Virgo: Starting at HIP 70469 it runs through HIP 69929, HIP 69658, HIP 69269, 86 Virginis, and 82 Virginis to 90 Virginis.

Exhausted Bather:

This Ojibwe asterism, "Noondeshin Bemaadizid", is made up of the stars of the IAU constellation Hercules (Lee et al 2014). It is a bent line of stars running from 1 Herculis through Phi (ϕ), Tau (τ), and Sigma (σ) Herculis, ending at Eta (η) Herculis.

Exhausted Vine Branch:

This German asterism with the Latin name "Palmes Emeritus" is the IAU constellation Draco. Johann Bayer's *Uranometria* (1603) lists "Palmes Emeritus" as a name for Draco. German astronomer Johann Bayer (1572-1625) lists "Palmes Emeritus" as a name for Draco.

Exit Post:

This Tahitian star “Anaiva” is probably Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Edwards (2015) lists this star as “Phaethon”, and this is an ancient Greek name for Auriga, though it is also an ancient Greek name for Eridanus.

Exotic Bird:

This Chinese xing guan “Yìquè” (异雀) is made up of stars in the IAU constellations Apus and Octans: The central star is Beta (β) Apodis. From here three lines go off in one direction, and one in the other:

- One line goes from Beta (β) Apodis through Iota (ι) Apodis to Zeta (ζ) Apodis,
- One of the three lines on the other side runs from Beta (β) Apodis through Alpha (α) Apodis to Epsilon (ε) Apodis,
- One runs from Beta (β) Apodis through Delta (δ) 1 Apodis to Eta (η) Apodis, and
- The last runs from Beta (β) Apodis through Gamma (γ) Apodis to Delta (δ) Octantis.

Expeditionary Force:

This Korean asterism “Wonjeong-gun” (원정군) is the IAU constellation Orion.

NOTE: The Chinese xing guan is identical, but the Chinese call their xing guan “Send Armed Forces to Suppress (Vassal of Three Stars)” (see below).

Expelled:

This Rapanui asterism “E Tui” (“the expelled”) is the belt and sword of Orion (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

This Raivavae asterism “Tuha’a Pae” “the expelled” or “cast away pieces”) is the belt and sword of Orion (Edwards 2015).

Exploding Cigar of Ursa Major:

This **telescopic** asterism “Fumítonans Úrsae Majóris” is the edge-on starburst galaxy NGC 3034 (Messier 82) in the IAU constellation Ursa Major. It was discovered in 1774 by German astronomer Johann Elert Bode. French astronomer Pierre Méchain observed it and reported it to his supervisor, French astronomer Charles Messier, in 1779. It is listed in the General Catalogue of 1864 as GC 1950. William Herschel listed it as IV 79. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Cigar Galaxy (see above).

Extended Forearm:

This Arabic manzil “adh-dhira’ al-matsuba” (الذراعة المبسوطة) or “Al Dhirāʿ al Mabsuṭāt” (as listed by 16th century Arabic astronomer Al Tizini), “Al-Thira-a”, “al-Dhraʿ” (الذراع), or “ʾAdh-Dhirāʿ” (ٱلذِّرَاعْ) is part of their asterism Lion (see above) and is the stars Beta (β) Geminorum (Pollux) and Alpha (α) Geminorum (Castor) in the IAU constellation Gemini. It is translated as “extended forearm” or “extended arm”:

- This appears in the *Kitāb al-Tabṣira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

- Dorn (1829) lists this as “the Arm” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists “Aldi” (Dekker 2000).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “ad’dhirá, the arm or paw of the lion”.
- R. H. Allen lists the alternate name “Al Awwal al Dhirāʿ” and translates that as “first paw or forearm” in his *Star Names* in 1899.
- W. Brennand lists this as “Al-Dira” in his *Hindu Astronomy* in 1896 and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449).

This Yemeni manzil “Dhirā’” is the stars Beta (β) Geminorum (Pollux) and Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Varisco 1995).

Extended Net:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of a quadrilateral of stars of the IAU constellation Hydra: Lambda (λ), Mu (μ), and Upsilon (υ) 1 Hydrae (the determinative star) and HIP 48615. Lines extend from either end:

- One from Mu (μ) to Phi (φ) Hydrae, and
- One from Upsilon (υ) to Kappa (κ) Hydrae.

In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Zhang” (張）.was associated to matters concerning the San He territory.

This Chinese Chenzhuo xing guan “Zhāngxiù” is made up of stars in the IAU constellation Hydra: The central body is four stars: Mu (μ) Hydrae, Lambda (λ) Hydrae, Nu (ν) 1 & 2 Hydrae, and HIP 48615. From Mu (μ) Hydrae a line runs out to Phi (φ) Hydrae. From Nu (ν) 1 & 2 Hydrae a line runs out to 38 Hydrae.

This Chinese xiù (lunar mansion) “Zhāngxiù” (张宿) is made up of a quadrilateral of stars of the IAU constellation Hydra: Lambda (λ), Mu (μ), and Upsilon (υ) 1 Hydrae and HIP 49321A. Lines extend from either end:

- One from Mu (μ) to Phi (φ) Hydrae, and
- One from Upsilon (υ) to Kappa (κ) Hydrae.

This appeared as “Zhāng” (张) in the Tang Dynasty (618 – 907 C.E.) and was compared to the Vedic nakshatra Purva Phalguni (Kotyk 2017, see First Reddish One, below).

This Chinese star “Zhang” is Upsilon (υ) 1 Hydrae A in the IAU constellation Hydra. The IAU approved Zhang for Upsilon (υ) 1 Hydrae A in 2017.

Exterior Yoke:

“Ecton Uedon” is a proposed early Celtic name for the IAU constellation Pisces from the *Book of Ballymote* through an etymological reconstitution (Boutet 2014).

Extremity of the Ship:

This Arabic star “Tarfat al-safīnah” is Rho (ρ) Puppis in the IAU constellation Puppis as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Eye:

This Arabic star “ʿAyn” (عين), later latinized to “Ain”, is Epsilon (ε) Tauri in the IAU constellation Taurus. It is one corner of the triangular Hyades cluster, which is the “head” of the constellation Taurus. The IAU approved the name Ain for Epsilon (ε) Tauri Aa1. This has an exoplanet named “Amateru” after the Japanese Sun Goddess Amaterasu.

This Coptic lunar mansion “Pi-autos” or “Piautos” is two stars in the IAU constellations Cancer and Leo: Xi (ξ) Cancri and Lambda (λ) Leonis. R. H. Allen lists this in his *Star Names* in 1899, where he translates it as “the eye, [a] lunar asterism”. W.B. Yeats listed it in *A Vision* in 1917, taking it from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636. Yeats translates it as “The Parturition of Self” and Kircher described it as “seipsam parturiens” (“giving birth to itself”). Compare this to the Persian asterism Nahn (see Nose, above).

This Latin asterism “Oculus” is the IAU constellation Corona Borealis. In his *Star Names* in 1899, R. H. Allen writes that it was very “common in poetry and post-Augustan prose for any celestial luminary”.

The stars of this Kiribati asterism “Mata” have not currently been identified (Trussel and Groves 1978).

There are two **telescopic** “Eye” asterisms:

- One is the open cluster NGC 3766 (Caldwell 97) in the constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as “III 7” in his catalogue. It is GC 2468 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster, Hilda’s Cluster, “B”, and the Rich Man’s Jewel Box. South African astronomer Carol Botha (2007) describes it as “almost the shape of an eye- central grouping (figure) could be seen as a pupil”.
- One is in the IAU constellation Orion and is Ennis 42 on the observing list of Canadian astronomer Charles Ennis. Size 80’ X 35’. The “eyebrow” is a curve of the stars HIP 24059, SAO 94365, HIP 23996, HIP 23898, HD 32895, and HIP 23786. The “pupil” is a triangle of 8^{th} – 9^{th} magnitude stars to the left of center: HD 32992, HD 32979, and HD 240907. This is one end of Jeffrey Corder’s “loose group” asterism Corder 804.

Eye Drawn Downwards:

This Hawaiian star “Kamakahelei” is Omicron (ο) Ceti (Mira) in the IAU constellation Cetus. The eye drawn downwards is an insulting gesture in this culture. This name refers to their Queen Kamakahelei who ruled the islands when British explorer Captain James Cook arrived.

Eye Nebula:

This **telescopic** asterism is the planetary nebula NGC 3242 (Caldwell 59) in the IAU constellation Hydra. It was discovered in 1785 by English astronomer William Herschel who listed it as “IV 27”. John Herschel included it in his catalogue as h 3248 and later as GC 2102 in his *General Catalogue* of 1864. It is also known as the Ghost of Jupiter or the Diamond Nebula.

Eye of God:

There are two **telescopic** “Eye of God” asterisms:

- One is the planetary nebula NGC 7293 (Caldwell 63) in the IAU constellation Aquarius. It was discovered by German astronomer Karl Ludwig Harding before 1824. It is GC 4795 in the *General Catalogue* of 1864. It is also known as the Helical Nebula, the Helix Nebula, the Eye of Sauron, or the Sunflower Nebula. Size 25' X 25'.
- One is NGC 1232, an intermediate spiral galaxy in the IAU constellation Eridanus. It was discovered by in October 1784 by English astronomer William Herschel, which he listed as "II 258". It is GC 651 in the *General Catalogue* of 1864. It is also known as "Gyes Eridani" (See below).

Eye of Horus:

This Egyptian star from the Pyramid Texts is either Alpha (α) Lyrae (Vega) in the IAU constellation Lyra or Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Abdel-Hadi and Yehia, 2009).

Eye of Lynx:

This **telescopic** asterism "Pupílla Lýncis" is the barred spiral galaxy NGC 2273 in the IAU constellation Lynx. This was discovered by Nils Dunér in 1867. This became GC 5363 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it "has the appearance of an eye with a pupil".

Eye of Medusa:

This **telescopic** asterism is NGC 4194, a pair of interacting galaxies in the IAU constellation Ursa Major known as the "Medusa Merger" (see below) or "Medusa Galaxy" (see below). It was discovered by English astronomer William Herschel in 1791 who listed it as "II 867". It is GC 2788 in the *General Catalogue* of 1864. Its central gas-rich star forming region is what is known as the "Eye of Medusa".

Eye of Pisces:

This **telescopic** asterism "Óculus Píscium" is the spiral galaxy NGC 470 (Arp 227) in the IAU constellation Pisces. It was discovered by William Herschel in 1784. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Eye of Rē:

This Egyptian star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Bomhard 2009) and appears from the 18th dynasty onward.

Eye of Sauron:

There are three **telescopic** asterisms by this name, the name coming from fans of the *Lord of the Rings Trilogy* by J. R. R. Tolkien (1892 – 1973):

- One asterism is the planetary nebula NGC 7293 (Caldwell 63) in the IAU constellation Aquarius. It was discovered by German astronomer Karl Ludwig Harding before 1824. It is GC 4795 in the *General Catalogue* of 1864. It is also known as the Helical Nebula, the Helix Nebula, the Eye of God, or the Sunflower Nebula.
- One asterism is planetary nebula M 1 -42 in the IAU constellation Sagittarius.
- One is NGC 4151, an intermediate spiral Seyfert galaxy in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in March 1787 who listed it as "I 165". It

is GC 2756 in the *General Catalogue* of 1864. Size 6.8’ X 5.3’. This name was listed by American astronomer Mark Friedman on the Deep Sky Forum in May 2018. It is also known as the “Gesticulating of Canes Venatici” (see below).

Eye of Sky:

This Korean asterism “Kui” is a quadrilateral of stars in the IAU constellation Cancer: Delta (δ), Gamma (γ), Eta (η), and Theta (θ) Cancri. These form an “enclosure” around the Beehive cluster (Messier 44), which the Koreans call “Pile of Dead” (see below). The Chinese call this asterism “Ghosts” (see below).

Eye of Taurus:

This Latin star “Oculus Tauri” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus:

- Robert Hues lists “Oculus Tauri” in his *A Learned Treatise of Globes* in 1659.
- R. H. Allen lists “Oculus Tauri” in his *Star Names* in 1899. It is derived from the original Arabic “Ain al Thaur” (see Eye of the Bull, below).

Eye of the Archer:

This Arabic star “ʿain al-rāmī” (عين الرامي) later latinized to “Ain al Rami” or “ainalrami” is the triple star Nu (ν) Sagittarii in the IAU constellation Sagittarius:

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “’ayn al-rāmī”.
- Edward Sherburne lists it as “Occulus Sagittarii” (“eye of Sagittarius”) in his *Sphere of Marcus Manilius* in 1675.
- The IAU approved the name Ainalrami for the star Nu (ν) 1 Sagittarii A.
- NOTE: Ptolemy (c.100 – c.170) described this double star as “νεφελοειδής καί διπλοῦς” (“nefeloeidís kaí diploús” or “cloudy and double”), making it one of the first double stars recorded.

Eye of the Bull:

This Arabic star “’Ayn al-thawr” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus:

- “’Ayn al-Thawr” and “Ain al-Thawr” are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- “’Ayn al-thawr” is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992):
- Robert Hues lists “Hain Altor” in his *A Learned Treatise of Globes* in 1659 and translates it as “bull’s eye”.
- John Hill lists it as “Ain al Thaur” in his *Urania* in 1754
- W. Brennand lists it as “Ain al Thaur” in his Hindu Astronomy in 1896, attributing this to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “’aïn al thaur, the bull’s eye”.
- NOTE: A more common Arabic name for the star Alpha (α) Tauri (Aldebaran) is actually “’Ad-Dabarān” (see Follower, below).

R. H. Allen writes in his *Star Names* in 1899 that “Western astronomers” corrupted this to “Atin” and “Hain Ator” and “the early English Bull’s Eye”.

Eye of the Creator:

This Pomo star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper below).

Eye of the Dragon:

This Arabic star “‘Ayn al-tinnin” is Gamma (γ) Draconis in the IAU constellation Draco as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Eye of the Mad Dog:

This Seleucid star is Gamma (γ) Lupi in the IAU constellation Lupus and is part of their asterism Mad Dog (see below).

Eye of the Pig:

This Suku Bali star “Suda Malung” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is part of their asterism Wild Boar’s Jaw (see below).

Eye of the Ram:

This Sumerian asterism “mullu-lim” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is Alpha (α) Arietis (Hamal) in the IAU constellation Aries.

This Akkadian asterism “lu-li-mu” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is Alpha (α) Arietis (Hamal) in the IAU constellation Aries. R. H. Allen lists “Lu-lim” or “Lu-nit” as “Euphratian” names for this asterism in his Star Names in 1899.

Eye of the Scorpion:

This **telescopic** asterism is the globular cluster Messier 4 (NGC 6121) in the IAU constellation Scorpius. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745 and included in Charles Messier’s catalogue in 1764. It is GC 4183 in the *General Catalogue* of 1864. It is also known as the “Crab Globular Cluster” (see above).

Eye of the South:

This Italian star “Oculus Australis” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). R. H. Allen writes in his *Star Names* in 1899 that Riccioli derived this from the name “Oculus Tauri” (see Eye of Taurus, above).

Eye With Big Hole/Darkness:

This Rapanui star “Ko Te Mata Pu” or “Ko Te Mata Po Nui” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

Eyelashes:

This Arabic asterism “al-ash’ar” (الأشعار) or “Al Ashfār” is part of their asterism “Lion” (see below) and is made up of stars in the IAU constellations Hydra and Leo. This was first recorded by Ibn Qutayaba (d. 889):

- The Northern Eyelashes are the stars Lambda (λ) and Mu (μ) Leonis in the IAU constellation Leo. NOTE: R. H. Allen writes in his *Star Names* in 1899 that the “eyebrows” of the lion are Epsilon (ε) and Mu (μ) Leonis.
- The Southern Eyelashes are the stars 6, 10, and Xi (ξ) Leonis and 2 Hydrae.

Eyelid:

This **telescopic** asterism is the open cluster NGC 6863 in the IAU constellation Aquila. René Merting describes it on the Faint Fuzzies website: ”At 144x, four relatively equally bright stars in the west and north are arranged like an eyelid, a fifth star is opposite them and forms a flat sheet, but it appears very faint in comparison

Eyes:

This Arabic and Bedouin manzil “Al- Tarf” (الطرف), “ʾAṭ-Ṭarf” (ٱلْطَّرْف) or “ʾAṭ-Ṭarfah” (ٱلْطَّرْفَة), translated as “the glance” or “the eyes” has several interpretations:

- One is the stars Omicron (ο) and Epsilon (ε) Leonis in the IAU constellation Leo. These are the most probable stars described by Ibn Qutayba (d. 889), who wrote that a group of stars called “al-ash’ar” (See Eyelashes, above) were located in front of them.
- One, “at-Tarf” (الطرف), is the stars Lambda (λ) and Kappa (κ) Leonis in the IAU constellation Leo and was described as the stars in front of Omicron (ο) and Epsilon (ε) Leonis by 'Abd al-Rahman al-Sufi (903 – 986) a century after Ibn Qutayba. This was later latinized to “Alterf”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Elterf, or Al-tarf, the Lion’s glance”. W. Brennand lists this as “Al-Terpha” in his *Hindu Astronomy* in 1896 and translates it as “the lion’s eyes”. The IAU approved the name Alterf for Lambda (λ) Leonis.
- One is the star Beta (β) Cancri in the IAU constellation Cancer. It was later latinized to “Tarf”, “Al Tarf”, or “Altarf”. This is in “front” of the “lion” which is the IAU constellation Leo, hence the name. The IAU approved the name Tarf for the star Beta (β) Cancri A.

This Yemeni manzil “Ţarf” is made up of stars of the IAU constellations Cancer and Leo (Varisco 1995): Kappa (κ) Cancri and Lambda (λ) Leonis. This appears in the *Kitāb al-Tabşira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

This KhoiKhoi asterism “Mura” is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Slotegraaf 2013).

There are two **telescopic** Eyes asterisms:

- One is a pair of interacting galaxies in the IAU constellation Virgo: Lenticular galaxy NGC 4438 and barred lenticular galaxy NGC 4435 (Arp 120). These were discovered by English astronomer William Herschel in 1784: Herschel listed them as “I 28.1” and I 28.2”. They are GC 2991 and GC 2994 in the *General Catalogue* of 1864. It is also known as “Copeland’s Eyes” as it was named “the Eyes” by Scottish astronomer Ralph Copeland (1837 – 1905) and as Markarian’s Eyes, as it is part of Markarian’s Chain of galaxies. This name appears as “Óppa Vírginis” (NGC 4435) and

"Omma Virginis" (NGC 4438) in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010), basically naming them as the "left" and "right" eyes.

- One is reflection nebula NGC 6914 in Cygnus. This was discovered by astronomer Édouard Stephan on 29 August 1881. This includes LBN 274 and LBN 280. It is also known as the "Bluebird".

Eyes of Christ:

This Quechua asterism "Ñawin Cristo" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Urton 1981).

Eyes of the Beautiful Three:

This Rapanui asterism "He Mata", "Mata Te Tautoru", or "Mataa Te Tautoru" is Gamma (γ) Orionis (Bellatrix) and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

Eyes of the Emu:

This Karajá asterism "Biura-et-kú" is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (De Freita Mourão 2009).

Eyes of the Lion:

This KhoiKhoi asterism "Xami di Mura" is the double star Mu (μ) 1 and 2 Scorpii in the IAU constellation Scorpius (Slotegraaf 2013). The IAU approved the name Xamidimura for the star Mu (μ) 1 Scorpii Aa in 2017.

Eyes of the Llama:

This Inca asterism "Llamacnawin" or "Llamaqñawin" (Gamarra & Gamarra 2009, Urton 1981 & 2022) is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus and is part of their asterisms "Catachillay" (see Female Llama, below) and "Yacana" (see Black Llamas, above).

This Quechua asterism "Llamañawi" is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Ciancia 2018).

Eyes of the Rayfish:

This Karajá asterism "Borórruéneare" is the stars Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa) in the IAU constellation Crux (De Freita Mourão 2009) and part of their asterism "Boró" (See Rayfish, below).

F:

This **telescopic** asterism is in the IAU constellation Eridanus and appears on Brazilian astronomer Bruno Alessi's BDCC 7.6 list. Jeffrey Corder lists it as Corder 563 and attributes it to American astronomer John A. Chiravalle. The upright of the "F" has HIP 17143 at the base. HIP 17063 and HIP 17088 form the middle crossbar of the "F". the top crossbar is a line of four stars running from HIP 16989 at the tip through HIP 16960 and then through a 9th magnitude double star to an 8.25 magnitude star. Size 55'.

F 117 Nighthawk:

This **telescopic** asterism is Ennis 20 on the observing list of Canadian astronomer Charles Ennis and is in the IAU constellation Cassiopeia. Size 115' X 70'. This resembles the USAF stealth bomber by this name.

- The "fuselage" is defined by the stars HIP 117775, 117830, the variable star HIP 181 and the double star HIP 99
- The "leading edges" of the "Nighthawk's wings" sweep back from this:
    - One "leading edge" is the variable star HIP 117830, the double star HIP 118090, HIP 124, and the rotating variable star HIP 418
    - The other "leading edge is the double star HIP 117775, and the stars HIP 118116, and 43.

Fa'a-nui:

This Tahitian asterism is the IAU constellation Auriga.

Fabergé Egg:

This **telescopic** asterism is NGC 4605, a dwarf barred spiral galaxy in the IAU constellation Ursa Major. It was discovered by English astronomer William Herschel in 1790 who listed it as "I 254". It is GC 3142 in the *General Catalogue* of 1864. It is also known as the Frankenstein Galaxy (see below). NOTE: The Fabergé egg was created by the House of Fabergé in Saint Petersburg, Russia, in 1885, so the name cannot predate this. Stephen James O'Meara named it both the "Faberge Egg" and the "Frankenstein Galaxy" in his *Hidden Treasures Catalogue* (2007).

Face:

This Kalinago asterism "Ombatapo" is the IAU constellation Coma Berenices.

There are two versions of the Carib asterism "Onbatapo" (Magaña, and Jara, 1982) which Carib myths describe as the remains of a great-grandmother Urayumaka who was partially eaten by pataka fishes or sharks. Its rising marks the drying out of marshes and streams:

- One is the Southern Cross asterism in the IAU constellation Crux,
- One is made up of stars of Canis Major and Puppis: One "earring" is the line of stars Eta (η) and Delta (δ) Canis Majoris. The other "earring" is the stars Chi (χ) and Xi (ξ) Puppis. The "face" is the curve of stars between the "earrings": Starting at HIP 36795 it runs through HIP 35817A, m Puppis, HIP 37229B, p Puppis, HIP 36258, HIP 35848, HIP 35427, Tau (τ) Canis Majoris, and 29 Canis Majoris to 145 Canis Majoris.

This **telescopic** asterism is Sánta 215, listed in 2017 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "face or hook of a dozen stars 7.6 – 10 magnitude" in the IAU constellation Monoceros.

Face of the Lord:

This Czech asterism "faciem Domini maxima" was created by Czech astronomer, optician, and friar Antoine Marie Schyrle de Rheita in 1643. It is a rectangle of stars with the corners being Rho (ρ) and Omicron (ο) Leonis, Beta (β) Sextantis, and Iota (ι) Hydrae. De Rehita writes "Sudarium Veronicae sive faciem Domini maxima similitudine in astris expressum" ("The shroud of Veronica, or the face of the Lord, expressed in the greatest similitude in the stars"). Compare this to Shroud of Veronica, below.

Fafnir:

This IAU star is 42 Draconis A in the IAU constellation Draco and was given this name by the IAU in 2015. Fafnir is a dwarf in Norse mythology who turned into a dragon. It has an exoplanet named Orbitar.

Fail Inis:

This Irish asterism is the IAU constellation Canis Minor. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). Failinis is a dog belonging to the God Lugh Lámhfhada in Irish mythology.

Faint One:

This Arabic star "al-Khawwār" (الخوار) or "al-ẖawwār" is 80 Ursae Majoris in the IAU constellation Ursa Major and later latinized to "Alcor":

- Dorn (1829) lists it as "Al-djoun". In Germany it became "Alkor".
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as "Alkor".
- The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Alcor".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782 lists this star as "Alcor".
- William Henry Smyth (1788 - 1865) insisted that the name Alcor wasn't derived from an Arabic name and came up with a name related to a Black Horse (see below).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alcor".
- Scottish uranographer Alexander Jamieson (1782 – 1850) listed this star as "Alcor" in his *Celestial Atlas* in 1822.
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists "Alcor".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Alcor".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Alcor": The author is unknown, but it is based on Jamieson's *Celestial Atlas.*
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Alcor".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alcor".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Alcor" for this star.
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alcor" and describes it as the "near one".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Alcor".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list the name "Alcor" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alcor" for this star.
- The IAU approved the name Alcor for 80 Ursae Majoris in 2016.
- Compare this to Forgotten One, below.

- Alcor was the smallest of the stars noted in Medieval Chinese, Arab, and Latin texts (Berezkin 2005).

Faint Uranus:

This **telescopic** asterism is planetary nebula NGC 6818 in the IAU constellation Sagittarius. It was discovered by English astronomer William Herschel in 1787 who listed it as "IV 51". It is GC 4510 in the *General Catalogue* of 1864. South African astronomer Magda Streicher makes several observational entries on the DOCdb website describing this as resembling a "faint Uranus". It is also known as the Little Gem Nebula (see below).

Fairy:

This **telescopic** asterism is a dust cloud that is part of the nebulosity of the Eagle Nebula Messier 16 (NGC 6611, IC 4703, SH 2-49, RCW 165, LBN 67, Cr 375, Mel 198, Ced 159).in the IAU constellation Serpens.

Fairy Lady's Palace:

This Hungarian asterism "Tündérasszon pasotája" is the IAU constellation Ursa Minor. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a castle.

Fairy Ring:

See Chaple's Arc, above.

Fairy's Dance:

This Hungarian asterism "Túnderök tánca" is possibly the stars of the IAU constellation Hercules. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a group of fairies dancing in a circle.

Faith:

R. H. Allen writes in his *Star Names* in 1899 that 1st century Roman poet Marcus Manilius "seems to have made two distinct constellations of Ptolemy's constellation Lyra: "Lyra" and "Fides" ("faith"), although we do not know their boundaries (see Fidicula, below).

Faith, Hope, and Charity:

This asterism is the stars Alpha (α) Carinae (Canopus) in the IAU constellation Carina, Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus, and Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus as listed by Dante Alighieri (1265 – 1321) in his *Purgatorio*.

Faith of Orpheus:

This asterism "Orphei Fides" is the IAU constellation Lyra as listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Falcon:

This Egyptian Dendera asterism is made up of the stars of the IAU constellations Camelopardalis and Ursa Minor (Hoffman 2017). The central star is Zeta (ζ) Ursae Minoris:

- Zeta (ζ) Minoris forms the corner of a triangle with Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris.
- From Zeta (ζ) Minoris two lines of stars run out:
    - One runs to a bend at Epsilon (ε) Ursae Minoris and ends at Alpha (α) Ursae Minoris (Polaris),
    - One runs to HIP 62572A and then splits into two lines:]
        - One runs to HIP 47193, and
        - One runs to VZ Camelopardalis.

NOTE: A falcon appears alongside the Greek asterism Archer (see above) on the *Daressy Zodiac* of the Roman Imperial Period.

Falcon of Horus:

This Egyptian asterism from the Old Kingdom (3100 B.C.E.) is the IAU constellation Aquila (Berio 2014).

Fallen Off of Coma Berenices:

This **telescopic** asterism "Delápsus Cómae Bereníces" is the spiral galaxy NGC 4450 in the IAU constellation Coma Berenices. This was listed by William Herschel as "II 56" and "II 90". John Herschel listed it as h 1282 and later as GC 3003 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the most conspicuous dust lane doesn't start near the nucleus but looks as if it is fallen far from its natural place of origin".

Fallen Star:

This Lakota star is unidentified at present but may be one of the stars in Ursa Major. Fallen Star was a supernatural hero who was the son of Polaris and one of the Maghpia Oyate ("cloud people") and a protector of the Lakota.

Falling Bird:

This telescopic asterism is Alessi 21 from the lists of Brazilian astronomer Bruno Alessi, which is in the IAU constellation Monoceros. René Merting describes it on the *Faint Fuzzies* website: "Cluster looks like a bird falling to the southeast, the stars are arranged similar to ASCC 101 in the constellation Lyra.

Falling Cross:

This Arabic asterism "Al Ṣalīb al Wāki῾" is made up of stars in the IAU constellation Draco: Beta (β) Draconis (Rastaban) and Xi (ξ) Draconis forming the perpendicular, with Gamma (γ), Mu (μ), and Nu (ν) Draconis the traverse:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Awáyid and El salib wáki… the Falling Cross and describes this as "β, γ, ξ, and μ; of which β and ξ are supposed to be joined by the perpendicular, and γ and μ by the transverse beam of the cross" and later as "el salib, the cross".

Falling Eagle:

This Latin asterism “Aquila Cadens” is the IAU constellation Lyra, which was often represented on renaissance star maps as an eagle carrying a lyre. Compare this to Alighting Vulture, above. R. H. Allen lists the variation “Falling Grype” in his *Star Names* in 1899.

Falling Man:

This **telescopic** asterism is in the IAU constellations Cassiopeia and is Ennis 32 on the observing list of Canadian astronomer Charles Ennis. Size 85’ X 60’:

- His “body” is bounded by 4 stars: HIP 10519, 10606, 10462, and an optical double (magnitude 7.75 & 8.35).
- One “leg” runs from HIP 10606 to HIP 10830.
- The other leg runs from HIP 10462 through an 8.25 magnitude star to a short arc of four stars (Corder 361) ending in HIP 10736.
- One “arm” runs from HIP 10519 through a line of 9th magnitude stars to a “wrist” at HIP 10544 and a “hand” at HIP 10610.
- One “arm” runs from the optical double through a 7th magnitude star to a “wrist” at HIP 10257 and a “hand” which is a magnitude 8.4 star.
- Between the raised “arms” is a triangle of stars (magnitude 8.35, 8.70, & 9.05) which form his “head”.

Falling Vulture:

This Latin asterism “Vultur Cadens” is the IAU constellation Lyra, which was often represented on renaissance star maps as a vulture carrying a lyre:

- The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel labels this constellation “Vultur Cades” and depicts it as an eagle with its wings partially extended.
- The celestial globe depicted in Hans Holbein’s *Double Portrait of Jean de Dinteville, the Bailly of Troyes, and Georges de Selve, Bishop of Lavaux* (more commonly known as “*The Ambassadors*”) from 1533 lists “VVLTVR CADENS” (Dekker & Lippincott, 1999).
- Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515 list this as “Vultur Cadens”, but those from 1534, and 1535 list “Lyra” (Dekker & Lippincott, 1999). Celestial globe gores (1517) of Schöner depicts “Vultur Cadens” as an eagle whose body is some sort of violin.
- A celestial globe atop a planetary clock modified by Oronce Fine in 1553 (the “Paris Globe”) lists “VVLTVR CADENS” (Dekker & Lippincott, 1999).
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Lyra, sev, Vultur Cadens” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Cadens Lyra Vultur” as a harp decorated as an eagle with extended wings.
- Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Vultur Cadens” for this constellation.
- Johann Bayer’s *Uranometria* (1603) lists the name “Vultur Cadens” for this constellation but also lists this as an alternate name for Cygnus.

- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Vultur Cadens” as a name for Cygnus.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Lira” and “Vultur Cadens” and depicts it as a six stringed instrument such as a violin.
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) list the names “Lyra” and “Vultur Cadens” for this constellation.
- Robert Hues lists “Vultur Cadens” in his *A Learned Treatise of Globes* in 1659.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Lyra” as an eagle carrying a lyre and has the subtitle “Vultur Cadens”.
- John Hill lists “Vultur Cadens” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Vultur Cadens”.
- R. H. Allen writes in his *Star Names* in 1899 that this Latin name has occasionally been used for Cygnus. Compare this to Alighting Vulture, above.

Falling Wand:

This Latin asterism “Virgula Jacens” is the IAU constellation Sagitta. Johann Bayer’s *Uranometria* (1603) lists the name “Virgula Iacens”. “Virgula Jacens” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. “Virgula Jacens” is listed by R. H. Allen in his *Star Names* in 1899.

False Blossom Cluster:

This Māori star “Puanga-hori” (‘false Puanga”) is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. It is called this to distinguish it from their star Puanga or Puanga-rua (see Blossom Cluster, above).

False Comet:

This **telescopic** asterism is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius, also known as the Northern Jewel Box, The Table of Scorpius, and the Crocodile. It is located a half a degree north of Zeta (ζ) Scorpii. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654, who called it Luminosae (Italian for “bright”). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel’s catalogue as h 3652. The cluster forms the head of the “false comet”, with stars running north from Zeta (ζ) Scorpii and NGC 6231 to a point roughly halfway to Mu (μ) Scorpii. The tail is formed by two clusters: Collinder 316 and Trumpler 24. Trumpler 24 is surrounded by the emission nebula IC 4628 (the Prawn Nebula) which gives the impression of the false comet’s tail fanning out. According to the Saguaro Astronomy Club asterisms list, this name originated in Australia.

False Cross:

This diamond-shaped asterism is composed of four stars. Two are in the IAU constellation Vela: Delta (δ) Velorum (Alsephina) and Kappa (κ) Velorum (Markab). Two are in the IAU constellation Carina: Epsilon (ε) Carinae (Avior) and Iota (ι) Carinae (Aspidiske). Although its component stars are not quite as bright as those of the Southern Cross (see Southern Cross below), it is somewhat larger and better shaped than the Southern Cross, for which it is sometimes mistaken, causing errors in astronavigation. Like the Southern Cross, three of its main four stars are whitish and one orange.

False Kids:

This asterism is in the IAU constellation Auriga and is the stars Upsilon (υ), Nu (ν), and Tau (τ) Aurigae. The asterism Kids (see below) is actually located near the star Alpha (α) Aurigae (Capella). This is listed in Brazilian astronomer Bruno Alessi's BDCC 7.6 list.

False Pleiades:

This **telescopic** asterism is made up of the stars of the IAU constellations Cepheus and Ursa Minor close to Alpha (α) Ursae Minoris (Polaris). The seven stars include 2 Ursae Minoris, HIP 115746, 109693, 112833, 113116 and 112519. It is also known as the "Seven Sisters of the Pole".

False Scale Beam:

This Arabic asterism "al-mīzān al-baṭīl", later latinized to "Mizan Batil" is made up of three stars in the IAU constellation Orion in the "sword" of Orion:

- 42 Orionis (Mizan Batil I)
- Theta (θ) 2 Orionis (MIzan Batil II), and
- 49 Orionis (Mizan Batil III).

Compare this to the Arabic asterism Scale Beam (see below). NOTE: In his *Star Names* in 1899, R. H. Allen lists the stars as 42 Orionis, Theta (θ) Orionis, Iota (ι) Orionis (which are all in the "sword") and Kappa (κ) Orionis (which is one of the "feet" of Orion and off line with the sword).

False Spouse of Leo:

This **telescopic** asterism "Pseudocónjunx Leónis" is the barred spiral galaxy NGC 2874 (Arp 307) in the IAU constellation Leo. This was discovered in 1784 by English astronomer William Herschel who listed it once as "II 58" and later as "II 547". John Herschel listed it as h 598 and later as GC 1840 and GC 1847 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "NGC 2874 is positioned close to NGC 2872 but does not form a physical pair with it".

False Tail of Cetus:

This **telescopic** asterism "Pseudúrus Céti" is the barred spiral galaxy NGC 151/3 in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1785. Lewis Swift observed it in 1886 and catalogued it as NGC 153, but it was later discovered to be NGC 151. This is GC 74 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it appears to have a tail.

Familiar Gods:

This Byzantine asterism "Ἑφέστιοι" ("Eféstioi") is the IAU constellation Gemini as listed by 5th century theologian Theodoret of Cyrus.

Family:

This Wichi asterism "Patsezlai" is the Pleiades cluster in the IAU constellation Taurus (Mariani 2017). They also call it the Hunters (see above). There are several stories relating to this. In one the Moon is their father and the Star Woman Venus their mother. As they grow up, they fall to the Earth and impregnate the soil. In another they are grandchildren of jaguar who have fled into the sky. Another

makes Patsezlai a being that can steal the husek (roughly equivalent to a soul) of infants or children who stare too intently at the sky.

Family Group:

This Assyrian asterism "Kimtu" or "Kimmatu" is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

This Syrian asterism "Kīmā" is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. 19th century German scientist and explorer Alexander von Humboldt listed this as "Gemat" in his *Cosmos: A Sketch of a Physical Description of the Universe.*

Family of Aba Bzay:

This Bedouin asterism "Āl Aba Bzay" (آل أبا بزي) is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris in the IAU constellation Ursa Minor.

Famine:

This Karanga asterism "Mazhara" is the Small Magellanic Cloud.

This Tswana asterism "Tlala" ("famine" or "drought") is the Small Magellanic Cloud. They called it this as food was scarce when it was in the sky in winter.

This Venda asterism "ndala" is the Large Magellanic Cloud. They called it this as food was scarce when it was in the sky in winter: Compare this to their asterism "tšefefo" (see Winter, below).

This Tswana and Sotho asterism "Tlala le kgora" is the IAU constellation Orion.

Famous Argo:

This Latin asterism "Nobilis Argo" is the asterism Argo's Ship (see above) as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.

Fan:

This Nahwal (Tanna) asterism "Kelel" (Ramik 2019) is made up of stars in the IAU constellation Orion: Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), Beta (β) Orionis (Rigel), Kappa (κ) Orionis (Saiph), and Zeta (ζ) Orionis (Alnitak). Compare this to the Netwar asterism "Kilil" (see Palm Fan, below).

There are three **telescopic** "Fan" asterisms:

- One is HII region NGC 2359 (SH 2-298. RCW 5, LBN 1041, Ced 94b)in the IAU constellation Canis Major surrounding the Wolf Rayet star WR7. Size 10' X 15'. It was discovered by English astronomer William Herschel in 1785 who listed it as "V 21" in his catalogue. It is GC 1511 in the *General Catalogue* of 1864. Swedish astronomer Sven Cederblad described it as a "fan shaped object" in 1946. It is also known as the "Duck Nebula", the "Duck Head Nebula", the "Flying Eye Nebula", the "Bust Silhouette", "Thor's Helmet", or the "Whistle Nebula".
- One is O'Neal 4 in the IAU constellation Lepus. René Merting describes it on the *Faint Fuzzies* website as "six equally bright, relatively faint stars form a conspicuous equilateral triangle", this being the "fan", including HIP 27232 and 27185. Two more stars form the "handle". Size 17' X 11'.

- One Japanese Fan is open cluster NGC 6025 (Caldwell 95) I n the IAU constellation Triangulum Australe. This was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1755. South African astronomer Magda Streicher (2009) described it as a “Japanese Fan”.

Fan-Tailed Cockatoo:

This Boorong asterism “Yurree” is made up of stars of the IAU constellation Gemini as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010) and is the fan tailed cockatoo (Cacomantis flabeliformis). The star Alpha (α) Geminorum (Castor) is the body with the fan tail being an arc of stars 70, 71, and 80 Geminorum and HIP 37580 and 38319 forming the base of a triangle with Castor. Yurree is one of the Two Hunters (see below) who pursue Purra (see Red Kangaroo, above).

This Wotjobaluk asterism “Turree” or “Yurree” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Hamacher 2011) and is part of their asterism Two Hunters (see below).

Fang:

See Room, below.

Fanui-tai:

This Polynesian (Tuamotu Archipelago) asterism is the IAU constellation Cygnus.

Farm Hand:

This German star “Landarbeiter” is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

Farm of Capital City:

This Korean asterism “Sudoui Nongjang” (수도의 농장) is a line of two stars in the IAU constellation Virgo: Tau (τ) and Omicron (ο) Virginis.

Farmstead:

This Gond asterism “Medi” is made up of stars of the IAU constellations Canis Major, Leo, Lepus, and Orion (Vahia 2014).

Fast Stars:

This Estonian asterism is the IAU constellation Cygnus and originates on the island of Saaremaa (Kuperjanov 2006).

Fat Camel:

This Arabic star “Al Fatīḳ” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and by R. H. Allen’s *Star Names* in 1899.

Fat Month Guiding Star:

The Celtic “PRIN” or guiding star in the Sequani Calendar in the third month, “Riuros” or “Rivros”, is Alpha (α) Leonis (Regulus) in the IAU constellation Leo. Ruiros is probably related to the Old Irish “remor” (stout, fat, thick) and Welsh “rhef” (thick, stout, great, large) so this name probably translates as “fat month”.

Fat One of Aquarius:

This **telescopic** asterism "Páchys Aquárii" is the spiral galaxy NGC 7377 in the IAU constellation Aquarius. It was discovered in 1786 by William Herschel who listed it as "II 598". It became GC 4834 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Fat One of Dorado:

This **telescopic** asterism "Crássa Dorádus" is the elliptical galaxy NGC 1549 in the IAU constellation Dorado. It was discovered by James Dunlop in 1826. It became h 2629 on John Herschel's list and later GC 834 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Fatana-lalo:

See Fatana-lua below.

Fatana-lua:

This Tongan asterism, also known as "Fata-olunga" and "Fata-lalo" is the IAU constellation Coma Berenices.

Fatana-olunga:

See Fatana-lua above.

Father:

This Quechua asterism "Tatalito" is dark nebulosity in the Milky Way (Ciancia 2018). Alternate names include "Llamero" (see Llama Herder, below) and "Hondero" (see Slinger, below).

Father, Mother and Child:

This Tasmanian asterism is made up of stars in the IAU constellations Centaurus and Crux (Robinson 1873, Clarke 2009). The parents are Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) and the child is believed to be Alpha (α) Crucis (Acrux).

Father of All Snakes:

This Barasana asterism "Anya Haku" is the IAU constellation Scorpius. (Hugh-Jones 2006). This is an alternate name for their asterism "Iya Yai" (see Caterpillar Jaguar, above).

Father of Tinniinyaranna:

This Kaurna star "Parnakkoyerli" is Beta (α) Orionis (Rigel) in the IAU constellation Orion (Hamacher 2015) and is related to their asterism "Tinniinyaranna" or "Kukukurkurra" (see Young Hunters, below).

Father of Ursa Major:

This **telescopic** asterism "Úranus Úrsae Majóris" is the interacting galaxy NGC 5218 in the IAU constellation Ursa Major. The two galaxies NGC 5216 and 5218 were discovered in 1790 by English astronomer William Herschel who listed them as "II 841" and "II 842". They became GC 3590 and GC 3592 in the *General Catalogue* of 1864. This system is named Keenan's System after the American astronomer Philip C. Keenan who studied them in 1935 and published a paper on the bridge of galactic

material connecting the two galaxies. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it in reference to the name they gave to NGC 5216 ("Mother of Ursa Major"). They called it "Úranus" as Ouranos was the God who inseminated Gaia, the mother of the Titans.

Father St. James:

The stars of this Quechua asterism "Tata Santiago" are unidentified at present (Ciancia 2018).

Fatigued Warrior:

This Polynesian asterism from the Marquesas Islands "Pao-toa" is the IAU constellation Aquila.

Fatty Tail of a Lamb:

There are three Arabic stars or asterisms with this name:

- One, "alyat al-hamal" (ألية الحمل), is the Pleaides Cluster in the IAU constellation Taurus. NOTE: The Arabic word "hamal" refers to a first-year lamb, not a sheep, but some translate this as "fatty tail of a sheep".
- One, "al-Alyah" (الألية) is the star Theta (θ) Serpentis in the IAU constellation Serpens and later latinized to "Alya" in the *Palermo Catalogue* of Giuseppe Piazzi (1786 – 1846) and "Alga". The IAU approved the name Alya for Theta (θ) 1 Serpentis A. NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Alyah… the broad sheep's tail" as a name for Alpha (α) Serpentis (Unukalhai) and for Theta (θ) Serpentis.
- One, "alyat al-hamal" (ألية الحمل), later latinized to "Alioth", "Allioth", "Aliioth", "Alyah", and "Alyat" is the star Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major:
  - "Alioth" first appeared in the first edition of the *Alfonsine Tables* (1483).
  - English author Geoffrey Chaucer (c.1340s – 1400) listed it as "Aliot" in his *Hous of Fame.*
  - The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Alioth"
  - The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists "Alioth" for this star.
  - German astronomer Johann Bayer (1572-1625) listed it as "Aliath" and "Risalioth" (quoting French scholar Joseph Justus Scaliger (1540 – 1609)). Johann Bayer's *Uranometria* (1603) lists "Ris Alioth" and "rictius Aliath" ("more correctly Aliath") for this star. NOTE: Bayer lists "Alahague" and "Alangue" as alternate names for Ophiuchus in his *Uranometria*.
  - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Alioth".
  - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alioth".
  - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Alabieth", "Alaioth", "Alhiath", "Alcore", and "Alhaiath".
  - Later editions of the *Alfonsine Tables* and the 1515 edition of the *Almagest* listed "Aliare", and "Aliore".
  - Robert Hues lists "Aliare" and "Aliath" in his *A Learned Treatise of Globes* in 1659.
  - The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this star "Alioth".

- American uranographer William Croswell (1760 – 1834) lists this star as “Alioth” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Alioth” in his *Celestial Atlas* in 1822.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists “Alioth”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Alioth”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as “Alioth”.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Alioth”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Alioth”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Alioth” and describes it as “the tail-sheep”.
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) list “Alioth” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Alioth” for this star.
- The IAU approved the name Alioth for Epsilon (ε) Ursae Majoris A.

NOTE: R. H. Allen in his *Star Names* in 1899 associates the names “Alioth”, “Alyah”, and “Alyat” with Theta (θ) Serpentis and reports that English astronomer William Henry Smith lists the names “Alangue” and “Ras Alangue” for this star. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Alangue and Ras Alaugue” as names for Alpha (α) Serpentis (Unukalhai) in the *Alfonsine Tables*.

Favdna:

This Sami star “Favdna” or “Favtna” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Persson 2022). Favdna is hunting the reindeer Sarva (see Reindeer, below).

Favdna’s Bow and Arrow:

To the Sami peoples, “Favdna” or “Favtna” was “the Hunter” (Lundmark 1982), the star Alpha (α) Boötis (Arcturus)- see Hunter, below. Favdna’s bow and arrow was the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). Favdna hunted Sarva the elk (see Elk above)). Favdna had to be very careful as if he missed Sarva and hit the sky support Boahjenaste (Alpha (α) Ursae Minoris (Polaris)- see “Sky Support” below), the sky would fall. The “bow” is the handle of the Big Dipper extended down to Beta (β) Ursae Majoris (Merak). The “arrow” is a line between Gamma (γ) Ursae Majoris (Phecda) and Alpha (α) Ursae Majoris (Dubhe).

Favorable Judge:

This Akkadian star “Dayan Sidi” is Alpha (α) Draconis (Thuban) in the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899.

Fawaris:

See Riders, below.

Fawn:

This star “al Hurr” is Lambda (λ) Aurigae in the IAU constellation Auriga as depicted on the Borgian globe. This is probably a corruption of the Arabic name Al Ḥibāʿ (ألحباع) – see Tent, below.

This Celtic (Gaulish) asterism “Elembos” is the IAU constellation Leo (Boutet 2017). Compare this to their asterism Deer (see above).

Fawns:

This Tiwa asterism is the Belt of Orion in the IAU constellation Orion.

Fearsome Eel:

This Rapanui star “Vari Koreha” or “Veri Koreha” is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Edwards and Edwards 2016, Edwards et al 2018). The Edwards give an alternate translation as “centipede curling into a circle). In 2010 the Edwards described this as “giant eel” and listed the star as Fomalhaut.

Feather:

This Sahtúotine star “k’it’a” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Cannon 2021). It is the fletching of an arrow.

Feather in Hercules’ Cap:

This **telescopic** asterism is a line of stars near Rasalgethi: Starting at 60 Herculis it runs through 34, 33, and 32 Ophiuchi, HIP 83435, HIP 83308, and then widening into a fan of 6th magnitude stars ending at HIP 82028. It was first recorded by Roland Deschesne of the Calgary Centre of the RASC.

Feather of Lynx:

This **telescopic** asterism “Pénna Lýncis” is the peculiar spiral galaxy NGC 2782 (Arp 215) in the IAU constellation Lynx. William Herschel listed this as “I 167”. John Herschel listed this as h 568 and later as GC 1778 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “the large faint halo at the eastern side of this galaxy looks like a feather”.

Fed:

This American asterism “The Fed” is made up of stars of the IAU constellation Cetus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is depicted as a federal law enforcement officer on a four wheeled all terrain vehicle: He is using binoculars to watch their asterism the “Hippie” (see below).

Fedora:

This telescopic asterism is in the IAU constellation Vela and is Ennis 52 on the observing list of Canadian astronomer Charles Ennis. Size 75’ X 50’. The “brim” is formed by the stars HIP 40088, HD 68806, the double stars HIP 40183, HD 69023, HIP 40299, HD 69257, the double star HIP 40285, HIP 40155, HIP 40109, and HD 68628. The “crown” of the hat is the stars HIP 40397, HIP 40478, HD 69493, and the double star HIP 40357. This includes stars of Corder 1536 on Jeffrey Corder’s list.

Feet:

The stars of this Kiribati asterism “Wae” or “Te Wae” are currently unidentified (Trussel and Groves 1978).

Feet of the Bulls:

This Flemish asterism “Pedes Se Tauris” is the IAU constellation Crux. Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists both this name and “Cruzero” for Crux and depicts it as a crucifix.

Feet of the Old Man:

This Babylonian asterism “GÌR.MESH SHU.GI” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 and is Beta (β) Persei (Algol) in the IAU constellation Perseus and is part of their asterism Old Man (see below).

Feet of Suhail:

This Arabic star “Qadam Suhail” is a star near Alpha (α) Carinae (Canopus) in the IAU constellation Carina, and from the description is probably the Large Magellanic Cloud. This was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Fehrenbach's Star:

This **telescopic** star is HD 116745 in the Omega Centauri globular cluster in the IAU constellation Centaurus. It is named after French astronomer Charles Fehrenbach (1914 – 2008).

Felixvarela:

This **telescopic** Cuban star is HIP 2247 (BD-17 63) in the IAU constellation Cetus (magnitude 7.03). It was given this name in the IAU NameExoWorlds campaign. It is named for a noted science teacher, Félix Varela. It has an exoplanet named Finlay after Carlos Juan Finlay (1833 – 1915), a pioneer in research of yellow fever.

Fellow Player of Cancer:

This **telescopic** asterism “Sympaéstor Cáncri” is the spiral galaxy NGC 2648 (Arp 89) in the IAU constellation Cancer. It was discovered in 1784 by William Herschel who listed it as “III 49”. It became GC 1688 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because it “appears to play with its small companion MCG+2-22-6”.

Feluco:

This German asterism is the IAU constellation Sagitta as listed by German astronomer Johann Bayer (1572-1625) in his Uranometria (1603) and listed in R. H. Allen’s *Star Names* in 1899. The meaning is obscure, Allen describing it as “unintelligible”.

Female Brolga:

This Boorong asterism “Kourt-chin” or “Kourtchin” refers to the brolga (a species of wetland bird) and was listed by Stanbridge (1857), Morieson (1999) and Hamacher and Frew (2010). This asterism is

made up of the stars of the IAU constellations Dorado, Reticulum, and Volans with the Large Magellanic Cloud in the middle:

- The center of the female brolga's "body" is the Large Magellanic Cloud and the star Theta (θ) Doradus,
- The "wing tips" are Gamma (γ) Hydri and Beta (β) Doradus,
- Its "head" is Beta (β), Kappa (κ), and Zeta (ζ) 2 Reticuli, and
- Its "feet" stretch down to Zeta (ζ) and Delta (δ) Volantis.

See Male Brolga below for comparison and compare this to the Kamilaroi asterism Brolga (see above).

Female Camel:

This Arabic star "Al Muḥdij" is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and by R. H. Allen's *Star Names* in 1899. Allen calls the stars around it "Little Camels", which suggests that this is a variation of the Arabic asterism Young She Camels (see below).

Female Crow:

This Boorong asterism, "Collowgulloric War", is in the IAU constellation Carina as listed by Stanbridge (1857), Morieson (1999) and Hamacher and Frew (2010). Collowgulloric is the wife of War (see Crow, above) and the stars around her are her children. Her "body" is centered on the star Eta (η) Carinae and the HII region around it, NGC 3372 (Caldwell 92). Her "wings" are two lines of stars:

- One runs from t2 Carinae through s Carinae to HIP 50785, and
- The other runs from HIP 52922A through u Carinae to x Carinae (which is next to NGC 3532 (Caldwell 91), the Wishing Well Cluster, one of our **telescopic** asterisms).

This Wotjobaluk asterism "Collow-collouricwar" is Eta (η) Carinae in the IAU constellation Carina (Hamacher 2011).

Female Giraffe:

This Tswana asterism "Thutlwa a namagadi" is the False Cross (see False Cross, above).

This G/wi and //Gana asterism "n//abedzi" is the IAU constellation Crux (Alcock 2014). There is another version of this: see Female Giraffes (below).

Female Giraffes:

This G/wi asterism "n//abedzi" is the is the Southern Cross in the IAU constellation Crux. Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa) are mother giraffes and Delta (δ) and Gamma (γ) Crucis are their daughters. Compare this to Giraffe's Eyes, below. Three is another version of this: See Female Giraffe (above).

Female Grape Gatherer:

This Latin star "Vindemiatrix" ("female grape gatherer") is Epsilon (ε) Virginis in the IAU constellation Virgo:

- This name appears in the 15th century *Alfonsine Tables*.

- 1st century Roman writer Lucius Junius Columella listed it as “Vindemiator” and Publius Ovidius Nasso (Ovid) listed it as “Vindemitor”.
- 1st century Roman architect Vitruvius listed it as “Provindemiator” and “Provindemia Major”.
- This star appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as “Vindemiator”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as “Protrigetrix” and another variation is “Protygetor”.
- Johann Bayer’s *Uranometria* (1603) lists “Vindemiatrix”, “Vindemiaor, and “Vindemitor”.
- “Praevindemiator”, “Praevindemiatrix”, “Antevindemiatrix”, “Vindemiator”, and “Provindemia” ares listed for this star in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Vindemiatrix”.
- Edward Sherburne lists it as “Praevindemiarix” and “Vindemiatrix” in his *Sphere of Marcus Manilius* in 1675.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Vindemiatrix“.
- American uranographer William Croswell (1760 – 1834) lists “Vindemiatrix” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Vindemiatrix” in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Vindemiatrix”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Vindemiatrix”. Compare this to Grape Gatherer (below) and Fruit Pickers (below).
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as “Vindemiatrix”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Vindemiatrix”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), does **not** list the name Vindemiatrix, but does state: “It is a curious fact that the star Epsilon (ε) in Virgo has more many ages been known as the Grape Gatherer”.
- NOTE: R. H. Allen writes in his *Star Names* in 1899 that “Vindemitor” and “Vindemiator” have also been used for Alpha (α) Virginis (Spica).
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Vindemiatrix, Roman vintage star”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists “Vindemiatrix” for this star.
- The IAU approved the name Vindemiatrix for Epsilon (ε) Virginis.

Female Guide of Virgo:

This **telescopic** asterism “Dúctrix Vírginis” is the elliptical galaxy NGC 4374 (Messier 84) in the IAU constellation Virgo. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it

this name due to its being at one end of Markarian's Chain (see below). It is also part of the "Great Galactic Face" (see below).

Female Hartebeest:
This /Xam star is Alpha (α) Orionis (Betelguese) in the IAU constellation Orion (Alcock 2014). She is the mate of the Male Hartebeest (see below).

Female Lions:

This /Xam asterism is the three brightest stars of the Southern Cross in the IAU constellation Crux: Alpha (α) 1 Crucis (Acrux), Beta (β) Crucis (Mimosa) and Gamma (γ) Crucis (Gacrux).

Female Llama:

There are two Inca asterisms with the name "Catachillay", or "Qatachillay":

- One is described by some as being in the IAU constellations Centaurus and Scorpius (Moyano 2011). The body of the llama is the dark nebulosity in the Milky Way stretching between Centaurus and Scorpius and its eyes are the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) (see Eyes of the Llama, below). It is similar to their asterism "Yacana" (see Black Llamas, above). Nearby they have a male llama "Urcochillay" (see Male Llama below).
- One is part of a triangle of stars in the IAU constellations Aquila, Cygnus, and Lyra: Alpha (α) Lyrae (Vega), Alpha (α) Aquilae (Altair) and Alpha (α) Cygni (Deneb), with Deneb being Catachillay and Deneb being Urcochillay (Gamarra & Gamarra 2009).

This Quechua asterism "Catachillay" or "Orochillay" is the IAU constellation Crux (Urton 1980).

Female Officer:

This Korean asterism "Yeojang-gyo" (여장교) is a quadrilateral of stars in the IAU constellation Ursa Minor: Eta (η) Ursae Minoris, HIP 81854A, 80480, and 78661.

Female Protocol:

This Chinese xing guan "Nǚshǐ" (女史) is the star Psi (ψ) Draconis in the IAU constellation Draco. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Nǚshǐ" is the star Chi (χ) Draconis in the IAU constellation Draco.

Female Revolving One:

This Diné asterism "Náhookǫs Bi'áád" or "Na´hookos ba'a´adii" is part of their three-part asterism "Náhookǫs", the other two parts being "Náhookǫs Bi'ką" (see Male Revolving One, below) and Náhookǫs Bikǫ' (see Central Fire of Náhookǫs, above). It is made up of the stars of the IAU constellations Andromeda, Cassiopeia, Cepheus, and Perseus (Childrey 2008):

- Her "body" is an hour-glass shape including the "W" asterism of Cassiopeia (see W below), with the "hips" being the stars Beta (β) Cassiopeiae (Caph) and Zeta (ζ) Cassiopeiae (Fulu), her "waist" being the stars Gamma (γ) Cassiopeiae (Navi) and Delta (δ) Cassiopeiae (Ruchbah), and her "shoulders" being HIP 7984A and 10000,
- Her "neck" runs between Epsilon (ε) Cassiopeiae (Segin) and HIP 10388,
- Her "head" is a square of the stars Iota (ι) Cassiopeiae and HIP 9909, 10557, and 12222,
- Her "hands" are the stars A Cassiopeiae and Eta (η) Persei, and
- Her "feet" are the stars Delta (δ) Cephei and Lambda (λ) Andromedae.

Of course, this asterism has this name because it revolves around the Hearth Fire (see Central Fire of Náhookǫs above) represented by the star Alpha (α) Ursae Minoris (Polaris).

Female Stars:

This Ukrainian asterism "Baby-Zvizdy"(Баби-Звізди) is the Pleiades cluster in the IAU constellation Taurus. This refers to ancient female tribal deities who dance traditional round dances.

Female Steenbok:

There are two versions of this G/wi (San) asterism "g≠eisa":

- One is the star Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Slotegraaf 2013, Alcock 2014). The call the star Alpha (α) Lyrae (Vega) the Male Steenbok. This is part of their asterism Steenboks (see below).
- Another is the star Alpha (α) Pavonis in the IAU constellation Pavo (Slotegraaf 2013).

Female Thrower of Virgo:

This **telescopic** asterism "Jaculátrix Virginis" is the giant elliptical galaxy NGC 4486 (Messier 87, Arp 152) in the IAU constellation Virgo. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)": They called it this because of "the famous jet projected from the centre of this galaxy". It is also known as Virgo A (see below) and the "Smoking Gun" (see below).

Female Tortoises:

This /Xam (San) asterism is the sword of Orion in the IAU constellation Orion.

Female Twin of Cetus:

This **telescopic** asterism "Geméllа Céti" is the lenticular galaxy NGC 274 (Arp 140) in the IAU constellation Cetus, which is interacting with NGC 275. It was discovered in 1785 by English astronomer William Herschel who listed it as III 429. It is GC 156 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Female Warrior:

This Latin star "Bellātrix" or "Bellatrix" is Gamma (γ) Orionis in the IAU constellation Orion:

- "Bellatrix" first appears in the works of Persian astrologer Abu Ma'shar al Balkhi (787 – 886) and translator Johannes Hispalensis (1100 – 1180), where it first appeared it originally was used in reference to Alpha (α) Aurigae (Capella) but was transferred to Gamma (γ) Orionis in the 15th century by the Vienna school of astronomers.
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists "Bellatrix".
- "Bellatrix" was listed by German astronomer Johann Bayer in 1603 in his *Uranometria*.
- "Bellatrix" and "Bellator" are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Bellatrix appears in reprints of the *Alfonsine Tables* (Kunitzsch 1986).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Bellatrix".

- William Herschel lists "Bellatrix" in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) depicts "Bellatrix" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Bellatrix" in his *Celestial Atlas* in 1822.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Bellatrix".
- This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Bellatrix": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Bellatrix".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Bellatrix".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Bellatrix".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Bellatrix" and incorrectly translates "Betelgeuse" as "martial star".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Bellatrix: and describes it as a "Female warrior".
- R. H. Allen lists this star as "Amazon Star" in his *Star Names* in 1899.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this as "Bellatrix – Female Warrior".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Bellatrix" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Bellatrix".
- The IAU approved the name Bellatrix for Gamma (γ) Orionis.

Female Water Snake:

This Greek asterism is the IAU constellation Hydra as originally described in Ptolemy's *Almagest* (2nd century). See Hydra, below.

Female Wedge Tailed Eagle:

This Boorong asterism, "Collowgulloric Warepil", is made up of stars of the IAU constellations Eridanus, Lepus, and Orion and was listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). She is the wife of Warepil (see below). Her "body" is made up of the stars Lambda (λ) Eridanus and Beta (β) Orionis (Rigel). From Lambda (λ) Eridanus her "wings" are two lines of stars:

- One runs through Psi (ψ) Eridanus to Omega (ω) Eridanus, and
- The other runs through Iota (ι) and Kappa (κ) Leporis to Mu (μ) Leporis.

Note: Duane Willis Hamacher II in his excellent *On the Astronomical Knowledge and Traditions of Aboriginal Australians* (2011) asserts that Collowgulloric Warepil is the variable star Eta (η) Carinae as Stanbridge's description of this did not refer to a group of stars.

For the male wedge-tailed eagle "Warepil", see Wedge Tailed Eagle, below.

Fence for Sheep:

This Sardinian asterism “su achile” is the IAU constellation Auriga (Putzolu 2019).

This Italian (Piedmont and Ligurian Alps) asterism “Parc” (“fence”) is the Great Square asterism in the IAU constellation Pegasus (see Great Square below). This was a sort of sheep fence, a mystical place the souls of the dead resided.

Ferry Boat:

This ancient Egyptian asterism “Djat” is made up of stars in the IAU constellations Puppis and Vela. It is a line between the two stars Zeta (ζ) Puppis and Gamma (γ) Velorum.

Ferry of Sky:

This Korean asterism “Haneul-ui Peli” (하늘의 페리) is an irregular oval of stars in the IAU constellation Cygnus. One side starts at Zeta (ζ) Cygni and runs through Upsilon (υ) Cygni, Tau (τ) Cygni, Nu (ν) Cygni, Alpha (α) Cygni (Deneb), and Omicron (ο) Cygni, ending at Delta (δ) Cygni. From here the other side runs back through Gamma (γ) and Epsilon (ε) Cygni, ending up back at Zeta (ζ) Cygni.

Ferryman Phrixi:

This Latin asterism “Portitor Phrixi” is the IAU constellation Aries. This refers to the Greek myth where Phrixus and his mother Helle are rescued by a golden ram.

Fertile of Leo Minor:

This **telescopic** asterism “Astridecórus Leónis Minóris” is the barred spiral galaxy NGC 3344 in the IAU constellation Leo Minor. It was discovered by English astronomer William Herschel in 1785 who listed it as “I 81” in his catalogue. It is GC 2178 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the number of star forming regions in this galaxy. It is also known as the “Sliced Onion” (see below). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as O’Meara 55 without a name.

Festivity of the Ascending Bird:

This Polynesian (Society Islands) star “Ta’aurua-i-te-ha’apara’a-manu” is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus. They also call it “Pira’etea” (see White Sea Swallow, below).

Festivity Whence Comes the Flux of the Sea:

This Society Islands star “Taurua-e-tupu-tai-nanu” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Fetus Nebula:

This **telescopic** asterism is nebula NGC 7008 in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1787 who listed it as “I 192”. It is GC 4627 in the *General Catalogue* of 1864. Size 1.4’ X 1.1’. It is also known as the Coat Button Nebula.

Feudal Kings:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a long line of stars in the IAU constellation Taurus: It starts with the determinative star Tau (τ) Tauri and runs through Iota (ι), 105, 108, 109, and 114 Tauri.

This Chinese xing guan “Zhūwáng” (诸王) is a long line of stars in the IAU constellation Taurus: Tau (τ), 99, 103, 118, 125, and 136 Tauri.

This Chinese Chenzhuo xing guan “Zhūwáng” is a bending line of stars in the IAU constellation Taurus: Starting at 109 Tauri it runs through 103 Tauri, 98 Tauri, HIP 22697, and HIP 21819 to Phi (ϕ) Tauri.

Feudal Kings and Three Excellencies:

This Chinese star “Zhuhousangong” from the 3 Kingdoms and Ming Dynasty Period is Lambda (λ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Steps (see below).

Fiddle in the Sky:

This Bohemian asterism “Hauslicky na Nebi” is the IAU constellation Lyra.

Fiddle Shaped of Eridanus:

This **telescopic** asterism “Panduráta Erídani” is the elliptical galaxy NGC 1700 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as “IV 32”. It became GC 932 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as “the X-ray images by the Chandra satellite show that this galaxy… has the shape of the body of a fiddle”.

Fiddlehead:

This **telescopic** asterism is NGC 772 (Arp 78), an interacting spiral galaxy in the IAU constellation Aries. It was discovered by English astronomer William Herschel in 1785, who listed it as “I 112”. It is GC 463 in the General Catalogue of 1864. This name appears as “Volúta Aríetis” (”Fiddlehead of Aries”) in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Nautilus Galaxy” (see below).

Fidicula:

This Latin asterism “Fidicula”, “Fidis”, or “Fides” (as described by Lucius Junius Moderatus) is the IAU constellation Lyra. A fidicula was a small lyre. Compare this to Cithara, above:

- The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists “Fides” and “Fidis”.
- Johann Bayer’s *Uranometria* (1603) lists the names “Fides”, Fidicen”, and “Fidicula” for Lyra.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Fidicula” as a name for Cygnus.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Fidicula”, “Fidis”, and “Fides” for the constellation Lyra.

This Latin star “Fidis” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra as described by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.), and Roman writer Lucius Junius Columella (4 – c. 70 C.E.), and Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*.

Field:

This Babylonian asterism from the MUL.APIN tablets “ASH.IKU” or “Iku” (Hunger 1992) and “ASH.GÁN” or “ikû” (Anthony 1996), also known as “One”, is the Great Square of Pegasus in the IAU constellations Andromeda and Pegasus (see Great Square below). It appears in later Seleucid sky lore. It is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “MUL.AS.GAN” (Hunger 1992) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul as.gan” (Koch-Westenholz 1995), and on planisphere K 8538 as “mulĂS-iku” (Koch 1989). Leitz lists it as “As-gana” in 2019 and lists Psi (ψ) Pegasi inside this square as the “altar of heaven”.

This Sumerian asterism “mulikux (AŠ+GÁN)” listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the Square of Pegasus in the IAU constellations Andromeda and Pegasus (see Great Square below).

This Assyrian and Akkadian asterism listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) “IKU” is the Great Square of Pegasus in the IAU constellations Andromeda and Pegasus (see Great Square below). It is listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) as “i-ku-ú”. NOTE: R. H. Allen lists “Ku”, “I-ku”, or “I-ku-u” is listed as an Akkadian name for the AIU constellation Aries and for Alpha (α) Arietis (Hamal) in *Star Names* in 1899 and translates this as “Prince” or “Leader” and gives the Assyrian name as “Rubū”.

This Egyptian Dendera asterism (Hoffman 2017) is basically identical to the Babylonian asterism ASH.IKU (see Field). It is depicted as the Egyptian hieroglyph for “water”, suggesting a fishpond.

Field Mouse:

This Babylonian asterism “Harriru” from the MUL.APIN tablets is the IAU constellation Eridanus.

Field of Offering:

This Egyptian asterism from the Pyramid Texts is star clusters on the northern side of the Milky Way (Abdel-Hadi and Yehia, 2009).

Field of Rushes:

This Egyptian asterism is mentioned in the Pyramid Texts and is star clusters, etc., which have at this time not been positively identified (Abdel-Hadi and Yehia, 2009).

Field of the Nebulae:

This American telescopic asterism is an early name for the Virgo Supercluster in the IAU constellation Virgo. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), uses this name to describe the large number of what were believed to be “nebulae” in that constellation and defines the area by stating: “It will be observed that the stars ε, δ, γ, η, and β, mark two sides of a quadrilateral figure of which the opposite corner is indicated by Denebola in the tail of Leo”. Of course, this was before anyone recognized that these were galaxies.

Field Shot with Diamond Dust:

This American asterism is the Double Cluster (NGC 869 and 884) in the IAU constellation Perseus as described by Amateur American astronomer Charles Edward Barns (1862 – 1937) in his *1001 Celestial Wonders* in 1931.

Fierce Hunter:

This Latin asterism “Acer Venator” is the IAU constellation Centaurus.

Fiery:

This Gaulish asterism “Cuti Prinnios” is the IAU constellation Aries and appears in the *Coligny Calendar* (Boutet 2001, 2014).

Fiery Hair of Sculptor:

This **telescopic** asterism “Ignicapíllus Sculptóris” is the flocculent spiral galaxy NGC 7793 in the IAU constellation Sculptor. It was discovered by American astronomer George Phillips Bond (1825 - 1865) in 1850 at Harvard College Observatory. It is GC 6233 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “its many disordered spiral arms full of star formation activity”. It is also known as “Bond’s Galaxy”.

Fiery Red:

This Chaldean star “mul ma-ak-ru-u” is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Fiery Red of Hydra:

There are two **telescopic** “Fiery Red of Hydra” asterisms:

- One asterism “Pyrrhazusa Hýdrae” is the lenticular galaxy NGC 2784 in the IAU constellation Hydra. It was discovered in 1784 by William Herschel who listed it as “I 59”. It became GC 1778 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).
- One asterism “Pýrrha Hýdrae” is the elliptical galaxy NGC 3923 in the IAU constellation Hydra. It was discovered in 1791 by William Herschel who listed it as “I 259”. It became GC 2586 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Fiery Spirited of Cetus:

This **telescopic** asterism “Pýrithymus Céti” is the barred spiral galaxy Messier 77 (NGC 1068) in the IAU constellation Cetus. This was discovered by French astronomer Pierre Méchain in 1780 and listed by his colleague Charles Messier. William Herschel described it as a “star cluster” and his son John Herschel did also, including it on his list as h 262. It was listed in John Herschel’s 1864 *General Catalogue* as GC 600. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name as due to its “very bright nuclear region”. It is also known as the “Squid Galaxy” (see below).

Fifth:

This Bedouin star “al-Ḫamis” (الخامس) is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major.

Fifth Ostrich:

This Arabic star “Al Khamis al Na'amah” (الخامس النعامة) is Gamma (γ) Andromedae in the IAU constellation Andromeda as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 . This was later latinized to “Quinta Struthionum”.

Fig Bird:

This Latin asterism “Avis Ficarius” is the IAU constellation Corvus and relates to the myth of Corvus loitering at a fig tree (see Corvus, above).

Fighter Jet:

This **telescopic** asterism is Vastagh 6, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Coma Berenices. Its size is 30’ X 27’. Vastagh describes it as “in the shape of a fighter jet. Its brightest star is located at the location of the engine of the imaginary plane, which is the 6.43 mag (HR4873). It has 13 members, evenly distributed. The nose of the fighter, as well as the delta wing and wingtips are perfectly outlined.”

Fighters:

This Macedonian asterism “Komiti” is the Big Dipper asterism in the IAU constellation Ursa Major (Cenev 2014). This represents fighters against Turkish occupation.

Fighting Dragons of Ara:

See Dragons of Ara.

Figure:

This Seleucid asterism “GU” (see Great One, below) or “sal-mu” (“figure”) in the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Aquarius (Foxvog 1993).

Figure Eight:

This **telescopic** asterism is planetary nebula NGC 2371-2 in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1785, who described it as “Two. Sp-nf, distance 1’, chevelure mixed. Both faint, small, equal, having a nucleus”. Herschel listed it as “II 316 and II 317” in his catalogue. It is GC 1519 and 1520 in the *General Catalogue* of 1864. It seemed to English astronomer John Louis Emil Dreyer (1852 – 1926) to be two objects and so was entered as NGC 2371 and 2372 in the *New General Catalogue of 1888*. It is actually a single planetary nebula. It is also known as the Double Bubble Nebula, the Ant Nebula, the Doughnut (Cut in Half), the Mini Dumbbell, or the Gemini Nebula. Size 1’ X 1’. American astronomer Steve Coe (1949 – 2018) described it as “a figure 8 with a star involved, a dark lane cuts the “8” shape into two fairly equal pieces”.

Figure Outline:

This **telescopic** asterism is the open cluster NGC 6664 in the IAU constellation Scutum. It was discovered by English astronomer William Herschel in 1785 who listed it as “VIII 12”. It is GC 4426 in the *General Catalogue* of 1864. South African astronomer Magda Streicher (2008) describes it as a “figure outline”. It is also known as the Teacup (see below) and Santa’s Sleigh (see below).

Filial Duty Stars:

This Japanese sei shuku or lunar station “Oyakoukou Boshi” is the belt of Orion in the IAU constellation Orion. They see it as a child holding up his/her parents or two parents and a child standing together.

Filamentary Nebula:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as “V 15”. It is GC 4600 in the *General Catalogue* of 1864. This is also known as the West Veil Nebula (see below), Cirrus Nebula (see above), or Witch’s Broom Nebula (see below).

Filly:

This German asterism “Füllen” is the IAU constellation Equuleus.

Final Generation:

This Coptic lunar mansion “Artulosia” is the stars Beta (β) Pegasi (Scheat) and Alpha (α) Pegasi (Markab) as listed in R. H. Allen’s *Star Names* in 1899, which he associates with the Arabic asterism Back Side of the Bucket for Water Pouring (see above). W.B. Yeats listed this in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as “Posterior Germinatio” (“Posterior Germination” or “later budding”).

Fine Ring Nebula:

This **telescopic** asterism is planetary nebula Shapley 1 in the IAU constellation Norma. It was discovered by American astronomer Harlow Shapley in 1936.

Finger of Grus:

This **telescopic** asterism “Digitus Grúis” is the edge-on barred spiral galaxy NGC 7462 in the IAU constellation Grus. This was discovered in 1834 by John Herschel who listed it as h 3968 and later as GC 4885 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Finish Fire:

This Naron star is two stars, one possibly Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Alcock 2014). One (Antares) is the Mother Star and the other her son. Compare this to the !Kung star Fire Finish Finish (see below), the /Gwi star Fire Finisher (below), and the !Xu star Fire Finishing Star (see below).

This //Gana and !Xo star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Alcock 2014).

Fire:

This Dakota/Lakota/Nakota asterism “Peta” is made up of the stars of the IAU constellation Leo. This is a semi-circle of stars: Eta (η), Gamma (γ), Zeta (ζ), Mu (μ) and Epsilon (ε) Leonis. It is also known as “Oceti” (see Fireplace, below).

There are two **telescopic** “Fire” stars:

- One is the Icelandic star “Funi” (“fire” or “blaze”) is HIP 61177 (HD 109246) in the IAU constellation Draco (magnitude 8.74). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Fold (“earth” or “soil”).

- One is the Latvian star “Liesma” is HIP 66192 (HD 118203) in the IAU constellation Ursa Major (magnitude 8.06). Liesma is a character in the poem *Staburags un Liesma*. This name was given to the star in the IAU NameExoWorlds campaign. It has an exoplanet named Starburags.

Fire Carrier:

This Kokatha and Ngalea star is Alpha (α) Scorpii in the IAU constellation Scorpius.

Fire Drill:

This Tzotzil, Mixe, Totonac, and Nahua asterism is the belt and sword of Orion in the IAU constellation Orion. This is a Spanish term “astillejos” from the *Nebrija* dictionary of the colonial period. Some colonial dictionaries link this to the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. This might be because some sixteenth century star charts link the stars of the constellations Gemini, Orion, and Taurus. Compare this to the Aztec asterism “Mamalhuaztli” (see Two Sticks, below).

Fire Finish Finish:

This !Kung star “Da Toa Toa” (“fire finish finish”) is probably Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Alcock 2014).

Fire Finisher:

This G/wi star “/edzini” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Slotegraaf 2013, Alcock 2014). NOTE: Alcock cites Silberbauer (1981) as the source of this and cites Marshall (1991) as identifying this star as Arcturus and calls it the Fire Finisher’s Child (see below).

Fire Finisher’s Child:

This !Xõ star, also known as “the fire finishing star,” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Slotegraaf 2013, Holt and Slotegraaf 2022).

This G/wi star “/edzinig /wa” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Marshall 1991, Alcock 2014).

Fire Finishing Star:

See Fire Finisher’s Child, above.

Fire Kindler:

This Greek asterism “Πυρκᾱεύς” (“Pyrkáéfs”) is the IAU constellation Cepheus. Compare this to the Arabic asterism On Fire (see below).

Fire Month Guiding Stars:

The Celtic PRIN or guiding stars in the Sequani Calendar in the eleventh month, Edrinios (Fire Month, related to the Old Irish áed (“fire” or “heat”), is the IAU constellation Eridanus (Benigni).

Fire Poker:

This Kamilaroi/Euahlayi asterism is the sword of Orion in the IAU constellation Orion. It is part of their asterism “Birray Birray” (see Uninitiated Boys, below). The star Beta (β) Orionis (Rigel) is their campfire.

Fire Serpent:

This Aztec asterism “Xiuhcoatl” from the Codex Borgia is stars in the IAU constellation Scorpius (Milbrath 2014).

Fire Spinner:

This American asterism is made up of stars of the IAU constellations Andromeda, Aries, Pisces, and Triangulum and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). One “fire wand” of the spinner is Triangulum. The other “fire wand” is the line between Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan). One “foot” is the stars Eta (η) and Zeta (ζ) Andromedae and the other “foot” is Chi (χ) and Psi (ψ) 1 and 2 Piscium.

Fire Star:

This Diné star “Na´hookos bokho´h” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Childrey 2008)**.**

This Chinese star “Huo” (火) or “Huo Hsing” was mentioned in the oracle bone inscriptions from the Shang Dynasty (c. 16th to 11th century B.C.E.) and is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. It also appears in the *Shangshuyaodian* 尚书尧典 (*Canon of Yao* of the *Book of Documents*-2300 B.C.E.), a collection of political documents from the legendary Emperor Yao. It is also known as “Ta Huo” (see Great Fire, below).

Fire Tail:

This Gaelic asterism “Drag Bhod” or “An Dreag Bhod” is the Little Dipper asterism in the IAU constellation Ursa Minor. R. H. Allen lists it as “Drag Blod” in his *Star Names* in 1899.

Firebird:

This Chinese xing guan “Huǒniǎo” (火鸟) has two curving lines representing “wings” running out from the central star Alpha (α) Phoenicis (Ankaa) in the IAU constellation Phoenix. You might think that this would resemble the IAU constellation Phoenix, since that is a firebird too, but this version includes stars from the IAU constellation Sculptor:

- One “wing” runs out from Alpha (α) Phoenicis through Kappa (κ) and Epsilon (ε) Phoenicis, HIP 116602, and Iota (ι) Phoenicis, ending at Beta (β) Sculptoris, and
- The other “wing” runs out from Alpha (α) Phoenicis through Mu (μ), Lambda (λ), and Beta (β) Phoenicis to Gamma (γ) Phoenicis.

Firefly Party:

This **telescopic** asterism is the open cluster NGC 3532 (Caldwell 91) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. English astronomer William Herschel thought it to be one of the finest star clusters he’d seen. It is also known as the Wishing Well Cluster (see below), the Fish Cluster (see above), the Football Cluster (see below), the Black Arrow Cluster (see above), and the Pincushion (see below). It is located between the constellation Crux and the False Cross asterism (see False Cross, above).

Fireman’s Hat:

This **telescopic** asterism is in the IAU constellation Auriga and is Ennis 44 on the observing list of Canadian astronomer Charles Ennis. Size 30'. The "brim" of the hat starts at the double star HIP 27198 and runs Gaia DR3 3454548436485479296, and HIP 27123 to HD 246901 and an 8th magnitude star. The "top" of the hat is two stars: HD 38113 and Gaia DR3 3454560187520863232. This is Corder 917 on Jeffrey Corder's list: Corder simply describes it as a "loose group".

Fireplace:

This Dakota/Lakota/Nakota asterism "Oceti" is made up of stars of the IAU constellation Leo. This is a semi-circle of stars: Eta (η), Gamma (γ), Zeta (ζ), Mu (μ) and Epsilon (ε) Leonis. It is also known as "Peta" (see Fire, above).

This Kamilaroi star is Alpha (α) Muscae in the IAU constellation Musca. This is a fireplace in Bulimah where all mothers go after death. It is also known as Byaambe's Campfire (see above).

Fireworks Galaxy:

This **telescopic** asterism is NGC 6946 (Caldwell 12, Arp 29), a face-on intermediate spiral galaxy in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in September 1798 who listed it as "IV 76". It is GC 4594 in the *General Catalogue* of 1864. It was originally thought to be part of the Local Group but is now believed to be beyond its confines and part of the Virgo Supercluster. It has this name due to the large number of supernovae that have been observed in this galaxy. Size 11.5' X 9.8'. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Pyróbolus Cýgni" ("Firework of Cygnus").

First Big One:

This Diné asterism, "Átsé Etsoh" or "Átsé'etsoh", is made up of stars in the IAU constellations Libra, Lupus, Ophiuchus, and Scorpius(Childrey 2008):

- His "head" is a quadrilateral of stars: Delta (δ) Ophiuchi, HIP 79545, 80840, and 80862,
- His "neck" runs from the stars HIP 80248 to 80016,
- His large "body" is an irregular quadrilateral running from the star HIP 80016 to a "shoulder" at Xi (ξ) Scorpii, then down through Delta (δ) and Eta (η) Scorpii to his "right hip" at Rho (ρ) Scorpii, then over to his "left hip" at Tau (τ) Scorpii, then up his left side through Omega (ω) and Phi (ϕ) Ophiuchi to his "left shoulder" at Zeta (ζ) Ophiuchi,
- His "arms" and "legs" are as follows:
    - Left "arm": Zeta (ζ) to Eta (η) Ophiuchi,
    - Right "arm": Xi (ξ) Scorpii to an "elbow" at Gamma (γ) Librae, and a "hand" at Theta (θ) Librae, with a "walking stick" running out through Upsilon (υ) Librae to Phi (ϕ) Lupi,
    - Right "leg": Rho (ρ) Scorpii to a "knee" at Chi (χ) Lupi and a "foot" at Eta (η) Lupi, and
    - Left "leg": Tau (τ) Scorpii to a "knee" at Epsilon (ε) Scorpii and a "foot" at Mu (μ) 2 Scorpii.

Átsé Ets' Ózí is never seen in the sky at the same time as their asterism "Átsé Etsoh" (see First Slender One, below).

First Connected of Hydra:

This **telescopic** asterism "Concatenáta Prima Hýdrae" is the Seyfert galaxy NGC 2992 (Arp 245) in the IAU constellation Hydra, which is interacting with NGC 2993. It was discovered in 1785 by William Herschel

who listed it as "III 277". It became GC 1918 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

First Dancer:

This German star with the Greek name "Χορευτής πρώτη" ("Choreftís próti") is Delta (δ) Ursae Minoris as listed by German astronomer Johann Bayer (1572-1625). It is part of the Latin asterism Dancers (see above).

First Dog:

This Latin asterism "Canis Primus" is the IAU constellation Canis Minor, so called as it rises before Canis Major. This name is listed in Johann Bayer's *Uranometria* (1603). The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Canis Primus".

First Dog of the Shepherd:

This Arabic star is Alpha (α) 1 Herculis (Rasalgethi) in the IAU constellation Hercules and is also known as the "First Dog of the Southern Shepherd". It is part of their asterism Desert Garden and the Goats (see above). Dorn (1829) describes this as "the Shepherd's Dog" as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

First Donkey Colt:

This Latin star "Asellus Primus" is Theta (θ) Boötis in the IAU constellation Boötes and is part of their asterism Donkey Colts (see above). Compare this to the Arabic asterism Whelps of the Hyenas (see below). German astronomer Johann Bayer (1572-1625) listed it under the name Asellus Primus.

First Frog:

This Arabic star "Al Ḍifdi' al Awwal" is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus:

- English Admiral Henry William Smyth's *Prolegomena* lists "Difda" and his *Bedford Catalogue* in 1844 lists "Difda al auwel".
- R. H. Allen lists this in his *Star Names* in 1899. The "second frog" is Diphda (see Second Frog, below).

First Giedi:

This Latin star "Prima Giedi" is Alpha (α) 1 Capricorni (Giedi) in the IAU constellation Capricornus. Alpha (α) Capricorni is a triple star system. Alpha (α) 1 Capricorni has been called Prima Giedi as it is next to Alpha (α) 2 Capricorni (Algedi- see Kid, above):

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Prima Giedi", from al jedi, the goat."
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Prima Giedi" for this star.
- Alpha (α) 1 Capricorni has not yet been assigned an approved name by the IAU.

First Great One:

This Chinese xing guan "Tàiyǐ" (太乙) is the star HIP 66798 in the IAU constellation Draco. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

First Horse:

This Latin asterism "Equus Primus" or "Equus Prior" is the IAU constellation Equuleus. It was called this as it rose before Pegasus. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Equus prior".

This Arabic asterism "Al Faras al Awwal" is the IAU constellation Equuleus. It was called this as it rose before Pegasus.

First in the Paw:

This Arabic star "Aoul al Dzira" is Alpha (α) Geminorum in the IAU constellation Gemini and was listed in the *Calendarium* of Al Achsasi al Mouakket in 1650.

This Latin star "Prima Brachii" is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini.

First Leap of a Gazelle:

There are two Arabic asterisms with the name "(al-Qafzat) ul-Ūla'" (القفزة الأولى) or "Al Karzah al Ūla":

- One, latinized to "Alkafzah", "Alkaphrah", or "El Koprah" and listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449) as "Al Firkrah", is the line of stars Nu (ν) and Xi (ξ) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Leaps of a Gazelle (see below).
    - American uranographer Elijah Burritt (1794 – 1838) listed it as "Acola" and "Al Kaphrah",
    - German astronomer Christian Ludwig Ideler (1776 – 1846) listed it as "Awla"
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al úla", "Al kafzah al úla", "Alula Australis", and "Al úla Borealis" as the first leap.
    - The *Standard Dictionary of Facts* (1908 – 1924) listed it as "El Kophrah".
- One, latinized to "Alkaphrah", "Kafzatania", or "Al Kaprha", is the star Kappa (κ) Ursae Majoris:
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "el Kaphzah": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - The name Alkaphrah was approved for Kappa (κ) Ursae Majoris A by the IAU's Working Group on Star Names in 2017.

NOTE: Nu (ν) Ursae Majoris later became further latinized as "Alula Borealis" and Xi Ursae Majoris as "Alula Australis". The IAU approved the name Alula Australis for Xi Ursae Majoris Aa and the name Alula Borealis for Nu (ν) Ursae Majoris.

First Observatory:

This Chinese Chenzhuo xing guan "Touguan" is the star Alpha (α) Draconis (Thuban) in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

First of the Aṣāḍhā:

This Vedic nakshatra (lunar mansion) “Purva Ashadha” or “Poorvashada” (translated as “First of the Aṣāḍhā”, “Aṣāḍhā the Invincible One”, “early victory”, or “first invincible one”) is in the IAU constellation Sagittarius and is the stars Delta (δ) and Epsilon (ε) Sagittarii. Ivanković (2021) lists this as “Asādhā” from the *Rig-Veda* and “Pūrvā Asādhā” from the *Taittirīya Brāhmana* and relates it to the Apah, who are Hindu Goddesses of rain. Leitz (2019) lists “Purva Asadha” as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies this as “the star Sagittarii”: Of course, Sagittarii is a suffix which could be applied to any star in Sagittarius. Leitz also writes that the maharshi Parasara listed the stars Gamma (γ), Delta (δ), Epsilon (ε), and Lambda (λ) Sagitarii, but the *Brhat Samhita* only lists Delta (δ) and Epsilon (ε) Sagittarii. W. Brennand lists this as “Purvashadha” in his *Hindu Astronomy* in 1896 and translates this as “a couch”. Bhagwath (2019) lists its symbols as either an elephant tusk, a fan, or a winnowing basket.

This Myanmar nekkhat (lunar mansion) “Pyobba Than” (ပြုပ္ဗာသင္ဍ) is in the IAU constellation Sagittarius and is the stars Delta (δ) and Epsilon (ε) Sagittarii.

This Tibetan gyukar (lunar house) “Chu Stod” or “Chutö” is in the IAU constellation Sagittarius and is the star Delta (δ) Sagittarii (Johnson-Groh 2013).

First of the Dabaran:

This Arabic star “Awwal al Dabarān” is Gamma (γ) Tauri in the IAU constellation Taurus as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 and in R. H. Allen’s *Star Names* in 1899. Compare this to First of the Hyades, below.

First of the Hyades:

This Latin star “Prima Hyadum” or “Primus Hyadum” is Gamma (γ) Tauri in the Hyades cluster in the IAU constellation Taurus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists it as “Hyadum primus, or leader of the Hyades”. The IAU approved the name Prima Hyadum for the star Gamma (γ) Tauri A in 2017. Compare this to First of the Dabaran, above.

First of the Sacred Feet:

This Vedic moon station consists of the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat) in the IAU constellation Pegasus, which form one side of the Great Square of Pegasus (see Great Square below).

First of the Virgins:

This Arabic star “al-ʿAdhāriy” (الْعَذَارِي), “first of the virgins/nymphs”, later latinized to “Adhara”, is Epsilon (ε) Canis Majoris in the IAU constellation Canis Major and is part of their asterism “Virgins” (see below). The IAU approved the name Adhara for Epsilon (ε) Canis Majoris A.

This Latin star “Prima Virginum” is Epsilon (ε) Canis Majoris in the IAU constellation Canis Major.

First Ostrich:

This Arabic star “awwal al-naʿām” or “awwil al naʿāmāt” (ول ألنعمة), later latinized to “Aoul al Naamet” or “Aoul al Naamat”, is Eta (η) Ceti in the IAU constellation Cetus. Aoul al Naamat is listed in the *Calendarium* of Al Achsasi al Mouakket in 1650. It is part of their asterism “Hen Ostriches” (see below). Compare this to “First Returning Ostrich” (see below).

This Latin star “Prima Struthionum” is Eta (η) Ceti in the IAU constellation Cetus.

First Ranking Son of Anu:

See Heir of the Temple, below.

First Reddish One:

This Vedic nakshatra (lunar mansion) “Purva Phalguni” or “Pūrva Phalgunī” (Ivanković 2021) is in the IAU constellation Leo and is the stars Delta (δ) and Theta (θ) Leonis. It is related to the deity Bhaga, God of wealth and marriage. It is also translated as “Front Feet of Marriage Bed”. Leitz (2019) lists “Purva Phalguni” as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but identifies the star as “the star Leonis”: Of course, Leonis is a suffix that could be applied to any star in Leo. The maharshi Parasara listed eight stars for this asterism. It appears as “Pūrve Phálgunī” in the *Taittirīya Brāhmana* (Ivanković 2021). W. Brennand lists this as “Purva Phalguni” in his *Hindu Astronomy* in 1896 and translates it as “a bedstead”. Bhagwath (2019) lists its symbols as the front legs of a bed, a hammock, or a fig tree. Along with their asterism Uttara Phalguni (see Second Reddish One, below) this is known as “Phálgunyau” (“Reddish Ones”).

This Myanmar nekkhat (lunar mansion) “Pyobba Baragonni” (ပြုပ္ဗာ ဘရဂုဏ္ဏီ) is in the IAU constellation Leo and is the stars Delta (δ) and Theta (θ) Leonis.

This Tibetan gyukar (lunar house) “Bre”, “Dre”, or “Ta Chung” is in the IAU constellation Leo and is the star Delta (δ) Leonis (Johnson-Groh 2013).

First Returning Ostrich:

This Arabic star “awwal al-naʿām al-ṣādira”, later latinized to “Aoul al Sadirah” or “Prima τού al Sadirah” is Phi (φ) Sagittarii in the IAU constellation Sagittarius (Knobel 1895) and is part of their manzil Ostriches (see below). Compare to their asterism First Ostrich (see above).

First Seen of Triangulum:

This **telescopic** asterism “Primovísus Triánguli” is the quasar 3C 48 in the IAU constellation Cassiopeia. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this “is one of the first known quasars and the first that was optically identified (in 1960)”.

First Slender One:

This Diné asterism, “Átsé Ets’ Ózí” or “Átsé’etsózí” (“first slender one” or “first slim one”) is made up of the stars of the IAU constellation Orion (Childrey 2008):

- His “head” is a quadrilateral of stars: HIP 28686, 28171A, 29138, and 29508,
- His “neck” runs from Mu (μ) Orionis to Alpha (α) Orionis (Betelgeuse),
- Betelgeuse forms the top of his “body”, which is a triangle with the “hips” being the belt of Orion,
- His “arms” and “legs” are as follows:
    - Two “arms” run out from Betelgeuse to the stars Lambda (λ) Orionis and Gamma (γ) Orionis (Bellatrix),
    - One “leg” runs from Zeta (ζ) Orionis (Alnitak) to his “knee” at the sword of Orion and his “foot” at Kappa (κ) Orionis (Saiph), and

- One “leg” runs from Delta (δ) Orionis (Mintaka) to a “knee” at Eta (η) Orionis and a “foot” at Beta (β) Orionis (Rigel).

Átsé Ets’ Ózí is never seen in the sky at the same time as their asterism “Átsé Etsoh” (see First Big One, above).

First Son of the Sun:

This Lokono (Arawak) asterism is the Pleiades cluster in the IAU constellation Taurus (Rybka 2018). The Sun had twin sons, one of whom was swallowed by the sky anaconda and became the star Antares (see Second Son of the Sun, below). The other the Sun placed in a safe place in the sky as the Pleiades. The rising of the Pleiades marks the new year and the beginning of horticultural activities in the coastal regions of Guiana.

This Kalina (Carib) asterism is identical to the Lokono asterism First Son of the Sun.

First Spout:

This Arabic manzil “al-fargh al-awal” (الفرغ الأول) is in the IAU constellations Andromeda and Pegasus and is the stars Alpha (α) Andromedae (Alpheratz) and Beta (β) Pegasi (Scheat) and was a name listed by Ibn Qutayba (d. 889 C.E.) and Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and is listed in R. H. Allen’s *Star Names* in 1899. It is also known as Front Side of the Bucket for Water Pouring (see below) and is part of their asterism Two Spouts (see below). Compare this to the Vedic nakshatra Purva Bhadrapada (see Early Blessed One, above).

First Star:

This Hawaiian star **“**Nanamua” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini.

First Star of the Butting One:

This Arabic star “al-awwal min al-nath” is Gamma (α) Arietis in the IAU constellation Aries as it appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003). Compare to Butting (above).

First Two:

This Bedouin asterism “Al Khilj”or “al-Ḫilj” (الخلج) is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major. It is also known as “al-Ḫilj al-awwalāt” (“the First Khilj”).

First Two Crossbars of the Bucket:

This Arabic asterism “‘arquwata ad-dalw al-ulayan” (العرقوتا الدلو الأليان) is two stars in the IAU constellations Andromeda and Pegasus: Alpha (α) Andromedae (Alpheratz) and Beta (β) Pegasi (Scheat). They were part of their rain stars calendar. It is also known as First Spout (see above) and Higher Crossbar of the Bucket (see below).

Fish:

This Babylonian asterism “MUL.KU” (Hunger 1992), or “KU” or “nunu” (Anthony 1996) from the MUL.APIN tablets and listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and “mul.ku” from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Piscis Austrinus. It appears in later Seleucid sky lore.

- The “body” starts the “nose” at Alpha (α) Piscis Austrini (Fomalhaut) and runs around through Epsilon (ε), Tau (τ), Theta (θ), Iota (ι), Mu (μ), and Beta (β) Piscis Austrini.
- From the “nose” two lines run out from Fomalhaut:
- One goes to Gamma (γ) Piscis Austrini, and
- One goes to Delta (δ) Piscis Austrini.

This Sumerian asterism “mulku” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Piscis Austrinus.

This Akkadian asterism “nu-ú-nu” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Piscis Austrinus.

This Assyrian asterism “Kua” is the IAU constellation Piscis Austrinus.

This Babylonian asterism “Nūnu” is the IAU constellation Pisces as listed by R. H. Allen in his *Star Names* in 1899.

This Persian asterism “Mahīk” is the IAU constellation Pisces as listed in R. H. Allen’s *Star Names* in 1899.

This Turkish asterism “Balīk” is the IAU constellation Pisces as listed in R. H. Allen’s *Star Names* in 1899.

This Chinese xing guan “Yú” (鱼) is the open cluster Messier 7 (NGC 6475, the Ptolemy Cluster) in the IAU constellation Scorpius and is identical to the Korean asterism “Fish” (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is the open cluster Messier 7 (NGC 6475) in the IAU constellation Scorpius.

This Korean asterism “Saengseon” (생선) is the open cluster Messier 7 (NGC 6475, the Ptolemy Cluster) in the IAU constellation Scorpius and is identical to the Chinese xing guan “Fish” (see above).

This Syrian asterism “Nano” is the IAU constellation Pisces as listed by John Hill in his *Urania* in 1754. R. H. Allen lists it as “Nūno” in his *Star Names* in 1899.

This Hebrew asterism “Dagim” is the IAU constellation Pisces as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud* and is related to their month Adar. Edward Sherburne lists it as “Dagáim” in his *Sphere of Marcus Manilius* in 1675 and translated this name as “Duo Pisces” (“two fish”).

This Chakavian asterism “Rybôj” is the IAU constellation Piscis Austrinus.

This German asterism “Fische” is the IAU constellation Pisces as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This English asterism “Piscis, the Southern Fish” is the IAU constellation Piscis Austrinus. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more room on astronomical charts. “Piscis” is listed in Proctor’s *A New Star Atlas* (1887) as an official constellation “recognized in the catalogue of the British Association”.

This Chinook star is Alpha (α) Canis Majoris (Sirius). It is part of a three-part asterism which includes the Little Canoe (see below) and Big Canoe (see above) which are in a race in a river (the Milky Way) for this “fish”.

There are four **telescopic** "fish" asterisms:

- One is in the IAU constellation Lyra and is Ennis 82 on the observing list of Canadian astronomer Charles Ennis. Size 140' X 40'. The fish's "body" is the oval of stars including HIP 90551, 90612, 90488, 90393, 90258, 90079, 89914, and the double stars HIP 90283A and 90370A. The fish's "tail" is four stars: HIP 90999, 90908, 90831, and 90886.
- One is Vastagh 18, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 77'. Vastagh describes it as "consisting of 120-150 members bright (3.9 mag.) NY. The members of the set form a trapezoid with rounded corners, the head of the fish-shaped [asterism]. The mouth of the fish is marked by the 6.44 magnitude star HD 5459. The trunk snake-shaped, in the shape of the letter 'S'. The caudal fin is the letter 'V' with a curved stem. Both the head and the tail are oversized compared to the body of the fish. The aforementioned snake-shaped trunk is none other than ASCC 4 marked NY."
- One is the "Fish Cluster", open cluster NGC 3532 (Caldwell 91), in the IAU constellation Carina as listed by South African astronomer Auke Slotegraaf. This was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. English astronomer John Herschel (1792 – 1871) described it as "the most brilliant object of the kind I have ever seen". It is also known as the Wishing Well Cluster, the Football Cluster, the Firefly Party, the Black Arrow, and the Pincushion. Auke notes that "Dieter Willasch sees 5th magnitude star X Carinae as the eye of the fish… but I trace it differently, with X Carinae not a part of the fish, but looking rather like a lure cast by a celestial angler".
- One, "der Füsch" is Gebauer 2 (SG 2) in the IAU constellation Draco. German amateur astronomer Sarah Gebauer discovered this in September 2023. The most prominent stars in this asterism are HIP 90502, Gaia DR3 2267194080282211328, and Gaia DR3 2267169994105609728.

Fish and Chips Galaxies:

This **telescopic** asterism is NGC 4567 and NGC 4568, a pair of colliding unbarred spiral galaxies in the IAU constellation Virgo: They are part of the Virgo Cluster. These were discovered by English astronomer William Herschel in 1784 who listed them as "IV 8" and "IV 9". His son John Herschel listed them as "1358" and "1359" in his catalogue. They are GC 3108 and GC 3109 in the *General Catalogue* of 1864. They are also known as the Butterfly Galaxies (see above) or the Siamese Twins (see below).

Fish Bucket:

This Babylonian star "Kullat Nunu" is Eta (η) Piscium in the IAU constellation Pisces.

Fish Farm Fencing:

This Tupi asterism "Ararapari" is the belt of Orion in the IAU constellation Orion (De Freita Mourão 2009).

Fish Fry Egret:

This Barasana asterism "Imika Yehe" is the stars surrounding Alpha (α) Persei (Mirfak) in the IAU constellation Perseus (Hugh-Jones 2006).

Fish Grill:

This Tukano asterism “Waikasa” or “Wai Kasabo” (“a kind of grill to cook fish”, also known as “Moquém”, is the Hyades cluster in the IAU constellation Taurus (Cardoso 2015, Cardoso 2016).

This Barasana asterism “Wai Kasabo” (“fish smoking rack”) is the Hyades cluster in the IAU constellation Taurus (Hugh-Jones 2006). This is also known as “Masu Ya Kasabo” (see Man’s Rack, below) and “Timia Ya Kasabo” (see Otter’s Rack, below).

This Tupi (São Luís Island) asterism “Seychouioura” is the IAU constellation Corvus. Compare this to the Tupi asterism “Muquentaúa” (see Cane Grill, above). Note: some experts dispute this and say that it is the Great Square of Pegasus (see Great Square below).

Fish Head Nebula:

This **telescopic** asterism is HII region IC 1795 (LBN 645, Ced 6) in the IAU constellation Cassiopeia. IC 1795 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923)

Fish Hooked:

This **telescopic** asterism is in the IAU constellation Cancer and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 1568. The “fish’s body” includes the stars HIP 41325, 41398, 41430, and 41532. The “tail” includes HIP 41569 and 41550.

Fish Mouth:

This Latin star “Os Piscis Notii” is Alpha (α) Piscis Austrinus (Fomalhaut) in the IAU constellation Piscis Austrinus.

- “Os Piscis Notii” is listed by 14th century Greek geographer and astronomer Georgius Chrysococcas.
- Johann Bayer’s *Uranometria* (1603) lists “Os Piscis”.

This **telescopic** asterism is the dark bay that extends from the north into the bright region of the Orion Nebula known as “Sinus Magnus” in the IAU constellation Orion.

Fish Net:

The Tukano asterism is made up of stars in the IAU constellation Orion (Bucur 2022): The belt of Orion plus the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix). The Tukano also call this “Circulo de Dança” (see Circle dances, below) and “Sioyahpu” or “Cabo do Enxó” (literally – “instrument to carve wood”, see Adze Handle, above).

Fish of Horologium:

This **telescopic** asterism “Ichthyódes Horológii” is the barred spiral galaxy IC 2000 in the IAU constellation Horologium. It was discovered by DeLisle Stewart in 1899. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the fish like shape”.

Fish of Horus:

This Coptic lunar mansion “Pi-Kutorion” is the star Beta (β) Arietis (Sheratan) in the IAU constellation Aries. John Hill gives it the Latin name “Statio Hori” in his *Urania* in 1754 and translates that as “Station

of Horus", but this is actually the Latin name of the Coptic lunar mansion "Ôrias" (see Station of Horus, below). W.B. Yeats listed it in *A Vision* in 1917, which was derived from the works of German astronomer Athanasius Kircher (1602 – 1680), who called it "Piscis Hori" ("fish of Horus") and "Caput Arietis" ("Head of Aries").

Fish of the Sky:

This Akkadian asterism "Nunu" or "Nun same" ("fish of the sky") from the *Astrological Reports to the Kings* of the late Assyrian period (Hunger 1992) is the IAU constellation Piscis Austrinus.

Fish on the Platter Nebula:

This **telescopic** asterism is dark nebula is Barnard 144 in the IAU constellation Cygnus.

Fish Snake:

This postclassic Mayan asterism from the *Paris Codex* is the IAU constellation Sagittarius (Milbrath 2014). Compare this to the Mayan asterism "Xoc" (see Shark, below).

Fish Trap:

This Yupik asterism "Taluyaq" is the IAU constellation Boötes.

This Tupi asterism "Cacuri" is the IAU constellation Crux (De Freita Mourão 2009).

This Tupi Guarani asterism "Cacuri" is the IAU constellation Crux (Lima and De M. Figueirôa, 2007).

This Sama asterism "Bupu" is the Big Dipper asterism in the IAU constellation Ursa Major (Ambrosio 2008). This is a rectangular bamboo fish trap. The stars of the "handle" of the Dipper are the rope used to pull the trap out of the water.

This Kiribati asterism "Ma ni kataenako" is a horseshoe shaped group of stars in the IAU constellation Eridanus (Trussel and Groves 1978). This is probably the loop of stars Delta (δ), Epsilon (ε), Zeta (ζ), Eta (η), and Tau (τ) 1, 3, 4, 5, and 6 Eridani. They are also known as "toriba ni Maiaki".

Fisher:

This German asterism is the IAU constellation Orion as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Anishinaabe and Ojibwe asterism "Odjiig" is the Big Dipper asterism in the IAU constellation Ursa Major (Lee et al 2014, Berezkin 2005). The fisher's "tail" is the "handle" of the Big Dipper, and he has an arrow in his tail represented by the stars 24 Boötis and 13 Boötis in the IAU constellation Boötes. NOTE: this animal is in the weasel family (Martes Pennanti).

This Ininew asterism "Ochekatak" or "Ochekatchakosuk" (Buck 2016) is identical to the Anishinaabe asterism "Odjig" (see above).

Fisher Star:

This Anishinaabe star "Ojiig Anung" is Alpha (α) Ursae Minoris (Polaris). It is called this as their asterism Fisher (see above) revolves around it (Lee et al 2014).

Fisherman:

This Hungarian asterism "halász" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism. It is depicted as a fisherman drawing a net into his boat. Caught in this net is

the Fishtail (see below). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Fishermen:

This Tupi asterism "Piracaçaras" is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (De Freita Mourão 2009). These fishermen are chasing their asterism "Juaraúa" (see Manatee, below).

This Tupi Guarani asterism is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Lima and De M. Figueirôa, 2007). These fishermen are chasing their asterism "Peixe Boi" (see Manatee, below).

Fishes:

This Greek asterism "Ἰχθύες" ("Ichthýes") is the IAU constellation Pisces as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest*. The Greeks also used the singular name "Ἰχθύε" ("Ichthýe"). Ptolemy (c.100 – c.170) described the parts of his constellation:

- "ἐπόμενος" ("epómenos" or "next") for the rear or eastern part,
- "ἡγουμένος" ("igouménos" or "prior") for the front or western part, and
- "νότιος" ("nótios" or "southern").

The stars in Ptolemy's Fishes are arranged like this:

- The bent line between the fishes was called "λίνον" ("línon" or "thread") by Ptolemy and is more crooked in the original version than what you see on today's star charts. The two lines run away from Alpha (α) Piscium (Alrescha):
    - One line runs through Omicron (ο), and 102 Piscium to Rho (ρ) Piscium,
    - The other crooked line runs through Xi (ξ), Nu (ν), Mu (μ), 89, 80, Zeta (ζ), Epsilon (ε), Delta (δ), 51, and 41 Piscium to Omega (ω) Piscium,
- At one end the "fish" is two lines of stars running off Omega (ω) Piscium:
    - One line runs through Lambda (λ) and Kappa (κ) Piscium to Gamma (γ) Piscium,
    - The other runs through Iota (ι), Theta (θ), and 7 Piscium to Beta (β) Piscium,
- At the other end the "fish" has two parts:
    - Rho (ρ) Piscium forms one corner of a bent triangle of the stars Phi (φ) Piscium, Psi (ψ) 1, 2 and 3 Piscium, and Chi (χ) Piscium, and
    - One side of the triangle formed by Phi (φ) and Psi (ψ) Piscium is a bending loop of the stars Upsilon (υ), 82, Tau (τ), Sigma (σ), 68, 65, and 67 Piscium.

This Gaulish asterism "Ogroni Prinnios" is the IAU constellation Pisces and appears in the Coligny Calendar (Boutet 2001). Compare to their asterism Winter Month Guiding Star (below).

This Romanian asterism "Peștii" is the IAU constellation Pisces (Ottescu 2009).

Fishhook:

This Kiribati asterism "Te Ngea" is the IAU constellation Corona Australis (Trussel and Groves 1978). Ngea is a hardwood used to make large fishhooks for catching sharks.

There are nine **telescopic** fishhook asterisms:

- One is HII region SH 2-245 (LBN 839) in the IAU constellation Taurus. It is also known as the Eridanus Loop.
- One from *Pattern Asterisms* by American astronomer John A. Chiravalle is in the IAU constellation Taurus and is 3 degrees north of the Hyades cluster. The star 56 Tauri is the end of the "hook", and the curve of the "hook" runs through the stars 51 Tauri, 53 Tauri, HIP 20417A, HIP 20493, Kappa (κ) 1 and 2 Tauri, and Upsilon (υ) Tauri, ending at 72 Tauri. Size 100' X 50'.
- One is NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as "I 176" and "I 177". The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Crowbar Galaxy (see above), the Hook (see below), the Hockey Stick Galaxies (see below), and the Hummingbird (see below). NOTE: It was originally thought that these were two galaxies, hence the name. However, it is now believed that this is one tidally distorted galaxy interacting (in radio wavelengths) with NGC 4631. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists the names "Crowbar Galaxy", "Fishhook Galaxy", and "Hockey Stick Galaxy".
- One is listed by René Merting on the *Faint Fuzzies* website and is in the IAU constellation Scutum. The top end is R Scuti (HIP 92202) and runs through HIP 91960, HIP 91880, HIP 91751, to HIP 91728A. From HIP 91728A a curve of 8th magnitude stars forms the "hook". Its size is 120' X 60'.
- One is Corder 2623 in the IAU constellation Boötes and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 75'. This is nine stars north of Alpha (α) Boötis (Arcturus): The "hook" includes HIP 69592, 69715, 69899, and 69918. HIP 69594 provides a "barb" at one end.
- One is Simonic 5AB from the list of Hungarian astronomer Ilona Simon Mogyorósi, which is in the IAU constellation Triangulum. This includes HD 9844, Gaia DR3 302921951738569728, Gaia DR3 302921058385377664, SAO 74811, HIP 7356 and 7374. This is Ennis 12 listed by Canadian astronomer Charles Ennis.
- One is in the IAU constellation Draco and is Corder 3359 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is ten 8th – 10th magnitude stars including HIP 86982.
- One is the open cluster NGC 6704 in the IAU constellation Scutum. It was discovered by German astronomer August Winnecke in 1854. It is GC 4435 in the *General Catalogue* of 1864. It was given this name by American astronomer Steve Coe, who describes it as a "fish hook shape that is surrounded by a dark lane that rings the cluster" on the DOCdb database. Also known as the Bull's Eye (see above).
- One is made up of stars of the IAU constellation Aquila and Scutum. It was posted by Will Rothfuss on *Cloudy Nights* in July 2022. It starts at Lambda (λ) Aquilae and runs through 12 Aquilae, Eta (η) Scuti, HIP 92391, and HIP 92202 to Beta (β) Scuti. Rothfuss uses it to star hop to Messier 11.

Fishhook Lure:

This Samoan asterism "Faipā" is stars in the IAU constellation Scorpius (Fitisemanu 2022): Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii. This is associated with the legend of 'Alo'alolelā and the magic fishhook (pā).

Fishhook of Leo:

This **telescopic** asterism "Hámus Leónis" is the barred spiral galaxy NGC 3509 (Arp 335) in the IAU constellation Leo. It was discovered in 1786 by William Herschel who listed it as III 598. It became GC 2292 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Fishhook of Scorpius:

This Western asterism is made up of stars of the "tail" of the IAU constellation Scorpius (Fitisemanu 2022): Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii.

Fishing Basket:

This Sama (Tawi-Tawi) asterism "Bubu" is the Big Dipper asterism in the IAU constellation Ursa Major (Masong 2017).

Fishing Rod:

This Kiribati asterism "kai n roa" is made up of the stars of Grus plus the "tail" of the IAU constellation Scorpius (Trussel and Groves 1978). This is also used to describe a stick with a string and a vessel for drawing water from a well.

This **telescopic** asterism is Streicher 60 in the IAU constellation Lacerta. It was discovered by South African astronomer Magda Streicher. Size 14' X 14'. René Merting lists it on the *Faint Fuzzies* website and describes it as "a fine line of stars, which stretches like a fishing rod from north to SSW- at 72X eight equally bright stars are equally spaced and recognizable as if pulled on a string, the string ends at a brighter star in the SW.

Fish's Head:

This asterism is in the Orion Nebula, Messier 42 (NGC 1976, SH 2-281, LBN 974, Ced 55d) in the IAU constellation Orion. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 describes this nebula as "familiarly called the Fish's head, with its streaming appendages, certainly has an irregular resemblance to the head of some monster of the polyneme genus" and describes the Trapezium asterism (see Trapezium, below) as being "in the Fish's mouth".

Fist of Cassiopeia:

This **telescopic** asterism "Pygmaéus Cassiopéiae" is the irregular galaxy IC 10 in the IAU constellation Cassiopeia. It was discovered by American astronomer Lewis Swift in 1887. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it appears to them as "the shape of a fist". It is also known as the "Starburst Galaxy" (see below).

Five Bull Reindeer:

This Chukchi asterism is the W asterism of the IAU constellation Cassiopeia. They see these reindeer standing in a pebbly river, which is the Milky Way.

Five Chariots:

This Chinese xing guan “Wǔchē” (**五**车) is a curve of five stars in the IAU constellations Auriga and Taurus: Alpha (α) Aurigae (Capella- the determinative star), Iota (ι) Aurigae, Beta (β) Aurigae (Menkalinan), and Theta (θ) Aurigae, and Beta (β) Tauri (Elnath). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Wǔchē” (**五**车) is a loop of stars in the IAU constellations Auriga and Taurus: Starting at Beta (β) Tauri (Elnath, “Sikong” (“Minister of Works”) it runs through Theta (θ) Aurigae (“Tiancang” (“Celestial Barn”), Beta (β) Aurigae (Menkalinan, “Yu” (“Prison”)), and Alpha (α) Aurigae (Capella, “Tianku” (“Celestial Arsenal”) to Iota (ι) Aurigae (“Xiang” (“Village”).

Five Corners:

This Basque asterism “Bost Kantoinak” is the IAU constellation Auriga ((Knörr 1999, Frank 2021).

Five Dromedaries:

This asterism “Quinque Dromedarii” (“the Five Dromedaries”) was created by German astronomer Petrus Apianus in 1533 in his *Horoscopion Apiani General*. It represents four camels with a baby camel in their middle and is made up of stars between the IAU constellations Draco and Lyra. It is centered on the “head” of the constellation Draco and includes stars between Draco and Lyra. NOTE: It was likely inspired by the Bedouin asterism Mother Camels (see below). Johann Bayer’s *Uranometria* (1603) lists “Quinque Dromedarii“ but attributes it to “Azophi Arabi”.

Five Feudal Kings:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of a line of five stars in the IAU constellation Gemini:

- Kappa (κ) Geminorum: “Taishi” (“Court Historian”),
- Upsilon (υ) Geminorum: “Boshi” (“Doctor”),
- Iota (ι) Geminorum: “Sangong” (“Three Excellencies”),
- Tau (τ) Geminorum: “Diyou” (“Emperor Friend”), and
- Theta (θ) Geminorum: “Dishi” (“Emperor Teacher”). This is the determinative star.

This Chinese xing guan “Wǔzhūhóu” (**五**诸**侯**) is made up of five stars in the IAU constellation Gemini: Theta (θ), Tau (τ), Iota (ι), Upsilon (υ), and Phi (ϕ) Geminorum.

Five Lords:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of five stars in the IAU constellation Coma Berenices: Starting with the determinative star 6 Comae Berenices, it runs through 11, 20, 26, and 35 Comae Berenices.

This later Chinese xing guan “Wǔzhūhóu” (**五**诸**侯**), despite the name, has become line of only three stars in the IAU constellation Coma Berenices: 6, 36, and 39 Comae Berenices.

This Korean asterism “Daseos Yeongju” (다섯 영주) is a line of five stars in the IAU constellation Gemini: Kappa (κ), Upsilon (υ), Iota (ι), Tau (τ), and Theta (θ) Geminorum.

Five Petals of Phoenix:

This **telescopic** asterism “Pentaphýlla Phoenícis” is the intermediate spiral galaxy NGC 7689 in the IAU constellation Phoenix. This was discovered by James Dunlop in 1826. John Herschel listed this as h 3996

and later as GC 4978 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "five arms".

Five Pin Bowling Alley:

This **telescopic** asterism is the Pleiades cluster in the IAU constellation Taurus. Chris Vaughan put out a challenge for a name for the stars surrounding Eta (η) Tauri (Alcyone) in the 6 June 2023 edition of the podcast *Insider's Guide to the Galaxy*. Dave Robertson or "Halifax 6 Dave" suggested a 10-pin bowling alley. NOTE: As this cluster has 6 primary stars including Alcyone, I'm making it a five-pin game.

Five Stars:

This Arabic asterism "Al Ḥams" or "Ḥamsah" is the principal stars of the IAU constellation Sagitta: Alpha (α) Sagittae (Sham), Beta (β) Sagittae, Delta (δ) Sagittae, Gamma (γ) Sagittae, and Eta (η) Sagittae:

- The 1521 edition of the *Alfonsine Tables* listed this as "Alahance" and the *Almagest* of that period as "Albanere"
- "Alhance" is listed by French scholar Joseph Justus Scaliger (1540 – 1609)
- "Alchanzato" is listed by German astronomer Wilhelm Schickard (1592 – 1635)
- Johann Bayer's *Uranometria* (1603) lists "Alahance" and "Alhance".
- "Alhance" is listed by R. H. Allen in his *Star Names* in 1899.

This Quechua asterism "Pisqa Collyur" is the Hyades cluster in the IAU constellation Taurus (Urton 1981). Compare this to their asterism Five Storehouses (see below).

Five Stars Woman:

This Mongolian asterism "Hun Tavan Od" is the "W" of the IAU constellation Cassiopeia (Lagain & Rousseau 2015).

Five Storehouses:

This Quechua asterism from Sonqo, "Pisqa Collca, is stars between the belt of Orion and the Hyades cluster in the IAU constellation Taurus (Urton 1981). Compare this to their asterism Five Stars (see above).

Five Times:

This Gallic asterism "Quinio" is made up of stars of the IAU constellations Libra and Scorpius. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. This is roughly a diamond shape, with Alpha (α) Scorpii (Antares) at one end, the three stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii in the middle, and Alpha (α) Librae (Zubenelgenubi) at the other end.

Five Troops:

This complex Korean asterism "Daseos Gundae" (다섯 군대) is in the IAU constellations Lupus and Norma. The center is a quadrilateral of stars: Gamma (γ), Delta (δ), Epsilon (ε), and g Lupi. From each of these stars as many as two lines run out:

- From g Lupi two lines run out, one to Eta (η) Normae and the other to Delta (δ) Normae,

- From Epsilon (ε) Lupi two lines run out, one to Eta (η) Lupi and the other to Beta (β) Lupi,
- From Delta (δ) Lupi a line runs out to Psi (ψ) Lupi, and
- From Gamma (γ) Lupi a line runs out to Eta (η) Lupi.

Fixed Projection:

This Hawaiian star “Kio-pa'a” or “Kio-pa” is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Hokupa’a” (“Fixed Star”), “Noho-loa” ("Eternal"), “Kumau” ("Standing Perpendicularly"), “Kia-pa'akai” (Biblical: "Pillar of salt"), or “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe").

Fixed Star:

This Hawaiian star “Hokupa’a” is Polaris (Alpha (α) Ursae Minoris) in the IAU constellation Ursa Minor. It is also known as “Noho-loa” ("Eternal"), “Kumau” ("Standing Perpendicularly"), “Kio-pa'a” or “Kio-pa” ("Fixed projection"), “Kia-pa'akai” (Biblical: "Pillar of salt"), or “Maka-holo-wa'a” ("Sailing-canoe eye" or "Star of the sailing canoe").

Fixed Star of the North:

This Tibetan star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Johnson-Groh 2013).

Flag:

This Scottish asterism “Vexillum” was created by Scottish mathematician Michael Scot in 1225. It is made up of stars in the IAU constellations Leo and Virgo. Scot’s *Liber introductorius* depicts it as a flag mounted on a lance and shows eight stars. German astronomer Christian Ludwig Ideler (1776 – 1846) called it “Fahne” (“banner”). The identity of the precise stars is uncertain.

This Basque asterism “Bandera” is the IAU constellation Lyra (Knörr 1999, Frank 2021) and their name for the star Alpha (α) Lyrae (Vega) is “Begi Urdina” (see Beautiful Face, above).

This Kiribati star “Maro” is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major (Trussel and Groves 1978).

Flag Bearer of Serpens:

This **telescopic** asterism “Vexillárius Serpéntis” is the spiral galaxy UGC 9829 in the IAU constellation Serpens. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the flag, to which the name refers, is the rectilinear streak at the end of the northern arm of this galaxy”.

Flag of Emperor:

This Korean asterism “Hwangje-ui Gisbal” (황제의 깃발) is a bent line of stars in the IAU constellation Eridanus. The line starts at HIP 23166A and runs through R and 60 Eridani to 59 Eridani, where it bends and runs through 58 Eridani and HIP 22028 to 54 Eridani, where it bends and ends at HIP 22086.

Flag of Saam:

This Korean asterism “Sam-ui Guggi” (삼의 국기) is a line of stars in the IAU constellation Orion. Starting at Eta (η) 6 Orionis, it runs through Eta (η) 5, 4, 3, 2, and 1 Orionis, 6, and Omicron (o) 2

Orionis, ending at 11 Orionis. NOTE: This refers to the Korean asterism and lunar mansion Saam (see Three Stars, below).

Flag of the Drum:

This Chinese Chenzhuo xing guan is three lines of stars radiating out of a central star in the IAU constellation Aquila: The central star is Delta (δ) Aquilae, from which three lines run out:

- One runs to Mu (μ) Aquilae,
- One runs to Sigma (σ) Aquilae, and
- One runs through Nu (ν) Aquilae, Iota (ι) Aquilae, Eta (η) Aquilae, Theta (θ) Aquilae, and 69 Aquilae to HIP 101345.

Flag of Wine Officer:

This Korean asterism "Podoju Jang-gyoui Gisbal" (포도주 장교의 깃발) is a triangle of stars in the IAU constellation Cancer: Alpha (α) Cancri (Acubens), Kappa (κ) Cancri, and Eta (η) Cancri.

Flail:

This Southern Estonian asterism "Koot" is a line of three stars in the IAU constellation Orion (Kuperjanov 2006) and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala): Kappa (κ) Orionis, Alpha (α) Orionis (Betelguese), and Gamma (γ) Orionis (Bellatrix).

Flail and Thresher:

This Lithuanian asterism "Spragilas ir Kūlėjas" is the belt and sword of Orion in the IAU constellation Orion.

Flame:

This "Euphratian" star "Gus-ba-ra" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

This American asterism "the Flame" is the IAU constellation Piscis Austrinus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

This **telescopic** Basque star "Gar" is the red dwarf star GJ 486 in the IAU constellation Virgo (magnitude 11.395). It received this name in the IAU's NameExoWorlds competition in 2022. It has an exoplanet, GJ 438b, "Su", which is the Basque word for "fire". This is related to the popular Basque saying "su eta gar" ("fire and flame"), which signifies passion and enthusiasm.

Flame Nebula:

This **telescopic** asterism is emission nebula NGC 2024 (SH 2-277, LBN 953, Ced 55p) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 28" in his catalogue. It is GC 1227 in the *General Catalogue* of 1864. Size 30' X 30'. This is O'Meara 31 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the Maple Leaf (see below), the Tank Tracks (see below), the Oak Leaf (see below) and the "Christmas Tree" (see above).

Flaming Eye of Leo:

This **telescopic** asterism "Phlógops Leónis" is the spiral galaxy UGC 6614 in the IAU constellation Leo. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it this because "the bright inner ring of this faint galaxy brings to mind a flaming eye."

Flaming of Eridanus:

This **telescopic** asterism "Flámmea Erídani" is the elliptical galaxy NGC 1407 in the IAU constellation Eridanus. It was discovered in 1785 by William Herschel who listed it as "I 107". This became GC 752 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name refers to the luminosity of this galaxy.

Flaming Star Nebula:

This **telescopic** asterism is the emission nebula IC 405 (Caldwell 31, SH 2-229, vdB 34, LBN 795, Ced 42) in the IAU constellation Auriga. It is also known as Schaeberle's Flaming Star Nebula after American astronomer John Martin Schaeberle (1853 – 1924) who discovered it and described it by this name.

Flamingo:

This Dutch asterism "Phoenicopterus" is the IAU constellation Grus, appearing in Paul Merula's 1605 *Cosmographiae Generalis*. Edward Sherburne lists the names "Grus", "Phaenicopterus" and "Geranos" (Latin "carry us") in his *Sphere of Marcus Manilius* in 1675. John Hill lists it as "Phaenicopterus" in his *Urania* in 1754 and also lists the name "Flammant", which is the Latin word for "blaze", not flamingo: The Latin name for Flamingo is "phoenicopteri". Robert Hues (1659) and John Chilmead (1899) list it as "Phoenicopter" in *A Learned Treatise on Globes.* Hues claimed that it represented the "Bittour", which would be the bittern, a bird in the heron family, and that the "Spaniards called it Flamgengo".

Flank:

There are two Arabic stars with the name "al-Janb" (الجنب), which translates as "the flank" or "al-jānib" (الجانب), which translates as "flank" or "side":

- One is the star Gamma (γ) Pegasi in the IAU constellation Pegasus and later latinized to "Algenib", "Algeneb", "Elgenab", "Genib", "Chenib", "Algemo", or "Alchemb":
  - Alchemb appears in the *Alfonsine Tables* (Kunitzsch 1986).
  - Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this star as "Algenib".
  - In his *A Learned Treatise of Globes* in 1659, Robert Hues lists this star as "Alchcemb" (attributing it to the 15th century *Alfonsine Tables*), "Alchenib", and "Algeneb" (which he attributes to Joseph Justus Scaliger (1540 – 1609)).
  - A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) simply labels this star "Pegasus".
  - The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Algenib".
  - Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Algenib".

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Algenib" it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists the name "Algenib" for this star.
- American uranographer William Croswell (1760 – 1834) lists this star as "Algenib" on his *Mercator Map of the Starry Heavens* in 1810 but also lists the star Alpha (α) Persei with this name.
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Algenib".
- A boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Albenib": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Algenib" but also uses this name for Alpha (α) Persei.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Algenib".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Algenib".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Algenib" and describes it as "the side".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Algenib".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Algenib" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Algenib" for this star.
- The IAU approved the name Algenib for the star Gamma (γ) Pegasi.
- NOTE: R. H. Allen writes in his *Star Names* in 1899 that some have incorrectly assumed that the name of this star originated in the Arabic "Al Janāḥ" ("the wing") as does Robert Burnham in his *Burnham's Celestial Handbook* in 1978. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 makes this error, claiming that "Algenib" is derived from "Jenáh-al-faras" which he translates as "the horse's wing".

- One, latinized to "Algenib" or "Alchemb" is Alpha (α) Persei (Mirfak):
  - Georgius Chrysococcas, a 14th century Greek geographer and astronomer, named it "Πλευρά Περσάους" ("Plevrá Persáous") or "Perseus' Side".
  - The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Algenib".
  - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this star as "Algenib".
  - Johann Bayer's *Uranometria* (1603) lists the names "Chenib", "Algenib", and "Genib" for this star.
  - American uranographer William Croswell (1760 – 1834) lists this star as "Algenib" on his *Mercator Map of the Starry Heavens* in 1810 but also labels Gamma (γ) Pegasi with this name.
  - Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Algenib".

- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists "Algenib" for this star but also uses it for Gamma (γ) Persei.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Algenib".
- Robert Burnham lists it as "Alchemb or Algenib" in his *Burnham's Celestial Handbook* in 1978.
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "Algemb" (Dekker 2000).

Flap Eared of Sculptor:

This **telescopic** asterism "Fláccus Sculptóris" is the elliptical galaxy IC 1657 in the IAU constellation Sculptor. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy with a small companion on both sides brings to mind a thin face with two protruding ears".

Flashing:

This Chaldean star "mul an.ta.sur.ra", " is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Flat Bread of Ursa Major:

This **telescopic** asterism "Plácus Úrsae Majóris" is the spiral galaxy NGC 4062 in the IAU constellation Ursa Major. It was discovered in 1787 by William Herschel who listed it as "I 174". It became GC 2687 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to it being a "flat looking galaxy".

Flat Dish of Canes Venatici:

This **telescopic** asterism "Pátera Cánum Venaticórum" is the lenticular galaxy NGC 5273 in the IAU constellation Canes Venatici. It was discovered in 1785 by William Herschel who listed it as "I 98". It became GC 3637 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has "a polar ring of dust material".

Flat of Virgo:

This **telescopic** asterism "Plátys Vírginis" is the edge-on spiral galaxy NGC 5170 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as "V 22". It became GC 3557 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Flat Road:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Virgo: Starting at the determinative star 74 Virginis it runs through 66 Virginis to 65 Virginis.

This Chinese xing guan “Píngdào” (平道) is a line of two stars in the IAU constellation Virgo: 82 and Theta (θ) Virginis. NOTE: This xing guan crosses the xing guan Horn (see below) forming a cross.

This Chinese Chenzhuo xing guan “Píngdào” is a line of two stars in the IAU constellation Virgo: 74 and 66 Virginis.

Flaxen Thread:

This Arabic asterism “Al Ḥaiṭ al Kattāniyy” is the lines of stars connecting the “fishes” in the IAU constellation Pisces. The two lines run away from Alpha (α) Piscium (Alrescha):

- One line runs through Omicron (ο), and 102 Piscium to Rho (ρ) Piscium,
- The other crooked line runs through Xi (ξ), Nu (ν), Mu (μ), 89, 80, Zeta (ζ), Epsilon (ε), Delta (δ), 51, and 41 Piscium to Omega (ω) Piscium.

Flea Nebula:

This **telescopic** HII region is SH 2-123 (LBN 414) in the IAU constellation Cygnus. It is also known as the Tick Nebula (see below).

Flegetonte:

This Italian star “Flegetonte” is HIP 57370 (HD 102195) in the IAU constellation Virgo and was given this name in the IAU NameExoWorlds campaign. It was named for Phlegethon, and underworld river in Greek mythology mentioned in Dante Alighieri’s *Divine Comedy*. It has an exoplanet named Lete, which is a river of oblivion made of fog in Greek mythology which appears in Dante’s *Divine Comedy*.

Fleming’s Triangular Wisp:

See Pickering’s Triangle, below.

Fleur-de-Lis:

This French asterism “Lilium” (“lily”), also known as “Apes” (see Bee above) and “Musca Borealis” (see Northern Fly, below) was created by French architect Augustin Royer in 1679, using stars of the IAU constellation Aries: 33, 35, 39, and 41 Arietis. The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Fleur de Lis” and depicts this next to Triangulum. Compare this to the asterism Bearer (see above) which appears in several cultures and the asterism Wasp (see below).

Flickering:

This Inuit star “Singuuriq” (“flickering” or “it pulsates”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (MacDonald 1998).

This Caribou Inuit (Naujaat) star “Singoreq” (“flickering” or “it pulsates”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

NOTE: Sirius would always appear close to the horizon from their location, so you’d be looking through more atmosphere which would interfere with “seeing”, so it would likely often appear to be flickering.

Flickering Cluster:

This **telescopic** asterism is the globular cluster Messier 62 in the IAU constellation Ophiuchus. It was discovered by French astronomer Charles Messier in 1771 and added to his catalogue eight years later. It is listed in the General Catalogue of 1864 as GC 4261 and in John Herschel’s catalogue as h 3661. This

is one of the 10 most massive globular clusters, and the name is probably a reference to the 245 variable stars that it contains.

Flies:

This Teduray asterism “Kufukufu” is the Pleiades cluster in the IAU constellation Taurus (Santos et al 2019).

Flintlock:

This Filipino asterism is the IAU constellation Aries (Margiza 2022).

Flocculent of Ursa Major:

This **telescopic** asterism “Floccósus Úrsae Majóris” is the spiral galaxy NGC 3675 in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as GC I 194”. It became GC 2413 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They call it this due to the “flocculent nature of the galaxy arms”.

Flock:

This ancient Egyptian decan “Khau” (“flock” or “myriad”) is the Pleiades cluster in the IAU constellation Taurus. In later Hellenistic texts it was named “ερω” or “ⲁⲣⲟⲩ” (“Arat”). In the Testament of Solomon, it became “Kairoxanondalon” or “Iudal”, Aristobulus of Paneas called it “Tourtour”, in Greek Hermeticism it became “Aron”, in Latin Hermeticism “Sarnotois”, 4th century Roman astrologer Julius Firmicus Maternus called it “Aryo” or “Ason”, Cosmas of Maiuma (d. 760) called it “die Horen”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Viroaso” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ϵλιτομϵνοc” (“Helitomeos”). Variations include “Aron”. It has been depicted as a woman with scepters in both hands.

Flock:

This Gallic asterism “Massa” is the Pleiades cluster in the IAU constellation Taurus. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. Gregory lists the name “Massa”, which likely is a reference to the Medieval asterism “Massa Gallinae” (see Mass of Hens, below). McKay (2020) also points out that “there is an Old Irish word maisse/masse worth investigating. This is a productive word, signifying both ‘beautiful’, ‘comeliness’, and a word that ‘confers dignity, lustre, renown’. These descriptors are appropriate for the Pleiades, the most beautiful star group in the sky, and of the ritual mace that confers power. However, the word isn’t attested in Old Irish as referring specifically to the Pleiades. The word is used when describing the seven pupils in the eye of the warrior-hero Cú Chulainn, the Pleiades usually given as 6 or 7 seven visible stars”.

Flock of Birds:

This Greek asterism “Πελειάδες” (“Peleiádes”) is the Pleiades cluster in the IAU constellation Taurus as listed by 3rd century Greek rhetorician and grammarian Athenaeus, 7th century B.C.E. Greek poet Hesiod, 6th century B.C.E. Greek lyric poet Pindar, and 6th century B.C.E. Greek lyric poet Simonides of Ceos and listed in R. H. Allen’s *Star Names* in 1899. Allen writes that they saw it as a flock of “Rock pigeons flying from the Hunter Orion”.

Flock of Birds Drinking Water:

This Boorong and Wotjobaluk asterism "Tourt-chinboiong-gherra" or "Tourtchinboionggherra" is the IAU constellation Coma Berenices as listed by Stanbridge (1857), Morieson (1999), Clarke (2009), and Hamacher and Frew (2010). The Boorong viewed it as a flock of birds drinking water from a rain puddle in the crotch of a tree and its appearance marked the dry season. Originally each of the birds had a separate name, but these names have been lost.

Flock of Chickens:

This Taureg asterism is the Pleiades cluster in the IAU constellation Taurus.

Flock of Coma Berenices:

This **telescopic** asterism "Flóccus Cómae Bereníces" is the spiral galaxy NGC 4414 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "I 77". It became GC 2972 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the "flocky nature of this galaxy". It is also known as the "Dusty Spiral Galaxy" (see above).

Flock of Geese:

This asterism is the open cluster Messier 44 (NGC 2632) in the IAU constellation Cancer. American astronomer Tom Lorenzin, in his 1000+ The Amateur Astronomer's Field Guide to Deep Sky Observing, describes it as including "a prominent open 'v' with apex pointing N like a flock of geese in the spring."

Flock of Mahutonga:

This Māori asterism "Kahui o Mahutonga" or "Kahui-ruamahu" is the Southern Cross in the IAU constellation Crux (see Southern Cross below).

Flock of Sheep:

There are two Arabic asterisms with this name:

- One is the Arabic asterism "al-Firqah" (الفرقة) or "Al Firq" as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449), which is the star Alpha (α) Cephei (Alderamin), Beta (β) Cephei (Alfirk), and Eta (η) Cephei in the IAU constellation Cepheus:
    - This was later latinized to "Alfirk", "Alphirk", or "Ficares".
    - Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283) applied this name to the star Alpha (α) Cephei (Alderamin).
    - American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Alphirk".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Alphirk and Ficares, from the Arabian kawákib al firk, stars of the flock".
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists Beta (β) Cephei as "Alphirk".
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Beta (β) Cephei as "Alphirk".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list Beta (β) Cephei as "Alphirk".
    - The IAU approved the name Alfirk for the star Beta (β) Cephei Aa.

- One is the Arabic asterism “al-aghnām”, later latinized to “Al Aghnam”, “Alinam”, or “Al Aglenam”, which is the stars Kappa (κ) and Pi (π) Cephei in the IAU constellation Cepheus (I and II Al Aghnam):
    - John Hill lists it as “Aglinam” in his *Urania* in 1754: Hill describes this as an Arabic name for a “cluster of stars in the hands of the constellation Cepheus” and that it “signifies sheep”.
    - NOTE: English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al Aghnán, the sheep” as a name for the constellation Cepheus.

Flock of Wool of Grus:

This **telescopic** asterism “Mállus Grúis” is the barred spiral galaxy IC 5273 in the IAU constellation Grus. This was first recorded by American astronomer Lewis Swift (1820 – 1913). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this rather small galaxy, with its thick and chubby short spiral arms, resembles a flock of wool”.

Flocking Together of Canis Major:

This **telescopic** asterism “Concúrsus Cánis Majóris” is the lenticular galaxy NGC 2293 in the IAU constellation Canis Major. It was discovered in 1835 by English astronomer John Herschel who listed it as 3063 and later as GC 1459 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its interaction with NGC 2292.

Flood:

This asterism is the IAU constellation Hydra as listed in R. H. Allen’s *Star Names* in 1899. Allen does not identify the cultural source but does indicate that it is a reference to the Biblical flood.

Flood Control:

This Korean asterism “Hongsu Jojeol” (홍수 조절) is a quadrilateral of stars in the IAU constellation Orion: Nu (ν), Xi (ξ), 72, and 69 Orionis.

Flood of Rich People:

This Hungarian asterism ”Dúsdosók árdjzála” appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts it as five stars falling into some sort of container. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Florence:

This asterism “Florensia” was created from stars of the IAU constellation Crater by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Florence and is depicted as a gold ring.

Florid of Aquarius:

This **telescopic** asterism “Florídula Aquárii” is the barred spiral galaxy NGC 7371 in the IAU constellation Aquarius. It was discovered in 1785 by William Herschel who listed it as “II 477” It became GC 4833 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because they describe it as a “humble-looking flower-like galaxy”.

Flounder:

This Māori asterism “Te Patiki” is the Coal Sack Nebula (see Coal Sack Nebula, above).

Flower Garden:

This Lithuanian asterism “Darželis” is the IAU constellation Corona Borealis.

Flower Like of Cassiopeia:

This **telescopic** asterism “Anthemódes Cassiopéiae” is the spiral galaxy NGC 278 in the IAU constellation Cassiopeia. It was discovered in 1786 by English astronomer William Herschel who listed it as I 159. It is GC 158 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as they were “inspired by the flower-like aspect of this galaxy”. It is also known as the “Ninja Star Galaxy” and the “Neon Sign Galaxy”.

Flower of Leo Minor:

This **telescopic** asterism “Flós Leónis Minóris” is the peculiar spiral galaxy NGC 3396 (Arp 270) in the IAU constellation Leo Minor. It was discovered by English astronomer William Herschel in 1785 who listed it as “I 81” in his catalogue. It is GC 2178 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it looks like a flower from which a hummingbird (NGC 3395) is sucking nectar.

Flower of the Heavens:

This Hawaiian star “Kaulua[-i-ha'i-mohai]” or “[-a-ha'i-mohai]” is the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is also known as, “A’a” (‘burning brightly”), “Hiki-kau-[e]-lia” or “Hiki-kau-e-lono” ("The-small-booby-bird-of-Lono"), “Hiki-kau-lono-meha” ("Star of solitary Lono"; also Lono or Lono-meha), “[Hiki] kaulana-o-meha” or “Kau-ano-meha” ("Standing alone and sacred"), “Hoku-kau'opae” ("Star for placing shrimp"), “Hoku-ho'okele-wa'a" ("Canoe-guiding star"), or “Kaulu-lena” or “Kaulua-lena” ("Yellow star").

Flowers on a Celestial Cross:

This Tzotzil (Zinacantán) asterism is a group of stars around a star cross believed to be the IAU constellation Crux (Milbrath 1999). This represents the souls of dead babies.

Flower Vase:

See Crown, above.

Flowing Sweetly of Virgo:

This **telescopic** asterism "Blandiflua Vírginis" is the barred spiral galaxy NGC 4717 in the IAU constellation Virgo. NGC 4716 and 4717 were discovered by Wilhelm Tempel in 1882. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "seems to caress its partner NGC 4716 with a gracious flowing gesture".

Fluffy of Lepus:

This **telescopic** asterism "Lanuginósus Léporis" is the barred spiral galaxy NGC 2139 (IC 2154) in the IAU constellation Lepus. NGC 2139 was discovered by English astronomer William Herschel in 1784. American astronomer Lewis Swift (1820 – 1913) later recorded it as IC 2154. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Fly:

See Musca, below.

Fly Cluster:

This Gnomish asterism "Sithaloth" or "Sithaloctha" is the Pleiades cluster in the IAU constellation Taurus in the works of J. R. R. Tolkien (1892 – 1973).

Fly Nebula:

This **telescopic** asterism is the bipolar emission and reflection nebula NGC 1931 (SH 2-237, LBN 810, Cr 68, Ced 49) in the IAU constellation Auriga. This was discovered in 1793 by English astronomer William Herschel who listed it as "I 261". It became GC 1137 in the *General Catalogue* of 1864. It is also known as the "Mini Orion Nebula".

Flying:

This Latin asterism "Volucris" or "Volatilis" is the IAU constellation Volans as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Volucris".

Flying Bat Nebula:

This **telescopic** asterism is HII region is SH2-129 in the IAU constellation Cepheus. It is also known as the Squid Nebula.

Flying Bird:

There are three **telescopic** flying bird asterisms:

- One is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. This is the name given to it by American astronomer Wayne Schmidt, who describes it as a 16-arcminute long bird flying towards a tiny cluster of stars. It is also known as the the Kachina Doll Cluster, Dragonfly Cluster, Massed Jewels, and the E.T. Cluster.
- One is PGC 34696, a galaxy in the IAU constellation Leo.
- One is the open cluster Messier 52 (NGC 7654) in the IAU constellation Cassiopeia. It was discovered by French astronomer Charles Messier in 1774. It was given this name by English astronomer William Henry Smyth (1788 – 1865), who described it as a triangular cluster with an 8th magnitude orange star at the apex, resembling "a bird with outstretched wings" in his

Bedford Catalogue in 1844 It is listed in John Herschel's *General Catalogue* of 1864 as GC 4957. This is also known as the Cassiopeia Salt and Pepper Cluster (see above), "October Salt and Pepper Cluster" (see below), "Scorpion" (see below), "Flying Bird", and as a "Crab (Jumping Off a Rock), see above.

Flying Cloud:

This Samoan asterism "Aolele" is the Small Magellanic Cloud in the IAU constellation Tucana (Fitisemanu 2022).

Flying Corridor:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a long line of stars in the IAU constellations Andromeda and Cassiopeia: Starting with the determinative star Phi (ϕ) Andromedae, it runs through Theta (θ), Chi (χ), 44, and Epsilon (ε) Cassiopeiae to HIP 9312.

This Chinese xing guan "Gédào" (㗎道) is a long line of stars in the IAU constellation Cassiopeia: Iota (ι), Epsilon (ε), Delta (δ), Theta (θ), Nu (ν), and Omicron (ο) Cassiopeiae.

This Chinese Chenzhuo xing guan is a bending line of stars in the IAU constellation Cassiopeia: Starting at Iota (ι) Cassiopeia it runs through HIP 9312, Epsilon (ε) Cassiopeiae, HIP 8362, and Delta (δ) Cassiopeiae to Phi (ϕ) Cassiopeiae.

Flying Dragon Nebula:

This **telescopic** asterism is HII region is SH 2-114 (LBN 347) in the IAU constellation Cygnus.

Flying Eagle:

There are two Arabic asterisms with the name "(an-Nisr) uṭ-Ṭā'ir" or "(an-nasr) aṭ-ṭāʾir" (النّسر الطّائر):

- One is the star Alpha (α) Aquilae in the IAU constellation Aquila:
    - "al-Nasr al-Tā'er" and "Al-Nasr al-Tāir" are both listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - This star is listed as "[Al-] nasr al-tā'ir" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
    - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "al-nasr al-tair" and the Hebrew name "ha-nesher ha me'ofef".
    - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-nasr al-tā'ir" and the Hebrew name "ha-nesher ha-me'ofef".
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-nasr al-tā'ir".
    - An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "nasīr al-tā'ir" and the Hebrew name "nesher me'ofef".
    - The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Altair".
    - "Altair is listed on the Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 (Dekker 2000).
    - This was later latinized to "Altair", "Althair", "Athair", and "Attair".
    - "Altair" and "al tāyir" are listed on a 14th century Christian Spanish astrolabe #4560 (King 2002).

- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r labels this star as “Altair” and the constellation as “Vultur Volans”.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the name “Alkayr” for this star.
- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists the name “alkaÿr Martius” for the this star.
- Dutch uranographer Hugo Grotius (1583 – 1645) lists the name “Alcair”
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Altair” and “Alcair”.
- German astronomer Johann Bayer (1572-1625) lists “Alcar”, “Alcair”, and “Atair” in his Uranometria (1603).
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Attair” and “Attayro”.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as “Altair”.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Athair”.
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as “Altare” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Atair”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) listed this star as “Althair” in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) it is listed as “Altair”.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Altair” and his *Bedford Catalogue* in 1844 lists “El nesr el táīr, the flying eagle”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as “Altair”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Altair”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Altair”.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists “Altair” in his *Star Atlas* (1893).
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Altair” and describes it as “the bird”.
- John Chilmead (1899) lists “Altayr”, which he derived from Robert Hues’ *A Learned Treatise of Globes* (1659), where Hues lists it as a name for the constellation Aquila, along with the “Arabic” name “Aquila Albhakkab”, which he translates as the “flying vulture” (see Flying Vulture, below).
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Altair”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Altair” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name “Altair” for this star.
- The IAU approved the name Altair for the star Alpha (α) Aquilae.

- One is a line of three stars in the IAU constellation Aquila: Beta (β) Aquilae (Alshain), Alpha (α) Aquilae (Altair), and Gamma (γ) Aquilae. Dorn (1829) lists this as "Eagle" as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). "Vultur Volans" ("flying eagle") is a Latin variation of the name for the IAU constellation Aquila (see Aquila, above).

Flying Eye Nebula:

See Thor's Helmet, below.

Flying Fish:

This Chinese xing guan "Fēiyú" (飞鱼) is made up of stars in the IAU constellation Volans and the name relates to the original name of the constellation Volans: Piscis Volans ('flying fish"). Five lines of stars run off to one side of Alpha (α) Volantis. The stars at the end of each of the five lines are: Beta (β), Delta (δ), Gamma (γ) 1 and 2, Zeta (ζ), and Kappa (κ) 1 and 2 Volantis.

This **telescopic** asterism is in the IAU constellation Octans and is Corder 2045 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is five 7^{th} – 8^{th} magnitude stars including HIP 51723 and 52020.

Flying Foxes:

This Wardaman asterism is the stars of the IAU constellations Ara and Pavo.

Flying Geese:

This **telescopic** asterism, also known as the Ghost Bush Cluster (see below), the Seacrest Cluster (see below), and the Silk Fan Cluster (see below), is the open cluster NGC 6939 in the IAU constellation Cepheus. It was discovered by William Herschel in 1798 who listed it as VI 42. It is GC 4590 in the *General Catalogue* of 1864. It lies 0.6 degrees northwest of the spiral galaxy NGC 6946 and 2 degrees southwest of the star Eta (η) Cephei.

Flying Ghost:

This **telescopic** asterism is the interactive galaxies NGC 520 (Arp 155) in the IAU constellation Pisces. It was discovered in 1784 by William Herschel who listed it as "III 253". It became GC 303 in the *General Catalogue* of 1864. It is also known as the "Entangled of Pisces" (see above).

Flying Grype:

This Old English asterism is the IAU constellation Aquila as listed in R. H. Allen's *Star Names* in 1899. NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Falling Grype" as a name for the constellation Lyra, claiming that this name was derived from the asterism "Vultur Cadens" (see Falling Vulture above).

Flying Horse:

This asterism "Equus Volans" is the IAU constellation Pegasus. This name is listed in Johann Bayer's *Uranometria* (1603).

Flying Jaw Nebula:

This **telescopic** asterism is the planetary nebula NGC 2899 in the IAU constellation Vela. This was discovered by English astronomer John Herschel in 1847 and listed as h 3169 on his list. It is GC 1859 in the *General Catalogue* of 1864. It is also known as the Glowing Butterfly (see Butterfly, above).

Flying Machine:

This **telescopic** asterism is made up of stars of the IAU constellation Scorpius. It was posted by Marty in March 2022 on *Cloudy Nights*. It is made up of two lines of stars: The first is the stars HIP 78246, 3 Scorpii, 2 Scorpii, and 1 Scorpii. From 2 Scorpii a line runs through HIP 77858 to HIP 77859.

Flying Minnow:

See Mini Delphinus, below.

Flying Owl Nebula:

This **telescopic** asterism is the nebulosity around NGC 2029, 2034, and 2062 in the IAU constellation Dorado, which is part of the Large Magellanic Cloud.

Flying Saucer:

There are two **telescopic** "flying saucer" asterisms:

- One is Deschesne 1, discovered at the Mount Kobau star party by Calgary Center RASC member Roland Deschesne in 2006, who was using 25 X 100 binoculars at the time. It consists of 9th – 10th magnitude stars about 30 arcminutes NNE of Epsilon (ε) Pegasi (Enif) in the IAU constellation Pegasus. Five 9th magnitude stars form a triangle, with the star Tycho TYC 1125-1586-1 at the apex which is the "top" of the flying saucer. 10th magnitude stars to either side form the "sides" of the flying saucer.
- One is Picot 1 (See Napoleon's Hat, below).

Flying Serpent:

This large Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars in the IAU constellations Andromeda, Cassiopeia, and Lacerta. The determinative star is Alpha (α) Lacertae, from which two long lines (forming the "body") and five short lines (forming the "head") run out:

- One long line runs through HIP 113388, 3, 7, 8, 11, Lambda (λ), and Kappa (κ) Andromedae to Iota (ι) Andromedae,
- One long line runs through HIP 112761, 113501, 114162, 114924, 117299, Rho (ρ) Cassiopeiae, and Tau (τ) Cassiopeiae to HIP 115990,
- One line runs to 5 Lacertae,
- One line runs to 4 Lacertae,
- One line runs to HIP 109521,
- One line runs to Beta (β) Lacertae, and
- One line runs to 9 Lacertae.

This large Chinese xing guan "Téngshé" (螣蛇) is made up of stars in the IAU constellations Andromeda, Cassiopeia, Cygnus, and Lacerta:

- One end starts at Iota (ι) Andromedae then runs in a line through Kappa (κ) Andromedae to Psi (ψ) Andromedae, where it bends into a line through Lambda (λ), 8, 7, and 3 Andromedae to a bend at 9 Lacertae,
- At 9 Lacertae the line then loops up through AR, Tau (τ), Rho (ρ) and Sigma (σ) Cassiopeiae to Beta (β) Lacertae, and

- At Beta (β) Lacertae the star line then loops through Epsilon (ε) and 13 Cephei, IC 1396, HIP 105064, Eta (η) 1 and 2 Cygni, and 4 Lacertae, ending up at Alpha (α) Lacertae. This is also translated as Flying Vulture (see below) and is part of the asterism Two Vultures (see below).

This Chinese Chenzhuo xing guan "Téngshé" is made up of stars of the IAU constellations Andromeda and Cassiopeia: The "body" is the line of two stars 3 Andromedae and HIP 114162. From each of these stars three lines run out:

- From 3 Andromedae:
  - One line runs to HIP 113288,
  - One line runs to HIP 113327, and
  - One curving line forming a "wing" runs through 7 Andromedae, 8 Andromedae, 11 Andromedae, Lambda (λ) Andromedae, Kappa (κ) Andromedae, Iota (ι) Andromedae, and 10 Andromedae to Omega (ω) Andromedae, and
- From HIP 114162:
  - One line runs to HIP 113501,
  - One line runs to HIP 112641, and
  - One curving line forming a "wing" runs through HIP 114924, HIP 118077, Sigma (σ) Cassiopeiae, Rho (ρ) Cassiopeiae, and Tau (τ) Cassiopeiae to a loop formed by HIP 115990, HIP 115395, 1 Cassiopeiae, and HIP 114622.

Flying Squirrel:

This American asterism "Sciurus Volans" was created from the stars of the IAU constellation Camelopardalis in 1810 by eccentric American educator and uranographer William Croswell (1760 – 1834). Croswell depicts on his *Mercator Map of the Starry Heavens* in 1810 as a flying squirrel.

This **telescopic** asterism is in the IAU constellation Hydra and is listed as Corder 1679 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 9'. This is a roughly X-shaped group of six 9th magnitude stars.

Flying Star:

This **telescopic** English star, listed by British astronomer Stephen Groombridge as Groombridge 1830 in his *Catalogue of Circumpolar Stars* in 1838, is HIP 57939 in the IAU constellation Ursa Major (magnitude 6.45). Groombridge called it the "Flying Star" or "Runaway Star" because at the time it was believed to have the greatest velocity of any star. It is also known as "Argelander's Star" after Friedreich Wilhelm Argelander, who observed it in 1842. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this star as the "Runaway Star".

Flying Sugarcane:

This Rapanui asterism "Nga Toa Rere" is stars in the IAU constellation Ursa Major (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

Flying Unicorn:

This **telescopic** asterism is the open cluster NGC 6709 in the IAU constellation Aquila. It is GC 4440 in the *General Catalogue* of 1864. The stars in this cluster form a line for the body with two parallel lines

branching out to form the legs and a blue/white star the horn. It is also known as the Bull's Head (see above).

Flying Vulture:

This Arabic asterism "An-nasr at-ta'ir" is made up of stars in the IAU constellation Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain), and Gamma (γ) Aquilae (Tarazed). It is part of their asterism Two Vultures (see below). This is also translated as "Flying Eagle" (see above). NOTE: Robert Hues listed the "Arabic" name "Aquila Albhakkab" in his A Learned Treatise of Globes in 1659 as well as the name "Altayr" for the constellation Aquila.

This Latin star "Vultur Volans" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

Flying Wing:

There are two **telescopic** "flying wing" asterisms:

- One, also known as the HD 4798 Group, resembles a bird's wing. It is in the IAU constellation Pisces, 40 arcminutes north of the star 65 Piscium. Includes HIP 3914 (HD 4798).
- One is open cluster NGC 7086 in the IAU constellation Cygnus. This was discovered by English astronomer William Herschel in 1788 who listed it as "VI 32". It is GC 4676 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a flying wing 8 arcminutes tall.

Flying Witch:

This asterism is the Coma Berenices Cluster, Melotte 111.

Flyswatter:

There are two **telescopic** "flyswatter" asterisms:

- One, the fly and flyswatter, Biever 1 on the asterism list of Barb Biever of the Rancho Bernardo-Murietta Astronomical Society, can be found in the IAU constellation Hydra, with the "fly" being the reddish carbon star U Hydrae. The "handle" is the three stars HIP 51832, 156057, and 51491. The "swatter" is the stars HIP 51832, 51933, 52003, and 52113.
- One, known as Poskus 1, is in the IAU constellation Delphinus, and is made up of 11th to 12th magnitude stars next to the star Gamma (γ) Delphini, with a curve of six stars forming the swatter, and two in the handle. American astronomer Sue French calls it the mandolin, and others call it the lute. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011.

Foal:

This Arabic star "al-Ruba'" (الربع) is a binary star HIP 86782 in the middle of the "head" of the IAU constellation Draco:

- "al-Ruba'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Alruba".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Al ruba', the camel's foal" and describes it as a "small star of the Borgian globe… described as being of 6th magnitude".
- The IAU approved the name Alruba for HIP 86782.

Foal of Pegasus:

This **telescopic** asterism "Púllus Pégasi" is the dwarf galaxy UGC 12613 in the IAU constellation Pegasus. It was discovered by A. G. Wilson in the 1950s. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Pegasus Dwarf.

Foam:

This Quechua asterism "Posuqu" or "Posuku" is the Milky Way between the IAU constellations Carina and Crux (Urton 1981 & 2022). They see the Milky Way as a river ("Mayu") which splits into two channels which then merge here in the sky, causing the colliding waters to foam here.

Foam Egret:

This Barasana asterism "Somo Yehe" is the IAU constellation Coma Berenices (Hugh-Jones 2006).

Focus:

This Latin asterism is the IAU constellation Ara.

- Johann Bayer's *Uranometria* (1603) lists "Focus" for this constellation.
- John Hill's *Urania* lists "Focus" in 1754. Hill attributes this to "old Latin writers".
- Other Latin names for hearth also applied to this constellation by Hill include "Hearth" (see below) and "Ignitabulum" (see below).

Fodder:

This Korean asterism "Macho" (마초) is a bent line of four stars in the IAU constellation Cetus: 80, Epsilon (ε), Rho (ρ), and Sigma (σ) Ceti.

Fog:

This Persian asterism "Ka-mus.niku.a" from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) has been identified as stars of the IAU constellation Andromeda and interpreted as "fog" (Boll 1918). Since the stars of this constellation make up the Babylonian asterism Anunitu (see above) and since the "head" of that asterism is Messier 31 (Andromeda Galaxy), which can easily be seen in a dark sky with the unaided eye, this is clearly a reference to that galaxy.

This Latin asterism "Nebula" is open cluster Messier 44 in the IAU constellation Cancer as listed in 16th and 17th century charts and translations of the *Almagest*.

Foggy Nebula:

"Girus ille nebulosus" is the open cluster Messier 6 (NGC 6405) in the IAU constellation Scorpius as listed in the 1551 edition of the Almagest. This was identified by a star cluster by Abbe Louis de Lacaille in 1752. Persian astronomer Ulugh Beg Mirza (1394 – 1449) referred to it as "Stella nebulosa quae sequitur aculeum Scorpionis" ("the cloudy ones which follow the sting"). It is Lac III 12 in de Lacaille's catalogue, and GC 4318 in the *General Catalogue* of 1864.

Folding of Virgo:

This **telescopic** asterism "Cólpias Vírginis" is the barred spiral galaxy NGC 4535 in the IAU constellation Virgo. This was discovered by English astronomer William Herschel in 1785 who listed it as "II 500" It is GC 3080 in the General Catalogue of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the beautiful curves of the inner arms of this spiral galaxy". It is also known as the "Lost Galaxy of Copeland" (see below).

Folding Screen:

This Korean asterism "Byeongpung" (병풍) is a quadrilateral of stars in the IAU constellation Virgo: Eta (η), Omicron (o), Xi (ξ), and Nu (ν) Virginis.

Foliated Crosses:

Classic Maya monuments from the 7th century in Palenque depict two foliated tree crosses with their associated temples aligned with IAU constellations:

- The Temple of the Cross is oriented to the setting of the IAU constellation Crux.
- The Temple of the Foliated Cross is oriented to the setting of the star Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus, the Northern Cross (see Northern Cross below).

Follower:

There are three Arabic asterisms by this name:

- The first is the Arabic manzil "Nāʾir al Dabarān" ("bright one of the follower") or "Al-Debran" or "ʾAd-Dabarān" ("follower" (of Al Thurayya) ٱلدَّبَرَان), which is in the IAU constellation Taurus and is the star Alpha (α) Tauri (Aldebaran) and the Hyades star cluster:
  - This star has been known by this name in Arabic culture since the 6th century when it appeared in the poetry of Muhalhil (d. 531 C.E.) and was listed by 'Abd al-Rahman al-Sufi (903 – 986) and Ibn Qutaybah (828 - 889) and in the poetry of Muhammad al-Murki and Mohammad al-Qadhi (d. 1868). Some versions would describe it as the Hyades and Pleiades clusters together.
  - "al-Dabarān" and "al-Tāb'" ("follower") are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "al dabarān" and the Hebrew name as "eyn ha-shor".
  - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al dabarān" and the Hebrew names "'eyn ha-shor" and "ha-semoli".
  - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-dabarān".
  - An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-dabaran" and the Hebrew name "'eyn ha-shor".
  - Dorn (1829) lists the name of Aldebaran as the Spanish Arabic "Debran" and the Hyades cluster as "Al debran" and attributes these names to Ulugh Beg Mirza (1394 – 1449) and Al Tizini.
  - The rete of astrolabe NMM AST 0570 in the National Maritime Museum lists "Aldevara" (Dekker 2000).
  - The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists this as "Aldebran" (Dekker 2000).

- The 14th century Christian Spanish astrolabe #4560 lists the Spanish Arabic "Dbran" and "dabrän" (King 2002).
- English author Geoffrey Chaucer (c.1340s – 1400) called it "Aldeberan" in his *A Treatise on the Astrolabe.*
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists the name "Aldebora" for this star.
- The 1483 edition of the *Alfonsine Tables* does not include Aldebaran, but the first edition of the *Alfonsine Tables* in 1252 does include it as "Aldebaran id est oculus vel cor Tauri" ("Aldebaran is the eye or heart of Taurus"), with "Al Dabaran" appearing in the 1515 edition of the *Almagest* and "Aldebaran" appearing in the 1521 *Alfonsine Tables* (Kunitzsch 1986).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Aldebran".
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists "Aldebaran" for this star.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists "Aldebara
- English poet Edmund Spenser (1552 – 1599) called it "Aldeboran" in his poem *Faerie Queen*.
- German astronomer Wilhelm Schickard (1592 – 1635) called it "Aldebiris" and "Debiron".
- Johann Bayer's *Uranometria* (1603) lists "Aldebaran".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Aldebaran".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists this star as "Aldebaran".
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Aldebaran".
- Edward Sherburne lists it as "Aldebaran or Southern eye" in his *Sphere of Marcus Manilius* in 1675.
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this star as "Aldebaran".
- English astronomical writer George Costard (1710 – 1782) called it "Aldebaron" in his *History of Astronomy*.
- French astronomer Jérôme Lalande (1732 – 1807) also listed this star as "Aldeberan".
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as "Palilicium Aldebaran".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Aldebaram (sic)".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Aldebaran".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists "Aldebaran" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Aldebaran".
- American uranographer William Croswell (1760 – 1834) lists "Aldebaran" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Aldebaran" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).

  - Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Aldebaran".
  - German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Aldebaran".
  - *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Aldebaran".
  - Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Aldebaran".
  - This star is listed as "Al-debaran" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873: Webb translates it as "the hindmost".
  - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Aldebaran".
  - German astronomer Hermann Joseph Klein (1844 – 1914) lists "Aldebaran" in his *Star Atlas* (1893).
  - W. Brennand lists this as "Al-Debasan" in his *Hindu Astronomy* in 1896, describes it as the Hyades, and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
  - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Aldebaren" on its chart but "Aldebaran" in the text.
  - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Aldeboran".
  - American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Aldebaran" and describes it as "the follower".
  - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Aldebaran".
  - The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Aldebaran" for this star. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Aldebaran" for this star.
  - Aldebaran is a name currently recognized by the IAU for the star Alpha (α) Tauri.
- The second is the star G Scorpii in the IAU constellation Scorpius. This is called "the follower" as it rises behind the "tail" of Scorpius.
- The third is the Arabic asterism "Al Radif" which is the IAU constellation Cepheus. R. H. Allen lists this in his *Star Names* in 1899 and attributes it to "a translator of Al Ferghani's *Elements of Astronomy*". This would be the 9th century astronomer Aben al Khethir of Fergana (known as Alfergan, Alferganus, Alfragani, Al Ferghani, and Alfraganus). It was translated by the Dutch translator Jakob Gohl (Golius) and published after his death in 1669.

This Yemeni manzil "Dabarān" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

This Persian lunar station "Paha" is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

This Sogdian and Khorasmian lunar station "Baharu" is the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

This Coptic lunar mansion “Πιώριων” (“Piórion”) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. This is listed by English author W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, where Kircher listed it as “Statio Hori Major” (“major station of Horus”) and “the eye of Taurus”.

Follower of the Star:

This Arabic star or “tabi’ an-najm” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. It is called this because it rises after “an-Najm”, “the Star”, which is an Arabic name for the Pleiades (see Star, below).

- “Tāb’ al-Najm” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- “tabi’ an-najm” appears in the list of “rain stars” of Qutrub (d. 821 C.E.) but as an indicator of the second period of summer heat.
- Compare to the asterism Driver of Al Thurayya (above) and Follower (above).

Followers:

This Egyptian asterism “Ennead” is the Pleiades cluster in the IAU constellation Taurus.

This Titan (Cotabato Province) asterism represents the followers of their hero Lagey Linguwos, who guided the people of Tiruray in planting, and is the Pleiades cluster in the IAU constellation Taurus.

Following Rādhā:

This Vedic nakshatra (lunar mansion) “Anuradha” or “Anurādhā” is in the IAU constellation Scorpius and is the stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii as listed by the maharshi Parasara. It is related to their nakshatra “Rahda” (see Forked, below). It is related to the deities Mitra (“friend” or “binding oath”, one of their names for the morning Sun) and Varuna (the evening Sun). In 2019 Leitz lists “Anuradha” as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir but oddly identifies this as “the star Scorpionis”. Ivanković (2021) lists this as “Anurādhā” from the Rig Veda and “Anūrādhāh” from the *Taittirīya Brāhmana*, translates it as “success/happiness/joy”, and relates it to the God Mitra, who is the guardian of “rtá” which has many interpretations such as “truth” and “order” and was increasingly associated with the light of dawn. W. Brennand lists this as “Anuradha” in his *Hindu Astronomy* in 1896 and translates this as “an obligation to the gods”. Bhagwath (2019) lists its symbols as either a triumphal archway or a lotus.

This Myanmar nekkhat (lunar mansion) “Anuyada” (အနုရာဓ) is in the IAU constellation Scorpius and is the stars Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii.

This Tibetan gyukar (lunar house) “Lha Tsham” or “Lhatsam” is in the IAU constellation Scorpius and is the star Delta (δ) Scorpii (Johnson-Groh 2013).

Fomalhaut:

See Mouth of the Whale, below.

Food Bearer:

This Lithuanian star “Nešėja valgio”, or “Walgio nešėja” is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. “Food Bearer” is listed in R. H. Allen’s *Star Names* in 1899. Compare this to the Latin asterism Horn of Plenty, above.

Food Carrier:

This Lithuanian asterism “Walgio neszėjis” is the IAU constellation Cassiopeia.

Food Gatherers:

This Northern Sotho asterism “Maselatheko” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

Fool:

This Hebrew asterism “Kesil” (בסיל) or “K’sil” (Rubin 2019) is the IAU constellation Orion, associated with their month Kislev. The origins of this name are unsure. This term can be translated as “foolish”, “impious”, “inconstant”, or “self-confident”. One possibility is that the name is actually derived from “kesel” or “kisla” (כֶּסֶל, כִּסְלָה) which means “hope” or “positiveness”.

- Johann Bayer’s *Uranometria* (1603) lists “Kesil” for this constellation.
- Robert Hues lists “Kesil” and “Chesil” in his *A Learned Treatise of Globes* in 1659.
- R. H. Allen suggests in his *Star Names* in 1899 that as it is associated with that month, it may refer to “tempestuous weather”.
- NOTE: English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Chesil” as a name for Scorpio.

Fool's Gold Galaxy:

See Spindle (Messier 102), below.

Foot of Al-Jawza’:

This Arabic star “ar-rijl al-jawzāʾ al-yasrá” (الرجل الجوزاء اليسرى) or “Rijl Jauzah al Yusrāʿ”, meaning “the left leg (foot) of Al Jawza’”, or “(Rijl) ul-Jabbār” (رجل الجبار), meaning “the foot of the giant”, is Beta (β) Orionis (Rigel) in the IAU constellation Orion and is part of their asterism Giant (see below):

- “Rijl al-Jauzā’” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- It was later latinized to “Algebar”, “Elgebar”, or “Rigel”.
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “rijl jawzā” and the Hebrew name “regel te’omim”.
- The IAU reports that the name Rigel first appeared in the 1252 edition of the *Alfonsine Tables* (published in 1483), but R.H. Allen writes in his *Star Names* in 1899 that it first appeared in the *Alfonsine Tables* of 1521.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “rijl al-jawzā’”.
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “rijl al-jawzā” and the Hebrew name “regel te’omim”.
- Johann Bayer’s *Uranometria* (1603) lists “Rigel”, “Elgebar”, “Algebar“, and “Algebra”.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Elgebar" and "Elgease".
- Robert Hues lists it as "Rigel Algeuze" or "Rigel Algibbar" in his *A Treatise of Globes* in 1659.
- A 14th century Christian Spanish #4560 astrolabe lists "Rigel" (King 2002). German poet Philipp von Zesen (1619 – 1689) lists the name "Ragulon" but applies it to the entire constellation.
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Rigel" and The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "Rigil" (Dekker 2000).
- Kunitzsch (1986) reports that the *Alfonsine Tables* of 1521 lists "& dictur Algebar. Nominatur etiam Rigel" ("and it is called Algebar. It is also called Rigel.").
- "Ragulon" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Rigel Algebar".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Regel".
- German astronomer Wilhelm Schickard listed it as "Riglon"
- John Chilmead listed it as "Rigel Algueze" and "Algibbar" in his *A Learned Treatise on Globes* in 1889.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists this star as "Regel Algebar".
- John Hill lists it as "Rai Al Giauza" in his *Urania* in 1754. It also appears as "rijl al-jabbār" (رجل الجبار), later latinized to "Algebar" or "Elgebar".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Rigel" and his *Bedford Catalogue* in 1844 lists "Rijl-al-jauzá, the giant's leg; and Recorde assure us, it was called 'Algebar by the Arabitians'".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Rigel" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Rigel": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Rigel" for this star..
- The IAU approved the name Rigel for Beta (β) Orionis A.

This Bedouin star "Riğl al-Ğawza " (رجل الجوزا) is Kappa (κ) Orionis (Saiph) in the IAU constellation Orion.

Foot of Al Ayyuq:

This Arabic star is Iota (ι) Aurigae in the IAU constellation Auriga and is part of their asterism "Al-Ayyuq and the Posts (see Obstructor and the Posts, below).

Foot of Monoceros:

This **telescopic** asterism "Pes Monocerótis" is the spiral galaxy UGCA 127 (PCG 18855) in the IAU constellation Monoceros. It was discovered by A. G. Wilson in 1955. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "it is located close to the foreleg of the unicorn… according to a drawing in the Uranographia atlas of Hevelius of 1690."

Foot of the Barking Dog:

This Arabic star "rijl al-ʿawwāʾ", later latinized to "Rijl al Awwa" or "Rigilawwa" is Mu (μ) Virginis in the IAU constellation Virgo. R. H. Allen lists this as "Rijl al ʿAwwā" in his *Star Names* in 1899 and attributes it to the *Calendarium* of Al Achsasi al Mouakket in 1650.

Foot of the Centaur:

This Arabic star "Rijl ul-Qanṭūris" (رجل القنطورس) is Alpha (α) Centauri in the IAU constellation Centaurus:

- "Rijl Qantūris" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "rijl qintūrus al-yumnā al-thāni huwa al-zāfir" ("the right, second, foot of Centaurus: it is the hoof").
- "Rijl ul-Qanṭūris" is listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- This was later latinized to "Al Rijl al Kentaurus", "Rigilken" or "Rigil Kentaurus".
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists this star as "regel ha-sus ha-mequddam" and gives the Arabic name as "rijl al-faras muqaddama".
- Georgius Chrysococcas, a 14th century Greek geographer and astronomer, gives it the Greek translation "ποῦς κοντούρος" ("poús kontoúros") in his *Syntaxis ton Person (Persian Compendium).*
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name of this star as "Rigil Kent".
- The IAU approved the name Rigil Kentaurus for the star Alpha (α) Centauri A.
- NOTE: The *Century Dictionary* of 1889 incorrectly gives it the name Rigel, which is the star Beta (β) Orionis.

Foot of the Chained Woman:

This Arabic star "Al Rijl al Musalsalah" is Gamma (γ) Andromedae in the IAU constellation Andromeda:

- "Rijl al-Musalsala" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "rijl al-mar'a al-yusrā" and the Hebrew name "regel ha-ishsha ha-semoit".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "rijl[ay] al-musalsala". NOTE: For some reason the plural form of foot, "rijlay" appears on this list.
- Dorn (1829) list this as "Foot of the Chained Lady" and attributes this to Ulugh Beg Mirza (1394 – 1449)
- "Al Rijl al Musalsalah" is attributed to English orientalist Thomas Hyde (1636 – 1703) by R. H. Allen in his *Star Names* in 1899. Allen translates this as "chained woman".
- **Foot Star:**

This Semelai (Lake Bera) asterism "Bintang Jong" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Jaafar and Khairuddin 2014). Compare to the Orang Asli asterism "Bintang Jong" (see Sailing Vessel Star, above).

Footprint Nebula:

This **telescopic** asterism is proto-planetary nebula Minkowski 1-92 (M1-9) in the IAU constellation Cygnus, discovered by German American astronomer Rudolph Minkowski (1895 – 1976). It is also known as Minkowski's Footprint.

Footstool of Al-Jawza:

There are three Arabic asterisms with this name:

- One, "al-kursi al-muqadam" (الكرسي المقدم) or "front footstool" or "Kursiyy al-Jauzah" ("footstool of Al-Jawza") is made up of four stars in the IAU constellations Eridanus and Orion: Psi (ψ) Eridani (Kursi al Jauzah I), Lambda (γ) Eridani (Kursi al Jauzah II), Beta (β) Eridani (latinized to "Cursa" or "Kursa"), and Tau (τ) Orionis. It is also known as "al-kursi al-muqadam" the Front Footstool. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Cursa, from the Arabic al-kursá, a chair or throne" and "Giant's throne", which is clearly a reference to Al Jawza (see above). The IAU approved the name Cursa for the star Beta (β) Eridani.
- One "kursīy al-jabbār" or "Al Kursiyy al Jabbār", later latinized to "Kursi al Jabbar" is the star Gamma (γ) Leporis in the IAU constellation Lepus. It is also known as "al-kursi al-mu'akhar" ("rear footstool").
- One, "Cursa" or "Kursa", is the star Beta (β) Eridani in the IAU constellation Eridanus:
    - Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Cursa".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Cursa" and "Kursa", but his 14th edition (1959) only lists this star as "Kursa".

Football:

This **telescopic** asterism is the open cluster NGC 3532 (Caldwell 91) in the IAU constellation Carina. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 and was listed as II 10. It is GC 2308 in the General Catalogue of 1864. William Herschel thought it to be one of the finest star clusters he'd seen. It is also known as the Wishing Well Cluster, the Fish Cluster, the Black Arrow Cluster, the Firefly Party, and the Pincushion. It is located between the constellation Crux and the False Cross asterism (see False Cross, above).

Ford:

This Chaldean asterism "mu ne-be-num" is listed in the *Great Star List* (Koch-Westenholz 1995) and the stars are not identified.

Fore-Foot:

This Latin asterism "Antepes" and "Antepedes" is the IAU constellation Sagittarius as listed by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.).

Forearm:

There are two Arabic stars named "Al Dhirāʿ":

- One is Gamma (γ) Persei in the IAU constellation Perseus and is part of their asterism Al Thurayya (see Little Abundant One, below).

- One is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

This Coptic lunar station "Pimafi" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

Forearm of the Horse:

This Arabic star "Yed Alpheras" is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus:

- The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Yed".
- "Yed Alpheras" is listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* in 1603.
- Edward Sherburne lists it as "Sa'd Alpharas" in his *Sphere of Marcus Manilius* in 1675.
- "Yed Alpheras" is listed by R. H. Allen in his *Star Names* in 1899.
- Robert Burnham lists "Yed Alpheras" in his *Burnham's Celestial Handbook* in 1978.

Forecast:

This Korean asterism "Yecheug" (예측) is a pentagon of stars in the IAU constellations Ara and Telescopium: Alpha (α) Arae, Theta (θ) Arae, Sigma (σ) Arae, Epsilon (ε) Telescopii, and HIP 87846.

Forecast Calamity:

This Korean asterism "Jaenan-eul Yecheughada" (재난을 예측하다) is a line of three stars in the IAU constellation Orion: 71 and Chi (χ) 1 and 2 Orionis.

Forehead:

This Coptic asterism is the Sickle of Leo asterism in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899: Epsilon (ε) Leonis, Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus).

There are two Arabic asterisms with the name "Forehead":

- One is the Arabic or Bedouin manzil "Al-Ǧabhah" (الجبهة), "ʾAl-Jab'hah" (ٱلْجَبْهَة), or "Al-jabha" (الجبهة), later latinized to "Al-Jabhah". This is in the IAU constellation Leo and is the stars Zeta (ζ) Leonis (Adhafera), Gamma (γ) Leonis (Algieba), Eta (η) Leonis, and Alpha (α) Leonis (Regulus). It is also known as "jabhat al-asad" ("forehead of the lion") and is part of their asterism Lion (see below).
    - Dorn (1829 lists this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as the tenth manzil.
    - W. Brennand lists it as "Al-Giebha" in his *Hindu Astronomy* in 1896 and translates this as "the lion's forehead".
- One is the Arabic star "al-Jab'hah" ("forehead" (of the lion) الجبهة). This is Gamma (γ) Leonis in the IAU constellation Leo:
    - This is later latinized to "Al jeb-bah", "Algieba", "Algeiba", or "Al Geiba".

- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-munīr alladhī fī 'unq al-asad" and the Hebrew name "ha-me-ir be-savar ha-aryeh".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Algieba, from Al jeb-bah, the forehead" but Smyth states that he doesn't understand this name "for no representation of the Lion, which I have examined, will justify that position".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Algieba".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), simply lists this star as "Gamma Leo".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Gamma (γ) 1 Leonis as "Algeiba".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists both "Algeiba" and "Algieba" for this star, but his 14th (1959) lists "Algeiba"
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name "Algeiba" for this star.
- The IAU approved the name Algieba for Gamma (γ) 1 Leonis.

This Yemeni manzil "Jabha" is the stars Zeta (ζ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

This Coptic lunar mansion "Ti-tehni" is stars in the IAU constellation Leo. W. B. Yeats lists it as "Tree in Leaf" in *A Vision* in 1917, which George Yeats derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, where Kircher lists it as "Frons Leonis" ("forehead of Leo"). This is probably the stars Zeta (ζ) Leonis (Adhafera), Gamma (γ) Leonis (Algieba), Eta (η) Leonis, and Alpha (α) Leonis (Regulus), which form the Arabic manzil "Al-Ǧabhah" (see above).

Forehead Jewelry:

This Banjara asterism "Shirser Jhumko" or "Jhumko Tara" is the Pleiades cluster in the IAU constellation Taurus (Vahia et al 2014).

Forehead of the Scorpion:

There are three Arabic stars with this name:

- One is "al-Jab'hah" (الجبهة), later latinized to "Al Jabhah" and "Dschubba", which is the star Delta (δ) Scorpii in the IAU constellation Scorpius. American uranographer Henry Whitall's planisphere (1871) lists "Dschubba". The IAU approved the name Dschubba for Delta (δ) Scorpii A.
- One is "al-Jab'hah" (الجبهة) is the star Nu (ν) Scorpii in the IAU constellation Scorpius and later latinized to "Jabbah". The IAU approved the name Jabbah for Nu (ν) Scorpii Aa.
- One is the optical pair Omega (ω) 1 and 2 Scorpii, "Jabhat al Akrab" or "Jabhat Acrabi I and II". R. H. Allen lists "Jabhat al 'Aḳrab" in his *Star Names* in 1899.

Foreleg:

This Persian star “pīshpāy” (پیش‌پای), later latinized to “Pish Pai”, is Mu (μ) Geminorum in the IAU constellation Gemini. NOTE: R. H. Allen suggests that this is a name for Eta (η) Geminorum in his *Star Names* in 1899. Compare this to the Persian asterism Forerunners, below.

Forerunner:

This Sesotho star “Torobela” (“forerunner”, “vanguard”, “brave warrior”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Forerunners:

This Persian lunar station “Pish Parvis” is made up of the three stars 35s, 39s, 41, and Mu (μ) Arietis in the IAU constellation Aries. Compare this to the Persian asterism Foreleg, above.

This Sogdian lunar station “Barv” is made up of the three stars 35, 39, 41, and Mu (μ) Arietis in the IAU constellation Aries.

This Khorasmian lunar station “Farrankhand” is made up of the three stars 35, 39, 41, and Mu (μ) Arietis in the IAU constellation Aries.

John Hill lists “Protrugetes” as a “bright star in the right wing of the constellation Virgo” in his *Urania* in 1754. Hill does not further specify which star. The brightest stars in Virgo visible from the Northern hemisphere are Alpha (α) Virginis (Spica- magnitude 0.95) and Gamma (γ) Virginis (Porrima- magnitude 3.04). Since the Greek name translates as plural, perhaps the original asterism includes both stars.

Forest:

This asterism “Seliquastri”, “Seliquastrum”, and “Siliquastrum” is the IAU constellation Cassiopeia. This name is listed in Johann Bayer’s *Uranometria* (1603).

This French asterism “Foret” is an alternate name for the asterism “Terebellum” (see Drill, above) given to it by French astronomer Camille Flammarion (1842 – 1925).

Forgotten One:

This Arabic star “al-Suhā” (السها), meaning “the forgotten one” or “the neglected one”, later latinized to “Alcor”, is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major:

- “al-Suhā” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). Al-Sufi called it this because good vision is required to see it.
- Dorn (1829) lists this as “Al-soha”, translates it as “forgotten” or “concealed” and describes it appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Suhà”.
- Compare this to Faint One, above.

Fork:

This asterism “Fouca” is the IAU constellation Canis Minor. This name is listed in Johann Bayer’s *Uranometria* (1603).

This Estonian asterism “Harg” is the IAU constellation Taurus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

This **telescopic** asterism “Gebel mit zwei Zinken” (“fork with two prongs”) is Basel 7 in the IAU constellation Monoceros. Size 5’ X 5’. René Merting describes it on the *Faint Fuzzies* website: “some shining stars from a fork with two prongs, which are bent inward- the fork points north.”

Fork Bearer of Hydra:

This **telescopic** asterism “Fúrcifer Hýdrae” is the barred spiral galaxy NGC 4304 in the IAU constellation Hydra. It was discovered by John Herschel in 1834 who listed it as h 3387 and later as GC 2879 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of the “two small protrusions at the west side of this galaxy, emerging at approximately the same spot where the northern arm starts”.

Forked:

This Vedic Nakshatra (lunar mansion) “Vishākhā”, “Visakha”, “Vishakha”, or “Vaisakha” (“forked” or “having branches”), also known as “Radha” or “Rādhā” (“the gift”) is in the IAU constellation Libra and is the double star Alpha (α) Librae (Zubenelgenubi), and the stars Beta (β) Librae (Zubeneschamali), and Iota (ι) Librae. In 2019 Leitz lists “Vaisakha” as appearing in the *Atharveda* but identifies this as “the star Librae”: Of course, Librae is a suffix that could be applied to any star in Libra. Leitz also writes that its alternate name is “Radha”. Leitz also lists “Vaishakha” as appearing on the nakshatra list of the scholar Varahamihir, and notes that in the *Brhad Samhita* five stars are listed. One version translated as “Well Branched” is made up of 10 stars (see Well Branched, below). The older Atharvaveda system only lists the star Alpha (α) Librae (Zubenelgenubi). Ivanković (2021) lists it as “Vishākhā” from the Rig Veda and “Visākhe” from the *Taittirīya Brāhmana* and describes it as the stars Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), and Gamma (γ) Librae. Ivanković relates it to the Vedic God of fire, Agni. W. Brennand lists this as “Visacha” in his *Hindu Astronomy* in 1896 and translates this as “a festoon of leaves”. Bhagwath (2019) lists the symbols of this nakshatra as either a triumphal arch or a potter’s wheel.

This Myanmar nekkhat (lunar mansion) “Withaka” (ဝိသာခါ) is in the IAU constellation Libra and is the double star Alpha (α) Librae (Zubenelgenubi), and the stars Beta (β) Librae (Zubeneschamali), and Iota (ι) Librae.

Former Footstool:

This Vedic asterism “Pūrvā Prósthapadā” is in the IAU constellation Pegasus and is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Algol) as listed in the *Taittiriya Samhita* and appearing as “Pūrve Prosthapadāh” in the *Taittiriya Brahmana* (Ivankovic 2021). Leitz (2019) lists this as “Prosthapada”, describes it as the IAU constellation Pegasus as listed in the *Rig Veda,* and translates it as “Horse in the Sky”. This is an older name for their nakshatra Purva Bhadrapada (see Early Blessed One, above).

Former Fruitful:

This Vedic moon station in the IAU constellation Leo consists of the stars Delta (δ) and Theta (θ) Leonis.

Former Invincible One:

This Vedic moon station consists of the stars of the IAU constellation Sagittarius:

- One end is a triangle of stars: Sigma (σ), Zeta (ζ), and Delta (δ) Sagittarii,
- From Delta (δ) Sagittarii three lines of stars run out:
    - One line goes to Gamma (γ) Sagittarii,
    - One line goes through Lambda (λ) Sagittarii to Mu (μ) Sagittarii, and
    - One line goes through Epsilon (ε) Sagittarii to Eta (η) Sagittarii.

Formosa:

See Beautiful, above.

Fornax:

None of its stars are brighter than 4th magnitude and the stars of this constellation only show up in 52 of the asterisms of this handbook.

This IAU constellation (IAU abbreviation For) was created by French astronomer Abbé Nicolas Louis de Lacaille, who originally called it "le Fourneau Chymique" (the chemical furnace"), before shortening this to "le Fourneau" in 1752. De Lacaille had observed it during a two-year stay at the Cape of Good Hope. Lacaille's *Planisphère des Étoiles Ausralea* (1756) labels this "Fourneau" and depicts this as a long rectangular work bench with a opening in the front in which one can see the flames of the furnace and having some chemical glassware on top.

In 1763 he translated the name into Latin: "Fornax Chimiae", and later it appeared as "Fornax Chemica".

German astronomer Johann Elert Bode named it "Apparatus Chemicus" in 1782 and named it "Chemische Apparat" in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820), and also used the names "Chymische Ofen", and "l'Apparat Chimique" (the last name meant to honor celebrated chemist Antoine Laurent Lavoisier).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Fourneau" ("the furnace") as a bench with a built in wood fireplace and a set of glassware on top.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Chymische Ofen" and depicts it as a bench with furnace built in and glassware on the top.

This constellation is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated label "Apparat Chem": He indicates the borders of this constellation on the chart but offers no illustration of it.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed it in his *Celestial Atlas* in 1822 as "Officina Chemica" on one chart and as "Fornax Chemica vel Fornais la Caille" on another chart.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Fornax Chemica" as a long oven with chemical flasks lined up on top.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Fornax Chemica" as a set of chemical laboratory glassware around a cylindrical furnace.

This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Officina Chemica": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Fornax, The Furnace" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Fornax" and describes it as the "Furnace".

The original name of this constellation was shortened to Fornax by the IAU when it was made one of the official constellations in 1922.

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Fornax" and gives the "original form" as "Fornax Chemica", describing it as a "Furnace".

A standard IAU chart depicts this constellation as a line of the two stars Alpha (α) Fornacis (Dalim) and Beta (β) Fornacis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Fornax in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of three stars: Alpha (α) Fornacis (Kitalpha), Beta (β) Fornacis, and Nu (ν) Fornacis. *Sky and Telescope Magazine*, founded in 1941, depicts Fornax in their magazine and publications in the same way as Hlad et al.

Fornax A:

This **telescopic** asterism is the lenticular galaxy NGC 1316 (Arp 154) in the IAU constellation Fornax. It was discovered by James Dunlop and became 2527 on John Herschel's list and GC 697 in the *General Catalogue* of 1864. It is also known as "Zygote of Fornax" (see below).

Fornax B:

This **telescopic** asterism is the barred spiral galaxy NGC 1317 (AKA 1318) in the IAU constellation Fornax. It was discovered by Julius Schmidt in 1865. It became GC 5312 in the *General Catalogue* of 1864. It is also known as "the Small Cell of Fornax" (see below).

Fornax Dwarf:

This **telescopic** asterism is the dwarf galaxy PGC 10074 (ESO 356-4) in the IAU constellation Fornax. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Nána Fornácis" ("female dwarf of Fornax").

Fortuna:

This Latin asterism is the IAU constellation Virgo. Fortuna was the Roman Goddess of fortune, luck, and fate:

- in Johann Bayer's *Uranometria* (1603) lists "Fortuna" as an alternate name for Virgo.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Fortuna".
- "Fortuna" is listed in John Hill's *Urania* in 1754.

Fortunate Rain:

See Auspice of Rain, above.

Fortune:

This Latin star "Fortuna Fortunarum" is Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius as listed in R. H. Allen's *Star Names* in 1899.

Fortunate:

This Arabic star "al-sa'ad", later latinized to "Alsad" is Zeta (ζ) Aquarii in the IAU constellation Aquarius.

Fortunate Stars:

See Auspicious Asterisms:

Forward Foot:

This Greek star "Πρόπους" ("Própous" or "Propus") is Eta (η) Geminorum in the IAU constellation Gemini as named by Ptolemy (c.100 – c.170) and Hipparchus (190 – 120 B.C.E.). It is called this as it is Castor's left foot:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Πρόπος" ("Própos").
- "Propus Praepes" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Edward Sherburne lists it as "Propus" in his *Sphere of Marcus Manilius* in 1675. Compare this to the Persian star Foreleg (see above).
- John Hill lists "Propus" in his *Urania* in 1754.
- William Herschel lists "Propus" in his *Catalogue of 500 new Nebulae* in 1802.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Propus" on some of his charts and "Hor vel Propus" on others in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Propus": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

NOTE: In his *Star Names* in 1899 R. H. Allen writes that the "Standard Dictionary" gave the name "Propus" to Iota (ι) Geminorum: I believe this to be the *Standard Dictionary of Facts* (1908 – 1924). Allen points out that this is clearly an error since Iota (ι) Geminorum "lies between the shoulders of the twins". The IAU approved the name Propus for Eta (η) Geminorum in 2016.

Forward Precursor:

This L-shaped Anutan asterism "Taki Mua" is the "front legs and shoulder" of the IAU constellation Pegasus. One angle is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat), with the other angle running off Beta (β) Pegasi to Iota (ι) Pegasi and Kappa (κ) Pegasi.

Forward Right Foot of the Serpent Charmer:

This Arabic star "Rijl al-hawwā al-yamini al-muqaddam" is Rho (ρ) Ophiuchi in the IAU constellation Ophiuchus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Forward Right Hand of the Serpent Charmer:

This Arabic star “Yad al-hawwā al-yumnā al muqaddam” is Delta (δ) Ophiuchi in the IAU constellation Ophiuchus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Fossil Footprint:

This **telescopic** asterism is the HII region NGC 1491 (SH 2-206, LBN 704, Ced 25) in the IAU constellation Perseus. This was discovered in 1790 by English astronomer William Herschel who listed it as “I 258”. It became GC 793 in the *General Catalogue* of 1864. It got this name as it looks like a three-lobed fossil footprint. It has an 11th magnitude star at its center.

Foster Father of Virgo:

This **telescopic** asterism “Trópheus Virginis” is the Magellanic barred spiral galaxy NGC 4496A (NGC 4505) in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “II 36”. It became GC 3045 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010)”: They called it this because “NGC 4496A is interacting with the smaller NGC 4496B and accordingly brings to mind the relationship of a parent with a child”. NOTE: A month later Herschel observed it again and listed it as NGC 4505, not realizing that it was the same object that he’d observed earlier.

Foundation Stone:

This Babylonian star “Temennu” is Eta (η) Tauri in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

Fountain:

This Romanian star “Fântâna” is Gamma (γ) Cygni in the IAU constellation Cygnus (Ottescu 2009). NOTE: This is sometimes assigned to Alpha (α) Cyngi (Deneb) as it is brighter.

Fountain of Cetus:

This **telescopic** asterism “Fóns Céti” is the interacting galaxy NGC 145 (Arp 19) in the IAU constellation Cetus. This is GC 70 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Fountain of the Crossroads:

This Romanian star “Fântâna din Răscruci” is Gamma (γ) Cygni in the IAU constellation Cygnus (Ottescu 2009). NOTE: This is sometimes assigned to Alpha (α) Cyngi (Deneb) as it is brighter.

Four Advisors:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellations Camelopardalis and Ursa Minor: HIP 72573, UY UMi, HIP 51384, and HIP 56253.

This later Chinese asterism “Sìfǔ” (四辅) became a triangle of stars in the IAU constellation Ursa Minor: HIP 51384, 51502, and 58874.

This Chinese Chenzhuo xing guan “Sìfǔ” is a “box” of four stars in the IAU constellation Ursa Minor: HIP 72573, HIP 62572, HIP 59504, and HIP 63340.

Four Channels:

This Chinese xing guan “Sìdú” (四渎) is a line of four stars in the IAU constellation Monoceros: Epsilon (ε), 13, and 17 Monocerotis, and HIP 34033. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Sìdú” is a line of four stars in the IAU constellation Gemini: 51 Geminorum, 45 Geminorum, HIP 33914, and 38 Geminorum.

Four Customary Ways:

This Netwar (Lenakel) asterism “Suatu Kywer” (“four customary ways” or “four roads”) is their name for the IAU constellation Crux (Ramik 2019). Three other peoples from this region have identical asterisms:

- Nahwal (Tanna): “Suatu Kuas”,
- Melsisi: “Wamso nan Kawolwol”, and
- Sesivi (Daakaka): “Lébuowuo”.

Four Eyed Fish:

There are two versions of the Carib asterism “Kutaiyuman” or “Kutai”:

- One is made up of stars of the IAU constellation Sagitta. The rising of this version marks the beginning of the fishing season for this fish.
- One is made up of stars in the of Scorpius (Magaña, and Jara, 1982), probably Lambda (λ) Scorpii and Upsilon (υ) Scorpii.

Four Guardians of Heaven:

This Persian asterism “Four Guardians of Heaven” or “Four Royal Stars” (Massoume 2001, Steiner 2017) marked the four cardinal points and marked the equinoxes and solstices 5,000 years ago and is their stars:

- “Hastorang” (“watcher of the south”): Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (winter solstice),
- “Venant” (“watcher of the north”): Alpha (α) Leonis (Regulus) in the IAU constellation Leo (summer solstice),
- “Tascheter” (“watcher of the east”): Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (vernal equinox), and
- “Savetis” (“watcher of the west”): Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (autumnal equinox).

Compare this to Archangel Stars (above). Massoume (2001) notes that the modern equivalents would be Eta (η) Tauri (Alcyone in the Pleiades cluster), Regulus, Beta (β) 1 and 2 Cygni (Albireo) and Alpha (α) Centauri (Rigil Kentaurus).

Four Horse Chariot Team of Grus:

This **telescopic** asterism “Quadrigárius Grúis” is the Grus Quartet of galaxies in the IAU constellation Grus. The galaxies were discovered by James Dunlop in 1826. The galaxies in this asterism are:

- Barred spiral galaxy NGC 7552
- NGC 7599
- NGC 7590
- Spiral galaxy NGC 7582

This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Four Hundred Southerners:

This Aztec asterism "Centzon Huitzinahua" is all the stars in the sky, which they believe Coatlicue gives birth to each night. Coatlicue is the mother of their Gods.

Four Hunters Returning to Earth:

This Dëne Suhne asterism is made up of stars in the IAU constellation Orion (Cannon 2021): Sigma (σ) Orionis, 42 Orionis, and Iota (ι) Orionis.

Four-Leaf Clover:

This **telescopic** asterism is the open cluster NGC 1664 in the IAU constellation Auriga. It was discovered by English astronomer William Herschel in 1786 who listed it as "VIII 59" in his catalogue. It is GC 907 in the *General Catalogue* of 1864. American astronomer Walter Scott Houston describes it as a "4-leaf clover". It is also known as the Kite (see below) or the 4-H Cluster (see above).

Four Spirit of River:

This Korean asterism "Ne Gaeui Gang Yeonghon" (네 개의 강 영혼) is a line of four stars in the IAU constellations Gemini and Monoceros: 38 Geminorum, and 15, 13, and Epsilon (ε) Monocerotis.

Four Stars of the Chest of the Eagle:

This Babylonian and Sumerian ziqpu "four stars of the chest of ur-a" is Alpha (α) Leonis (Regulus), Eta (η) Leonis, Gamma (γ) Leonis, and Zeta (ζ) Leonis in the IAU constellation Leo and is listed as ziqpu 22 in the star catalogue BM 78161 (Liechty 1988).

Four Streams of Aquarius:

This **telescopic** asterism "Quadríflua Aquárii" is the spiral galaxy IC 1438 in the IAU constellation Aquarius. It was discovered by French astronomer Stéphane Javelle in 1892. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "[French astronomer Gerard] De Vaucouleurs recognizes four rings in this face on galaxy, two inner rings (one very elliptical) and two outer rings (one best seen in infrared).

Four Supports:

This Japanese lunar station "Shiho" is the Great Square of Pegasus (see Great Square, above) and is depicted on the ceiling of the 17th or 18th century Takamatsuzuka (Miyajima 2014).

Four Supports of Heaven:

This Chinese xing guan from the *Zhuanxu Calendar* of the Xia Dynasty (2180 – 1600 B.C.E.) is the Great Square of Pegasus (see Great Square, above). It is also known to them as the Yingshi (see below), Palace of Darkness, and as the Ancestral Temple.

Fourcade-Figueroa Object:

This **telescopic** asterism the Fourcade-Figueroa Object or Fourcade-Figueroa Galaxy is PGC 47847 (ESO 270-17), a galaxy shred in the IAU constellation Centaurus. It is also known as the "Fragment of Centaurus" (see below). It was discovered by astronomer C.R. Fourcade and his assistant Figueroa in 1970.

Fourth Ones:

This Bedouin asterism "al-Rubbaʿ" (الربّع) is the stars Gamma (γ) Ursae Majoris and Delta (δ) Ursae Majoris in the IAU constellation Ursa Major.

Fourth Ostrich:

This Arabic star "raabi al naʿāmāt" (رابع ألنعامة), later latinized to "Rabah al Naamat", is Zeta (ζ) Ceti in the IAU constellation Cetus and is part of their asterism Hen Ostriches (see below) as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650.

This Latin star "Quarta Struthionum" is Zeta (ζ) Ceti in the IAU constellation Cetus.

Fourth Son Behind the King:

This Babylonian star "Maru-sha-arkat-Sharru" ("fourth son behind the king" or "four-year-old son") is Rho (ρ) Leonis in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

Fowl of Sky:

This Korean asterism "Haneulsae" (하늘새) is a line of two stars in the IAU constellation Aquila: 37 and Kappa (κ) Aquilae.

Fox:

This Babylonian asterism "MUL.KA.A" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and "mul ka.a" in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major (Hunger and Pingree 1989). Anthony Hope lists it as "KA.A" and "shelebu" in his *A Guide to Ancient Near Eastern Astronomy* in 1996 and describes it as "Ursae Majoris (?)".

This Akkadian asterism "Selabu" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or "še-el-le-bi" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Sumerian asterism "mul ka-aka-a" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Greek star "Ἁλώπηξ" ("Álópix") is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

This Egyptian Dendera star is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major (Hoffman 2017) and part of their asterism Ox Thigh (see below).

This Macedonian asterism "Lisica" or "Lysitsa" is a bent line of stars in the IAU constellation Taurus (Cenev 2004 & 2014): Alpha (α) Tauri (Aldebaran), HIP 21251B, HIP 21517, and HIP 22176 in the IAU constellation Taurus. It is the enemy of Kvachka (see the Mother Hen below) and Petal (see Rooster below).

This Belarussian asterism "Lisa" is the constellation Orion (Avilin 2009). It is also known as "Kryzhe" (see Cross, above), "Kosy" (see Scythes, below), "Matawila" (see Wheel, below), "Traiko" (see Three Times, below), "Karomyselko" (see Small Yoke, below), "Grabli" (see Rake, below), "Kastsy" (see Mowers, below), "Try Karali" (see Three Kings, below), "Kasar" (see Mower, below), "Kreselca Pana Jezusa" (see Lord Jesus' Chair, below), "Tri Siostry" (see Three Sisters, below), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Asilki" (see above), "Kigachi ragachy" (see Shaft of a Plough, below), and "Trohkutnaia" (see With Three Corners, below).

This Inca asterism "Atoq" is the dark nebulosity around the IAU constellation Scorpius (Urton 1981, 2016, & 2022). Urton describes it as a "rather amorphous dark-cloud constellation which stretches at a right angle from the tail of Scorpio crossing the ecliptic between Scorpio and Sagittarius".

This English asterism "Vulpes" is the IAU constellation Vulpecula. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more room on astronomical charts. However, it appears as "Vulpecula" in Proctor's *A New Star Atlas* (1887) as an official constellation "recognized in the catalogue of the British Association".

This Polish asterism with the Latin name "Vulpis" is part of the asterism "Vulpecula cum Anser" (see Fox and the Goose, below), created by Polish astronomer Johannes Hevelius (1611 – 1687).

Fox and the Goose:

This asterism "Vulpecula cum Anser" or "Vulpecula et Anser" ("the little fox with the goose") was created by the Polish astronomer Johannes Hevelius (1611 – 1687). In Hevelius' *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, it was illustrated as a goose with its neck in the jaws of a fox who is running to our left. Hevelius wrote "I wished to place a fox with a goose in the space of sky well fitted to it; because such an animal is very cunning, voracious, and fierce. Aquila and Vultur are of the same nature, rapacious and greedy." It was known in Italy as "Volpe colla Oca", in Germany as "Fuchs" or "Füchschen, mit der Gans", and in France as "Petit Renard avec l'Oie". Later the two were separated into the constellations Vulpecula (see below) and Anser (see Goose, below), but they were merged again by the time the IAU accepted Vulpecula as a constellation.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depict Vulpecula the fox carrying Anser the goose in its mouth.

Vulpecula is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: This is depicted as a fox with a goose in its jaws, this goose representing the asterism Anser (see Goose, above).

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Vulpecula as a fox carrying a goose labeled "Anser".

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this constellation as "Le Rénard" ("the fox") and depicts it as a fox with a goose in its jaws (this being the asterism Anser, see Goose, above).

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Vulpecula in his *Celestial Atlas* in 1822: It is depicted as a fox with a goose in its jaws, this goose representing the asterism Anser (see Goose, above).

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this as "Fuchs" and "Gans" and depicts it as a fox running to our right with a goose in its jaws.

English astronomer Richard A. Proctor (1837 – 1888) merged them both in his Atlas and shortened the name to "Vulpes", though he later changed this back to "Vulpecula".

"Vulpecula and Anser" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as a goose in the jaws of a fox: The author is unknown, but it is based on Jamieson's *Celestial Atlas.*

It is listed as "Anser" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873: Webb describes it as "numbered as part of Vulpecula".

Fox Eyes:

This **telescopic** asterism is the pair of interacting galaxies NGC 5331 in the IAU constellation Virgo. It was discovered in 1793 by William Herschel who listed it as "III 929". It became GC 3678 in the *General Catalogue* of 1864. This name is posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in June 2024. It is also known as the "Rope Dancer of Virgo".

Fox Face Nebula:

This is an alternate name for the Cosmic Bat Nebula (see above).

Fox Head:

This **telescopic** asterism is the open cluster NGC 6819 in the IAU constellation Cygnus. This was discovered by English astronomer Caroline Herschel in 1784. It is GC 4511 in the *General Catalogue* of 1864. Size 5' X 5'. American astronomer Tom Lorenzin gave it the name "Fox Head". It is also known as the Octopus (see below) and has also been described as a letter "U", "K", or "X".

Fox Star:

This Ininew star is Epsilon (ε) Ursae Minoris in the IAU constellation Ursa Minor (Buck 2016) and is part of their asterism "Atima Atchakosuk" (see Dog Stars, above).

This Greek star is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. There is an ancient Greek legend regarding Electra (which is the star 17 Tauri in the IAU constellation Taurus) wandering into the Big Dipper asterism in the IAU constellation Ursa Major and becoming "Ἀλώπηξ" ("Alōpēx", an ancient Greek word for "fox"). The Greek philosopher Proclus (412 – 485 C.E.) wrote that the fox star nibbles continuously at the thong of the yoke which holds together heaven and earth, another reference to Alcor. There is another reference to this in the Scholia to Aratus [n9 257; E. Maass, Commentariorum in Aratum Reliquae (1898), p. 391, 11. 3ff] which says that Electra, mother of Dardanus, left her station among the Pleiades, desperate because of Illion's fall, and retired "above the second star of the beam… others call this star 'fox'".

Fragment of Centaurus:

This **telescopic** asterism "Frágmen Centaúri" is the galaxy ESO 270-17 (PGC 47847) in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "two outer spiral arms of this galaxy form a pseudoring, i.e. a ring that is not completely closed". It is also known as the "Fourcade-Figueroa Object" or Fourcade-Figueroa Galaxy (see above).

Frame Galaxy:

This **telescopic** asterism NGC 3621 is a field spiral galaxy in the IAU constellation Hydra. It was discovered in 1790 by English astronomer William Herschel who listed it as "I 241" in his catalogue. It is GC 2371 in the *General Catalogue* of 1864. It is also known as the Southern Cross Galaxy (see below). It is also known as the "Wreath Weater of Leo" (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 57 without a name.

Frankenstein Galaxy:

There are two **telescopic** "Frankenstein Galaxy" asterisms:

- One is NGC 4605, a dwarf barred spiral galaxy in the IAU constellation Ursa Major. This was discovered in 1790 by English astronomer William Herschel who listed it as "I 254". It is GC 3142 in the *General Catalogue* of 1864. It is also known as the Faberge Egg Galaxy (see above). Stephen James O'Meara named it both the "Faberge Egg" and the "Frankenstein Galaxy" in his *Hidden Treasures Catalogue* (2007).
- One is the galaxy UGC 1382 in the IAU constellation Cetus. This name was posted by American astronomer Jimi Lowrey on the *Deep Sky Forum* in November 2018.

Franz:

This Austrian star is WASP 27 (HAT-P-14) in the IAU constellation Hercules (magnitude 10). It was given this name by the IAU. Franz is a character in the movie "Sissi" embodying an emperor of Austria in the 19th century played by the actor Karlhein Böhm. It has an exoplanet named Sissi, who is a character in the movie that married Franz, this character being played in the movie by Romy Schneider.

Frederick's Glory:

This **telescopic** "Y" asterism is found in the IAU constellations Andromeda and Lacerta. This was created in 1787 by German astronomer Johann Elert Bode to honour King Frederick II of Prussia: Bode named it "Frederich's Ehre" originally but this was later latinized to "Frederici Honores" or "Honores Frederici". Johann Elert Bode published it in his *Jahrbuch* in 1790 and it appeared in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) as "Friedrich's Ehre". The principal stars are a cascade of stars: Iota (ι), Kappa (κ), Lambda (λ), and Psi (ψ) Andromedae.

Scottish uranographer Alexander Jamieson (1782 – 1850) listed "Gloria Frederici" in his *Celestial Atlas* in 1822. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists it as "Honores Frederici" and depicts it as a staff with an eagle's head and foliage surmounted by a crown.

American uranographer Elijah Burritt (1794 – 1838) listed it as “Gloria Frederica” in his *The Constellations for each Month in the Year* (1835) and depicted it as a crown.

Irish astronomer Agnes Mary Clerke (1842 – 1907) called it “Gloria Frederici”.

English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Honores Frederici”.

This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Gloria Frederici”.

Jeffrey Corder lists this as “Fredrick’s Glory” and Corder 4947 and it is also listed on the SAC database.

Freeman:

This Estonian star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Kuperjanov 2006).

Freya’s Distaff:

This Scandinavian asterism is the IAU constellation Orion.

Fried Egg:

This **telescopic** asterism NGC 7742 is a face-on interacting spiral galaxy in the IAU constellation Pegasus. This was discovered in 1784 by English astronomer William Herschel who listed it as “II 255”. It is GC 5005 in the *General Catalogue* of 1864. This is also known as the “Diadem of Pegasus” (see above).

Frigate Bird:

This **telescopic** asterism, also known as the Kite or the Pirate Bird, is the open cluster NGC 6866 in the IAU constellation Cygnus. It was discovered by German astronomer Caroline Herschel in 1783 and recorded by her brother William in 1790 as “VII 59. It is GC 4544 in the *General Catalogue* of 1864. Note: A large-scale Frigate Bird is ‘Iwakeli’I, a Hawaiian asterism (see Chief Frigate Bird above).

This Italian asterism “Fregata Minor” is the “W” asterism of the IAU constellation Cassiopeia (see W below).

Frigga’s Distaff:

This Scandinavian (Sweden, Denmark, Norway) asterism “Friggjarrocks” or “Friggerock” (“Frigga’s Distaff” or “Frigg’s Distaff”) is the belt of Orion in the IAU constellation Orion.

This Norse asterism “Friggjarrokkr” is the belt of Orion in the IAU constellation Orion.

This Icelandic asterism “Roca Frigg” is the belt of Orion in the IAU constellation Orion.

This Teutonic asterism “Frejerock” or “Fröjas rock” is the belt of Orion in the IAU constellation Orion.

This West Gothland asterism “Frigge Rakken” is the belt of Orion in the IAU constellation Orion.

This Schleswig asterism “Peri Pik” is the belt of Orion in the IAU constellation Orion.

Frigg’s Distaff:

This Saxon asterism “Frigg’s Rocken” is the belt of Orion in the IAU constellation Orion as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Frill-Necked Lizard:

This Bundjalung star “Bunnungar” is Alpha (α) Piscis Austrini in the IAU constellation Piscis Austrinus.

Frisia:

This asterism “Frisia” was made up of the stars of the IAU constellation Carina by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as a single fleur de lys and represents the Netherlands.

Frog:

This Vedic rashi “Karka”, “Kark”, or Karkata” (as appearing in the Vedic *Candragarbha-parivarta)* is the IAU constellation Cancer (Kotyk 2017, Bhagwath 2019, Rath 2022). The Chinese phonetically translated “Karkata” from the Vedic *Candragarbha-parivarta* in 566 as “Jiejiazhajia” (Kotyk 2017). W. Brennan lists it as “Carcati” in his *Hindu Astronomy* in 1896. Bhagwath (2019) writes that it represents the energy of the God Varuna.

This Kolam asterism “Pande” is made up of stars of the IAU constellation Centaurus (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

This Tamil asterism “Karkatan” is the IAU constellation Cancer.

This Tibetan khyim (zodiac constellation) “Karta” or “Karkata” is the IAU constellation Cancer (Johnson-Groh 2013). It is seen by them as a pregnant frog, the frog’s eggs in its womb being the open cluster Messier 44 (see Beehive, above).

This postclassic Mayan asterism from the *Paris Codex* is the IAU constellation Cancer.

This Northern Andean asterism “Hernán Crespo Toral” or “Hampatu” consists of the stars of the IAU constellation Crux (Quinatoa 2018).

This Latin star “Rana” is Delta (δ) Eridanus in the IAU constellation Eridanus. The derivation of the name is uncertain.

Frond:

This Assyrian star “Eru’a” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) and “Erua” (Anthony 1996) is Gamma (γ) Comae Berenices in the IAU constellation Coma Berenice plus other stars not yet unidentified.

This Babylonian star “MUL.A.EDIN” listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) and “A.EDIN” (Anthony 1996) is Gamma (γ) Comae Berenices in the IAU constellation Coma Berenice plus other stars not yet unidentified.

Front Feet and Hands of the Great Twins:

This Babylonian and Sumerian ziqpu “front feet and hands of mas-tab-ba-gal-gal” is the stars Theta (θ) and Nu (ν) Geminorum in the IAU constellation Gemini and is listed as ziqpu 18 in the star catalogue BM 78161 (Liechty 1988).

Front Feet of Marriage Bed:

See First Reddish One, below.

Front Footstool:

See Footstool of Al-Jawza, above.

Front Head:

This Chukchi star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. The star Vega is the "Rear Head" (see below). They use these two stars for navigation.

Front Ostrich:

This Arabic star "Al Thalimain Prior" or "Al Thalimain I" is Lambda (λ) Aquilae in the IAU constellation Aquila and is part of their asterism Two Ostriches (see below).

Front Pillar:

This Tahitian star "Anamua" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Edwards 2015).

Front Side of the Bucket for Water Pouring:

This Arabic and Bedouin manzil "Al-Muqaddam" (المقدم), "Farghu ʾd-Dalū ʾl-Muqdim" (فَرْغُ ٱلدَّلُو ٱلْمُقْدِم), "al-Fargh al-Muqadam", or "ʾAl-Muqdim" (ٱلْمُقْدِم) is in the IAU constellations Andromeda and Pegasus and is the stars Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Algenib). This is translated as "Front Side of the Water Bucket for Water Pouring" or simply "Front Spout":

- Dorn (1829) lists this as "First Aperture of the Bucket" as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Fargh al delwi l mukaddem, the hither emptying place of the bucket, or its lip".
- W. Brennand lists this as "Al-Pherg-Al-Mukaddem" in his *Hindu Astronomy* in 1896.
- R. H. Allen lists "Al Fargh al Mukdim" in his *Star Names* in 1899 and translates it as "fore spout of the water bucket". The First Spout is actually Al Fargh al Awwal (see First Spout, above), although Allen also lists "Al Fargh al Awwal" as a name listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and translates it as "the First, or the Upper, Spout".

This Yemeni manzil "al-Fargh al-Muqaddam" is the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat) in the IAU constellation Pegasus (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296). NOTE: These two stars appear as the Arabic and Bedouin manzil Back Side of the Bucket for Water Pouring (see above).

Front Spear Tassel:

See Armed One, above.

Front Spout:

See Front Side of the Water Bucket for Water Pouring, above.

Front Star of the Crab to the North:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL IGI sa ALLA sa SI" is Eta (η) Cancri in the IAU constellation Cancer (Hunger and Sachs 1988) and is part of their asterism Crab (see above).

Front Star of the Crab to the South:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL IGI sa ALLA sa SI" is Theta (θ) Cancri in the IAU constellation Cancer (Hunger and Sachs 1988) and is part of their asterism Crab (see above).

Front Star of the Goat Fish:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL IGI sa SUHUR MAS" is Gamma (γ) Capricorni in the IAU constellation Capricornus (Hunger and Sachs 1988).

Front Star of the Twin's Feet:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL IGI sa se-pit MAS-MAS" is Eta (η) Geminorum in the IAU constellation Gemini (Hunger and Sachs 1988) and is part of their asterism Twins (see below).

Front Twin Star:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MAS-MAS IGI" is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Hunger and Sachs 1988) and is part of their asterism Twins (see below).

Frontier Guard of Indus:

This **telescopic** asterism "Horórophylax Índi" is the spiral galaxy NGC 7205 in the IAU constellation Indus. This was discovered in 1834 by John Herschel who listed it as h 3919 and later as GC 4753 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is located on the border between Indus and Tucana. This galaxy is part of two other asterisms: "Dolphin's Diamonds" (see above), and the "Toadstool" (see below).

Frosty Leo:

This protoplanetary star is at the centre of the Frosty Leo Nebula IRAS 09371+1212 (see below) and is in the IAU constellation Leo. It is called this because of its location in Leo and because it has the only known circumstellar outflow in which crystalline ice dominates the long-wavelength emission spectrum.

Frosty Leo Nebula:

This **telescopic** asterism is the planetary nebula IRAS 09371+1212 in the IAU constellation Leo. Robert Zebahl lists it on his *Faint Fuzzies* website. Size 0.4' X 0.4'. The "body" is the dark nebula LDN 889, with the bright nebulosity to either side forming the "wings". It is named for the star within: See Frosty Leo, above. This name was posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in February 2013.

Frowning Face:

There are two **telescopic** "frowning face" asterisms:

- One is in the IAU constellation Cassiopeia and is Ennis 28 on the observing list of Canadian astronomer Charles Ennis. The "eyes" are the stars 21 and 23 Cassiopeiae. Two stars of magnitude 9 form the "nose". The "frowning lips" is a bent line of six stars between magnitude 8 and 10 starting at HIP 3500 and ending at HIP 3097. This actually incorporates two of American astronomer Jeffrey Corder's asterisms: Corder 123 is the "L" shape at one end of the "lips" and Corder 136 is the pair of 21 and 23 Cassiopeiae.
- One is in the IAU constellation Monoceros and is Ennis 70 on the observing list of Canadian astronomer Charles Ennis. Size 10'. This is six 8^{th} – 9^{th} magnitude stars. The "eyes" are HIP 33604 and a 10^{th} magnitude star. Five stars form the "frowning lips": HIP 33602, HD 51915, HD 51874, Gaia DR3 3049409772093374208, and Gaia DR3 3049410081328810112. The "eyes" are HIP 33534 and HIP 33604. This includes the stars of Corder 1219 on Jeffrey Corder's list.

Frowning Man:

This asterism is Ennis 19 on the observing list of Canadian astronomer Charles Ennis and is in the IAU constellation Draco:

- The "eyes" are the stars HIP 82020 and 81437.
- The "nostrils" are the stars HIP 81840 and 82048,
- The "mouth" is the curve of stars HIP 82255, 82141, 82051, and 81947, and
- His "beard" is a wedge of stars including HIP 82513, 82484, 82473A, and 82122.

Fruit:

This Korean asterism "Gwail" (과일) is a diamond of four stars in the IAU constellation Delphinus: the binary star Beta (β) Delphini (Rotanev), and the stars Delta (δ), Gamma (γ), and 9 Delphini.

Fruit Pickers:

This Greek star "Προτρυγετήρ" ("Protrygetír"), "Προτρυγετής" ("Protrygetís"), "Προτρύγετος" ("Protrýgetos"), and "Τρυγετήρ" ("Trygetír") is Epsilon (ε) Virginis in the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Allen attributes these names to "Ptolemy, Plutarch, and other Greek authors".

This Arabic star "Muḳdim al Ḳitāf" is Epsilon (ε) Virginis in the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899.

Fruitful of Cetus:

This **telescopic** asterism "Polycárpus Céti" is the intermediate spiral galaxy NGC 1087 in the IAU constellation Cetus. This was discovered by English astronomer William Herschel, who listed it as "II 466". It became GC 605 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of the "many star formation regions of this galaxy".

Frying Pan:

This **telescopic** asterism is in the IAU constellation Centaurus and is Corder 2501 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is five 8^{th} magnitude stars including HIP 65560, 65502, 65404, and 65386.

Fugitive:

This Latin asterism “Profugus” is the IAU constellation Perseus as listed in R. H. Allen’s *Star Names* in 1899. Allen translates this as “flying one”, but the more common translations of this are “fugitive”, “homeless”, “refugee”, or “vagabond”.

Full of Clouds of Coma Berenices:

This **telescopic** asterism “Nubigósus Cómae Bereníces” is the spiral galaxy NGC 4689 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as II 128. It became GC 3219 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the flocculent nature of this spiral galaxy brings to mind a fuzzy system ‘full of clouds’”.

Full of Corners of Virgo:

This **telescopic** asterism “Angulósus Vírginis” is the barred spiral galaxy NGC 4123 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as “V4”. It became GC 2733 in the *General Catalogue* of 1874. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “the rather angular morphology of the arms of this spiral galaxy”.

Full of Fire of Virgo:

This **telescopic** asterism “Pyripléthes Vírginis” is the intermediate spiral galaxy NGC 5468 in the IAU constellation Virgo. It was discovered in 1785 by William Herschel who listed it as “III 286”. It became GC 3777 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “four supernovae have been observed in this galaxy since 1999.”

Full of Flowers of Leo:

This **telescopic** asterism “Flóridus Leónis” is the spiral galaxy NGC 3810 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “I 21”. It became GC 2499 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the many HII regions are a clear sign of the fertility of this beautiful galaxy and bring to mind a bouquet full of flowers.”

Full of Veins of Leo:

This **telescopic** asterism “Venósa Leónis” is the lenticular galaxy NGC 3593 in the IAU constellation Leo. William Herschel listed this as “I 29” in his catalogue, and his son John Herschel listed it as h 840 and later as GC 2347 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Full of Wine of Draco:

This **telescopic** asterism “Vinósa Dracónis” is the barred lenticular galaxy NGC 6654 in the IAU constellation Draco. It was discovered by Lewis Swift in 1883. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it

this due to “the red colour of this galaxy and the dark spot in the northwestern part resembling a birthmark on a face”.

Fumalsamakah:

See Mouth of the Fish, below.

Fumigating of Andromeda:

This **telescopic** asterism “Thallóphorus Andrómedae” is the spiral galaxy UGC 1886 in the IAU constellation Andromeda. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the thin branched arms of this spiral galaxy look like young shoots sprouting from the nuclear region”.

Fumigating of Aquarius:

This **telescopic** asterism “Fúmigans Aquárii” is the peculiar galaxy NGC 7727 (Arp 222) in the IAU constellation Aquarius. William Herschel listed this as “I 111”. John Herschel listed it as h 2262 and later as GC 5000 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the vague plumes escaping from this galaxy”. NOTE: This galaxy harbours two galactic nuclei, each containing a supermassive black hole.

Funi:

See Fire, above.

Funnel:

There are three **telescopic** “funnel” asterisms:

- One is the Funnel Cloud, Le Gentil 3, a dark nebula in the IAU constellation Cygnus. It lies between the North American Nebula (NGC 7000) and IC 1306.
- One from *Pattern Asterisms* by American astronomer John A. Chiravalle is a seven-star group in the IAU constellation Lepus one degree south of the star 14 Leporis. One corner of the “funnel” is the star HIP 27232 and HIP 27185 is on the other edge of this “funnel”. Size 25’.
- One is in the IAU constellation Ophiuchus and is Ennis 78 on the observing list of Canadian astronomer Charles Ennis. Size 25’. This is six 6^{th} – 9^{th} magnitude stars including HIP 82186 and 82126 and the double stars 19 Ophiuchi, HIP 82133, and HIP 82142. Jeffrey Corder lists this as a “wedge”, Corder 3122.

Fur in Frost:

This Swedish asterism “Suttjenēs Rauko” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Furious Dancer:

This **telescopic** asterism is galaxy NGC 6744 (Caldwell 101) in the IAU constellation Pavo. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3776 and later as GC 4464 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010) as “Choromanía Pavónis” (“furious dancing of Pavo”).

Furious of Boötes:

This **telescopic** asterism “Furiósa Boótis” is the elliptical galaxy NGC 5532 in the IAU constellation Boötes. It was discovered in 1784 by William Herschel who listed it as “III 47”. It became GC 3825 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called it this because it “emits two giant jets that can be observed in radio frequencies.”

Furnace:

This Latin star “Fornacis” is Alpha (α) Eridani in the IAU constellation Eridanus. It was given this name in American astronomer Elijah Burritt’s *Geography of the Heavens* and *Celestial Atlas* in 1833.

Furrow:

This Babylonian asterism from the MUL.APIN tablets “AB.SIN”, “MUL.AB.SIN” (Hunger 1992, Parpola 1993), or “Absinnu” and listed in the Babylonian star catalogue BM 78161 (5th – 7th century B.C.E.) as “ab-sin” is a line between Alpha (α) Virginis (Spica) and Nu (ν) Virginis with a line running off at roughly right angles from Gamma (γ) Virginis in the middle of this line towards Delta (δ) and Epsilon (ε) Virginis (Bartel van der Waerden, 1974). The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) list it as “MUL.AB.SIN”, as “mul.ab.sin” (Koch-Westenholz 1995) in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period, and as “mulab-sin” on the K 8538 planisphere (Koch 1989). The Babylonians called Alpha (α) Virginis “the ear of grain”. This asterism disappears in later Seleucid sky lore, replaced by the much larger asterism “The Maiden” or “Goddess Shala” (see below).

This Babylonian star “AB.SÍN” is the star Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Anthony 1996).

This Akkadian asterism “Šer'u”, “Siru” (Hunger 1992, Parpola 1993), or “Seru” from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or “ši-ir-u” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “AB.SIN” above.

This Sumerian asterism “mulab-sin” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “AB.SIN” above (Boutet 2014).

This Persian asterism “Siru” from the list of Tikpi Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) as listed by Franz Boll’s *Ancient Observations of Coloured Stars* in 1918 and by Alfred Jeremias in his *Handbuch der Altorientalischen Geisteskultur* in 1929 and as “AB.SIN” in the list of Zodiacal Signs in VAT 4956 from the same period (Bartel van der Waerden 1974) is the IAU constellation Hydra plus the star Beta (β) Cancri (Tarf) in the IAU constellation Cancer.

This star “Sulcus” is Theta (θ) Eridani in the IAU constellation Eridanus as listed by French astronomer Ismaël Boulliau (Ismaël Bullialdus, 1605 – 1694), who translated this from the name “Αὖλαξ” (“Avlax” or “furrow”) in the works of Georgius Chrysococcas, a 14th century Greek geographer and astronomer. Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists the name “Sulcus” (“groove”) in his *Astronomia Reformata*. Edward Sherburne lists “Sulcus” in his *Sphere of Marcus Manilius* in 1675 but

associates it with Alpha (α) Eridani (Achernar). Orientalist Jacob Golius (1596 – 1667) translates this as "Terra fossi primitus putei" ("The earth was originally a well") or "Agger in Aquae Extremitate" ("A mound at the Water's End").

Furrow Yoke:

"Aruauedon" is a proposed early Celtic name for the IAU constellation Aries from the *Book of Ballymote* through an etymological reconstitution (Boutet 2014).

Furud:

See Solitary Ones, below.

Fùyuè:

See Axe, above.

Fuzzy Butterfly:

See Butterfly, above

Gabriel:

This German asterism "Gabriel" or "Saint Gabriel the Archangel" is the IAU constellation Pegasus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Gabriel Al Pegasus". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

This is one of the Archangel Stars (see above), Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus.

Gabriela Mistral Nebula:

This asterism is NGC 3372 (Caldwell 92) in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752 and placed in his 1755 catalogue as "III 6". It is GC 2197 in the *General Catalogue* of 1864. It has been named for the Chilean poet Gabriela Mistral. It is also known as the Eta Carina Nebula. NOTE: Lacaille originally referred to this as the Eta Argus Nebula as at the time of discovery it was part of the now obsolete constellation Argo's Ship (see above). Irish astronomer Charles Edward Burton (1846 – 1882) referred to it as the "Great Nebula around eta Carinae".

Gachari:

This Tangut star "Gachari" is a red star that is currently unidentified (Berezkin 2005). Gachari is a jealous husband of the women represented by the Pleiades cluster (see Wives of Gachari, below). Gachari broke the back of the Hunter Orion (see Hunter, above).

Gacrux:

This American star is Gamma (γ) Crucis in the IAU constellation Crux and is probably a contraction of the name Gamma Crucis. It was given this name in American astronomer Elijah Burritt's *Geography of the Heavens* and *Celestial Atlas* in 1833. The IAU approved Gacrux as a name for Gamma (γ) Crucis in 2016.

Gadio:

This “Syrian” asterism “Gadio” is the IAU constellation Capricornus as listed in John Hill’s *Urania* in 1754. R. H. Allen lists it as “Gadjo” in his *Star Names* in 1899.

Gaigalyung:

This Dharug asterism is the Large Magellanic Cloud. Dr. Bob Fuller believes this was recorded by Philip, Hunter, and Collins in 1790. Collins original spelling was “Gnar-rang-al-le-on”.

/Gaishay:

This Nyae Nyae !Kung star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Alcock 2014) and is part of their asterism Kalidi (see below).

Gajiri:

This Wardaman star is 17 Tauri in the Pleiades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Gakyid:

See Happiness, below.

Galactic Couple:

This telescopic asterism is the interacting galaxies NGC 3166 and 3169 in the IAU constellation Sextans.

Galactic Squadron:

This telescopic asterism is made up of stars of the IAU constellation Sagittarius. Spanish astronomer “Takuan” posted it in July 2025 on *Cloudy Nights*. Takuan describes it this way: …14 [Sagittarii] (the brightest star, m 5.6, orange in color) looked like the lead ship of a galactic squadron with smaller ships (m ~ 8-9) surrounding it in triangular formation, led by a pair of fighters flying close together”. The “fighters” are HD 167145 and HIP 89410. The triangular formation is the stars Gaia DR3 4090803968384989568 and HD 166966 on one side and HD 167115, Gaia DR3 4090791427079538560, HD 167114, and HD 167113 on the other side, with 14 Sagittarii in the middle.

Galactic Trainwreck:

This American **telescopic** asterism is the interacting galaxy UGC 1810 (Arp 273) in the IAU constellation Andromeda. This name was posted on the *Deep Sky Forum* in September 2012 by Dragan Nikin. It is also known as the “Dancing Master of Andromeda”.

Galaxy Chain:

There are eleven **telescopic** galaxy chains or lines:

- One is the galaxies NGC 2633 (Arp 80, VV 519, UGC 4574), NGC 2634 (UGC 4581) and NGC 2634A (UGC 4585) in the IAU constellation Camelopardalis. NGC 2634 and 2634A were discovered by Wilhelm Tempel in 1882. This name was posted on the *Deep Sky Forum* in June 2014 by Uwe Glahn.

- One is Shakhbazian 317 (Shkh 317) is a chain of the galaxies PGC 8340, 96667, 8329, 8330, 8328, 8316 and 8315 in the IAU constellation Cetus. Length 6'.
- One is Hickson 16 (Arp 318) in the IAU constellation Cetus: HCG 16B, 16A, 16C and 16D. Size 8'.
- One is Hickson 68 in the IAU constellation Canes Venatici: This is the galaxies NGC 5350, 5354, 5353, and 5358. Alongside this is NGC 5371.
- One is NSC j131822+471007 = [YSS2008] 264 in the IAU constellation Canes Venatici. It is less than 2° west of Messier 51. It consists of five MCG galaxies: +8-24-102/103/104/105/106. Size 7'.
- One is Rose 16 in the IAU constellation Canes Venatici. This is four galaxies (Rose 16 A – 16 D), also known as GGCG 162-31, CGCG 162-34, CGCG 162-33, and CGCG 162-32. This was first described in the 1977 ApJ paper by James Rose, *A Survey of Groups of Galaxies*.
- One is Hickson 55 (HCG 55, VV 172) in the IAU constellation Draco. This is five galaxies (HGC 55 a, b, c, d, and e), also known as PGC 35572, 35573, 35574, 35575 and 35576. It was found by Russian astronomer Vorontsov-Veljaminov in 1959. Size 1'.
- One is a chain of galaxies in the IAU constellation Lyra near Alpha (α) Lyrae (Vega). These are UGC 11341, NGC 6695, NGC 6686, NGC 6685, IC4772, NGC 6675, NGC 6663, IC 1289, NGC 6646, and IC 1288. It was posted on the *Deep Sky Forum* by Cypriot astronomer Rolandos Constantinides in July 2014.
- One is the chain of galaxies UGC 3274 (VV 161, Abell 539) in the IAU constellation Orion.
- One is a chain of galaxies in the IAU constellations Grus and Piscis Austrinus: IC 5270, IC 5269, IC 5269B, IC 5269A, IC 1459, IC 5264, NGC 7418B, NGC 7418, NGC 7421, and IC 5273.
- One is a chain of galaxies in the IAU constellation Pisces: NGC 379, NGC 380, NGC 383, NGC 382, NGC 387, NGC 386, NGC 385, NGC 388, and NGC 384.

Galijba:

This Wardaman star is Delta (δ) Piscis Austrini in the IAU constellation Piscis Austrinus (Cairns and Harney 2003).

Galileo's Finger:

This **telescopic** asterism is the HII region LBN 420 in the IAU constellation Lacerta. Astrophotographer Greg Meyer listed it by this name on the Astrophotography page on Facebook on 8 August 2025. This is also known as the Dementor Nebula (see above).

Galla:

This Sami star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Lundmark 1982, Persson 2022). Persson notes that some believe this star to be Beta (β) Orionis (Rigel) in the IAU constellation Orion. To the Sami people Galla is an old man who is the helper of the great hunter Favdna (see above). It is related to their asterism Galla's Sons (see below).

Galla's Sons:

This Sami asterism "Gallabarneck" or "Gallabarnit" is the sons of Galla (see above) and Favdna's helpers (see Favdna above) and is the belt of Orion in the IAU constellation Orion ((Lundmark 1982, Persson 2022).

Gallows:

This **telescopic** asterism is in the IAU constellation Cepheus near Polaris and is Leiter 3 on astronomer Frank Leiter's list of asterisms. Its size is 18' X 7'. It's brightest star (5.5 magnitude) is the double/variable star HIP 20860A (V408 Cep) and forms the end of the top of the "gallows".

Gambarlarla:

This Wardaman star is Epsilon (ε) Ursae Majoris (Alioth) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Gamma:

This **telescopic** asterism is the Hyades cluster (Caldwell 41, Collinder 50, Melotte 25, see below) in the IAU constellation Taurus. This is an ancient Greek asterism.

Ganymede:

This asterism is the asterism Antinous (see above) in the IAU constellation Aquila. This was the original Greek name of this asterism: Ganymede was a divine hero who was abducted by an eagle by the Greek Gods to serve as Zeus' cup bearer:

- German astronomer Johann Bayer lists "Ganymedes" in his *Uranometria Omnium Asterismorum* in 1603.
- "Ganymded" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as an alternate name for Antinous (see above).
- "Ganimedes" is listed as a name for Antinous on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633).
- French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) lists this asterism as "Ganimede" and depicts a youth being carried by Aquila.
- John Hill gives "Ganymede" as a name for Aquila in his *Urania* in 1754. English poet Alfred Tennyson (1850 – 1892) picked up on this and put it in a poem: "Flush'd Ganymede, his rosy thigh, half buried in the Eagle's down."
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists "Der Adler und Antinous" but also lists Bayer's "Ganymede".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Antinous, sive Ganymedes" ("Antinous or Ganymede") and attributes it to German astronomer Wilhelm Schickard (1592 - 1635). Smyth also lists "Ganymede" and "Juvenis".

This Latin asterism "Ganymedes" is the IAU constellation Aquarius. "Ganymedes" title was used by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.), 1st century Roman author Gaius Julius Hyginus, and 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil). 1st century B.C.E. Roman poet Ovid called it "Ganymeded Juvenis" in the *Fasti*.

- Johann Bayer's *Uranometria* (1603) lists "Ganymedes" as a name for Aquarius.
- Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 lists "Ganymedes" and attributes it to 1st century Roman poet Marcus Manilius, although Sherburne incorrectly associates it with the IAU constellation Coma Berenices.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Ganymedes" as an alternate name for Aquarius.
- "Ganymedes" is listed as a name for Aquarius in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Ganymede" as an alternate name for Aquarius.
- R. H. Allen lists "Ganymedes" in his *Star Names* in 1899 as a name for Aquarius and attributes it to 1st century Roman poet Marcus Manilius,

Ganymede's Eagle:

This Latin asterism "Ganymedes Raptrix" is the IAU constellation Aquila and relates to how Ganymede was carried to the skies to be Jupiter's cup bearer. Johann Bayer's *Uranometria* (1603) lists "Ganymedes Raptrix" as a name for Aquila.

Gaper:

This Greek star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. The ancient Greeks thought that dogs were affected by the annual heliacal rising of Sirius, indicated by their panting, which led to them calling Sirius the "Gaper". Compare this to their asterism Dog Star (see above).

Garage for Chariot:

This Korean asterism "Jeoncha Chago" (전차 차고) is the IAU constellation Auriga.

Garangal:

This Walpiri star "Garangal" is a star in the Pleiades cluster in the IAU constellation Taurus (Fuller & Bursill 2021). Garangal is the older of a mythical pair of Wagalag or Wauwalak sisters, daughters of the Djanggawul (important ancestors) who got pregnant by the "wrong men" and were tracked down and punished by the serpent Julunggul by being placed in the sky. The other sister is Boaliri (see above).

NOTE: In a Yuin version of this story, these sisters come down from the Pleiades and then are sent back.

Garden of Paradise:

This Lithuanian asterism "Rojaus darželis" is the IAU constellation Corona Borealis.

Garden of Sky:

This Korean asterism "Haneul Jeong-won" (하늘 정원) is a long, crooked line of stars in the IAU constellations Cetus and Eridanus. The line starts at Gamma (γ) Eridani and runs through Eta (η), Delta (δ), Epsilon (ε), Zeta (ζ), and Eta (η) Eridani, Eta (η) Ceti, Tau (τ) 1, 2, 3, 4, 5, 6, and 8 Eridani, ending at Tau (τ) 9 Eridani.

Garden Sprinkler:

This **telescopic** asterism is the protoplanetary nebula Henize 3-1475 (IRAS 17423-1755, PK 009+05.1, PNG 009.3+05.7) in the IAU constellation Sagittarius. This was discovered by South African astronomer Karl Gordon Henize in 1976. This name is posted on the *Deep Sky Forum* by German astronomer Uwe Glahn in July 2012.

Garden Trowel:

This **telescopic** asterism from the asterism list of the American astronomer John Davis is 1.5˚ southwest of globular cluster Messier 62 in the IAU constellation Ophiuchus. The quadrilateral that forms the "spade" is a group of 9th magnitude stars including HIP 83522. The "handle" is a row of 9th magnitude stars that runs between this quadrilateral and Messier 62.

Garland:

This English asterism is the IAU constellation Corona Borealis as listed in John Hill's *Urania* in 1754.

This Belarussian asterism "Venochok" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009).

This **telescopic** asterism NGC 3077 is a small disrupted elliptical galaxy in the IAU constellation Ursa Major. This was discovered in 1801 by English astronomer William Herschel who listed it as "I 286" in his catalogue. It is GC 1982 in the *General Catalogue* of 1864.

Garlawarra:

This Wardaman star is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Garlic Head Nebula:

This **telescopic** asterism is the HII region LBN 576 in the IAU constellation Cassiopeia.

Garnet Star:

This English star, "Garnet Star" or "Herschel's Garnet Star", is Mu (μ) Cephei in the IAU constellation Cepheus. English astronomer William Herschel gave it this name as he described its color as "a very fine deep garnet colour". Italian astronomer Giuseppe Piazzi lists it under this name in his *Palermo Catalogue* in 1804. It is listed by this name in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Garnet Star". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Garnet Star" for this star.

This Italian star "Garnet Sidus" is Mu (μ) Cephei in the IAU constellation Cepheus. Italian astronomer Giuseppe Piazzi (1786 – 1846), influenced by William Herschel, gave it this name. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Garnet Sidus". *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it with the Latin name "Garnet Sidus" and attributes it to Herschel.

Garrndarin:

There are two stars with this name in Wardaman sky culture:

- One is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Cairns and Harney 2003).
- One is Sigma (σ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Garrulus Traitor:

This Latin asterism “Garrulus Proditor” is the IAU constellation Corvus. Garrulus is a genus of European jays.

Garuda:

This Hindu asterism is named for their half-eagle, half-human deity and is the IAU constellation Aquila.

Gas Pump Handle:

This **telescopic** asterism from *Pattern Asterisms* by American astronomer John A. Chiravalle is in the IAU constellation Ursa Major halfway between the binary star Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) situated at the bend in the handle of the Big Dipper (see Big Dipper, above), and Eta (η) Ursae Majoris (Alkaid). The “handle” is a quadrilateral of the stars 82 Ursae Majoris, HIP 66735, HIP 66440 and 66380. The “spout” runs from the star 82 Ursae Majoris through HIP 66684 to HIP 66705. Size 120’ X 40’. Jeffrey Corder lists this as Corder 2521 and John Raymond calls it “82” as includes 82 Ursae Majoris.

Gas Stream:

This Hungarian asterism “Gáspar” from the Hortobágy Puszta area is unidentified, but may be near to the IAU constellation Perseus.

Gate:

This Coptic lunar mansion “Klusos” (“barrier” or “gate”) is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by English author W.B. Yeats, who took it from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, where Kircher described it as “claustrum” and the “head of Gemini”. R. H. Allen translates it as “watery” in his *Star Names* in 1899 and describes it as the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion.

Compare this to the Arabic manzil Extended Forearm (see above).

Gate of Sky:

This Korean asterism “Seukai Geiteu” (스카이 게이트) is a line of two stars in the IAU constellation Virgo: 69 and 53 Virginis.

Gate of the Gods:

This Latin asterism “Porta Deorum” is the IAU constellation Capricornus as listed in John Hill’s *Urania* in 1754. Hill described it as a “Pythagorean” constellation. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists as a Platonic name for this constellation. R. H. Allen also lists it in his *Star Names* in 1899 but calls it a “Platonic” constellation.

Gate of Yang:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hydra: 49 Hydrae (the determinative star) and 50 Hydrae.

This Chinese xing guan “Yángmén” (阳门) is a line of two stars in the IAU constellation Centaurus: c1 and b Centauri.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Hydra: 51 and 52 Hydrae.

Gatekeeper:

This Chinese Chenzhuo xing guan “Shoumen” is the star Lambda (λ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden West Wall.

Gateway for Troops:

This Korean lunar mansion “Pil” is a line of two stars in the IAU constellation Centaurus: Eta (η) and A Centauri.

Gathering Point:

This Wardaman asterism is the IAU constellation Corona Borealis: They saw it as a gathering point for Men’s and Women’s Law.

Gauntlet:

This Persian asterism, later known by its Latin name “Manica” is the stars Omicron (ο) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis and was listed by the Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986). Compare this to Cloth (above).

This Latin star “Manica” is 6 Orionis in the IAU constellation Orion.

Gaykid:

See Happiness, below.

Gazelle:

This Arabic asterism “al-Zibā” is the stars Omicron (ο) Ursae Majoris, 2 Ursae Majoris, Pi (π) 2 Ursae Majoris, Rho (ρ) Ursae Majoris, Sigma (σ) 1 and 2 Ursae Majoris in the IAU constellation Ursa Major

- “al-Zibā” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010) and described as these six stars.
- “Al Ṭhibā” is listed by Persian astronomer Zakariyya’ al-Qazwini (1203 – 1283) as just the stars Sigma (σ) 1 and 2 Ursae Majoris.
- “Al Ṭhibā” is listed by R. H. Allen in his *Star Names* in 1899.

Gazelle with Her Young:

This Arabic asterism “Al Thibā' wa-Aulāduhā”, called “Gazelle with her Young” or “Gazelles and their Youngsters” is three lines of stars in the IAU constellations Canes Venatici and Ursa Major: The central star is Psi (ψ) Ursae Minoris, from which three lines of stars run out:

- One runs through HIP 52469 to 31 Ursae Majoris,
- One runs through Chi (χ) Ursae Majoris to 5 Canum Venaticorum, and
- One runs through 56 Ursae Majoris and 67 Ursae Majoris to Beta (β) Canum Venaticorum.

This asterism appears many places:

- It appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- German astronomer Christian Ludwig Ideler (1776 – 1846) identified this asterism as the stars of the IAU constellation Leo Minor, which is beside the asterism described above and reported

that this asterism was displayed on a 13th-century Arabic celestial globe recovered by Cardinal Stefano Borgia and housed in the prelate's museum at Velletri.
- Arabist Friedrich Wilhelm Lach reports that this was actually displayed as “Al Haud” (see Pond, below), which the Gazelle jumps into.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al-dhibá wa auládu há, the gazelles and their young” as being on “the Borgian globe” but connects it with the stars of their asterism Three Leaps of a Gazelle (see below).

Gazelles:

This Arabic asterism “al-ẓibāʾ, later latinized to “Althiba” (I, II, III, IV, V, VI, and VII) is the stars Omicron (ο), Pi (π), Rho (ρ), Sigma (σ), and 2 Ursae Majoris in the IAU constellation Ursa Major.

This Arabic asterism al-Jawazi (الجوازي) is the stars 42, Theta (θ) 2, and Iota (ι) Orionis in the IAU constellation Orion as listed by Ibn Qutaybah (828 - 899) in his book of Anwaa.

Gazelles and Their Youngsters:

See Gazelle with Her Young, above.

Gazelle’s Tracks:

This Arabic asterism “Athar Zulfa al-Zība” or “Ṭhufr al Ghizlān”. is made up of three pairs of stars roughly equally spaced stars that look like the footprints of a leaping animal in the IAU constellation Ursa Major:

- One is the stars Nu (ν) and Xi (ξ) Ursae Majoris
- One is the stars Lambda (λ) and Mu (μ) Ursae Majoris,
- One is the stars Iota (ι) and Kappa (κ) Ursae Majoris.

“Athar Zulfa al-Zība” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). Compare this to “Three Leaps of a Gazelle” (below).

Gecko:

There are two **telescopic** “gecko” asterisms:

- One is the emission nebula LBN 437 in the IAU constellation Lacerta.
- One is the dark nebula Barnard 86 in the IAU constellation Sagittarius. This is also known as the Ink Spot (see below) and Herschel’s Hole in the Heavens (see below).

Gem:

This Latin star “Gemma” is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis. R. H. Allen suggests in his *Star Names* in 1899 that this may have come from the Roman poet Ovid’s Nine Precious Stones (see below). It appears elsewhere as “Gema”:

- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Alphacca vel Gemma” in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Gemma” and his *Bedford Catalogue* in 1844 as “Gemma”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Gemma”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists "Gemma" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists both "Gemma" and "Alphecca" for this star.
- Compare this to "Crown Jewel" (above).

This Belarussian asterism "Litwa" is the IAU constellation Gemini (Avilin 2009). It is also known as "Blizniuki" ("Twins") or "Korona" ("Crown").

Gem Cluster:

This **telescopic** asterism is open cluster NGC 3293, discovered by Nicolas Louis de Lacaille in 1751 in the IAU constellation Carina. Lacaille described it in his 1755 catalogue as a "small heap of 4 small stars forming a lozenge." It is GC 2144 in the *General Catalogue* of 1864. It is also known as the Spider Spit Cluster (see below), "U" (see below), the Horseshoe (see below), the Little Jewel Box (see below) and the Hubbly Bubbly Pipe (see below).

Gemini:

Castor, magnitude 1.93, is the second brightest star in Gemini but 24th brightest star in the sky. Despite Pollux bearing the Bayer designation Beta (β) Geminorum, it is the brighter star at magnitude 1.14 and the 17th brightest star in the sky. Castor is a sextuple star system of three binary pairs (Castor Aa/Ab, Ba/Bb, and Ca/Cb). Pollux is the closest giant star to our Solar System (34 light years). The star Gamma (γ) Geminorum (Alhena) is the 43rd brightest star in the sky. The stars of this constellation appear in 420 asterisms of those listed here from all over the world.

The IAU constellation Gemini has the brightest twin stars in the sky: Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux). The Babylonians described these stars in the IAU constellation Gemini as "Tu'amu Rabutu" (see Great Twins below), but this was just the upper half of what is now the IAU constellation Gemini: The lower half was "Tu'amu Sehrutu" (see Little Twins, below). The Seleucids later combined them to form the modern constellation. The version listed by Ptolemy (100 – 170) in the *Almagest* is "Δίδυμοι" ("Dídymoi") (see Twins, below) which is essentially identical to the modern IAU constellation Gemini except for more detail concerning the heads of the twins. This constellation might have been influenced by the proposed Egyptian asterism Double Falcons (see below).

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Gemini as a male and a female together (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as two nude males standing side by side. The twins are depicted much larger and are incorrectly oriented: They should be located on the ecliptic but are instead perpendicular to the parallel circles on the globe so that their legs occupy the space that should contain Orion's torso.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts the twins nude, facing away from us, with their inner arms embracing one another.

Gemini is listed in various forms in editions of the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) this is depicted as two youths holding spears or staves in their outer hands,

- In the Cologne 83 II edition the twins are wearing long cloaks with the Pollux holding a lyre and both twins with their inner arms around their twin's shoulders,
- In the Prague IX C.6 edition, the left twin (Pollux) is holding a viol.
- Three editions (Paris BN 12957, St. Gall 902, Vat Reg lat 1324) have the twins holding their inner hands across their chests,
- In the Paris BN n.a. 1614 editions the twins are gesturing with their inner hands,
- In the St. Gall 250 edition the twins are using their staves as crutches,
- In the Prague IX C 6 edition Pollux is holding a lyre.

Gemini is depicted in the Leiden *Aratea* (816), as clean-shaven nude twins, their bodies facing us, with the twins looking towards one another (Katzenstein & Savage-Smith, 1988). Both are wearing silver bowl shaped helmets surmounted by a gold cross and each has a red cape over one shoulder. Pollux has a club in his right hand and a spear in his left hand. Castor has an arrow in his right hand and is holding a lyre with his left hand.

The 9th century Berlin 130, Madrid 3307, and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Pollux holding a lyre and Castor holding a spear. The Monza F.9/176 manuscript of the *De ordine ac positione stellarum* omits the lyre, replacing it with the folds of his cloak. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict both twins holding spears. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict both twins in short tunics, holding spears. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts the twins nude, pointing to each other with their inner hands.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depicts Castor holding a lyre in one hand with his other hand on the shoulder of Pollux. Padua 27 shows the twins nude wearing cloaks, while the Oxford and Venice manuscripts have them in ankle length robes. The Dijon 448 manuscript of *De signis caeli* depicts the twins with the inner arms crossing so that they both have a hand on the other's back. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Montecassino 3, and Zwettl 296 manuscripts of *De signis caeli* depict the twins both holding spears: In the Montecassino 3 manuscript the twins are gesturing towards their spears with their inner hands. In the Klosterneuberg 685 manuscript they are wearing full medieval armour. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts Castor holding a lyre.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Gemini on one page as two nude clean-shaven males facing to our right. Both of their arms are extended so that the arms between them overlap. The other page shows them facing to our left. Their hands are empty.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Pollux touching Castor's chin.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Gemini as twins facing us. They both have their arms extended out to each side as if in greeting.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Gemini as nude twins.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r,

depicts Gemini as a pair of nude boys. The male on the left has blonde hair and has his arms extended, and the artist has painted his right arm green. The male on the right is standing behind the other. The right hand male has dark hair and is waving with his left arm, which the artist has painted green.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists the abbreviated form "GEMIN" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Gemini as a pair of nude twins walking to our right with their arms outstretched. Both are wearing caps.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Gemini" as a pair of curly haired nude boys. They are viewed from behind and the twin on the left has his right arm around the twin on the right.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Gemini" as a pair of nude figures. The drawing is very poor, so it is impossible to determine gender. Each is holding aloft a branch of some sort.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Gemini as a tiny pair of male figures. The figure on the left is looking towards us. The figure on the right is partially behind his twin and appears to be whispering in his twin's ear.

A translation of The *Liber Introductorius* and of the *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Gemini as twins with winged feet. They are both nude except for a cape over their shoulders. The twin on the left has a sickle in his right hand at his side and has his left arm around his twin: The gender of this twin is indeterminate as the twin's right leg is stepping forward, concealing the crotch. The twin on the right has male genitalia and has his right arm around his twin and his holding up a bucket or basket in his left hand.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Gemini" as a pair of nude twins walking, turned slightly to our left. The twin on the left is male, walking with a shepherd's crook in his right hand and having his left arm behind his twin's back. The twin on the right is *female*, with her right arm behind her twin's back and her left hand holding what appears to be a bucket or possibly a basket.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Gemini as twins in knee length tunics turned slightly to our right.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Gemini as clean-shaven nude twins. The twin on the left has his back to us, with his right arm around his twin and his left arm holding up a harp. The twin on the right is behind his twin, facing him, with his left arm raised towards the sky.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Gemini as two long-haired males nude except for capes. Pollux has his left arm around Castor and Castor is holding up a lyre in his right hand.

Gemini appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as two nude twins embracing, each holding their outer arm upwards, and labelled with the astrological sign for Gemini.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. "Gemini" is depicted as long-haired twins with wings. Each twin is touching the other's chest with the hands between them. Pollux has a serrated scythe in his right hand and Castor is holding a lyre in his left hand.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Gemini" as a pair of nude males viewed from behind with their inner arms around one another. Their hands are empty.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Gemini" as nude twins facing away from us. Pollux has his right arm around the back of Castor. The left arm of Pollux and the right arm of Castor are raised skyward, and the twins are looking into each other's eyes.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Gemini" as nude twins facing away from us. Pollux has his right arm around the back of Castor. The left arm of Pollux and the right arm of Castor are raised skyward, and the twins are looking into each other's eyes.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Gemini" as a pair of nude twins walking together to our left. The twin on the left is labelled "Apollinis" and is holding aloft a violin and its bow in his right hand. The twin on the right is labelled "Herculis". A celestial globe (1522) of Schöner (1477 – 1547) depicts them as nude twins facing away from us with nothing in their hands.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Gemini as nude twins as viewed from behind. They are walking away from us. The twin on the left has his left arm raised to the sky and his right arm around the back of his companion.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Gemini in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Gemini" as two nude seated figures facing away from us: The one on the left has darker skin, shorter hair, and appears to be a male, while the one on the right has lighter skin, long blonde hair, and may be female. The "male" figure's right arm is embracing his twin so that the upper torso of the other "twin" is obscured.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "De I Gemegli". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Twins”.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists “Gemini” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Gemini as nude twins, one facing us, one with his back to us. They are embracing and both has one arm raised high. This is only labeled with the astrological symbol for Gemini.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Gemini” as two nude boys viewed from behind. The one on the left has his right arm around the back of the other, and the one on the right is pointing at something with his left hand. Both have their outer arms raised skyward.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “Les Gemeaux” as a pair of nude twin boys. Castor has his arm around the front of Pollux.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Gemini” as nude twins. The twin on the left is facing away from us with his left arm raised skyward and his right arm around his companion. The right twin is partially concealed behind the other twin and appears to be facing him with his left arm raised skyward: His right arm is concealed.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Gemini” as two nude males , with Castor behind Pollux. Pollux is brandishing a whip in his right hand.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Gemini” as nude twins with drapery over their left shoulder wearing round caps with a six-pointed star on the front topped by a cross. Pollux is holding a spear in his left hand and a club in his right hand. Castor is holding an arrow in his left hand and a harp in his left hand.

“Gemini” is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as seated naked twins with their backs to us and their arms around each other.

Gemini is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts Gemini in his *Uranometria* in 1603 as twins both wearing caps with crosses on top. Pollux holding a sickle in his right hand and Castor holding an arrow in his left hand and some sort of rectangular harp cradled in his right arm. Bayer lists these names for Gemini: “Gemini, Castor and Pollux, Amphion and Zethus, Tyndaridae, Ledaeiiuuenes Dioscuri, Duo corpuscula cofertis brachiolis & crusculis [“Two small bodies with brachioli and small scales”], Ledaeum Sidus, Dij Samothraces, Duo Pauones, Zwilling, Abrachaleus and Aphellan seu Auellar”.

“Gemini” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and is reversed, with the twins viewed from behind with Castor on the left and Pollux on the right. Both are wearing conical caps. Castor is holding up and arrow in his left hand and Pollux is holding up a club.

"Gemini" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as two nude male twins with spiked caps: They are embracing with their inner arms and their outer arms are brandishing spears.

Gemini is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe's catalogue, in 1627.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Gemini" for this constellation.

"Gemini" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as seated twins with arms around each other: Pollux is holding an arrow up in his right hand and Castor is holding a spear up in his left hand.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts Gemini as nude twins with their backs to us. The twin on the left is labelled "Castor" and is pointing at something with his left hand and has his right arm around Pollux. The twin on the right is labelled "Pollus" and is turned towards Castor: Both of his arms are out of view.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Gemini as nude twins wearing conical helmets. The twin on the left is facing us, partially obscured behind his twin, and has raised a club in his right hand. The twin on the right is facing away from us, and is holding a stick with arrow points at both ends. The twin in the back is also wearing a blue drapery.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Gemini Algenife" with the captions "Castor vel Appollo" and "Pollux Alias Herculis": This depicts two nude twins viewed from behind.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Gemini as two nude males, Castor with his back to us and Pollux facing us: Castor is holding aloft an arrow in his left hand and Pollux is holding aloft a club in his left hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Gemini" as seated twins viewed from behind with arms around each other and one pointing.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Gemini" as twins seated with arms around one another and one pointing.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Gemini" as nude twins with a feather tucked into a band around their heads. "Pollux" is on the right holding a raised club in his left hand and "Castor" is on the left holding a three-thong whip aloft in his left hand and having his right arm around Pollux.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts Gemini as nude children facing one another. Pollux on the left has his back to us and is holding a stick with arrow points

at eac end in his right left hand. Castor on the right is facing us straddling the right leg of Pollux and has drapery over his left shoulder. His left had is holding up a club.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Gemini as nude twins walking away from us, both wearing a circlet in their hair with a leafy frond in front. Pollux has a stick in his left hand.

Gemini is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: The twins are depicted seated with Pollux's inner arm around Castor's back. Pollux is holding a club in his right hand. Castor is cradling a lyre in his right arm and is holding aloft an arrow in his left hand.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Gemini".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Gemini as a pair of twins seated facing away from us. This is located at the edge of one of the halves of the folding globe. Castor is holding a large leaf in his right hand.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts Gemini as nude male twins, with Pollux seated as viewed from his right side with Castor seated facing away from us in the lap of Pollux. Pollux has a club raised in his right hand and Castor has a whip with three thongs raised in his right hand.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Gemini as nude twins, Castor with his back to us overlapping Pollux, who faces us: Castor is holding aloft a burning torch in his left hand and Pollux is holding aloft a club in his left hand.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Gemini as twins seated side by side. They are both wearing skull caps. Pollux has a sickle raised in his left hand over his head. Castor has what appears to be an arrow in his right hand and his holding a lyre in his lap.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Les Gemeau" as two youths. Pollux has his left arm around Castor's back and has a scythe raised in his right hand. Castor is cradling a lyre in his right arm and holding an arrow in his left hand.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Gemini" as two nude twins viewed from behind. Castor is holding aloft what appears to be a three-thong whip.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "les Gemeaux" ("the Twins") as two nude males with their inner arms around each other and their outer arms raised on the northern hemisphere chart. Later in a closeup chart the twins are wearing shorts and sandals and Castor is holding an arrow in his left hand and cradling a lyre in his left arm and Pollux is holding a club in his right hand. The 1778 edition depicts the twins as seated with Pollux's inner arm around Castor's back. Pollux is holding a club in his right hand. Castor is cradling a lyre in his right arm and is holding aloft an arrow in his left hand.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Zwillinge" and depicts the twins from the rear, seated,

with Pollux holding a club aloft in his left hand and Castor holding an arrow in his left hand. Bode's various *Jahrbuch* also use this name. *Vorstellung Der Gestirne* (1782) lists this constellation as "Zwillinge, Castor und Pollux" (see Twins, below) and depicts them as seated side by side, with Pollux cradling a club with his right arm and Castor cradling a lyre in his right arm and holding aloft an arrow in his left hand.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Gemini" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Gemini" as seated twins: Castor has his arm around "Pollix" and is pointing at something with his left hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Gemini" as two nude males viewed from the rear. Pollux is holding up a three thong whip and Castor is holding up what appears to be a feather.

American uranographer William Croswell (1760 – 1834) depicts "Gemini the Twins" on his *Mercator Map of the Starry Heavens* in 1810 as two seated youths: Castor has his back to us and is brandishing a spear in his left hand. Castor overlaps Pollux, who faces us.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Gemini in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): This constellation is depicted as two seated twins, with Castor slightly overlapping Pollux. Pollux is cradling a club in his right arm and Castor is cradling a harp in his right arm and brandishing a bow and arrow in his left hand. NOTE: Jamieson lists one twin as "Hercules vel Pollux" and the other as "Apollo vel Castor" in his Atlas and as "Pollux" and "Castor" in the *Northern Celestial Planisphere*.

"Gemini" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as two males with sandals seated together. Pollux is holding a scythe over his head in his right hand and has his left arm around Castor. Castor is holding a lyre in front of him in his right arm and has an arrow raised in his left hand.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Gemini" as two male twins facing away from us, with Castor on the left and Pollux on the right. Castor is holding aloft a bow in his left hand and Pollux is holding a club in his right hand.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Gemini" as seated twins: Pollux is holding a club in his right hand and Castor is cradling a lyre in his lap with his right hand and holding out a bow and arrow in his left hand.

Gemini is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. Gemini is depicted as seated twins with Castor's right shoulder overlapping Pollux's left shoulder. Pollux has a huge wooden club tucked under his right arm and Castor is holding a lyre in his left arm and holding aloft a bow and arrow in his right hand.

"Gemini" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as twins facing us standing side by side with their inner arms around one another. Castor is gesturing with his left hand.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Gemini, the Twins".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this as "Gemini, the twins".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Gemini" in his *Star Atlas* (1893) and describes it as "The Twins".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Gemini" and describes it as the "Twins".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Gemini, the Twins".

The French call it "Gémeaux". Romanians call it "Gemenii" but the brothers are Romulus and Remus.

The standard IAU chart depicts Gemini this way:

- "Pollux" has the star Beta (β) Geminorum (Pollux) as his "head", with his "shoulders" the star Upsilon (υ) Geminorum and his body running down to Delta (δ) Geminorum. Arms are two lines running out from Upsilon (υ) Geminorum to Kappa (κ) and Iota (ι) Geminorum. One "leg" runs from Delta (δ) Geminorum to a "knee" at Lambda (λ) Geminorum to a "foot" at Xi (ξ) Geminorum and the other "leg" runs from Delta (δ) Geminorum to a "knee" at Zeta (ζ) Geminorum to a "foot" at Gamma (γ) Geminorum.
- "Castor" has the star Alpha (α) Geminorum (Castor) as his "head", with his "shoulders" at Tau (τ) Geminorum and his body running down to Epsilon (ε) Geminorum. Arms are two lines running out from Tau (τ) Geminorum to Iota (ι) Geminorum and Theta (θ) Geminorum. One "leg" runs from Epsilon (ε) Geminorum to a "foot" at Nu (ν) Geminorum and the other "leg" runs from Epsilon (ε) Geminorum through Mu (μ) and Eta (η) Geminorum to a "foot" at 1 Geminorum.

Sky and Telescope Magazine, founded in 1941, depicts Gemini in their magazine and publications in the same manner as standard IAU charts.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) simplify Gemini in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* by eliminating two of the twin's legs, having Pollux end with a line from Gamma (γ) Geminorum to Xi (ξ) Geminorum and Castor end with a line from Mu (μ) Geminorum through Eta (η) Geminorum to 1 Geminorum.

Gemini Nebula:

This is an alternate name for the Peanut Nebula (see below).

Gemini Spartans:

This Latin asterism "Gemini Lacones" is the IAU constellation Gemini. English poet John Milton (1608 – 1674) called it "Spartan Twins". This name relates to their birthplace in Sparta. A related name is "Spartana Suboles" ("Sparta offshore").

Gemstone Bearer of Pisces:

This **telescopic** asterism "Gemmífera Píscium" is the intermediate spiral galaxy NGC 718 in the IAU constellation Pisces. It was discovered in 1784 by William Herschel who listed it as "II 270". This became GC 430 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to "draw attention to the unassuming b) eauty of this galaxy".

Gemstone of Pyxis:

This **telescopic** asterism "Gemma Pýxidis" is the elliptical galaxy NGC 2663 in the IAU constellation Pyxis. It was discovered by Lewis Swift in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They describe it as a "simple elliptical galaxy [which] shines as a gemstone… like a jewel in a jewel box".

General:

This Chinese star "Jiang" is Mu (μ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) "Dǒuxiù" (斗宿) – see Dipper, above.

General of Border:

This Korean asterism "Guggyeong Jang-gun" (국경 장군) is a two-pronged fork of stars in the IAU constellation Taurus. The "handle" is the stars Gamma (γ) and Lambda (λ) Tauri. From Gamma (γ) Tauri, two lines of stars emerge:

- One line runs through Delta (δ) 1, 2 and 3 Tauri, ending up at Epsilon (ε) Tauri, and
- One line runs through 71, Theta (θ) 1 and 2 Tauri, HIP 21029, and Alpha (α) Tauri (Regulus), ending at Sigma (σ) 1 and 2 Tauri.

General of Mobile Troops:

This Korean asterism "Gidong Budaeui Jang-gun" (기동 부대의 장군) is a triangle of stars in the IAU constellation Centaurus and Circinus: Alpha (α) Centauri (Rigil Kentaurus), Beta (β) Centauri (Hadar) and Alpha (α) Circini.

General of the East:

This 9th century Zoroastrian star "Tištar" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Raffaelli 2018) which they saw as a general ("spāhbed") of the east. The Zoroastrians saw it as opposing their "general of generals" named "Tīr" (the planet Mercury). Compare this to the Persian asterism Four Guardians of Heaven (see above).

General of the North:

This 9th century Zoroastrian asterism "Haftōring" is the IAU constellation Ursa Major (Raffaelli 2018) which they saw as a general ("spāhbed") of the north. The Zoroastrians saw it as opposing their "general of generals" named "Ohrmazd" (the planet Jupiter). Compare this to the Persian asterism Four Guardians of Heaven (see above).

General of the South:

This 9th century Zoroastrian star "Sadwēs" is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Raffaelli 2018) which they saw as a general ("spāhbed") of the south. The

Zoroastrians saw it as opposing their "general of generals" named "Anāhīd" (the planet Venus). Compare this to the Persian asterism Four Guardians of Heaven (see above).

General of the Stellar Generals:

This 9th century Zoroastrian star "Mēx ī mayān ī asmān" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Raffaelli 2018) which they saw as a stellar general of generals. The Zoroastrians saw it as opposing their "general of the generals" named "Kēwān" (the planet Saturn).

General of the West:

This 9th century Zoroastrian star "Wanand" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Raffaelli 2018) which they saw as a general ("spāhbed") of the west. The Zoroastrians saw it as opposing their "general of generals" named "Wahrām" (the planet Mars). Compare this to the Persian asterism Four Guardians of Heaven (see above).

Genie in a Bottle:

This **telescopic** asterism is the peculiar ring galaxy NGC 2445 (Arp 143) in the IAU constellation Lynx which is interacting with NGC 2444 (GC 5392). It was discovered by Édouard Stephan in 1877 and later became GC 5393 in the *General Catalogue* of 1864. This name was posted on the *Deep Sky Forum* by American astronomer Jimi Lowrey in February 2012. It is also known as the "Cat's Paw of Lynx".

Genoa:

This asterism "Genoa" was made up of stars of the IAU constellation Corvus by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It represents Genoa and is depicted as a cross.

Gentry:

This Chinese star "Shi" from the 3 Kingdoms and Ming Dynasty Period is Nu (ν) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Three Steps (see below).

George's Psaltery:

This asterism "Psalterium Georgii" or "Psalterium Georgianum" was created by Hungarian astronomer Abbé Maximilian Hell in 1789 to honor King George III of Great Britain. It is made up of stars of the IAU constellations Eridanus and Taurus and included the star 10 Tauri. French astronomer Jérôme Lalande (1732 – 1807) renamed it "Harpa Georgii". German uranographer Adolf Stieler (1775 – 1836) listed it on his planisphere as "Georg's Harfe", and German astronomer Johann Elert Bode (1747 – 1826) listed it as "Georgs Harfe" in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820). Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Psalterium Georgii" in his *Celestial Atlas* in 1822: It is depicted as a harp with the frame the bust of a winged nude woman. *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Psalterium Georgii" as a harp with the frame the bust of a winged nude woman. NOTE: A psaltery is a stringed instrument of the zither family.

German:

This Latin asterism “Almannus” is the IAU constellation Hercules and relates to forms of that hero worshipped in early German territories.

Gesticulating of Canes Venatici:

This **telescopic** asterism “Gestículans Cánum Venaticórum” is the intermediate spiral Seyfert galaxy NGC 4151 in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in March 1787 who listed it as “I 165”. It is GC 2756 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Eye of Sauron” (see above).

Gherges:

This Persian asterism is the IAU constellation Aquila.

Ghirdegan:

This Persian asterism is the IAU constellation Gemini as listed in John Hill’s *Urania* in 1754.

Ghost Bush Cluster:

This **telescopic** asterism, also known as the Flying Geese Cluster (see above) and the Silk Fan Cluster (see below), is the open cluster NGC 6939 in the IAU constellation Cepheus. It was discovered by William Herschel in 1798 who listed it as VI 42. It is GC 4590 in the *General Catalogue* of 1864. It lies 0.6 degrees northwest of the spiral galaxy NGC 6946 and 2 degrees southwest of the star Eta (η) Cephei. It is also known as the Silk Fan cluster and the Flying Geese.

Ghost Cluster:

This **telescopic** asterism is the open cluster NGC 7789 in the IAU constellation Cassiopeia. It was discovered in 1783 by English astronomer Caroline Herschel. John Herschel listed it as “”VI 30”. John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864. It is also known as Caroline’s Rose, the White Rose, the Star Mist Cluster, Herschel’s Spiral Cluster, and the Screaming Skull Cluster.

Ghost Globular Cluster:

There are two **telescopic** “ghost globular cluster” asterisms:

- One is open cluster NGC 5466 in the IAU constellation Boötes. It was discovered by English astronomer William Herschel in 1784 who listed it as “VI 9”. It is GC 3776 in the *General Catalogue* of 1864.
- One is globular cluster NGC 5897 in the IAU constellation Libra. This was discovered by English astronomer William Herschel in 1784 who listed it as “VI 19” and “VI 8?”. It is GC 4075 in the *General Catalogue* of 1864. This globular cluster is a satellite of the Milky Way. This is listed in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Ghost Head Nebula:

This **telescopic** asterism is emission nebula NGC 2080 in the IAU constellation Dorado south of the Tarantula Nebula (see below). It was discovered in 1827 by Scottish astronomer James Dunlop and belongs to the Large Magellanic Cloud. It is listed as GC 1278 in the *General Catalogue* of 1864. It is called this as this cloud has two bright patches that look like “eyes”.

Ghost Nebula:

This reflection nebula is Sharpless 2 – 136 (VdB 141) in the IAU constellation Cepheus.

Ghost of Cassiopeia:

This **telescopic** asterism is the HII region IC 59/IC 63 which is 19 arcminutes away from Gamma (γ) Cassiopeia in the IAU constellation Cassiopeia inside Sharpless 2-185. American astronomer Edward Emerson Barnard (1857 – 1923) and German astronomer Max Wolf (1863 – 1932) are both listed in the first Index catalogue as having observed it. Some people call it the Ghost Nebula of Cassiopeia.

Ghost of Jupiter:

This **telescopic** asterism is the planetary nebula NGC 3242 (Caldwell 59) in the IAU constellation Hydra. It was discovered in 1785 by English astronomer William Herschel who listed it as "IV 27". John Herschel included it in his catalogue as h 3248 and later as GC 2102 in his *General Catalogue* of 1864. English Admiral Henry William Smyth describes it as a "fine object [which] resembles Jupiter" in his *Bedford Catalogue* in 1844. It is also known as the Eye Nebula (see above) or the Diamond Nebula (see above). Size 0.7' X 0.6'. English astronomer William Henry Smyth (1788 – 1865) noted in his observations that its apparent size was similar to Jupiter, which is how it acquired that name. Rev. Thomas William Webb describes it as "resembling Jupiter" in the third edition of his *Celestial Objects for Common Telescopes* in 1873.

Ghost of Mars Nebula:

This **telescopic** asterism is planetary nebula NGC 6369 in the IAU constellation Ophiuchus. It was discovered by English astronomer William Herschel in 1784 who listed it as "IV 11". It is GC 4302 in the *General Catalogue* of 1864. It is also known as the Little Ghost Nebula (see below) and the TIE Fighter (see below). This is listed in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Ghost of Neptune Nebula:

This **telescopic** asterism is planetary nebula NGC 1535 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as "IV 26" in his catalogue. It is GC 826 in the *General Catalogue* of 1864. It is also known as the "Celestial Jellyfish" and "Cleopatra's Eye". Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this name and makes it O'Meara 22.

Ghost of the Moon Nebula:

See Snow Globe Nebula (below).

Ghost of Uranus:

This **telescopic** asterism is the planetary nebula NGC 5882 in the IAU constellation Lupus. This was discovered by English astronomer John Herschel in 1835 who listed it as h 3594. It is GC 4066 in the *General Catalogue* of 1864. It is also known as the Puff Cluster (see below).

Ghost of Ursa Major:

This **telescopic** asterism "Larvális Úrsae Majóris" is the intermediate spiral galaxy NGC 4088 (Arp 18) in the IAU constellation Ursa Major. William Herschel listed this as "I 206". It became GC 2708 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the apparent shape

of this galaxy resembles the characteristic figure of a ghost, the head being the bright spot at the northeastern end".

Ghost Ring Nebula:

This **telescopic** asterism is planetary nebula IC 5148 in the IAU constellation Grus about 1 degree west of Lambda (λ) Gruis. It was discovered by Australian amateur astronomer Walter Frederick Gale (1865 - 1945) in 1894. This is also known as the Spare Tire Nebula.

Ghostly Cheerio:

See Cheerio Nebula above.

Ghostly Streak:

This **telescopic** asterism "Acúleus Píscium" is the galaxy NGC 100 in the IAU constellation Pisces. It was discovered by American astronomer Lewis Smith in 1885. This name is posted in the *Deep Sky Forum* in October 2015 by American astronomer Jimi Lowrey. It is also known as the "Sting of Pisces".

Ghosts:

This Chinese xiù (lunar mansion) "Guǐxiù" (鬼宿) is a quadrilateral of stars in the IAU constellation Cancer: Delta (δ), Gamma (γ), Eta (η), and Theta (θ) Cancri. These form an "enclosure" around the open cluster Messier 44 (the Beehive Cluster, see Beehive, above), which the Chinese call "Cumulative Corpses" or "Cumulative Corpse Gas" (see above). In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Yu Gui" (輿鬼） was associated to matters concerning the Yongzhou territory. It appears as Gui (鬼）in the Tang Dynasty (618 – 907 C.E) and is compared with the Vedic nakshatra Pushya (Kotyk 2017, see Nourisher, below).This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

The Koreans call this xing guan "Eye of Sky" (see above).

Ghost's Head:

This Latin asterism "Caput Larvae" is the asterism Medusa's Head (see below) in the IAU constellation Perseus and appeared in the 16th century according to R. H. Allen in his *Star Names* in 1899. Robert Burnham lists "Caput Larvae", which he translates as "the Spectre's Head" as a name for the star Beta (β) Persei (Algol) in his *Burnham's Celestial Handbook* in 1978.

Ghunaīma:

This Arabic asterism "Ghunaīma" is stars surrounding Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Giant:

This Arabic asterism "Aleimlaq" (العملاق), "Algebar", "al-jabbar", or "ul-Jabbār", is the IAU constellation Orion. Arabic astronomers translated the Greek constellation Orion this way, although their own name for it was Al Jawza' (see above):

- "al-Jabbār" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

- "Algebar" and "Algebaro" are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- German poet Philip von Zesen (1619 – 1689) lists it as "Algauza".
- John Hill lists it as "Algabbar" in his *Urania* in 1754
- John Chilmead lists it as "Algibbar" in his *A Learned Treatise on Globes* in 1889.
- Other variations include "Algebra", and "Algebaro".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "jebbér" and as "El-Jebbár, the hero".

This ancient Celtic asterism "Helith" is associated with the Cerne Abbas giant and anthropologists have described it as an early representation of the IAU constellation Hercules.

This large, ancient Egyptian asterism "Nekhet" is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and is made up of stars of the IAU constellations Aquila, Aquarius, Delphinus, Lacerta, Pegasus, Pisces, and Andromeda:

- The lower part of its "body" is the Great Square of Pegasus (see Great Square below) with "knees" being the stars 68 Pegasi and 17 Piscium,
- The "shoulders" of the upper body are the stars Epsilon (ε) and Kappa (κ) Pegasi,
- One "arm" goes off from Kappa (κ) Pegasi along a line of faint stars ending in 11 Lacertae,
- The other "arm" runs from Theta (θ) Pegasi to an "elbow" at Eta (η) Aquarii and on to a "hand" at Beta (β) Aquarii (Sadalsuud), and
- This Giant has two "antennae":
    - One ends in the star Alpha (α) Aquilae (Altair), and
    - The other ends in a quadrilateral of stars: Beta (β) Delphini (Rotanev) and Delta (δ) Delphini and 9 and 12 Delphini.

This Greek asterism "Γίγας" ("Gigas") is the IAU constellation Orion:

- Johann Bayer's *Uranometria* (1603) lists "Gigas".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists Gigas.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Gigas".
- Gigas is listed in John Hill's *Urania* in 1754 and in R. H. Allen's *Star Names* in 1899.

This Hebrew asterism "Gibbōr" is the IAU constellation Orion.

This Syrian asterism "Gavero" is the IAU constellation Orion as listed in John Hill's *Urania* in 1754. R. H. Allen lists it as "Gabbārā" in his *Star Names* in 1899.

This Ininew (Cree) asterism "Mistapiw" is the IAU constellation Orion (Buck 2016). He is also known as "Wesakayckak" the "Trickster" or "Teacher" (see "Teacher" below). The three stars of Orion's belt are the "Three Chiefs" (see below).

This Anishinaabe asterism "Misabe" or "Nanabush Anung" ("Teacher", see below) is the IAU constellation Orion (Lee et al 2014).

This Armenian asterism "Haik" is the IAU constellation Orion.

Giant Angel:

This Hebrew asterism from their *Tanakh*, "Kesîl" (כְּסִיל), is the IAU constellation Orion.

Giant Behemoth:

This **telescopic** asterism NGC 6907 is a grand design spiral galaxy in the IAU constellation Capricornus. It was discovered by English astronomer William Herschel in July 1784 who listed it as "III 141". It is GC 4573 in the *General Catalogue* of 1864. It is also known as the "Curved of Capricornus" (see above).

Giant Gate:

This Chinese star "Jumen" from the Three Kingdoms to the Ming Dynasty is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Jumen" is the star Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Giant of Eridanus:

This **telescopic** asterism "Pergrándis Erídani" is the huge elliptical galaxy NGC 1132 in the IAU constellation Eridanus. It was discovered in 1827 by John Herschel who listed it in his catalogue as 273 and later as GC 619 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Giant of Pavo:

This **telescopic** asterism "Gígas Pavónis" is the barred spiral galaxy NGC 6872 in the IAU constellation Pavo. It was discovered by John Herschel in 1835, listing it as h 3816. It is GC 4549 in the *General Catalogue* of 1864. It is the largest known spiral galaxy and is interacting with the lenticular galaxy IC 4970. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "its long extending arms merits to be named after the mythological… Gigantes, often pictured with long snakelike tails. The Gigantes were beaten and injured by Zeus… as can be seen in this galaxy with its broken arm." It is -70 46also known as the "Condor" (see above).

Giant Shovelnose Ray:

This Kala Lagaw Ya asterism "Kaigasiu Usu" is the region of the galactic bulge in the IAU constellation Scorpius.

Giant Squid:

There are two **telescopic** "Giant Squid" asterisms:

- One is NGC 134 is a barred spiral galaxy in the IAU constellation Sculptor. It was discovered by Scottish astronomer James Dunlop. It is GC 67 in the 1864 *General Catalogue*. It was given this name by American astronomer and author Stephen James O'Meara. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).
- One is the nebula Outters 4 (OU 4) in the IAU constellation Cepheus. This was discovered by amateur astronomer Nicolas Outters in 2011. It is embedded in the HII region Sharpless Sh2 – 192 (bat nebula).

Giant Triggerfish:

This Tongan asterism "Humu" is the Coal Sack Nebula (see Coal Sack Nebula, above) in the IAU constellation Crux and is related to their asterism the Twins (see below). Humu was also a famous

ho'okele ("navigator/steersman") in Polynesian mythology: Compare this with the Hawaiian asterism Humu (see below).

This Micronesian (Caroline Islands) asterism is the Southern Cross in the IAU constellation Crux.

Giausar:

See Poison Place, below.

Gideon's Fleece:

This German asterism is the IAU constellation Lepus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Vellus Gedeonis "Gideon's fleece") Al Leques". Gideon's Fleece later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Gienah:

See Wing, below.

Gift:

This Vedic Nakshatra (lunar mansion) "Radha" or "Rādhā" ("the gift"), also known as "Vishākhā", "Visakha", "Vishakha", or "Vaisakha" ("forked" or "having branches"- see Forked, above), is in the IAU constellation Libra and is the double star Alpha (α) Librae (Zubenelgenubi), and the stars Beta (β) Librae (Zubeneschamali), and Iota (ι) Librae (Ivanković 2021).

Gift of the Nile:

This asterism "Nili Domum" is the IAU constellation Triangulum. This name is listed in Johann Bayer's *Uranometria* (1603). This is listed in R. H. Allen's *Star Names* in 1899: Allen points out "Nili Donum" ("Gift of the Nile") is an early name of the Nile, and offers the alternative translation "the Nile's home"

Gihon:

This asterism is the IAU constellation Eridanus. The11th century *De signis caeli ("of the signs of heaven*") lists "Gyon" and "Gion" for this constellation. The river Gihon is mentioned in the book of Genesis.

- Johann Bayer's *Uranometria* (1603) lists "Gyon vel Nilus".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Gyon vel Nilus".
- "Gyon" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Gilimma:

This Assyrian star "Gilimma" listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is unidentified and the translation is uncertain.

This Babylonian star "MUL.GILIM.MA" listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is unidentified and the translation is uncertain.

Gilirringa:

This Wardaman star is Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion (Cairns and Harney 2003).

Gin Ginman:

This Wardaman star is Delta (δ) 3 Tauri in the Hyades cluster in the IAU constellation Taurus (Cairns and Harney 2003). Compare this to their star Rival Fish, above.

Ginan:

This Wardaman star is Epsilon (ε) Crucis in the IAU constellation Crux (Cairns and Harney 2003).

Ginnungagap:

This Norse asterism is the sky other than the Milky Way and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Ginnungagap in Norse mythology is the void in which the world was created.

Giraffe:

This Basotho asterism "Thutlwa" is made up of stars in the IAU constellation Crux plus the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus, the Pointers (see Pointers below).

This Venda asterism "Tuda" is made up of stars in the IAU constellation Crux plus the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus, the Pointers (Alcock 2014).

This French asterism "Girafe" is the IAU constellation Camelopardalis.

This Italian asterism "Giraffa" is the IAU constellation Camelopardalis.

This **telescopic** asterism is in the IAU constellation Serpens and is Corder 2869 on the observing list of American astronomer Jeffrey Corder. Size 180' X 120'. This includes Tau (τ) 1, 2, 3, 5, and 6 Serpentis, and HIP 75810, 75861, 76043, 76136, 76699, 76511, and 76198. NOTE: Corder also lists these stars as Corder 2875 and describes it as a "paddle or tennis racket".

Giraffe Eyes:

This G/wi and //Gana asterism is the Southern Cross in the IAU constellation Crux (Alcock 2014) plus the Pointer Stars (see Pointers below). The Southern Cross is male giraffes and the Pointers female giraffes. Compare this to Female Giraffe, above.

Giraffe Star:

This Hiechware asterism "gabee /khaine" is the Southern Cross in the IAU constellation Crux (Alcock 2014) plus the Pointer Stars, Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Giraffes:

This Sotho and Tswana asterism "Dithutlwa" is the stars of the Southern Cross in the IAU constellation Crux and the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU

constellation Centaurus, the Pointers (Holbrook and Baleisis 2007, Slotegraaf 2013). The Southern Cross is a male giraffe, and The Pointers are a female giraffe.

In this Venda asterism "Thudana" the stars Gamma (γ) Crucis and Delta (δ) Crucis in the IAU constellation Crux are female giraffes and the stars Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa) are "Thuda", the male giraffes (Slotegraaf 2013). An alternate translation is "Giraffe Stars".

Girdle:

There are two Arabic stars by this name:

- One, "an-Niṭāq" (النطاق) or "Al Niṭāk" is the star Zeta (ζ) Orionis and is the star at one end of the "belt" of the IAU constellation Orion:
    - This was later latinized to "Alnitak" or "Alnitah".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Alnitak, the Arabic al-niták, the girdle".
    - The IAU approved the name Alnitak for the star Zeta (ζ) Orionis Aa.
- One, "Al-Izar" (الإزار) is the star Epsilon (ε) Boötis in the IAU constellation Boötes:
    - This was later latinized to "Izār" or "Izar".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Izár,… a zone or girdle". NOTE: Smyth also associates this with the name "Mizar", but this is actually a name for 80 Ursae Majoris (see Mizar, below).
    - Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich incorrectly lists this star as "Mizar".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Izar", "Mizar", and "Mirac" for this star, but his 14th edition (1959) only lists "Izar" and "Mizar".
    - The IAU has approved the name Izar for the star Epsilon (ε) Boötis A.

This Greek star "ζῶσμα" ("zósma"), later latinized to "Zosma", "Zosma", "Zozma", "Zozca", or "Zosca" is the star Delta (δ) Leonis in the IAU constellation Leo:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Zosma… a tunic or girdle".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Zosma".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Zosma".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists the names "Zosca" and "Zosma" for this star, but the 14th edition (1959) lists the names "Zosma" and "Zozca" for this star.
- The IAU Working Group on Star Names chose Zosma as the name for Delta (δ) Leonis.

This Latin star "Perizoma" is Epsilon (ε) Boötis in the IAU constellation Boötes as listed in the 15th century *Alfonsine Tables*.

This Lithuanian asterism "Jukštandis", "Jostandis", "Juksztande", or "Josta" is the IAU constellation Cassiopeia. "Jostandis" is listed in R. H. Allen's *Star Names* in 1899.

Girl:

This Chinese xiù (lunar mansion) “Nǚxiù” (女宿) is a quadrilateral of stars in the IAU constellation Aquarius: Epsilon (ε), Mu (μ), 3 and 5 Aquarii. This xiù appears in the Tang Dynasty as “Nǚ” (女) as listed by Kotyk (2017) and Kotyk writes that it was compared to the Vedic nakshatra Shravana (see Hear Star of Learning, below) which is in the nearby constellation Aquila. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Wu Nü” (婺） was associated to matters concerning the Youzhou territory. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Greek lunar mansion is the IAU constellation Virgo and is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This Romanian asterism “Coromâsla” is the IAU constellation Cygnus (Ottescu 2009). Compare this to Great Maiden with a Yoke, below.

Girl with a Ponytail:

This **telescopic** asterism is the open cluster NGC 2244 (Caldwell 50) and HII region NGC 2238 in the IAU constellation Monoceros and includes the nebulae NGC 2237 (Caldwell 49), 2239, and NGC 2246. Size 80’ X 60’. English astronomer William Herschel discovered this open cluster (NGC 2244) in 1784 and listed it as “VII 2” in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. American astronomer Lewis Swift (1820 – 1913) first called attention to its large size. American astronomer Edward Emerson Barnard (1857 – 1923) came across it in 1883 while searching for comets, and his observations motivated Swift to publish a note about it in 1884. South African astronomer Carol Botha (2015) describes it as “A round haze lying over the open cluster… and seems to have a strand of nebulosity extending over a string of stars which ends with a bright star SW. This looks more like the soft silhouette of a girl with a cheeky ponytail”. It is also known as the Skull Nebula (see below), and the Rosette Nebula (see below).

Girl with a Yoke:

This Ukrainian asterism “divchyna z koketkoyu” (дівчина з кокеткою) is the IAU constellation Aquila.

Girls:

This Kaykavian asterism “Déklice” is the IAU constellation Virgo.

This Boorong and Wotjobaluk asterism **“**Larnankurrk” or “Larnan Kurrk” (“girls” or “young women”) is the Pleiades cluster in the IAU constellation Taurus as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). They are playing music for the Young Men Dancing (see below).

This Marra and Moporr asterism **“**Kuurokeheear” is the Pleiades cluster in the IAU constellation Taurus (Dawson 1881, Hamacher 2011).

Girls Digging for Roots:

This Kaurna asterism “Mankamankarranna” is the Pleiades cluster in the IAU constellation Taurus (Hamacher 2015).

Girls of the Night:

This Tuareg asterism is the Pleiades cluster in the IAU constellation Taurus. The Taureg names for the six brightest stars in the Pleiades cluster are: Mâteredjrê, Erredjeàot, Mâteseksek, Essekâot,

Màtelarhlarh and Ellerhâot. The seventh star is said to be the eye of a boy that left his head and went into the sky (Duveyrier 1864, Holbrook 2020).

Girl's Wreath:

This Lithuanian asterism "arba Mergaičių vainykėlis" is the Pleiades open cluster in the IAU constellation Taurus.

Giving Birth to Itself:

See Eye, above.

Gjallarbru:

This Norse asterism "Gjallarbru" or "Gjallarbrú" (literally "Gjöll Bridge") is where the ecliptic crosses the Milky Way near Scorpius and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). In Norse mythology Gjallarbrú is a bridge which crosses the underworld river Gjöll, which must be crossed to reach Hel.

Gjallarhorn:

This Norse asterism "Gjallarhorn" ("hollering horn") is made up of stars of the IAU constellation Ursa Minor and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Gjallarhorn is Heimdallur's horn which will signal the beginning of Ragnarök.

Glaucus:

This Greek asterism is the IAU constellation Ophiuchus. Glaucus is a name that shows up in many Greek myths involving the Trojan war. Johann Bayer's *Uranometria* (1603) lists "Glaucus" for this constellation. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Glaucus" as an alternate name for Ophiuchus.

Glahn's Whip:

This German **telescopic** asterism in the IAU constellation Cassiopeia was discovered by German astronomer Uwe Glahn in 2022 while searching for the planetary nebula Hubble 12. It is located about 13' SW of this nebula. It is listed on Robert Zebahl's *Faint Fuzzies* website and is described by him as a "small, fine pattern… formed by nine stars aligned in a perfect curved arc, which looks like a whip…Interestingly, the star brightness in this arc decreases continuously beginning from the south from magnitude 11 to 16.5 mag at the eighth star. The last star in the north is… 15.5 mag."

Gleaming Faintly of Grus:

This **telescopic** asterism "Sublúcidus Grúis" is the spiral galaxy NGC 7456 in the IAU constellation Grus. This was discovered in 1834 by John Herschel who listed it as h 3966 and h 3967 and later as GC 4881 and GC 4882 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy resembles a giant crab". It is also known as the "Grand Design Galaxy" (see below).

Gleaming Gold of Pavo:

This **telescopic** asterism “Chrysaúges Pavónis” is the elliptical galaxy NGC 6876 in the IAU constellation Pavo. It was discovered in 1835 by John Herschel who listed it as h 3817 and later as GC 4553 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “the brightest of this small group in Pavo”.

Gleaners:

This Phoenician asterism is the stars surrounding the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda, which is their asterism Threshing Floor (see below).

Glede:

This Greek asterism “Ικτίνος” (“Iktínos”) is the IAU constellation Cygnus.

This Latin asterism “Miluus”, “Milvus”, or “Mylvius” is the IAU constellation Cygnus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Milvus”.

NOTE: A glede is a European bird of prey such as the European kite or European buzzard.

Gliding Star:

This Samoan star “Fētūsolonu‘u” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Fitisemanu 2022). This is a zenith star for travel between Sāmoa and Fiji. It is also called “Telegese” (see Slow Moving, below) and “Ta’ulua” (see Two Salutations, below).

Glinea:

This star with the Greek name “γλήνεα” (“glínea”) is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed by German astronomer Johann Bayer (1572-1625), who attributed it to Aratus (315 – 240 B.C.E). R. H. Allen writes in his *Star Names* in 1899 that this is not found in the works of Aratus.

Glint in the Dusk:

This Elvish (Qenya) star “Morwinyon” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and appears in the works of J. R. R. Tolkien (1892 – 1973).

This Gnomish star “Morwinthi” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and appears in the works of J. R. R. Tolkien (1892 – 1973).

Glittering With a Star of Sextans:

This **telescopic** asterism “Stellímicans Sextántis” is the lenticular galaxy NGC 2974 in the IAU constellation Sextans. It was discovered in 1785 by William Herschel who listed it as “I 61”. It became GC 1904 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as from our perspective the ”dusty galaxy is adorned with a bright foreground star”.

Globe of the Pleiades:

This Latin asterism “Globus Pleiadum” is the Pleiades cluster in the IAU constellation Taurus as listed by 1st century Roman poet Valerius Flaccus and in R. H. Allen’s *Star Names* in 1899. 1st century Roman poet Marcus Manilius called it “Glomerabile Sidus” (“rounded asterism”).

Glorious:

There are three Arabic stars with the name “Al Suhail al Wazn” or “Suhayl” (سهيل),meaning “glorious”:

- One is the star Lambda (λ) Velorum in the IAU constellation Vela:
    - This was later latinized to “Alsuhail” or “Suhail”.
    - R. H. Allen lists “Al Suhail al Muhlif” in the second edition of his *Star Names* in 1963.
    - The IAU approved the name Suhail for Lambda (λ) Velorum.
- One is the star Gamma (γ) Velorum (Regor) in the IAU constellation Vela.
- One is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina:
    - “Suhayl” appeared in the poetry of Muhalhil (d. 531 C.E.).
    - “Suhail” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - This was later latinized to “Suhel”, “Suhil”, “Suhail”, “Souhail”, “Suhilon”, “Suheyl”, “Sohayl”, “Suhayil”, “Shoel”, “Sohil”, “Soheil”, “Sahil”, “Suhayeel”, “Sohayil”, “Sihel”, and “Sihil”.
    - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name “Suhayl” and the Hebrew name “kesil vehu’ meha-‘erekh ha-rison”..
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “Suhayl”.
    - The 1515 edition of the *Almagest* lists “Subhel”.
    - Johann Bayer’s *Uranometria* (1603) lists “Suhel” and “Sihel”.
    - Robert Hues lists “Sohel” and “Syhel” in his *A Learned Treatise of Globes* in 1659 and translates this as “ponderous” or “weighty”.
    - John Hill lists Alpha (α) Carinae (Canopus) as “Soheil” and “Soheila” in his *Urania* in 1754.
    - R. H. Allen lists “'Al Suhail al Yamaniyyah, the Suhail of the South” for this star in his *Star Names* in 1899.
    - An ancient Arabic story makes him the fiancé of Al Jawza (see Al Jawza, above) and the brother of the stars Sirius and Gomeisa (see Bleary-Eyed Woman (above) and Teary-Eyed Woman (below)).

This Bedouin star “Shail” (سهيل) is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. The Bedouin of the Negev desert call it “Suhayil” (Steiner 2017).

This Persian star “Σοαὶλ Ιαμανῆ” or “Soail lamani” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed by Georgius Chrysococcas, a 14th century Greek geographer and astronomer in his *Syntaxis ton Person (Persian Compendium)* and appears in *Astronomia Philolaica* by French astronomer Ismaël Boulliau (Ismaël Bullialdus- 1605 – 1694), who did a translation of the work of Chrysococcas. John Hill lists it as “Soail Jamane” in his *Urania* in 1754.

This Turkish star “Süheyl” or “Süheyla” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Glorious Weight:

This Spanish asterism "Suhel Ponderosus" is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in the 15th century *Alfonsine Tables*. It is a Latinization of two names for Canopus, one being the name "Suhayl" ("glorious", see Glorious, above) and the other being "Al Wazn" ("weight", see Weight, below).

Glowing:

This Greek star "Σείριος", "Seírios", "Seirios" ("glowing" or "scorcher"), "Σείριος ἀστήρ" ("Seírios astír"), "Σείριον ἄστρον" ("Seírion ástron"), or "το ἄστρον" ("to ástron", "the Istron"), is the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as described by Hesiod and Aratus (315 – 240 B.C.E). The earliest mentions of Sirius are in the Orphic *Argonautics* and in the 8th century B.C.E. poet Homer's *Iliad* (XXII) and *Odyssey* (Theodossiou et al 2011, Guglielmino, Cipolla, and Giudice 2017), though Homer did not use the name Sirius, but called it "midsummer's purest flaming star", "a baleful summer star", and "Orion's dog" (see Orion's Dog, below). The earliest listing of "Seírios astír" is in Hesiod's *Works and Days* in the 7th century B.C.E. Prior to this it was known to the Greeks as "the dog" or "the dog star" (see Dog Star, above). This was not originally a Greek name: ancient Greek authors are uncertain as to the source of this name. It may have an Indo-European origin (Holberg 2007):

- This star is listed in *De Natura Rerum Liber ("book on the nature of things"*) by Isidori Hisapensis (Isidore of Seville, ca 560 – 636 C.E.) as "Syrius". Variations in Latin texts include "Sirion" and "Syrius", and it appears as "Canis Syris" in the 15th century *Alfonsine Tables*.
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists this star as "Alhabor".
- The *Germanicus Aratea* (Siciliensis, c. 1469) lists this star as "Syrtus".
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "Sirius" for this star.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Alhabor Sirius" for this star.
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as "Canicula" ("little dog").
- The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) uses "Sirius" as a name for Canis Major, though the illustration of a dog with rays emanating from its head makes it clear that this star is the principal focus.
- This name is listed in Johann Bayer's *Uranometria* (1603) lists the name "Candens", which also translates as "glowing".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Sirius" as a name for both the star Alpha (α) Canis Majoris and for Canis Major
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Sirius".
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Sirius".
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists this star as "Sirius".
- Edward Sherburne lists it both as "Syrius" and "Sirius" in his *Sphere of Marcus Manilius* in 1675.
- English uranographer John Seller's *A coelestiall planisphere* (1678) labels this star "Syrius".

- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this star as “Cirius”.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as “Sirius Canicula”.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as “Syrius”.
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as “Sirio” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as “Syrius”.
- A celestial pocket globe created by English uranographer Dudley Adams circa 1795 labels this star “Canicula”.
- “Sirius” is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- William Herschel lists “Sirius” in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) lists this star as “Sirius Canicula the Dog Star” on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Sirius” in his *Celestial Atlas* in 1822.
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Sirius” as does his *Vorstellung Der Gestirne* (1782).
- Admiral William Henry Smyth’s *Prolegomena* of 1844 lists this star as “Sirius”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as “Sirius”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Sirius”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Sirius”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Sirius” and as the “Great Dog Star”.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists “Sirius” in his *Star Atlas* (1893).
- English astronomers Crossley, Gledhill, and Wilson list “Sirius” in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Sirius”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Sirius” and translates it as “From Sirius – the Nile”.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this star as “Sirius, the Scorcher”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list the name “Sirius” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Sirius”.

- The IAU approved the name Sirius for the star Alpha (α) Canis Majoris A in 2016.
- NOTE: Sirius is the brightest star in the sky: Only the Sun, Moon, and at times Venus, Jupiter, and Mars (when it is on closest approach to Earth) shine brighter. The only place it cannot be seen from the surface of the Earth is a zone north of the Arctic Circle.
- NOTE: Eratosthenes (d.194 B.C.E.) used the term "sirios" as an adjective for various stars (Theodossiou et al 2011).

Glowing Butterfly:

See Butterfly, above.

Glowing Dog:

This Greek star "Κύων σείριος" or "Kýon seírios" ("glowing dog") is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. "Canis Sirius" is listed in Johann Bayer's *Uranometria* (1603) as a name for Canis Minor.

Glowing Eye:

This **telescopic** asterism is planetary nebula NGC 6751 in the IAU constellation Aquila. It was discovered by German astronomer Albert Math in 1863 immediately east of the red-coloured carbon star V Aquilae. It is GC 5940 in the *General Catalogue* of 1864. It is also known as the "Dandelion Puffball" (see above).

Glowing Red:

This Latin asterism "Rutilans" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as described by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*.

Glum Cyclops:

This **telescopic** asterism, the "Glum Cyclops" or "Howling Cyclops", is star cluster NGC 7134 in the IAU constellation Capricornus. It was discovered by Danish astronomer Christian Heinrich Friedrich Peters in 1860. Its size is 1' X 1'. It is listed in German astronomer Robert Zebahl's *Faint Fuzzies* website. Zebahl describes the "eye" as an 11.33 magnitude star and that "next to this star [is] a curved chain of faint stars." René Merting describes an "arc of faint stars in the direction of the brighter star is clearly visible- the four stars of the howling cyclops' mouth are already slightly separated." Compare this to Laughing Cyclops (below).

Glutton of Ursa Major:

This **telescopic** asterism "Pantópharynx Úrsae Majóris" is the Seyfert 1 galaxy UGC 8058 in the IAU constellation Ursa Major, discovered in 1969. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "massive accreting black hole".

Glutton of Vela:

This **telescopic** asterism "Gúlo Velórum" is the peculiar galaxy NGC 3256 in the IAU constellation Vela which is probably the result of the collision of two galaxies. John Herschel listed this as h 3254 and later as GC 2114 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand*

Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "the tidal arms are probably remnants of a swallowed galaxy."

Gnaerang Kuuronn:

This Marra and Moporr asterism is the Small Magellanic Cloud (Hamacher 2011).

Gnarled Crook:

This **telescopic** asterism is Vastagh 16, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 31.5'. Vastagh describes it as "A cascade resembling a gnarled crook 3° N of Beta [β] Cas. It is mainly made up of 9-10 core stars, 11 in number. The upper part of the shape bends towards D by 90°. On the vertical stem of the stick, two stars in the middle create a peak, as it slightly protrudes from the stars that define the straight line. The stick is held by ASCC 1 NY, connected to it with two stars. The defining shape of the area, which is immediately obvious, is a good point of reference for exploring the rich open spaces of the environment… a total brightness of 7.1 mag."

Gnomon:

This **telescopic** Romanian star is the K type star WASP-43 in the IAU constellation Sextans (magnitude 12.46). It received this name in the IAU's NameExoWorlds competition in 2022. The gnomon is a basic astronomical instrument. It has an exoplanet WASP-43b, "Astrolábos" (ἀστρολάβος) which is the Greek name for the astrolabe.

Gnosia Star of Corona:

This Latin asterism "Gnosia Stella Coronae" is the IAU constellation Corona Borealis as described by 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil) in his *Georgics*. 1st century Roman writer Lucius Junius Columella calls it "Gnosia Ardor Bacchi" ("Gnosia's enthusiasm for Bacchus") or "Naxius Ardor" ("Naxius' enthusiasm"). This is a reference to Ariadne's birthplace of Gnosos. Johann Bayer's *Uranometria* (1603) lists "Gnossia seu Gnosia". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Gnossia Stella" for the star Alpha (α) Coronae Borealis (Alphecca). Compare this to Crown of Gnosida, above.

Goads:

This Greek asterism "Βουλήγες" or "Voulíges" is made up of stars in the IAU constellations Auriga and Lynx: Psi (ψ) 1 Aurigae (46 Aurigae), Psi (ψ) 2 Aurigae (50 Aurigae), Psi (ψ) 3 Aurigae (52 Aurigae), Psi (ψ) 4 Aurigae (55 Aurigae), Psi (ψ) 5 Aurigae (56 Aurigae), Psi (ψ) 6 Aurigae (57 Aurigae), Psi (ψ) 7 Aurigae (58 Aurigae), Psi (ψ) 8 Aurigae (60 Aurigae), Psi (ψ) 9 Aurigae, and Psi (ψ) 10 Aurigae (16 Lyncis).

This Latin asterism "Stimulus" is identical to the Greek asterism Vouliges, above and was also known as "Dolones" (see Pike, below).

Goanna Lizard:

This Wiradjuri asterism "Guggaa" or "Gugaa" is described both as the star Alpha (α) Scorpii (Antares) and as the stars surrounding it (Leaman 2019).

This Kamilaroi star “Gudda” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by William Ridley in 1875. Leaman listed the name as “Guggaa” in 2019.

Goat:

A goat or gazelle appears next to a man carrying scales (representing the constellation Libra) on the *Daressy Zodiac* of the Roman Imperial Period.

This English asterism is the IAU constellation Capricornus. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Manilio Caper” (“goat”) as a name for Capricornus. “Goat” is listed in Robert Hues’ *A Learned Treatise of Globes* in 1659 as a name for Capricornus.

This Bugis asterism “Bembé’é” is the Coal Sack Nebula (see Coal Sack Nebula, above).

This Basque asterism “Ahuntza” is the IAU constellation Capricornus (Knörr 1999, Frank 2021).

There are five Arabic asterisms named “goat” (sometimes translated as “kid”):

- One, “al-Tays” or “Al Tāis” (التيس) is the stars Delta (δ) Draconis, Epsilon (ε) Draconis, Pi (π) Draconis (Tais I), and Rho (ρ) Draconis (Tais II).
    - Variations include “Jais”.
- One, with the Bedouin name “al-Judayy” (الجدي), “Al-Jady” or the Arabic name “Almaeiz” (الماعز), is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor and is part of their asterism Daughters of Na’sh (see above) and Axe of the Grindstone (see above):
    - “al-Juday” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Juddah, the kid”.
    - R. H. Allen lists this as “Al Jadī, the Young He-Goat” in his *Star Names* in 1899 and lists the variation “Juddah” and “Giedi”.
- One, “al-Jady” (الجدي) is the star Alpha (α) 2 Capricorni in the IAU constellation Capricornus and was later latinized to “Algedi”, “Al Giedi”, “Giedi”, or “Gredi”.
    - “al-Jadī” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name for Capricornus (Hafez 2010).
    - The 14th century Christian Spanish astrolabe #4560 lists “al jady” and “Caud:Coari” , the latter being a mistranslation of the abbreviation “Cauda Corni” or “Cauda Capricorni” (King 2002).
    - Johann Bayer’s *Uranometria* (1603) lists “Algedi”.
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Algedi”.
    - This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as “Algedi seu Algedio”.
    - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed “Elgedi”, “Elguedi” and “Gadio” as names for the IAU constellation Capricorn.
    - Robert Hues lists “Algecli” as a name for Capricornus in his *A Learned Treatise of Globes* in 1659.
    - John Hill lists “Giedi” and “Al Gjedo” as Arabic names for the entire constellation Capricornus in his *Urania* in 1754 and correctly translates this as the “Kid”.

    - English Admiral Henry William Smyth's *Prolegomena* lists the abbreviated "Geidi Secun" and his *Bedford Catalogue* in 1844 lists "al jedi, the goat".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Giedi", but his 14th edition (1959) lists it as "Giedi, Prima and Secunda".
    - Hoffleit and Jaschek (1982) list it as "Secunda Geidi" and "Algedi".
    - The IAU approved the name Algedi for Alpha (α) 2 Capricorni.
- One, "al-Tays" or "Al Tāis" (التيس) is the star Delta (δ) Draconis in the IAU constellation Draco:
    - This was later latinized to "Altais", "Al Tais", "Taïs", or "Aldib".
    - The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the name "Cauda" ("tail").
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al taīs, the goat".
    - R. H. Allen lists "Al Tais" in his *Star Names* in 1963.
    - The IAU approved the name Altais for Delta (δ) Draconis A.
- One, "'Anāq", is the star Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major:
    - "'Anāq" is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992)
    - "al-'Anāq" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - This appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Jedi, or the Kid" as a name for Alpha (α) Ursae Minoris (Polaris) in this constellation.

This Assyrian asterism "UZA" is the IAU constellation Lyra. Bartel van der Waerden lists "UR.KU.UZA" in his *Science Awakening II: The Birth of Astronomy* in 1974.

This Seleucid asterism "MAS" (see Goat Fish, below) or "u-ri-ga" ("goat") from the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Capricornus. This was listed by Daniel Foxvog in his *Astral Dumuzi* in 1993.

This Egyptian Dendera asterism is made up of stars of the IAU constellation Auriga (Hoffman 2017). It is a quadrilateral of the stars Alpha (α) Aurigae (Capella), Iota (ι) Aurigae, Theta (θ) Aurigae, and Beta (β) Aurigae (Menkalinan).

This Latin asterism "Hircus" is the IAU constellation Auriga as described by 1st century Roman poet Marcus Manilius and Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*. Hircus means "goat" and is clearly a reference to Alpha (α) Aurigae (Capella).

- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "HEDVS" for Alpha (α) Aurigae (Capella).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the name "Hircus" for Alpha (α) Aurigae (Capella).
- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) lists the name "Hircus" next to "Auriga": It appears that he is using it to label the star Alpha (α) Aurigae (Capella).

- Johann Bayer's *Uranometria* (1603) lists "Aequoris Hircus" as a name for Capricornus and "Hircus" as a name for Alpha (α) Aurigae (Capella).
- This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Hircus".
- "Capella Hircus" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as a goat on the back of Auriga.
- A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, labels the star Alpha (α) Aurigae (Capella) as "Hircus".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this name for Auriga.

This French star "Chèvre" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

This Hebrew asterism "Gedi" is the IAU constellation Capricornus as listed in their list of constellations of the zodiac (mazzaroth) in their *Talmud* and is related to their month Tevet. John Hill lists this name for Capricornus in his *Urania* in 1754.

Goat-Fish:

This Babylonian asterism from the MUL.APIN tablets "SUḪUR.MEŠ", "MULSUḪUR.MAŠ", "MUL.SUHUR.MÁSH" (Bartel van der Waerden 1974), "MUL.SUHUR.MAS" (Hunger 1992), "SUHUR.MÁSH" (Anthony 1996) or "MULSUḪUR.MAŠ.KU" is the IAU constellation Capricornus (Boutet 2014).

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is "Suḫurmāšu", "Suhurmasu" (Hunger 1992) or "suhurmashû" (Anthony 1996) is the IAU constellation Capricornus.

This Seleucid asterism "MAS" or "u-ri-ga" ("goat") from the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Capricornus. This was listed by Daniel Foxvog in his *Astral Dumuzi* in 1993

This Persian asterism "SUHUR" from the list of Zodiacal Signs in VAT 4956 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the IAU constellation Capricornus (Bartel van der Waerden 1974).

This Egyptian asterism appeared on coffin lids of the Middle Kingdom (~2000 B.C.E.) and is the IAU constellation Capricornus (Berio 2014).

This Egyptian Dendera asterism (Hoffman 2017) is basically identical to the Babylonian asterism SUḪUR.MEŠ (See Goat-Fish).

This "Euphratian lunar asterism Munaχa" is the stars Epsilon (ε) Aquarii, Mu (μ) Aquarii, and Nu (ν) Aquarii in the IAU constellation Aquarius as listed in R. H. Allen's *Star Names*.

Goat Fold:

This Romanian asterism "Tarcul" is the IAU constellation Auriga (Ottescu 2009).

Goat Sheds:

This Hungarian asterism “Kecskes gódólyek” is made up of stars of the IAU constellation Auriga. The celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism as goat and two kids, which probably represents Alpha (α) Aurigae (Capella) and the “Haedi”: Zeta (ζ) Aurigae (Saclateni or Haedus I), Eta (η) Aurigae (Haedus), and Epsilon (ε) Aurigae (Almaaz).

Goatlings:

See Kids, below.

Goats:

This Kaykavian asterism “Kózleki” is the IAU constellation Auriga.

This Chakavian asterism “Kozlÿtje” is the IAU constellation Auriga.

Goat’s Star:

This Latin asterism “Hircinus Sidus” is the IAU constellation Capricornus as listed by 2nd century Roman senator Quintius Servilius Pudens.

Gobi Bear:

This telescopic Mongolian star “Mazaalai” is HAT-P-21 in the IAU constellation Ursa Major (magnitude 11.46). It was given this name in the IAU NameExoWorlds campaign.

Goblet:

This Greek asterism “Κάνθαρος” (“Kántharos”) is the IAU constellation Crater. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Goblet” for this constellation.

God is Watching Over:

This Ainu (Kamikawa) Nociw (“asterism”) “Cinucarkur nociw” is the Big Dipper asterism in the IAU constellation Ursa Major. This represents a dancing male: His head is Beta (β) Ursae Majoris (Merak), his right elbow Alpha (α) Ursae Majoris (Dubhe), and his left elbow Gamma (γ) Ursae Majoris. The line of stars Delta (δ) Ursae Majoris, Epsilon (ε) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Eta (η) Ursae Majoris is his body down to his feet at Eta (η) Ursae Majoris. On the first day of summer this figure is seen as facing downwards and is named “Upsi Noka nociw” (“face down”). On the first day of winter it is see as facing upwards and is named “Kuttoka Noka nociw” (“face upward”). Polaris is known as “Cinukar nociw”.

God of the Storm:

This Akkadian asterism “Rammān” or “Rammānu” is the asterism Great One (see below).

Gods:

“The Gods” is the Egyptian name for their asterisms Osiris (which is the IAU constellation Orion, see Osiris, below) and Isis (which is the star Alpha (α) Canis Majoris, see Isis, below) as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003).

God’s Chair:

This Romanian asterism “Scaunul lui Dumnezeu” is the IAU constellation Cassiopeia (Ottescu 2009, Lite, Lodina, and Ignat 2018).

God’s Chariot:

This Romanian asterism “Carul lui Dumnezeu” is the IAU constellation Auriga (Ottescu 2009). Romanian legend describes this as the chariot Jesus will use to transport righteous men to heaven.

God’s Eagle:

This Romanian asterism “Vulturul Domnului” is the IAU constellation Aquila (Ottescu 2009).

God’s Garden:

This Lithuanian asterism “Dievo darželis” is the IAU constellation Corona Borealis.

God’s Hand:

This **telescopic** asterism is the globule CG4 (DB2002b, G259.43.12.72) in the IAU constellation Puppis.

God’s Hook:

The stars of this Kaska asterism are unidentified at present (Cannon 2021).

God’s Horses:

This Lithuanian asterism “Dievo Kumeliai” is made up of stars of the IAU constellation Ursa Major: I believe this to be stars around Upsilon (υ), Omicron (ο), and h Ursae Majoris.

Gods of Samothrace:

This Latin asterism “Dii Samothraces” is the IAU constellation Gemini. Johann Bayer’s *Uranometria* (1603) lists “Dij Samothraces”. “Dij Samothraces” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

God’s Palace:

This Chinese xing guan “Shéngōng” (神宫) is open cluster NGC 6231 (Caldwell 76), also known as the Northern Jewel Box.

God’s Patch:

This //Gana asterism is the Coal Sack Nebula in the IAU constellation Crux (Alcock 2014).

Godzilla:

This **telescopic** star is a variable star in the gravitationally lensed galaxy behind the galaxy cluster PSZ1 G311.65-18.48 in the IAU constellation Apus. This is the most luminous known star.

Goibniu:

This Celtic (Irish) asterism may be the IAU constellation Hercules. Goibniu was a lame blacksmith God in Old Irish mythology, appearing as Gofannon in Welsh versions of the myth. (Mosenkis, date N/K).

Going Home Star:

This Ininew (Cree) star "Keewatin" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Buck 2016) and is part of their asterism Atima Atchakosuk (see Dog Stars, above). It is also known as "Altar for Sweat Lodge" or "Keewatin Atchakos" (see Wolf Star, below).

This Anishinaabe and Ojibwe star "Giiwedinong" or "Kiiwedinong" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Morin 2022).

Going Toward:

This Lakota star "Iktobu" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Gokū:

This Filipino asterism is the IAU constellation Crater (Margiza 2022). Gokū has his arms raised as if using his Genki Dama Qi manipulation technique used in the Dragon Ball game series, which was created in 1984. This series was originally inspired by the classical 16th century Chinese novel *Journey to the West*.

Golconda:

There are tow **telescopic** Golconda asterisms:

One is a chain of eight stars in the IAU constellation Serpens: These stars share the name Tau (τ) Serpentis:

- Tau1 Serpentis, also designated 9 Serpentis or HD 137471.
- Tau2 Serpentis, also designated 12 Serpentis or HD 138527.
- Tau3 Serpentis, also designated 15 Serpentis or HD 139074.
- Tau4 Serpentis, also designated 17 Serpentis or HD 139216.
- Tau5 Serpentis, also designated 18 Serpentis or HD 139225.
- Tau6 Serpentis, also designated 19 Serpentis or HD 140027.
- Tau7 Serpentis, also designated 22 Serpentis or HD 140232.
- Tau8 Serpentis, also designated 26 Serpentis or HD 140729.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns describes this collection of stars as "a stellar Golconda". This is a reference to Golconda, a fortified citadel in Hyderabad, Telangana, India which has been become associated with wealth, advantages, or happiness. Size 40' X 3.5'.

One is the open cluster Messier 25 in the IAU constellation Sagittarius. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes this as a "Golconda of the heavens".

Gold:

This **telescopic** Ewe star "Sika" is HIP 95262 (HD 181720) in the IAU constellation Sagittarius (magnitude 7.86). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Toge ("earring").

Golden:

This asterism with the Greek name "Chrysophris" is the IAU constellation Dorado as listed in John Hill's *Urania* in 1754. Dorado was created in 1592 by Flemish astronomer Petrus Plancius (1552 – 1622), so

this is not an ancient Greek name, and Hill recognized this, but Dorado is a Spanish word that means "golden".

Golden Cat:

This Quechua asterism from Sonqo, "Coque Chinchay", is either the tail of the IAU constellation Scorpius or a dark spot inside the "tail" (Urton 1981). Brosseder (2010) lists it as "Chuqui Chinchai".

Golden City of Draco:

This **telescopic** asterism "Chrysópolis Dracónis" is the elliptical galaxy NGC 4125 in the IAU constellation Draco. It was discovered by English astronomer John Russell Hind in 1850. It became GC 2735 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Golden Cluck Hen and Her Five Chicks:

This Wallachian asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899.

Golden Coin:

This **telescopic** asterism is NGC 4945 (Caldwell 83), a galaxy in the IAU constellation Centaurus, which was discovered by Scottish astronomer James Dunlop in 1827. This is listed as GC 3386 in John Herschel's General Catalogue of 1864. This is also known as the Tweezers (see below).

Golden Crown of Sagittarius:

This Latin asterism "Corona Aurea Sagittarii" or just "Corona Sagittarii" is the IAU constellation Corona Australis.

Golden Diadem:

This English asterism is the IAU constellation Corona Borealis as described by Edmund Spenser (1552 – 1599) in his *Shepheard's Kalendar.*

Golden Earring:

This **telescopic** asterism is open cluster NGC 2547 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as Lac III 2 in his catalogue. It is GC 1636 in the *General Catalogue* of 1864. It is also known as St. Peter's Cross (see below), the Heart (see below), "T" (see below), and the Malus Cluster (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 40.

Golden Eye:

This **telescopic** asterism, also known as the "Pac-Man Cluster" and the "King Cobra Cluster", is the open cluster Messier 67 (NGC 2682) in the IAU constellation Cancer. This was discovered by Johann Gottfried Koehler in 1779. It is listed in the *General Catalogue* of 1864 as GC 1712 and in John Herschel's catalogue as h 531.

Golden Eye of Eridanus:

This **telescopic** asterism "Chrysópis Erídani" is the ring galaxy NGC 1291 in the IAU constellation Eridanus. It was discovered by James Dunlop in 1826, and Johann Dreyer entered it as NGC 1291. John Herschel later added it as NGC 1269 (GC 670), not realizing it was a duplicate. NGC 1291 is listed as GC 685 in the *General Catalogue* of 1864. This is O'Meara 12 on astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Snow Collar" (see below).

Golden Field:

This French asterism is the IAU constellation Dorado as listed by French astronomer Camille Flammarion (1842 – 1925) in his *Astronomie Populaire*. It is a mistranslation of Hues' "Golden Fish" (see below).

Golden Fish:

This English asterism "Auratus Piscis" is the IAU constellation Dorado as listed in John Hill's *Urania* in 1754. In 1659 Robert Hues (and later John Chilmead in his translation of Hues' *A Learned Treatise on Globes* in 1889) calls it the "Gilthead Fish", but this is a fish found on British coasts and not the swordfish that Dorado was named for. One translation of *Astronomie Populaire* by French astronomer Camille Flammarion (1842 – 1925) lists it as "Golden Field" (see above) and "Craver" (see above), both equally erroneous. Compare this to Golden, above.

This American asterism is the IAU constellation Piscis Austrinus as described by Henry Wadsworth Longfellow (1807 – 1882) in the notes to his translation of the *Divine Comedy*.

Golden Gate of the Ecliptic:

This asterism consists of the Hyades Cluster (Melotte 25) and the Pleiades Cluster (Messier 45) in the IAU constellation Taurus. One is on either side of the ecliptic, so planets regularly pass between them. From 4000 to 1500 B.C.E. the equinox was in the constellation Taurus, so this added importance to this asterism which was probably displayed in the 4,500-year-old neolithic sky tablet of the Tal-Qadi Temple in Malta, and also in the Cave of La-Tête-du-lion in Ardèche, France (Rappenglück 2000).

Golden Grain of Serpens:

This **telescopic** asterism "Chrysocóccus Serpéntis" is the barred spiral galaxy NGC 5921 in the IAU constellation Serpens. It was discovered in 1786 by William Herschel who listed it as "I 148". It became GC 4097 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the beautiful yellow inner region of this magnificent galaxy".

Golden Grains:

This Arabic asterism "Al Alkāt" ("golden grains" or "nuts") is the Belt of Orion in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986):

- It is listed by English Admiral Henry William Smyth in his *Bedford Catalogue* in 1844 as "al-lekat".
- It is listed by R. H. Allen as "Al Alkat" in his *Star Names* in 1899.

Golden Harp:

This **telescopic** asterism is the small open cluster NGC 1502 in the IAU constellation Camelopardalis, discovered by William Herschel in 1787 who listed it in his catalogue as "VII 47". It is GC 802 in the *General Catalogue* of 1864. It is also known as the Jolly Roger Cluster (see below).

Golden Horns of Taurus:

This asterism is made up of stars of the Hyades cluster in the IAU constellation Taurus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), depicts this in a diagram as Zeta (ζ) Tauri and Beta (β) Tauri (Elnath).

Golden Light of Leo:

This **telescopic** asterism "Chrysolámprus Leónis" is the elliptical galaxy NGC 3384 (3371) in the IAU constellation Leo. It was discovered by William Herschel in 1784 and listed as "I 18" Herschel 400 catalogue. It became GC 2207 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Golden Nectar Cluster:

This telescopic asterism is NGC 6397 (Caldwell 86) in the IAU constellation Ara. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1755 who listed it as Lac III 11. It is GC 4311 in the *General Catalogue* of 1864. It is also known as the Blue Straggler (see above).

Golden Rings of Pisces:

This **telescopic** asterism "Chrysocýcla Píscium" is the spiral galaxy NGC 488 in the IAU constellation Pisces. It was discovered in 1784 by William Herschel who listed it as "III 252". It became GC 276 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Whirligig (see below).

Golden Sea Serpent:

This Catalan star "Filetdor" is the F type star WASP-166 in the IAU constellation Hydra. It received this name in the IAU's NameExoWorlds competition in 2022. It has an exoplanet WASP-16b, "Catalineta", which is the name of a little girl who was the heroine in "Na Filet d'Or".

Golden Sheep:

This Latin asterism "Ovis Aurea" is the IAU constellation Aries. This relates to the myth of Phrixus, who was rescued by a golden ram and later sacrificed the creature and hung its fleece in the Grove of Ares, where it turned to gold and was later the subject of the quest of the Argonauts.

Golden Shield of Virgo:

This **telescopic** asterism "Chrysáspis Vírginis" is the lenticular galaxy NGC 5701 in the IAU constellation Virgo. It was discovered in 1786 by William Herschel who listed it as "II 575". It became GC 3956 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Golden Stick:

This Mongolian star “Altan Hadaas” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Lagain & Rousseau 2015).

Golden Yard Arm:

This English asterism “Yard”, “Golden Yard”, or “Golden Yard Arm” is the belt of Orion in the IAU constellation Orion. John Hill lists it as “Golden Yard” in his *Urania* in 1754. Hill identifies it as a term used by “our sailors”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as the “Golden Yard of seamen”. R. H. Allen lists it as “Golden Yard Arm” in his *Star Names* in 1899, but only lists the source as “seamen”.

Golden Yoke:

“Aurinion Uedon” is a proposed early Celtic name for the IAU constellation Capricornus from the *Book of Ballymote* through an etymological reconstitution (Boutet 2014).

Goldfish:

This Chinese xing guan “Jīnyú” (金鱼) is a line of five stars in the IAU constellation Dorado: Gamma (γ), Alpha (α), Beta (β), Delta (δ), and Nu (ν) Doradus.

Goldsmith of Delphinus:

This **telescopic** asterism “Aúrifex Delphíni” is the galaxy Z 448-20 in the IAU constellation Delphinus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because this “system of merging galaxies luminous golden regions can be seen at the point of contact.”

Golf Club:

This **telescopic** asterism is in the IAU constellation Scutum. Ken Hewitt-White of the RASC’s Okanagan Centre wrote about it in SkyNews in July 2015. The “shaft” of the golf club runs along the Scutum Star Cloud, starting at HIP 91532 and running through HIP 91751, 91880, and 91960 to R Scuti (HIP 92202). The “blade” of the “golf club” is the triangle of stars R Scuti, HIP 92391 and HIP 92296. The “golf ball” is the open cluster Messier 11 (NGC 6705).

Golf Putter:

There are three **telescopic** “golf putter” asterisms:

- One is in the IAU constellation Andromeda is a line of stars with two brighter stars for the clubhead. Size 95’ X 18’. Open cluster NGC 752 (Caldwell 28) is the “ball”. A line of stars from HIP 8423 through HIP 8606, 8734, and 8805A to 8930 form the “handle” and the narrow triangle of stars HIP 8930 and the double stars HIP 9001 and 9021 (56 Andromedae) form the “putter blade”. Size 95’ X 18’. This Harrington 14 on American astronomer Phil Harrington’s asterism list.
- One is in the IAU constellation Puppis and is Corder 1433 on the observing list of American astronomer Jeffrey Corder. Size 40’ X 20’. This is eight 7^{th} – 10^{th} magnitude stars including HIP 38369.
- One is in the IAU constellation Libra and is Ennis 77 on the observing list of American astronomer Charles Ennis. Size 70’ X 35’. The “golf ball” is the Ghost Globular Cluster, NGC 5897. The “shaft” is 8^{th} – 10^{th} magnitude stars running from HIP 74667 through HD 135521, HD

135683, to HD 135826. The “putter head” is the triangle of stars HIP 74892, Gaia DR3 6253039282775360896, HIP 135983, and HD 135910. This includes stars of Corder 2810.

Gomeisa:

See Bleary-Eyed Woman, above.

Gómez’s Nebula:

This **telescopic** asterism “Gómez’s Nebula” or “Gómez’s Hamburger” is IRAS 18059-3211, a possible protoplanetary nebula in the IAU constellation Sagittarius. It was named for Arturo Gómez at the Cerro Tololo Inter-American Observatory in Chile.

Göncöl's Wagon:

This Hungarian asterism “Göncölszekér” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). Göncöl is a mythological táltos (“shaman”) who could cure any disease. The four stars of the “bucket” of the Big Dipper are the four wheels and the three stars of the “handle” are the curved shaft.

Goncÿne:

This Chakavian asterism “Goncÿne” is the IAU constellation Boötes. Goncÿne (Göncöl) is a mythological táltos (“shaman”) who could cure any disease. R. H. Allen lists this as “Göntzol” in his *Star Names* in 1899.

Good Fortune Star:

This Chinese star “Lucun” from the Three Kingdoms to the Ming Dynasty is Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Lucun” is the star Gamma (γ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Good Goer:

This Persian asterism “Huçru” is the stars Iota (ι), Kappa (κ), and Theta (θ) Virginis in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Good Gourd:

This Chinese xing guan “Hùguā” (瓠瓜) is a diamond of stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin- the determinative star), Beta (β) Delphini (Rotanev), Delta (δ) Delphini, and Gamma (γ) 2 Delphini. The “stem” is the star Zeta (ζ) Delphini. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. Their xing guan Rotten Gourd (see below) is alongside.

This Chinese Chenzhuo xing guan “Hùguā” is a diamond shape of four stars with a “stem” at one end in the IAU constellation Delphinus: The “diamond” is the four stars Beta (β) Delphini (Rotanev), Delta (δ) Delphini, Gamma (γ) 2 Delphini and Alpha (α) Delphini (Sualocin). From Beta (β) Delphini a line runs out to Zeta (ζ) Delphini to form the “stem”.

Good Luck of the Excelling One:

See Auspice of the Exalted One, above.

Good Luck of the Two Beasts:

See Auspice of Lambs, above.

Good Shepherd:

This asterism is the IAU constellation Auriga. R. H. Allen lists it in his *Star Names* in 1899 and attributes it to “Seiss”.

Goose:

This Arabic asterism “Al-Wazza“ is the IAU constellation Lyra as listed by 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010):

- Andreas Cellarius’ Harmonia Macrocosmica (1660) depicts this constellation as a tortoise.
- Johann Hevelius depicts this constellation as a tortoise in his Uranographia (1690).
- “Al Iwazz” is listed by R. H. Allen in his *Star Names* in 1899.

This star “Anser” is Alpha (α) Vulpeculae in the IAU constellation Vulpecula. It is derived from the name of the Polish asterism “Vulpecula cum Anser” (see Fox and the Goose, above). While the “fox” became the IAU constellation Vulpecula, the goose disappeared, but is remembered in the name of Alpha (α) Vulpeculae: “Lucida Anser” (“Bright Goose”):

- The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Anser as a goose in the mouth of a fox (Vulpecula).
- Anser is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists “Anser” as the name of this star and depicts a goose in the mouth of Vulpecula.
- “Anser” appears in John Hill’s *Urania* in 1754.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “l’Oye” (“the goose”) as a goose in the jaws of “le Renard” (Vulpecula) as does the 1778 edition.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Anser” in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a goose in the jaws of Vulpecula the fox.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Anser” and describes stars in this asterism with the suffix “Anseris”. The IAU approved the name Anser for Alpha (α) Vulpeculae.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Anser” in the mouth of a fox (Vulpecula).
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Vulpecula et Anser” as a fox with a goose in its mouth.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Vulpecula (cum Anser” and describes it as a “Fox with Goose”.

One Roman zodiac shows the IAU constellation Aquarius as a goose, which was sacred to the Goddess Juno. The sun was in this sign in January and February which was their month Gamelion, which was sacred to her.

There are two **telescopic** "Goose" asterisms:

- One in the IAU constellation Perseus is centered on the star Alpha (α) Persei (Mirfak) and is made up of mostly 4th to 5th magnitude stars which form part of a cluster of stars known as Melotte 20, the Alpha Persei Moving Group, or the Perseus OB Association. The stars forming the "body" are between Mirfak and Delta (δ) Persei, with Psi (ψ) and Sigma (σ) Persei at the bottom, and two stars (29 and 31 Persei) forming the "neck" running upwards from the area of Mirfak towards Gamma (γ) Persei. Canadian astronomer and author Gary Seronik listed it as the Christmas Goose in his 2007 book *Binocular Highlights*. NOTE: This asterism is "next door" to the IAU constellation Vulpecula and the obsolete constellation Anser (see above), it is possible that it was influenced by it, as Anser was also a goose.
- This telescopic asterism is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764 and R. H. Allen in his *Star Names* in 1899. It is listed in John Herschel's General Catalogue as GC 4403. South African astronomer Magda Streicher (1997) calls it the Goose. It is also known as the Horseshoe Nebula, the Checkmark Nebula, "2", the Omega Nebula, Swan Nebula, the Duck, and the Lobster Nebula.

Goose Foot:

This Omaha asterism is the Belt of Orion in the IAU constellation Orion.

Goose's Way:

This Belarussian star is Beta (β) Cassiopeiae (Cas) in the IAU constellation Cassiopeia.

Gordian Knot of Virgo:

This **telescopic** asterism "Gordiána Vírginis" is the lenticular galaxy NGC 4753 in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in February 1784 who listed it as "I 16". It is GC 3273 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the unusual intricate dust lanes of this galaxy calls to mind a… Gordian Knot". It is also known as the "Dust Devil" (see above).

Gordolya:

This Wardaman star is Gamma (γ) Delphini in the IAU constellation Delphinus (Cairns and Harney 2003).

Gorgo:

This Egyptian asterism is one of the paranatellonta of the second decan of Aries as listed in the *Sphaera Barbarica* described by Teucros (Mosenkis, date n/k). Mosenkis describes this as "part of Perseus", and the name suggests the stars surrounding Beta (β) Persei (Algol).

Gorgon:

This Latin asterism "Gorgonius" is the IAU constellation Pegasus. This is related to the myth of Perseus and the Gorgon Medusa.

- Variations include "Gorgonus", "Gorgonifer", or "Gorgonisue".

- *De Astronomica* (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt refers to this asterism as “Gorgona”.
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) labels this “Caput Gorgonus”.
- Johann Bayer’s *Uranometria* (1603) lists “Gorgonisue”.
- “Gorgoneum istud” (”that Gorgonian”) is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Gorgon is one of the names for this asterism listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.
- John Hill’s *Urania* in 1754 lists “Gorgonius”.
- Scottish uranographer Alexander Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) lists it as “Gorgon”.
- R. H. Allen lists “Gorgon” in his *Star Names* in 1899. This is related to the myth of Perseus and the Gorgon Medusa.

Gorlma:

This Wardaman star is Mu (μ) 1 Scorpii in the IAU constellation Scorpius as listed by Cairns and Harney in 2003.

Gösz:

This Hungarian asterism is the stars of the IAU constellation Lyra. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a male in traditional Hungarian dress with a walking stick in his left hand and carrying what appears to be a sort of long Alpenhorn in his right hand. He has a dog sitting at his feet. I believe that this represents Göncöl the mythological táltos (“shaman”) who could cure any disease. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky.

Gothic of Coma Berenices:

This **telescopic** asterism “Gothica Cómae Bereníces” is the intermediate barred spiral galaxy NGC 4725 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as “I 84”. It became GC 3249 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the pointed form of the spiral arm at the northeastern edge of this galaxy… resembles an arc in gothic architecture”. This is O’Meara 69 in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Gourd Woman:

This Kogi asterism is the Pleiades cluster in the IAU constellation Taurus. She is depicted as a naked old woman.

Governor of Andromeda:

This **telescopic** asterism "Praétor Andrómedae" is the spiral galaxy NGC 70 (IC 1539, Arp 113) in the IAU constellation Andromeda. It was discovered by R. J. Mitchell, an assistant to the 3rd Earl of Rosse, in 1855. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name Praétor ("he who walks in front") as its position seems to lead a small group of local galaxies. A Praétor was an official ranking under a Consul in ancient Rome.

Grab:

This Greek asterism "Arpadone" ("grab" or "grabbed") is the IAU constellation Pisces as listed in John Hill's *Urania* in 1754. Hill translates this as "something that ties them together".

Grace Note:

This **telescopic** asterism is in the IAU constellation Lyra. It is Lorenzin 18 on Tom Lorenzin's list. The top of the "musical grace note" is the line of stars HIP 93393, HIP 93407, HIP 93357 and HD 176801. The bottom is the star HIP 93256.

Graceful Andromeda:

This **telescopic** asterism "Hábra Andrómedae" is the barred lenticular galaxy NGC 108 in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1784. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Graceful Curves of Virgo:

This **telescopic** asterism "Colpábrus Vírginis" is the spiral galaxy IC 971 in the IAU constellation Virgo. It was discovered by Truman Henry Safford in 1868. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the beautifully curved spiral arms of this… galaxy."

Graffias:

See Claws, above.

Graff's Cluster:

This asterism is the open cluster IC 4756/Melotte 201 in the IAU constellation Serpens. It was discovered by American astronomer Solon Irving Bailey (1854 – 1931) in 1908. It is named for Polish-German astronomer Kasimir Romuald Graff (1878 —1950) who worked as an assistant at the Hamburg Observatory and became a professor in 1916, and later the director of the Vienna Observatory. The Nazis forced him to retire in 1938, but he was reinstated in 1945. Lunar and Martian craters are also named for Graff. It is also known as the Secret Garden Cluster and the Tweedledee Cluster.

Graham's Ring:

See Ring, below.

Granary:

This Ukrainian asterism “Stozhary” (Стожари) is the Pleiades cluster in the IAU constellation Taurus. It is derived from the term “stozharnya” (стожарня) meaning a “granary” but others suggest that it was derived from the root word “sto-zhar” (сто-жар), meaning “hundredfold glowing” or "a hundred embers”.

Grand Cross:

This Estonian asterism is the IAU constellation Cygnus (Kuperjanov 2006).

Grand Design Galaxy:

This **telescopic** asterism is NGC 7424, a barred spiral galaxy in the IAU constellation Grus. This was discovered by English astronomer John Herschel in 1847. It is GC 4867 in the *General Catalogue* of 1864. It got this name due to its well-defined spiral arms.

Grandchildren:

This Korean asterism “Sonja” (손자) is a line of two stars in the IAU constellation Canis Major: Epsilon (ε) and Kappa (κ) Canis Majoris.

This Wichi asterism is the stars Zeta (ζ) 1 and 2 Scorpii in the IAU constellation Scorpius (Mariani et al 2017). They are brothers hunting “Ñandú” or “Suri” (see Rhea, below). This is also known as Hunters (see above).

Grandfather:

This Chinese xing guan “Zhàngrén” (丈人) is a line of two stars in the IAU constellation Columba: Alpha (α) Columbae (Phact) and Epsilon (ε) Columbae. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Zhàngrén” is three stars in the IAU constellation Columba: Alpha (α) Columbae (Phakt), HIP 26019, and Epsilon (ε) Columbae.

This Abipones asterism “Groaperikie” is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899.

Grandfather Stars:

This Tahltan asterism is the Big Dipper in the IAU constellation Ursa Major (see Big Dipper, above).

Grandma's Dentures:

This telescopic asterism was created by Brian Fenerty and Roland Deschesne of the Calgary Centre of the RASC circa 2000. It is made up of stars of the IAU constellation Corona Borealis. They created the Martini Glass and Cocktail Umbrella asterism at the same time (see below).

Grandmother:

This /Xam star “!keisse” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Alcock 2014).

Grandmother Carrying Rice:

This /Xam star “!Kuttau” or “!Kúttăŭ” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

Grandmother Face:

This Carib star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major and its rising announces the beginning of the fishing season.

Grandmother of Canopus:

This /Xam star is the is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Slotegraaf 2013). They call it this because it rises after Canopus, and the elderly usually follow behind the youth.

Grandmother Spider:

This Ininew (Cree) asterism "Kokominakasis" is made up of stars of the IAU constellations Aries, Andromeda, Perseus, and Cassiopeia (Buck 2016):

- The "W" of Cassiopeia is the front legs of the spider (see W below),
- The tip of the spider's back end is the star Alpha (α) Arietis (Hamal), and
- The sides of the "body" are defined by the stars Alpha (α) Persei (Mirfak) and Beta (β) Andromedae (Mirach).

Grandmother's Cudgels:

This Serbian asterism "Babine Tojage" from the Vrajne area is found in the Etymological Dictionary of Serbian Language and is a five-sided figure in the IAU constellation Orion. It starts at Nu (ν) Orionis and runs around through Xi (ξ) Orionis, 69 Orionis, Chi (χ) 2 and Chi (χ) 1 Orionis. This is also known as Orion's Cudgel (see below), Cudgels (see above), and the Bent Stick (see above). The word "Baba" used to refer to any woman that had given birth but is mostly used nowadays to refer to a grandmother. However, another old meaning of this word was "stone, rock, boulder, mountain, Earth, or Mother Earth. This may be an ancient reference to the Orionid meteor shower, the radiant of which is situated next to Orion's "club".

Grandson:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hydra: 49 Hydrae (the determinative star) and 50 Hydrae.

This Chinese xing guan "Sūn" (孙) is a line of two stars in the IAU constellation Columba: Kappa (κ) and Theta (θ) Columbae.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Columba: Delta (δ) Columbae and Lambda (λ) Columbae.

Grant Life:

This Korean asterism "Saengmyeong-eul Buyeohada" (생명을 부여하다) is a line of two stars in the IAU constellation Lacerta: 10 Lacertae and HIP 109754A.

Grape Gatherer:

This Arabic star "Alarph" is the is Alpha (α) Virginis in the IAU constellation Virgo. Compare this to Female Grape Gatherer (above) and Fruit Pickers (above).

Grappling Hook of Horologium:

This **telescopic** asterism “Hárpago Horológii” is the barred spiral galaxy IC 1908 in the IAU constellation Horologium. It was discovered by American astronomer DeLisle Stewart in 1898. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Grass Snakes:

This Belarussian asterism “Dazhdzhaviki” or “Vuzhy” is the Hyades cluster in the IAU constellation Taurus (Avilin 2009). It is also known as “Charviaki” (see Worms, below).

Grasshopper:

This Samoan asterism “Sē” is made up of stars of the IAU constellation Pegasus (Fitisemanu 2022):

- A line of stars forming the “body” runs from Upsilon (υ) Pegasi through Tau (τ) Pegasi, Lambda (λ) Pegasi, Iota (ι) Pegasi to Kappa (κ) Pegasi.
- A bent “leg” runs from Lambda (λ) Pegasi through Mu (μ) Pegasi to a bend at Beta (β) Pegasi (Scheat) and then runs down to Alpha (α) Pegasi (Markab).

This grasshopper is being stalked by “Ti‘otala” (see Kingfisher, below).

This **telescopic** asterism “Grasshopper” or the “Grasshopper Galaxy” is PGC 26132 (UGC 4881 A and B or Arp 55), a pair of interacting galaxies in the IAU constellation Lynx. It was first given this name by astrophysicist Dr. Boris Vorontsov-Velyaminov in 1977. It is also known as the Shrimp Galaxy.

Grave Front:

This Korean asterism “Mudeom Ap” (무덤 앞) is a line of three stars in the IAU constellation Leo: Upsilon (υ), 87, and Phi (ϕ) Leonis.

Grecian Harp:

This “Persian” asterism “Ciengh Rumi” is the IAU constellation Lyra as listed in John Hill’s *Urania* in 1754.

Great:

This Babylonian asterism “GAL”, “rabbu” or “rabû” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified.

This Greek star “μέγας”, “Mégas”, or “Megas” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as described by Hesiod and Aratus (315 – 240 B.C.E).

This German asterism “Magnus” is the IAU constellation Canis Major as listed by German astronomer Johann Bayer (1572-1625). It is a misunderstanding of the name of the Greek star “Mégas”, above.

This Sogdian asterism “Magh” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

This Khorasmian star “Armagh” is Delta (δ) Leonis in the IAU constellation Leo as listed by R. H. Allen in his *Star Names* in 1899.

Great Advisor:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Shangfu" is the star Lambda (λ) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Right Wall (see below).

Great Adze:

This Samoan asterism "To'ivā" (an abbreviation of "To'ivaitotonuole'atoatufuga" ("great adze within the builder's tool basket") is the curve of stars at the front end of the IAU constellation Leo, which resembles a mirror-image question mark or a sickle: Epsilon (ε), Mu (μ) Leonis, Zeta (ζ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis), and Alpha (α) Leonis (Regulus). This represents the son of Tapu'itea, represented by the planet Venus. Tapu'itea is the cannibal demigoddess who self-exiled herself to outer space to spare her son To'ivā from her insatiable appetite.

Great and Tortured:

This Latin asterism "Magnus et Tortus" is the IAU constellation Draco.

Great Auger:

This Romanian asterism "Mare Melc" or "Sfredelul Mare", also known as "the Three Saints" (see below), is Orion's belt plus Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Lite, Lodina, and Ignat 2018).

Great Barred Spiral Galaxy:

This **telescopic** asterism is NGC 1365, a double-barred spiral galaxy in the IAU constellation Fornax It was discovered by English astronomer John Herschel in 1837.It is GC 731 on the *General Catalogue* of 1864. It is also known as the "Propeller" (see below) and "Z" (see below).

Great Bear:

This Greek asterism "Μεγαλή ᾽΄Αρκτος" ("Megalí ᾽΄Arktos") is the IAU constellation Ursa Major (see Big Dipper, above) as described in Ptolemy's *Almagest* (2nd century). This name for the IAU constellation Ursa Major originated in Homer's *Iliad* (8th century B.C.E.), which refers to this IAU constellation both as "the Bear" and "the Wain". The classic Greek myth of Callisto has her changed into a Bear by Hera, the wife of Zeus. Ptolemy's version looks like this:

- The "tail" is the handle of the Big Dipper asterism: Epsilon (ε) Ursae Majoris, Zeta (ζ) Ursae Majoris, and Eta (η) Ursae Majoris.
- The "body" of the Big Dipper starts at the base of the "tail" at Delta (δ) Ursae Majoris and runs through Alpha (α) Ursae Majoris (Dubhe), 23 Ursae Majoris, Upsilon (υ) Ursae Majoris, Phi (ϕ) Ursae Majoris, Beta (β) Ursae Majoris (Merak), and Gamma (γ) Ursae Majoris.
- The "head" is the stars 23 Ursae Majoris, Tau (τ) Ursae Majoris, Sigma (σ) 1 and 2 Ursae Majoris, Rho (ρ) Ursae Majoris, Omicron (ο) Ursae Majoris (which is described as "the star on the end of the snout"), and Upsilon (υ) Ursae Majoris, with the "tip of the ear" being 24 Ursae Majoris.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as the "Great Bear".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) refers to this constellation as "the Great Bear (Ursa)" or simply "the Great Bear".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists "Great Bear" as an alternate name for Ursa Major.

This Lakota asterism "Wičhákhiyuhapi" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Germanic asterism "Großer Bär" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Scandinavian asterism "Stora Björn" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Dutch asterism "Grote Beer" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Basque asterism is the IAU constellation Hercules (Frank 2021). Knörr (1999) lists it as "Bost Izarrak" and identifies it with Ursa Major. It is related to the story of the Bear Son, Harzkume (see Bear Son, above). NOTE: Pan-European versions of this story exist all over with the Bear Son appearing as "the Strong Man", "der Starke Hans", "the Man with the Iron Club", and "L'Homme au Bâton de Fer" and this suggests that there may be other cultures who associated this figure with this IAU constellation in ancient times.

This Romanian asterism "Ursul Mare" is the IAU constellation Ursa Major (Ottescu 2009). The trapezium of the Big Dipper is called "Trupul Ursului" ("the Bear's Body") and the "handle" is "Coada Ursului" ("the Bear's Tail").

Great Beast:

This Greek asterism "Μεγαθηρίον" ("Megathiríon") is the IAU constellation Scorpius as described by Aratus (315 – 240 B.C.E). This appeared in the 1720 edition of Johann Bayer's *Uranometria* in 1603 as "Μελαθυρίον" ("Melathyríon").

Great Bird Cluster:

This **telescopic** asterism is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as "VI 27" in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. Size 12' X 12'. In the 19th century it was known as Copeland's Golden Worm. American astronomer Phil Harrington called it the Great Bird Cluster as to him it "resembles a bird in flight": The Herschel Club/Ancient City Astronomy Club use this name for it. South African astronomer Carol Botha also describes it as a "Sparrow". More recently astronomers who are fans of J. K. Rowling's *Harry Potter* series named it Hagrid's Dragon.

Great Bow:

This Estonian asterism is made up of stars of the IAU constellation Taurus (Kuperjanov 2006): Zeta (ζ) Tauri, Beta (β) Tauri (Elnath), and Iota (ι) Tauri, with the fletching of the arrow being the Hyades cluster.

Great Brown Bull:

This Irish asterism is the IAU constellation Taurus. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). This is a reference to Donn Cúailnge, the mythical Brown Bull of Cooley, was the largest, fiercest and most virile bull in Ireland, who is found in the Táin Bó Cúailnge.

Great Canoe of Tama Rereti:

This Māori asterism "Te Waka a Tamarereti" is made up of the stars of the "tail" of the IAU constellation Scorpius: Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii. Tama Rereti was a great Māori warrior. The rope of his boat is the asterism "Te Taura-O-Te-Waka-O-Tamarereti" (see Rope of the Great Boat of Tama Rereti, below), and the "anchor" is "Taki-O-Autahi" (see Anchor, above). NOTE: Robertson and Po Eung (2016) suggest that this asterism is actually part of the ancient asterism Argo's Ship (see above).

Great Chariot:

This Romanian asterism "Carul Mare" is the Big Dipper asterism (see above) in the IAU constellation Ursa Major (Ottescu 2009, Lite, Lodina, and Ignat 2018). The four stars of the "dipper" are "Roatele Carului" ("the Chariot Wheels"), and the stars of the "handle" are "Proţapul" ("the Shaft"), "Tânjala Carului" ("the Slow Chariot Shaft") or "Oiștea" (the Axle"). Some Romanians see the four stars of the "dipper" as four wheels, others as the body of the chariot, with the next two stars of the "handle" the "oxen". Others see the three stars of the "handle" of the Big Dipper as three pairs of oxen. Some Romanian stories have Yahweh transporting his treasures into the sky in this chariot, following himself in the Little Chariot (see below).

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels the Big Dipper asterism (see above) as "Le Grand Chariot".

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Grand Chariot" for this asterism.

This French asterism is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899. Allen writes that it "was seen on Gaulish coins".

This Anglo-Norman asterism "Charere" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed by the 12th century Anglo-Norman poet Philip de Thaun and as listed in R. H. Allen's *Star Names* in 1899.

Great Cluster:

See Hercules Cluster, below.

Great Cross:

This Romanian asterism "Mare Cruce", "Crucea Mare", or "Crucea" is the Northern Cross asterism (see below) in the IAU constellation Cygnus (Lite, Lodina, and Ignat 2018).

This Estonian asterism "Suur Rist" is the Northern Cross asterism in the IAU constellation Cygnus (see Northern Cross below).

This Quechua asterism "Jatun Cruz" is made up of stars of the IAU constellation Scorpius (Ciancia 2018): Nu (ν), Lambda (λ), Zeta (ζ), Mu (μ), and Epsilon (ε) Scorpii.

Great Cup:

This Arabic asterism "Alkas Aleazim" (الكأس العظيم) is the IAU constellation Crater.

Great Dark Horse:

See Dark Horse Nebula, above.

Great Darkness/Infinity:

This Rapanui star “Po’o” or “Po Roroa” is Kappa (κ) Orionis (Saiph) in the IAU constellation Orion (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018). NOTE: In their 2010 paper the Edwards identify this as Canopus and in their 2016 paper the Edwards identify Saiph several times as Po Roroa but there is also one reference of this name to the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina, although Canopus is identified as Atutahi in several other places in this paper.

Great Dawn Star:

This Romanian star “Luceafărul din Zori” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Ottescu 2009).

Great Deer:

This Finnish asterim "Jalopeura" is the IAU constellation Leo.

Great Diamond:

This Western asterism consists of stars from four different IAU constellations: Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes, Alpha (α) Virginis (Spica) in the IAU constellation Virgo, Beta (β) Leonis (Denebola) in the IAU constellation Leo, and Alpha (α) Canum Venatici (Cor Caroli) in the IAU constellation Canes Venatici. An east-west line from Arcturus to Denebola forms an equilateral triangle with Cor Caroli to the North, and another with Spica to the South. R. H. Allen describes it as the “Virgo Diamond” in his *Star Names* in 1899. This name was listed in May 2016 in *Constellation Guide* (https://www.constellation-guide.com/category/asterism/).

Great Dipper:

This American asterism is the Big Dipper asterism in the IAU constellation Ursa Major. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name.

Great Eastern General:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Dongshangjiang” is the star 42 Comae Berenices in the IAU constellation Coma Berenices and is part of their xing guan Supreme Palace Left Wall (see below).

Great Eastern Premier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Dongshangxiang” is the star Gamma (γ) Virginis in the IAU constellation Virgo and is part of their xing guan Supreme Palace Left Wall (see below).

Chinese Chenzhuo xing guan “Dongshangxiang” is the star Gamma (γ) Virginis in the IAU constellation Virgo. It is part of the Supreme Palace Left Wall.

Great Elk:

This Sdoh-doh-hohbsh asterism is the Big Dipper asterism in the IAU constellation Ursa Major (See Big Dipper, above).

Great Emperor of Heaven:

This Chinese xing guan “Tianhuangdadi” from the Three Kingdoms to the Ming Dynasty is the star HIP 115746 in the IAU constellation Cepheus.

This Chinese xing guan “Tiānhuángdàdì” (天皇大帝) is the star HIP 109693 in the IAU constellation Ursa Minor.

This Chinese Chenzhuo xing guan “Tianhuangdadi” is 2 Ursae Minoris in the IAU constellation Ursa Minor.

Great Festivity of the Border of the South:

This Society Islands star “Taurua-nui-o-te-hiti-apatoa” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Great Fire:

This Chinese star “Dahuo” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius and is part of their asterism Heart (see below).

This Chinese star “Ta Huo”.is mentioned in oracle bone inscriptions from the Shang Dynasty (ca. 16th to 11th century BC) and is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. It also appears in the *Shangshuyaodian* 尚书尧典 (*Canon of Yao* of the *Book of Documents*- 2300 B.C.E.), a collection of political documents from the legendary Emperor Yao. It is also known as “Huo” (火) or “Huo Hsing” (see Fire Star, above).

Great Fish:

This Mesopotamian asterism is an oval of stars in the IAU constellations Andromeda and Perseus as listed by John H. Rogers in his *Origins of the Ancient Constellations* article in the Journal of the British Astronomical Association in 1988. It is basically identical to the Arabic asterism Great Fish (al-hut, see below).

This Arabic asterism “al-Hut” (الحوت) or “as-samaka al-‘azima al-hut” is from the *Book of Fixed Stars* of Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986). It is made up of the stars of the IAU constellations Andromeda and Pisces: Basically, the constellation Pisces is extended into the constellation Andromeda, with the “great fish” being an oval of stars:

- One side runs from the star Nu (ν) Andromedae through 29 Andromedae, Delta (δ) Andromedae, Epsilon (ε) Andromedae, Zeta (ζ) Andromedae, and Psi (ψ) Piscium to Rho (ρ) Piscium, and
- The other side runs from Rho (ρ) Piscium through Upsilon (υ) Piscium, Beta (β) Andromedae (Mirach), and Mu (μ) Andromedae back to Nu (ν) Andromedae.
- The Andromeda Galaxy (Messier 31) was also included in this asterism by 'Abd al-Rahman al-Sufi (903 – 986).

This appears in several places:

- The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts this as a large fish, viewed from above, overlapping Andromeda, and itself overlapped by the northern fish of Pisces.
- John Hill lists it as “Haut” and “Al Haut” in his *Urania* in 1754.
- Catholic librarian Giuseppe Simone Assemani (1687 - 1768) latinized this to “Alhut” and assigned it to Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major and says that it appeared on the “Cufic globe”: This would be 622 AH (1225/26 CE) a globe with Cufic lettering.

- NOTE: This is part of the Arabic asterism complex Two Fish (see below). Another Arabic "fish" asterism is next to this, "as-samaka as sughra" (see Smaller Fish, below). In some Arabic manzil sky cultures listed on Stellarium this is mislabeled "the bucket rope".

This English asterism "Adir Dags" or "Odir Dags" is the IAU constellation Cetus as listed in John Hill's *Urania* in 1754: He describes this as a Hebrew name for this constellation.

This Boorong and Wotjobaluk asterism "Otchocut" is the IAU constellation Delphinus as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). This is probably the Murray Cod (Maccullochella peelii).

Great Flame:

This Egyptian star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in the 19th dynasty *Cairo Calendar* (Hardy 2003).

Great Galactic Face:

This **telescopic** asterism is made up of galaxies in Markarian's Chain, including NGC 4387, an elliptical galaxy in the IAU constellation Virgo forming the "nose", Messier 86 (NGC 4406) and Messier 84 (NGC 4374) the "eyes", and edge on galaxy NGC 4388 forming the "mouth".

Great General:

There are Chinese xing guans from the Three Kingdoms to the Ming Dynasty using the name "Dajiangjun":

- One is the star Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and is part of their asterism Drum at the River (see above).
- One is the star Rho (ρ) Scorpii in the IAU constellation Scorpius and is part of their xing guan Room (see below).

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty using the name "Shangjiang":

- One is the star Eta (η) Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).
- One is the star 23 Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism "Wénchāng" (文昌) - see Administrative Centre, above.

There are two Chinese Chenzhuo xing guans called "Shangjiang":

- One is the star Rho (ρ) Scorpii in the IAU constellation Scorpius. It is part of their xing guan "Room".
- One is the star Omicron (o) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan "Administrative Centre".

Great General of Heaven:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an irregular oval of stars in the IAU constellations Andromeda, Perseus, and Triangulum:

- One side runs from the determinative star 10 Trianguli through Iota (ι) Trianguli, Beta (β) Trianguli, HIP 9001, 8423, Tau (τ) Andromedae, Upsilon (υ) Andromedae, Chi (χ) Andromedae and 51 Andromedae, ending at Phi (ϕ) Persei.
- One side runs from the determinative star 10 Trianguli through Gamma (γ) 1 and 2 Andromedae, ending at Phi (ϕ) Persei.

This later oblong Chinese xing guan "Tiāndàjiāngjūn" (天大将军) is made up of the stars of the IAU constellations Andromeda, Perseus, and Triangulum. One straight side runs from the star Gamma (γ) Trianguli through Gamma (γ) 1 and 2 Andromedae to Phi (ϕ) Persei. The other curving side runs from Gamma (γ) Trianguli through Beta (β) Trianguli, 56, Tau (τ), Upsilon (υ), 52, 49, and 51 Andromedae back to Phi (ϕ) Persei.

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellations Andromeda, Perseus, and Triangulum: From the central star Gamma (γ) 1 Andromedae three lines run out:

- One runs to 60 Andromedae,
- One runs through Upsilon (υ) Andromedae, Omega (ω) Andromedae, and 51 Andromedae to Phi (ϕ) Persei, and
- One runs through 58 Andromedae, Beta (β) Trianguli, and Gamma (γ) Trianguli to 14 Trianguli.

Great Globular Cluster:

See Hercules Cluster

Great Goddess of the Winter Sky:

In *The Myth of the Year*, Benigni, Carter and Ua Cuinn connect the IAU constellation Orion to a Great Goddess of the Winter Sky. Lithuanian archaeologist Marija Gimbutas (1996) tells us that Orion is a later name from the Iron Age and that Neolithic cultures may have seen Orion as a pre-agricultural goddess representing regeneration and fertility. Bellatrix is "the female warrior" and Betelgeuse and Bellatrix are the first to rise. Some neolithic art shows a female accompanied by two beasts, like Orion and the constellations Canis Major and Canis Minor.

Great-Hearted Snake:

This Latin asterism "Coluber Magnanimus" is the IAU constellation Hydra. Johann Bayer's *Uranometria* (1603) lists "Coluber Magnanimus".

Great Hercules Cluster:

See Hercules Cluster.

Great Horn:

This Chinese xing guan "Dàjiǎo" (大角) is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Dajiao" is the star Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Great Horse:

This Arabic asterism “Alhisan Aleazim” (الحصان العظيم) is the IAU constellation Pegasus. They called the neighbouring constellation Equuleus “part of the horse”.

Great Horse Stud:

This Romanian asterism “Gavădul Mare” is the IAU constellation Leo (Ottescu 2009). Compare to Little Horse Stud (below).

Great Imperial Guard:

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty with the name “Shangwei”:

- One is the star Kappa (κ) Cephei in the IAU constellation Cepheus and is part of their xing guan Purple Forbidden Left Wall (see below).
- One is the star HIP 33827 in the IAU constellation Camelopardalis and is part of their xing guan Purple Forbidden right Wall (see below).

Great Imperial Minister:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shangcheng” is the star HIP 14862 in the IAU constellation Cassiopeia and is part of their xing guan Purple Forbidden Right Wall (see below).

Great Lacerta Nebula:

See Cosmic Fireplace (above).

Great Large Llama:

This Quechua asterism “Hatun Llamaytoq” (Urton 1981) is the dark nebulosity in the Milky Way stretching between Centaurus and Scorpius and its eyes are the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar).

Great Limb:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Great Looped Nebula:

This **telescopic** asterism is the open cluster and HII region NGC 2070 in the IAU constellation Dorado. This was discovered by French astronomer Nicolas Louis de Lacaille in 1755. This name comes from English astronomer John Herschel, who in 1834 described it as “an assemblage of loops” and listed it as h 2941. It appears in the 1864 General Catalogue as GC 1269. The New General Catalogue of 1888 describes it as “looped”. The 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) lists this as the “Great Looped Nebula”. It is also known as the Tarantula Nebula, the True Lover’s Knot, the 30 Dorado Cluster or the 30 Dorado Association.

Great Maiden with a Yoke:

This Romanian asterism “Fata Mare cu Cobiliţa” is the IAU constellation Cygnus (Ottescu 2009). Compare this to Girl, above.

Great One:

This complex Babylonian asterism from the MUL.APIN tablets, “MulGU.LA” (Bartel van der Waerden 1974) or “GU.LA” (“the God Ea”) is made up of the stars of the IAU constellations Aquarius, Cetus, Pegasus, and Pisces:

- The “body” is a pentangle of the stars Alpha (α) Aquarii (Sadalmelik), Epsilon (ε) Pegasi, Beta (β) Aquarii (Sadalsuud), Iota (ι) Aquarii and Theta (θ) Aquarii.
- Two lines of stars form “legs”:
    - One from Theta (θ) Aquarii through Lambda (λ) Aquarii, Psi (ψ) Aquarii, and 94 Aquarii to 98 Aquarii, and
    - One from Iota (ι) Aquarii through Tau (τ) Aquarii and Delta (δ) Aquarii to 88 Aquarii.
- An “arm” runs from Sadalmelik through Gamma (γ) Aquarii and Gamma (γ) Piscium to Iota (ι) Piscium.
- Two bending lines starting at 52 Aquarii represent streams of water issuing from Ea:
    - One runs through 27 Piscium, 30 Piscium, 3 Ceti, and 6 Ceti to 7 Ceti, and
    - One runs through Zeta (ζ) 1 Aquarii, Eta (η) Aquarii, Phi (ϕ) Aquarii, Psi (ψ) Aquarii, and Omega (ω) 2 Aquarii to 104 Aquarii.

Hope Anthony lists this as “GU.LA” in his *A Guide to Ancient Near Eastern Astronomy* in 1996 and identifies it only as the IAU constellation Taurus.

This appears in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul gu.la” and in the list of Zodiacal Signs in VAT 4956 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) as “GU” (Bartel van der Waerden 1974).

This Akkadian asterism “Sinundu”, “Ku-ur-ku” (“Seat of the Flowing Waters”), “Rammanu”, “Rammān”, or “Rammānu” (“God of the Storm”), or “ŠU” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MulGU.LA” above. NOTE: “ŠU” also shows up on the Ura =hubulla XXII lists associated with the Sumerian name “mul dšul-pa-è-a”.

This Sumerian asterism “mulgu-la” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MulGU.LA” above.

This Seleucid asterism “GU” or “sal-mu” (“figure”) in the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Aquarius (Foxvog 1993).

Two stars in the IAU constellation Draco bear the name “Tàiyǐ” (太乙） or “Tàiyī” (太一）, the which means “the great one”:

- One is the star 8 Draconis. The name Taiyi was approved for this star by the IAU.
- One is the star Alpha (α) Draconis (Thuban) which appeared on Chinese star charts in the 1st and 2nd millennia C.E. (Didier 2009). Didier lists the variations “Dayi” (大乙), “Di”, “Tian”, and “Ding” for this star and describes it as appearing in art in the 16th century B.C.E. when it would have been the pole star.

Great One Who Rules the Mysterious Presence of the Akua:

This Hawaiian star “Haumea” is Epsilon (ε) Cassiopeiae (Segin) in the IAU constellation Cassiopeia. This is the name of a Hawaiian Goddess of childbirth, war, and politics.

Great Orion Nebula:

See Orion Nebula, below.

Great Panther and Curly Tail:

This Ojibwe asterism, “Mishibizhii and Gaadidnaway”, is made up of stars of the IAU constellations Leo and Hydra (Lee et al 2014):

- The “head” of the panther (and the IAU constellation Hydra) is a circle of stars: Epsilon (ε), Delta (δ), Sigma (σ), Eta (η), and Rho (ρ) Hydrae, and
- The “body” is a long line running from Rho (ρ) Hydrae to Alpha (α) Leonis (Regulus), where the line bends up into the “curly tail”, which is the Sickle (see Sickle below). This is the curve of stars at the front end of the constellation Leo from the star Epsilon (ε) Leonis to the star Alpha (α) Leonis (Regulus), resembling a mirror-image question mark.

NOTE: The Great Panther is an underwater panther who resides in turbulent waters.

This Anishinaabe asterism Mishi Bizhiw” is identical to the Ojibwe asterism “Mishibizhii” (see above).

Great Plain:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Great Plough Tail:

This Welsh asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Freer 2004).

Great Premier:

Three are two Chinese asterisms from the Three Kingdoms to the Ming Dynasty using the name “Shangxiang”:

- One is the star Beta (β) Scorpii (Acrab) in the IAU constellation Scorpius. It is part of their xing guan Lock, Vassal of Room (see below).
- One is the star Beta (β) 1 Scorpii (Acrab) and is part of their xing guan Room (see below).

This Chinese Chenzhuo xing guan “Shangxiang” is the star Beta (β) Scorpii (Acrab) in the IAU constellation Scorpius. It is part of their xing guan “Room”.

Great Prime Minister:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shangzai” is the star Theta (θ) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Left Wall (see below).

Great Protector:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shangbi” is the star Zeta (ζ) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Left Wall (see above).

Great Pumpkin:

This **telescopic** asterism is the belted HII region Sharpless 2-232 in the IAU constellation Auriga. Most astrophotography sites list this as the “Great Pumpkin” but some just call it the “Pumpkin”. NOTE: The blue dot at the middle of Sh2-232 is a known planetary nebula, PN G173.5+03.2.

Great Rift:

This **telescopic** asterism, the Great Rift, also known as the Dark Rift or the Dark River, is caused by interstellar clouds of dust that block our view of the center and some radial sections of the Milky Way and is located in the IAU constellation Aquila. The classical Greeks viewed it as a path of devastation left by Phaeton, who unsuccessfully tried to guide the chariot of Helios across the sky. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the Great Rift.

Great Saffron-Coloured One:

This Sogdian star "Maghan Sadwis" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by R. H. Allen in his *Star Names* in 1899.

Great Serpent:

This Barasana (Vaupés region) asterism "Boiassu" is the IAU constellation Scorpius (Hugh-Jones 2006). Hugh-Jones writes that this is found throughout the Vaupés region and "in many parts of Amazonia".

Estonian asterism is made up of stars of the IAU constellations Leo and Hydra (Kuperjanov 2006). It is an arc of stars starting at Beta (β) Leonis (Denebola) and running through Delta (δ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus) to Alpha (α) Hydrae (Alphard).

Great Shaftbow:

This Estonian asterism is made up of stars of the IAU constellations Leo and Hydra (Kuperjanov 2006). It is an arc of stars starting at Beta (β) Leonis (Denebola) and running through Delta (δ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis, and Alpha (α) Leonis (Regulus) to Alpha (α) Hydrae (Alphard).

Great Ship:

This Welsh asterism is the Ptolemy's asterism Argo's Ship (see above) made up of stars of the IAU constellations Carina, Puppis, Pyxis, and Vela, as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). NOTE: Freer (2004) speculates that this may be the constellation Lynx.

Great Sign:

This Greek asterism "Τέρας μέγα" ("Téras méga") is the is the IAU constellation Scorpius as described by Aratus (315 – 240 B.C.E).

Great Sky Man:

This is an alternate Upper Tanana name for their asterism "Yihdaa" (see Traveler, below (Cannon 2021)).

Great South Star:

The identity of this Palawa star is currently uncertain, but Hamacher (2011) writes that it might be Alpha (α) Eridani (Achernar) or Alpha (α) Carinae (Canopus).

Great Spotted Bull:

This Vedic asterism is the is the Big Dipper asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Great Square of Pegasus:

The Great Square is a quadrilateral formed by the stars of two IAU constellations: Pegasus and Andromeda. These four stars are Alpha (α) Pegasi (Markab- 90th brightest star), Beta (β) Pegasi (Scheat- 84th brightest star), Gamma (γ) Pegasi (Algenib), and Alpha (α) Andromedae (Alpheratz- 56th brightest star). The Great Square stands out in the sky above as to the unaided eye this box of stars seems empty:

- The Egyptian nome (district) "White Wall" ("ỉnbw-ḥḏ") from the Old Kingdom (3100 B.C.E.) is related to Great Square asterism (Berio 2014).
- The Norwegians call this "Pegasus Kvadretet" ("Pegasus Square").
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lables this "Quarré de Pegase".
- This is listed as "the great square" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) labels this asterism the "Great Square of Pegasus".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Great Square of Pegasus".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns labels this the "Great Square".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the "Great Square".
- Jeffrey Corder lists this asterism as Corder 4926.

Great Star:

This /Xam star "//Xwhai" or "!Gaunu" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Dechend 1975, Alcock 2014). It is part of their asterism the "//kohai stars" (see below).

This Chinese Chenzhuo xing guan "Dachen" is the star Alpha (α) Scorpii (Acrab) in the IAU constellation Scorpius. It is also known as "Celestial King".

Great Star Cluster:

See Hercules Cluster.

Great Star of Midnight:

This Romanian star "Luceafărul cel Mare de Miezul Nopţii" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Ottescu 2009).

Great Sun Swarm:

This American **telescopic** asterism is the globular cluster Messier 13 in the IAU constellation Hercules. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name and describes it as a "ball of suns".

Great Swallow:

This Babylonian asterism from the MUL.APIN tablets "KUNMUŠ (ša)", "mulSIM.MAH" (Bartel van der Waerden 1974), "SHIM.MA", or "SIM.MAḪ" is made up of the stars of the IAU constellations Aries, Cetus, and Pisces (Boutet 2014):

- The middle of the "body" from which the "wings" and triangular "tail" emerge is the binary star Alpha (α) Piscium (Alrescha),
- The "head" is a circle of stars made up of Delta (δ), Gamma (γ), 69, and 75 Ceti and HIP 11738,
- One "wing" runs from Alrescha to Delta (δ) Arietis,
- One "wing" runs from Alrescha to Theta (θ) and Eta (η) Ceti,
- One side of the "tail" is a line from Alrescha through Omicron (ο) and Rho (ρ) Piscium, and
- The other side of the "tail" runs from Alrescha through Mu (μ), Epsilon (ε), and Delta (δ) Piscium.

This Babylonian asterism is listed in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as "si-im-ma-a" or "MUL.SIM.MAH" (Hunger 1992) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul sim.mah" (Koch-Westenholz 1995).

This Akkadian asterism "Šinūnūtu" or "Sinunutu".(Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or "si-nun-tum" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism Great Swallow.

This Sumerian asterism "mulsim-mahmušen" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism Great Swallow.

This asterism disappears in later Seleucid sky lore, replaced by "the Swallow" (see Swallow, below) in a new location.

Great Twins:

This Babylonian asterism from the MUL.APIN tablets "MAŠ.TAB.BA.GAL.GAL" is the "upper" half of the IAU constellation Gemini. It is a box containing Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Epsilon (ε) Geminorum, and Delta (δ) Geminorum (Bartel van der Waerden 1974, Boutet 2014). The Great Twins are Lugalirra and Meslamta'ea or Lulal-irra and Meslamtaea, a pair of netherworld Gods (Belmonte & Esteve 2018). In the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) the lower half is "Tu'amu Sehrutu" (Little Twins, see below) and the upper half is "Tū'āmū Rabûtu", or "Tu'amu Rabutu" (Hunger 1992). In later Seleucid star lore "Tu'amu Rabutu" and "Tu'amu Sehrutu" are combined to form "the Twins" (see below). This is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul mas.tab.ba" and "mul mas.tab.ba.gal.gal" (Koch-Westenholz 1995) and is depicted on the K 8538 planisphere as "mulmaš-tab-ba-ga-gal" (Koch 1989). NOTE: The cuneiform tablet K 42 associates Lulal-irra and Meslamtaea with Mercury and Mars.

This Babylonian asterism "MASH.TAB.BA.GAL.GAL" or "tu'amu rabûtu" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

This Assyrian asterism "MASH.TAB.BAGAL.GAL" listed in the *Astrological Reports to the Assyrian Kings* (Hunger 1992) is identical to the Babylonian asterism "MAŠ.TAB.BA.GAL.GAL" (see above).

This Mesopotamian asterism from the *Three Stars Each* tablet "MASH.TAB.BA" is two stars in the IAU constellation Canis Minor: Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa).

This Persian asterism "Tu'amu-rabuti" from the list of Masu Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Boll 1918, Jeremias 1929). It appears in the list of Zodiacal Signs in VAT 4956 from this period as "MASH" (Bartel van der Waerden 1974). Ernst Weidner lists it as "mas-tab-ba-gal-gal" in his *Fixsterne* in 1971

Great Valley:

This Polynesian (Society Islands) asterism "Faa-nui" is the IAU constellation Auriga. They call the star Alpha (α) Aurigae (Capella) "Tahi-anii" ("Unique Sovereign").

Great Wagon:

This German asterism "Großer Wagen" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above):

- "Der Großer Wagen" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as the "Großen Wagen".

This Italian asterism "Grande Carro" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Romanian asterism "Vagon Mare" is the Big Dipper asterism (see above) in the IAU constellation Ursa Major (Lite, Lodina, and Ignat 2018).

This Slavic asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Danish, Swedish, and Icelandic asterism "Stori Vagn" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Great Wain:

This Estonian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006).

Great Western Premier:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Xishangxiang" is the star Delta (δ) Leonis in the IAU constellation Leo and is part of their xing guan Supreme Palace Right Wall (see below).

This Chinese Chenzhuo xing guan "Xishangxiang" is the star Delta (δ) Leonis in the IAU constellation Leo. It is part of the Supreme Palace Right Wall.

Great Western General:

This Chinese Chenzhuo xing guan "Xishangjiang" is the star Sigma (σ) Leonis in the IAU constellation Leo. It is part of the Supreme Palace Right Wall.

This Chinese Three Kingdoms to Ming Dynasty xing guan "Xishangjiang" is the star Sigma (σ) Leonis in the IAU constellation Leo. It is part of the Supreme Palace Right Wall.

Great Yulo:

This Wichi asterism is made up of stars of the IAU constellations Orion and Taurus (Mariani 2017). The yulo's head is the Pleaides cluster, the Hyades cluster is the body, and the belt of Orion is the legs and feet. NOTE: A yulo is a large bird similar to a stork.

Greater Bear:

This Arabic asterism "Aldubu Al'akbar" (الدب الأكبر) is the IAU constellation Ursa Major:

- "Al-Dub al-Akbar" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010).
- In 1754 in his *Urania*, John Hill lists the name as "Akber or Dub Akber"
- German astronomer Johann Bayer (1572-1625) listed it as "Dubhelacbar" in his *Uranometria* in 1603.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Dhub Aylabar" as an Arab name for Ursa Major.
- Robert Hues lists it as "Dub Alacbar" in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne lists "Akber or Dub Akber" in his *Sphere of Marcus Manilius* in 1675, attributing this name to the Persian astronomer "Ulugh Beigh" (Ulugh Beg Mirza (1394 – 1449)).
- R. H. Allen lists it as "Al Dubb al Akbar" in his *Star Names* in 1899.
- John Chilmead lists it as "Dub Alacber" in his *A Learned Treatise of Globes* in 1889.

This Italian asterism "Orsa Maggiore" is the IAU constellation Ursa Major.

This French asterism "Grande Ourse" is the IAU constellation Ursa Major.

This Saxon asterism "Grosser Bär" is the IAU constellation Ursa Major as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Italian asterism "Orsa Maggiore" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Greater Beauty of Pegasus:

This **telescopic** asterism "Púlchrior Pégasi" is the edge-on peculiar lenticular galaxy NGC 7469 (Arp 298) in the IAU constellation Pegasus. It was discovered in 1784 by William Herschel who listed it as "III 230". It became GC 4888 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 7469 forms a pair with the smaller irregular IC 5283. The former one is doubtless the more beautiful partner".

Greater Bier:

John Hill lists the Latin name "Feretrum Major" for the IAU constellation Ursa Minor in his *Urania* in 1754. This is probably influenced by the Arabic asterism Daughters of the Bier (see above).

Greater Cloud:

This American asterism is the Large Magellanic Cloud in the IAU constellation Dorado as listed by R. H. Allen in his *Star Names* in 1899.

Greater Cross:

This French asterism is the IAU constellation Cygnus and appears in *De cursu stellarum* of Saint Gregory of Tours (573).

Greater Dog:

This Arabic asterism "Alkalb Al'akbar" (الكلب الأكبر) is the IAU constellation Canis Major:

- This waslater latinized to "Alcheleb Alachbar" by John Chilmead in his *A Learned Treatise on Globes* in 1889.

This German asterism "Großer Hund" is the IAU constellation Canis Major as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Greater Seven Bulls:

This Persian asterism "Hafturengh Mihin", "Heft Averengh Mihin", or "Heft Rengh Mihin" is the Big Dipper asterism in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899. Allen writes that English essayist J. F. Hewitt (1835 – 1908) lists "Hapto-iringas" as an earlier name (see Which Has Seven Signs, below).

Greater Wolf's Jaws:

This Saxon asterism "Grosser Wolfsrachen" is depicted in the 1934 *Nördliche Sternhimmel* map of O. S. Reuter is a large semicircle of stars in the IAU constellations Andromeda, Cygnus, and Pegasus. It starts at Gamma (γ) Andromedae and runs through Beta (β) Andromedae (Mirach), Alpha (α) Andromedae (Alpheratz), and Beta (β) Pegasi (Scheat), ending at Alpha (α) Cygni (Deneb).

This Old Icelandic asterism is identical to Reuter's Saxon asterism above. NOTE: The opening of the "jaws" is facing the north celestial pole, which makes it useful for navigation.

Greedy Wolf:

This Chinese star "Talang" from the Three Kingdoms to the Ming Dynasty is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Tanlang" is the star Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Green Hill:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Centaurus: Starting at the determinative star l Centauri (HIP 61789) it runs through HIP 61468, 61379, 61916, 63033, 63066, and n Centauri.

This Chinese xing guan Qīngqiū (青丘) is made up of six stars in the IAU constellation Crater: 17, 18, 19, 25, 28, and 29 Crateris.

This Chinese Chenzhuo xing guan is an oval of stars in the IAU constellation Centaurus. From HIP 62896 it runs through HIP 64408, 64003, 62683, 60449, 60855, and 62896.

Green Leaf Horn:

This Jū/Wãsi and Nyae Nyae !Kung star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Slotegraaf 2013, Alcock 2014) and is part of their asterism "Tshxum" (see Rain Bull, above).

Green Nebula:

See Blue Racquetball, above.

Green Parrots:

This Kamilaroi asterism "Gijeri-gu" or "Gidgeriga" is two stars in the IAU constellation Scorpius, though the person who recorded this information (and the second name above) in 1873, William Ridley, did not specify which stars (Fuller et al 2014). The stars are Lambda (λ) and Upsilon (υ) Scorpii. The Boorong have a similar asterism, "Djuit" (see Red-Rumped Parrot, below).

Green Rectangle Nebula:

See Jewel Bug Nebula, below.

Green Ridge:

This Korean asterism "Nogsaeg Neungseon" (녹색 능선) in the IAU constellation Carina is an irregular oval of stars: r, s, q, p, w, and u Carinae and HIP 52742.

Green Ring Nebula:

This **telescopic** asterism is HII region is SH 2-3 in the IAU constellation Scutum.

Greenwood Box/Coffin:

The stars of this Dena'ina asterism "Tsal q'elchini" are unidentified at present (Cannon 2021).

Greeter of Lynx:

This **telescopic** asterism "Salutáta Lýncis" is the barred spiral Magellanic galaxy NGC 2799 (Arp 283) in the IAU constellation Lynx. It was discovered by Ralph Copeland in 1874. It became GC 5467 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "NGC 2799 is inclined to its neighbour NGC 2798 as if it bows to greet him politely".

Gregory's Unnamed Stars:

This Gallic asterism likely includes the star Alpha (α) Virginis (Spica) of the IAU constellation Virgo. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this asterism of two stars to help monks use certain stars in the sky to determine the time for prayers, which he oddly doesn't name (McKay 2020). The identity of the other star is uncertain.

Grey Jay:

This Mi'kmaq star "Mikjaqoqw" is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major. It is part of their asterism Muin and the Seven Hunters (see below).

Greyhound:

This **telescopic** asterism is in the IAU constellation Coma Berenice and was listed by Jack Kramer of the Lake County Astronomical Society in Illinois. Kramer describes it in the LCAS *NightTimes* newsletter in April 1994 as "a group of eight stars arrayed in the shape of two diamonds that suggested a greyhound

dog running at full stride - the star at lower left being the front paw [HIP 62524], the star farthest to the right the rear paw [HIP 62176], and the brightest star being the head [28 Comae Berenices (HIP 624780)]. The group spans just over 1o and is about 15 east of the star Beta [β] Leonis." This asterism is surrounded by galaxies including NGC 4689, 4659 and 4654.

This Lithuanian asterism "Kurtas" is the IAU constellation Canis Minor.

Greyhound of the Skies:

See Barnard's Star, above.

Greyhounds:

This French asterism "Levriers" is the IAU constellation Canes Venatici. The French edition, Atlas Céleste, Seconde Édition (1776) of the Atlas Coelestis of English astronomer John Flamsteed (1646 – 1719) depicts "Les Vevrieres" as two dogs whose leashes are being held by "Le Bouvier" on the northern hemisphere chart. On a later close-up chart they are labeled "les Levriers" ("the greyhounds") and depicted as two leashed dogs, the leashes being held by Boötes.

This Italian asterism "Levrieri" is the IAU constellation Canes Venatici.

Griffin:

This Arabic asterism "Ghirifin" (غريفين) is the IAU constellation Phoenix.

Grill:

This Lokono (Arawak) asterism "Yorhada" is the Great Square asterism in the IAU constellation Pegasus (Rybka 2018). It is a grill taken up into the sky by the seven hunters of the myth of Siritjo.

Grivenescos:

This asterism is the IAU constellation Cancer as listed by German astronomer Johann Bayer (1572-1625), who describes this as a "barbarian" name.

Grizzly Bear:

This Shoshone asterism is the IAU constellation Cygnus (see Northern Cross below). He climbed a tall mountain to go hunting and the snow and ice crystals behind him is the Milky Way.

This Kootenai star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper below).

Grizzly Bear and Three Hunters:

There are three First Nations asterisms by this name:

- One Sčicwi (Coeur D'Alene) asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above). The bucket of the dipper is the bear, and the stars of the handle are the hunters (Shandin Pete 2022). In the Sčicwi (Coeur D'Alene) version of this story the hunters are grizzlies that are brothers-in-law of the grizzly being hunted. A Nlaka'pamux version has three black bears hunting the grizzly.
- One Nlaka'pamux asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper below). Alpha (α) Ursae Minoris (Polaris) is the Grizzly being hunted (Pete

2022). The stars Delta (δ), Epsilon (ε), and Zeta (ζ) Ursae Minoris are the hunters, and Theta (θ) Ursae Minoris (beside Zeta) is that hunter's dog.

- One Salish asterism is the Big Dipper Asterism in the IAU constellation Ursa Major (see Big Dipper above). The bucket of the dipper is the bear, and the stars of the handle are the wolves hunting it (Shandin Pete 2022).

Grizzly in the Sky:

This Salish star "Smxéy̓čn̓asqt" is Alpha (α) Ursae Minoris in the IAU constellation Ursa Minor (Pete 2023). This was originally documented in the early 1800's by Gregory Mengarini SJ.

Grizzly Sisters:

This Paiute asterism is the IAU constellation Aries. They play with the Deer Sisters (see above).

Gro Brzhin:

This Tibetan gyukar (lunar house) is the star Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Groom:

This Korean asterism "Sinlang" (신랑) is a fan of stars in the IAU constellation Cepheus. The central star is Delta (δ) Cephei, and from this star three lines run out to the stars Epsilon (ε) and Zeta (ζ) Cephei, and HIP 109592.

Group:

See Many, below, for this Armenian asterism.

This Mayan asterism "Motz" ("the group") is the Pleaides cluster in the IAU constellation Taurus. The Mayan creation story, Popol Vuh, tells of how 400 boys trick Zipacna (a crocodile) to dig a giant post hole for their house and then try to kill him. Zipacna pulls the house down on them, killing the boys, who are transformed into the Pleiades.

This Aymara asterism "Qutu" is the Pleiades cluster in the IAU constellation Taurus (Urton 1981). Compare this to the Quechua asterism "Qutu" (see Pile, below).

Group of Arrernte Camps:

This Arrernte asterism is the IAU constellation Musca (Maegraith 1932). Maegraith writes that this represents a group of camps of the Arrernte people.

Group of Birds:

This Kolam asterism "Kovela Kor" is the Pleiades cluster in the IAU constellation Taurus (Vahia et al 2014). They saw this as one large bird with several smaller ones.

Group of Eavesdroppers:

This Tzotzil (of Zinacantán) asterism is the sword of Orion in the IAU constellation Orion (Milbrath 1999).

Group of Islands:

This Filipino (Mayayaw Ifugao) asterism "Mupu" or "Pupu" is the Pleiades cluster in the IAU constellation Taurus (Masong 2017).

Group of Men:

This /Xam (San) asterism is the IAU constellation Corona Australis (Slotegraaf 2013, Alcock 2014). The story is that a young woman, who should not have looked at a group of men for fear of harm to them, saw some sitting together at a rock rabbit's house of branches. Her looks fixed them and the branch house into stars in the sky.

Group of Rocks:

This Filipino (Mayayaw Ifugao) asterism "Nachalipo'pong" is the IAU constellation Corona Australis (Masong 2017).

Group of Soldiers:

This large Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Lupus, Norma, and Scorpius. In the center is a quadrilateral of the stars HIP 79320, 80212, 80945, and 80337. From each of these stars two lines run out:

- From HIP 79320 lines run out to the determinative star, Eta (η) Lupi and HIP 78323,
- From HIP 80212 lines run out to Epsilon (ε) and Theta (θ) Normae,
- From HIP 80945 lines run out to HIP 81305 and 81972, and
- From HIP 80337 lines run out to N and H Scorpii.

This later Chinese xing guan Jīzú (积卒) has shrunk to a line of two stars in the IAU constellation Lupus: Eta (η) and Theta (θ) Lupi.

This Chinese Chenzhuo xing guan is a quadrilateral of stars with two lines running out from each corner in the IAU constellations Lupus, Norma, and Scorpius. The square is made up of the stars HIP 80945, 80337, 79320, and 80212. From these corners the lines are:

- From HIP 80945 to HIP 81305 and 81972,
- From HIP 80337 to HIP 81304 and HIP 80911,
- From HIP 79320 to Eta (η) and Theta (θ) Lupi, and
- From HIP 80212 to Epsilon (ε) and Theta (θ) Normae.

Group of Stars:

This Tukano asterism "Ñohkoatero" or "Grupo de Estrelas", is their name for the Pleiades cluster in the IAU constellation Taurus (Cardoso 2015, Cardoso 2016).

This Basque asterism "Izar Molkoak" is the Pleiades cluster in the IAU constellation Taurus (Frank 2021).

This Italian (Piedmont and Ligurian Alps) asterism "Gnoch" or "Bucc 'd este`le" ("group of stars") is the Pleiades cluster in the IAU constellation Taurus.

This Jū/Wãsi, Nyae Nyae !Kung and Jū /'hoansi asterism "//kanosi" is the IAU constellation Orion (Alcock 2014). The belt of Orion is three zebras (see Three Zebras, below).

Group of Stars (Thrown into the Sky):

This !Xõ asterism "Kanandura" ("a group of stars thrown into the sky by God") is the Pleiades cluster in the IAU constellation Taurus.

Group of Theodosius:

This is a Welsh name for the Pleiades cluster in the IAU constellation Taurus as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). This is probably a reference to Theodosius of Bithynia (169 – 100 B.C.E.), an astronomer and mathematician. Freer (2004) lists this as "Theodosius' Group".

Group of Three Stars:

This Shona asterism "Chimutatu" is the belt of Orion in the IAU constellation Orion.

Group of Women:

This Pitjantjatjara asterism "Kunkarunkara" or "Kungkarangkara" is the Pleiades cluster in the IAU constellation Taurus (Clarke 2009, Hamacher and Norris 2011). They used it to determine when the breeding season of the Dingo was as they used the pups as a food source. It was also used as an indicator of frost season. They are being chased by the hunter "Nirunya" or "Njiru" (see Hunter, below), whom they constantly outsmart. Compare this to Seven Young Sisters, below.

This Mutitjulu asterism "Kungkarungkara" is the Pleiades cluster in the IAU constellation Taurus (Clarke 2015). Compare this to Seven Young Sisters, below.Their rising marks the beginning of the cold and dry nyinnga season (May to September).

This Yankunytjatjara asterism "Kunkarangkalpa" is the Pleiades cluster in the IAU constellation Taurus. Compare this to Seven Young Sisters, below.

Groups of Small Things Thrown into the Air:

This Dëne Suhne asterism is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021).

Grove of Blodenwedd:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909). Ian Freer (2004) in his article *The British Constellations* believed the "Grove of Blodeuwedd" to be the IAU constellation Cepheus.

Grown-up:

This Korean asterism "Eoleun" (어른) is a line of two stars in the IAU constellation Columba: Alpha (α) Columbae (Phact) and Beta (β) Columbae (Wazn).

Grumium:

See Snout, below.

Grus:

This tiny constellation contains the star Alpha (α) Gruis (Alnair) which is the 31st brightest star and Beta (β) Gruis (Tiaki) which is the 62nd brightest star. The stars of this constellation show up in 72 asterisms in this handbook.

This IAU constellation (IAU abbreviation Gru), "the crane", was one of twelve constellations identified by the Flemish astronomer Petrus Plancius (1552 – 1622) in 1592 based on the observations of Dutch navigator and uranographer Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1565 – 1599) using some stars previously assigned to Piscis Austrinus. De Houtman originally called it "Den Reygher" ("the Heron"). It first appeared on globes by Plancius published in Amsterdam by

cartographer Jodocus Hondius (1563 – 1612) in 1598, 1600 and 1601 under the name “Krane” with a subtitle with the Latin name “Grus” (“crane”) and, though this was changed to “Crane” on Hondius’ 1601 globe.

Dutch historian Paulus Merula (1558 – 1607) listed it as “Phoenicopterus” and “Rondtvleugel”.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts a crane in flight for this constellation but the image that I was working from did not reveal which name was used for this constellation.

When Dutch uranographer Willem Blaeu (1571 – 1638) listed it on his globe in 1603, and when Johann Bayer listed it in 1603 in his *Uranometria*, they used “Grus” as the name.

German uranographer Johann Bayer (1572 – 1625) depicts “Grus” in his *Uranometria* in 1603 as a flying crane.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Grus” as a crane standing facing to our left.

“Grus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a crane in flight as viewed from below.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Grus” for this constellation.

“Grus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a crane in flight as viewed from below.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Grus” as a crane in flight as viewed from above.

Grus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Grus as a bird walking with its wings outstretched.

Edward Sherburne lists Grus in his *Sphere of Marcus Manilius* in 1675.

Grus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted as a heron on his southern star chart of 1678.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Grus” as a heron about to take flight. Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts “Grus” as a heron about to take flight. The star lines are depicted as follows:

- Its “head” is Gamma (γ) Gruis,
- Its “neck” is a line running from Gamma (γ) Gruis through Lambda (λ) Gruis to Delta (δ) 1 Gruis,

- Its “body” is a line from Delta (δ) 1 Gruis to Beta (β) Gruis,
- One “wing” is a triangle made by Delta (δ) 1, Beta (β), and Alpha (α) Gruis (Alnair),
- One “wing” is a quadrilateral made by Delta (δ) 1, Beta (β), Iota (ι) and Theta (θ) Gruis, and
- Two lines run out from Beta (β) Gruis to form “legs”:
    - One to Zeta (ζ) Gruis, and
    - One to Epsilon (ε) Gruis.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Grus” as a heron in flight.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, label this constellation “Columba Noachi” and depict it as a dove in flight.

Grus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Grus as a crane taking flight to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Grus” as a crane taking flight.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Grus as a crane taking flight.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Grus as a crane in flight.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “la Grue” as a heron in flight as viewed from below.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Grue” as a heron in flight.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Grus” as a crane taking flight.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Grue” as a crane taking flight, as does the 1778 edition.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Grus” as a heron about to take flight.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Grus” as a crane taking flight.

Grus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Kraanvogel” (“crane”): It is depicted as a crane in flight.

American uranographer William Croswell (1760 – 1834) depicts Grus on his *Mercator Map of the Starry Heavens* in 1810 as a heron standing with wings spread.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Grus" in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Grus the Crane" as a heron with wings spread.

"Grus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation simply as "Crane".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Grus, The Crane" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Grus" and describes it as a "Crane", incorrectly attributing it to Bayer.

Grus is depicted on standard IAU charts this way:

- The "body" is a five-sided figure made up of Alpha (α) Gruis (Alnair), Beta (β) Gruis (Tiaki), Iota (ι) Gruis, Theta (θ) Gruis, and Delta (δ) 1 and 2 Gruis.
- The "neck" runs from Alnair through Lambda (λ) Gruis and HIP 108543 to a "beak" at Gamma (γ) Gruis, and
- Two lines forming "legs" run out from Tiaki:
    - One to Zeta (ζ) Gruis, and
    - One to Epsilon (ε) Gruis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict in Grus their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of stars running from Gamma (γ) Gruis through HIP 108543, Lambda (λ) Gruis, Mu (μ) 1 and 2 Gruis, Delta (δ) 1 and 2 Gruis, Beta (β) Gruis, and Epsilon (ε) Gruis to Zeta (ζ) Gruis. A single line runs from Delta (δ) 1 and 2 Gruis to Alpha (α) Gruis (Alnair).

Sky and Telescope Magazine, founded in 1941, depicts Grus in a similar fashion to Hlad et al in their magazine and publications:

- The "body" of Grus is a triangle made up from Alpha (α) Gruis (Alnair), Beta (β) Gruis, and Delta (δ) 1 and 2 Gruis, and
- Two lines form "wings":
    - One runs from Beta (β) Gruis through Epsilon (ε) Gruis to Zeta (ζ) Gruis, and
    - One runs from Delta (δ) 1 and 2 Gruis through Mu (μ) 1 and 2 Gruis, Lambda (λ) Gruis and HIP 108543 to Gamma (γ) Gruis.

Grus Quartet:

This **telescopic** asterism is a quartet of galaxies in the IAU constellation Grus which were discovered by James Dunlop in 1826. The galaxies in this cluster are:

- Barred spiral galaxy NGC 7552
- NGC 7599
- NGC 7590
- Spiral galaxy NGC 7582

This is also known as the Four Horse Chariot Team of Grus (see above).

Guahayona:

This **telescopic** Taíno star "Guahayona" is the K type star HAT-P-26 in the IAU constellation Virgo (magnitude 11.76). It received this name in the IAU's NameExoWorlds competition in 2022. Guahayona is a mythological hero who was "the one who shone with his own light" and is identified with the morning star and Venus. It has an exoplanet, HAT-P-26b, "Guataubá", which is named for the herald of impending hurricanes and who brought clouds, lightning, and thunder.

Guanaco:

There are two Mapuche asterisms by this name:

- One, "Mañke", is stars of the IAU constellations Sagittarius and Scorpius (Catricheo 2022). This is the "tail" of Scorpius plus two stars from Sagittarius: Theta (θ), Iota (ι) 1, Kappa (κ), Lambda (λ), and Upsilon (υ) Scorpii and Eta (η), Epsilon (ε), Delta (δ), and Gamma (γ) Sagittarii.
- One, "Luan" or "Poxo Luan" is made up of stars of the IAU constellations Centaurus and Lupus (Menares 2008):
    - The "head" is Epsilon (ε) Centauri,
    - The "neck" is Epsilon (ε) and Zeta (ζ) Centauri,
    - The "back" is Zeta (ζ), Mu (μ), and Nu (ν) Centauri,
    - The "feet" are Eta (η) Centauri and Alpha (α) Lupi

NOTE: The guanaco is a camelid, related to camels and llamas, which is found in South America.

Guard:

This Egyptian Dendera star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Hoffman 2017) and is part of their asterism Tawaret (see below).

Guard of the North:

This Arabic star "Al Ḥāris al Samā'" or Al Haris Al-Sama" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes:

- Boötes was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) with the name "Hāris al-Shamāl" as well as the names "Al-'Awwā", "al-Sayyāh", and "al-Naqqār".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Háris as semá, keeper of heaven."

Guard of the Sun:

This Chinese xing guan Tàiyángshǒu (太阳守) is the star Chi (χ) Ursae Majoris in the IAU constellation Ursa Major. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained

unchanged in later Chinese sky lore. The IAU approved the name Taiyangshou for Chi (χ) Ursae Majoris.

This Chinese Chenzhuo xing guan "Taiyangshou" is the star Psi (ψ) Ursae Majoris in the IAU constellation Ursa Major.

Guardian Messenger:

This Chaldean star "Papsukal" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Guardian of Arcturus:

This Latin asterism "Arcturi Custos" is the IAU constellation Boötes as listed in the 15th century *Alfonsine Tables*. This is related to an earlier name of the star Arcturus (see Guardian of the Bear, below).

Guardian of Europe:

This Latin asterism "Custos Europae" is the IAU constellation Canis Major.

Guardian of the Bear:

This Greek star "Ἀρκτοῦρος", "Arktoúros", or "Arktouros" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. The name has been used since the time of Hesiod (c 700 B.C.E.), when he listed it in his *Works and Days*. It was replaced by Arabic names, but the name was revived during the Renaissance. This is related to their asterism and star Arcas (see above). Originally the name was used by Hesiod, Aratus (315 – 240 B.C.E), and Ptolemy (c.100 – c.170) for the entire constellation, but eventually it became used for the star Arcturus and another name used by Hesiod, "Arktofýlax" or "Arctophylax" was used for the constellation instead (see Bear Watcher, above) This led to uranographers using both names of the asterism up until the 18th century and combinations such as "Carlwaynesterre", which is a combination of the asterism Men's Wagon (see below) and this star:

- 1st century Roman architect Vitruvius called it "Custos" ("guardian") and "Custos Arcti" ("close guardian".
- The Roman poet Ovid (b. 43 B.C.E.) called it "Custos Erymanthidos Ursae" ("Guardian of the Erymanthian Bear").
- English scholar and translator John Wycliffe (c. 1320 – 1384) lists it as "Arture" in a translation of Amos v.8, and Cornish translator John Trevisa (1342 – 1402) lists it as "Arthurus" and other variations of the name include "Arturis", and Ariture".
- English author Geoffrey Chaucer (c.1340s – 1400) listed Arcturus as "Arctour".
- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as "Alrameth".
- German uranographer Johannes Stöffler's Constance Celestial Globe (1493) lists this star as "Arcturus".
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists "Arcturus" for this star.
- The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) lists "Arcturus".
- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) lists this star as "Arture" and "Alramec".

- Johannes Kepler's *Stella Nova in Pede Serpentarii* (1606) lists this star as "Arturo".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Arcturus".
- German astronomer Johann Bayer (1572-1625) listed it as "Arcturzona".
- The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) list the names "Arctophylax" and "Bootes" for this constellation.
- "Arcturus" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- *The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678* by English uranographer James Clerk lists "Arcturus".
- French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760)
- French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) lists Arcturus.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists Arcturus.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Arcturus".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Arturo" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- William Herschel lists "Arcturus" in his *Catalogue of 500 new Nebulae* in 1802.
- American uranographer William Croswell (1760 – 1834) lists "Arcturus" on his *Mercator Map of the Starry Heavens* in 1810.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Arcturus".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Arcturus" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Arcturus" and his *Bedford Catalogue* in 1844 lists "Arctophylax, or bear keeper", but associates this name with the entire constellation. The name Arcturus was often used for the entire constellation.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Arcturus".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Arcturus": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists Alpha (α) Boötis as "Arcturus (Job ix. 9)".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Alpha (α) Boötis as "Arcturus".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Arcturus" and translates it as "Bear Driver".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Arcturus" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Arcturus" and describes it as "Guardian of the bear".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this star as "Arcturus… Gk. The Bearkeeper".

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th (1959) list "Arcturus" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Arcturus".
- This constellation is known in Germany as "Arctur" and to the Italians and Spanish as "Arturo".
- The IAU approved the name Arcturus for the star Alpha (α) Boötis.

Guardian of the Hesperides:

This Latin asterism "Custos Hesperidum" or "Hesperidum Custos" is the IAU constellation Draco and relates to stories of Draco guarding the Garden of the Hesperides. Johann Bayer's *Uranometria* (1603) lists "Hesperidum Custos". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Hesperidum Custos". Compare this to Ladon, below.

Guardians:

This asterism is the stars Beta (β) Ursa Minoris (Kochab) and Gamma (γ) Ursae Minoris (Pherkad), which are the two end stars in the "Little Dipper" asterism of the constellation Ursa Minor (see Little Dipper, above). They are called this as they are constantly circling Alpha (α) Ursae Minoris (Polaris). *The safegarde of saylers*, of Cornelius Antoniszoon (b. ca. 1499) translated out of Dutch into English by Robert Norman hydrographer in 1605 lists the "Guards".

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists the name "le Marins la Claire des Gardes" for the Little Dipper asterism.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) lists these stars as "Guardians" in his book *The Stars - A New Way to See Them* (1952). Compare this to Guardians of the Pole, below.

This Norwegian asterism "Vokterne" is the stars Beta (β) Ursa Minoris (Kochab) and Gamma (γ) Ursae Minoris (Pherkad), which are the two end stars in the "Little Dipper" asterism of the constellation Ursa Minor (see Little Dipper, above).

Guardians of the Pole:

This asterism is the stars Beta (β) Ursa Minoris (Kochab) and Gamma (γ) Ursae Minoris (Pherkad), which are the two end stars in the "Little Dipper" asterism of the constellation Ursa Minor (see Little Dipper, above). They are called the Guardians of the Pole as they are constantly circling Alpha (α) Ursae Minoris (Polaris):

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Guardians of the Pole" for these stars.
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists the star Gamma (γ) Ursae Majoris as "Guardian of the Pole".
- Compare this to Guardians, above.
- Jeffrey Corder lists this as Corder 2755.

Guards:

This Portuguese asterism “Las Guardas” or “Os Guarsas” (“the guards”) is the IAU constellation Crux as described by Portuguese navigator João Faras in 1500.

This Murrawarri asterism is the Pointer Stars (see Pointers below). These two guards are “Giduba:mbi” and “Dhadeba:mbi”, who are guarding the sacred fires (see Sacred Fires, below).

This Spanish asterism “Guardare” is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor as listed by English astronomical writer Thomas Hood (c. 1590). Compare this to the Arabic and Bedouin asterism Two Guards (below). English alchemist and translator Richard Eden (c.1520 -1576) in his 1572 translation of the *Arte of Navigation* written Spanish navigator Martin Cortés 1532 – 1589) gave the name “Guardians” or “Guardians of the North Pole”. *The Safegard of Saylers*, translated by the English mariner Robert Norman in 1632 from the rutter of Dutch navigator Cornelius Antoniszoon (1499 -c1557) lists these stars as the “Guards”, as does John Smith’s *The Sea-Mans Grammar* (1692). Italian astronomer Giovanni Batista Riccioli (1598 – 1671) listed it as “guardsmen” and “guardians”. American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists these stars as “the Guards”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Guardas”.

Guards of the North:

This Mayan asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper below).

Gudja:

See Water Goanna, below.

Gud’s Fairies:

This Saxon asterism “Gudssfeen” is the IAU constellation Lyra as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Guest House:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a twisting line of stars in the IAU constellations Camelopardalis and Cassiopeia: HIP 20266, 19177, BE Camelopardalis, CQ Camelopardalis (the determinative star), HIP 8362, 35 Cassiopeiae, HIP 5566, HIP 4572, and HIP 3951.

This Chinese xing guan “Chuánshè” (传舍) is a line of stars in the IAU constellations Camelopardalis and Cassiopeia: HIP 16292, 16281, 16228, and 13665, and 55 and 32 Cassiopeiae, and HIP 117371.

This Chinese Chenzhuo xing guan “Chuánshè” is a long curving line of stars in the IAU constellations Cassiopeia and Cepheus: From Alpha (α) Cephei (Alderamin) it runs through Xi (ξ) Cephei, 26 Cephei, Iota (ι) Cephei, HIP 113864, Omicron (ο) Cephei, 50 Cassiopeiae, and HIP 12273 to HIP 14862.

Guide:

This Ayt Xebbac asterism “Amanar” (Arabic “Elmecbuḥ”) is the IAU constellation Orion (Souag 2019).

Guide of the People:

This Ininew (Cree) star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Buck 2016).

Guide Star:

This German star "Leit Stern" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Guiding Star:

This Norse star "Leidarstjarna" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Persson 2022).

This Phoenician asterism "Parrasis" is the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899. Allen later names it "Doube or Dōbher (?), similar to the Arabian title" (a reference to the Arabic asterism Back of the Bear, see above) and that English mythologist Jacob Bryant (1715 – 1804) called it "Cahen ourah, whatever that may be".

This Hebrew asterism "Pharashah" is the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899.

Guiding Stars:

This Norwegian asterism "Ledestjernene" the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus. Compare this to Pointers, below.

Guitar:

This **telescopic** asterism is NGC 3561 (Arp 105), a pair of interacting galaxies in the IAU constellation Ursa Major. John Herschel listed it as h 835 and later as GC 2326 in his *General Catalogue* of 1864.It is also known as Ambartsumian's Knot (see above).

Gulf of Mexico Nebula:

This **telescopic** asterism is dark nebula is LDN 935 in the IAU constellation Cygnus. Size 150' X 40'. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024)

Gumala:

This **telescopic** Malay star "Gumala" is HIP 94645 (HD 179949) in the IAU constellation Sagittarius (magnitude 6.24). A Gumala is a magical bezoar stone found in snakes or dragons. It has an exoplanet named Mastika, which means "gem" or "precious stone".

Gum Nebula:

This **telescopic** asterism is emission nebula Gum 12 is in the IAU constellation Vela. It was named for its discoverer, Australian astronomer Colin Stanley Gum (1924 – 1960). *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the "Gum Nebula".

Guman:

This Wardaman star is Kappa (κ) Orionis (Saiph) in the IAU constellation Orion (Cairns and Harney 2003).

Gumball Cluster:

This **telescopic** asterism is the globular cluster Messier 12 (NGC 6218) in the IAU constellation Ophiuchus. It was discovered by French astronomer Charles Messier in 1764. Messier described it as a

"nebula without stars": One needs a telescope of at least 20 cm (8-inch) aperture to resolve the stars involved. It is listed in the General Catalogue of 1864 as GC 4238 and in John Herschel's catalogue as h 1971. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply calls this a "Ophiuchus Cluster".

Gungangman:

This Wardaman star is Gamma (γ) Cygni in the IAU constellation Cygnus (Cairns and Harney 2003).

Gunggun:

This Darkingjung asterism is the belt of Orion in the IAU constellation Orion (Jones 1993).

Gunibuu:

See Robin, below.

!Guonni:

This /Xam star "!Guonni" is either Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Tarazed) in the IAU constellation Aquila. This is part of their asterism the //kohai stars (see below). !Guonni and ≠ku-kyam (see Cape Daisy, above) are sisters of !Gaunu (see Great Star, above) which is the star Altair. We are currently unsure exactly which represents each sister. !Guonni is named for a //garraken flower which grows from a bulb.

Guramana:

This Wardaman star is Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Major (Cairns and Harney 2003).

Guugaarr:

This Euahlayi star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Fuller et al 2014).

Guyaru:

This Wardaman star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Cairns and Harney 2003).

Gwainbilla:

This Dharawal star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Bursill 2014).

Gwyn and Gwyrthur:

This Welsh asterism is the IAU constellation Gemini. They are the sons of Greidawl, the "rivals of May" who are battling in the sky.

Gyes:

This **telescopic** asterism "Gýes Erídani" is the intermediate spiral galaxy NGC 1232 (Arp 41) in the IAU constellation Eridanus. . It was discovered by in October 1784 by English astronomer William Herschel, which he listed as "II 258". It is GC 651 in the *General Catalogue* of 1864. This is O'Meara 11 in Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). This name appears in *The*

Catalogue of One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010). Gyes (sometimes written Gyges) is one of the three hekatoncheires, the hundred-armed giants figuring in the early phases of Greek cosmogony. It is also known as the "Eye of God" (see above).

Gypsy Moth Cluster:

This **telescopic** asterism is the open cluster NGC 5662 in the IAU constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752 and added to Scottish astronomer James Dunlop's catalogue in 1826. It is GC 3922 in the *General Catalogue* of 1864.

Gyre in the Hilt of the Sword:

This Latin asterism "gyrus ille in capulo ensis" is the Double Cluster (see above) as listed in the 1551 edition of the *Almagest*. This is listed on Stellarium as the "Sword Handle". This refers to the sword of Perseus. Compare this to Sword Hand of Perseus, below.

Gyulbudaghian's Nebula:

This is a variable reflection nebula (HH 215, GM 1-29) surrounding the star PV Cephei in the IAU constellation Cepheus. It was discovered by Armenian astronomer Armen Gyulbudaghian at the Byurakan Observatory in 1977.

Ha-niddam mi-shtei ha-surot:

This is a Hebrew name for Alpha (α) Librae (Zubenelgenubi) as listed in the star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985).

Ḥā-tchat:

This Egyptian decan "Ḥā-tchat" was in the IAU constellation Leo. In later Hellenistic texts it was named "ητητ" ("Ha-tet"). In the Testament of Solomon, it became "Leroel" or "Kumeatêl", the 2nd century B.C.E. Jewish philosopher Aristobulus of Paneas called it "Effraa", in Greek Hermeticism it became "Ipi", in Latin Hermeticism "Zachor", 4th century Roman astrologer Julius Firmicus Maternus called it "Sic", Cosmas of Maiuma (d. 760) called it "Isis", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Sithacer", and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "περοεογς" ("Peroeus"). It has been depicted as a naked man with a lunar crescent on his head and a scepter in his hand.

Ha'amonga 'o Maui:

This Tongan asterism is made up of stars of the IAU constellation Orion. The stars Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis, (Bellatrix), Kappa (κ) Orionis (Saiph) and Beta (β) Orionis (Rigel) form the corners. Inside is the asterism "Toloa" (see Wild Duck below).

ḫab-ba-tum:

This Akkadian asterism "ḫab-ba-tum" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mul lúsa-gaz.

Habasiranu Demon:

This Babylonian asterism "EN.TE.NA.BAR.HUM" from the MUL.APIN tablets (Anthony 1996) or "habasiranu" or "MUL.EN.TE.NA.BAR.GUZ" (Hunger 1992) from the *Astrological Reports to the Kings* (~900 – 600 B.C.E) is the IAU constellation Centaurus.

This Persian asterism “EN.TE.NA.MAS.SIG” or “habasiranu” from the Persian (Achaemenid) Period (539 – 331 B.C.E.) as listed in the K 250 and VAT 9418 lists is the IAU constellation Centaurus (Boll, 1918, Jeremias 1929). Ernst Weidner lists it as “en-te-na-bar-sig” in his *Fixsterne* in 1971

This Chaldean asterism “mul ha-ba-si-ra-nu” from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti. Koch-Westenholz defines it as “the mouse-like”.

This Akkadian asterism “Habasiranu” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or “ha-ba-si-ra-nu” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015)is the IAU constellation Centaurus.

This Sumerian asterism “[mu]len-te-na-bar-hum” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti.

Hadar:

See Settlement, below.

Hadari:

This Arabic star is Alpha (α) Phoenicis in the IAU constellation Phoenix.

Hadāri Causing the Swearing of a Bad Oath:

This Arabic star “al-zalīm wa-huwa hadāri al-muhnith yatlu’ qabla suhyal min matla’ihi” (“the ostrich: it is hadāri causing the swearing of a bad oath; it rises before suhayl at the same rising place”) is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus as listed in the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

Hades Supernova Remnant:

This telescopic asterism is SNR G288.2+5.6 in the IAU constellation Centaurus. This is next to A Centauri. This was discovered by amateur astronomers Aygen Erkaslan, Daniel Stern, Bray Falls, and Rob Fesen.

Hagrid’s Dragon:

This **telescopic** asterism is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as “VI 27” in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. In the 19th century it was known as Copeland’s Golden Worm, later named the Great Bird Cluster (see above) by Phil Harrington and as the “Sparrow” by South African astronomer Carol Botha. More recently astronomers who are fans of J. K. Rowling’s *Harry Potter* series named it Hagrid’s Dragon. This is O’Meara 36 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007), which lists the names “Hagrid’s Dragon”, “Romulan War Bird”, and “Klingon Battle Cruiser”.

Hair:

This French asterism “Chevelure” is the IAU constellation Coma Berenices. French astronomer Joseph Jérôme Lefrançois de Lalande (1732 –1807) gave it the Latin name “Capilli” (“hair”).

This Italian asterism “Chioma” is the IAU constellation Coma Berenices.

This German asterism “Haupthaar” is the IAU constellation Coma Berenices.

This Belarussian asterism “Valosny”, “Valoski”, “Valasazhar”, or “Czary-valasazhary” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009). Avilin writes that these are believed to be names of the wives of the God Veles in some myths and that “a surviving legend from the Horvats tells of seven vil, souls of deceased brides who live in the Pleiades and take part every night in khorovod (walking in a circle holding hands with each other)”.

Hair Braids:

This Arabic asterism “adh-dhawa’ib” (الذوائب), meaning “hair braids” or “flowing locks of hair” is a cloud of stars attached to a curve of stars in the IAU constellation Orion:

- The cloud of stars is 1110 Tauri to 137 Tauri.
- The curve or “braid” starts at 15 Orionis, it runs through 11 Orionis, Omicron (o) 2 Orionis, Pi (π) 2, 3, 4, and 5 Orionis, ending at Pi (π) 6 Orionis.

Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) lists this as “Dhawā’ib al-Jauzā’” and describes it as the curve of the stars Pi (π) 1, 2, 3, 4, 5, and 6 Orionis in the IAU constellation Orion in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Hair on the Tail:

This Arabic and Bedouin manzil “ʾAl-Ghafr” (ٱلْغَفْر) or “Al-Ġafr” (الغفر) is in the IAU constellation Virgo and is the stars Iota (ι) Virginis (Syrma), Kappa (κ) Virginis, and Lambda (λ) Virginis. This asterism was described by Persian astronomer az-Zajaz. This is a very old Arabic name and opinions on the translation vary. One is that this is the downy hair on the back of a neck which is hard to see, the other translation is “to conceal, cover, or hide” or “concealment”. As these stars are faint, both translations seem to fit. Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) described this asterism as the neck armor (“mighfar”) of their asterism “al-‘aqrab” (see Scorpion, below). Az Zijaz and al Biruni both suggest that Ibn Qutayba (d. 889 C. E.) mentioned this asterism:

- German astronomer Christian Ludwig Ideler (1776 – 1846) listed it as “Elgafar” in his 1838 book *Investigations on the Origin and Significance of the Names of Stars,* describing this manzil as made up of the stars Phi (ϕ), Iota (ι), and Kappa (κ) Virginis.
- W. Brennand lists this as “Al-Gaphr” in his *Hindu Astronomy* in 1896.
- The IAU Working Group on Star Names approved Elgafar as the name for the star Phi (ϕ) Virginis A in 2018. It is also known as Algafar II.

This Yemeni manzil “Ghafr” is the stars Iota (ι) Virginis, Kappa (κ) Virginis, and Lambda (λ) Virginis in the IAU constellation Virgo (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Hairbrush:

This Sumerian asterism is the Pleiades cluster in the IAU constellation Taurus (Boutet 2014).

Hairy Eyebrow:

This **telescopic** asterism is NGC 4526, a lenticular galaxy with a prominent dusty disk in the IAU constellation Virgo. It is also known as the Lost Galaxy (see below). It was discovered by English astronomer William Herschel in April 1784, who listed as two objects: “I 31” and “I 38”. It is GC 3075 in

the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Supercilióosa Vírginis” (“heavy eyebrow”). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists it without a name. It is also known as the “Lost Galaxy”.

Hairy Head:

This Chinese Chinese xiù (lunar mansion) “Mao” (昴) or “Mǎoxiù” (昴宿) was mentioned in the *Shangshuyaodian* 尚书尧典 (*Canon of Yao* of the *Book of Documents*), a collection of political documents from the legendary Emperor Yao, founder of the Han Dynasty. It is the Pleiades cluster in the IAU constellation Taurus. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Mao” was associated to matters concerning the Jizhou territory. In the Tang Dynasty it was compared to the Vedic nakshatra Kṛttikā (Kotyk, 2017, see Cutters, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Mǎoxiù” is the open cluster Messier 45, the Pleiades cluster in the IAU constellation Taurus.

Hairy One of Ursa Major:

This **telescopic** asterism “Hirsútus Úrsae Majóris” is the spiral galaxy NGC 3780 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as “I 227”. It became GC 2476 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the rather ‘hairy’ aspect of this spiral galaxy with its many, thin and fragmented arms”.

Half a Heart:

There are two **telescopic** “half a heart” asterisms:

- One is in the IAU constellation Lyra and is Leiter 12 on astronomer Frank Leiter’s list of asterisms. Its size is 1.5’ X 08’. The stars are 12th magnitude or fainter. It is next to the edge on galaxy UGC 11372.
- One is Ennis 13 in the IAU constellation Lyra. This is an arc of seven stars near Beta (β) Lyrae (Sheliak). The curve of the “half heart” starts at the double stars HIP 92829 and HIP 92833 and runs through HIP 92933 and the double star HIP 92932, Gaia DR3 2092032978811450368, SAO 67604, and SAO 67592 to HIP 92696. The “middle line” of the heart runs from HIP 92696 through SAO 67536, Gaia DR3 2092206495489325056, and SAO 67554 to HIP 92829. NOTE: This is next to another Half a Heart asterism, Leiter 12, which is much smaller.

Half Beast:

This Latin asterism “Semi Fer” is the IAU constellation Centaurus.

- Johann Bayer’s *Uranometria* (1603) lists “Semifer”.
- “Semifer” is listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Half Breed:

This Hungarian asterism “Félkenyér” is probably the stars of the IAU constellation Corona Borealis. This is part of the end of a wagon handle. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as the end of the shaft of Göncöl's Wagon (see above).

Half Folded Fan:

This **telescopic** asterism is Berkeley 3 (Stock 24) in the IAU constellation Cassiopeia. Robert Zebahl lists it on his *Faint Fuzzies* website. Size 4’ X 4’. René Merting describes it as “roughly arranged in a triangle… looks like a half-folded fan, the brightest star is at the top where the fan converges”.

Half Man:

There are two Latin asterisms with the name “Semi Vir” or “Semivir”:

- One is the IAU constellation Centaurus.
- One is the IAU constellation Sagittarius as listed by R. H. Allen’s *Star Names* in 1899.

Half the Course of the Sun Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the eighth month, Simivisonnios (“half the course of the Sun”) is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Benigni). Their PRIN for the seventh month “Giamonios” (see Beginning of Darkness, above) is also Altair. Compare to their asterism Semiuisoni Prinnios (see Twins, below).

Hall:

This Norse asterism is made up of stars of the IAU constellation Ophiuchus and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006).

Hall of Glory:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Leo: Phi (ϕ) Leonis (the determinative star), 87 Leonis and Upsilon (υ) Leonis.

This Chinese xing guan “Míngtáng” (明堂) is a triangle of stars in the IAU constellation Leo: Tau (τ), Upsilon (υ), and 87 Leonis.

This Chinese Chenzhuo xing guan “Míngtáng” is a bent row of three stars in the IAU constellation Leo: Nu (ν) Leonis, 87 Leonis, and Phi (ϕ) Leonis.

Halley’s Coronet:

This **telescopic** asterism is NGC 1532, an edge-on barred spiral galaxy in the IAU constellation Eridanus. It was discovered by Scottish astronomer James Dunlop in October 1826. It is GC 823 in the *General Catalogue* of 1864. Interaction with the amorphous dwarf galaxy NGC 1531 has resulted in plumes of stars above the disk of NGC 1532. It is named after English astronomer Edmond Halley (1656 – 1742). It is also known as “Embracing of Eridanus” (see above).

Haloed of Reticulum:

This **telescopic** asterism “Halonáta Retículi” is the lenticular galaxy NGC 1574 in the IAU constellation Reticulum. It was discovered in 1834 by English astronomer John Herschel who listed it as 2640 in his

catalogue and later as GC 850 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Halved Horse:

This asterism "Equus Dimidiatus" is the IAU constellation Pegasus. This name is listed in Johann Bayer's *Uranometria* (1603). Geminus of Rhodes (1st century B.C.E.) described it as the "fore part of a horse according to Hipparchus". It was often referred to in the earliest texts as cut in two or incomplete with adjectives such as "Dimidiatus" ("halved") and 5th century Greek poet Nonnus referred to it as the "half visible Libyan horse". Danish astronomer Tycho Brahe described it as "Equi Sectio" ("horse's section").

Hamal:

See Head of the Ram, below.

Hamburger:

There are two **telescopic** "Hamburger" asterisms:

- One is NGC 3628, a spiral galaxy with a prominent dust lane in the IAU constellation Leo. This was discovered by English astronomer William Herschel in 1784 who listed it as "V 8" in his catalogue. It is GC 2378 in the *General Catalogue* of 1864. It is also known as King Hamlet's Ghost (see below), Sarah's Galaxy (see below), "King Hamlet's Ghost" (see below), the "Northernmost of the Triad of Leo" (see below) and the Vanishing Galaxy (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 58 and lists the names "Hamburger Galaxy" and "Sarah's Galaxy".
- One is the galaxy NGC 5128 (Caldwell 77) in the IAU constellation Centaurus. This was discovered by Scottish astronomer James Dunlop in 1827 who listed it as h 3501. It is GC 3525 in the *General Catalogue* of 1864. It is an edge on galaxy that got this name due to its prominent dust lane. South African astronomer Auke Slotegraaf (1981) lists this galaxy under this name. As a prominent radio source, it is known as Centaurus A.

Hammer Stars:

This Semelai asterism "Bintang Kukul" is the Big Dipper asterism in the IAU constellation Ursa Major (Jaafar and Khairuddin 2014).

Hammerer of Draco:

This **telescopic** asterism "Malleátor Dracónis" is the spiral galaxy NGC 3147 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as "I 79". It became GC 2024 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "the remarkable hammer-like feature at the west side of this galaxy".

Hammerhead Shark:

This Kiribati asterism "Ánoi" is five stars at the "tail" end of the IAU constellation Scorpius (Trussel and Groves 1978): Upsilon (υ), Lambda (λ), Kappa (κ), Iota (ι) 1, Theta (θ), Eta (η), Zeta (ζ) 1, Mu (μ) 1, and Epsilon (ε) Scorpii.

Hammon:

This asterism is the IAU constellation Aries as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a man with horns carrying a staff in each hand and also gives the name "Amun" (see Amun, above). Aries did not appear at all in ancient Egyptian skies and its stars appeared as part of the asterism Sheep (see below) in Seleucid skies. Baal Hammon was the chief God of Carthage. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennan writes that the "Ram was assimilated to Jupiter Ammon" by Macrobius. Brennand writes that "the Ram was an animal consecrated to the Egyptian Neitha, a goddess who presided over the Upper Hemisphere, whence Aries was dedicated to her". Neitha is an Egyptian archer Goddess of war, creation, funerals, and motherhood from the Predynastic Period (c. 6000 – 3150 B.C.E) to the time of Ptolemy (c.100 – c.170) and I can find nothing that associated her with a ram.

Hammosciush:

This Hebrew asterism "Hammosciush" is the IAU constellation Triangulum as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and John Hill's *Urania* in 1754. R. H. Allen lists "Shālīsh" in his *Star Names* in 1899.

Hamstring:

This Arabic star "al-ʿArqūb" (العرقوب) is the binary star Beta (β) Sagittarii in the IAU constellation Sagittarius:

- "'Urqūb al-Rāmī" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Arkab" and "Urkab".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "urqūb al-rāmī" and the Hebrew name "qarsol ha-qeshet ha-semoli".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "'urqūb al-rāmī al-aysar".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "urkab ur ramih": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- NOTE: The IAU has assigned the name Arkab Prior to Beta (β) 1 Sagittarii and Arkab Posterior to Beta (β) 2 Sagittarii.

Hán:

This Chinese star "Hán" from the 3 Kingdoms and Ming Dynasty Period is the star Zeta (ζ) Ophiuchi in the IAU constellation Ophiuchus and is part of their xing guan Heavenly Market West Wall (see below).

Hance:

This "Arabic" asterism "Hance", "Al Hance" or "Al Tahin" is the IAU constellation Sagitta as listed in John Hill's *Urania* in 1754.

Hand:

This Kumeyaay asterism is the IAU constellation Corona Borealis.

This Vedic nakshatra (lunar mansion) “Hasta” is in the IAU constellation Corvus and is the stars Alpha (α) Corvi (Alchiba), Beta (β) Corvi (Kraz), Gamma (γ) Corvi, Delta (δ) Corvi, and Epsilon (ε) Corvi (Bhagwath 2019). It is related to their deity Saviti or Surya. In 2019 Leitz lists “Hasta” as appearing in the *Atharveda*, but in one place identifies this as “the star Carvi” (probably mistaking the suffix Corvi as a star name and misspelling it) and elsewhere as Alpha (α) Cancri. Leitz writes that it appears on the nakshatra list of the scholar Varahamihir. Ivanković (2021) lists this as “Hásta” from the Rig Veda and “Hástah” from the *Taittirīya Brāhmana*, describes it as the constellation Corvus, and relates it to the solar God Savitar. W. Brennand lists this as “Hasta” in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists its symbols as either a hand or a fist.

This Myanmar nekkhat (lunar mansion) “Hathada” (ဟဿဒ) is in the IAU constellation Corvus and is

the stars Alpha (α) Corvi (Alchiba), Beta (β) Corvi (Kraz), Gamma (γ) Corvi, Delta (δ) Corvi, and Epsilon (ε) Corvi.

This Tibetan gyukar (lunar house) “Me Zhi” or “Mezhi” is in the IAU constellation Corvus and is the star Delta (δ) Corvi (Johnson-Groh 2013).

This Dakota/Lakota/Nakota asterism **“**Nape” is made up of the stars of the IAU constellations Orion and Eridanus. The “arm” starts at Alpha (α) Orionis (Betelgeuse) and runs down to the “wrist”, which is the three stars of the belt of Orion with the “fingers” spreading out with the “little finger” being the sword of Orion, the “middle finger” ending at the star Beta (β) Orionis (Rigel), and the “thumb” ending in Beta (β) Eridani (Cursa).

This **telescopic** asterism is the open cluster NGC 3114 in the IAU constellation Carina. It was discovered by Scottish astronomer James Dunlop in 1827 who listed it as h 3224 in his catalogue. It is GC 2007 in the *General Catalogue* of 1664. An oval of stars at one side is the “palm” and five lines of stars radiating out from it the “fingers”. Auke Slotegraaf (2008) attributes this name to astronomer Dieter Willasch. It is also known as the Spider (see below), or the Octopus (see below).

Hand Before:

This star “Yed Prior” is Delta (δ) Ophiuchi in the IAU constellation Ophiuchus. “Yed” is the modern Arabic name, derived from “yad” (يد), meaning hand, and this is combined with the term Prior to indicate that it leads Epsilon (ε) Ophiuchi (Yed Posterior) across the sky. Another name for this is Palm of Al Awwa (see below):

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists this as “IED” (Dekker 2000).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this as “Yed”.
- Johann Bayer’s *Uranometria* (1603) lists this star as “Yed”.
- This is listed in the abbreviated form “Yed” in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Yed Prior, from the Arabic word yed, the hand.”
- NOTE: John Raymond has named this asterism “Yed Prior” on his list and Jeffrey Corder has it as Corder 3021.

- In 2016 the IAU approved the name Yed Prior for Delta (δ) Ophiuchi.

Hand Behind:

This star "Yed Posterior" is Epsilon (ε) Ophiuchi in the IAU constellation Ophiuchus. "Yed" is the modern Arabic name, derived from "yad" (يد), meaning hand, and this is combined with the term Posterior to indicate that it follows Delta (δ) Ophiuchi (Yed Prior) across the sky:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Yed Posterior… from the Arabic word yed, the hand".
- In 2016 the IAU approved the name Yed Posterior for Epsilon (ε) Ophiuchi.

Hand of al-Jauzā:

This Arabic star "Yad al-Jauzā'" (يد الجوزاء) or "yad ul-Jawzā'" is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. When translated to Latin in the 13th century the translator mistook "ya" as "ba", which led to the latinized name "Betelgeuse". There are four different opinions on how this name should be pronounced, depending on whether the first "e" is pronounced short or long and whether the "s" is pronounced as "s" or "z":

- "Yad al Jauzā'" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Variations include "Bed Elgueze", "Beit Algueze", "Bet El-geuze", "Beteigeuze", "Betelguese", "Betelgeuze", and "Betelgeux".
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "Bedelgeuze" (Dekker 2000).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "yad al-jawzā'".
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists "Bedelgeuze".
- The *Alfonsine Tables* of the 15th and 16th centuries listed "Beldengenze" or "Beldelenze" (Kunitzsch 1986).
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) list this star as "Betelgeuze".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed "Bectelgeuze" and "Bedalgeuze".
- Robert Hues lists "Ied Algeuze", "Bed Elgeuze", and "Bet Elgeuze" in his *A Learned Treatise of Globes* in 1659.
- "Betelgeuse" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Betelgeuse".
- American uranographer William Croswell (1760 – 1834) lists "Betelgeuze" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Betelgeux" in his *Celestial Atlas* in 1822.

- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Betelgue": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Prolegomena* in 1844 lists "Betelgeuse" and his *Bedford Catalogue* in 1844 lists "ibt-al-jauzá, the giant's axilla, or shoulder".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Betelgeuse".
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Betelgeuse".
- R. H. Allen lists it as "Ibt al Jauzah" and "Betelgeuze" in his *Star Names* in 1899 and translates it as "armpit of the central one" and others have translated it as "hand of the central one".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Betelgeux".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Betelgeuz".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Betelgeuse" and incorrectly translates it as "martial star".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Betelgeux" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Betelgeuse" and describes it as the "armpit of the giant".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Betelgeuse".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Betelgeux" and "Betelgeuse" for this star, but the 14th edition (1959) only lists "Betelgeuse" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Betelgeuse" for this star.
- The IAU approved the name Betelgeuse for Alpha (α) Orionis Aa.

Hand of God:

This **telescopic** asterism is planetary nebula PSR B1509-58 is in the IAU constellation Circinus. It was discovered in 1982 by the Einstein X-Ray Observatory.

Hand of the Crook:

This Seleucid star is Theta (θ) Aurigae in the IAU constellation Aurigae and is part of their asterism Crook (see above).

Hand with a Bangle:

This Tibetan khyim (zodiac constellation) "Lak-Sur" is made up of stars in the IAU constellation Scorpius (Johnson-Groh 2013): Alpha (α) Scorpii (Antares) is the "wrist", with "fingers" going out to Psi (ψ) Scorpii, Nu (ν) Scorpii, Beta (β) Scorpii (Acrab), Delta (δ) Scorpii, and Eta (η) Scorpii.

Handcart (that Lost its Wheels):

This **telescopic** asterism is in the IAU constellation Andromeda and is Ennis 26 on the observing list of Canadian astronomer Charles Ennis. The "carrying base" of the handcart is formed by an "L" shaped arrangement of the three stars Sigma (σ) Andromedae, Rho (ρ) Andromedae, and Theta (θ)

Andromedae. The "handle" is a loop of five stars: HIP 525 and 714 and the double stars HIP 508A, HIP 626, and HIP 737. The handcart has lost its "wheels" which are the nearby Andromeda Galaxy (M 31) and M 110. NOTE: The three stars of the "carrying base" are Corder 78 on the observing list of American astronomer Jeffrey Corder.

Handful:

This K'iche' asterism "Mot" or "Motz" is both the Hyades and Pleaides star clusters in the IAU constellation Taurus. To the K'iche' the Pleiades represent a handful of maize kernels and the Hyades a handful of beans. The evening setting of the Pleiades in March indicates the beginning of the planting season for high altitude maize, and the planting of low altitude maize by the conjunction of the Pleiades with the Sun in May. They begin ploughing when the Pleiades reach the meridian shortly after sunset.

This Belarussian asterism "Kupki" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009).

Handgun:

There are two **telescopic** "Handgun" asterisms:

- One is open cluster Collinder 69 in the IAU constellation Orion. It is listed on the AstroHam blog of the William Brydone Jack Unit of the New Brunswick Centre of the RASC. Size 1° 10'.
- One is in the IAU constellation Pegasus and is Corder 4645 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is six 6^{th} – 8^{th} magnitude stars and some fainter stars including HIP 110092, 110166, and 110225.

Handle:

This Filipino (Mayayaw Ifugao) asterism "Balbala'ys Ilihan" is part of the Big Dipper asterism in the IAU constellation Ursa Major (Masong 2017).

This Māori asterism "Te Kakau", "Te Kakau a Maui" ("The Handle of Maui"), "Te Tira o Puanga" ("The Handle of Puanga" or "the handle of Rigel"), "Te Tuke o Tautoru", or "Te Tuke o Maui" is the three stars of the belt of Orion. This is the handle of an adze. It is also the glittering waters streaming back from the rear of Tainui's boat (see Sail of Tainui). It is also known as "Tautoru" (see below).

Handle of Antlia:

This **telescopic** asterism "Multianuláta Ántliae" is the barred lenticular ring galaxy NGC 3084 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3212 and later as GC 1987 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this "because of its southern arm" which to them resembled a handle.

Handlebar:

This **telescopic** asterism "Manubrian Nebula" is the planetary nebula Messier 27 (NGC 6853) in the IAU constellation Vulpecula. It was discovered by French astronomer Charles Messier in 1764. It is also known as the Diabolo Nebula (see above), the Double-Headed Shot (see above), the Dumbbell Nebula (see above), and the Apple Core Nebula (see above). Manubrian means "handle shaped". "Manubrio" ("handlebar") was posted on the Astrophotography Facebook page by Italian astrophotographer Sergio

Paganelli on 24 August 2025. It is also known as the Dumbbell Nebula (see above), Diabolo Nebula (see above), the Double-Headed Shot (see above), the Manubrian Nebula (see below), and the Apple Core Nebula (see above).

Hands of Nunki:

This Seleucid star "Nunki" is Gamma (γ) Velorum in the IAU constellation Vela which is one corner of their asterism Harrow (see above). Compare this to Star of Eridu, below.

Hanis:

This Babylonian star listed as "mul hanis" in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus and is part of the "foot" of their asterism Numushda (see below). Compare this to the Seleucid star Khanish. It is listed in the Babylonian star catalogue BM 78161 (Liechty 1988) as "hanis" but identified as the star Epsilon (ε) Centauri.

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "hanis" as listed by Ernst Weidner's *Fixsterne* in 1971 is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Hans the Dwarf:

This Holstein star "Hans Dümken" or "Hans Dünkle" is 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899 and Grimm in 1883. A Dümken is a Dwarf or Thumbkin and comes from the Lower German word "dümeke". The story goes that gave Jesus a ride and was allowed to drive across the sky forever astride the "Middle Horse" (Mizar). Allen translated the word as "dim witted", but that would actually be "dunkel". In 2020 Herman Bender speculated that an Anglo-Saxon name for Alcor may have been a "cognate of the words dümeke (dwarf), in Anglo-Saxon *dveorg* and Norse *dverger* (Cleasby and Vigussion 1874.110), and Dünkl/dunkel".

Hanumat:

This asterism is the IAU constellation Capricornus as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a dog headed man with a staff in his left hand and a leash in his right hand to which is attached a goat headed fish and also gives the name "Pan" (see Pan, below). Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. A dog or jackal headed figure is used in Egyptian hieroglyphics to represent their God Anubis, which they related to the stars of Canis Major, not Capricornus. There was no Hanumat in Egyptian mythology: Hanumat is a deity found in Jainism and Hinduism.

Hao-o-rua:

This Māori asterism is the sword of Orion in the IAU constellation Orion.

Hapi:

This Egyptian Dendera asterism is the IAU constellation Aquarius (Hoffman 2017), but it has been depicted as the Egyptian God of the Nile, Hapi.

Hapleturengh Mehen:

This "Persian" asterism is the IAU constellation Ursa Major as listed in John Hill's *Urania* in 1754.

Happiness:

This Bhutan star "Gakyid" is HIP 42446 (HD 73534) in the IAU constellation Cancer (magnitude 8.24). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet Drukyul, which is the land of the thunder dragon, a native name for Bhutan.

Happy Arabia:

This Latin star "Felix Arabia" is Alpha (α) Canis Major (Sirius) in the IAU constellation Canis Major. English Admiral Henry William Smyth lists this name in his *Bedford Catalogue* in 1844.

Haratan:

This Arabic star "Haratan" is Theta (θ) Centauri in the IAU constellation Centaurus.

NOTE: The name "Al Haratan" has been associated with the star Theta (θ) Leonis by some sources.

Harbinger:

This Zulu star "isAndulela" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Slotegraaf 2013, Holt and Slotegraaf 2022). It is a guide for shepherds, marking the time to begin travelling to new grazing grounds during the dry season.

This Latin star "Antecursor" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. It is a variation of their Antecanis (see Preceding the Dog, below).

Hard Flint Boys:

This Diné asterism "Beesh Ashiké" is the Pleiades cluster in the IAU constellation Taurus (Childrey 2008). These young warriors perform healing activities during the summer months.

Hard to Discern of Dorado:

This **telescopic** asterism "Dýscritus Dorádus" is the intermediate spiral galaxy NGC 1515 in the IAU constellation Dorado. It was discovered in 1826 by James Dunlop in 1826. It was listed as 2609 in John Herschel's list, and then as GC 811 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The name is a reference to its being nearly edge-on, making the spiral arms hard to see.

Hard to Understand of Perseus:

This **telescopic** asterism "Dysgnóstus Pérsei" is the spiral galaxy NGC 1003 in the IAU constellation Perseus. It was discovered in 1784 by William Herschel who listed it twice, once as "II 238" and once as "III 198". It became GC 571 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They gave it this name due to difficulty in interpreting it "morphologically".

Hardcastle's Galaxy:

This **telescopic** asterism "Hardcastle's Galaxy" or "Hardcastle Nebula" is PGC 45901, a spiral galaxy in the IAU constellation Centaurus. I was named for English astronomer Joseph Alfred Hardcastle (1868 – 1917), grandson of John Herschel.

Hardcastle Nebula:

See Hardcastle's Galaxy, above.

Hare:

This Greek asterism "Λαγῶς" ("Lagõs") or in the Epic dialect "Λαγωός" ("Lagoós") is the IAU constellation Lepus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest* (2nd century).

This Arabic name "Al'arnab" (الأرنب) is used for both the IAU constellation Lepus and for its star Alpha (α) Leporis:

- Lepus was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) as "al-Arnab" in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Arneb", "al-Arnab", "Alarnebet", "Elarneb", and "Harneb".
- Johann Bayer's *Uranometria* (1603) lists "Harneb" and "Elarneb".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Harneb" and "Elarneb".
- Robert Hues lists "Alarnebet" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists "Arneb" and "Arnebeth" as names for this constellation in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Arneb, from al-arneb, the hare".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Alpha (α) Leporis as "Arneb".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Arneb" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists Alpha (α) Arietis as "Sheratan".
- The IAU approved the name Arneb for Alpha (α) Leporis A.

This Hebrew asterism "Arnebeth" is the IAU constellation Lepus.

Hare Star:

This Anglo-Saxon star "harasteorra" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Hall 1916). This is a reference to it "chasing" the hare (the IAU constellation Lepus), which rises before Sirius.

Harem:

This Chinese star from the Three Kingdoms to the Ming Dynasty "Hougong" is 4 Ursae Minoris in the IAU constellation Ursa Minor.

This Chinese Chenzhuo xing guan “Hougong” is the star 4 Ursae Minoris in the IAU constellation Ursa Minor. It is part of their xing guan “Northern Pole”.

Haris:

This Czech star is Gamma (γ) Boötis in the IAU constellation Boötes as listed in Czech astronomer Antonín Bečvář's 1951 atlas *Atlas Coeli*. This may have been derived from the Arabic “Al-Haris Al-Sama” (see Guard of the North, above).

Harmonious Radiance:

This Chinese Chenzhuo xing guan “Shunguang” is the star HIP 92056 in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Harnessing Horses:

This Vedic nakshatra (lunar mansion) “Ashvini” (अश्विनी *aśvinī*) or “Aśvayúj” is in the IAU constellation Aries and is the stars Beta (β) Arietis (Sheratan) and Gamma (γ) Arietis. Ivanković (2021) lists this as “Asvinī”, translates this as “horse tamers”, and relates it to the Ashvini, the “horse twins” who are the physicians of the Gods. Ivanković also lists an earlier name as “Asvayújau” (See Horse Yoking, below). Bhagwath (2019) notes that the symbol of this nakshatra is a horse’s head and W. Brennand lists this as “Ashwini” in his *Hindu Astronomy* in 1896 and translates it as “a horse’s head”. In 2019 Leitz listed “Asvini” as appearing in the *Atharveda* but identifies this as “the star Arietis”: Of course, Arietis is a suffix which could be applied to any star in Aries. Leitz writes that the maharshi Parasara lists Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) and that the *Brhat Samhita* lists 3 stars. Leitz also lists “Asvini” as appearing on the nakshatra list of the scholar Varahamihir, calling Asvini “physicians to the gods”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Aswini, the horse’s head”.

This Myanmar nekkhat (lunar mansion) “Athawani” (အသဝဏီ) is in the IAU constellation Aries and is the stars Beta (β) Arietis (Sheratan) and Gamma (γ) Arietis.

This Tibetan gyukar (lunar house) “Tha Skar”, “Takar” or “Yugu” (Johnson-Groh 2013) is in the IAU constellation Aries and is the star Beta (β) Arietis (Sheratan).

Harp:

This English asterism is the IAU constellation Lyra as listed by Robert Hues in his *A Learned Treatise of Globes* in 1659.

This Teutonic asterism “Harapha” is the IAU constellation Lyra.

This Saxon asterism “Hearpe” is the IAU constellation Lyra.

This Irish asterism is the IAU constellation Lyra. This asterism is found in Julie Ormonde’s *Constellation Stories of Ancient Ireland* (2015).

This Venetian asterism “Harpa” is the IAU constellation Lyra as listed by bishop and poet Venantius Fortunatus (c. 530 – c. 609).

There are two Arabic asterisms with the name “harp”:

- One, “Al Lurā”, is the IAU constellation Lyra:

- This was later latinized into “Allore” (in the 1515 edition of the *Almagest*), “Alahore” and “Alohore” (in other 16th century editions of the *Almagest*), “Alloure”, “Alchoro” (in the 15th century *Alfonsine Tables*).
- Johann Bayer’s *Uranometria* (1603) lists the name “Alohor” for Lyra.
- John Hill lists “Lura”, “Alohor”, Alhador”, “Allore” and Alohore” in his *Urania* in 1754. Hill also gives “Alohor” as a name for Alpha (α) Lyrae (Vega).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Alohor… or Al lúrá”.

- One, “Al-Silyāq”, is the IAU constellation Lyra as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). This was corrected by Kunitzsch to “Salbāq” which is a type of harp (Kunitzsch & Smart 2006).

Harp Cluster:

This **telescopic** asterism is the open cluster NGC 2244 in the Rosette Nebula (Caldwell 49) in the IAU constellation Monoceros. English astronomer William Herschel rediscovered this open cluster in 1784 and listed it as “VII 2” in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster and the Satellite Cluster.

Harpocrates:

This Seleucid asterism is the IAU constellation Gemini as described by the rulers of Ptolemaic Alexandria, who adapted the Egyptian Gods Horus the Elder and Horus the Younger into this God of silence, secrets, and confidentiality.

Harrow:

This Babylonian asterism “Maskakatu” from the MUL.APIN tablets is made up of stars of the IAU constellations Carina and Vela. It is a circle of the stars Beta (β) Carinae (Miaplacidus), Epsilon (ε) Carinae, Theta (θ) Carinae, Mu (μ) Velorum, Lambda (λ) Velorum, and Gamma (γ) Velorum. Anthony Hope lists it as “GÁN.ÙR(.RA) (GISH.GÁN.ÙR)” and “mashkakatu” in his *A Guide to Ancient Near Eastern Astronomy* in 1996. It appears in later Seleucid sky lore.

This Babylonian and Sumerian asterism “gis-gan-gur” listed in the BM78161 star catalogue (Liechty 1988) is identical to the Babylonian asterism “Maskakatu”, above.

This Romanian asterism “Grapa” is the IAU constellation Ursa Minor (Ottescu 2009).

This Ukrainian asterism “Borona” (борона) is the “W” asterism of the IAU constellation Cassiopeia.

Harry Potter and the Golden Snitch:

This **telescopic** asterism is the open cluster NGC 7380 (SH 2-142, LBN 511, Cr 452, Ced 206) in the IAU constellation Cepheus. It was discovered by English astronomer Caroline Herschel in 1787 and listed by her brother William Herschel as “VIII 77”. It is GC 4842 in the *General Catalogue* of 1864. Recently fans of J. K. Rowling’s *Harry Potter* series gave it this name after the principal game piece of the game Quidditch. It is also known as the Wizard Nebula.

Hartebeests:

This San asterism is made up of stars in the IAU constellations Orion and Taurus. The star Alpha (α) Tauri (Aldebaran) is the male hartebeest and Alpha (α) Orionis (Betelgeuse) is the female hartebeest.

Harvest:

This Latin asterism “Arista” (“harvest” or “ear of corn”) is the IAU constellation Virgo.

- German astronomer Johann Bayer (1572-1625) lists the name “Arista” in is Uranometria (1603).
- “Arista Puella” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- German poet Philipp von Zesen (1619 – 1689) listed it as “Arista Puellae” (“maidens of the harvest”), which Allen points out should probably be the singular “Arista Puella”.
- R. H. Allen’s *Star Names* in 1899 lists “Arista“.

Harvest Keeper:

This asterism “Custos Messium” was created by French astronomer Jérôme Lalande in 1775 to honor astronomer Charles Messier. It is located in the stars between the IAU constellations Camelopardalis, Cassiopeia, and Cepheus and is next to another obsolete constellation, Rangifer (see Reindeer, below). This part of the sky had previously been known as the “Wheat Field” (see below), which probably inspired Lalande to choose this name for his asterism. He also called it “le Messier”.

German astronomers of the time called it “Erndtehüter”.

Scottish astronomer Alexander Jamieson (1782 – 1850) listed “Custos Messium” in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): He is depicted as a male in a toga wearing a laurel wreath and holding a shepherd’s staff in his left hand and a sickle in his right hand.

“Custos Messium” is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

Urania’s Mirror depicts a standing male wearing a laurel wreath, holding a sickle in his right hand and a shepherd’s crook in his left hand.

Harvester:

This Greek asterism “Τρυγετής” or “Trygetís” is the IAU constellation Boötes as described by Aratus (315 – 240 B.C.E) and is listed in R. H. Allen’s *Star Names* in 1899. Allen translates it as “vintager”.

Hassaleh:

Hassaleh is the star Iota (ι) Aurigae in the IAU constellation Auriga and appears under this name in Czech astronomer Antonín Bečvář's 1951 atlas *Atlas Coeli*. No connection to any language has been discovered for this name. The IAU approved the name Hassaleh for Iota (ι) Aurigae.

Hastorang:

This Persian star “Hastorang” (“watcher of the south”) is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus and is part of their asterism Four Guardians of Heaven (see above). Compare to the Zoroastrian asterism “Haftōring” (see General of the North, above).

Hasus Chail Rezmin:

This “Hebrew” asterism “Hasus Chail Rezmin” is the IAU constellation Pegasus as listed in John Hill’s *Urania* in 1754.

Hat of Zubenelgenubi:

This **telescopic** asterism the “Hat of Zubenelgenubi” is Hay-Merting 9 in the IAU constellation Libra. Robert Zebahl lists it on his *Faint Fuzzies* website. Its size is 30’ X 30’. Zebahl describes it as “a conspicuous formation of six stars of 7th to 9th magnitude in the shape of a cap or hat directly north of Alpha (α) Librae (Zubenelgenubi). René Merting refers to it in his description as “Zubs Hut” (“Zub’s Hat”). This includes the stars HIP 72769, 72676, and 72640. Jeffrey Corder lists this as a rough “U” and it is Corder 2724 on his list.

Hatchet:

There are two **telescopic** “Hatchet” asterisms:

- One is Lorenzin 23 on American astronomer Tom Lorenzin’s asterism list and is in the IAU constellation Sextans. Size 30’ X 30’. The straight line that forms the “handle” includes HIP 52856 and 52821
- One is in the IAU constellation Vulpecula and is Corder 4366 on the observing list of American astronomer Jeffrey Corder. Size 45’ X 15’. This is seven 7th – 9th magnitude stars. The “blade” includes the stars HIP 105129, 105161, 105344, and 105255. The “handle” is the line of stars HIP 105071, 105111, and 105435.

Hatching Hen and Her Chicks:

This Romanian asterism “Cloşca cu Pui” is the Pleiades cluster in the IAU constellation Taurus (Ottescu 2009, Lite, Lodina, and Ignat 2018). They also call it the Hen (see below).

This French is the Pleiades cluster in the IAU constellation Taurus (Ottescu 2009).

Hathor:

There are two Egyptian stars with this name:

- One is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holbrook 2020). This is found in the Circular Zodiac of the Temple of Hathor at Dendera (Holberg 2007, Bomhard 2009). Hathor, whose name means “house of Horus”, was a cow-headed Goddess who was the predominant Mother Goddess in Egypt before she was replaced by Isis. Compare this to the later Egyptian star Sopdet (see below).
- One is Alpha (α) Columbae (Phact) in the IAU constellation Columba as listed in the 19th dynasty Cairo Calendar (Hardy 2003).

Hathor Cow:

This Egyptian Dendera asterism is the IAU constellation Canis Minor (Hoffman 2017). Hathor was a major sky Goddess and one of her maternal aspects, as depicted here, is the cow.

Hatysa:

This is Iota (ι) Orionis in the IAU constellation Orion and appears under this name in Czech astronomer Antonín Bečvář's 1951 atlas *Atlas Coeli.* No connection to any language has been discovered for this name. The name Hatysa was approved by the IAU for Iota (ι) Orionis Aa.

Haunch:

This Medieval Latin star "Ancha" ("haunch" or "hip") is Theta (θ) Aquarii in the IAU constellation Aquarius. R. H. Allen lists Dutch uranographer Hugo Grotius (1583 – 1645) as the person who assigned this name to the star. "Ancha" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Ancha" and Bode's *Vorstellung Der Gestirne* (1782) also lists this star. A French variation of the name is "Hanche". The IAU approved the name Ancha for Theta (θ) Aquarii in 2016.

Haversack:

This Italian (Piedmont and Ligurian Alps) asterism "Portopan" is the sword of Orion in the IAU constellation Orion.

Havi:

This Estonian asterism is made up of stars in the IAU constellation Pisces (Kuperjanov 2006).

Having a Goat:

This Latin asterism "Habens oleniam capram" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below). The Roman poet Ovid (43 B.C.E. – 18 C.E.) lists this in his *Metamorphoses*.

Having a He-Goat:

This Latin asterism "Habens Hircum" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below). The Roman poet Ovid (43 B.C.E. – 18 C.E.) lists this in his *Metamorphoses*.

Having Goats:

This Latin asterism "Habens Capellas" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below). The Roman poet Ovid (43 B.C.E. – 18 C.E.) lists this in his *Metamorphoses*. Johann Bayer's *Uranometria* (1603) lists this as "Habenifer", and "Habens hircum capellas hoedos oleniam capram".

Having Horns:

This Greek asterism "Ἀιγοκέρως" or "Aigokéros" is the IAU constellation Capricornus as listed by Aratus (315 – 240 B.C.E). Ptolemy (c.100 – c.170) listed it as "Αἰγόκερος" ("Ægoceros") in his *Almagest*. It was later latinized to "Aegoceros". The 1515 edition of the *Almagest* lists it as "Alcaucurus" and defines it as "habens cornua hirci" ("having horns") and German astronomer Johann Bayer (1572-1625) lists it as "Alcantarus" in his *Uranometria* (1603). The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Aegocerus" and "Caper Cornutus" ("horned goat"). Aegoceros is listed under this name in John Hill's *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Aegoceros" as a name for Capricornus. This is how Ptolemy described it:

- The "body" is a bending pentagon of the stars Beta (β) Capricorni (Dabih), Theta (θ) Capricorni, Iota (ι) Capricorni, Zeta (ζ) Capricorni, 24 Capricorni, Omicron (ο) Capricorni, and Sigma (σ) Capricorni,
- The "front leg" runs between Omicron (ο) Capricorni and Psi (ψ) Capricorni,
- The "rear leg" runs between 24 Capricorni and Omega (ω) Capricorni,
- The "tail" starts at Iota (ι) Capricorni, runs through Gamma (γ) Capricorni to a bend at Delta (δ) Capricorni and then through Kappa (κ) Capricorni to Epsilon (ε) Capricorni,
- From Beta (β) Capricorni two lines run out to form "horns":
    - One runs out to Xi (ξ) Capricorni, and
    - The other runs out to a bend at Alpha (α) 1 and 2 Capricorni (Algedi) and ends at Nu (ν) Capricorni.

NOTE: This Greek asterism appears on the *Daressy Zodiac* of the Roman Imperial Period as a goat-fish next to a baboon or ape.

Having Kids:

This Latin asterism "Habens Haedos" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below). The Roman poet Ovid (43 B.C.E. – 18 C.E.) lists this in his *Metamorphoses*.

Hawaiki:

This Hawaiian star is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus.

Hawk:

This Norse asterism "Vedrfolnir" or "Ve.rfonir" ("the hawk which lives in the world tree") was listed by Cleasby and Vigfusson in 1874, though it is not clear precisely which stars are involved. Kuperjanov (2006) shows Alpha (α) Aquilae (Altair) as the head of the hawk with the stars of Cygnus forming the body. Timothy Stephany on his Norse Constellations webpage describes it as sitting on the head of their asterism Eagle (see above) with "one star for its body and one star for its head, two stars for its left wing, and three stars for its right wing."

This Greek lunar mansion, representing a hawk or a falcon, is made up of stars of the IAU constellation Aquila and is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This Egyptian asterism is one of the paranatellonta of the decans of Sagittarius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Aquila.

This Macedonian star "Jastreb" or "Yastreb" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Cenev 2004 & 2014). "Jastreb" is right next to their asterism "Petal" (see Rooster below) and their asterism "Kvachka" (see Mother Hen below).

This K'iche asterism "Xic" is the IAU constellation Aquila (Milbrath 1999). This is specifically the Swainson's hawk (Buteo swainsoni).

This Welsh asterism is listed in Marie Trevelyan's *Folk-lore and Folk-stories of Wales* (1909) and is currently unidentified.

Hawk Footprint:

This central Australian aboriginal asterism is the False Cross asterism (see False Cross above) made up of the stars of the IAU constellations Vela and Carina: Delta (δ) Velorum (Alsephina), Kappa (κ) Velorum (Markab), Epsilon (ε) Carinae (Avior) and Iota (ι) Carinae (Aspidiske).

Hawk of May:

This Welsh asterism "Gwalchmai" is the IAU constellation Aquila.

Hay:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of six stars forming two intersecting triangles in the IAU constellation Cetus:

- One triangle is the stars Rho (ρ) Ceti (the determinative star), Sigma (σ) Ceti, and HIP 12444, and
- The other triangle is the stars AB Ceti, Epsilon (ε) Ceti, and HIP 11029.

This later Chinese xing guan "Chúgǎo" (刍藁) is made up of six stars forming two intersecting triangles in the IAU constellation Cetus, just like the earlier version, but some of the stars have changed:

- One triangle is the stars Epsilon (ε) Ceti, 71 Ceti, and HIP 11029, and ,
- The other triangle is the stars Rho (ρ), 77 and 67 Ceti.

This Chinese Chenzhuo xing guan "Chúgǎo" is a zig-zagging line of stars in the IAU constellation Cetus: Starting at HIP 12562 it runs through Sigma (σ) Ceti, Epsilon (ε) Ceti, Rho (ρ) Ceti, and HIP 12444 to HIP 11029.

Hayebâje:

This Chakavian asterism is a combination of the IAU constellations Aquarius and Capricornus. The central star is Delta (δ) Capricorni.

Hayk:

This Armenian asterism is the IAU constellation Orion and is named for their legendary patriarch and founder.

Haymakers:

This Lithuanian asterism "Šienpjuvis", "Šienpjiūvis", or "Šienpjoviai" is the belt of Orion in the IAU constellation Orion.

Haystack:

This **telescopic** asterism is the open cluster NGC 2477 (Caldwell 71) in the IAU constellation Puppis. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751. It is GC 1593 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a 15-arcminute long haystack.

Hazy Tail of Canis Major:

This **telescopic** asterism "Vagicaudátus Cánis Majóris" is the spiral galaxy NGC 2280 in the IAU constellation Canis Major. It was discovered in 1835 by English astronomer John Herschel who listed it as 3062 and later GC 1450 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

HD 98046 Cascade:

See Waterfall, below.

HE.GAL.A.A:

This Babylonian asterism "HE.GAL.A.A" is listed by Bartel van der Waerden in his *Science Awakening II: The Birth of Astronomy* in 1974. The identity of this star is not known.

He-Goat:

This Arabic star "al-Māʿaz" (المعز) is Epsilon (ε) Aurigae in the IAU constellation Auriga:

- This was later latinized to "Maaz", "Almaaz", "Al Ma'az", and "Alanz".
- The Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) listed it as "Al Anz".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al'anz, the goat".
- The IAU approved the name Almaaz for Epsilon (ε) Aurigae.

This Greek lunar mansion is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as "Taurus or less Monoceros".

This Egyptian asterism "Capra" is one of the paranatellonta of the decans of Libra as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

This Etruscan asterism "Caper" is the IAU constellation Capricornus. Johann Bayer's *Uranometria* (1603) lists "Caper" as a name for Capricornus.

This Romanian asterism "Tapul" or "Capra" is the IAU constellation Capricornus (Ottescu 2009, Lite, Lodina, and Ignat 2018). NOTE: Ottescu (2009) lists "Capra" as a name for Alpha (α) Aurigae (Capella).

He Leans Away from Us:

The stars of this Ahtna asterism "Nec'aadze' Teltaen" are unidentified at present (Cannon 2021). This is a humanoid or remnant monster ("ggux") from ancient times with "knives in his mouth" that spews evil. Nek'eltaeni (see That Which Moves Over Us, below) threw it into the sky, where it circles around with Nek'eltaeni. The Ahtna avoid speaking of it.

He Who Never Goes Out on Newly Formed Ice:

This Inuit star "Sikuliaqsiujuittuq" is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (MacDonald 1998). It is also known as "Name of a Murdered Man" (see below).

He Who Pours Out the Water:

This Romanian asterism "Cel Care Varsă Apa" or "Vărsătorul" is the IAU constellation Aquarius (Ottescu 2009, Lite, Lodina, and Ignat 2018).

He Who Stands Alone:

This Tuamotu people star "Te Tau-rari" or "Marere-te-tavahi" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

He Who Will Be Killed by the Bell Board:

This Romanian star “Ucigă-l Toaca” is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). This is a reference to the Devil (compare to He Who Will Be Killed by the Cross, below). See Bell Board, above.

He Who Will Be Killed by the Cross:

This Romanian star “Ucigă-l Crucea” is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). This is a reference to the Devil (compare to He Who Will Be Killed by the Bell Board, above).

Head of Al Jawza’:

This Arabic star “Al Rās al Jauzā’” or “ra’s al-jawza’” is Lambda (λ) Orionis in the IAU constellation Orion and this name is related to its position in that constellation. R. H. Allen lists this in his *Star Names* in 1899 and attributes it to the 9th century astronomer Aben al Khethir of Fergana (Al Ferghani) and 16th century Arabic astronomer Al Tizini. NOTE: Elsewhere in his book Allen also associates this name (as have some other early astronomers and uranographers) with Beta (β) Geminorum (Pollux).

Head of Family:

This Korean asterism “Gajang” (가장) is a line of two stars in the IAU constellation Ophiuchus: Beta (β) Ophiuchi (Cebalrai) and Gamma (γ) Ophiuchi.

Head of Rams:

This Latin asterism “Caput Arietinum” is the IAU constellation Aries.

Head of Town:

This Korean asterism “Ma-eul-ui Meoli” (마을의 머리) is a bent “W” of stars in the IAU constellations Aquila and Scutum: 12, 14, and 15 Aquilae and Lambda (λ), Eta (η), Beta (β), Epsilon (ε), Delta (δ), and Alpha (α) Scuti. This is identical to the Chinese xing guan “Market Officer” (see below).

Head of the Cacodaemon:

This asterism “Caput Cacodaemonis” is an alternate name for the asterism “Medusa’s Head” (see above) in the IAU constellation Perseus and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Head of the Evil One:

This Khorasmian asterism “Sardhiwa” is the stars Zeta (ζ) and Eta (η) Ophiuchi in the IAU constellation Ophiuchus.

Head of the Foremost Twin:

This Arabic star “Ra’s al-taw’am al-muqaddam” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini:

- “Ra’s al-taw’am al-muqaddam” is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “ra’s al-taw’am al-muqaddam” and the Hebrew name “rosh he-te’om ha-niqdam”.

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "ra's al-taw'am huwa muqaddam al-dhirā'" ("the head of the twin; it is the first one of al-dhirā'").
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Rás al tawum al mokaddem, head of the foremost twin".
- R. H. Allen lists it as "Al Rās al Taum al Muḳaḍḍim" in his *Star Names* in 1899.

Head of the Ghoul:

This Arabic star "(Ra'as) al-Ghūl" ((head of) "the Ghoul" رأس الغول) or "Ra's al Ghul" is Beta (β) Persei in the IAU constellation Perseus:

- "Rae's al-Ghūl" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to "Algol" and "Alove".
- It is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) as "Ra's al-ghūl". This probably influenced the later European asterism "Caput Medusa" (see Medusa's Head, below).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists "rosh ha-shed" and the Arabic name "ra's al-ghūl".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "ra's al-ghūl" and the Hebrew name "rosh ha-satan".
- The rete of astrolabe NMM AST 0750 in the National Maritime Museum lists "Algon" (Dekker 2000).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "ra's al-ghū'".
- Dorn (1829) describes it as "head of a monster" as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists "ra's al-ghūl" and the Hebrew name "rosh ha-shed".
- A 14th century Christian Spanish astrolabe #4560 lists "Algol" (King 2002).
- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists "Ras algol".
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) list this star as "Algol".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Algol".
- This star "Ras Algol" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues lists this as "Ras Algol" in his *A Learned Treatise of Globes* in 1659.
- In his *Sphere of Marcus Manilius* in 1675, Edward Sherburne translates this Arabic name as "portans caput larvae" ("ghosts carrying hair") but also lists "Ras Al Gol".
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) labels this star "Persuso/Algl".

- A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, lists "Caput Medusa" for this star.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Algol" for this star.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Algol".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Algol" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Algol": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Algol, a variation of Al-ghúl, the monster or demon".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Algol".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Algol".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Algol, the Demon-Star".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Algol" and describes it as "the monster".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this star as "Algol, the Ghoul, or Demon Star".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Algol" for this star and describes it as the "Demon Star" or the "Winking Demon Star".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Algol" for this star.
- The IAU approved the name Algol for the star Beta (β) Persei Aa1.

Head of the Hindmost Twin:

This Arabic star "Al Rās al Taum al Muʾaḥḥār" is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini:

- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "ra's al-taw-am al-mu'akhkar" and the Hebrew name "rosh he-te-om ha-me'uhhar".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists ra's al-taw'am al-mu'akhkhar".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists " "Rás al tawum al muäkhkhar, the head of the hindmost twin".

Head of the Kneeler:

This Arabic star "Ra'as ul-Jathī" (رأس الجاثي) or "Al Rās al Jāthīyy" is Alpha (α) Herculis in the IAU constellation Hercules. This name relates to an older name for this constellation (see Kneeler, below):

- "Rae's al-Jāthī" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

- This is listed as “Ra’s al-jāthī” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992). This was later latinized to “Rasalgethi”, “Ras Algethi”, “Ras Algeti”, “Ras Algiatha”, or “Ras Algathi”.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “ra’s al-jāthī”.
- The first three editions of the *Alfonsine Tables* (1483 – 1515) list “Ras Alheti” or “Rasalheti” (Kunitzsch 1986) but for some reason the fourth edition (and Robert Hues) incorrectly lists “Rasaben”, which is a corruption of Rastaban (see Head of the Snake, below) which is Beta (β) Herculis.
- “Rasalheti” appears on the 1468 astrolabe of Regiomontanus (Kunitzsch 1986).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Rasalheti”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists “Ras Elhhathi”, “Ras Alhathi”, and “Rasalheti”.
- Johann Bayer’s *Uranometria* (1603) lists “Rasaben” as a name for Hercules.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Algethi”.
- “Ras Algethi”, “Rasogathii”, “Algethi”, “Algathio”, and “Alai rochbatihi” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch
- John Chilmead (1899) lists “Rasacheti”, which he derived from Robert Hues’ *A Learned Treatise of Globes* in 1659.
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Ras Algethi”.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Ras Algethi”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Ras Algothi” in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Ras Algeti” and his *Bedford Catalogue* in 1844 lists “Rasalgeti, from the Arabian rás al játhí, the kneeler’s head”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as “Ras Algethi”.
- English Uranographer Thomas Malby depicted “Ras Algothi” on his globes in 1850.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Ras Algethi”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Ras Algethi”.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Ras Algethi”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Ras Algethi” and describes it as “head of the kneeler”.
- The *Standard Dictionary* of Facts (1908 – 1924) lists “Ras Algetta”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Ras Algethi” and “Rasalegti” for this star, but his 14th edition (1959) lists the name “Ras Algethi” for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Ras Algethi”.

- The IAU approved the name Rasalgethi for the star Alpha (α) 1 Herculis Aa.

Head of the Lion:

There are two Arabic stars with this name:

- One, "Ra'as ul-Assad" (رأس الأسد), is Epsilon (ε) Leonis in the IAU constellation Leo, later Latinized to "Rasalased" or "Ras Elased".
- One, "hāmat al-asad" is Mu (μ) Leonis in the IAU constellation Leo as it appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

This Latin star "Ras Elased Australis" ("southern Rasalased") or "Asad Australis" is Epsilon (ε) Leonis in the IAU constellation Leo.

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "SAG.A" is Epsilon (ε) Leonis in the IAU constellation Leo (Hunger and Sachs 1988). R. H. Allen lists "Rishu A" as a Babylonian name for this star in his *Star Names* in 1899.

Head of the Ram:

This Arabic star "Rā's al-Ḥamal" (رأس الحمل) is Alpha (α) Arietis in the IAU constellation Aries:

- This was later latinized to "Hamal", "Hemal", "Hamul", and "Hammel".
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "Caputar", which is an abbreviation of the Latin "caput Arietis" (Dekker 2000).
- A 14th century Christian Spanish astrolabe #4560 lists "al hamal" for the entire constellation Aries. Giovanni Battista Riccioli (1598 – 1671) lists this star as "Ras Hammel".
- Johann Bayer's *Uranometria* (1603) lists "Arietium Caput", "Elhemal", and "Elhamel".
- John Hill gives the name "Hamel" or "Alhamal" as an Arabic name for the entire constellation of Aries in his *Urania* in 1745.
- American uranographer William Croswell (1760 – 1834) incorrectly lists this star as "Arietis" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) mistakenly lists "Arietis" as the name of this star in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth lists "Hamal" in his *Prolegomena* and "Hamal" in his *Bedford Catalogue* in 1844 and translates it as "a sheep".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list "alhama".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this star as "α Arietis (Alpha of Aries, more commonly called simply Arietis)" but does NOT mention the name Hamal.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Hamal".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Hamal".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Hamal" as the "Shepherd's Star".

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Hamal" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Hamal".
- The IAU approved the name Hamal for Alpha (α) Arietis.

Head of the Razor Blade:

This star "Rasoguli Caput Attenuationis" is Beta (β) Persei (Algol) in the IAU constellation Perseus as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Head of the Series:

The Arabic star "Ra's al-Musalsala" is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Head of the Snake:

This Arabic star "Ra'as uth-Thuʿabān" (رأس الثعبان) or "Al Rās al Thuʿbān" is Beta (β) Draconis in the IAU constellation Draco and later latinized to "Rastaban:

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Raztaben" (Dekker 2000).
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "razdaben".
- The 4th edition (16th century) of the *Alfonsine Tables* listed "Rasaben" (Kunitsch 1986).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Rasaben".
- German astronomer Johann Bayer (1572-1625) listed it as "Rastaben" in his *Uranometria* (1603).
- In the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch the names "Cauda Draconis" and "Ras taben seu Rasotahbani" are listed.
- German astronomer Wilhelm Schickard (1592 - 1635) listed "Raso tabbani".
- Robert Hues lists it as "Rastaben" and Rusaben" in his *A Learned Treatise of Globes* in 1659.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Rastaban" in his *Celestial Atlas* in 1822 and in his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).
- American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Rastaban".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Rás al thu'bán, head of the devouring basilisk".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Rastaban" and "Rasaben" for this star, but the 14th edition (1959) lists "Rastaban" for this star.
- The IAU approved the name Rastaban for the star Beta (β) Draconis A.

Head of the Snake Man:

This Arabic star "Ra'as ul-Ḥawwāʿ" (رأس الحوّاء) or "Rās al Ḥawwāʿ" is Alpha (α) Ophiuchi in the IAU constellation Ophiuchus:

- This is listed as “Ra’s al-hawwā” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “ra’s al-hāwī” and the Hebrew name “rosh mi sh-eyn lo ko’ah”.
- This was later latinized to “Ras alhague”, “Rasalgue”, “Rasalhague”, “Ras Alhagas”, “Ras Alhagus”, “Rasalange”, “Ras al Hangue”, “Rasalangue”, “Ras Alaghue”, “Rasalhagh”, “Ras al Hayro”, “Alhague”, “Alangue”, and “Azalange”.
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “ra’s al-hāwī” and the Hebrew name “rosh mi she-eyn lo ko’ah” .
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “ALhAVE” (Dekker 2000).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists “Alhavni”.
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as “Rasalhabe”.
- The 1521 edition of the 16th century *Alfonsine Tables* lists it as “Rasalauge” (Kunitzsch 1986).
- The celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as “Rasalhague”.
- Johann Bayer’s *Uranometria* (1603) lists “Rasalhague” for this star.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Alhague” and “Aseichus”.
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Ras Alague”.
- Robert Hues lists it as “Rasalangue” in his *A Learned Treatise of Globes* in 1659.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as “Ras Alhague”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as “Ras Alhague” it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822)
- German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Ras Alhague”.
- English Admiral Henry William Smyth’s *Prolegomena* of 1844 lists “Rasalague” and his *Bedford Catalogue* in 1844 lists “rás al hawwá, the serpent charmer’s head” as well as “el hauwé of the Moors… being spelt el hague by the Spaniards”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as “Ras Alhague”.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Ras Alhague”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Ras Alhague”.
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Ras Alhague”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Ras Alhague” and describes it as “head of the serpent charmer”.

- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Ras Alhagua" and "Ras-al-hague" for this star but the 14th edition (1959) lists "Ras Alhague" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name "Ras Alhague" for this star.
- The IAU approved the name Rasalhague for the star Alpha (α) Ophiuchi A.

Head of the Triangle:

This Arabic star "Ra'as ul-Muthallath" (الرعس المثلث) is Alpha (α) Trianguli in the IAU constellation Triangulum:

- "R'as al-Muthallath" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- It was later latinized to "Mothallah", "Methallah", "Rasalmudallah", "El Muthalleth", "Almutallath", "Almutaleh", "Almutlato", "Mutlat", "Mutlaton", "Mutlathum", "Mutlathun", "Mutlatun" or "Rasalmothallah".
- Johann Bayer's *Uranometria* (1603) lists "Mutlathum".
- Robert Hues lists "Almuta'eh" and "Mutlathun" as names for the constellation Triangulum in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne lists "Mothallah" as the name of the entire constellation Triangulum in his *Sphere of Marcus Manilius* in 1675
- "Mothallah" is listed in John Hill in his *Urania* in 1754.
- English Admiral Henry William Smyth lists "Rás al Mothallath" as the Arabic name in his *Bedford Catalogue* in 1844.
- R. H. Allen lists "Ras al Muthallath" and "Caput Trianguli" in his *Star Names* in 1963. Hill also lists "Almutabel Algunuli" as a name for Triangulum Australe in Urania, describing it as ""a name by which those, who love strange names for every thing [sic], have called the southern triangle; 'tis an Arabic name of their forming for a constellation the Arabs know nothing of." As Hill points out, the Arabs did not have a name for this constellation.
- The IAU approved the name Mothallah for Alpha (α) Trianguli.

This Latin star "Caput Trianguli" is Alpha (α) Trianguli in the IAU constellation Triangulum. English Admiral Henry William Smyth lists this name in his *Bedford Catalogue* in 1844.

Head of the Twin:

This Arabic star "R'as al-Taw'am" is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini:

- "R'as al-Taw'am" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Head of the Twin" is listed by R. H. Allen in his *Star Names* in 1899, although he incorrectly assigns the Arabic name ""Al Rās al Jauzā'", which means "head of al Jauzah" and is related to Orion, not Gemini (See Head of Al Jauzah, above):
    - This shows up in the 15th century *Alfonsine Tables* as "Rasalgense" (Kunitzsch 1986) and "Rasalgeuze" and elsewhere as "Rasalgauze".

- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as “Rasalgeuze”.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the name “Rasalgenze” for Alpha (α) Geminorum (Castor).
- German astronomer Johann Bayer (1572-1625) assigns “Rasalgeuze” to Castor instead of Pollux in his *Uranometria* (1603).
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) also assigns it to Castor instead of Pollux and lists it as “Algueze”, “Elhenaat”, and “Elgiautzi”.
- Robert Hues lists “Algeuze” as a name for the constellation Gemini in his *A Learned Treatise of Globes* in 1659, and lists “Rasalgeuze” as a name for Pollux.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Ras al geuze, the twin’s head” and attributes this to the “Alphonsine [sic] Tables, and in other old astronomical works”.

Head of the Twins:

This Latin asterism “Caput Geminorum” is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists Alpha (α) Geminorum (Castor) as “Caputgemino”, which is an abbreviation of the Latin “caput Geminorum” (Dekker 2000).

Head of the Whale:

This asterism from the Saguaro Astronomy Club asterisms database is made up of star of the IAU constellation Cetus: Alpha (α) Ceti (Menkar), Lambda (λ) Ceti, Mu (μ)Ceti, Xi (ξ) 2 Ceti, Nu (ν) Ceti and (γ) Gamma Ceti form a circlet.

Head of the Woman in Chains:

This Arabic star “Al Rās al Marʾah al Musalsalah” is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda and is related to their asterism “al-mar’ah al-musalsalah” (see Chained Woman, above):

- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name of this star as “ra’s al-mar’a” (“head of the woman”).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “ra’s al-mar’a” and the Hebrew name “rosh ha-ishsha”.
- Johann Bayer’s *Uranometria* (1603) lists the Latin version “Caput Andromedae”.
- English Admiral Henry William Smyth lists this in his *Bedford Catalogue* in 1844.

Headband of the Archer:

This Arabic star “‘Isābat al-rāmī” is Zeta (ζ) 2 Sagittarii in the IAU constellation Sagittarius as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Headhunter:

This **telescopic** asterism also known as the Starfighter, is the open cluster NGC 2269 in the IAU constellation Monoceros. It was discovered by William Herschel in 1784 who listed it as “VI 3” in his catalogue. It is GC 1444 in the *General Catalogue* of 1864. Headhunter is a reference to the particular

model of Starfighter from the Star Wars series franchise created by George Lucas in 1977: We don't know who chose this name at present.

Headless Angel:

This asterism is the IAU constellation Sagittarius as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Headless Corpse:

This Barasana asterism "Rihoa Mangu" ("headless corpse of the eagle") is the IAU constellation Sagittarius. Hugh-Jones (2006) translates this as "headless one". This headless eagle is Wekomi, the mythical father-in-law of both the morning star (busuri nyoko) and evening star (nyamikarima), whose head was mistakenly cut off by this own daughter Star Snake (see below).

Headphone Nebula:

This **telescopic** asterism is planetary nebula Jones-Emerson 1 (PK 164+31.1) in the IAU constellation Lynx. This was discovered in 1939 by Rebecca Jones and Richard M. Emerson.

Heap of Corpses:

This Chinese xing guan "JīShī" (积尸) is the star 22 Persei in the IAU constellation Perseus. This is located inside their xing guan Mausoleum (see below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Heap of Corpses (in Mausoleum):

This Chinese Chenzhuo xing guan "JīShī" is the star Pi (π) Persei in the IAU constellation Perseus.

Heap of Sand:

This **telescopic** asterism is the globular cluster Messier 2 (NGC 7089) in the IAU constellation Aquarius. This was discovered by French astronomer Giovanni Domenico Maraldi (1709 – 1788) in 1746. English astronomer John Herschel described it as a "heap of fine sand". It is GC 4678 in the *General Catalogue* of 1864. Italian astronomer Giuseppe Piazzi's assistant Niccolò Cacciatore (1770 – 1841) described it as "l'arena delle spiaggie maritime" ("the sea beach arena" to English Admiral Henry William Smyth, who records this and Herschel's description in his *Bedford Catalogue* in 1844. It is listed in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873, which notes Herschel's description. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) calls this the "Aquarius Cluster".

Heap of Sheaves:

This Estonian asterism "Kuhjalava" is the IAU constellation Corona Borealis. Compare this to the Belarussian asterism Kuchki (see Ten Sheaves, below).

Heap of Stars:

This Belarussian asterism "Kučka zorak" or "Kuročka", is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Hear Star of Learning:

This Vedic nakshatra (lunar mansion) “Shravana”, “Sravana”, “Śravaṇā” (Ivanković 2021), or “Sravan” (Devanagari नक्षत्र) is in the IAU constellation Aquila and is the stars Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain), and Gamma (γ) Aquilae. Ivankovic (2021) lists it as “Srávanā”, translates it as “hearing”, lists the variation (contraction) “Sronā” (which appears in the *Taittirīya Samhitā* and the *Taittirīya Brāhmana*), and relates it to the God Visnu or Vishnu who is the preserver of the universe. It is listed as “Srávana” in the *Atharveda* (Leitz 2019, Ivankovic 2021). Leitz lists it as “Sravana” on the nakshatra list of the maharshi’s Varahamihir and Parasara but identifies this as “The star Aquilae”: Of course, Aquilae is a suffix which could be applied to any star in Aquila. W. Brennand lists this as “Sravana” in his Hindu Astronomy in 1896 and translates this as “the three-footed step of Vishnu”. Bhagwath (2019) lists its symbols as either an ear or three footprints.

This Myanmar nekkhat (lunar mansion) “Tharawun” (သရုဝဏ်) is in the IAU constellation Aquila and is the stars Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain), and Gamma (γ) Aquilae.

Heart:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a row of three stars in the IAU constellation Scorpius:

- Sigma (σ) Scorpii: “Taizi” (“Crown Prince”). This is the determinative star.
- Alpha (α) Scorpii (Antares): “Tianwang” (“Celestial King”), “Mintang” (“Cosmological Temple”), or “Dahuo” (“Great Fire”).
- Tau (τ) Scorpii: “Shuzi” (“Bastard”).

This Chinese xiù (lunar mansion) “Xīnxiù” (心宿) is a line of three stars in the IAU constellation Scorpius: Sigma (σ), 21, and Tau (τ) Scorpii. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Yuzhou territory. This appears in the Tang Dynasty (618 – 907 C.E.) as “Xīn” (心) and was compared to the Vedic nakshatra Jyeshtha (Kotyk 2017, see Eldest, Most Excellent, above).

This Chinese Chenzhuo xing guan “Xin” is a line of three stars in the IAU constellation Scorpius:

- Tau (τ) Scorpii, known as “Shuzi” (“Bastard”),
- Alpha (α) Scorpii (Antares), known as “Dachen” (“Great Star”) or “Tianwang” (“Celestial King”), and
- Sigma (σ) Scorpii, known as “Taizi” (“Crown Prince”).

This Japanese sei shuku or lunar mansion “Nakago Boshi” is a bent line of three stars in the IAU constellation Scorpius: Alpha (α) Scorpii (Antares), Sigma (σ) Scorpii, and Tau (τ) Scorpii. It is one of three sets of three stars known as “Oyaninai Boshi” (see below).

There are nine **telescopic** “heart” asterisms:

- One, often described as heart-shaped or as a blunt arrowhead and also known as the Coil Cluster, is the open cluster Messier 50 (NGC 2323) in the IAU constellation Monoceros. It was recorded by G. D. Cassini before 1711 and independently discovered by Charles Messier in 1772. It is listed as GC 1483 in the *General Catalogue* of 1864.
- One is the open cluster NGC 2546 in the IAU constellation Puppis. It was discovered by French astronomer Abbé Lacaille in 1751 who listed it in his catalogue as Lac II 4. It is GC 1635 in the *General Catalogue* of 1864. It is also known as the Heart and Dagger or Wounded Heart as there is a line of stars through its center.

- One, from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the IAU constellation Hydra less than a degree northeast of 38 Hydrae. It includes the stars HIP 47697, 47754, 47634 and 47616.
- One is Vastagh 19, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 50'. Vastagh describes this as a "Heart-shaped [asterism] with a structure made of star strings… its total brightness is 5.6 [magnitude]., it consists of 100 members. The two parts of the heart are slightly different in size, the two chambers are clearly separated by a cascade. A thickening can be observed at the tip of the shape, this is the NY marked NGC 225."
- One is Mayer 100 in the IAU constellation Gemini. Its size is 11' X 11'. This is listed on Robert Zebahl's *Faint Fuzzies* website.
- One is Ruprecht 173 in the IAU constellation Cygnus. René Merting lists it on the *Faint Fuzzies* website as a "verquollenes Herz" ("swollen heart"). Size 49' X 49'. This includes the stars HIP 102105, 102276, 102049, 102195, and 101974. It is located on the line between and Gamma (γ) and Epsilon (ε) Cygni.
- One is in the IAU constellation Eridanus and is Ennis 39 on the observing list of Canadian astronomer Charles Ennis. This starts at Gaia DR3 3253579462686260224 and runs around through HD 25780, HD 25781, the visual double HD 25751 and Gaia DR3 3252998579200881152, HD 25696, HD 25630, HD 25609, HD 25571, and HD 25559 to HD 25629. Size 45'. This is Corder 622 on Jeffrey Corder's list: Corder describes it as a "very deep arc, nearly a circlet… located 35' following 35 [Eridani]". The galaxy NGC 1507 is just south of this asterism.
- One is open cluster NGC 2547 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as Lac III 2 in his catalogue. It is GC 1636 in the *General Catalogue* of 1864. It is also known as the Golden Earring (see above), Saint Peter's Cross (see below), "T" (see below), the Malus Cluster (see below). South African astronomer Magda Streicher (2011) writes: "This cluster… could well be nick named the "Heart Cluster". Willie Koorts draw [sic] my attention to the shape of this cluster. After investigation I could whole heartedly agree with him. The brighter stars are… in a round half-moon shape towards the eastern side… [and] the pointed heart shape point towards the north [sic]". NOTE: "Heart Cluster" is a name more commonly used for NGC 2546. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 40.
- One is made up of the stars of the IAU constellation Cygnus. "Live Long" posted it on *Cloudy Nights* in February 2022 and describes it as "a group of stars which surrounds Gamma [γ] Cygni".

Heart and Dagger:

This **telescopic** asterism is the open cluster NGC 2546 in the IAU constellation Puppis. It was discovered by French astronomer Abbé Lacaille in 1751 who listed it in his catalogue as Lac II 4. It is GC 1635 in the *General Catalogue* of 1864. It is also known as the Wounded Heart as there is a line of stars through its center. It is also known simply as the Heart Cluster. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 42 and he lists the names "Wounded Heart Cluster" and "Heart and Dagger Cluster".

Heart Nebula:

This **telescopic** asterism is the emission nebula and open cluster IC 1805 (SH 2-190, LBN 654, Mel 15, Ced 7) in the IAU constellation Cassiopeia. It was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). This is also known as the Running Man (see below) and the Valentine Nebula (see below).

Heart of Brahma:

This Vedic and Hindu star "Brahma-hrdaya" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Heart of Scorpio:

This Coptic lunar mansion "Kharthian" is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher's *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as "Cor Scorpii":

Heart of the Bull:

This Latin star "Cor Tauri" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in the 15th century *Alfonsine Tables*.

Heart of the Fish:

This Arabic manzil "Al Ḳalb al Ḥūt" is the star Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda. It is also known as Belly of the Fish (see above) and is part of their asterism Well Bucket rope (see below). The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) gives the Arabic name "qalb al-hūt" and the Hebrew name "lev ha-dag".

Heart of the Lion:

This Arabic star "Qalb al-Asad" (قلب الأسد) is the star Alpha (α) Leonis (Regulus) in the IAU constellation Leo:

- "Qalb al-Asad" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Qalb al-Asad" is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992):
- This was later Latinized to "Al Kalb al Asad", "Al Kalb", "Kabeleced", "Kalbelasit", "Kalbeleced", "Kalbeleceid", "Kalbol asadi", "Calb-elez-id", "Calb-elesit", "Calb-alezet", and "Kale Alased".
- King (2002) lists the variants "Calbalazeda", "Galbalaceda", "Calbalaceda", "Calbalaze", "Calbalazed", and "Kalb elected".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "galb al-asad" and the Hebrew name "lev ha-aryeh".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "qalb al-asad malakī" ("heart of the lion, Regulus").
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "qalb al-asad" and the Hebrew name "lev ha-aryeh".
- Johann Bayer's *Uranometria* (1603) lists "Kalbeleced", "Kalbeleceid", and "Kalbelasit" for this star.

- "Calbelezid" and "Kalbol-asadi" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Robert Hues lists it as "Cale Alased" in his *A Learned Treatise of Globes* in 1659.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "le Cœur du Lion" for this star.
- Dorn (1829) lists it as "Kalb-el-Asad" and "Kalbelesed" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kalb al Asad, or lion's heart".
- W. Brennand lists this as "Al-Kalb" in his *Hindu Astronomy* in 1896.

This Hebrew star is "lev ha-aryeh" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed on the star list of Abraham Bar Hiyya in 1104, who also lists the Arabic name "qalb al-asad" (Goldstein 1985).

This Greek star "Καρδία λεόντος" ("Kardia Leontos") is Alpha (α) Leonis in the IAU constellation Leo as listed by R. H. Allen's *Star Names* in 1899.

This Latin star "Cor Leonis" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo:

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Corleonis" (Dekker 2000).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists this as "Cor"
- A 14th century Christian Spanish astrolabe #4560 lists the abbreviated form "Cor Leo" (King 2002).
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists this star as "Cor Leonis".
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this star as "Cor Leonis".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cor Leonis" and "Cauda Leonis".
- This star is listed by Robert Hues in his *A Learned Treatise of Globes* in 1659 as "Cor Leonis".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cauda Leonis" and "Cor Leonis".
- "Cor Leonis" and "Cauda Leonis" are listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- Robert Hues lists this in his *A Learned Treatise of Globes* in 1659, Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675, and John Hill lists this name in his *Urania* in 1754.
- *The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678* by English uranographer James Clerk lists "Cor Leonis".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Cor Leonis".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Cor Leonis".

- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Cor Leonis vel Regulus": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Cor Leonis" and "Regulus".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Cor Leonis".

Heart of the Scorpion:

This Arabic and Bedouin manzil "Ḳalb al ʿAḳrab" or simply "al-qalb" (القلب) is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius:

- "Qalb al-'Aqrab" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as "Qalb al'aqrab" on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Hebrew name "lev ha-aqrav" and the Arabic name "qalb al-aqrab".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) with the Arabic name "qalb al-'aqrab" and the Hebrew name "lev ha-'aqrav".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "qalb al-'aqrab".
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "qalb al'aqrab" and the Hebrew name "lev ha'aqrav".
- Latinized variations include "Kelbalacrab", "Calbalacrab", "Calbolacrabi", and "Cabalatrab".
- It appears in the *Alfonsine Tables* as "Calbalatrab" (Smyth 1844, Kunitzsch 1986).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists this star as "Calb Alatrab".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as "Alcantub" and "Kalb Aakrab".
- Robert Hues lists "Kelebalacrab" in his *A Learned Treatise of Globes* in 1659.
- Dorn (1829) lists this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- The rete of the 14th century Spanish astrolabe NMM AST0570 in the National Maritime Museum lists "Calbalagra" (Dekker 2000).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kalb al 'akrab… the scorpion's heart".
- NOTE: The IAU approved the name Acrab for Beta (β) Scorpii Aa, (see Scorpion, below). Compare this to Heart of Scorpio (above).

This Yemeni manzil "Qalb" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

This Greek star "Καρδία Σκορπίου" ("Kardía Skorpíou") is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.

This Latin star "Cor Scorpii" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius:

- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Corscorpionis" (Dekker 2000).
- A 14th century Christian Spanish astrolabe #4560 lists the abbreviated form "Cor Scorpi" (King 2002).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Cor" for this star.
- Johann Bayer's *Uranometria* (1603) lists "Cor Scorpij" for this star.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists the name "Cor Scorpii" for this star.
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cor Scorpii".
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius label this star "Cor Scorpy".
- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 both as "Cor Scorpi" and "Antares".
- Edward Sherburne lists Cor Scorpii in his *Sphere of Marcus Manilius* in 1675.
- Johannes Kepler's *Stella Nova in Pede Serpentarii* (1606) lists this star as "Cor Scorpionis".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Cor Scorpii".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Cor Scorpionis".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Antares" and "Cor Scorpionis".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Cor Scorpionis" for this star, but his 14th edition (1959) lists both "Cor Scorpii" and "Cor Scorpionis" for this star.
- R. H. Allen lists this in his *Star Names* in 1899. Compare to Heart of the Scorpion (below).

This Tzotzil star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Milbrath 1999).

Heart of the Serpent:

This Latin star "Cor Serpentis" is Alpha (α) Serpentis (Unukalhai) in the IAU constellation Serpens:

- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "le Cœur du Serpent".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it as "Cor Serpentis of astrologers".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Cor Serpentis" for this star.
- R. H. Allen's *Star Names* in 1899 lists it as an astrological name.

Heart of the Sky:

This K'iche' Maya asterism is the IAU constellation Orion, which they associate with a deity by this name. In their creation story, Popol Vuh, one of the aspects of Heart of Sky is the one-legged Jun Rakán or Huracán ("one leg" or "hurricane")

Heart Star:

This Chinese xing guan "Xin Xing" (心星) also known as the "heart of the Dragon" is the stars Alpha (α) Scorpii, Sigma (σ) Scorpii and Tau (τ) Scorpii in the IAU constellation Scorpius. It appears in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.). It is part of the larger xing guan Dragon Star (see above).

This Japanese star "Shin Boshi" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Renshaw and Ihara 2000).

Hearth:

This Latin asterism "Lar" is the IAU constellation Ara.

- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Lar, sive Thuribulum, sev Ara" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- Johann Bayer's *Uranometria* (1603) lists "Lar" for this constellation.
- John Hill lists this name for Ara in his *Urania* in 1754.
- Other Latin names for hearth also applied to this constellation include "Focus" and "Ignitabulum".

Hearts of the First People:

This Payómkawichum asterism is the Pleiades cluster in the IAU constellation Taurus.

Heaven Point:

This Chinese star "Thien Shu" is 32 Camelopardalis in the IAU constellation Camelopardalis which around 800 C.E. would have been within 7° of celestial north.

Heavenly Beast:

This Ticuna asterism "Wücütcha" is the belt of Orion in the IAU constellation Orion.

Heavenly Bird:

This asterism "Avis Paradisiaca" is the IAU constellation Apus and is listed in John Hill's *Urania* in 1754. This is a mixture of the Latin word Avis ("bird") and the Italian word Paradisiaca ("heavenly"). Hill also lists the name Avis Indica (see Indian Bird, above). Earlier German poet Philipp von Zesen (1619 – 1689) called it "Paradisaeus Ales".

Heavenly Couples:

This Estonian asterism "Taevapaarid" ("heaven's couples" or "heavenly pairs") is made up of pairs of stars in the IAU constellation Leo and Ursa Major and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006). The pairs of stars are:

- Delta (δ) and Theta (θ) Leonis,
- Eta (η) and Alpha (α) Leonis (Regulus),

- Gamma (γ) 1 and Zeta (ζ) Leonis,
- Mu (μ) and Epsilon (ε) Leonis, and
- Iota (ι) and Kappa (κ) Ursae Majoris.

Heavenly Fish Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Pisces as "Heavenly Fish Deity" (Kotyk 2017).

Heavenly G:

The Heavenly G is a loop of eight of the 21 brightest stars starting with Alpha (α) Aurigae (Capella) in the IAU constellation Auriga, Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini, Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor, Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major, Beta (β) Orionis (Rigel) in the IAU constellation Orion, and Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus, ending back in the IAU constellation Orion again with Alpha (α) Orionis (Betelgeuse).

Heavenly Market Enclosure:

"Tiānshìyuán" (天市垣) is one of the three enclosures in Chinese sky culture, the others being Supreme Palace Enclosure and Purple Forbidden Enclosure (see Lunar Mansions, Stations of the Moon, Nakshatra, and Zodiacs above).

Two asterisms mark the boundaries of this enclosure:

- **Heavenly Market Left Wall ("Tiānshìzuǒyuán" (天市左垣)):** This Chinese xing guan is a long curving line of stars in the IAU constellations Aquila, Hercules, Ophiuchus, and Serpens. It starts at Eta (η) Ophiuchi and runs through Xi (ξ) Serpentis, 64 Ophiuchi, Eta (η) and Theta (θ) Serpentis, Zeta (ζ) Aquilae, 112, 103, Mu (μ), and Lambda (λ) Herculis, ending at Delta (δ) Herculis. It is in a similar location and is similar part of the Korean asterism "Market Fence" (see below). In the Three Kingdoms and Ming Dynasty period this was called the Heavenly Market East Wall.
- **Heavenly Market Right Wall ("Tiānshìyòuyuán" (天市右垣)):** This Chinese xing guan is a long, curving line of stars in the IAU constellations Hercules, Ophiuchus, and Serpens: Beta (β) Herculis (Kornephoros), Gamma (γ) Herculis, Kappa (κ) Herculis, Gamma (γ) Serpentis, Beta (β) Serpentis (Nasak Shamiya), Delta (δ) Serpentis, Alpha (α) Serpentis (Unukalhai), Epsilon (ε) Serpentis, Delta (δ) Ophiuchi, Epsilon (ε) Ophiuchi, and Zeta (ζ) Ophiuchi. This is identical to one of the two Korean asterisms "Market Fence" (see below). In the Three Kingdoms and Ming Dynasty period this was called the Heavenly Market West Wall.

In Chinese Chenzhuo skies two asterisms mark the boundaries of this enclosure:

- **Right Wall**: This is a long line of stars of the IAU constellations Hercules, Ophiuchus, and Serpens: Beta (β) Herculis (Kornephoros, "Hezhong"), Gamma (γ) Herculis ("Hejian"), Kappa (κ) Herculis ("Jin"), Gamma (γ) Serpentis ("Zheng"), Beta (β) Serpentis (Nasak Shamiya, "Zhou"), Delta (δ) Serpentis ("Qin"), Alpha (α) Serpentis (Unukalhai, "Shu"), Epsilon (ε) Serpentis ("Ba"), Delta (δ) Ophiuchi ("Liang"), Epsilon (ε) Ophiuchi ("Chu"), and Zeta (ζ) Ophiuchi ("Han"), and
- **Left Wall**: This is a long line of stars of the IAU constellations Aquila, Hercules, Ophiuchus, and Serpens: Delta (δ) Herculis ("Wei"), Lambda (λ) Herculis ("Zhao"), Mu (μ) Herculis ("Jiuhe"), Omicron (ο) Herculis ("Zhongshan"), 110 Herculis ("Qi"), Zeta (ζ) Aquilae ("Wuyue"), Theta (θ)

Serpentis (“Xu”), Eta (η) Serpentis (“Donghai”), Nu (ν) Ophiuchi (“Yan”), Xi (ξ) Serpentis (“Nanhai”), and Eta (η) Ophiuchi (“Song”).

Heavenly Mountain:

This Latin star “Mons Coelius” is Alpha (α) Ursae Minoris in the IAU constellation Ursa Minor as listed in R. H. Allen’s *Star Names* in 1899. It is related to the asterism “Tramontane” (see Person Living on the Side of a Mountain, below).

This Finnish star “Taehti” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Heavenly of Hydra:

This **telescopic** asterism “Coelestina Hýdrae” is the barred spiral galaxy NGC 3313 in the IAU constellation Hydra. It was discovered by Ormond Stone in 1886. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Heavenly of Virgo:

This **telescopic** asterism “Caeléstis Vírginis” is the grand design spiral galaxy NGC 4030 in the IAU constellation Virgo. William Herschel listed this as “I 121”. John Herschel listed this as h 1048 and later as GC 2663 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): The Plinian Sciapods were one-legged people who protected themselves from sunlight by using their big foot as a parasol.

Heavenly Scales:

This Lithuanian asterism “Dangaus svarstyklės” is made up of the stars of the IAU constellations Aquila, Cygnus, and Lyra: The constellation Cygnus is the “scales” and the “weights” are the stars Alpha (α) Aquilae (Altair) and Alpha (α) Lyrae (Vega).

Heavenly Sieve:

This Belarussian asterism “Нябеснае Сіта” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018). Compare this to the Estonian asterism “Taeva Sõel” (see Sieve of Heaven, below).

This Lithuanian asterism “Dangaus sėtas” or “Dangaus sietas” is the Pleiades open cluster in the IAU constellation Taurus.

Heavenly Staircase:

This Dogon asterism is the Belt of Orion in the IAU constellation Orion.

This Akkadian asterism “Ḫegala” is the IAU constellation Coma Berenices.

Heavenly Steps:

This Chinese Chenzhuo xing guan “Tianjie” (天阶) is made up of stars of the IAU constellation Ursa Major:

- The Lower Step is the stars Xi (ξ) and Nu (ν) Ursae Majoris,
- The Middle Step is the stars Mu (μ), and Lambda (λ) Ursae Majoris, and
- The Upper Step is the stars Kappa (κ) and Iota (ι) Ursae Majoris.

It is also known as the “Three Steps”.

Heavenly Swordsman:

This Elvish asterism “Menelmacar” is the IAU constellation Orion. He is the “heavenly swordsman” from the works of J. R.R. Tolkien (1892 – 1973).

Heavenly Umbrella:

This Japanese asterism “Tengaisei” is stars near the north celestial pole (Miyajima 2014) as depicted by Japanese Emperor Go-Yozei (1586 – 1611). NOTE: A tengaisei is a silk umbrella placed above statues of the Buddha.

Heavenly Wagon:

This asterism “Woz Niebeski” is the IAU constellations Boötes and Ursa Major. Ursa Major is the wagon. R. H. Allen lists this in his *Star Names* in 1899 and describes Ursa Major as the wagon and the IAU constellation Boötes as the “Ogka or Thills”. Thills are a pair of shafts connecting the cart to the animal drawing it.

This German asterism “Himmel Wagen” is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen’s *Star Names* in 1899. Allen lists the “Dutch and German versions Wagen am Himmel”.

This English asterism is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in Myles Coverdale’s *Coverdale Bible* of 1535. R. H. Allen notes in his *Star Names* in 1899 that Anglican theologian Edmund Becke listed it in his Bible in 1549 as “Vaynes”.

Heavenly Woman Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Virgo as “Heavenly Woman Deity” (Kotyk 2017).

Heavy Eyebrow of Eridanus:

This **telescopic** asterism “Episcýnius Erídani” is the intermediate spiral galaxy NGC 1637 in the IAU constellation Eridanus. This was listed as “I 222” by William Herschel and 327 by his son John Herschel, later becoming GC 888 in John’s *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as “the large dark cloud at the northern part of this galaxy gives it the shape of an eye with a heavy eyebrow”.

Heavy Object Came Out:

This T’atsaol’ine and Wiidiideh star “bek’a yéhká” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021).

Hebrew Harp:

This Hebrew asterism “Nevel” is the IAU constellation Lyra. Johann Bayer’s *Uranometria* (1603) lists this as “Nablon”. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Nablon”. “Nablon” is probably derived from the Phoenician “Nabla”.

Hecate's Dogs:

This Greek asterism is the IAU constellations Canis Major and Canis Minor. Lithuanian archaeologist Marija Gimbutas (1996) identifies these constellations as representing Hecate's dogs. Hecate is an ancient Greek Goddess, often accompanied by snakes or dogs and often depicted as carrying two torches. She is also described as being able to transform herself into a dog or a bear. Hecate is associated with crossroads, entrances, night, light, and magic.

Hedge of Cetus:

This **telescopic** asterism "Saeptátus Céti" is the intermediate spiral galaxy NGC 681 in the IAU constellation Cetus. This was discovered by William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "has the appearance of a hedge".

Hedj-Hotep:

This Egyptian star is Gamma (γ) Leonis in the IAU constellation Leo as listed in the 19th dynasty Cairo Calendar (Hardy 2003). Hedj Hotep was a minor God of fabrics and clothing dating back to the 12th dynasty who later was given medicinal roles. NOTE: Hedj Hotep is sometimes described as a Goddess.

Heel:

This Latin star "Calx" is Mu (μ) Geminorum in the IAU constellation Gemini. English astronomer John Flamsteed (1646 – 1719) listed this name in his translation of Danish astronomer Tycho Brahe's catalogue.

Heifer Inachia:

This Latin asterism "Juvenca Inachia" is the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. This refers Inachus, who is the father of Io, who was seduced by the God Zeus and then turned into a cow to hide her from his wife Hera, who sent her wandering the world without rest.

Heimdallur:

This Norse asterism is made up of stars of the IAU constellation Cepheus and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Heimdallur or Heimdallr is the watchman of the Gods, dwelling at the entry to Asgard where he guards Bifrost, the rainbow bridge. He depicts Heimdallur as a bearded male in a tunic and boots with light radiating from his head and both arms raised high.

Heir of the Emah Temple:

This Babylonian star from the MUL.APIN tablets "Apilemah", translated as "Heir of the Emah Temple" or "Heir of the Sublime Temple", is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Hunger and Pingree 1989). This appears in later Seleucid sky lore as "Heir of the Sublime Temple" or "First Ranking Son of Anu".

Heirloom War Club:

This Samoan asterism "'Anava" is made up of stars of the IAU constellations Auriga, Lynx, and Ursa Major (Fitisemanu 2022):

- The “club handle” runs from Alpha (α) Aurigae (Capella) through 15 Lyncis to Omicron (o) Ursae Majoris.
- The “club head” is the triangle formed by the stars Omicron (o) Ursae Majoris, Beta (β) Ursae Majoris (Merak), Gamma (γ) Ursae Majoris, Delta (δ) Ursae Majoris, and Alpha (α) Ursae Majoris (Dubhe).

Héjiān:

This Chinese star “Héjiān” from the 3 Kingdoms and Ming Dynasty Period is the star Gamma (γ) Herculis in the IAU constellation Hercules and is part of their xing guan Heavenly Market West Wall (see above).

Helical:

This Greek asterism “Ἕλιξ” (“Élix”) or “Ἑλίκη” (“Elíki”) is the IAU constellation Ursa Major as described by Aratus in his *Phaenomena* in 270 B.C.E. (see Little Dipper below), Hesiod, and as described by Greek author Apollonius Rhodius (b. 295 B.C.E.). Both are indications that the Greeks of their time recognized that it was circumpolar (Guglielmino, Cipolla, and Giudice 2017). The *De ordine ac positione stellarum in signis* (“*On the order and position of the stars in the signs*”) in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists “Helice”, “Haelice”, and “Henrice”. The Omens in Klosterneuberg manuscript of the 11th century *De signis caeli (“of the signs of heaven*”) lists “Helice” and “Helix”.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Ursa Maior, quam Helicen vocant” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists “Helice” as a name for Ursa Major.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Helice” as an alternate name for Ursa Major.

Johann Bayer’s *Uranometria* (1603) lists “Helice” as a name for Ursa Major.

The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Helice” as a name for Ursa Major.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists “Ursa Major” and “Helice” for this constellation.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists the names “Ursa Maior”, “Helice”, and “Casto” for this constellation.

John Hill lists “ElíkZ” (“Helice”) as a “name used by old writers” for Ursa Major in his *Urania* in 1754.

American uranographer William Croswell (1760 – 1834) labels this constellation “Ursa Major vel Helice the Great Bear” on his *Mercator Map of the Starry Heavens* in 1810.

R. H. Allen also lists the variation “Helicen” for Ursa Major in his *Star Names* in 1899 and gives the translation “helix”. Helice is the nurse of the infant God Zeus in Greek mythology.

Italian author Dante Alighieri calls Ursa Minor “Helice” in his *Paradiso*.

NOTE: English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Helice” as a name for Beta (β) Ursae Majoris and Ursa Major.

Helical Nebula:

This **telescopic** asterism is the planetary nebula NGC 7293 (Caldwell 63) in the IAU constellation Aquarius. It was discovered by German astronomer Karl Ludwig Harding before 1824. It is GC 4795 in the *General Catalogue* of 1864. It is also known as the Helix Nebula, the Eye of Sauron, the Eye of God, or the Sunflower Nebula. English astronomer Harry Edwin Wood (1181 – 1946) described it as the “Great ring nebula in Aquarius”.

Helios:

This Latin asterism “Trinacria” is the IAU constellation Triangulum as listed in R. H. Allen’s *Star Names* in 1899. This is another name for the island of Helios, to which Odysseus traveled in the 8th century B.C.E. poet Homer’s *Odyssey*.

Helix:

There are two **telescopic** “helix” asterisms:

- One is the planetary nebula NGC 7293 (Caldwell 63) in the IAU constellation Aquarius. It was discovered by German astronomer Karl Ludwig Harding before 1824. It is GC 4795 in the *General Catalogue* of 1864. Scottish astronomer Robert T.A. Innes (1861 – 1933), writing in his observation notes in 1917, notes “Helix or ring not seen”, which indicates the name Helix was already in use. Robert Zebahl lists this on his *Faint Fuzzies* website as the “Helix”. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the “Helix Nebula”. Sir Patrick Caldwell Moore listed it as Caldwell 63 as it is the brightest planetary nebula. It is also known as the Helical Nebula, the Eye of Sauron, the Eye of God, or the Sunflower Nebula.
- One is NGC 2685, a lenticular and polar ring galaxy in the IAU constellation Ursa Major. This is Arp 336 in Arp’s *Atlas of Peculiar Galaxies*. Size 4.6’ X 2.1’. It is also known as the Pancake Galaxy (see below). It is also known as the “Perpendicular of Ursa Major” (see below).

Helm:

This Latin star “Gubernaculum” (“ship’s helm”) is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as described by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.).

Helmet:

This Dutch asterism “Casque” is the IAU constellation Tucana and was created by Dutch uranographer Willem Blaeu in 1603.

Helper:

This pair of Korean asterisms “Dobneun Salam” (돕는 사람), are both triangles of stars in the IAU constellation Boötes:

- One triangle is the stars Omicron (ο), Eta (η) 1, and Zeta (ζ) Boötis, and
- One triangle is the stars Upsilon (υ), Tau (τ), and Eta (η) Boötis.

This Korean double star “Wi” is the double stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major.

Helping Hand:

There are two “Helping Hand” asterisms:

- One is the Kiribati star “Baibuobuoki”, which is an unidentified star in the IAU constellation Pegasus (Trussel and Groves 1978).
- One **telescopic** “Helping Hand” is LDN 1355, a dark and reflection nebula in the IAU constellation Cassiopeia. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024).

Helvetios:

This Swiss star is 51 Pegasi in the IAU constellation Pegasus and was given this name in the IAU NameExoWorlds campaign. This is Latin for “Helvetian”, referring to the Celtic tribe that lived in Switzerland in ancient times. It has an exoplanet named Dimidium (“half”).

Hemitocles Hippus:

This “Greek” asterism is the IAU constellation Pegasus as listed in John Hill’s *Urania* in 1754.

Hen:

This Arabic asterism “Aldajaja” (الدجاجة) or “Al Dajājah” is the IAU constellation Cygnus:

- “Al-Dajāja” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Adige”, “Adigege”, “Aldigaga”, “Addigagato”, “Degige”, “Edegiagith”, and “Eldigiagich”.
- The Madrid edition of the *Alfonsine Tables* lists “Altayr Aldigeya”. The 1515 edition of the *Alfonsine Tables* lists “Eurisim”, which it describes as a flying hen, and the 1521 edition has “Hyresym” with the same translation but adding “returning like a lily”.
- Johann Bayer’s *Uranometria* (1603) lists the names “Hirezem”, “Degige vel Adegige”, “Digegi”, and “Adigegi vel Adigege”
- Robert Hues lists it as “Aldigaga” and “the hen” in his *A Learned Treatise of Globes* in 1659.
- Variations include “Hirezym” and “Hierizim”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed “quasi Galli rosa” (“like a rooster’s rose”).
- Alpha (α) Cygni (Deneb) is listed sometimes as “Deneb el Adige”.

This Greek asterism “᾽Ορνις” (“Ornis”) is the IAU constellation Cygnus as mentioned in Aratus’ poem *Phaenomena* (270 B.C.E.) and as it appeared in Ptolemy’s *Almagest* (2nd century). This is pretty much the same as the Northern Cross asterism (see Northern Cross below) but with lines connecting the “wing tips” to the “tail” at Alpha (α) Cygni (Deneb). John Hill lists this name for Cygnus in his *Urania* in 1754.

This Latin asterism “Gallina” is the IAU constellation Cygnus:

- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists this constellation as “Gallina” and “Olor”.
- The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel lists this constellation as “Gallina” and depicts it as a swan in flight as viewed from above.
- Unmounted gores for a celestial globe by Johannes Schöner from 1515, 1534, and 1535 (Dekker & Lippincott 1999) list “Gallina” and depict this constellation as a heraldic rooster. Celestial globe gores (1517) of Johann Schöner depicts “Gallina” as a swan in flight as viewed from below.
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Gallina” as a swan in flight as viewed from below.
- A 15th century text Biblioteca Apostolica Vaticanna MS Pal. Lat. 1368, folio 51, depicts Cygnus as a hen with chicks (Dekker & Lippincott 1999).
- The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, labels this constellation “Gallina” and depicts it as a swan in flight as viewed from above.
- Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Olor, sive Cygnus qvi Etiam. Auis, feu Gallina dicitur” (“Olor, also Cygnus. A fowl is called a hen”) in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
- Johann Bayer’s *Uranometria* (1603) lists the name “Gallina” for this constellation and as an alternate name for Alpha (α) Cygni (Vega).
- “Gallina” is listed as a name for Cygnus in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Cisne” and “Galina” and depicts it as a swan in flight.
- “Gallina” is listed in Robert Hues’ *A Learned Treatise of Globes* in 1659.
- “Gallina” is listed in John Hill’s *Urania* in 1754 and R. H. Allen’s *Star Names* in 1899.
- German astronomer Johann Bayer (1572-1625) named it “Galina”.
- The star Beta (β) 1 Cygni is called “Rostrum Gallinae” (“hen’s beak”), which is a Latin translation of the original Arabic name “minqār al-dajājah” (منقار الدجاجة), which also means “hen’s beak”.

This Romanian asterism “Găină” is the Pleiades cluster in the IAU constellation Taurus (Ottescu 2009, Lite, Lodina, and Ignat 2018). They also call it Hatching Hen and Her Chicks (see above).

Hen and Her Chicks:

This Italian asterism “Gallinella” is the Pleiades cluster in the IAU constellation Taurus as listed in John Hill’s *Urania* in 1754.

This German asterism “gallina fovens pullos suos” (“hen nursing her chicks”) is the Pleiades cluster in the IAU constellation Taurus and is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This Ukrainian asterism ‘kurka ta kurchata” (курка та курчата) is the Pleiades cluster in the IAU constellation Taurus.

This German (Volga Community, Argentina) asterism “la gallina y sus pollitos” is the Pleiades cluster in the IAU constellation Taurus (Mudrik 2011).

There are two Basque asterisms about a hen and her chicks (Frank 2021):

- One, “Oilo Txitoek” or “Oilo Txitoak” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).
- “Oilo Txitoek” is also used to describe the Pleiades cluster in the IAU constellation Taurus. This is also known as “Oiloa Kolka Txitekin” (see Broody Hen and her Chicks, above).

NOTE: Many European cultures from southern England to the Ukraine see the Pleiades cluster as a hen and her chicks.

This Mali asterism “niugu-niugu” is the Pleiades Cluster in the IAU constellation Taurus.

This Bulsa asterism “chibiisa” is the Pleiades Cluster in the IAU constellation Taurus.

This Mapuche asterism “Chawün Achawall” or “Chawün Achawaj” (“hen and her chicks” or “gathering of chicks”) is the Theta (θ) Carinae open cluster (Melotte 102), also known as the Southern Pleiades. The star Theta (θ) Carinae is the hen and the rest of the stars the chicks.

Hen and Her Chicks and a Girl:

This Serbian asterism is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Allen suggests that the “girl” is the star Eta (η) Tauri (Alcyone) in this cluster.

Hen Nesting Chicks:

This Latin asterism “Butrum” is the Pleiades cluster. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) lists the names “Butrio” and “Butrionem” as names for this cluster. It is listed by 7th century philosopher Isidor of Seville as “Butrum”. R. H. Allen lists “Butrum” in his *Star Names* in 1899. This later appeared in German catalogues as “Bruthean” and English catalogues as “Butrio”, which can also be translated as “chicken run”.

Hen Ostriches:

This Arabic asterism “al-naʿāmāt”, later latinized to “Al Naymat” is the stars Theta (θ) Ceti (Thanih Al Naamat or Al Naymat I), Tau (τ) Ceti (Thalath Al Naamat or Al Naymat II), Upsilon (υ) Ceti (Al Naymat III), Eta (η) Ceti (Deneb Algenubi), and Zeta (ζ) Ceti (Baten Kaitos) in the IAU constellation Cetus. Compare this to the Arabic asterism Ostriches (see below). NOTE: Another star nearby, Eta (η) Ceti, is their star First Ostrich.

Hen with Chickens:

See Mother Hen and Her Chicks, below.

Hens:

This Belarussian asterism “Kurki”, “Koruchka”, “Kuročka”, “Kury”, “Kurica”, or “Kurački” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009, 2018).

Hen’s Beak:

This Arabic star “minqār al-dajājah” (منقار الدجاجة), “Al Minḥar al Dajājah”, or “Menchir al Dedjadjet” is Beta (β) 1 Cygni in the IAU constellation Cygnus as listed in the *Calendarium* of Al Achasi al Mouakket in 1650:

- “Minqār al-Dajāja” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “minqār al-dajāja”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Menkar Eldigiagich” and “Hierizim”.
- Johann Bayer’s *Uranometria* (1603) lists the name “Rostrum Gallinae” for this star.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Minkár el dejájeh, the hen’s beak.”

Ḥer-ab-uâa:

This Egyptian decan “Ḥer-ab-uâa” was in the IAU constellation Sagittarius. In later Hellenistic texts it was named “ⲏⲣⲏⲟⲩⲱ”(“Hre-ua”). In the Testament of Solomon, it became “Anatreth”, Aristobulus of Paneas called it “Ortusa”, in Greek Hermeticism it became “Sebos”, in Latin Hermeticism “Clinothois”, 4th century Roman astrologer Julius Firmicus Maternus called it “Eregbuo” or “Ergbuo”, Cosmas of Maiuma (d. 760) called it “Loimos”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Eregbuo” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲧⲟⲗⲙⲟⲫϯ” (“Tolmophta”). It has been depicted as a man covered with a net having a needle in his hand next to several spears.

Ḥer-âb-khentu:

This Egyptian decan “Ḥer-âb-khentu” was in the IAU constellation Pisces. In later Hellenistic texts it was named “ⲃⲓⲟⲩ” or “ⲧⲡⲓⲃⲓⲟⲩ” (“Tpi-bui”). In the Testament of Solomon, it became “Bianakith”, Aristobulus of Paneas called it “Ajaras”, in Greek Hermeticism it became “Syro”, in Latin Hermeticism “Piatris”, Roman astrologer Julius Firmicus Maternus called it “Uiu” or “Aatexbui”, Cosmas of Maiuma (d. 760) called it “Elpis”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Atembui” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲫⲁⲗⲗⲟⲫⲟⲣⲟⲥ” (“Phallophorus”). Variations include “Suro”. It has been depicted as a crowned invisible man with a beard with a dragon coiled around him.

Her Bracelet:

This **telescopic** star “Siwarha” is a star orbiting Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. This was reported in Steve Howell et al, "Probable Direct Imaging Discovery of the Stellar Companion to Betelgeuse," The Astrophysical Journal Letters (2025). This Arabic name has been proposed but not approved.

Heracles:

This Greek star “Ἡρακλῆς” (“Iraklís”) or “Ἡρακλέης” (“Irakléis”) is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini:

- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists “Abrachaleus” for this star.
- Dutch uranographer Hugo Grotius (1583 – 1645) listed this as “Abrachaleus”, “Aracaleus”, and “Iracleus”.
- English orientalist Thomas Hyde (1636 – 1703) listed it as “Heraclus”.

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671)) listed it as “Garacles”.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Abracheleus” as a name for “Hercules”.
- Robert Hues lists it as “Abracaleus” and “Gracleus” in his *A Learned Treatise of Globes* in 1659.

This Egyptian asterism “Heracles” is one of the paranatellonta of the decans of Gemini as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Hercules.

Herald:

This Arabic star “’al-Murzim” (الْمُرْزِم) is Beta (β) Canis Majoris in the IAU constellation Canis Major.

- This was later latinized to “Murzim”, “Murzam”, or “Mirzam”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Mirzam, the roarer” and “al-mirzam” for this star.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Mirzam”.
- R. H. Allen in his *Star Names* in 1899 translates this as “the roarer” or “the announcer”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) lists this star as “Mirzam”.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as “Mirzam”.
- The IAU approved the name Mirzam for this star.

Herald of Al-Jauza:

This Arabic star “Mirzam al-Jauzā’” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010). Sufi explained that some Arabs called it this incorrectly, as it was the practice of the Arabs to begin the name of any bright star by the word “Mirzam”.

Heralds:

This Arabic asterism is the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “al-mirzamáni, the two roarers” for these stars, which is related to his translation “roarer” of the name “al mirzam” for Beta (β) Canis Majoris (see Herald, above).

Herald’s Wand:

This Greek lunar mansion is the IAU constellation Scorpius and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

Herculaeus:

This Latin asterism “Herculeus” or “Herculeus Leo” is the IAU constellation Leo as described by 1st century B.C.E. poet Ovid. It is called this to honor Hercules, who killed the Nemean lion. Variations include “Herculeum Astrum”.

Hercules:

None of the stars in this constellation are brighter than 3rd magnitude, but its stars appear in 250 of the world's asterisms.

The modern IAU constellation Hercules (IAU abbreviation Her) originated in the ancient Babylonian asterism "MUL.DINGIR.GUB.BA.MESH" (see Standing Gods, below). The earliest Greek references to this constellation are not as Hercules, but as "Εγγόνασιν" ("Engónasin", "the Kneeler"), which is how it appeared in the 2nd century in Ptolemy's *Almagest* (see Kneeler below).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a nude male kneeling on his left knee with his arms raised.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts this constellation as a nude male kneeling on his left knee with his arms raised.

The globe of the 2nd century Farnese Atlas depicts this constellation as a nude male viewed from the rear who is kneeling on his right knee and has his empty hands raised (Stevenson 1921).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (St. Gall, Stiftsbiliothek MS 902, fol. 84) Hercules is a man facing left, kneeling on his left knee, with a lion skin draped over this left arm and holding a branch aloft in his right hand,
- In other editions (Dresden DC 183, Paris BN 12957, Cologne 83 II) Hercules is shown as a kneeling naked male facing the snake in the Garden of Hesperides,
- In the Dresden edition he is holding a branch,
- In the Prague IX C. 6 edition Hercules is standing in a tree facing left with a branch beside him,
- In the Vat Reg lat 1324 edition Hercules is holding a leafy frond,
- In the Gottweig 7 (146) and Siena L. IV. 25 manuscripts Hercules is holding a small knife in his left hand.

This constellation is depicted in the Leiden *Aratea* (816) as a man in a short tunic and sandals with a crook in his right hand and a lion skin draped over his left arm (Katzenstein & Savage-Smith, 1988).

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Hercules nude, kneeling on his left knee, with a lion's skin over his left arm and a club upraised in his right hand. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Hercules with an animal skin, running to the right, holding a branch in his right hand. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Hercules nude from the rear, kneeling on his right knee, holding a lion's skin over his left arum and a club in his right hand. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Hercules nude walking to the left, holding a lion's skin over his left arm in front of him and holding a raised stick in his right hand behind him. The Los Angeles, Getty Ludwig XII, 5 manuscript of the *De ordine ac positione stellarum in signis* depicts Hercules as nude, running to the left holding an oddly shaped club in his left hand and an animal skin in his right hand: The Paris BN lat 8663 manuscript is identical, except he is holding a piece of cloth rather than a skin.

The Maass 1898 manuscript of the 11th century *De signis caeli ("of the signs of heaven*") lists "Hercules" and "Ercules, qui stans genuflexu" ("Ercules, who was standing kneeling"). The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts depict Hercules striding to the left, a lion's skin over this right arm. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296

manuscripts of *De signis caeli* depict Hercules in the Garden of Hesperides with a snake. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Montecassino 3, and Zwettl 296 manuscripts of *De signis caeli* depict Hercules kneeling in the Garden of Hesperides in front of the snake. The Klosterneuberg 685, Vat lat 643, Laon 422, Rouen 26, and Zwettl 296 manuscripts arm him with a club. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts Hercules in the Garden of Hesperides.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Hercules as a clean-shaven male wearing a head band with a floral decoration on the front, dressed in knee-length robes. On one page he is kneeling on his left knee, turned to our left, holding his right palm out in front of him as if to gesture someone to halt and he is brandishing a sickle in his left hand. On the other page he is kneeling on his right knee, turned to our right, holding his left palm out in front of him and brandishing a sickle in his right hand.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Hercules as a male kneeling on his left knee and is turned to our left. He is brandishing a sickle over his head in his left hand and is gesturing towards the ground before him with his right hand.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Hercules as a male kneeling on his left knee, turned slightly to our left. He is wearing a cap on his head. He is brandishing a sickle over his head in his left hand and is gesturing to his right as if to warn someone not to approach.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Hercules Genuflexus" as a male kneeling on his right knee, viewed from behind. He is dressed in Medieval tunic and tights. His left hand is held out in front of him, and his right hand is brandishing a scimitar over his head.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Hercules as a male kneeling on his right knee as viewed from behind. It is a very poor drawing that seems to show him wearing a tunic, shorts and knee pads. His left arm is extended out to his side and he is brandishing a sword aloft with his right hand.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Hercules as a nude male walking to our left. He has a lion's skin draped over his extended left arm and a club raised in his right hand. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Hercules as a clean-shaven nude male striding to our left. He is brandishing a long sword above his head in his left hand and has a lion's skin draped over his right arm. He is walking towards an apple tree around which a serpent is winding.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Hercules as a nude male walking to our left with a lion's skin draped over his left shoulder and a club raised in his right hand. He is walking towards an apple tree around which a serpent is wound.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Hercules as a nude male walking to our left with a lion's skin draped over his left shoulder and a club raised in his right hand. He is walking towards an apple tree around which a serpent is wound.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Hercules aut Genuflexus" as a man in colourful attire kneeling on his right knee with his left foot above the head of Draco. He holds a lion's skin in his left hand and brandishes a club in his right hand. A branch bearing fruit is in front of this right lower leg.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Hercules as a nude male kneeling on his right knee facing to our right. He has a sickle raised over his head in his right hand.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Hercules" as a nude bearded male kneeling on his right knee with his back to us: He is turned towards our left, holding aloft a club in his right hand and has a lion's skin draped over his left forearm.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Hercules" as a nude bearded male kneeling on his right knee with his back to us: He is turned towards our left, holding aloft a club in his right hand and has a lion's skin draped over his left forearm.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Hercules" as an armoured warrior as viewed from behind, kneeling on his right knee. He is gesturing forward with his left hand and brandishing a scimitar over his head in his right hand. A celestial globe (1522) of Schöner (1477 – 1547) depicts "Hercules" as a nude male viewed from behind, kneeling on his right knee. He is holding an animal skin in his left hand and is brandishing a club over his head in his right hand.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "HERCVLES" as a nude male with is back to us, kneeling on his right knee, holding a club aloft in his right hand and having a lion's skin draped over his extended left arm.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Hercules in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Hercules" as a nude male kneeling on his right knee as viewed from behind. He is facing to our left with a club raised in his right hand and has gripped a lion by the neck with his left hand.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Di Hercole". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Hercules as a bearded nude male with his back to us, kneeling on his right knee and turned slightly to our left. He is brandishing a club over his head in his right hand and has a lion's skin draped over his left forearm.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Engonasin qui et Hercules” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572): see Kneeler, below.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Hercules” as a male in a loin cloth kneeling on his left knee. He has a club raised over his head in his left hand and has raised his right arm straight out at shoulder level: There is nothing in his right hand.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a nude male kneeling on his left knee facing to our right holding a club over his head in his right hand. The label is unintelligible.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Hercules” as a nude male with his back to us, kneeling on his right knee. He has a lion skin draped over his left arm and is holding aloft a spiked mace in his right hand.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this constellation as “Engonasin” with the subtitle “Hercules”. He is depicted as a very long-haired, bearded male kneeling on his left knee with a serpent wound around his extended left arm.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Engonasin” as a male dressed in a tunic and sandals, walking to our right, with a crook in his right hand and a lion’s skin draped over his left arm.

German astronomer Johann Bayer (1572 – 1625) depicts in his *Uranometria* in 1603 this as a long-haired man wearing a lion’s skin with a club raised in his left hand and an apple branch in his right hand. Bayer lists the following names for this constellation: “Hercules, Engonasi, Ingeniculus, Prociduus in genua, Incuruatus in genu, Genu flexus, Nixus, Nisus, Saltator, Aper, Cetheus, Theseus, Alcides, Ixion, Prometheus, Thamyras, Orpheus, Algiethi, Algethi, Rasaben, Elgeziale rulxbachi, Persis Ternuelles”. NOTE: Bayer also lists “Hercules” as an alternative name for Ophiuchus, for Leo (“Herculeius”), and for Beta (β) Geminorum (Pollux).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Hercules” as a bearded male viewed from behind, kneeling on his right knee. He has a club raised in his right hand, a lion skin draped over his left arm, and his holding an apple branch in his left hand.

“Hercules” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a bearded male kneeling on his left knee, pointing towards Lyra with his left hand and raising a club in his right hand.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Hercules” and “Enconaso” and depicts a nude bearded male kneeling on his right knee with his back to us. He had an animal skin draped over his left arm and is holding aloft a club in his right hand.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) list the names “Hercules” and “Engonasi” for this constellation.

“Heracles” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a long-haired male kneeling on his right knee raising a club in his right hand and holding out a branch with three balls (apples presumably).

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this constellation “Engonasi” and “Hercules”.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Hercules as a bearded male wearing a loincloth as viewed from behind. He is kneeling on his left knee. He is brandishing a club aloft in his left hand, has a lion’s skin draped over his extended right arm, and is holding an apple branch in his right hand.

Hercules is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and is depicted as a male kneeling on his right knee.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Hercules” as a nude long-haired male wearing what looks like a fez. We view him from his left side and he is kneeling on his right knee holding a branch in his left hand and raising a club in his right hand.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Hercules” as a nude bearded male viewed from behind who is kneeling on his right knee, with a lion’s skin draped over his left arm, holding a club in his right hand and a three headed snake labelled “Cerberus” (see above) in his left hand.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts “Hercules” as a bearded male with long hair kneeling on his left knee. He is holding aloft a club in his left hand and holding an apple branch in his right hand.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels Pollux as “Pollux al Hercules”.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts Hercules as a nude male viewed from behind kneeling on his right knee. He is holding a branch with three serpents in his left hand and holding aloft a club in his right hand.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Hercules as a male wearing a lion’s skin, kneeling on his left knee, holding aloft a club in his left hand and the asterism “Ramus Cerberus” (see Cerberus, above) in his right hand.

Hercules is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: He is depicted as a bearded male kneeling on his right knee. He is holding aloft a club in his right hand and has his empty left hand fisted in front of him.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Hercules” as a nude male kneeling on his left knee facing away from us. He has a lion skin draped around his neck and his holding a three headed snake in his right hand.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Hercules” as a male kneeling on his left knee with his body turned away from us, looking over his right shoulder. He has a lion skin draped over his right shoulder and is holding a three headed snake labelled “Cerberus” in his right hand.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Hercules as a bearded male with hair which reaches down his back to almost his knees. He is turned slightly away from us, facing to our right, and kneeling on his left knee. He is holding an apple branch in his right hand and brandishing a club aloft in his left hand.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Hercules as a male kneeling on his right knee, facing left away from us, holding a club aloft in his right hand and a branch with serpents in his left hand.

The French edition, *Atlas Céleste, Seconde Édition* (1776), of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Hercule" as a male kneeling on his right knee, wearing a lion's skin, with a club raised in his left hand and a branch with three serpents twined through it in his left hand.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Herkules" and depicts a male wearing a lion's skin who is kneeling on his right knee. He is holding aloft a club in his right hand and is holding a branch with three serpents labeled "Cerberus u Zureig".

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Ercole" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Hercule" as a bearded male kneeling on his left knee, facing to our right. He is wearing a lion's skin, has a club raised in his left hand, and is holding an apple branch in his right hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Hercules" as a nude male with long hair kneeling on his right knee with his back to us holding an apple branch in his right hand and raising a club in his left hand.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Hercules" as a nude male kneeling on his right knee facing away from us, looking over his left shoulder, with a club raised in his right hand.

American uranographer William Croswell (1760 – 1834) depicts "Hercules" on his *Mercator Map of the Starry Heavens* in 1810 as a long-haired male kneeling on his right knee and holding aloft a branch and two serpents in his left hand and a club in his right hand.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this constellation as "Hercule". He is depicted as a long haired, bearded male kneeling on his right knee, with an animal skin around his loins. He is holding a club aloft in his right hand, and an apple branch with two snakes in the foliage (See Cerberus, above, and Apple Branch, above).

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Herkules" and depicts him as holding a club aloft in his right hand and an apple branch with three snakes in his left hand. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Herkules".

NOTE: Scottish uranographer Alexander Jamieson (1782 – 1850) describes the Gemini twins in his *Celestial Atlas* in 1822 as "Hercules vel Pollux" and "Apollo vel Castor".

"Hercules" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a bearded male kneeling on his left knee, facing to our right, with a branch in his raised right hand and a club raised in his left hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Hercules in his *Celestial Atlas* and in his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): He is depicted as a long haired and bearded male kneeling on his right knee, brandishing a club aloft in his right hand. Hercules is wearing a lion's skin around his middle and has a bow and quiver draped over his left leg. In his left hand he is holding an apple branch with three snakes in the foliage (See Cerberus, above, and Apple Branch, above).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Hercules" as a male in a tunic kneeling on his right knee as viewed from behind. He has a club raised in his right hand and is holding three snakes in his left hand.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Hercules" as a male kneeling on his right knee, wearing a lion's skin.

Hercules is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822. He is depicted kneeling on his right knee, with an animal skin around his loins, with a club raised in this right hand and an apple branch with two snakes in the foliage (See Cerberus, above, and Apple Branch, above). He has a bow and quiver draped over his left leg.

"Hercules" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a bearded male kneeling on his right knee, holding aloft a club in his right hand and a branch with three serpents entwined in his left hand.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Hercules" as "a warrior clad in the skin of the Nemean lion, holding a club in his right hand and the dog Cerberus in his left".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Hercules" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Hercules".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Hercules" in his *Star Atlas* (1893).

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Hercules".

W. Brennand in his Hindu Astronomy in 1896 writes that "Sagittary was made Hercules, the Conqueror of Giants (Macrobius 1,20)." Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Sagittary was a common variation of the name of the constellation Sagittarius in the years prior to the publication of Brennand's book.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as Hercules and does not describe it.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Hercules: The Mighty One”.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Hercules in his book *The Stars - A New Way to See Them* (1952). The standard version found on star charts has the “Keystone” quadrilateral in the middle: Epsilon (ε), Pi (π), Eta (η), and Zeta (ζ) Herculis. From each of these stars, lines run out representing arms and legs. In Rey’s version:

- The “Keystone” becomes the “head” of Hercules,
- His “body” is the bent quadrilateral of the stars Epsilon (ε), Mu (μ), Omicron (ο), Xi (ξ), and Pi (π) Herculis,
- One “arm” starts at Pi (π) Herculis and runs to an “elbow” at Theta (θ) Herculis and a hand at Iota (ι) Herculis, which is holding a club formed by the stars Iota (ι), Sigma (σ), Phi (φ), and Tau (τ) Herculis,
- One “arm” starts at Epsilon (ε) Herculis and runs through Beta (β) Herculis (Kornephoros) to Gamma (γ) Herculis,
- One “leg” runs from Mu (μ) Herculis through Lambda (λ) Herculis to a “knee” at Delta (δ) Herculis and a “foot” at Alpha (α) 1 and 2 Herculis (Rasalgethi), and
- One “leg” runs from Omicron (ο) Herculis to a “knee” formed by 95 and 102 Herculis, then through 109 and 110 Herculis to a “foot” at 111 Herculis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Hercules in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* with the Keystone asterism in the middle (see Keystone, below), but the four lines running out from the corners differ from the standard IAU version:

- One line runs from Pi (π) Herculis to Theta (θ) Herculis,
- One line runs from Eta (η) Herculis through Sigma (σ) and Tau (τ) Herculis to Phi (φ) Herculis,
- One line runs from Zeta (ζ) Herculis through Beta (β) Herculis (Kornephoros) to Alpha (α) 1 Herculis (Rasalgethi), and
- One line runs from Epsilon (ε) Herculis through Delta (δ), Lambda (λ), Mu (μ), and Xi (ξ) Herculis to Omicron (ο) Herculis.

Sky and Telescope Magazine, founded in 1941, depicts Hercules in their magazine and publications like this:

- His “head” and “upper body” is a pentagonal shape formed by the stars Zeta (ζ) Herculis, Beta (β) Herculis (Kornephoros), Alpha (α) Herculis (Rasalgethi), Delta (δ) Herculis, and Epsilon (ε) Herculis,
- His “lower body” is the “Keystone” asterism made up of Epsilon (ε), Pi (π), Eta (η), and Zeta (ζ) Herculis,
- One “arm” runs from Kornephoros through Gamma (γ) and Omega (ω) Herculis to 29 Herculis,
- One “arm” runs from Delta (δ) Herculis through Lambda (λ), Mu (μ), and Xi (ξ) Herculis to Omicron (ο) Herculis,
- One “leg” runs from Pi (π) Herculis through Rho (ρ) Herculis to a “knee” at Theta (θ) Herculis and a “foot” at Iota (ι) Herculis,

- One “leg” runs from Eta (η) Herculis through Sigma (σ) Herculis to a “knee” at Tau (τ) Herculis and then through Phi (ϕ) Herculis to a “foot” at Chi (χ) Herculis.

An Italian name for this constellation is “Ercole”.

NOTE: The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) gives “Hercules” as an alternate name for Orion. The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch gives “Hercules” as an alternate name for Ophiuchus.

Hercules Box:

This **telescopic** asterism is in the IAU constellation Hercules and is Leiter 6 on astronomer Frank Leiter’s list of asterisms. It is made up of five 10^{th} – 12^{th} magnitude stars and is only 2 arcseconds in size, so you’ll need higher magnification to see it. Its size is 1.6’ X 0.4’.

Hercules Cluster:

This **telescopic** asterism is the globular cluster Messier 13 (NGC 6205) in the IAU constellation Hercules. This was discovered by English astronomer Edmund Halley in 1714. The 1864 *General Catalogue* lists it as GC 4230, Edmund Halley lists it as Halley 1714, and John Herschel’s catalogue lists it as h 1968. American astronomer Solon Irving Bailey (1854 – 1931) lists it as the Great Cluster in Hercules” as does British schoolmaster Arthur P. Norton in the 14^{th} edition of his *A Star Atlas* (1959). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply calls this a “Hercules Cluster”. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the “Great Cluster”. This is also known as the Propellor, the Great Star Cluster, the Great Globular Cluster, the Great Hercules Cluster, the Spider, and the Mercedes Emblem.

Hercules Lydius:

This Greek asterism is the IAU constellation Ophiuchus as listed in John Hill’s *Urania* in 1754. This is a reference to the Lydian dragon of the river Hermus in Lydia.

Hercules’s Club:

This asterism from the Saguaro Astronomy Club asterism database is made up of stars of the IAU constellation Hercules: Iota (ι), Tau (τ), Nu (ν), and Phi (ϕ) Herculis. Compare this to the obsolete constellation Ramus Pomifer (see Apple Branch, above).

Herd:

This Sardinian asterism “sa mandra” is the IAU constellation Auriga (Putzolu 2019). It is related to the Sardinian asterism “Fence for Sheep” (see above).

Herd of Boars:

This Saxon and Anglo-Saxon asterism “Ebergedrangel” is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen calls this “Boar Throng” in his *Star Names* in 1899 and writes that this may be either the Hyades cluster or Orion.

Herd of Goats:

This Bedouin asterism “Qatie min Almaeizis” (قطيع من الماعز) is the IAU constellation Auriga.

Herd of Horses:

This Kazakh asterism is the Pleiades cluster in the IAU constellation Taurus (Jaambayeva 2019).

Herdsman:

This Latin asterism "Bubulcus" ("herdsman", "cattle driver", or "bullwhacker") is the IAU constellation Boötes is the IAU constellation Boötes as described by 2nd century Roman poet Juvenal. It also appears as "Bubulus" ("bovine").

- This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Herdsman" and "Bear Keeper".
- English linguist John Minsheu (1560 – 1627) listed this constellation as "Bubulcus coelestis" ("celestial cattle driver").
- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) lists this constellation with the label "Bubulcus".
- Johann Bayer's *Uranometria* (1603) lists "Bubulus" and "Bubulcus" as alternate names for Boötes.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Bubulcus" as an alternate name for Boötes.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Bubulcus" as a name for Boötes.
- This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as both "Bootes" and Bubulcus".
- Robert Hues lists "Heardsman" in his *A Learned Treatise of Globes* in 1659.
- French astronomer Jérôme Lalande (1732 – 1807) lists this constellation as "Bubulcus".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Bubulus" and also "Icarus" and attributing the latter to Roman general Germanicus (15 B.C.E. – 19 C.E.).
- R. H. Allen notes in his *Star Names* in 1899 that "Bubulcus" was sometimes also used for Taurus.

This French asterism "Bouvier" is the IAU constellation Boötes. The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists "le Bouvier": He is depicted as a male in a kilt-like garment with a club in his right hand and the leashes of two greyhounds in his left hand. The 1776 edition depicts him as a male in tall boots, a thigh length tunic, with a switch in his right hand and the leashes of two greyhounds in his left hand.

This German asterism "Boote" is the IAU constellation Boötes. The name is transliterated from the original Greek name "Βοώτης" or "Voótis" (see Boötes, above).

This Romanian asterism "Păstor" or "Văcarul" is the IAU constellation Boötes (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Latin asterism "Crotos" is the IAU constellation Sagittarius as listed by 1st century Roman writer Lucius Junius Columella. 1st century Roman author Gaius Julius Hyginus called it "Croton".

- Johann Bayer's *Uranometria* (1603) lists "Croton" and "Crotus" as names for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists both "Croton" and "Crotus" as alternate names for Sagittarius.

- "Crotos" and "Croton" are listed in R. H. Allen's *Star Names* in 1899.

Herdsman and Dog:

This Nuer asterism is the stars of the belt and sword of Orion: The star Delta (δ) Orionis (Mintaka) is the herdsman, Epsilon (ε) Orionis (Alnilam) is his cow and Zeta (ζ) Orionis (Alnitak) is his dog, while the sword of Orion is a hyena following them.

Herdsman of the Jauzah:

This Arabic asterism "Rāʿi al Jauzah" is the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899. Allen relates it to the asterism Camels (see above).

Herdsman's Crook:

This Greek star "Κᾶλᾶυροψ" or "Káláyrops", later latinized to "Alkalurops" is Mu (μ) Boötis in the IAU constellation Boötes:

- The name first appeared in the translations of the 5th century grammarian Hesychius of Alexandria.
- This appears in the 15th century *Alfonsine Tables* as "Incalurus", "Inkalunis", or "Icalurus", which may be a misreading or mistranslation of "et es inalurus" ("and you are hot").
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists the name "Icalurus" for this star.
- The 1515 edition of the *Almagest* lists it as "Incalurus".
- Johann Bayer's *Uranometria* (1603) lists this star as "Venabulum", "Incalurum", and "Alkalurops."
- This is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Inkalarus".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Colorrhobus".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Alkalurops".
- American uranographer William Croswell (1760 – 1834) lists this star as "Alkalurops" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Alkalurops" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "inkalúrus" and "Al kalurops,… a shepherd's crook… or herdsman's staff".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Alkalurops": It is depicted as a spear on these cards.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Alkaturops (sic)".
- In his *Star Names* in 1899, R. H. Allen writes that Ptolemy (c.100 – c.170) used the term "Κολλορόβος" or "Kollorónos" for this star as "probably a word of his own coining to designate the position of the star in the club".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alkalurops" for this star.
- The IAU approved the name "Alkalurops" for Mu (μ) 1 Boötis Aa.

This Latin asterism "Ρόπαλον" or "Rópalon" is Mu (μ) Boötis in the IAU constellation Boötes as described by 1st century Roman author Gaius Julius Hyginus

This French star is Gamma (γ) Boötis in the IAU constellation Boötes in the IAU constellation as listed by French astronomer Camille Flammarion (1842 – 1925) in his *Astronomie Populaire*.

Here After Yoke:

"Alnon Uedon" is a proposed early Celtic name for the IAU constellation Scorpius from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Herman's Cross:

This **telescopic** asterism, also known as Terebellum, is a small quadrilateral or cross of four faint stars in the IAU constellation Sagittarius made up of the star Omega (ω) Sagittarii plus the stars 59, 60 and 62 Sagittarii.

Hermanubis:

This asterism is the IAU constellation Cancer as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This "Ancient Zodiac of Egypt" also lists the name "Ibis" for this constellation (see Ibis, below). This depicts a seated man with the head of an ibis, which is how the Egyptian god Thoth is typically depicted. Anubis was associated with Canis Major in ancient Egyptian skies. In later Seleucid skies this constellation appears as a crab, "NAGAR", which is not related to Anubis. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

Hermidone:

This asterism is a group of stars between the IAU constellations Pisces and Cetus, first described by 1st century Roman architect Vitruvius with the Greek name "Ἑρμεδόνη" ("Ermedóni") and by 5th century Greek lexicographer Hescychius of Alexandria as the "Stream of Faint Stars":

- The 11th century *De signis caeli ("of the signs of heaven"*) mentions "Effusio" ("absoprion") for this asterism.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) called it "Hermindone", describing it as "effusio Aquarii" ("absorption of Aquarius").
- John Hill lists it as "Hermedone" in his *Urania* in 1754 and associates it with the entire constellation of Pisces.
- R. H. Allen writes in his *Star Names* in 1899 that French scholar Joseph Justus Scaliger (1540 – 1609) and "Baldus" assign it the Greek name "Ἀρπεδόνη" ("Arpedóni" or "cord") and that this may be the same stars as William Henry Smith's asterism Testudo (see Turtle, below).

Hermippus:

This asterism is the IAU constellation Delphinus. "Hermippus" is listed in Johann Bayer's *Uranometria* (1603) as an alternate name for Delphinus. "Hermippus" is listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) and Italian astronomer Giovanni Battista Riccioli (1598 – 1671).

John Hill lists “Hermippus” in his *Urania* in 1754. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Hermippus”. Hermippus was a 3rd century Greek philosopher.

Hermit Bird:

This German asterism “Einsiedler Vogel” is made up of stars of the IAU constellation Hydra and is listed in German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820). Bode depicts it standing on the tip of the tail of Hydra facing towards the tip of the tail. This includes the stars HIP 61908, 62131, 62500, 62788, 63159 and the double star HIP 61621.

Hero of Tiryns:

This Latin asterism “Heros Tirynthius” is the IAU constellation Hercules as listed in R. H. Allen’s *Star Names* in 1899 and is a reference to the place Hercules was raised.

Hero of the Sky Furrow:

This Babylonian lunar mansion “Dan-nu” is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Hero Teacher:

This Ojibwe asterism is named for their hero Nanaboujou, the “hero teacher”, and made up of the stars of the IAU constellation Scorpius (Lee et al 2014). Basically, this is the stars of the front end of Scorpius, centered on Alpha (α) Scorpii (Antares), minus the “stinger” (see Fishhook, above). Nanaboujou is a trickster God.

Heron:

This asterism “Den Reygher” is the IAU constellation Grus as described by Dutch navigator Frederick de Houtman in 1592. John Hill lists this name in his *Urania* in 1754.

This Carib asterism “Kumawariyuman” or “Kumawari” is the heron (Ardea herodias). Its present location is unknown (Magaña, and Jara, 1982).

This **telescopic** asterism is Arp 84, a pair of interacting galaxies in the IAU constellation Canes Venatici. Spiral galaxy NGC 5395 (the “heron’s body”) is interacting with the smaller spiral galaxy NGC 5394 (the “heron’s head”). These were discovered by English astronomer William Herschel in May 1787, who listed them as “I 191” and “I 191”. They are GC 3730 and GC 3731 on the *General Catalogue* of 1864.

Hero’s Raft:

1st century Roman poet Marcus Manilius called Ptolemy’s asterism Argo’s Ship (see above) “Ratis Heroum”.

Hero’s Weapon:

This Arabic asterism “Kullāb” is the IAU constellation Perseus:

- Variations include “Cheleub”, “Chelueb”, “Chelùb” in the 1515 edition of the *Almagest,* the *Alfonsine Tables* of the 15th and 16th centuries, and German astronomer Johann Bayer’s *Uranometria* in 1603.

- Johann Bayer's *Uranometria* (1603) lists "Cheleub" and "Chelub" for this constellation. Bayer also lists "Cheleub" as an alternate name for Alpha (α) Persei (Algol).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Cheleub".
- All the above variations plus "Kellùb" are found in Edward Sherburne's *Sphere of Marcus Manilius* in 1675. Sherburne translates it as "Deceptor".
- John Hill lists "Cheleub" and "Chelub" as names for this constellation in his *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Cheleub" and "Kelb", the latter being attributed to Hugo Grotius (1583 – 1645).
- "Cheleub" is listed in R. H. Allen's *Star Names* in 1899: Allen translates it as "hero's weapon", though he agrees that a common translation of this Arabic word is "dog".
- Robert Burnham lists "Kullab", "Chelub", and "Celeub" in his *Burnham's Celestial Handbook* in 1978.

Herring:

This **telescopic** asterism NGC 4631 (Caldwell 32) is an edge-on barred spiral galaxy in the IAU constellation Canes Venatici. This was discovered by English astronomer William Herschel in 1786 who listed it as "V 42". It is GC 3165 in the *General Catalogue* of 1864. It is also known as the Whale (see above).

Herschel's Galaxy of Cetus:

This **telescopic** asterism "Herscheliánus Céti" is the edge-on spiral galaxy NGC 1055 in the IAU constellation Cetus. It was discovered in 1783 by English astronomer William Herschel who listed it twice: Once as "I 1" and once as "II 6". It became GC 591 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it was the first item listed by Herschel in his catalogue of bright nebulae (I.1).

Herschel's Hole in the Heavens:

See Ink Spot (below).

Herschel's Jewel Box:

This **telescopic** asterism is the open cluster NGC 4755 (Caldwell 94) in the IAU constellation Crux. It was originally discovered by Nicolas Louis de Lacaille in 1751 but named by English astronomer John Herschel (1792 – 1871), who described it as "a superb piece of fancy jewelry" in his catalogue of 1828 where it is listed as h 3435. It is GC 3275 in the *General Catalogue* of 1864. It is also known simply as the "Jewel Box" (see below).

Herschel's Large Telescope:

See Herschel's Telescope, below.

Herschel's Ray:

This **telescopic** asterism is NGC 2736, a part of the Vela Supernova Remnant in the IAU constellation Vela. This was discovered by English astronomer John Herschel in March 1835 and listed it as h 3145. It is GC 1745 in the *General Catalogue* of 1864. Herschel described it as "an extraordinary long narrow ray

of excessively feeble light" which is how it got this name. It is also known as the Pencil Nebula (see below) and the Streak Nebula (see below).

Herschel's Ring:

This **telescopic** asterism is Messier 51 (NGC 5194), a pair of interacting galaxies in the IAU constellation Canes Venatici. It was discovered by French astronomer Charles Messier in October 1773. The name comes from John Herschel, who observed it in 1830, listed it in his catalogue as h 1623, and described it as "a vB neb 1' in diameter of a resolvable kind with a double ring or rather 1 1.2 ring like an armillary sphere". Irish astronomer Lord Rosse first recorded its spiral structure in 1845

Herschel's Small Telescope:

See Herschel's Telescope, below.

Herschel's Spiral Cluster:

This **telescopic** asterism is the open cluster NGC 7789 in the IAU constellation Cassiopeia. It was discovered in 1783 by English astronomer Caroline Herschel. John Herschel listed it as ""VI 30". John Herschel listed it as h 2284 and later as GC 5031 in his *General Catalogue* of 1864.. It is also known as Caroline's Rose, the White Rose, the Star Mist Cluster, the Ghost Cluster, and the Screaming Skull Cluster.

Herschel's Telescope:

This asterism "Telescopium Herschelii" was created by Hungarian priest and astronomer Abbé Maximilian Hell in 1798 to honor William Herschel's discovery of the planet Uranus and published by German astronomer Johann Bode in 1800. American uranographer Elijah Burritt included it in his atlas in 1833. It is made up of the stars of the IAU constellation Auriga and located close to the IAU constellation Lynx. Originally it included two asterisms, the first commemorating Herschel's 20-foot telescope, and the second his 7-foot telescope:

- "Tubus Herschelii Major" ("Herschel's Large Telescope") was made up of stars of the IAU constellations Gemini, Lynx, and Auriga, with the "scaffold" starting at the brightest star Psi (ψ) 2 Aurigae and running through to Psi (ψ) 9 Aurigae, and a tube including open cluster NGC 2281.
- "Tubus Herschelii Minor" ("Herschel's Small Telescope") was made up of stars in the IAU constellations Orion and Taurus.

German astronomer Johann Ehlert Bode (1747 – 1826) changed the name of Hell's constellation Tubus Herschelii Major to Telescopium Herschelii in 1801 and disregarded Tubus Herschelii Minor. Bode later labelled it "Herschel's Telescop" in his *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts this asterism as a refractor telescope on a tripod facing to our left. The label is hard to make out, but it appears to say "Herschelii".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Telescopium Herschelii" in his *Celestial Atlas* in 1822 and on his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Telescopium Herschelii” as a telescope on a tripod under the constellation Lynx.

Herschel's Wonder Star:

This triple star is Beta (β) Monocerotis in the IAU constellation Monoceros. It is named for English astronomer William Herschel, who recorded it in 1781, noting that it was “one of the most beautiful sights in the heavens”.

Hes:

This Hebrew asterism “Ḥēṣ”or “Ḥēts” is the IAU constellation Sagitta as listed by R. H. Allen in his *Star Names* in 1899.

Hesperides:

This Greek asterism is the Pleiades cluster as listed by R. H. Allen in his *Star Names* in 1899. The Hesperides were the “daughter of the evening”, nymphs of evening and sunset.

Hester’s Crown:

This German asterism is the IAU constellation Corona Borealis and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This appears as “Queen Hester’s Crown” in Edward Sherburne’s Sphere of Marcus Manilius in 1675 and as “Hester’s Crown” in John Hill’s *Urania* in 1754.

Hexagon:

This **telescopic** asterism is Kronberger J2048.9+2312 in the IAU constellation Vulpecula. René Merting describes it on the Faint Fuzzies website: “At 45x, it is already visible as a hexagon with six corners running from east to west; the brightest stars are in the east and form a corner in the north and south. At 103x, the cluster is beautiful to look at; the hexagonal shape is preserved, within which many small stars now run from east to west, some spots remain empty. The western flank is formed by three faint stars. A good two dozen stars are visible in total.” The four principal stars are Gaia DR3 1842110889138852736, 1842106907708810112, 1842110889138852736, and 1842111511913954560.

Hexagonal of Pavo:

This **telescopic** asterism “Sexanguláta Pavónis” is the barred lenticular galaxy NGC 7020 in the IAU constellation Pavo. It was discovered in 1836 by John Herschel who listed it as h 3853 and later as GC 4635 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the inner ring of this double ringed galaxy has a remarkable hexagonal structure.”

Hexagonal of Virgo:

This **telescopic** asterism “Hexagonális Vírginis” is the intermediate spiral galaxy Messier 61 (NGC 4303) in the IAU constellation Virgo. It was discovered by Italian astronomer Barnaba Oriani in May 1779, six days before French astronomer Charles Messier recorded it. English astronomer William Herschel listed it as “I 139”. It is GC 2878 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One*

Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its "characteristic hexagonal shape". It is also known as the "Swelling Spiral" (see below).

Heze:

This Czech star is Zeta (ζ) Virginis in the IAU constellation Virgo and was listed under this name by Czech astronomer Antonín Bečvář in his Atlas Coeli in 1951, which was approved for Zeta (ζ) Virginis A in 2018 by the IAU.

Hézhōng:

This Chinese star "Hézhōng" from the 3 Kingdoms and Ming Dynasty Period is the star Beta (β) Herculis (Kornephoros) in the IAU constellation Hercules and is part of their xing guan Heavenly Market West Wall (see above).

Hidden Galaxy:

This **telescopic** asterism is the intermediate spiral galaxy IC 342 (Caldwell 5) in the IAU constellation Camelopardalis. It was discovered by British astronomer William Frederick Denning in 1892. It has this name as it is difficult to observe, being located behind dusty areas of the galactic equator. It is also known as "Behind a Veil of Stars of Camelopardalis" (see above).

Hidden Nebula

This **telescopic** asterism is the HII region SH 2-124 (LBN 426) in the IAU constellation Cygnus. This name appeared in a post on the *Astrophotography* Facebook page by astrophotographer Patrick A. Cosgrove of *Gosgrove's Cosmos* on 23 August 2025. It is also known as the "Mysterious Nebula".

Hidden of Cassiopeia:

This **telescopic** asterism "Crýptus Cassiopéiae" is the galaxy PGC 100170 (Dwingeloo 1) in the IAU constellation Cassiopeia. It was discovered by Cuno Hoffmeister in 1929 but originally thought to be a variable star. John Schmitt identified it as a radio source in 1968. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). This galaxy is on the galactic equator and is almost obscured by foreground stars. It was first detected by the Dwingeloo radio telescope in the Netherlands in 1994.

Hidden Virtue:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Ursa Minor: HIP 74605 (the determinative star) and RR UMi.

This Chinese xing guan "Yīndé" (阴德) is two stars in the IAU constellation Ursa Minor: HIP 51808 and 51734A.

This Chinese Chenzhuo xing guan "Yīndé" is a line of two stars in the IAU constellation Ursa Minor: HIP 73199 and HIP 74605

Hide Bucket:

This Latin asterism "Hyde Situla" is a Latinization of the Arabic asterism Well Bucket (see above).

Hiding Arms of Fornax:

This **telescopic** asterism "Crypsibráchion Fornácis" is the lenticular galaxy NGC 1380 in the IAU constellation Fornax. It was discovered by James Dunlop in 1826. This became 2559 on John Herschel's list and subsequently GC 739 on his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Hiding Place Dweller of Vela:

This **telescopic** asterism "Latebrícola Velórum" is the barred spiral galaxy NGC 3366 in the IAU constellation Vela. It was discovered in 1836 by John Herschel who listed it as h 3294 and later as GC 2192 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to a foreground star.

High Altar:

This Latin asterism "Altare" is the IAU constellation Ara and is listed under this name in John Hill's *Urania* in 1754.

High Backed Ceremonial Sandal:

This Tzotzil (of Zinacantán) asterism "Chak Shonob" is the Pleiades cluster in the IAU constellation Taurus. Compare this to the Ch'ol and Tzeltal asterism "Sonom" (see Sandal, below).

High Born:

This Māori star "Ariki" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

High Judge:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars in the IAU constellation Leo Minor: Omicron (o) Leonis Minoris, 37 Leonis Minoris, 30 Leonis Minoris (the determinative star), and Beta (β) Leonis Minoris.

This Chinese xing guan "Nèipíng" (内平) is a quadrilateral of stars in the IAU constellation Leo Minor: 13, 18, 21, and 22 Leonis Minoris.

This Chinese Chenzhuo xing guan is a "box" of stars in the IAU constellation Leo Minor: Omicron (o) Leo Minoris, 37 Leo Minoris, 30 Leo Minoris, and Beta (β) Leo Minoris.

High Ministers and Nobles:

This Chinese star "Qingdafu" from the 3 Kingdoms and Ming Dynasty Period is Mu (μ) Ursae Majoris in the IAU constellation Ursa Major and is part of their xing guan Three Steps (see below).

High Mountains:

This Hittite asterism, whose complete name is "High mountains, deep valleys, the prairie of the Storm God in the reeds" is the IAU constellation Capricornus as listed in the I KUB 1, KBO III 8 and 14/KUB XXV tablets (Boutet 2014)

High One with the Spear:

This Arabic star is Alpha (α) Boötis in the IAU constellation Boötes and is part of their asterism the "Armed One" (see above).

Higher Crossbar of the Bucket:

This Arabic asterism "'arquwat ad-dalw al-'ulya" (عرقوة الدلو العليا) is two stars in the IAU constellations Andromeda and Pegasus: Alpha (α) Andromedae (Alpheratz) and Beta (β) Pegasi (Scheat). These were part of their rain stars calendar. It is also known as First Spout (see above) and First Two Crossbars of the Bucket (see above).

Highest Post:

This Tahitian star "Anatipu" ("highest post" or "guardian post") is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Edwards 2015).

Highest Ranking Imperial Consort:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty "Furen" is the star Eta (η) Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

Highway:

This Korean asterism "Gosogdolo" (고속도로) is a line of stars in the IAU constellation Cassiopeia: One end starts at Iota (ι) Cassiopeiae and runs through Epsilon (ε), Delta (δ), Theta (θ), and Nu (ν) Cassiopeiae, ending at Omicron (o) Cassiopeiae.

Hikianalia:

This Hawaiian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

Hiki-'au-moana:

This Kauai'ian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

Hikule'o:

This Tongan star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Hilda's Cluster:

This **telescopic** asterism is the open cluster NGC 3766 (Caldwell 97) in the constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "III 7" in his catalogue. It is GC 2468 in the *General Catalogue* of 1864. It is also known as the Pearl Cluster, the Eye, "B", and the Rich Man's Jewel Box. South African astronomer Auke Slotegraaf lists it under this name and as the "Rich Man's Jewel Box" in his observations at Mount Ceder in 2008.

Hill:

This Japanese sei shuku or lunar station "Tatara Boshi", sometimes interpreted as "lasso" or "bellows", is a bent line of four stars in the IAU constellation Aries: Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan) and the variable/double stars Gamma (γ) 1 and 2 Arietis.

Hill of Dinan:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Hill of Sky:

This Korean asterism “Haneul-ui Eondeog” (하늘의 언덕) is a long, crooked line of stars in the IAU constellations Eridanus and Fornax: It starts at Upsilon (υ) 1, 2, 3, and 4 Eridani and runs through g, f, h, γ, e, Theta (θ) 1, and Iota (ι) Eridani, Phi (ϕ) and Beta (β) Fornacis, HIP 13166, and ends at Alpha (α) Fornacis (Dalim).

Himinbjörg:

This Norse star “Himinbjörg” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Himinbjörg was the home of the God Heimdallur (see above). Jónsson depicts Heimdallur as standing on this star.

Hind:

This German star “der Hinde” is 80 Ursae Majoris in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899.

Hind Leg of the Lion:

This Babylonian star “Shēpu-arkū sha-A” is Beta (α) Virginis (Zavijava) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Hindmost:

This Arabic star “Al Ridf” is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus:

- This was later latinized to “Aridif” and “Arion”.
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name “al-ridf” and the Hebrew name “zenav ha-tarnegolet”.
- Shams al-Dīn Muhammad B. Mu’ayyad al-‘Urdī’s inlaid celestial globe (1288) lists this star as “al-ridf”.
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name “al-rādf” and the Hebrew name “zenav tarnegolet”.
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists “Alref” (Dekker 2000).
- The rete of the 14th century Spanish astrolabe NMM AST0570 lists “Alrif” (Dekker 2000).
- “Alredaf” and the abbreviated form “Radf” appear on the 14th century astrolabe #4560 from Christian Spain (King 2002), which is translated as “person riding on a horse behind the main rider”: King notes that this is not known from the textual tradition or from any known medieval astrolabe, the more common forms being “Ridf” and “Redf”.
- A 14th century Christian Spanish astrolabe #4560 lists “radf” (King 2002).
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as “Addigege avior”.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists “Deneb adigege [vel] Arided”.
- It is listed as “Arided” and “Arrioph” by German astronomer Johann Bayer (1572-1625) in his Uranometria (1603).
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists this star as “Aridef”.

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al-ridf" and "Arided".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Arided" and "Deneb Adiga".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Arided" and describes it as "the tail piece".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Arided" and "Deneb Adige" for this star, but his 14th edition (1959) only lists "Arided" for this star.

Hind's Crimson Star:

This pulsating variable star is R Leporis (HP 23203) in the IAU constellation Lepus. It is named for the British astronomer John Russell Hind, who observed it in 1845. This cool carbon star is one of the reddest stars visible. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Crimson Star". The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Hind's 'Crimson Star'".

Hind's Variable Nebula:

This **telescopic** asterism is HII region NGC 1555 in the IAU constellation Taurus. It contains the star T Tauri and was discovered in 1852 by British astronomer John Russell Hind. It is listed in the General Catalogue of 1864 as GC 839. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as "Hind's Nebula". NOTE: this name is also sometimes given to NGC 1554 (see Struve's Lost Nebula, below).

Hip:

This Latin star "Coxa" is Theta (θ) Leonis in the IAU constellation Leo. It is a mistranslation of the original name of the star "al-kharātān" (see Two Small Ribs, above).

Hip Bone:

This Jū /'hoansi star "//Kum" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014). It may have at one time been part of their "tshxum" asterism (see Rain Bull, below).

This Jū/Wãsi star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It may have at one time been part of their "tshxum" asterism (see Rain Bull, below).

Hippie:

This American asterism is made up of stars of the IAU constellation Cetus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). This is the "tail end" of Cetus.

Hippocampus Nebula:

This **telescopic** asterism, the "Hippocampus Nebula" or the "Hippocampi Dark Nebula" is Barnard 150 in the IAU constellation Cepheus. It is also know as the "Sea Horse", the "Dark Sea Horse", or the "Sea Horse in the Red Sea".

Hippocrator:

This Egyptian asterism is one of the paranatellonta of the decans of Aquarius as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and may be stars of Perseus or Pegasus.

Hippolytus:

This Greek asterism "Hippolytus" is the IAU constellation Auriga. Hippolytus (whose name means "unleasher of horses") was the son of Theseus and the main character in a play by Euripides (480 – 408 B.C.E.).

Hippopotamus:

This ancient Egyptian asterism "Reret" ("rrt"), or "Isis-Djamet" ("ꜣst-ḏꜣmt*")* is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and the ceiling of the Temple of Hathor at Dendera (Krupp 1983, Hoffman 2017). It is made up of the stars of the IAU constellations Draco, Corona Borealis, Boötes, Hercules, and Lyra. The "body" is a very rough quadrilateral with four stars at the corners: Theta (θ) Herculis, Gamma (γ) Draconis, and Gamma (γ) and Xi (ξ) Boötis. The "tail" is the stars of Lyra. Alongside it, as if on its back, is their asterism "Saq" (see Crocodile, above). Reret is probably a representation of the nursing Goddess Taweret, a hippotamus figure with a crocodile tail that stands on two feet. The name Reret means "sow" (the ancient Egyptians saw hippos as part of the pig family) and is related to Tawaret in her form as Ipet. Compare this to the Babylonian asterism Pig (see below). She was known as Lady of Heaven or Mistress of the Horizon.

Other researchers suggest that this asterism was associated with Ursa Minor (Berio 2014): This would have the "bucket" of the Little Dipper as the "head" and an oval of stars as the "body": Beta (β) Ursae Minoris (Kochab), Zeta (ζ) Ursae Minoris, Delta (δ) Ursae Minoris, Alpha (α) Ursae Minoris, HIP 62572A, 4 Ursae Minoris, and 5 Ursae Minoris. Berio suggests that the Egyptian word for hippopotamus, "dỉb" is the probable source for several words meaning "bear" which refer to Ursa Major: Akkadian "dabû", Hebrew "dōbh", Arabic "dub", and Ethiopian "dĕb(b)". The cult of Tawaret spread to the Levant and to Minoan Greece around 1800 B.C.E., so this might have been an influence on the later naming of the constellation Ursa Major. English Admiral Henry William writes "The Egyptians, we are assured, called [Ursa Major] the Hippopotamus" in his *Bedford Catalogue* in 1844, and goes on to quote French philologer Jean-François Champollion: "In tabulis astronomicis indicator figura hippopotami: Horus Apollo" ("In astronomical tables the figure of the hippopotamus is an indicator: Horus Apollo").

Hircus Aequoris:

This Latin asterism is the IAU constellation Capricornus as listed in John Hill's *Urania* in 1754. Hill describes this name as "half a goat and half a fish". Hircus is "goat", but Aequoris is Latin for "level surface".

Hired Man:

This Babylonian asterism from MUL.APIN, "MUL.HUN.GA", "MUL.LU.HUN.GA" (Hunger 1992), "mulLU.HUN.GA" (Bartel van der Waerden 1974, Parpola 1993), "LU.ḪUĜ.GA", "LUHUN.GA", or "LÚ.HUN.GÁ" (Anthony 1996) translates as "hired worker", "hired man", "hireling", or "farm hand", and is made up of stars from the IAU constellations Triangulum and Aries. Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) form a line attached to a "loop" of stars: Alpha (α) and Beta (β) Trianguli and c Arietis.

This Seleucid asterism “LU” or “UDU.NIT” (‘ram”) from the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Aries (Foxvog 1993).

This Akkadian asterism “Agru” (Hunger 1992, Parpola 1993, Anthony 1996) from the *Astrological Reports to the Kings* tablets or “ag-ri” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MUL.HUN.GA” above.

This Sumerian asterism “mul lúhun-ĝá” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism “MUL.HUN.GA” above.

This Assyrian asterism “LU.HUN.GA” is identical to the Babylonian asterism “LU.ḪUĜ.GA” above. They associated it with their God Dumuzi (Tammuz).

This Persian asterism “LU.HUNGA” from the list of Zodiacal Signs in VAT 4956 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is identical to the Babylonian asterism “LU.ḪUĜ.GA” above (Bartel van der Waerden 1974).

NOTE: The Greeks turned this Babylonian “MUL.HUN.GA” (“hired man”), into a ram (Aries) possibly due to a translation error. The character “LU” is a determinative for “people” in Sumerian, but has no use in Babylonian, so they used another character “LU”, meaning “ram”. In Akkadian this is “Agru” which sounds like “o kriou”, which is Greek for “ram”.

Hitched Yoke:

This Babylonian asterism from the MUL.APIN tablets **“**Mubukesda” is a line of stars in the IAU constellation Ursa Minor (Hunger and Pingree 1989). A curve of stars runs between Apil-Emah (“heir of the Emah temple”- the star Alpha (α) Ursae Minoris (Polaris)) and Beta (β) Ursae Minoris (Kochab).

This appears in later Seleucid sky lore.

Hoag’s Object:

This **telescopic** asterism is PGC 54559, a ring galaxy in the IAU constellation Serpens. It was named for American astronomer Arthur Hoag, who discovered it in 1950. It was originally thought to be a planetary nebula. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Hoágium Serpéntis”.

Hoar Frost Stars:

This KhoiKhoi asterism “≠ao /gamiroti” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014).

Hockey Stick:

There are two “hockey stick” asterisms:

- One is the stars at the tail end of the IAU constellation Draco, starting with the star Lambda (λ) Draconis and proceeding down the “stick” to Kappa (κ) Draconis, Alpha (α) Draconis (Thuban), and turning into the “blade” at Iota (ι) Draconis. The “blade” is the stars Theta (θ) Draconis and Eta (η) Draconis. The Spindle Galaxy (Messier 102) is near Iota (ι) Draconis and forms the “puck”.

- One is in the IAU constellation Scorpius and is Corder 2938 on the observing list of American astronomer Jeffrey Corder. Size 120' X 35'. This is five stars including 1, 2, and 3 Scorpii, HIP 77859, and the double star HIP 77858.

There are twelve **telescopic** "hockey stick" asterisms:

- One is in the IAU constellation Auriga and is Corder 951 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. One end of the "stick" is the optical double HIP 28644 and 28626 and the line runs down through HIP 28429 and HIP 28212 to HIP 27778 where it bends and runs through HIP 27775 to HIP 27791 which form the "blade".
- One is found on the asterism list of American astronomer John Davis and is located in the IAU constellation Scorpius in the HII region NGC 6357.
  - The "handle" is a bent line of 5 5^{th} – 6^{th} magnitude stars starting at HIP 85372, running through HIP 85250, and ending at HIP 85237, and
  - The "blade" is the star HIP 85158.
- One is in the IAU constellation Orion and is Corder 1041 on the observing list of American astronomer Jeffrey Corder. Size 60' X 25'. The "stick" is the line of 6^{th} – 8^{th} magnitude stars including HIP 29665 and 29694. The "blade" is the stars 72 Orionis and HIP 29637.
- One is in the IAU constellation Camelopardalis and is Corder 1325 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is the stars HIP 35506, 35771, 36100, and 36025.
- One is in the IAU constellation Columba and is Corder 1148 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is five 8^{th} – 10^{th} magnitude stars including HIP 31815.
- One is in the IAU constellation Antlia and is Corder 1947 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is four 6^{th} – 8^{th} magnitude stars including HIP 49375, HIP 49311 and the double stars HIP 49411A, and 49336A.
- One is in the IAU constellation Hydra and is Corder 2207 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7^{th} – 8^{th} magnitude stars including HIP 56460 and 56454.
- One is in the IAU constellation Libra and is Corder 2851 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is ten 9^{th} – 10^{th} magnitude stars including HIP 75821, 75721, and 75716.
- One is in the IAU constellation Scorpius and is Corder 3267 on the observing list of American astronomer Jeffrey Corder. Size 60' X 35'. This is five 7^{th} magnitude stars including HIP 85250, 85237, and 85158. Corder describes this as an "'easy chair' or 'hockey stick'".
- One is in the IAU constellation Lyra and is Corder 3760 on the observing list of American astronomer Jeffrey Corder. Size 35' X 20'. This is twelve 7^{th} – 10^{th} magnitude stars including HIP 93741, 93808, and 93841.
- One is in the IAU constellation Microscopium and is Corder 4362 on the observing list of American astronomer Jeffrey Corder. Size 180' X 60'. This is five 5^{th} – 6^{th} magnitude stars including HIP 104925 and 104738 and the double stars Theta (θ) 1 and 2 Microscopii and HIP 104680.
  - One is made up of stars of the IAU constellation Pisces and was posted on *Cloudy Nights* in July 2022 by American astronomer "Napp". It is the stars 29, 27, 24, and 20 Piscium.

Hockey Stick Galaxies:

This **telescopic** asterism is NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as "I 176" and "I 177". The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Crowbar Galaxy (see above), the Hook (see below), the Fishhook (see above), the letter "S" (see below) and the Hummingbird (see below). American astronomer Tom Polakis wrote to Tony Flanders in June 1998: "I like to call this galaxy 'The Hockey Stick'". This name was Latinized in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Pilamálleus Cánum Venaticórum" ("hockey stick of Canes Venatici"). NOTE: It was originally thought that these were two galaxies, hence the name. However, it is now believed that this is one tidally distorted galaxy interacting (in radio wavelengths) with NGC 4631. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists the names "Crowbar Galaxy", "Fish Hook Galaxy", and "Hockey Stick Galaxy".

Hoeing Stars:

This Bantu asterism is the Pleiades cluster in the IAU constellation Taurus.

Hoffmeister's Star:

This **telescopic** star is V442 Cassiopeiae (Sonneberg 9484) in the IAU constellation Cassiopeia. It is named after German astronomer Cuno Hoffmeister.

Hoggar:

This **telescopic** Algerian star is HIP 21109 (HD 28678) in the IAU constellation Taurus (magnitude 8.44). It was given to this star in the IAU NameExoWorlds campaign. It is named after the Hoggar Mountains. It has an exoplanet named Tassili, after the UNESCO World Heritage site in the Sahara Desert.

Hoko-kumara:

This Māori asterism is the Pleiades cluster in the IAU constellation Taurus. Kumara are a form of sweet potato cultivated by the Māori. This asterism is also known as "Matariki" ("chief's eyes", "small face" or "small eyes"), "Tātai o Matariki", "Ao-Kai", or "Huihui o Matariki" ("the assembly of Matariki").

Hokuto:

This Japanese asterism "Hokuto" is the Big Dipper asterism in the IAU constellation Ursa Major (Miyajima 2014) as depicted by Japanese Emperor Go-Yozei (1586 – 1611).

Hola:

This Gond asterism is the IAU constellation Canis Major (Vahia 2014).

Hold Tight:

This Musquakie (Iroquois) asterism is the double stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above), which to them represent a small dog by this name. The Musquakie call the Big Dipper the Bear and Three Hunters (see above). Compare this to the Pawnee asterism Two Stretchers, with Medicine Man, Wife, Errand Man, and Dog (see below).

Holding Fast of Perseus:

This **telescopic** asterism "Ténax Pérsei" is the intermediate barred spiral galaxy NGC 1169 in the IAU constellation Perseus. It was discovered in 1786 by William Herschel who listed it as "II 620". It became GC 635 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the "closely wound spiral arms of the galaxy, creating a compact appearance".

Holding the Reins:

This Latin asterism "Tenens habenas" ("holding the reins") is the IAU constellation Auriga. Variations include "Habenifer". These appear in tables and editions of the *Almagest* down to the 16th century. Compare this to Driver, above. Alternative names for this constellation listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch include "Habenis" and "Habenifer".

Hole in a Cluster:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. It is also known as Nefertiti's Headpiece, the Smoke Ring, or the Reliquary. This open cluster bears this name because it has a dark patch in the middle.

Hole in the Heavens:

This **telescopic** asterism is the Rho (ρ) Ophiuchi Nebula, IC 4604, in the IAU constellation Ophiuchus. It was recorded by English Astronomer William Herschel, who wrote "Hier ist Wahrhaftig ein Loch in Himmel" ("here is truly a hole in Heaven"). It is part of the Rho Ophiuchi Cloud Complex.

Hole in the Sky:

This Ojibwe asterism "Bugona Giizhig" is the Pleiades cluster in the IAU constellation Taurus (Lee et al 2014). It is also known as Madoo'asinik (see Sweating Stones, below).

This Anishinaabe asterism "Behgonay Geesik" is the Pleiades cluster in the IAU constellation Taurus (Lee et al 2014).

This Ininew (Cree) asterism "Pakone Kisik" is the Pleiades cluster in the IAU constellation Taurus (Buck 2016). It is also known as Atchakos Ahkoop (see Star Blanket, below) and "Mahtootisan Assiniuk" (see Sweating Stones, below).

NOTE: This is related to a story line in which birds disappear through a hole in the sky and are rescued by the Fisher (see Fisher, above).

This Evenk star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Dmitrieva and Romeiko 2009).

Holy Fish:

This Greek asterism "Heiros Ichthys" is the IAU constellation Delphinus as listed in John Hill's *Urania* in 1754.

This Latin asterism "Piscis Sacer" is the IAU constellation Delphinus as listed in John Hill's *Urania* in 1754.

Holy Kettle:

This Korean asterism "Geolughan Jujeonja" (거룩한 주전자) is a bent line of three stars in the IAU constellation Virgo: 59, 70, and Sigma (σ) Virginis.

Holy Men:

This Lenape asterism is the Pleiades cluster in the IAU constellation Taurus (Frank 2021).

Holy Mound:

This Irish asterism is a circle of stars in the IAU constellation Libra named by Irish astronomer Agnes Mary Clerke (1842 – 1907): Alpha (α) Librae (Zubenelgenubi), Mu (μ) Librae, Xi (ξ) Librae, Delta (δ) Librae, Beta (β) Librae (Zubeneschamali), Chi (χ) Librae, Zeta (ζ) Librae, and Nu (ν) Librae. She saw this as the Holy Mound, "Tul Ku", representing the Tower of Babel.

Holy Palace:

This Korean asterism "Seong-gung" (성궁) is a curving line of stars in the IAU constellation Scorpius. This is the stars of the "tail" of Scorpius: Lambda (λ) Scorpii, Kappa (κ) Scorpii, Iota (ι) 1 Scorpii, Theta (θ) Scorpii, Eta (η) Scorpii, Zeta (ζ) 2 Scorpii, Mu (μ) 1 Scorpii, and Epsilon (ε) Scorpii. The area inside the curve is called "Hwanghuleul Wihan Madang" 황후를 위한 마당 (see Yard for Empresses, below).

Homam:

See Auspice of the Aspiring One, above.

Home of the Sun:

This Latin asterism "Domicilium Solis" is the IAU constellation Leo. The Egyptian king Nechepso (688 – 672 B.C.E.) and his philosopher Petosiris taught that at the Creation the sun rose near the star Denebola, which inspired this name. Compare this to "Dominis Solis" (Lords of the Sun, below).

Home Plate:

This **telescopic** asterism is a pentagon of five 6th magnitude stars in the IAU constellation Andromeda 1.2 degrees west southwest of the star 23 Andromedae: Double stars HIP 737, 508, 626, 525 and 714. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011.

Homunculus Nebula:

This **telescopic** asterism is the HII region NGC 3372 (Caldwell 92) in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752 and listed in his catalogue as "III 6". It is GC 2197 in the *General Catalogue* of 1864. A homunculus (Latin "little person") is a miniature human, popularized in 16th century alchemy and 19th century fiction. This nebula is also known as the Gabriela Mistral Nebula (see above) and the Keyhole Nebula (as it resembles a keyhole) and the Eta Carina Nebula.

Honey Singer Star:

This /Xam star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Alcock 2014).

Honey Whip:

This Vedic star ‘‘Madhukaśā" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus in the Atharva Veda (Ivanković 2021). This is an aspect of Ushas (see below).

Honeycomb (Covered in Bees):

This **telescopic** asterism is the globular cluster Messier 30 (NGC 7099) in the IAU constellation Capricornus. It was discovered by French astronomer Charles Messier in 1764. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4687. South African astronomer Magda Streicher (1998) described this as "a sort of elongated honeycomb covered in bees." This is also known as the Jellyfish.

Honorable:

This Hindu asterism "Āryikā" ("honorable" or "worthy") is the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

Hook:

This asterism is in the IAU constellation Pegasus and is Corder 4938 on the observing list of American astronomer Jeffrey Corder. Size 480' X 150'. This is 63, 64, 67, 72, 78, 79, and Psi (ψ) Pegasi.

There are sixty **telescopic** "hook" asterisms:

- One in the IAU constellation Sagitta, also known as Leiter 4, was discovered by American astronomer Frank Leiter. It is located 40 arcminutes northeast of the star Gamma (γ) Sagittae. The "hook" is attached to the star PPM 110215. Its size is 8' X 4'.
- One is NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as "I 176" and "I 177". The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Crowbar Galaxy (see above), the Hockey Stick Galaxies (see below), the Fishhook (see above) and the Hummingbird (see below). NOTE: It was originally thought that these were two galaxies, hence the name. However, it is now believed that this is one tidally distorted galaxy interacting (in radio wavelengths) with NGC 4631.
- One is Sánta 215, listed in 2017 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "face or hook of a dozen stars 7.6 – 10 magnitude" in the IAU constellation Monoceros.
- One is in the IAU constellation Lepus and is Corder 993 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60' X 45'. This includes the star HIP 16306.
- One is in the IAU constellation Cassiopeia and is Corder 555 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60'. This includes the stars HIP 28350, 28344, 28434, and 28533.
- One is Corder 2738 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45' X 25'. The eight stars of magnitude 8.5 to 10 include HIP 72874 and 73009.
- One is Corder 2782 in the IAU constellation Boötes and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 70' X 60'. This includes the stars HIP 73975, 74080, 74130, 74158, and 74265.
- One is Corder 3797 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25'. This includes the stars HIP 94501 and 94522.
- One is Corder 4049 in the IAU constellation Sagittarius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 30' X 15'. Includes the stars HIP 98898 and 98961.

- One is Corder 4779 in the IAU constellation Cepheus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 75' X 50'. Includes the stars HIP 112246, 112721, 113066, 113499, 114194, and 113664.
- One is Corder 4839 in the IAU constellation Cepheus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 60'. Includes the stars HIP 114792, 114540, 114285, and 114327.
- One is in the IAU constellation Perseus and is Corder 695 on the observing list of American astronomer Jeffrey Corder. Size 55'. This is twelve stars including HIP 20800, 20975, 21023, 20993, 21289 and 21301.
- One is in the IAU constellation Orion and is Corder 808 on the observing list of American astronomer Jeffrey Corder. Size 80' X 60'. This includes HIP 24162, 24130, 23995, 23919, 23955, 23929, 23930, and 23935.
- One is in the IAU constellation Monoceros and is Corder 1202 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8^{th} – 9^{th} magnitude stars.
- One is in the IAU constellation Ursa Major and is Corder 1729 on the observing list of American astronomer Jeffrey Corder. Size 30' X 10'. This is four 7^{th} – 8^{th} magnitude stars including HIP 43863 and 43931.
- One is in the IAU constellation Leo and is Corder 2182 on the observing list of American astronomer Jeffrey Corder. Size 65'. This is nine 5^{th} – 9^{th} magnitude stars including 79 Leonis, HIP 55703, 55907, and 55906.
- One is in the IAU constellation Ursa Major and is Corder 2399 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is six 9^{th} – 10^{th} magnitude stars. This is also known as Ennis 56 (see 7 above).
- One is in the IAU constellation Phoenix and is Corder 88 on the observing list of American astronomer Jeffrey Corder. Size 100' X 45'. This is six stars including HIP 1667, 1795, 2001, 2076, 2240, and 2392.
- One is in the IAU constellation Sculptor and is Corder 173 on the observing list of American astronomer Jeffrey Corder. Size 45' X 35'. This is seven 8^{th} – 9^{th} magnitude stars including HIP 5046 and 4799 and the double star HIP 4974A.
- One is in the IAU constellation Dorado and is Corder 652 on the observing list of American astronomer Jeffrey Corder. Size 30' X 15'. This is five 6^{th} – 9^{th} magnitude stars including HIP 20074 and 20217 and the double star HIP 20109A.
- One is in the IAU constellation Lepus and is Ennis 67 on the observing list of Canadian astronomer Charles Ennis. Size 25' X 5'. This is seven 7^{th} – 10^{th} magnitude stars: Gaia DR3 2942312670918247936, Gaia DR3 2942291642758394752, SAO 151056, Gaia DR3 2942290440167604352, HIP 28601, and SAO 151060. This includes the cascade Corder 1003 from Jeffrey Corder's list.
- One is in the IAU constellation Canis Major and is Ennis 68 on the observing list of Canadian astronomer Charles Ennis. Size 65' X 15'. This is eight 6^{th} – 8^{th} magnitude stars including HIP 29671, 29546, 29756, 29836, the double star HIP 29619 and HD 44010. NOTE: This shares stars with Corder 1044 (see "Y", below).
- One is in the IAU constellation Orion and is Corder 809 on the observing list of American astronomer Jeffrey Corder. Size 80' X 60'. This is twelve 6^{th} – 9^{th} magnitude stars including HIP 24162, 24130, 23995, 23919, 23955, 23929, 23930, and 23935.

- One is in the IAU constellation Columba and is Corder 1060 on the observing list of American astronomer Jeffrey Corder. Size 8'. This includes the 5th magnitude star HIP 29842.
- One is in the IAU constellation Dorado and is Corder 1104 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is seven 6th – 10th magnitude stars including HIP 31150, 31160, 30973, 30467, and the double star HIP 30515A.
- One is in the IAU constellation Carina and is Corder 1222 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is six 6th – 8th magnitude stars including HIP 33863, 33577, 33464, 33440, 33473, 33588, and the double star HIP 34105.
- One is in the IAU constellation Vela and is Corder 1674 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is seven 5th – 8th magnitude stars including HIP 42788, 42771, 42679, 42564 and the double stars HIP 42587 and 42653.
- One is in the IAU constellation Pyxis and is Corder 1722 on the observing list of American astronomer Jeffrey Corder. Size 55' X 25'. This is ten 7th – 9th magnitude stars including HIP 43710, 43809, and the double star HIP 43509A.
- One is in the IAU constellation Vela and is Corder 2043 on the observing list of American astronomer Jeffrey Corder. Size 7'. This is five 9th magnitude stars including HIP 51844 and the double star HIP 51815.
- One is in the IAU constellation Antlia and is Corder 2073 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is ten 7th – 9th magnitude stars including HIP 52900 and 52960.
- One is in the IAU constellation Centaurus and is Corder 2389 on the observing list of American astronomer Jeffrey Corder. Size 120' X 75'. This is 6 stars including HIP 62081, 61544, and 61682, and the double stars HIP 61789 and 61498.
- One is in the IAU constellation Centaurus and is Corder 2410 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is nine 10th – 11th magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2470 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 8th magnitude stars including HIP 64601 and HIP 64572.
- One is in the IAU constellation Libra and is Corder 2694 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is eight 7th – 9th magnitude stars including HIP 71875, 71807, 71745, and 71684.
- One is in the IAU constellation Lupus and is Corder 2784 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is six 6th – 8th magnitude stars including HIP 74220 and 74302, and the double star HIP 74066
- One is in the IAU constellation Lupus and is Corder 2960 on the observing list of American astronomer Jeffrey Corder. Size 8'. This is eight 9th – 11th magnitude stars.
- One is in the IAU constellation Scorpius and is Corder 3056 on the observing list of American astronomer Jeffrey Corder. Size 50' X 35'. This is twelve 8th – 9th magnitude stars including HIP 80556 and 80683 and the double star HIP 80504A.
- One is in the IAU constellation Ophiuchus and is Corder 3257 on the observing list of American astronomer Jeffrey Corder. Size 50'. This is twelve 7th – 10th magnitude stars including HIP 85053, 85023, and 84958.
- One is in the IAU constellation Sagittarius and is Corder 3506 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is six 7th – 8th magnitude stars.

- One is in the IAU constellation Draco and is Corder 3526 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 7th -10th magnitude stars including HIP 89779.
- One is in the IAU constellation Sagittarius and is Corder 3719 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 7th – 10th magnitude stars including HIP 93227, 93191, 93152, and the double star HIP 93109.
- One is in the IAU constellation Vulpecula and is Corder 3910 on the observing list of American astronomer Jeffrey Corder. Size 35' X 15'. This is six 7th – 8th magnitude stars including the double stars HIP 96623A, 96617, and 96563A.
- One is in the IAU constellation Telescopium and is Corder 4063 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is ten 8th – 9th magnitude stars including HIP 99222.
- One is in the IAU constellation Capricornus and is Corder 4096 on the observing list of American astronomer Jeffrey Corder. Size 55' X 35'. This is ten 7th – 9th magnitude stars including HIP 99708 and 99800 and the double star HIP 99823.
- One is in the IAU constellation Sagittarius and is Corder 4151 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is six 7th – 9th magnitude stars.
- One is in the IAU constellation Vulpecula and is Corder 4204 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is six 8th – 9th magnitude stars including HIP 101822.
- One is in the IAU constellation Delphinus and is Corder 4274 on the observing list of American astronomer Jeffrey Corder. Size 25' X 15'. This is six 5th – 9th magnitude stars including 16 Delphini.
- One is in the IAU constellation Equuleus and is Corder 4311 on the observing list of American astronomer Jeffrey Corder. Size 50' X 35'. This is seven 6th – 8th magnitude stars including HIP 104041 and the double star HIP 103987.
- One is in the IAU constellation Cygnus and is Corder 4315 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is a curve of 9th magnitude stars.
- One is in the IAU constellation Capricornus and is Corder 4328 on the observing list of American astronomer Jeffrey Corder. Size 90'. This is six 5th – 8th magnitude stars including Chi (χ), 27, and 26 Capricorni and HIP 104204.
- One is in the IAU constellation Equuleus and is Corder 4369 on the observing list of American astronomer Jeffrey Corder. Size 50' X 30'. This is eight 7th – 8th magnitude stars including HIP 105188 and 105093 and the double stars HIP 105202 and HIP 105038.
- One is in the IAU constellation Indus and is Corder 4391 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 6th – 10th magnitude stars including HIP 105494, 105422, and 105425.
- One is in the IAU constellation Pavo and is Corder 4402 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 10th magnitude stars including HIP 105664.
- One is in the IAU constellation Cygnus and is Corder 4505 on the observing list of American astronomer Jeffrey Corder. Size 40' X 20'. This is eight 7th – 8th magnitude stars including HIP 107636.
- One is in the IAU constellation Piscis Austrinus and is Corder 4606 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is eight 7th – 10th magnitude stars including HIP 109553.

- One is in the IAU constellation Pegasus and is Corder 4763 on the observing list of American astronomer Jeffrey Corder. Size 90' X 45'. This is fourteen 7th – 9th magnitude stars including HIP 112883, 112801, 112701, 112589, 112633, and 112625.
- One is in the IAU constellation Aquarius and is Corder 4869 on the observing list of American astronomer Jeffrey Corder. Size 125' X 75'. This is eight 4th – 7th magnitude stars including Psi 2 Aquarii, HIP 114600, 114666, 115015 and 115119 and the double stars Psi (ψ) 1, and 3 Aquarii and HIP 114750. John Raymond calls this asterism "Psi".
- One is in the IAU constellation Cepheus and is Corder 4944 on the observing list of American astronomer Jeffrey Corder. Size 60' X 30'. This is six 5th – 9th magnitude stars including HIP 116714, 116858, 116760, and 117039.
- One is made up of stars in the IAU constellation Scutum and is Ennis 86 on the observing list of Canadian astronomer Charles Ennis. This is a hook shaped cascade of stars. Size 140' X 40'. It starts at 5th magnitude star HIP 92202 and runs in a straight line through HIP 92171, 92082, 91960, the double star HIP 91880, and HIP 91751 to the double star HIP 91728, then runs through a curve of six 8th – 9th magnitude stars including HD 172810, HD 172852, HD 172929, HIP 91867 and the double star HIP 91933.
- One is the barred spiral "Hook Galaxy", NGC 5297 in the IAU constellation Canes Venatici. It was discovered in 1787 by William Herschel who listed it as "I 180". It became GC 3652 in the *General Catalogue* of 1864. This name was posted by American astronomer Jimi Lowrey on the *Deep Sky Forum* in July 2023. He named it this as it has "a most unusual hook like appearance in its southern spiral arm. It is also known as the "Sharp Leaf of Canes Venatici".

Hook Echo Galaxy:

This **telescopic** asterism is Messier 99 (NGC 4254), a grand design spiral galaxy in the IAU constellation Coma Berenices. French astronomer Pierre Méchain discovered it in March 1781. It is listed in the General Catalogue of 1864 as GC 2838 and in John Herschel's catalogue as h 1173. Dreyer lists it in the New General Catalogue of 1888 as "3 branched spiral". It is also known as the Saint Catherine's Wheel (see below), the Virgo Cluster Pinwheel (see below) and the Coma Pinwheel (see above).

Hook for Dress:

This Korean asterism "Deuleseu Hukeu" (드레스 후크) is a "hook" of stars in the IAU constellations Cygnus and Cepheus: 63, Xi (ξ), 68, Rho (ρ) and Eta (η) 1 and 2 Cygni and Mu (μ) and Nu (ν) Cephei.

Hooked Galaxy:

This **telescopic** asterism PGC 54817 is a galaxy in the IAU constellation Libra. It is also known as the "Mare of Libra" (see below).

Hooked of Cancer:

This **telescopic** asterism "Hámiger Cáncri" is the intermediate spiral galaxy NGC 2595 in the IAU constellation Cancer. It was discovered in 1787 by William Herschel who listed it as "III 599". It became GC 1661 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "The northern arm extends like a hook".

Hoop:

This Havasupai asterism is the IAU constellation Corona Borealis.

Hoop Marker:

This Dakota/Lakota/Nakota star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. It is part of their asterism "Can Gleshka Wakan" (see Sacred Hoop, below).

Hoopskirt:

This **telescopic** asterism is the open cluster IC 2488, discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1752 in the IAU constellation Vela. It ended up on the Index Catalogue after being recorded by American astronomer Solon Irving Bailey (1854 – 1931). It is located 30 arcminutes west of N Velorum, a 3rd magnitude star located near the False Cross asterism (see False Cross above). It is also known as the Strings of Pearl (see below), the Milk Can (see below), and the Chinese Hat (see above).

Hoot Owls:

This Chaldean asterism "musen.mes hu-u-u" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Horn:

This Latin asterism "Cornus" is the IAU constellation Aries as named by Cicero (106 – 43 B.C.E.) and the Roman poet Ovid (b. 43 B.C.E.).

In his *Commedia*, Italian author and philosopher Dante Alighieri (1265 – 1321) refers to the IAU constellation Ursa Minor as a horn ("corno") with the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Minoris forming the "mouth" ("bocca") of the horn. R. H. Allen lists this as "Cornu" in his *Star Names* in 1899, and that Italian merchant explorer Amerigo Vespuci (1451 – 1521) called it "Elcorno". In his Bedford Catalogue in 1844, English Admiral Henry William Smyth attributes this name to Richard Eden, in his 1572 translation of the *Arte of Navigation* written Spanish navigator Martin Cortés 1532 – 1589).

This Latin star "Cornu" is Sigma (σ) Lyrae in the IAU constellation Lyra.

This Spanish asterism "Bocina" is the IAU constellation Ursa Minor as listed in R. H. Allen's *Star Names* in 1899. Allen describes it as being used by "Spanish shepherds".

This Chinese xiù (lunar mansion) "Jiǎoxiù" (角宿) is a line of two stars in the IAU constellation Virgo: Alpha (α) Virginis (Spica) and Zeta (ζ) Virginis. NOTE: this xing guan crosses the xing guan Flat Road (see above) forming a cross. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Yanzhou territory. This This appeared in the Tang Dynasty (618 – 907 C.E.) as "Jiǎoxiù" (角) and was compared to the Vedic nakshatra Chitra (Kotyk 2017, see Bright One, above). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Jiǎo" is a line of two stars in the IAU constellation Virgo: Alpha (α) Virginis (Spica) and Zeta (ζ) Virginis.

This Elvish (Qenya) star "Til" ("point" or "horn") is a "small star near Sirius" according to early linguistic writing by J. R. R. Tolkien (1892 – 1973). It is probably Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major.

Horn Footed:

This Latin asterism "Cornipedes" is the IAU constellation Sagittarius.

Horn of Plenty:

This Latin star "Cornu Copiae" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Compare this to Food Bearer.

Horn of the Goat Fish:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "SI MAS" is Beta (β) Capricorni (Dabih) in the IAU constellation Capricornus (Hunger and Sachs 1988).

Horn of the She-Goat:

This Romanian asterism "Cornul Caprei" is the IAU constellation Capricornus (Ottescu 2009). Romanians believed that when lightning appears from the Horn of the She-Goat then rain is sure to follow.

Horn Star:

This star "Si-mal" or "Si-mul" is Alpha (α) Arietis (Hamal) in the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899. He lists the culture as "Euphratian".

This Sotho, Jū/Wãsi, Langa Ndebele, Pedi, Lobedu, and Nyae Nyae !Kung and Tswana star "Naka" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Holbrook and Baleisis 2007, Slotegraaf 2013). It is part of the asterism Rain Bull (see below). They used it as an indication of weather patterns, and a Northern Sotho saying goes "naka e tšhumilê/ragilê" ("frost is fallen, it is very cold").

This Venda star "Nanga" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Slotegraaf 2013).

Horna:

This **telescopic** Finnish star is HAT-P-38 in the IAU constellation Triangulum (magnitude 12.557). It received this name in the IAU NameExoWorlds Campaign. Horna is the underworld in Finnic mythology. This star has an exoplanet named Hilsi which represents sacred localities and later evil spirits in Finnic mythology.

Horned:

This Latin asterism "Corniger" is the IAU constellation Aries. Compare this to Horn, above. NOTE: Johann Bayer's *Uranometria* (1603) lists "Corniger" as an alternate name for Capricornus.

This Persian asterism "Çrob" is the stars Alpha (α) Librae (Zubenelgenubi) and Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899.

Horned Goat:

This Latin asterism "Hircus Corniger" is the IAU constellation Capricornus as listed by Vergil (70 – 19 B.C.E.).

Horned Serpent:

This Babylonian asterism “Bašmu” was a precursor to the modern IAU constellation Serpens.

Horned Snake:

This Ikoots asterism “Ndiïk” is made up of stars of the IAU constellations Cassiopeia and Perseus.

Horns:

This Japanese sei shuku or lunar station “Su Boshi”, sometimes translated as “angle” or “corner”, is a line of two stars in the IAU constellation Virgo: Alpha (α) Virginis (Spica) and Zeta (ζ) Virginis.

Horns of the Lamb:

This Arabic asterism “qarna al-hamal” (قرنا الحمل) is Alpha (α) Arietis (Hamal) and Beta (β) Arietis (Sheratan) in the IAU constellation Aries. It is also known as the Butting (see above). These are rains stars in the calendars of Qushayr and Qays and are also known as the Sign (see below).

Horns of the Rain Bull:

This Jū/Wãsi, Jū /’hoansi, !O Kung, and Nyae Nyae !Kung asterism “tshxum-!Khusi” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (which they call “Naka”, the “Horn Star”) and Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (which they call the “Green Leaf Horn”): together they call the stars “the horns of the Tshxum”. These stars are separated by 98 degrees of celestial latitude, although they are near to each other in right ascension, and the Pleiades cluster is ahead of them by and hour and a half, so it is difficult for outsiders to see how they connected these three into an asterism.

Horologium:

None of the stars of this constellation brighter than 4th magnitude and they only show up in 19 asterisms in this handbook.

This IAU constellation (IAU abbreviation Hor) was created by the French astronomer Abbé Nicolas Louis de Lacaille in 1756. He called it “l’Horloge à Pendule & à Seconds”. Later this was changed to the Latin name “Horologium Oscillatorium” (“pendulum clock”) from the Greek “ὡρολόγιον” (“an instrument for telling the hour”). This was later shortened to “Horologium” or “Horloge”. Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “Horloge” as a pendulum clock.

The Italians call it “Orologio”.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “L’Horloge” as a pendulum clock.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Horologium in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “Horologium the Clock” as a pendulum clock.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Horologium” as a pendulum clock.

American uranographer Henry Whitall labelled it “Horoscope” on his planisphere in 1871.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Pendelhur" and depicts it as a pendulum clock.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Horologium, The Clock" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Horologium" and describes it as a "Clock".

Standard IAU charts show this constellation as an "L" shaped formation of three stars: Alpha (α) Horologii, Zeta (ζ) Horologii, and Mu (μ) Horologii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) extend Horologium in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* into a line of five stars: Alpha (α) Horologii, Eta (η) Horologii, Zeta (ζ) Horologii, Mu (μ) Horologii, and Beta (β) Horologii.

Sky and Telescope Magazine, founded in 1941, depicts Horologium in their magazine and publications as a line of six stars: Alpha (α) Horologii, Iota (ι) Horologii, Eta (η) Horologii, Zeta (ζ) Horologii, Mu (μ) Horologii, and Beta (β) Horologii.

Horrible Star:

This star "Sidus Horridum" is the Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. This name is listed in Johann Bayer's *Uranometria* (1603) and attributed to Pliny.

Horrid and Insane Stars:

This Latin asterism "horrida et insana sidera" ("horrid and insane stars") is the Haedi asterism (see Kids above) as described by 1st century B.C.E. Roman poet Quintus Horatius Flaccus (Horace (65 – 8 B.C.E.)). This asterism was used by navigators and farmers as an indicator star of a season of stormy weather. Compare this to Mad Goat Stars, below.

Horrid Star:

This Latin star "Horridum Sidus" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes as described by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*. This name was used as it was used by navigators and farmers as an indicator star of a season of stormy weather.

Horse:

This Greek asterism "΄Ιππος" ("΄Ippos") is the IAU constellation Pegasus as mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and as originally described in Ptolemy's *Almagest* (2nd century), including stars of the IAU constellations Andromeda and Pegasus. This was later latinized to "Equus" and "Equus Ales". "Equus" appears as a name for Pegasus in editions of the 8th century *Revised Aratus Latinus*. Ptolemy's "horse" looked like this:

- The "body" is an extended version of the Great Square of Pegasus (see Great Square, above) with the line between the stars Alpha (α) Pegasi (Markab) and Beta (β) Pegasi (Scheat) extended out to Lambda (λ) Pegasi,
- The base of the "neck" is the star Markab, with a large triangular neck including the stars Sigma (σ) Pegasi, Nu (ν) Pegasi, Theta (θ) Pegasi, and Zeta (ζ) Pegasi,

- The “head” is another triangle of the stars Nu (ν) Pegasi, Theta (θ) Pegasi, and Epsilon (ε) Pegasi,
- The “wing” is a triangle formed by two stars on one side of the “Great Square”, Markab and Gamma (γ) Pegasi, connected to 77 Pegasi,
- One “leg” runs from the star Scheat through Eta (η) Pegasi to a “hoof” at 29 Pegasi, and
- The other “leg” runs from Lambda (λ) Pegasi through 24 Pegasi to a “hoof” at Kappa (κ) Pegasi.

The 9th century Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Equus as a whole horse with no wings. The Los Angeles, Getty Ludwig XII, 5 manuscript of the *De ordine ac positione stellarum in signis* depicts the front half of the horse.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels Pegasus “Equus” and depicts it as the front half of a winged horse facing to our right emerging from a cloud.

“Equus” is given as an alternate name for the IAU constellation Pegasus in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

NOTE: This is listed as a Greek lunar mansion in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This Arabic asterism overlaps the Ptolemaic constellation Pegasus (which Ptolemy also called “the Horse”) and is made up of stars of the IAU constellations Andromeda, Cygnus, Lacerta, and Pegasus. This overlaps legs with the Ptolemaic constellation Pegasus:

- The “nose” of the horse is the stars 1 and 2 Andromedae.
- The rest of the “head” is the stars 6, 11, 13, 15, and 16 Lacertae. The “body” is a line running from 6 Lacertae through HIP 109754, 1 Lacertae, Pi (π) Pegasi, 14 Pegasi, Mu (μ) 1 Cygni, Kappa (κ) Pegasi, Iota (ι) Pegasi, HIP 110992, Eta (η) Pegasi, 10 Lacertae, and 12 Lacertae to 13 Lacertae.
- The “tail” runs from Mu (μ) 1 Cygni through 2 Pegasi and 5 Pegasi to 9 Pegasi.
- The “rear legs” run from 12 Pegasi to HIP 107887. The “front legs” are two lines running from Eta (η) Pegasi: One to Mu (μ) Pegasi, and the other to Beta (β) Pegasi (Scheat).

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts the “Horse” in left and right profiles. In R. H. Allen’s *Star Names* in 1899 he incorrectly describes this as being made up of the stars of IAU constellations Hydra, Leo, and Sextans.

This Romanian asterism “Cal” or “Calul” is the IAU constellation Leo (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Celtic asterism “Ekwos” or “Ecui Prinnios” is the IAU constellation Cancer (Boutet 2017).

This Gaulish asterism “Equi Prinnios” is the IAU constellation Cancer and appears in the *Coligny Calendar* (Boutet 2001, 2014).

This Basque asterism “Zaldia” is the IAU constellation Leo (Knörr 1999, Frank 2021) and their name for the star Alpha (α) Leonis (Regulus) is “Zaldi-oina” (see Horse Foot, below).

This Babylonian asterism in the MUL.APIN tablets “ANSHE.KUR.RA” (Anthony 1996), “Ssisu” or “sisû” (Anthony 1996) is a diamond of four stars in the IAU constellation Cepheus: Alpha (α) Cephei (Alderamin), Beta (β) Cephei (Alfirk), Gamma (γ) Cephei, and Iota (ι) Cephei. This appears in later Seleucid sky lore. It is listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul anse.kur.ra” (Koch-Westenholz 1995).

This English asterism “Equus” is the IAU constellation Equuleus. English astronomer Richard Anthony Proctor gave it this name in 1873 as he believed that shortening the name would make more room on astronomical charts. However, it appears as “Equuleus” in Proctor’s *A New Star Atlas* (1887) as an official constellation “recognized in the catalogue of the British Association”.

There are two Lithuanian asterisms associated with a horse:

- One is the asterism “Arklys” (“horse”) and is made up of the stars of the IAU constellations Aquarius and Pisces (Vairkünas 1999).
- One from the Samogitia region is “Kybelka” (“jade”) which is the name of a horse and is the IAU constellation Taurus.

This Latvian asterism “Kumel’š” is made up of the stars of the IAU constellations Aquarius and Pisces (Vairkünas 1999). Vairkünas notes that Goba (1990) associates it with Pegasus.

This Lithuanian asterism “Kumelys” is possibly made up of stars of the IAU constellation Ursa Major according to the Lithuanian Ethnoastronomy site. Compare to the Latvian asterism Horse (“Kumel’š”).

This Byelorussian asterism “Konj” is made up of the stars of the IAU constellations Aquarius and Pisces (Vairkünas 1999).

This Seima-Turbino asterism is the IAU constellation Ursa Major and the star Alpha (α) Draconis (Thuban) in the IAU constellation Draco: At the time of that culture (2300 – 1700 B.C.E.) Draco was the north star. This is depicted in artwork in the Terekty-Auliye settlement (Polyakova 2009).

This Kolam asterism “Gurram” is the IAU constellation Crux (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

Robert Hues, in his *A Learned Treatise of Globes* in 1659, writes that the “inhabitants of Azania called [the asterism Argo’s Ship (see below)] a horse, as Ptolomy affirmes”. Hues cites the *Geographike Hyphegesis* of Ptolemy (100 – 170) as the source. Anzania is a name applied to various parts of southeastern tropical Africa.

Horse and Rider:

This English asterism is the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), claims the name “Horse and Rider” as an “Arabic” name for these stars. R. H. Allen also lists this name in his *Star Names* in 1899. It appears on modern astronomy club asterism lists as a **telescopic** asterism but as you can see from the many examples from ancient times in this handbook, it has been an unaided eye asterism for centuries.

Horse and Wheels:

This Belarussian asterism “Kon’ i Kaliosy” (“horse and wheels”) or “Kon’ s Vazom” (“Horse and cart”) is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009).

Horse Foot:

This Basque star “Zaldi-oina” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Knörr 1999, Frank 2021).

Horse Forehead Star:

This Arabic star is Xi (ξ) Cephei in the IAU constellation Cepheus.

Horse Head:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is made up of stars of the IAU constellations Cygnus, Lyra, and Sagitta. The central star is 15 Cygni, from which three lines of stars emerge:

- One spiraling line runs through HIP 96459, 97757, and 28 Cygni, ending at Alpha (α) Sagittae (Sham),
- One runs to Eta (η) Cygni, and
- One runs to Theta (θ) Lyrae.

Horse Head Nebula:

This **telescopic** dark asterism (one of few recognized in the northern hemisphere) is the dark nebula Barnard 33, discovered in 1888 by Scottish American astronomer Williamina Fleming (1857 – 1911) inside the emission nebula IC 434 on photographic plate B2312 taken at the Harvard College observatory. Fleming described it as “a semicircular indentation 5 minutes in diameter 30 minutes south of Zeta [Orionis]”. When the original jacket for this plate was replaced after 1888, someone wrote on it “Historic Plate: Contains the Horsehead”. It is in the IAU constellation Orion. It was first described by American astronomer Edward Emerson Barnard (1857 – 1923) and entered in his catalogue in 1913. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the “Horsehead Nebula”.

Horse Month Guiding Star:

The Celtic PRIN or guiding stars in the Sequani Calendar in the ninth month, Equos, is Alpha (α) Piscis Austrini (Fomalhaut) the IAU constellation Piscis Austrinus (Benigni). This is related to the Celtic concept of the horse Goddesses such as Epona or Macha.

Horse of Lir:

“Epos Leruos” is a Gaulish name for the IAU constellation Pegasus (Boutet 2001).

Horse of Llyr:

This Welsh asterism, representing the horse of the sea God Llyr, is the IAU constellation Pegasus as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909).

Horse of Neptune:

This Latin asterism “Equus Neptunius” is Ptolemy’s asterism Argo’s Ship (see above). In his *Star Names* in 1899 R. H. Allen wrote that Ptolemy (100 – 170) asserted that this asterism “was known as a Horse by

the inhabitants of Azania, the modern Ajan, on the northeastern coast of Africa, south of Cape Gardafui".

Horse of the Air:

This asterism "Equus Aerus" is the IAU constellation Pegasus. This name is listed in Johann Bayer's *Uranometria* (1603).

Horse Track:

This Arabic star "Dhilf al-faras" (ظلف الفرس), "Al Ṭhīlf al Faras", or "aṭ-ṭilf al-faras" is Pi (π) 1 Cygni in the IAU constellation Cygnus:

- This was later latinized to "Azelfafage", "Adelfalferes", and "Azelfafge".
- This is listed as "Azelfage" by German astronomer Johann Bayer (1572-1625).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Azelfafage".
- "Azelfafage" was listed by Scottish uranographer Alexander Jamieson (1782 – 1850) in his *Celestial Atlas* in 1822.
- This is listed as "Azelfafage" in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Azelfafage".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Azelfafage" for this star, but his 14th edition (1959) does not list this name at all.
- NOTE: some suggest that it is derived from the same source as the star "Tail of the Hen" (see below), which is a name for Alpha (α) Cygni (Deneb).
- The IAU's Working Group on Star Names approved the name Azelfafage for Pi (π) 1 Cygni in 2016.

Horse Yoking:

This Vedic asterism "Asvayújau" is the stars Beta (β) Arietis (Sheratan) and Gamma (γ) Arietis in the IAU constellation Aries appearing in the *Taittiriya Brahmana* (Ivanković 2021). This is an earlier name for their nakshatra Ashvini (see Harnessing Horses, above).

Horseman:

This Kiribati star "Bantongo" or "Nei Bantongo" is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major (Trussel and Groves 1978).

This star "Eques" is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini as listed by 1st century B.C.E. Roman poet Publius Ovidius Naso (Ovid).

There are two Greek asterisms with the name "Ἱππότης" ("Ippótis"):

- One is the IAU constellation Perseus as listed in R. H. Allen's *Star Names* in 1899. Robert Burnham lists this in his Burnham's Celestial Handbook in 1978.
- One is the IAU constellation Sagittarius as listed by R. H. Allen's *Star Names* in 1899.

Horseman Beast:

This Greek asterism "Ἱππότα Φήρ" or "Ippóta Fír" is their asterism Centaur (see above).

Horsemen:

This Greek asterism “Hippolates” is the IAU constellation Auriga as listed in John Hill’s *Urania* in 1754.

Horses:

This Kazakh asterism is the IAU constellations Ursa Major and Ursa Minor, which were seen as two horses circling the celestial pole as if tied to a pole (Polyakova 2009).

This Bashkir asterism is two stars in the IAU constellation Ursa Minor, named Akbuzat and Kharat (Polyakova 2009).

This Belarussian asterism “Koni” is the IAU constellations Ursa Major and Ursa Minor (Avilin 2009).

Horse’s Abdomen:

This Chinese xing guan “Mǎfù” (马腹) is a line of two stars in the IAU constellation Centaurus: Beta (β) Centauri (Hadar) and HIP 65129.

Horses and Foals:

This Arabic asterism is a bent oval of stars in the IAU constellations Ara, Centaurus, Lupus, and Norma: One end is the star Iota (ι) Centaurus and from here the line runs through Zeta (ζ) Centauri, Eta (η) Ara, Beta (β) Ara, Theta (θ) Ara, Alpha (α) Ara, Gamma (γ) 2 Normae, Eta (η) Lupi, Phi (φ) Lupi, c1 Centauri, and Theta (θ) Centauri. John Hill incorrectly lists this as “Horse and Bear” in his *Urania* in 1754.

Horse’s Tail:

This Chinese xing guan “Mǎwěi” (马尾) is a triangle of stars in the IAU constellation Centaurus: Delta (δ), Rho (ρ) and G Centauri.

Horseshoe:

There are ten **telescopic** “horseshoe” asterisms:

- One is in the IAU constellation Cygnus near NGC 7000 (the North America Nebula) and includes HIP 104361 and 104268 and several faint double stars (Sky & Telescope May 1998). René Merting lists it on Robert Zebahl’s *Faint Fuzzies* website as Calvet 1 and describes it as “Webb’s horseshoe”. It is also known as the Egg (see above) which is Leiter 2. Size 30’ X 30’. Nearby is the **telescopic** asterism the Checkmark (see above).
- One is Vastagh 15, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 39’. Vastagh describes it as “A horseshoe-shaped [asterism] between NGC7795 and Berkeley 58... The horseshoe shape is outlined by bright stars. Two members stick out of the shape, giving the effect of a nail sticking out of an imaginary horseshoe. The angle is formed by two stars of very different colors (mag. 7.14 HD 224855 & mag. 8.3 HD 224869). The entire repertoire of the star association includes 68 members. A medium-dense set with a high overall brightness. In places with the grouping of faint members. It can be broken down and is connected to its star environment to the west via three straight and bright rows of stars, which meet at the upper arch of the horseshoe shape.”
- One is the “Golden Horseshoe” in the IAU constellation Circinus is fourteen stars in a “U” shape 1.5˚ southeast of Alpha (α) Circinus. One end of the “horseshoe” is the star HIP 72965

and it loops around through HIP 72752, 72494, 72383, 72324, 72224, 72332, 72364, 72403, ending at HIP 72438. Size 60'. Jeffrey Corder lists this as Corder 2722.

- One is Corder 2520 in the IAU constellation Centaurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 40'. The seven stars include HIP 66292, 66394A, 66469, and 66527.
- One is in the IAU constellation Vela and is Corder 1988 on the observing list of American astronomer Jeffrey Corder. Size 180' X 120'. This is a curve of 5th – 9th magnitude stars including HIP 51077, 51014, 50903, 50799, 50480, 50196, 50191, 50200, 50162, and 50241.
- One is in the IAU constellation Cygnus and is Corder 3940 on the observing list of American astronomer Jeffrey Corder. Size 40'. Corder calls this the "Lucky Horseshoe" and is twelve 7th – 9th magnitude stars including HIP 97078, 97153, and the double stars 97106 and 97316.
- One is open cluster NGC 2439 in the IAU constellation Puppis, which was discovered by English astronomer John Herschel in 1847. It is GC 1566 in the *General Catalogue* of 1864.American astronomer Steve Coe (1949 – 2018) described it as a "Arc de Triumph [sic]" (see Arc de Triomphe, above) and as a "horseshoe shape". It is also known as the "Bold Arrow Cluster" (see below).
- One, the Horseshoe Nebula, is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius, discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux catalogued by French astronomer Charles Messier in 1764, and listed in John Herschel's General Catalogue in 1864 as GC 4403:
    - American astronomer Solon Irving Bailey (1854 – 1931) listed it as "the Horse Shoe, or Omega nebula".
    - It is listed as "the horseshoe" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
    - John Dreyer lists it in the New General Catalogue of 1888 as "2 hooked" and "shaped".
    - William Denning's *Telescopic Work for Starlight Evenings* (1891) lists it as the "Horseshoe Nebula".
    - German astronomer Hermann Joseph Klein (1844 – 1914) lists this nebula as having a "horseshoe shape" in his *Star Atlas* (1893).
    - American astronomer Edward S. Holden, writes about it in his article *The Horseshoe Nebula in Sagittarius* in Popular Science in January 1876.
    - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "famous Horseshoe Nebula".
    - It is listed as the "Horseshoe" in R. H. Allen in his *Star Names* in 1899.
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as the "Horseshoe".
    - The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Horseshoe Nebula".
    - It is also known as the Checkmark Nebula, Omega Nebula, Swan Nebula, "2", and the Lobster Nebula.
- One is open cluster NGC 3293, discovered by Nicolas Louis de Lacaille in 1751 in the IAU constellation Carina. Lacaille described it in his 1755 catalogue as a "small heap of 4 small stars forming a lozenge." It is GC 2144 in the *General Catalogue* of 1864. It is also known as the Spider Spit Cluster (see below), Hubbly Bubbly Pipe (see below), the Little Jewel Box (see below) and the Gem Cluster (see above). South African astronomer Carol Botha described it in 2016 as a "'U' or horseshoe shape".

- One is dark nebula Barnard 87 in the IAU constellation Sagittarius. This was discovered by English astronomer William Herschel in 1785. Australian astronomers Rodgers, Campbell, and Whiteoak (1960) labelled it RCW 1 and described it as a "horseshoe-shaped bright region".

Horus:

This large Egyptian asterism "Anu" represents the God Horus and is made up of stars from the IAU constellations Ursa Major, Cancer, Canes Venatici, Coma Berenices, Leo, and Lynx:

- His "body" is a rough quadrilateral with the four corner stars being Psi (ψ), 10 and 54 Ursae Majoris and 40 Lyncis,
- One "arm" runs from 10 Ursae Majoris through 9 Ursae Majoris to Theta (θ) Ursae Majoris,
- The other "arm" runs from Alpha (α) Lyncis to an "elbow" at Kappa (κ) Leonis and a "hand" at 48 Cancri,
- One "leg" runs from Psi (ψ) Ursae Majoris down to 12 Canes Venaticorum, and
- The other "leg" runs from 54 Ursae Majoris to Beta (β) Comae Berenices.

NOTE: Horus was a falcon-headed Egyptian God of kingship and the sky. Anu is an avatar of Horus, depicted as a falcon-headed god with a long spear harpooning a bull (see Bull's Foreleg, below).

This Egyptian Dendera asterism is made up of stars of the IAU constellations Carina and Columba (Hoffman 2017). This is depicted as a falcon sitting on a canopy at Dendera, the falcon being the stars of Columba and the bottom of the pillar being the star Alpha (α) Carinae (Canopus).

German Jesuit astronomer Athanasius Kircher (1602 – 1680) used the name "Horus" for the Egyptian decan Sasaqet (see below).

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Horus" as a name for Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Hostile:

This Chaldean star "mul [n]a-ka-ru" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Hot Air Balloon:

In 1798 French astronomer Jérôme Lalande created the constellation "Globus Aerostaticus", "Ballon Aerostatique", or "Aetherius" to honor the invention of the hot air balloon by the Montgolfier brothers. It lay between the IAU constellations Piscis Austrinus, Capricornus, and Microscopium. German astronomer Christian Ludwig Ideler (1776 – 1846) as "Luft Ball", and Italian astronomer Angelo Secchi as "Aerostáto". Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Le Ballon Aerostaique" in his *Celestial Atlas* in 1822. German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Luft Ballon". Brazilian astronomer Bruno Alessi lists it on his BDCC 7.6 list as "Air Ballon". Jeffrey Corder lists it as Corder 4436 and it is in the SAC database.

Hound:

This Irish asterism is the IAU constellation Canis Major. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). This is probably a reference to the story of Cu-Chulainn. Compare this to Cú Roí, above.

This Lithuanian star “Skaliks” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Hourglass:

This asterism is the IAU constellation Orion as listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844. Compare this to Clepsydra, above.

There are four **telescopic** “hourglasses”:

- One is an alternate name for HII region Messier 8 (NGC 6533, SH 2-25, RCW 146, LBN 25) in the IAU constellation Sagittarius. This was discovered by Italian astronomer Giovanni Hodierna before 1654. It is listed in John Herschel’s General Catalogue of 1864 as GC 4361. It is also known as the Lagoon Nebula (see below), and Dragon Nebula (see above).
- One is planetary nebula NGC 2346 in the IAU constellation Monoceros. This was discovered in c.1784 by English astronomer William Herschel who listed it as “IV 65” in his catalogue. It is GC 1500 in the *General Catalogue* of 1864. Size 1’ X 0.9’.It is also known as the Butterfly or the Crimson Butterfly (see Butterfly, above).
- One is in the IAU constellation Ursa Minor and is Corder 3084 on the observing list of American astronomer Jeffrey Corder. Size 25’. This is eight 7^{th} – 9^{th} magnitude stars including HIP 81156, 81219, and 81528. This forms part of John Chiravalle’s “Shark” (see below) and John Raymond calls this the “Ursa Minor Pseudo Cluster”.
- One is the open cluster NGC 6530 in the IAU constellation Sagittarius. It was discovered by Italian astronomer Giovanni Battista Hodierna prior to 1654 and later recorded by English astronomer John Flamsteed. John Herschel listed it as h 3724 and later as GC 4365 in his *General Catalogue* of 1864.

House:

This asterism is formed by the brightest stars of the IAU constellation Cepheus: Alpha (α) Cephei (Alderamin), Beta (β) Cephei (Alfirk), Gamma (γ) Cephei, Zeta (ζ) Cephei, and Iota (ι) Cephei. Jeffrey Corder lists this as the “House of Cepheus”, Corder 4570.

This Kiribati asterism “Auti” or “Nei Auti” is the Pleiades cluster in the IAU constellation Taurus (Trussel and Groves 1978).

There are four **telescopic** “house” asterisms:

- One is in the IAU constellation Andromeda and Corder 24 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25’ X 15’. The house is a square formed by HIP 525, 737, 714, and 508A. The “peak of the roof” is the pair of stars HIP 625 and 626. Corder describes it as a “group of 10 stars that are magnitudes 6.5 through 8… includes the double star STF3064 at the southern end.”
- One is in the IAU constellation Auriga and is Corder 1134 on the observing list of American astronomer Jeffrey Corder. Size 60’. This is five stars including HIP 31340 and the double stars HIP 31579, 31373A, and 31454A.
- One is in the IAU constellation Virgo and is Corder 2576 on the observing list of American astronomer Jeffrey Corder. Size 20’. This is five 9^{th} – 10^{th} magnitude stars including HIP 68116.
- One is in the IAU constellation Cygnus and is Corder 3863 on the observing list of American astronomer Jeffrey Corder. Size 15’. This is six 8^{th} – 9^{th} magnitude stars including HIP 95725 and 95802. Corder describes this as “house” or “Cepheus” shaped.

House for Musical Instruments:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a set of five roughly parallel wavy lines of stars in the IAU constellations Carina, Centaurus, and Crux:

- Line 1: Mu (μ) 1 Crucis, HIP 62327, HIP 60379, HIP 58642, HIP 57870, A Centauri, and n Centauri (the determinative star
- Line 2: Gamma (γ) Crucis, Beta (β) Crucis (Mimosa), 39 Crucis, 35 Crucis, Delta (δ) Crucis, HIP 58901, 57512, and HIP 55581.
- Line 3: Iota (ι) Crucis, Epsilon (ε) Crucis, HIP 59200, HIP 58921, HIP 57439, Omicron (ο) 1 and 2 Centauri, and x Carinae.
- Line 4: Alpha (α) Crucis (Acrux), Theta (θ) 1 and 2 Crucis, HIP 57175, HIP 56986, HIP 56754, HIP 55831, and y Carinae.
- Line 5: Zeta (ζ) Crucis, Eta (η) Crucis, j Centauri, and Lambda (λ) Centauri.

This Chinese Chenzhuo xing guan consists of four roughly parallel lines of stars in the IAU constellation Carina, Centaurus, Crux, and Vela:

- One line starts at Gamma (γ) Crucis and runs through Delta (δ) Crucis, HIP 56250, HIP 54463, HIP 53154, and HIP 52154 to HIP 51523,
- One line starts with HIP 60781 and runs through HIP 57439, HIP 54751, HIP 53253, and HIP 51849 to HIP 51140,
- One line starts with Epsilon (ε) Crucis and runs through Lambda (λ) Centauri, HIP 54301, HIP 52468, HIP 52102, HIP 51232, HIP 51192, and HIP 50676 to HIP 50555, and
- One line starts with Alpha (α) 1 & 2 Crucis (Acrux) and runs through Zeta (ζ) Crucis, Theta (θ) 1 & 2 Crucis, HIP 57669, Theta (θ) Carinae, HIP 51576, and HIP 50371 to Phi (φ) Velorum.

House of Branches:

This /Xam asterism “≠nabbe ta !nu” is the IAU constellation Corona Australis: They see it as people sitting in a semi-circle around a fire.

House of Cepheus:

This asterism from the Saguaro Astronomy Club asterism database is made up of stars of the IAU constellation Cepheus: Alpha (α) Cephei (Alderamin), Beta (β) Cephei, Gamma (γ) Cephei, Iota (ι) Cephei and Lambda (λ) Cephei form a 5-sided figure resembling a “house” with the peak of the “roof” pointing at Polaris.

House of Queen:

This Korean lunar mansion “Zeo” is a quadrilateral of stars in the IAU constellation Libra: the double star Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), Gamma (γ) Librae and Iota (ι) 1 Librae.

House of Saturn:

This astrological asterism is the IAU constellations Aquarius and Capricorn and is listed in R. H. Allen’s *Star Names* in 1899.

House of Tutakaiolo:

This Tongan (Pukapuka Island) asterism “Te Wale-o-Tutakaiolo” is the IAU constellation Auriga.

House Swallow:

This asterism is the IAU constellation Apus as listed in English astronomer J. Ellard Gore's English edition of *Astronomie Populaire,* written by French astronomer Camille Flammarion (1842 – 1925).

House with a Courtyard:

This Romanian asterism "Casa cu Ograda" is the IAU constellation Corona Borealis (Ottescu 2009). Alpha (α) Coronae Borealis (Alphecca) represents the "house".

Howling Dog:

This Latin asterism "Canis Ululans" is the IAU constellation Lupus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).

Howling Dogs:

There are two Arabic asterisms with the name "al-'awa'" (العواء), "Al-Uwwa" or "'Al-ʿAwwāʾ" (ٱلْعَوَّاء):

- One is the Arabic and Bedouin manzil in the IAU constellation Virgo and is the stars Beta (β) Virginis (Zavijava), Eta (η) Virginis (Zaniah), Gamma (γ) Virginis (Porrima), Delta (δ) Virginis and Epsilon (ε) Virginis (Vindemiatrix). It is part of the Arabic asterism Lion (see below). In the calendars of Qushayr and Qays the morning setting of the Howling Dogs indicates the spring rainy season:
    - Dorn (1829) lists this as "the Barker".
    - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as "the retreat of the howling dog".
    - This was later latinized to "Al Awwa" or "Alhava" by John Chilmead in his *A Learned Treatise of Globes* in 1889.
    - W. Brennand lists this as "Al-Auwa" in his *Hindu Astronomy* in 1896.
    - R. H. Allen lists this as "Barker" and "Barking Dog" in his *Star Names* in 1899 and this led Allen to refer to this asterism as the "kennel corner".
- One is the Arabic asterism with the latinized name "Aleawa'" which is a name for the IAU constellation Boötes. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "'Auwá" and "Al 'auwà" and translates this as "canis latrans" ("barking dog").

NOTE: The meaning of the ancient Arabic "al-ʿAwwā'" is uncertain. It resembles a medial Arabic letter kaf (ﻜـ), the final form of the Arabic letter alif (ﺎ) or an English capital L, which has led to some translating this as "the turn" or "the bend" (see Bend, above).

This Yemeni manzil "'Awwā'" is Beta (β) Virginis (Zavijava), Eta (η) Virginis, Gamma (γ) Virginis, Delta (δ) Virginis and Epsilon (ε) Virginis in the IAU constellation Virgo (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Hrusa:

This Bohemian star "Hrusa" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen does not provide a translation.

Hu Gadarn:

This Welsh asterism is named for a mythological figure who is a ploughman. The IAU constellation Boötes becomes the ploughman Hu Gadarn, the Big Dipper in the IAU constellation Ursa Major (see Big Dipper, above) the plough, and the IAU constellations Auriga and Taurus his oxen pulling his plough.

Huaman:

This Inca star is Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion (Gamarra & Gamarra 2009).

Hubble's Galaxy of Fornax:

This **telescopic** asterism "Hubbélia Fornácis" is the lenticular galaxy NGC 1201 in the IAU constellation Fornax. It was discovered in 1785 by English astronomer William Herschel who listed it as "I 109". It became GC 645 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name to honor astronomer Edwin Hubble.

Hubble's Variable Nebula:

This **telescopic** asterism Hubble's Nebula or Hubble's Variable Nebula is reflection nebula NGC 2261 (Caldwell 46, LBN 920, Ced 83) in the IAU constellation Monoceros. This was discovered in 1783 by English astronomer William Herschel who listed it as "VI 2". It became GC 1437 in the *General Catalogue* of 1864. It was imaged by American astronomer Edwin Hubble in 1949 at Palomar Observatory's Hale Telescope first light. Size 2' X 1'. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as "Hubble's Nebula".

Hubbly Bubbly Pipe:

This **telescopic** asterism is open cluster NGC 3293, discovered by Nicolas Louis de Lacaille in 1751 in the IAU constellation Carina. Lacaille described it in his 1755 catalogue as a "small heap of 4 small stars forming a lozenge." It is GC 2144 in the *General Catalogue* of 1864. It is also known as the Spider Spit Cluster(see below), the Little Jewel Box (see below), and the Gem Cluster (see above). South African astronomer Carol Botha described it in 2012 as reminding her "of the hubby-bubbly Hookah pipes so popular in SA bars". It has also been described as a "U" or "Horseshoe".

Huchra's Lens:

This **telescopic** asterism PGC 69457 is a galaxy in the IAU constellation Pegasus. It is called this because it is the lensing galaxy of the Einstein Cross (Quasar 2237+30). It is named after American astronomer John Huchra (1948 – 2010), who was a key member of the team that discovered it. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as "Crúx Einsteiniána Pegási" ("Einstein's Cross of Pegasus").

Humans:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars in the IAU constellations Cygnus and Pegasus. Four lines radiate out of the star 14 Pegasi, forming a figure with arms and legs:

- One to 15 Pegasi,
- One to 16 Pegasi,
- One to Kappa (κ) Pegasi (the determinative star), and
- One to Mu (μ) 1 and 2 Cygni.

This Chinese xing guan Rén (人) is a quadrilateral in the IAU constellation Pegasus: 1, 2, 9, and 12 Pegasi.

This Chinese Chenzhuo xing guan "Rén" is four lines of stars radiating out of a central star in the IAU constellations Cygnus and Pegasus: The central star is 14 Pegasi. From this star four lines run out:

- One to 15 Pegasi,
- One to 16 Pegasi,
- One to 10 Pegasi, and
- One to Mu (μ) 1 Cygni.

This Korean asterism "Ingan" (인간) is identical to the Chinese xing guan Rén above.

Hummingbird:

This Bribri star "Batsů" is the red dwarf star LHS 3844 in the IAU constellation Indus. It received this name in the IAU's NameExoWorlds competition in 2022. Batsů are messengers of their creator Sibȍ. It has an exoplanet LHS 3844b, "Kua'kua", which means "butterfly".

This **telescopic** asterism is NGC 4656 and 4657 in the IAU constellation Canes Venatici. This was discovered in 1787 by English astronomer William Herschel: He listed them as "I 176" and "I 177". The became GC 3189 and GC 3190 in the *General Catalogue* of 1864. It is also known as the Crowbar Galaxy (see above), the Hook (see above), the Fishhook (see above) and the Hockey Stick (see above).

Hummingbird of Leo Minor:

This **telescopic** asterism "Cólibri Leónis Minóris" is the peculiar spiral galaxy NGC 3395 (Arp 270) in the IAU constellation Leo Minor. It was discovered by English astronomer William Herschel in 1785 who listed it as "I 81" in his catalogue. It is GC 2178 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it "looks like a hummingbird sucking nectar from a flower (NGC 3396)".

Humped:

This Dutch asterism "Gibbus" is the IAU constellation Cetus as listed by Dutch astronomer Hugo Grotius (1583 – 1645).

Humu:

This Hawaiian star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila. This is one of the stars of the Navigator's Triangle (see below).

Humu-ma:

This Hawaiian asterism is three stars in the IAU constellation Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Tarazed). In Polynesian mythology Humu is a famous ho'okele ("navigator/steersman") and this asterism represents Humu and his two sons.

Hunahpú:

This Honduran star is HIP 55174 (HD 98219) in the IAU constellation Crater and was given to this star in the IAU NameExoWorlds campaign. It is named for one of the Maya Hero Twins who became the Sun in

K'iche' Mayan mythology. It has an exoplanet named Ixbalanqué, who was one of the twin Gods who became the Moon.

Hundred Cures:

This Vedic asterism is in the IAU constellation Aquarius. At the center is a triangle of stars: Alpha (α) Aquarii (Sadalmelik), Gamma (γ) Aquarii, and Theta (θ) Aquarii. From two of the corners, star lines emerge:

- From Gamma (γ) Aquarii a line runs through Zeta (ζ) 1, Eta (η), Lambda (λ), and Tau (τ) Aquarii, ending at Delta (δ) Aquarii, and
- From Alpha (α) Aquarii (Sadalmelik) a line runs to Beta (β) Aquarii (Sadalsuud) and then three lines run off from here:
    - One line goes to Iota (ι) Aquarii,
    - One line goes to Nu (ν) Aquarii, and
    - One line goes to Epsilon (ε) Aquarii.

In 2019 Leitz writes that the *Brhat Samhita* claims 100 stars for this asterism, while some earlier texts claim only the star Satabhisak (see Comprising a Hundred Physicians, above).

Hundred Handed:

This Greek asterism "Hekatonkheires" is made up of the stars of the IAU constellations Sagittarius and/or Ophiuchus (Mosenkis, date n/k). The Hundred Handed were monsters exiled to Tartarus by Uranus. This is related to their asterisms Cyclopes (see above) and Campe (see above).

Hundredth of Coma Berenices:

This **telescopic** asterism "Centésimus Cómae Bereníces" is the grand design spiral galaxy Messier 100 (NGC 4321) in the IAU constellation Coma Berenices. It was discovered by French astronomer Pierre Méchain in 1781 and English astronomer William Herschel described it in the *Philosophical Transactions* in 1814. It is listed in the General Catalogue of 1864 as GC 2890 and in John Herschel's catalogue as h 1211. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it was the hundredth object listed in Messier's catalogue. It is also known as the "Blow Dryer" (see above).

Hungarian Coat of Arms:

This asterism "Hungar" was made up of the stars of the IAU constellation Columba by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This is depicted as a double cross with crossed keys above it.

Hunor:

This **telescopic** Hungarian star is HAT-P-2 in the IAU constellation Hercules (magnitude 8.4). This name was given to this star in the IAU NameExoWorlds campaign. It was named after a legendary Hungarian ancestor. It has an exoplanet named Magor: Magor was the brother of Hunor.

Hunter:

This Latin asterism “Venator” is the IAU constellation Orion. “Venator” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This Teduray asterism “Seretar” is the IAU constellation Orion (Santos et al 2019).

This Lokono star “Yokhârhin” is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Rybka 2018). Yokhârhin is hunting Hithikoya (see Spirit of the Black Curassow, below) and his torchbearer is Alêti (see Torch, below).

This Bukidnon asterism “Magbangal” is the belt of Orion in the IAU constellation Orion and “Moroporo” (the rest of Orion) is his hunting ground (see Hunting Ground, below).

This Kankana-ey asterism “Binabbis” is the belt of Orion in the IAU constellation Orion.

This Palawan and Tagalog asterism “Binawagan Magsasawad” is the belt and sword of Orion (Santos et al 2019) and “Moroporo” (the rest of Orion) is his hunting ground (see Hunting Ground, below). Binawagan Magsasawad hunts Sangat at Bjak (the Hyades) which ate the Moroporo (Pleiades). The Ibaloi call this “Bodays”.

This Filipino asterism “Moroporo” or “Molopolo” is the Pleiades cluster in the IAU constellation Taurus (Santos et al 2019).

This Maranao asterism “Mbangal” is the belt of Orion in the IAU constellation Orion.

This Khinaang asterism “Farrais” is the belt of Orion in the IAU constellation Orion.

This Fontok asterism “Farrais” is the belt of Orion in the IAU constellation Orion.

This Ilokano asterism “Gaganayan” is the belt of Orion in the IAU constellation Orion.

This Igorot asterism “Gaganayan” is the belt of Orion in the IAU constellation Orion.

This Chukchi and Koryak asterism (Berezkin 2005) is the IAU constellation Orion (Berezkin 2005) and Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus is his arrow (see Arrow above). He is pursuing a reindeer represented by Cassiopeia (see Reindeer, below). He is described as a hunchback, as his jealous wife hit him as he was giving too much attention to the Pleiades women. Compare this to the Sami asterism Favdna (see above).

This Yakut and Nganasan asterism (Berezkin 2005) is the IAU constellation Orion and Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus is his arrow (see Arrow above). He is pursuing a reindeer represented by the Pleiades cluster (see Reindeer, below). Compare this to the Sami asterism Favdna (see above). There is another Nganasan version where the Pleiades are the hunters (see Hunters, below).

This Pitjantjatjara asterism “Nirunya” or “Njiru” is the IAU constellation Orion. This hunter is chasing “Kunkarunkara” (see Group of Women, above) which is the Pleiades cluster.

This Seri asterism “Hapj” is the belt of Orion in the IAU constellation Orion. The three stars are:

- Hap (“mule deer”)- Zeta (ζ) Orionis (Alnitak),
- Haamoha (“pronghorn”)- Epsilon (ε) Orionis (Alnilam), and
- Mojet (“bighorn sheep”)- Delta (δ) Orionis (Mintaka).

This Desana asterism is the IAU constellation Orion.

This Sesotho star “Moliana” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

In KhoiKhoi sky lore (in eastern Namibia) the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus represents the hunter Archernar whose wives are the Pleiades cluster in the IAU constellation Taurus. When Archernar shot his arrow (Orion's sword), at three zebras (the belt of Orion -see Three Zebras, below) it fell short. Archernar didn't recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching (Alcock, 2014). Compare this to Husband of the Daughters of the Sky God (see below).

This Teleut star is Alpha (α) Canis Majoris in the IAU constellation Canis Major (Kuperjanov 2006). He is hunting Three Deer (see below). His arrow (the star Rigel) has fallen short but another has hit a deer represented by Betelgeuse (see Deer, above).

This Evenk asterism "Mangi", "Mani", "Chanchi", or "Chahintylan", is the stars of the "handle" of the Big Dipper asterism in the IAU constellation Ursa Major (Dmitrieva and Romeiko 2009). He is hunting the elk "Helgen" (see Elk, above).

This Belarussian asterism "Palojnik" is the IAU constellation Ursa Major (Avilin 2009).

This Southern Paiute asterism is the IAU constellation Orion (Gillard 2021). The first appearance of this asterism marked the beginning of winter.

This Tangut asterism is the IAU constellation Orion (Berezkin 2005). His back was broken by Gachari (see above).

Hunter and Dog:

This Songye asterism "Aspibwe na Mbwa na Nyama" is the belt of Orion (Slotegraaf 2013).

The ancient Celtic God Cernunnos is sometimes associated to the IAU constellation Orion, as is the Brythonic deity Herne the Hunter and the Welsh god Mabon, deity of the winter son, who is the only one who can handle the hunting dog Drudwyn.

This Tibetan asterism is Delta (δ) Ursae Minoris and 24 Ursae Minoris in the IAU constellation Ursa Minor (Johnson-Groh 2013).

Hunter and Torch:

This Lokono or Arawak asterism (Rybka 2018) is the Pointer Stars (see Pointers below). Alpha (α) Centauri (Rigil Kentaurus) is "Yokhârhin" (see Hunter, above), and Beta (β) Centauri (Hadar) is "Alêti" (see Torch, below).

This Carib asterism is made up of stars of the IAU constellation Centaurus and Crux. The southern cross asterism represents a Paui bird resting in a tree and the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Mimosa) are the torch (Magaña, and Jara, 1982).

Hunter, Dog, and Buck:

This !Xõ asterism is the belt of Orion in the IAU constellation Orion.

Hunter of the Bear:

This Latin asterism "Venator Ursae" is the IAU constellation Boötes and a variation of the Greek asterisms Guardian of the Bear (see above) and Bear Watcher (see above). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Venator" for this constellation.

Hunter of the Seven Sisters:

This Ngalea asterism “Nyeeruna Nyiruna” (“hunter of the seven thorny devil sisters”) is the IAU constellation Orion. He is chasing the Mingarri sisters (see Seven Young Sisters, below). The belt of Orion is Nyeeruna’s string belt, and the sword of Orion is its whitened tassel.

NOTE: the Mingarri or Mingari is a totem animal, the Thorny Lizard (Moloch horridus).

This Kokatha asterism “Nyeeruna” is the IAU constellation Orion. Nyeeruna is chasing the Yugarilya (see Thorny Devil Lizard, below).

This Pila Nguru asterism “Njuru” is identical to the Kokatha asterism “Nyeeruna”, above.

This Pitjantjatjara and Yankunytjatjara asterism “Nirunja” is identical to the Kokatha asterism “Nyeeruna” above.

Hunters:

The Oroch, Evenk, and Udege in eastern Siberia see the three stars of the handle of the Big Dipper asterism in the IAU constellation Ursa Major as hunters (Berezkin 2005): Epsilon (ε) Ursae Majoris (Alioth), Zeta (ζ) Ursae Majoris (Mizar) and Eta (η) Ursae Majoris (Alkaid). They see the star 80 Ursae Majoris (Alcor) as the hunter’s dog (see Dog, above) and the bucket of the Big Dipper as the elk “Helgen” (see Elk, above). Some versions of the story have the three stars representing the hero-hunter “Mangi” (see Hunter, above). Berezkin writes that the four stars of the Dipper are sometimes seen as a storehouse which an animal is approaching with the three stars of the handle hunters following it.

The Khanty, Selkup, Ket, and Khalasha of Siberia see the three stars of the handle of the Big Dipper asterism in the IAU constellation Ursa Major as hunters (Berezkin 2005): Epsilon (ε) Ursae Majoris (Alioth), Zeta (ζ) Ursae Majoris (Mizar) and Eta (η) Ursae Majoris (Alkaid). They see the star 80 Ursae Majoris (Alcor) as the hunter’s cooking pot (see Pot, below) and the bucket of the Big Dipper as either a bear (see Bear, above) or an elk (see Elk, above).

This Evenk asterism is the Pleiades cluster in the IAU constellation Taurus. They are pursuing a mountain sheep and the Pleiades cluster is their net. Compare this to the Chukchi and Yakut asterism Hunter (see above).

This Nganasan asterism is the Pleiades cluster in the IAU constellation Taurus. They are pursuing a reindeer and the Pleiades cluster is their net. There is another Nganasan version where the hunters are the constellation Orion and the Pleiades cluster is the reindeer (see Hunter, above).

This Chemehuevi, Numu, Yavapai, Maricopa, Kiliwa, and Aaniiih asterism is the IAU constellation Orion (Berezkin 2005). The stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) are the hunters, the sword of Orion their arrow, and the belt of Orion the sheep.

This Dakelh asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). They are pursuing a Cariboo which is represented by the Pleiades (see Cariboo, above).

This Salish, St’at’imc, Nlaka'pamux, Secwépemc, Hul’qumi’num, Snohomish, Schitsu'umsh and Chinookan asterism is the stars of the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). The three stars of the “handle” are the hunters, and the four stars of the “dipper” are the animal being pursued.

This Salish, Chinookan, Lenape, Iroquois, and Meshkwahkihaki asterism is the stars of the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005). The three stars of the “handle” are the hunters, and the four stars of the “dipper” are the animal being pursued and the star Alcor is their hunting dog (see Dog, below).

There are three Wichi asterisms by this name (Mariani et al 2017) which refer to brothers hunting rhea in the sky:

- One is the Pleiades cluster in the IAU constellation Taurus. They were trapped in the sky when an elder they offended burned the tree which they climbed into the sky.
- One is the stars Zeta (ζ) 1 and 2 Scorpii in the IAU constellation Scorpius, which is also known as the Grandchildren (see above).
- One is the Coal Sack Nebula.

This Iñupiat asterism is the Pleiades cluster and the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Berezkin 2005). The Pleiades is the hunters pursuing a polar bear, Aldebaran.

This Kinlinermiut asterism is the belt of Orion in the IAU constellation Orion (Berezkin 2005). The hunters are pursuing a bear.

This Siona and Secoya asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005).

Hunters and Dogs:

The stars of this Inuvialuit asterism are unidentified at present (Berezkin 2005).

Hunters and Dogs Encircling a Bear:

This Netsilik, Iglulingmiut, and Inughuit asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005).

This Labrador Inuit asterism is the IAU constellation Orion (Berezkin 2005).

This Nunatsiarmiut asterism is the IAU constellation Orion (Berezkin 2005). The star Alpha (α) Orionis (Betelgeuse) represents a bear, the belt of Orion the hunters, and the sword of Orion their dog sledge.

Hunters Pursuing Mountain Sheep:

This Evens asterism is the Pleiades cluster in the IAU constellation Taurus (Berezkin 2005).

Hunter's Right Arm:

This Kokatha and Ngalea star "Nyeeruna's Right Arm" (see Hunter of the Seven Sisters, above) is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Hunting Dog:

This Northern Sotho star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. They tell of seven virgins (the Pleiades) fleeing from this hunting dog. An alternate version has the hunting dog chasing three pigs (see Three Pigs, below).

Hunting Dogs:

This German asterism "Jagdhunde" is the IAU constellation Canes Venatici (see Canes Venatici, above).

This French asterism "Chiens de Chasse" is the IAU constellation Canes Venatici.

This French asterism "Canes Venatica" is the IAU constellation Ursa Major as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) and R. H. Allen in his *Star Names* in 1899. It is probably a corruption of the asterism Cynosura (see Dog's Tail, above).

Hunting Eagle:

This Turkish asterism “Taushaugjil” is the IAU constellation Aquila.

Hunting Ground:

This Bukidnon asterism “Moroporo” is the constellation Orion and “Magbangal”, the belt of Orion, is the Hunter (see above).

This Palawan asterism “Moroporo” is the constellation Orion and “Binawagan Magsasawad”, the belt of Orion, is the Hunter (see above).

Hunting Spear:

This star “Venabulum” is the Mu (μ) Boötis in the IAU constellation Boötes. This name is listed in Johann Bayer’s *Uranometria* (1603).

Huntress:

This Greek and Minoan asterism is the IAU constellation Orion. Lithuanian archaeologist Marija Gimbutas (1996) linked it to the Greek huntress Goddess Artemis and the Minoan A-ti-me-te. She is accompanied by dogs represented by Canis Major and Canis Minor.

Hurricane of Ursa Major:

This **telescopic** asterism “Procélla Úrsae Majóris” is the barred spiral galaxy NGC 3953 in the IAU constellation Ursa Major. William Herschel listed it as “V 45”. John Herschel listed it as h 1013 and later as GC 2606 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “it brings to mind a giant hurricane”.

Huruhata's Object:

This is an eclipsing binary star in the IAU constellation Canis Minor. It is named after Masaaki Huruhata (1912 – 1988).

Huruhata's Variable Star:

This **telescopic** variable star is the WZ Sagittae type dwarf nova EG Cancri in the IAU constellation Cancer. It is named after Masaaki Huruhata (1912 – 1988).

Husband of the Daughters of the Sky God:

This Nama asterism includes the Pleiades cluster in the IAU constellation Taurus, Alpha (α) Tauri (Aldebaran) in the Hyades cluster in the IAU constellation Taurus, and the IAU constellation Orion. The star Aldebaran represents the husband of the daughters of the sky god (the Pleiades). When the husband shot his arrow (Orion’s sword) at three zebras (the belt of Orion) it fell short. He didn’t recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching in ambush.

In Jū/Wãsi sky lore the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus represents the husband of the daughters of their Sky God Gao ǂN!a. The daughters are the Pleiades cluster in the IAU constellation Taurus. When Gao ǂN!a shot his arrow (Orion’s sword) at three zebras (the belt of Orion) it fell short. He didn’t recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching in ambush.

Husbands:

This //Gana asterism is the stars Alpha (α) Carinae (Canopus) in the IAU constellation Carina and Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major, whose brother is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Slotegraaf 2013, Alcock 2014). These two are married to the Pleiades cluster (see Wives, below).

Hut:

To the Kamilaroi/Euahlayi the V shape of the Hyades cluster in the IAU constellation Taurus is the "gunya" or "hut" of Old Dthillar (see below) or the "Werrinah", "Wurunna" or "Wurrunnah" (see Wise Man, below).

Another Euahlayi asterism is "Mia Mia", which is the sword and belt of Orion.

This Sardinian asterism is the Hyades cluster in the IAU constellation Taurus. The Sardinians call the star Alpha (α) Tauri (Aldebaran) "the Bunch's Driver" (See above), a reference to the nearby Pleiades, which they call "the Bunch" (see above).

This Romanian asterism "Coliba" or "Cociorva" is the IAU constellation Corona Borealis (Ottescu 2009).

Hvergelmir:

This Norse asterism "Hvergelmir" (Old Norse "bubbling boiling spring") is the stars making up the "tail" of the IAU constellation Scorpius and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Hvergelmir is the source of many rivers in Norse mythology.

Hyades:

This open cluster, Caldwell 41, Collinder 50, Melotte 25, is the nearest open cluster to Earth, and its stars are recognized in 148 sky cultures of the world. Its principal stars are Alpha (α) Tauri (Aldebaran-14th brightest star), Theta (θ) 1 Tauri (Hyadum III), Gamma (γ) Tauri (Hyadum I or Prima Hyadum), Delta (δ) 1 Tauri (Hyadum II), Delta (δ) 3 Tauri, and Epsilon (ε) Tauri (Ain or Oculus Boreus). NOTE: Aldebaran is actually a foreground star and not part of the cluster.

The Hyades appear in Homer's *Iliad and Odyssey* (8th century B.C.E.) and in Hesiod's poem *Works and Days* (late 8th century B.C.E.) and in the works of the Roman poet Ovid (born 43 B.C.E.). In Greek mythology, the Hyades were the five daughters of Atlas and Aethra and half-sisters to the Pleiades. When their brother Hyas died, in their grief they were transformed into stars. The number of stars varies from as little as two (Hipparchus (190 – 120 B.C.E.) and Ptolemy (c.100 – c.170) listed Alpha (α) Tauri (Aldebaran) and Gamma (γ) Tauri as "Υάδων" ("Yádon")) to as many as seven. Ptolemy's name later became "Υάδες" ("Yádes"), which became the Latin name "Hyades". The Greeks often described it as a letter Gamma (γ) or Lambda (λ) as it resembled both letters, and the Romans saw their letter "V". The Greeks and Romans used them to mark their rainy season.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Hyade".

"Hyades" and "Hyadum" are listed for this asterism in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Giovanni Battista Hodierna catalogued this cluster in 1654, and it appeared in subsequent star catalogues.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists the Hyades.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this cluster as the "Hyades".

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this asterism as "Les Hyades", as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "die Hyaden" in the text and as "Hyades" on the charts.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts the Hyades but does not label them.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists the Hyades.

American uranographer William Croswell (1760 – 1834) lists the "Hyades" on his *Mercator Map of the Starry Heavens* in 1810.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists the Hyades it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822).

The Hyades are listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism as the "Hyades"

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists the "Hyades" cluster.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this cluster as the "Hyades" and translates it as "From Greek- to rain".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists the "Hyades".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists the name "Hyades" for this cluster.

In Southeast Asia the spring trap is identified with the IAU constellation Orion. One of the most common things that they capture with this trap are wild varieties of pig, which have a triangular jaw which resembles the triangular Hyades cluster. So, it is not surprising to see peoples of this part of the world identifying the Hyades cluster with a pig's jaw, and you'll see many examples in this handbook.

Hydra:

Hydra's brightest star is Alpha (α) Hydrae (Alphard) which is 47th on the list of the 90 brightest stars and its stars appear in 306 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Hya), female water snake, was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) as "Ὑδρη" ("Ýdri"). Eratosthenes (d.194 B.C.E.), Hipparchus (190 – 120 B.C.E.), and 1st century B.C.E. Greek astronomer Geminus called it "῾Υδρος" ("Ýdros"). Hipparchus also called it "Δράκων" ("Drákon"). Eratosthenes also labelled it "Κόραξ" ("Kórax"- "raven" or "crow"). Roman general Germanicus (15 B.C.E. – 19 C.E.) called it "Hydros". 1st century B.C.E. Roman poet Ovid described Hydra in his *Fasti* as "Anguis, Avis, Crater, sidera juncta micant" ("Snake, Bird, Crater, joined stars"), indicating that this constellation was originally conceived as four parts. Hesiod referred to it as the "Lernean Hydra" as it was the offspring of Typhon and Echidna in Greek myth. Variations include "Ὑδρα" ("Ýdra"), "Hidra", "Idra", "Ydra" and the "Stellatio Ydre" that appears in the 2nd century in Ptolemy's *Almagest*. Hydra was one of Ptolemy's 48 original constellations. It was influenced by the earlier Babylonian asterism "serpent" constellation MUL.DINGIR.MUŠ. The male water snake is Hydrus (see below).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Hydra with Crater on its back and Corvus standing on its back near the end of the tail, facing forwards.

This constellation appears as "Ydra" in editions of the 8th century *Revised Aratus Latinus*, which merge the stars of Hydra, Crater, and Corvus:

- The Dresden DC 183, Paris BN 12957, and Prague IX. C. 6 editions depict a snake moving to the left with Crater in the middle of his back and Corvus standing by his tail,
- In the Paris BN n.a. 1614 manuscript Hydra is moving right with Corvus facing backwards on its tail.
- In the Munich 560 edition Hydra is shown without Corvus or Crater.

Hydra appears in the Leiden *Aratea* (816) as a snake slithering to our right with Crater and Corvus on its back.

Up to the 18th century astronomers listed Hydra as "Hydra", "Hydra et Crater" ("Hydra and Crater"), "Hydra et Corvus" ("Hydra and Corvus"), and "Continuatio Hydrae" ("continuation of Hydra"). Many of the names also used for Draco were used for Hydra, including "Asiua", "Asuia", "Asvia", "Alsugahh" and "Coluber".

The 9th century Berlin 130, Madrid 3307, Monza F.9/176, Vat lat 645, Paris BN, 12117, Los Angeles, Getty Ludwig XII, 5 Paris BN lat 8663,and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Hydra with Crater and Corvus on his back: Corvus is looking towards Hydra's tail. However, Corvus and Crater are also shown individually elsewhere in these texts. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* do not depict Crater and Corvus on his back.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Hydra in left and right profile on one page. The serpent has one coil. The stars of Crater and Corvus are marked, but not illustrated on his page: They are illustrated elsewhere in the book.

The Oxford Laud 644, Padua 27, Laon 422, Rouen 26, and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Hydra, Corvus, and Crater (called Urna) as a single constellation: Hydra is slithering to the left with Corvus on his back, facing the tip of Hydra's tail. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De*

signis caeli depict Corvus pecking at the back of Hydrus, facing toward its head. The Rouen 26 manuscript of *De signis caeli* depicts Hydra with a cock's comb. The Durham Hunter 100 manuscript of *De signis caeli* depicts Hydra without Crater on his back and with Corvus facing the front.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Hydra as a long serpent slithering to our left with Crater and Corvus on its back.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) lists Hydra.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Hydra as a long serpent with ears and two coils. Crater and Corvus are on Hydra's back.

The Paris manuscript of al-Sufi's Book of Fixed Stars (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg's library (c 1430 – 1440) depicts Hydra as a long serpent with one coil.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Hydra as a serpent with one coil. The stars of Crater and Corvus are illustrated but not depicted as a cup and raven.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Ydra" as a serpent with two coils. Crater and Corvus are on its back.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Hydra as a dragon headed serpent with two coils that has Crater and Corvus on its back. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Hydra as a long, thin dragon serpent with wings and front legs. It is not labelled. Crater and Corvus are on its back.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Hydra as a winding serpent slithering to our left with Crater and Corvus on its back.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Hydra as a serpent slithering to our left. On its back is Crater and Corvus.

Hydra appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a dragon headed snake slithering to our right with Crater and Corvus on its back.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Hydra" as a serpent climbing into a tree with Crater and Corvus on its back.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Hydra" as a serpent with teeth.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Hydra as a snake slithering to our right. Its head is blurred on his chart. It has one coil and has Crater and Corvus on its back. It is not labelled.

The “Nuremburg Maps”, a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts “Hydra” as a water snake with two coils.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Hydra as a dragon headed snake with Crater and Corvus on its back.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Hydra” as a serpent with three coils slithering to our left with Crater and Corvus on its back.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts “Hydra” as a snake with one coil slithering to our left with Crater and Corvus on its back.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Hydra as a serpent slithering to our right with Corvus (but NOT Crater) on its back.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and labels this constellation with the abbreviated title “Lep” and depicts in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Hydra” as a dragon-headed serpent with two coils slithering to our left with Crater and Corvus on its back.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “De l’Hidra”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

“Hydra” appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Hydra as a dragon-headed serpent with three coils slithering to our left with Crater and Corvus on its back.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists “Hydra” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Hydra” as a serpent with feathery ears swimming to our left. Crater and Corvus are not shown in the illustration: They appear separately in the text.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Hydra” as a snake with two coils and with Crater and Corvus on its back.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a long snake with Crater and Corvus on its back.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Hydra” as a serpent with one coil slithering to our left with Crater and Corvus on its back.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Hydra" as a long serpent with two coils heading to our left with Crater and Corvus on its back.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Hydra" as a serpent crawling to our right with Crater and Corvus on its back.

Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Idrus", "Idrus Aquaticus", and "Serpens Aquaticus".

"Hydra" is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a serpent slithering to our left with Crater and Corvus on its back.

Hydra is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts this constellation in his Uranometria in 1603 as a serpent having four coils.

German uranographer Johann Bayer (1572 – 1625) depicts Hydra in his *Uranometria* in 1603. Bayer lists these names for this constellation: "Hydra, Hydrus Aquaticus, Asina, Coluber, Anguis, Sublimatus, Magnanimus, Furiosus, Fortis, Asuia".

"Hydra" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a serpent slithering to our right with Crater and Corvus on its back. Bartsch also lists the alternate name "Serpens Aquaticus".

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Hydra" for this constellation.

"Hydra" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a serpent slithering to our right with Crater and Corvus on its back.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Hydra" as a serpent slithering to our left with one coil and with Crater and Corvus on its back.

Robert Hues (1659) and John Chilmead (1899) listed "Alshugahh" and "Asuia": Hues translated this as "Strong or Furious".

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Hydra Aquaticus Alfagalh". It is depicted as a serpent with Crater and Corvus on his back.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Hydra as a snake with Crater and Corvus on its back.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Hydra" as a serpent with Crater and Corvus on its back.

Hydra is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 and depicted on his southern sky chart of 1678 as a dragon headed serpent with one coil with Crater and Corvus on its back.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Hydra" as a serpent swimming to our left with one coil and with Crater and Corvus on its back.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "l;Hdyre", "Hydrus (sic)" and "῾Υδρος"

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts Hydra as a snake with Crater and Corvus on its back.

Hydra is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a dragon headed serpent with one coil and with Corvus and Crater on its back.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Hydra" as a dragon headed snake slithering to our right with Crater and Corvus on its back.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Hydra as a serpent with one coil with Crater and Corvus on its back.

French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) listed it as "Asina" ("she ass").

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "L'Hydre" as a water snake.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "l'Hydre" as a snake with two coils with Corvus and Crater on its back.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Hydre femelle" as a snake with two coils with Crater and Corvus on its back.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Hydre" as a dragon headed snake with one coil with Crater and Corvus on its back.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Die grosse Wasserschlange" in the text and "Wasserschlange" on the charts, depicting it as a snake with a forked tongue whose body has one coil.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Idra" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Hydra" as a serpent with Crater on its back.

Hydra is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Slang" ("snake"): It is depicted as a snake slithering to our right with Crater and Corvus on its back.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Wasser Schlange".

American uranographer William Croswell (1760 – 1834) depicts “Hydra the Water Snake” on his *Mercator Map of the Starry Heavens* in 1810 as a snake.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Hydra it in his *Celestial Atlas* in 1822: it is depicted as a dragon headed serpent. NOTE: On one chart depicting the rear end of Hydra, Jamieson labels this “Hydra Continua” (“continuous Hydra”).

English Admiral Henry William Smyth writes in his *Bedford Catalogue* in 1844 that Bayer also used the name “Asina”.

“Hydra” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a snake with Crater and Corvus on its back slithering to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Hydra” as a three headed serpent with five coils slithering to our left.

Hydra is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

“Hydra” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a snake slithering to our right with Crater and Corvus on its back.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as “Hydra”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Hydra, The Sea Serpent” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Hydra, the Water-Serpent”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Hydra” in his *Star Atlas* (1893) and describes it as “The Hydra”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Hydra” and describes it as a “Snake”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Hydra”.

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists “Hydra (Sea Serpent or Monster”.

Hydra is depicted on standard IAU charts as a long cascade of stars. This starts at Hydra’s “head”, which is a pentagon of the stars Rho (ρ), Epsilon (ε), Delta (δ), Sigma (σ), and Eta (η) Hydrae. From Rho (ρ) Hydrae a long cascade of stars runs through Zeta (ζ) Hydrae, Theta (θ) Hydrae, Tau (τ) 1 and 2 Hydrae, Alpha (α) Hydrae (Alphard), Upsilon (υ) 1 and 2 Hydrae, Lambda (λ) Hydrae, Mu (μ) Hydrae, Nu (ν) Hydrae, Xi (ξ) Hydrae, Beta (β) Hydrae, and Psi (ψ) Hydrae, ending at Gamma (γ) Hydrae.

Sky and Telescope Magazine, founded in 1941, depicts Hydra in their magazine and publications in the same manner as standard IAU charts except that they tack on Pi (π) and 58 Hydrae to one end of the long winding line of stars.

The French call it "Hydre" and the Italians "Idra".

Medieval astronomers were interested in the "houses" in which the Sun rose or set as they indicated the month of the year. During the Middle Ages, the Sun rose and set in Hydra (at the tip of the tail) at the time of the Winter Solstice.

Hydra's Heart:

This Danish star "Cor Hydrae" is Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra as listed by Danish astronomer Tycho Brahe (1546 – 1601):

- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Cor Hydrae".
- Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius lists this star as "Cor Hydra".
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Cor Hydrae" on some charts and as "Cor Hydrae Alpharad" on others.
- English astronomer Edmund Halley's chart of 1678 lists "Cor Hydrae".
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Alphard Cor Hydrae".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Cor Hydrae".
- American uranographer William Croswell (1760 – 1834) uses the name "Cor Hydrae" for this star on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Cor Hydrae" for this star in his *Celestial Atlas* in 1822.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Cor Hydrae".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Cor Hydrae".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Cor Hydrae" and "Alphard".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Hydra's Heart" but incorrectly assumes this to be a translation of "Alphard".
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Cor Hydrae" for this star.

Hydra's Neck:

This Latin asterism "Collum Hydrae" is Alpha (α) Hydrae (Alphard) in the IAU constellation Hydra and was influenced by the Arabic asterism Neck of the Snake (see below).

Hydridurus:

This asterism “Hydridurus” or “Idrudurus” is the IAU constellation Aquarius.

- Johann Bayer’s *Uranometria* (1603) lists “Hydridurus” as a name for Aquarius.
- John Hill in his *Urania* in 1754 lists “Hydridurus” and attributes it to Appian of Alexandria
- R. H. Allen in his *Star Names* of 1899 attributes “Hydridurus” to Appian of Alexandria and writes that “Idrudurus” appears in the 1515 translation of the *Almagest*.

Hydrophobia:

This German asterism “Υδροφοβία” or “Ydrofovía” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by German astronomer Johann Bayer (1572-1625) and was related to the idea that summer heat caused madness.

Hydrus:

None of the stars of this constellation are brighter than 3rd magnitude and only show up in 16 asterisms in this handbook.

This IAU constellation (IAU abbreviation Hyi) “male water snake” was one of twelve constellations identified by the Flemish astronomer Petrus Plancius (1552 - 1622) based on the observations of Dutch navigator and uranographer Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627). De Houtman called it “De Waterslang” (“water snake”) and Petrus Plancius “Waterslange”. It is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a serpent labelled “Waterslange” with the subtitle “Hydrus”.

Dutch historian Paulus Merula (1558 – 1607) called this constellation “Waterslanghe” and “Hydrus Polaris”.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this as “Wasserslanghe” and “Hydrus”.

The 1551 edition of the *Almagest* lists it as “Hydrus” (“male water snake”).

Flemish cartographer Jodocus Hondius (1563 – 1612) called this constellation “Waterslange” and “Hydrus”.

Dutch uranographer Willem Blaeu (1571 – 1638) called this constellation “Hydrus”.

German astronomer Johann Bayer (1572 – 1625) depicts “Hydrus” in his *Uranometria* of 1603 as a serpent with two coils: Tucana and Pavo are standing on its back.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts only the front half of “Hydrus”.

“Hydrus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Bartsch also gives the local name “Wasser Schlange”.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Hydrus” for this constellation.

"Hydrus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a serpent with two coils.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Hydrus" as a long thin serpent with Tucana standing on its back.

Robert Hues lists it as the "water serpent" in his *A Learned Treatise of Globes* in 1659.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Hydrus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Hydrus" as a snake.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts Hydrus as a snake with Tucana standing on its back.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Hydrus as a water snake.

Hydrus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Hydrus" as a snake.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Hydrus" as a snake.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Hydrus as a snake with two coils.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels this constellation "L'Hydre", which is the same name he gives to Hydra, and depicts it as a snake with two coils, which is basically the same as Hydra as well.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Hydra" as a snake.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Hydre" as a water snake on the southern hemisphere chart and as "l'Hydre Male" on a later closeup chart.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "WAsserschlange" and depicts it as a snake.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Hydrus" as a snake.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Hydrus” as a snake.

Hydrus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Waterslang” (“water snake”) and is depicted as a snake.

American uranographer William Croswell (1760 – 1834) depicts Hydrus on his *Mercator Map of the Starry Heavens* in 1810 as a snake.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Hydrus in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts “Hydrus the Water Snake” as a snake.

“Hydrus” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Hydrus” as a snake.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Hydrus, The Water Snake” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Hydrus” and describes it as a “Watersnake”, incorrectly attributing it to Bayer.

The standard IAU charts show Hydrus as a bending line of stars starting at Alpha (α) Hydri and running through Delta (δ), Epsilon (ε), and Gamma (γ) Hydri to Beta (β) Hydri.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Hydrus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a triangle of the stars Alpha (α), Beta (β), and Gamma (γ) Hydri.

Sky and Telescope Magazine, founded in 1941, depicts Hydrus in their magazine and publications as a bent triangle of the stars Alpha (α) Hydri, Beta (β) Hydri, Gamma (γ) Hydri, and Delta (δ) Hydri.

The French call Hydrus “l’Hydre Mâle” and the Germans “der Kleine Wasserschlange”.

Hyena:

There are three Arabic asterisms with this name:

- One is the star “’aḍ-Ḍibaāʿ”, “’aḍ-Ḍibāʿ”, or “Adh-Dhibaa’e”, (الضّباع), which is the star Zeta (ζ) Draconis in the IAU constellation Draco. It is part of their asterism Two Hyenas (see below):
    - This was later latinized to “Aldhibhah”.
    - English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al dhibá” and “Al dhib”.
- One is the star “Al Dhini” or “adh-Dhikh” (الذّيخ) which is the star Iota (ι) Draconis in the IAU constellation Draco:
    - This was later latinized to “Edasich”, “Eldsich”, or “Ed Asich”.

    - This appears on a globe made by Mohammed ben Helal in 1275 in Mosul (Dorn 1829), based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "ed Asich": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - The IAU approved the name Edasich for Iota (ι) Draconis. This has an exoplanet named Hypatia after the Greek astronomer and philosopher.
- One is made up of stars of the IAU constellation Boötes. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as Beta (β) Boötis (Nekkar), Gamma (γ) Boötis, Delta (δ) Boötis, and Mu (μ) Boötis. This forms part of the Arabic asterism Hyenas and their Youngsters (see below).

Hyenas and Their Youngsters:

This Arabic asterism is a bent loop of stars of the IAU constellations Boötes, Corona Borealis, and Hercules: Starting at Zeta (ζ) Herculis it runs around through Eta (η) Herculis, Sigma (σ) Herculis, Tau (τ) Herculis, Theta (θ) Boötis, Kappa (κ) 1 and 2 Boötis, Lambda (λ) Boötis, Gamma (γ) Boötis, Omega (ω) Boötis, 45 Boötis, Eta (η) Coronae Borealis, HIP 76617, and Xi (ξ) Coronae Borealis. Compare this to Whelps of the Hyenas, below.

Hyena's Claws:

This Arabic star "al-'aẓfār al-dhi'b" (الأظفار الذئب), later latinized to "Adfar Aldib", is Omega (ω) Draconis in the IAU constellation Draco. It is part of their asterism Mother Camels (see below). This is a spectroscopic binary star, so the two stars have the names Adfar Aldib and Adfar Aldib I (though these names have not been approved by the IAU).

Hypentherian:

This "Coptic" asterism is the IAU constellation Aquarius as listed in John Hill's *Urania* in 1754.

Hyperborean of Cepheus:

This **telescopic** asterism "Hyperbóreus Céphei" is the intermediate spiral galaxy NGC 2276 (Arp 25) in the IAU constellation Cepheus. This was discovered by Friedrich August Theodor Winnecke in 1876. This became GC 5364 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named it for the Hyperboreans, who Pliny the Elder described as being in the extreme north.

Hypocyrrus:

This star is Alpha (α) Tauri in the IAU constellation Taurus as listed in John Hill's *Urania* in 1754. He does not identify the source.

Hyrieus:

This Greek asterism "Hyreides" is the IAU constellation Orion. In Greek mythology Hyrieus was son of the sea God Poseidon and the nymph Alycone. Hyrieus built the city of Hyria in Boeotia and as he was childless, was gifted the son Orion in a bull hide by Poseidon, Zeus, and Hermes. This is why the constellation Orion is often depicted as a man holding up a skin or hide.

- German astronomer Johann Bayer (1572-1625) listed it as “Hyriades” in his Uranometria (1603).
- John Hill lists it as “Hyrides” or “Hyriades” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Hyreides of the old astrologers”.

I-Hobe lika Nowa:

This Xhosa asterism (eastern cape, 1903) is the constellation Columba Noachi, which is now the IAU constellation Columba.

I-Nja encinane:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Canis Minor (Alcock 2014).

I-Nja ‘nkulu:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Canis Major (Alcock 2014).

I-Ntlanzi zase zantsi:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Piscis Austrinus (Alcock 2014).

I-Sikepe sika Ago:

This Xhosa asterism (eastern cape, 1903) is the ancient asterism Argo’s Ship (Alcock 2014).

I-Sitebe:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Ara (Alcock 2014).

I-Sitsaba sase zantsi:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Corona Australis (Alcock 2014).

I-Sitya:

This Xhosa asterism (eastern cape, 1903) is the IAU constellation Crater (Alcock 2014).

I Will Return to You:

This German asterism “Rediabeami” is the IAU constellation Scorpius as listed in the charts of the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Iaiapom:

This Netwar and Nahwal star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Ramík 2019).

Iasides:

This Greek asterism “Ιασίδαο” (“Iasídao”) is the IAU constellation Cepheus as listed by Aratus (315 – 240 B.C.E). The Iasides were the sons of Iaso, the Greek Goddess of recuperation from illness, whose sisters were Aceso, Aglaea, Hygieia, and Panacea. Johann Bayer’s *Uranometria* (1603) lists “Iasides” as an alternate name for Cepheus.

This Latin asterism “Iasides” is the IAU constellation Cepheus as described by the Roman general Germanicus (15 B.C.E. – 19 C.E.).

Ibis:

This asterism is the IAU constellation Cancer as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This "Ancient Zodiac of Egypt" also lists the name "Hermanubis" for this constellation (see Hermanubis, above). This depicts a seated man with the head of an ibis, which is how the Egyptian god Thoth is typically depicted. The stars of Cancer show up in the ancient Egyptian asterism Stars of Water (see below), and in later Seleucid skies as a crab, "NAGAR", neither of which is related to an Ibis or Anubis. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

An ibis appears next to the Greek asterism Water Carrier (see below) on the *Daressy Zodiac* of the Roman Imperial Period.

Ibex:

This Arabic asterism "Bādan" is the IAU constellation Capricornus as listed in R. H. Allen's *Star Names* in 1899.

This German asterism "Steinbock" is the IAU constellation Capricornus. Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Steinbock". "Steinbock" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826). See Capricornus, above.

Icarius:

This Greek asterism "Icarius" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. This relates to the myth of Icarius' dog Maera, who was turned into this star. Compare this to Erigonaeus, above.

This Greek asterism is the IAU constellation Boötes. In Greek mythology Icarius of Athens was carried into the sky to become Boötes and his daughter Erigone became Virgo.

Icarus:

This asterism is the IAU constellation Ursa Major as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638)

This asterism is the IAU constellation Boötes as listed by Johann Bayer's *Uranometria* (1603).

This **telescopic** star is MACS J1149 Lensed Star 1 in the IAU constellation Leo. It was discovered in 2018 by the Hubble Space Telescope. It was once on record as the most distant star, but it is now in 7th place and is approximately 14 billion light years away.

Icarus Star:

There are two Latin asterisms with the name "Icarium Astrum":

- One is the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by 1st century poet Roman poet Publius Papinus Statius.

- One is the IAU constellation Canis Minor as listed by Roman scholar Gaius Julius Hyginus (d. 17 C.E.).

Icarus' Ox:

This Latin asterism "Icarii Boves" is their asterism "Septem Triones" (see Seven Oxen, below) and was given to this asterism by the 1st century B.C.E. Roman poet Sextus Propertius.

Ice Axe:

There are two **telescopic** "ice axe" asterisms:

- One is in the IAU constellation Cassiopeia and is Corder 40 on the observing list of American astronomer Jeffrey Corder. A line of stars including HIP 894, 859, 838 and 855 form the "axe head" while the "shaft" runs from HIP 838 through a line of four 7th – 9th magnitude stars to HIP 1178 with the bottom of the shaft being Pearce's Star (see below), a double rotating variable star (HIP 1415). Size 70' X 30'.
- One is in the IAU constellation Hydra and is Ennis 73 on the observing list of Canadian astronomer Charles Ennis. Size 180' X 85'. The "axe" is a narrow triangle formed by four stars: Tau (τ) 2 Hydrae being the point of the "pick", the double star HIP 46504A being the top of the handle, and the stars HIP 46288 and 46273 the "blade" end. The handle runs from HIP 46504A through HIP 46529, Tau (τ) 1 Hydrae, and HIP 46522 ending at HIP 46543. This includes stars of Corder 1835 and 1836 on Jeffrey Corder's observing list.

Ice Blue:

This Middle Earth star "Helluin" was Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in the works of J. R. R. Tolkien (1892 – 1973).

Ice Cream Cone:

There are two **telescopic** "Ice Cream Cone" asterisms:

- One is NGC 6885 (Caldwell 37) in the IAU constellation Vulpecula. This was discovered by English astronomer William Herschel in 1785 and listed as "VIII 20". It is GC 4559 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as an upside-down ice cream cone 18 arcminutes tall.
- One is the globular cluster NGC 5139 (Caldwell 80) in the IAU constellation Centaurus. It is also known as "Omega Centauri" (see below) and the "Star in the Cloud on the Horse's Back" (see below), which was how it was described by Ptolemy (c.100 – c.170). . It is listed in the *General Catalogue* of 1864 as GC 3531 and in John Herschel's catalogue as h 3504. Astronomer Rui Henriques described it thus in his observations in 1997: "Stars in field form a cone pointing to the north east- overall appearance of an ice cream cone". It is also known as the Snowball (see below).

Ichthion:

This asterism is the IAU constellation Pisces as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a mermaid with a male figure in the palm of her left hand and a bent stick in her

right hand and also gives the name “Dagon” (see Dagon, above). Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. The stars of the constellation Pisces did not appear in any ancient Egyptian asterism and its stars appeared in the Seleucid asterisms “Tails” (see below) and “Swallow” (see below). There was an ancient Egyptian decan “Ker-khept-sert” in the IAU constellation Aquarius, which appears in the Testament of Solomon as “Ichthion”. Dagon was an ancient Syrian God of prosperity, and appears in Syrian skies (see Dagon, below).

Icy Maidens:

This Adnyamathanha asterism “Makara” is the Pleiades cluster in the IAU constellation Taurus (Kieneswenger 2016).

Igloo:

This **telescopic** asterism is the open cluster NGC 225 in the IAU constellation Cassiopeia. This was discovered by English astronomer William Herschel in 1788. It is listed as GC 120 in the *General Catalogue* of 1864. American astronomer Wayne Schmidt gave it this name. It is also known as the Sailboat (see below), “W” (see below), and the Broken Heart (see above).

Ignitabulum:

This Latin asterism “Ignitabulum” is the IAU constellation Ara.

- Johann Bayer’s *Uranometria* (1603) lists “Ignatabulum”.
- “Ignatabulum” is listed in John Hill’s *Urania* in 1754. Hill attributes this to “old Latin writers”.
- Other Latin names for hearth also applied to this constellation include “Focus” (see above) and “Hearth” (See above).

Iguana:

This Carib asterism “Wayamakuyuman” or “Wayamaku” represents the iguana (Iguana turbercuata) which lays eggs in the sand in August. Its present location is unknown (Magaña, and Jara, 1982).

Iklil:

See Crown of the Forehead, above.

Ilabrat:

This Chaldean asterism “mul i-li-ab-[rat] is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Illyrian:

This Albanian star is HIP 47087 (HD 82886) in the IAU constellation Leo Minor and was given this name in the IAU NameExoWorlds campaign. It is named for the Illyrians, the people the Albanians are descended from. It has an exoplanet named Arber, which is a Medieval name for the inhabitants of Albania.

I’m Wearing:

This Arabic star “Meboula”(مبلي) is Epsilon (ε) Geminorum in the IAU constellation Gemini.

Imai:

This Mursi star “Imai” is Delta (δ) Crucis in the IAU constellation Crux. This name refers to a type of grass that grows along the banks of the Omo River. They used the star as part of their calendar to determine the flooding season. The IAU approved the name Mursi for Delta (δ) Crucis in 2018. The other three stars that they used in this system were Sholbi (see below), Thaadoi (see below), and Waar (see below).

Imbal’ubusuku:

This Xhosa star “Imbal’ubusuku” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Holbrook and Baleisis 2007).

Imhotep:

This Egyptian Dendera asterism is made up of stars of the IAU constellations Hercules, Lyra, Ophiuchus, and Serpens (Hoffman 2017) and is in the area of the sky where the Babylonian/Seleucid asterism Zababa (see below) was located. It is depicted at Dendera as a seated purple figure holding a staff. Imhotep was a historical physician who became deified. This is a large triangular asterism with Alpha (α) Lyrae (Vega) at the apex with one side running down through Alpha (α) Ophiuchi (Rasalhague) to Zeta (ζ) Ophiuchi, and the other running down through Beta (β) Herculis (Kornephoros) to Alpha (α) Serpentis (Unukalhai). From Zeta (ζ) Ophiuchi a line runs out through Eta (η) Ophiuchi to Xi (ξ) Serpentis. From Alpha (α) Serpentis (Unukalhai) a line runs out through Delta (δ) Serpentis to Beta (β) Serpentis (Nasak Shamiya).

Imitator of Horologium:

This **telescopic** asterism “Mimélus Horológii” is the spiral galaxy IC 1949 in the IAU constellation Horologium. It was discovered by American astronomer DeLisle Stewart in 1899. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “sems to be imitated… by the identical looking ESO200-32 [which] is approximately of equal size but is situated at double distance.”

Immovable:

This Vedic star “Dhruva” (“immovable” or “fixed”) from the *Puranas* is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Vahia 2014, Leitz 2019). Dhruva was the son of king Uttānapāda and his wife Suniti (or Sunrita). Between 4000 and 1900 B.C.E. this would probably have been Alpha (α) Draconis (Thuban) as listed in older Vedic texts.

Immovable of Ursa Major:

This **telescopic** asterism “Immóbilis Úrsae Majóris” is the peculiar dwarf galaxy NGC 2976 in the IAU constellation Ursa Major. It was discovered in 1801 by William Herschel who listed it as “I 285”. It became GC 1905 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “the redshift of this galaxy is almost zero”.

Imperfect of Coma Berenices:

This **telescopic** asterism "Áteles Cómae Bereníces" is the intermediate spiral galaxy NGC 4189 in the IAU constellation Coma Berenices. It was discovered in 1784 by William Herschel who listed it as II 106". It became GC 2783 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called it this because "the spiral arms of this galaxy are fragmented, and the overall structure is rather asymmetric".

Imperial City:

This Chinese xing guan represents the Daming Palace in Chang'an, the capital city of China during the Tang Dynasty (618 – 907). It includes stars of the IAU constellations Boötes, Ursa Major and Leo. One "wall" is the line of stars starting at Alpha (α) Ursae Majoris (Dubhe) and running through Delta (δ) Ursae Majoris (Megrez), Epsilon (ε) Ursae Majoris (Alioth), Zeta (ζ) Ursae Majoris (Mizar), Eta (η) Ursae Majoris (Alkaid) and ending at Alpha (α) Boötis (Arcturus). It then runs back through a bending line to Alpha (α) Leonis (Regulus), then back up through Beta (β) Ursae Majoris (Merak) to Dubhe.

Imperial Concubine:

There are three Chinese xing guans from the Three Kingdoms to the Ming Dynasty with the name "Pin" in the IAU constellation Scorpius and all are part of their asterism Tail (see below):

- One is the star Theta (θ) Scorpii.
- One is the star Iota (ι) 2 Scorpii.
- One is the star Kappa (κ) Scorpii.

Imperial Consort:

There are four Chinese xing guans from the Three Kingdoms to the Ming Dynasty with the name "Fei" in the IAU constellation Scorpius and the first three are part of their asterism Tail (see below):

- One is the star Mu (μ) 1 Scorpii.
- One is the stars Zeta (ζ) 1 and 2 Scorpii.
- One is the star Eta (η) Scorpii.
- One the star Gamma (γ) 1 Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

Imperial Guards:

This Chinese xing guan Qíguān (骑官) is a twisting line of stars in the IAU constellations Lupus and Centaurus: Starting at Gamma (γ) Lupi, it winds through Delta (δ) Lupi, Kappa (κ) Centauri, Beta (β), Gamma (γ), Epsilon (ε), Mu (μ), Eta (η), and Omicron (ο) Lupi, ending at Alpha (α) Lupi.

This Chinese xing guan from the 3 Kingdoms and Ming Dynasty is nine lines of stars in the IAU constellations Centaurus and Lupus:

- One is f, i, and HZ Lupi,
- One is c1 Centauri and HIP 72959 and 73559,
- One is b Centauri and HIP 72432 and 72800,
- One is Phi (φ) 1 and 2 Lupi and HIP 75647,
- One is k, Delta (δ) and Gamma (γ) Lupi,
- One is Kappa (κ) Centauri, Beta (β) Lupi, and Omicron (ο) Lupi,
- One is Omega (ω), g, and d Lupi,
- One is Epsilon (ε), Lambda (λ), and n Lupi, and
- One is Nu (ν) 1 Lupi, Mu (μ) Lupi, and HIP 75828.

This complex Chinese Chenzhuo xing guan is made up of stars in the IAU constellations Centaurus, Lupus, and Norma: There is a central ragged oval of stars having multiple branches coming off:

- The central "oval" starts at Delta (δ) Lupi and runs through HIP 75501, Phi (φ) 1 & 2 Lupi, HIP 73624, 73049, 72010, 72432, 72800, and 71865, and Kappa (κ) Centauri.
- From Kappa (κ) Centauri a bending line runs through Beta (β) and Omicron (ο) Lupi to Gamma (γ) Lupi. From Gamma (γ) Lupi three lines emerge:
    - One to Kappa (κ) Lupi,
    - One to HIP 73111A, and
    - One through Pi (π) Lupi to Zeta (ζ) Lupi.
- From Delta (δ) Lupi a line runs to Omega (ω) Lupi. From Omega (ω) Lupi:
    - One line runs through HIP 76939 to Psi (ψ) 1 & 2 Lupi, and
    - One line runs to HIP 76829, where it splits in two:
        - One line running to Delta (δ) Normae, and
        - One line running to HIP 75828.
- From HIP 73624 two lines run out:
    - One to HIP 73937, and
    - One through 1 Lupi to 2 Lupi.

This Chinese star "Ke Kwan" is Kappa (κ) Centauri in the IAU constellation Centaurus.

This Chinese star "KeKouan" is Beta (β) Lupi in the IAU constellation Lupus. The IAU is considering the name "Kekouan" for this star.

Imperial Military Flag:

This Chinese xing guan "Jiǔyóu" (九斿) is a line of stars in the IAU constellations Eridanus and Lepus: It starts at 49 Eridani and runs through Mu (μ), Omega (ω), 63, 60, and 58 Eridani to 54 Eridani, where it bends and runs to an end at 1 Leporis.

This Chinese Chenzhuo xing guan "Jiǔyóu" is a winding line of stars in the IAU constellations Eridanus and Lepus: HIP 21743, HIP 23362, HIP 22860, HIP 22881, HIP 23060, 64 Eridani, 63 Eridani, 56 Eridani, and 46 Eridani.

Imperial Passageway:

This Chinese xing guan Niǎndào (辇道) is a line of stars in the IAU constellations Cygnus and Lyra: 13, Eta (η), and Theta (θ) Lyrae, and 4 and 17 Cygni. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Niǎndào" is a line of five stars in the IAU constellations Cygnus and Lyra: 13 Lyrae, Eta (η) Lyrae, Theta (θ) Lyrae, 4 Cygni, and 8 Cygni.

Imperial Pomp:

See Leopold's Orb.

Imperishable Star:

This Egyptian star from the *Pyramid Texts* is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Abdel-Hadi and Yehia, 2009).

Imperishable Stars:

This Egyptian asterism is the northern circumpolar stars (Krupp 1983). They are called this because they never set.

Impetuous of Fornax:

This **telescopic** asterism "Férox Fornácis" is the barred spiral galaxy NGC 1385 in the IAU constellation Fornax. It was discovered by William Herschel in 1784. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Impetuous of Sextans:

This **telescopic** asterism "Véhemens Sextántis" is the interacting galaxy NGC 3166 in the IAU constellation Sextans, which is interacting with NGC 3169. This was discovered by English astronomer William Herschel in 1787 who listed it as "I 163" in his catalogue. It is GC 2008 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). These two galaxies are also known as the "Galactic Couple" (see above).

Imprint of a Foot:

This **telescopic** asterism PGC 44491 is a galaxy in the IAU constellation Virgo.

In the Manzil Awwa:

This Arabic star "min al-ʿawwā'" (من العواء), which means "in the manzil 'awwa" is the star Delta (δ) Virginis in the IAU constellation Virgo:

- This was later latinized to "Minelauva", "Minelava", or "Auva".
- The IAU approved the name Minelauva for Delta (δ) Virginis. The manzil being referred to here is Howling Dogs (see above).

In the Middle of Grus:

This **telescopic** asterism "Medióximus Grúis" is the spiral galaxy NGC 7582 in the IAU constellation Grus. This was discovered in 1836 by John Herschel who listed it as h 3978 and later as GC 4927 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy is located in the middle of the Grus Quartet."

Inachides:

This Greek asterism "Inachides" is the IAU constellation Perseus and relates to the great grandfather of Perseus, the first king of Argos:

- Johann Bayer's *Uranometria* (1603) lists "Inachides" for this constellation.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Inachides" as an alternate name for Perseus.
- "Inachides" is listed in R. H. Allen's *Star Names* in 1899

Inactive:

This Gaulish asterism "Anaganti Prinnios" is the IAU constellation Aquarius and appears in the *Coligny Calendar* (Boutet 2001, 2014). Boutet notes that "Anaganti" ("inactive") is a pun with "Anacantios" ("calamitous").

Incalculable:

This Chaldean star "mul la sid.mes" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Incense Altar:

This Greek asterism "Ara Thymiamatis" is the IAU constellation Ara. Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675.

Incense Burner:

This Greek asterism "Θυτήριον" or "thytírion" is the IAU constellation Ara as named by Aratus (315 – 240 B.C.E).

Incense Pan:

This Greek asterism "Batillus" is the IAU constellation Ara. Johann Bayer's *Uranometria* (1603) lists "Batillus" for this constellation.

Inchworm:

There are two **telescopic** "inchworm" asterisms:

- One is the open cluster NGC 6910 in the IAU constellation Cygnus. This open cluster was discovered by William Herschel in 1786 who listed it as "VIII 56". His son John Herschel listed it as h 2077 in 1828. It is GC 4575 in the *General Catalogue* of 1864. It is also known as the Rocking Horse Cluster. It is located a half degree east-northeast of Gamma (γ) Cygni (Sadr) and may be related to the nebula IC 1318 (the Gamma Cygni Nebula). At low magnification it looks like a crescent between two brighter stars. NOTE: IC 1318 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923) and Dreyer's *Index Catalogue of Nebulae* (1888 – 1894) describes it as "γ Cygni, surrounded by L patches of F neby".
- One is in the IAU constellation Lynx. One end is the star UX Lyncis and then runs through a line of four stars between magnitude 7.8 and 9.3 and then loops through HIP 44700, 44728, and 44707, runs straight through two more magnitude 9 stars and ends at HIP 44794.

Inclined of Perseus:

This **telescopic** asterism "Inclináta Pérsei" is the intermediate barred spiral galaxies NGC 1186 and 1174 in the IAU constellation Perseus. NGC 1186 was discovered in 1786 by William Herschel and listed as "IV 43": It became GC 639 in the *General Catalogue* of 1864. NGC 1174 was discovered by American astronomer Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies*

by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as they were inclined at 70° to the line of sight.

Inconspicuous of Cetus:

This **telescopic** asterism "Inconspícuus Céti" is the unbarred spiral galaxy NGC 173 in the IAU constellation Cetus. This is III 871 in William Herschel's catalogue and GC 84 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as they describe it as "rather inconspicuous".

Incomplete House Stars:

This Bugis asterism "Bintoéng Bola Képpang" is the IAU constellation Crux.

Increase:

This Kiribati asterism "Kama Iti" ("increase" or "multiplier") is made up of some of the stars of the IAU constellation Draco (Trussel and Groves 1978).

Incredible Shrinking Nebula:

This **telescopic** asterism is the planetary nebula NGC 6804 in the IAU constellation Aquila. This was discovered by English astronomer William Herschel in 1791 who listed it as "VI 38". It is GC 4499 in the *General Catalogue* of 1864. It is also known as the Snowball Nebula and Lipstick Marks on a Mirror.

Incubus of Pavo:

This **telescopic** asterism "Íncubus Pavónis" is the interacting barred spiral galaxy NGC 6770 in the IAU constellation Pavo. It was discovered in 1836 by John Herschel who listed it as h 3784 and later as GC 4477 in his *General Catalogue* of 1864. This galaxy is interacting with NGC 6769. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is one of the "eyes" of the Devil's Mask (see above).

Indian Bird:

This asterism "Apus Indica" is the IAU constellation Antlia as listed in an abridged edition (1720) of German astronomer Johann Bayer's *Uranometria,* which was originally published in 1603. John Hill lists this as "Avis Indica" in his *Urania* in 1754 . Hill gives the additional name "Avis Paradisiaca" (see Heavenly Bird, above). Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Apus Indica" in his *Celestial Atlas* in 1822.

Indian Crab:

This Latin asterism "Crabro Indicus" is the IAU constellation Musca as listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675

Indian Hornet:

This asterism "Crabro Indicus" is listed in John Hill's *Urania* in 1754. Hill lists it as "the constellation Apis, the Bee, or, as others call it, the Fly, Musca". Of course, the IAU constellations Apus and Musca are two different constellations side by side in the southern sky. Edward Sherburne lists "Crabro Indicus" as Apus in his *Sphere of Marcus Manilius* in 1675.

Indian Magpie:

This German asterism "Pica Indica" is the IAU constellation Tucana. German poet and author Philippus Caesius (Philipp von Zesen, 1619 – 1689) gave it this name and it is clearly a reference to the star catalogue of Dutch navigator Frederick de Houtman (1571 – 1627) where de Houtman referred to it as an "Indian magpie" (see Tucana below). Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists "Pica Indica" and depicts it as a bird with a long bill. Edward Sherburne also lists "Pica Brasilica seu Indica" ("Brazilian or Indian Magpie") in his *Sphere of Marcus Manilius* in 1675.

Indian Triangle:

See Indus, below.

Indifferent of Pisces:

This **telescopic** asterism "Léntus Píscium" is the barred spiral galaxy NGC 7541 in the IAU constellation Pisces. This was discovered in 1785 by William Herschel who listed it as "II 430". It became GC 4909 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 7541 forms a physical pair with NGC 7537 [II 429, GC 4906], although neither of them shows any sign of distortion. It looks as if they are indifferent to each other."

Indistinct Branches of Camelopardalis:

This **telescopic** asterism "Acritobráchius Camelopardális" is the spiral galaxy IC 356 (Arp 213) in the IAU constellation Camelopardalis. This was observed by British astronomer William Frederick Denning (1848 – 1931) and American astronomer Edward Emerson Barnard (1857 – 1923). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the spiral arms of this galaxy are rather vague and indistinct".

Indubanna:

This Babylonian asterism "MUL.IN.DUB.AN.NA" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Sagittarius. Its meaning is uncertain.

This Akkadian asterism "Indubanna" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Sagittarius. Its meaning is uncertain.

Indus:

None of the stars of this constellation are brighter than 3rd magnitude and only show up in 31 asterisms in this handbook.

This IAU constellation (IAU abbreviation Ind), "the Indian", was one of twelve constellations identified by the Flemish astronomer Petrus Plancius (1495 – 1552) based on the observations of Dutch navigator and uranographer Pieter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627): De Houtman listed it as "De Indianen". Plancius' celestial globe (late 1597) published by Amsterdam cartographer Jodocus Hondius the Elder depicts Indus.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Indus as a male striding to our right brandishing a spear in his right hand and having three more spears tucked under his left arm.

Flemish cartographer Jodocus Hondius (1563 – 1612) included it on his globes (1598 – 1603) as "Indiaen" and "Indus" and depicts it as a male in a loin cloth brandishing a spear in his right hand and holding three more spears in his left hand at his side.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Indus" as a male in a loin cloth holding up an arrow in his right hand and holding three more arrows in his left hand.

German uranographer Johann Bayer (1572 – 1625) listed it as "Indus" in his *Uranometria* of 1603. He depicts it as a man turned slightly to our right holding a spear aloft in his left hand and carrying three more spears in his right hand.

"Indus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Indus" for this constellation.

German astronomer and uranographer Johann Bayer (1572-1625) depicts Indus in his *Uranometria* in 1603 as a male holding aloft a spear in his left hand and carrying three more at his waist in his right hand.

"Indus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a male in a skirt holding up an arrow in his left hand with three more arrows tucked under his right arm.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Indus" as a nude male partially turned to our left. He has a spear raised in his right hand and three more spears tucked under his left arm.

Robert Hues listed Indus as "the naked Indian" in his *A Learned Treatise of Globes* in 1659.

Indus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 which depicts a dark-skinned male brandishing a spear in his right hand and carrying arrows in his left.

Edward Sherburne lists Indus in his Sphere of Marcus Manilius in 1675 but also gives the name "Sagittifer" ("carrying arrows"), which is most often associated with Sagittarius (see below).

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Indus as a black male holding an arrow in his right hand and cradling three more arrows in his left arm.

English astronomer Edmund Halley's chart of 1678 depicts Indus as a male brandishing an arrow in his left hand with three more arrows bundled under his right arm.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) includes this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Indus" as a female in a grass skirt holding up an arrow

in her right hand and cradling another arrow in her left arm on one chart and cradling three arrows on two other chart pages. Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Indus" as a female in a grass skirt holding up an arrow in her left hand and cradling three more arrows in her right arm. Hevelius shows it as a triangle of the stars Alpha (α), Beta (β), and Theta (θ) Indi.

French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) lists this constellation as "Triangle Indien" ("Indian Triangle") due to the outline of its chief stars.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "L'Indien", "Indus" and "Ινδός" and depicts. He is holding up an arrow in his right hand.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Indus" as a male with a feathered headdress with a spear in his left hand and three arrows under his right arm.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Indus as a nude male holding aloft and arrow in his left hand and cradling three more arrows under his left arm.

Indus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a naked male holding an arrow in his left hand and cradling three more arrows with his right arm.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Indus" as a male in a grass skirt facing to our right holding an arrow in his left hand and cradling three more arrows with his right arm.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Indus" as a male with a feathered headdress with an arrow in his left hand and cradling three more arrows with his left arm.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Indus as a male holding aloft an arrow in his right hand and cradling three more arrows in his left arm.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Indus as a nude male viewed from behind. He has an arrow raised in his right hand and has three more arrows tucked under his left arm.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "L'Indien" as a male facing away from us holding aloft an arrow in his right hand with three more arrows in his left hand.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "l'Indien" as a male holding aloft an arrow in his left hand with three more arrows cradled under his right arm.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Indus" as a male in a grass skirt holding aloft an arrow in his right hand and cradling three more arrows with his left arm.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Indien" as a male facing us with an arrow raised in his left

hand and three more arrows cradled in his right arm. In a later closeup chart he is depicted with a grass skirt holding aloft and arrow in his RIGHT hand and holding three more arrows in his LEFT hand.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts Indus as a male wearing a loin cloth brandishing a spear in his right hand and holding three more spears in his left hand.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Indianer" and depicts it as a nude male holding aloft an arrow in his left hand and cradling three more arrows in his right arm.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Indus" as a male in a grass skirt holding aloft an arrow in his right hand and cradling a bundle of arrows with his left arm.

Indus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Indiaan" and is depicted as a male facing slightly to our right holding up an arrow in his left hand and cradling three more arrows under his right arm.

American uranographer William Croswell (1760 – 1834) depicts "Indus the Indian" on his *Mercator Map of the Starry Heavens* in 1810 as a male in a grass skirt holding an arrow up in his right hand and wearing a quiver of arrows on his left hip.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Indus" in his *Celestial Atlas* in 1822: It is depicted as a male holding an arrow with a quiver over his shoulder.

"Indus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Indus" as a male in a grass skirt and triple ponytail brandishing an arrow over his head with his right hand and having his left hand behind him.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on the charts simply as "Indian".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Indus, the Indian" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Indus" and describes it as the "Indian", incorrectly attributing it to Bayer.

Italian astronomers "Indiano" and French astronomers "Indien".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Indus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows Indus as the triangle of stars Alpha (α) Indi (Persian), Eta (η) Indi, Beta (β) Indi, and Theta (θ) Indi. Rey makes a triangle of the stars Epsilon (ε) Indi, Delta (δ) Indi, and Beta (β) Indi, with a line running from this last star to Alpha (α) Indi. *Sky and Telescope Magazine*, founded in 1941, depicts Lacerta in their magazine and publications in the same manner as Reyersbach.

Sky and Telescope Magazine, founded in 1941, depicts Indus in their magazine and publications as a bent triangle of the stars Delta (δ) Indi, Theta (θ) Indi, Alpha (α) Indi, Eta (η) Indi, and Beta (β) Indi.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Indus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a "T" shaped constellation of Delta (δ), Theta (θ), Alpha (α), and Beta (β) Indi.

Indus Triplet:

This telescopic asterism is found in the IAU constellation Indus and was discovered by John Herschel in 1834. It consists of:

- The lenticular galaxy NGC 7041,
- The lenticular galaxy NGC 7049, and
- The elliptical galaxy NGC 7029.

Ingá Fruit Egret:

This Barasana asterism "Mene Yehe" is part of the IAU constellation Cassiopeia (Hugh-Jones 2006).

Ingaba:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing a brother and is part of their asterism "Murabibi" (see Teenagers and Little Ones, below).

Ingenious:

This asterism is the IAU constellation Hercules:

- 1st century Roman architect Vitruvius called it "Ingeniculatus" ("ingenuated"),
- 4th century Roman astrologer Julius Firmicus Maternus called it "Ingeniculus" ("ingenious"),
- 1st century Roman poet Marcus Manilius called it "Ingenicla Imago" ("ingenious image") and "Ignota Facies" ("you will face the unknown").
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Qui et In geniculo dictur" ("Who is also called In geniculus") as does Kauffmann's translation of the *De ordine ac positione stellarum in signis* in 1888.
- The *Aratus Latinus* lists "Ingeniculo… quod in genu laborat" ("Ingenius… that's working on his knee").
- Ingeniculus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- French astronomer Ismaël Boulliau (Ismaël Bullialdus, 1605 – 1694) listed "Ingeniclus" ("Ingenous").

Ingongoli:

This Xhosa star "Ingongoli" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Holbrook and Baleisis 2007).

Ingswagen:

This asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Bender 2020). This may be related to traditions of a Danish king Ing (Davidson 1993) or the Swedish god Ingvi, representing fruitfulness and life force, both related to the Gods Freyr and Freyja who ride in a cart drawn by cows.

Ingula:

This asterism is the IAU constellation Hercules as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Injured of Camelopardalis:

This **telescopic** asterism "Saúcius Camelopardális" is the barred spiral galaxy NGC 2146 in the IAU constellation Camelopardalis. It was discovered by Friedrich August Theodor Winnecke in 1876. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the "Dusty Hand" (see above).

Ink Spot Nebula:

This **telescopic** asterism is dark nebula is Barnard 86 in the IAU constellation Ophiuchus. This is also known as Herschel's Hole in the Heavens and the Gecko (see above). Astronomer Edward Barnard recorded it in 1884 as "a drop of ink" in the German professional astronomy periodical *Astronomical Nachtrichten.*

Inner Five Lords:

This Chinese Chenzhuo xing guan is a line of five stars in the IAU constellation Coma Berenices: Beta (β) Comae Berenices, 35 Comae Berenices, 24 Comae Berenices, 11 Comae Berenices, and 6 Comae Berenices.

Inner Kitchen:

This Chinese xing guan Nèichú (内厨) is a line of two stars in the IAU constellation Draco: 7 and 8 Draconis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Nèichú" is a line of two stars of the IAU constellation Ursa Major: HIP 52338 and 50685.

Inner Pestle:

This Chinese Chenzhuo xing guan is a line of three stars in the IAU constellations Lacerta and Pegasus: Pi (π) Pegasi, HIP 109654, and 1 Lacertae.

This Korean asterism "Naebu Yubong" (내부 유봉) is a line of two stars in the IAU constellations Lacerta and Pegasus: 1 Lacertae and Eta (η) Pegasi. Nearby is the Korean asterism "Mortar" (see below).

Inner Screen:

This Chinese xing guan Nèipíng (内屏) is a quadrilateral of stars in the IAU constellation Virgo: Xi (ξ), Nu (ν), n, and Omicron (o) Virginis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Nèipíng” is four stars in the IAU constellation Virgo: Omicron (ο) Virginis, Pi (π) Virginis, Nu (ν) Virginis, and Xi (ξ) Virginis.

Inner Seats of Nine Senior Officers:

This Chinese Chenzhuo xing guan is a line of three stars in the IAU constellation Coma Berenices: 27, 32, and 36 Comae Berenices.

Inner Seats of the Five Emperors:

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Cepheus and Draco: The central star is Kappa (κ) Cephei, from which four lines run out:

- One runs to 73 Draconis,
- One runs to 59 Draconis,
- One runs to HIP 95167, and
- One runs to 77 Draconis.

Inner Seats of Three Excellencies:

This Chinese Chenzhuo xing guan is a triangle of stars in the IAU constellation Virgo: Rho (ρ) Virginis, 33 Virginis, and 32 Virginis.

Inner Stairway:

This Korean asterism “Naebu Gyedan” (내부 계단) is a zig-zagging line that resembles a very regularly spaced set of stairs in the IAU constellation Ursa Major:

- The “top step” is the stars HIP 47594 and 24 Ursae Majoris,
- The “middle step” is the stars Sigma 2 and Rho (ρ) Ursae Majoris, and
- The “bottom step” is the stars 2 and 4 Ursae Majoris.

Inner Steps:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is two interlocking triangles of stars in the IAU constellations Camelopardalis and Ursa Major:

- The first triangle is the stars 4 Ursae Majoris (the determinative star), 55 Camelopardalis, and HIP 36211,
- The second triangle is the stars Rho (ρ) Ursae Majoris, 51 Camelopardalis, and HIP 36528.

This Chinese xing guan “Nèijiē” (内阶) is two interlocking triangles of stars in the IAU constellation Ursa Major:

- The first triangle is the stars Omicron (ο), 16, and 6 Ursae Majoris, and
- The second triangle is the stars 23, 5, and 17 23 Ursae Majoris.

This Chinese Chenzhuo xing guan “Nèijiē” (内阶) is a zig-zagging line of stars in the IAU constellation Ursa Major: HIP 47594, 24 Ursae Majoris, Sigma (σ) 1 & 2 Ursae Majoris, Rho (ρ) Ursae Majoris, Pi (π) 1 & 2 Ursae Majoris, and 2 Ursae Majoris.

Innes’ Star:

This **telescopic** star is HIP 55042 (HD 304043) in the IAU constellation Carina (magnitude 11.52). This is an M3.5 red dwarf star discovered by Scottish astronomer Robert T.A. Innes in 1920 in observations made from the Union Observatory in South Africa. Innes is the astronomer who discovered Proxima Centauri.

Innocent Maiden:

This Arabic asterism "Al ʿAdhrāʾ al Naṭhīfah" is the IAU constellation Virgo:

- Persian astronomer Abu Ma'shar (Albumasar- 787 – 886) listed it as "Adrenedesa".
- Johann Bayer's *Uranometria* (1603) lists "Eladari" and "Adrenedesa" as names for Virgo.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Eladari".
- Robert Hues listed it as "Eladari" in his *A Learned Treatise of Globes* in 1659.
- Edward Sherburne in his *Sphere of Marcus Manilius* in 1675 lists "Adra" and "Adrenedepha" as names for Virgo.
- John Hill listed it as "Adra" in his *Urania* in 1754 and listed the alternative name "Adrenedepha".
- Variations include "Eleadari" and "Adrendesa".

Innocents Slain by Herod:

This German asterism "Sainted Innocent Children" or "Innocents Slain by Herod" is the IAU constellation Draco and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. S. Innocentes al Draco". It appears in Edward Sherburne's Sphere of Marcus Manilius in 1675 as "Innocents" and later appears in John Hill's *Urania* in 1754 as "Innocents Slain by Herod".

iNoqoyi:

This Zulu star "iNoqoyi" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Holbrook and Baleisis 2007).

Inqiull:

This Peruvian star is HIP 84787 (HD 156411) in the IAU constellation Ara and was given this name in the IAU NameExoWorlds campaign. It is named for a character in Abraham Valdelomar's *Way to the Sun*. It has an exoplanet named Sumajmajta: Sumaj Majta was one half of the couple in this love story.

Inside of Antlia:

This **telescopic** asterism "Introvérsus Ántliae" is the spiral galaxy NGC 3175 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3236 and later as GC 2046 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to "inner activity as well as… the introverted appearance".

Insistence:

This Latin asterism “Institia” is the IAU constellation Virgo as listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638)

Intact of Leo:

This **telescopic** asterism “Intáctus Leónis” is the intermediate spiral galaxy NGC 3041 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “II 98”. It became GC 1956 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “this perfect, unperturbed spiral galaxy is intact.”

Integral Sign:

This **telescopic** asterism PGC 20348 (UGC 3697) is a low-mass spiral galaxy in the IAU constellation Camelopardalis. It was discovered by astronomer Geoffrey Burbidge in the Palomar Observatory Sky Survey. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Integrális Camelopardális” (“Integral Sign of Camelopardalis”). This name was posted on the *Deep Sky Forum* in January 2013 by American astronomer Jimi Lowrey.

Intercrus:

See Between the Legs (above).

Intergalactic Wanderer:

This **telescopic** asterism is globular cluster, the “Intergalactic Wanderer” or “Intergalactic Tramp” is NGC 2419 (Caldwell 25) in the IAU constellation Lynx. Size 6’ X 6’. It was discovered by English astronomer William Herschel in 1788, who listed it as “I 218” in his catalogue. It is GC 1548 in the General Catalogue of 1864. English astronomer William Parsons, 3rd Earl of Rosse first identified it as a globular cluster in the mid-1800s and believed it to not be in orbit around the Milky Way, which explains this name.

Interior Seats of the Five Emperors:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a cross of stars in the IAU constellation Cepheus: The central (and determinative) star is HIP 112519 and from this star four lines run out:

- One to HIP 113116,
- One to HIP 108456A,
- One to HIP 110724, and
- One to V Cephei.

This Chinese xing guan “WŭdìnèiZuò” (五帝内座） is a cross of stars in the IAU constellation Cassiopeia. The central star is HIP 14417A. The four stars around it forming the cross are 47 Cassiopeiae and HIP 15547, 19461A, and 13055.

Interposed of Coma Berenices:

This **telescopic** asterism “Rubélla Cómae Bereníces” is the barred lenticular galaxy NGC 4477 in the IAU constellation Coma Berenices. It was discovered by Heinrich d’Arrest in 1865. William Herschel listed it as “II 116”. It became GC 3029 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it

this because “two broad diffuse arms extend from the disk of this galaxy, giving it the appearance of being put between brackets”. It is part of Markarian’s Chain (see above).

Interpreters of Nine Dialects:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Eridanus: It starts at the determinative star Omicron (o) 2 Eridani and runs through 39 Eridani, DU Eridani, HIP 21239A, HIP 21297, 47 Eridani, 46 Eridani, Xi (ξ) Eridani, and HIP 19996.

This Chinese xing guan “Jiǔzhōushūkǒu” (九州殊口) is a curve of stars in the IAU constellation Eridanus: 39, Omicron (o) 1, Xi (ξ), Nu (η), 56, and 55 Eridani.

This Chinese Chenzhuo xing guan “Jiǔzhōushūkǒu” is a bent oval of stars in the IAU constellation Eridanus: 53 Eridani, HIP 20922, HIP 20892, 54 Eridani, HIP 22028, 58 Eridani, 60 Eridani, HIP 22439, and HIP 21644.

Inthronata:

This asterism is the IAU constellation Cassiopeia as listed in R. H. Allen’s *Star Names* in 1899. Allen attributes this name to English orientalist Thomas Hyde (1636 – 1703).

Intricate of Canes Venatici:

This **telescopic** asterism “Intricátus Cánum Venaticórum” is the spiral galaxy NGC 5033 in the IAU constellation Canes Venatici. This was discovered by English astronomer William Herschel in 1785 who listed it as “I 97”. It is GC 3459 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the “Waterbug” (see below).

Inuit Nebula:

This **telescopic** asterism is the planetary nebula NGC 2392 (Caldwell 39) in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1787 who listed it as “IV 45” in his catalogue. It is listed as GC 1532 in the *General Catalogue* of 1864. Size 0.9’ X 0.9’. This name was posted on the *Deep Sky Forum* by American astronomer Howard Banich in February 2019. NOTE: Western astronomers previously also called this the Eskimo Nebula, but as the term Eskimo is offensive to the Inuit, I’m not listing it here under that name. Some people are now calling it the Parka Nebula or the Clown Face Nebula.

Invakā:

This Hindu asterism “Invakā” or “Invalā” is the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899. Allen writes that the meaning of this name is “doubtful”.

Investigator:

This Japanese sei shuku or lunar mansion “Kagasuki Boshi” is the belt of Orion plus the star Beta (β) Orionis (Rigel).

Io the Wanderer:

This Greek asterism is the IAU constellation Taurus. This refers to the myth of Io being seduced by the God Zeus and then turned into a cow to hide her from his wife Hera, who sent her wandering the world without rest.

- "Io" is listed as a name for this constellation in Johann Bayer's *Uranometria* (1603).
- R. H. Allen's *Star Names* in 1899 lists "Io the Wanderer".

Iota's Ghost:

This **telescopic** asterism is NGC 5102, a lenticular galaxy in the IAU constellation Centaurus. It was discovered by English astronomer John Herschel in 1835 who listed it as h 3492. It is GC 3504 in the *General Catalogue* of 1864. It is called this as it is located next to the star Iota (ι) Centauri. It is also known as "Close to Iota" see above. This is O'Meara 70 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Irat Zuqaqipi:

This Akkadian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Scorpius.

Irena:

This **telescopic** Slovenian star is WASP 38 in the IAU constellation Hercules (magnitude 7.998). It was given this name in the IAU NameExoWorlds campaign. It is named for a character in Fran Saleški Finžgar's novel *Under the Free Sun.* It has an exoplanet named Iztok, which is the name of a freedom fighter in this novel.

Irene:

This Greek asterism "Εἰρήνη" ("Eiríni") is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. In Greek mythology Irene was the sister of Astraea (see above).

Iris Nebula:

This **telescopic** asterism is the open cluster and reflection nebula NGC 7023 (Caldwell 4, vdB 139, LBN 487, Cr 429, Ced 187) in the IAU constellation Cepheus. This was discovered by English astronomer William Herschel in 1794 who listed it as "IV 74". It is GC 4634 in the *General Catalogue* of 1864. Size 18' X 18'.

Irmin's Wagon:

This Saxon asterism "Irmines Wagen" is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899 and by John D. Bengtson (2016). Allen notes that German philologist Jakob Grimm (1785 – 1863) listed it as "Herwagon", and that German astronomer Johann Bayer (1572-1625) listed this as "Horwagon" and German poet Philip von Zesen (1619 – 1689) listed it as "Hurwagon". In 2020 Herman Bender listed the Anglo-Saxon "Irmeneswagen" and wrote that this name was also associated with Boötes, as Irmin was a hero associated with that constellation. The center of Irmin worship was Lower Saxony.

Iron Pole:

This Kazakh star “Timir Qazyq” or “Temir Kazyk” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. The horses Aqbozat and Kökbozat are tethered to it and walk in a perpetual circle.

Iron Star:

This **telescopic** variable star is HIP 86777 (HD 161114) in the IAU constellation Ophiuchus. It was discovered in 1908 by Scottish astronomer Williamina Fleming at the Harvard College Observatory.

Irti-su:

This Babylonian ziqpu “mul sa GAB” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Leonis (Regulus), Gamma (γ) Leonis, Eta (η) Leonis, and Zeta (ζ) Leonis in the IAU constellation Leo.

Isha:

This “Hebrew” asterism is the IAU constellation Andromeda as listed by John Hill in his *Urania* in 1754. Hill claims that the complete name is “Isha Sha-Jahajala Baal” and translates this as “woman wanting a husband”.

Ishtar:

This Akkadian, Babylonian, and Assyrian asterism is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. This is named for their Goddess Ishtar, known as the Queen of Heaven, who is a Goddess of love and war. The Greeks named her “Ἀστήρ” (“Astír”) and later Aphrodite (see above).

Isias:

This “Coptic” asterism is the IAU constellation Scorpius and is listed in John Hill’s *Urania* in 1754.

Isis:

This Egyptian Dendera asterism is made up of stars of the IAU constellations Carina and Vela (Hoffman 2017). The Goddess Isis is the wife of the God Osiris in Egyptian mythology. Isis is depicted at Dendera as seated with a human figure standing on one of her hands. The central star is Mu (μ) Velorum, from which three lines of stars run out:

- One to Theta (θ) Carinae,
- One to i Velorum, and
- One to q Velorum.

This Egyptian star from the *Pyramid Texts* and as depicted in the Ramesseum (c. 3285 B.C.E.), the mortuary temple of Rameses II at Thebes, is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Krupp 2001). It also appears in the 19th dynasty Cairo Calendar (Hardy 2003). Compare this to Sopdet (below). During the reign of the Roman Antoninus Pius (138 – 161 C.E), a drachma was minted in Alexandria depicting Isis riding a dog (Holberg 2007).

This German asterism is the IAU constellation Taurus. This name is listed in Johann Bayer’s *Uranometria* (1603).

This Dutch star is Mu (μ) Canis Majoris in the IAU constellation Canis Major. It was given this name by diplomat, lawyer, theologian, poet, and playwright Hugo Grotius (Huig de Groot, 1583 – 1645). It has also been used for the star Gamma (γ) Canis Majoris.

German Jesuit astronomer Athanasius Kircher (1602 – 1680) used the name "Isis" for the Egyptian decan "Themat-hert" (see below).

This asterism is the IAU constellation Virgo:

- Johann Bayer's *Uranometria* (1603) lists "Auieno Isis" as an alternate name for Virgo.
- as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a woman bearing stalks of grain. In ancient Egyptian skies some of the stars of Virgo were included in their asterism Selkis (see below). Isis is a name for the Egyptian decan "Themat-hert" (see below) in the IAU constellation Virgo assigned by German Jesuit astronomer Athanasius Kircher (1602 – 1680). Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennan writes that the Egyptian Goddess Isis was "converted into Ceres". Ceres was an aspect of the Greek goddess Demeter and originated in Greek culture, not Egyptian.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Ceres, or Isis".

Island of Auriga:

This **telescopic** asterism is in the IAU constellation Auriga and is Corder 827 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. Size 75' X 40'. This runs along one side of IC 405 (see Flaming Star Nebula, above). Corder describes it as an "elongated collection of 3 wide double stars." It includes the stars 16, 17, 18, and 19 Aurigae, and the double variable star AE Aurigae.

Ismael:

This German asterism is the IAU constellation Sagittarius as listed by German poet Philipp von Zesen (1619 – 1689). Edward Sherburne lists this in his Sphere of Marcus Manilius in 1675.

Isoceles Triangle:

This American asterism "Isoceles Triangle" is made up of the stars of Hercules: Alpha (α) Herculis (Rasalgethi), Beta (β) Herculis (Kornephoros), and Delta (δ) Herculis. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Ras Algethi (α Herculis)… [forming] an isoceles triangle with β and δ".

It Blinks Its Eyes:

This T'atsaol'ine and Wiidiideh star "wendaà at'ı" is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Cannon 2021).

It Goes Down After the Sun:

This Sahtúotine star “sak’éeda” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Cannon 2021) during its evening appearance in autumn.

It is Naming the Morning:

This Gwich’in asterism “Vành Oozhrii” is Delta (δ) Boötis, Epsilon (ε) Boötis, and Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021). They also call this “They Rose Far Up” (see below) and “They Rose Straight Up” (see below) and “Vats’at K’èegogaajil”.

It Leads Light into Day:

This Koyukon asterism “Yokkolaaye” is Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila (Cannon 2021).

It Makes Light:

This Sahtúotine star “bek’éahka” or “bek’énaehka” (“it makes light” or “It makes whiteness again after it”) is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021).

It Never Moves:

This Inuit star “Nuuttuittuq” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (MacDonald 1998). Some versions include the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) Ursae Majoris (Pherkad).

It Went Under:

This Lakota star “Ihuku Kigle” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Itapitiontara:

This Uanana asterism “Itapitiontara” is the Pleiades cluster in the IAU constellation Taurus. It is part of their Mehsenkeró initiations(De Freita Mourão 2009).

Its Own Count:

See Bright Star above.

It’s Tail Measurer:

This T’atsaol’ine and Wiidiideh asterism “wetseè dzà” is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021). It is related to their asterism “Yida” (see Traveler, below).

Ittha:

This Vedic asterism “Ittha” is the IAU constellation Pisces as listed by the Indian astrologer and polymath Varāhamihira (c. 505 – c. 587) and in R. H. Allen’s *Star Names* in 1899. Allen lists an earlier name as “Jitu”.

I’ve Fallen and Need Help:

This asterism is the IAU constellation Taurus as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Ivy Wreath:

This German asterism is the IAU constellation Coma Berenices as shown on the Dresden globe.

Ixion:

This asterism "Ixion" is the IAU constellation Hercules. Johann Bayer's *Uranometria* (1603) lists "Ixion". The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Ixion". R. H. Allen lists "Ixion" as an alternate name for Hercules in his *Star Names* in 1899. Ixion was an outlaw in Greek mythology who was punished by being bound to a burning solar wheel.

Ixion's Wheel:

This Greek asterism "Τροχός Ἰξιόνος" ("Trochós Ixiónos") is the IAU constellation Corona Australis as listed in R. H. Allen's Star Names in 1899.

This Latin asterism "Rota Ixionis" or "Rota" is the IAU constellation Corona Australis:

- In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Corona Austrina, quae et Rota Ixionis" as a jeweled crown.
- Johann Bayer's *Uranometria* (1603) lists "Rota Ixionis".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Rota Ixionis".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Globulus Ixionis" and "Rota Ixionis" as names for Corona Australis.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Rota Ixionis al Corona Austral" and depicts it as a laurel wreath. Rota Ixionis appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754 and R. H. Allen's *Star Names* in 1899. Ixion was an outlaw in Greek mythology who was punished by being bound to a burning solar wheel.

Izar:

See Girdle, above.

izinkanyezi eziyisiphambano ezulwini:

Zulu asterism "izinkanyezi eziyisiphambano ezulwini" is the IAU constellation Crux.

J:

There are two **telescopic** "J" asterisms:

- One is in the IAU constellation Phoenix and is Corder 284 on the observing list of American astronomer Jeffrey Corder. Size 80' X 25'. This is five 6^{th} – 8^{th} magnitude stars including HIP 8563, 8322, 8253, 8287, 8320, and the double star HIP 8398.
- One is in the IAU constellation Indus and is Corder 4287 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is five 7^{th} – 8^{th} magnitude stars including HIP 103607, 103424, and the double star HIP 103438A.

Jaap:

This Micronesian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

Jabaga:

This Wardaman star is 23 Tauri in the Pleiades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Jabakka:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing an eldest child and is part of their asterism "Murabibi" (see Teenagers and Little Ones, below).

Jabbah:

See Forehead of the Scorpion, above.

Jaburú Crane:

The stars of this Tupi Guarani asterism are unidentified at this time (Lima and De M. Figueirôa, 2007).

Jack on the Middle Horse:

This English asterism is the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major as listed by R. H. Allen in his *Star Names* in 1899. "Jack" is Alcor, and his "horse" is Mizar.

Jackal Star:

The Egyptian word for the jackal "sꜣb" is almost identical to their word for star "sbꜣ". The *Pyramid Texts* of Unas refer to a "jackal star" which could be Zeta (ζ) Draconis (Aldhibah) "hyena" or nearby Eta (η) Draconis (Athebyne- part of their asterism Two Hyenas, see below). or even Alpha (α) Draconis (Thuban), which was once the north polar star and was known to Arab astronomers as Al-dhi'b (الذئب) or "Wolf" (see below).

Jacky Lizard:

This Boorong asterism "Unurgunite" or "Nganurganity" is in the IAU constellation Canis Majoris as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). This is a male Jacky Lizard or Jacky Dragon (Amphibolurus muricatus). The tip of the "tail" is the star Delta (δ) Canis Majoris, and a curve of stars goes around to the "head" at the star Sigma (σ) Canis Majoris. Unurgunite fights the Moon (Mityan) for trying to seduce one of his wives (see Wives of Unurgunite, below). The IAU approved the name Unurgunite for the star Sigma (σ) Canis Majoris in 2016.

This Wotjobaluk star "Urnugunite" is Delta (δ) Canis Majoris in the IAU constellation Canis Major (Hamacher 2011).

Jacob:

This German asterism is the IAU constellation Lupus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Iacobus major". "Jacob" later appears as a name for this constellation in John Hill's *Urania* in 1754. German poet Philipp von Zesen (1619 – 1689) also lists it

under this name. Edward Sherburne lists it as "Jacob the Patriarch" in his *Sphere of Marcus Manilius* in 1675 and attributes it to German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658).

Jacob and Esau:

This German asterism is the IAU constellation Gemini as listed by German astronomer Wilhelm Schickard (1592 – 1635). "Jacob" and "Esau" are given as alternate names for the twins of Gemini in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754.

Jacob's Staff:

This Italian asterism "Baculus Jacobi" is the belt of Orion in the IAU constellation Orion as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Jacobsstab". R. H. Allen's *Star Names* (1899) lists the name "Jacob's Staff" for this constellation.

This English asterism is the belt of Orion in the IAU constellation Orion:

- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as "Jacob's Rod".
- R. H. Allen's *Star Names* in 1899 calls this "Jacob's Staff".

This German asterism "Jakob Stab" is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen's *Star Names* in 1899.

This Finnish Asterism "Jaakobin Sauva" is the Belt of Orion asterism in the IAU constellation Orion.

Jacob's Wagon:

This German asterism is the Little Dipper asterism in the IAU constellation Ursa Minor and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in John Hill's *Urania* in 1754. Edward Sherburne lists it as "Wagon of Iacob" in his *Sphere of Marcus Manilius* in 1675.

Jacunda Fish:

The Jacundá is a species of pike (Crenicichla) in the Amazon basin (Chrenichicla sp. – muha buhua).

This Tukano asterism "Mhua", "Jacundá", or "Peixe" ("fish") is made up of stars of the IAU constellation Aquarius (Cardoso 2007, Cardoso 2016):

- A triangle of stars forms the "body": the double star Psi (ψ) 1 and 2 Aquarii and 92 Aquarii,
- From 92 Aquarii, a line runs out to Phi (ϕ) Aquarii, and
- From Psi (ψ) 2 Aquarii a short line runs out to the star Psi (ψ) 3 Aquarii.

NOTE: Cardoso (2015) writes that some Tukano see this as stars of Aquarius and Pisces.

This Barasana star "Muha Buhua" ("Jacundá fish") is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Hugh-Jones 2006).

This Tupi asterism “Jacundá” is a small group of stars close to their asterism “Camarão” (see Prawn, below) and as the “prawn” is made up of stars in the IAU constellations Crux and Lupus, this could be stars of Centaurus, Norma, Circinus, Musca, or Carina (De Freita Mourão 2009).

Jade Ornament on Ladies’ Wear:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Piscis Austrinus: Starting with the determinative star 6 Piscis Austrini, it runs through 5 Piscis Austrini to HIP 105476.

This Chinese xing guan “Líyú” (离瑜) is a two-star line in the IAU constellations Microscopium and Piscis Austrinus: Epsilon (ε) Microscopii and 5 Piscis Austrini.

This Chinese Chenzhuo xing guan “Líyú” is a bent line of three stars in the IAU constellation Piscis Austrinus: 5 and 6 Piscis Austrini and HIP 105476.

Jade Sighting Tube:

This Chinese star “Yuheng” from the Three Kingdoms to the Ming Dynasty is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major. This star appears on Han Dynasty diviner’s boards as the center of the cosmos (Didier 2009).

This Chinese Chenzhuo xing guan “Yuheng” is the star Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Jade Well:

This Chinese xing guan “Yùjǐng” (玉井) is a square of four stars in the IAU constellations Orion and Eridanus: Tau (τ) Orionis and Beta (β) Eridani (Cursa- the determinative star), Psi (ψ) Eridani and Lambda (λ) Eridani. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Yùjǐng” is a square of stars in the IAU constellations Eridanus and Orion: Tau (τ) Orionis, Beta (β) Eridani (Cursa), Psi (ψ) Eridani, and Lambda (λ) Eridani.

This Korean asterism “Og-eul Jal” (옥을 잘) is identical to the Chinese xing guan Jade Well above.

Jaguar:

This Mayan asterism “Balaam” is a triangle of stars in the IAU constellations Piscis Austrinus and Sagittarius: 60 Sagittarii, Iota (ι) Piscis Austrini, and HIP 98761.

This Haliti-Paresi asterism is dark spots in the Milky Way (Urton 2016). The Jaguar is pursuing a deer.

This Conibo asterism is dark spots in the Milky Way (Urton 2016). The Jaguar is pursuing a deer.

This Northern Andean asterism “Estalina Quinatoa”, “Wilca”, or “Otorongo”, is an irregular shape basically consisting of the stars of the IAU constellation Monoceros centered on NGC 2244, the Rosette Nebula (Quinatoa 2018).

This Tukano asterism “Onça” is the dark nebulae around the IAU constellation Centaurus, which they see as a jaguar catching an anteater (Urton 2016).

This Ticuna asterism “Ai” is made up of stars of the IAU constellation Scorpius. The “right paw” is Alpha (α) Scorpii (Antares), Sigma (σ) Scorpii and Tau (τ) Scorpii. The left paw is Lambda (λ) Scorpii (Shaula), Iota (ι), and Theta (θ) Sco. Jaguar fights with the Anteater Tchatü (see Anteater, above).

This Kogi asterism “Nebbi” is the IAU constellation Canis Major.

This Quechua and Moche star is Epsilon (ε) Orionis (Alnilam), the central star of the belt of Orion in the IAU constellation Orion.

This Kobeua asterism is made up of stars of the IAU constellations Cetus and Eridanus:

- Its “head” is the stars Lambda (λ), Mu (μ), Xi (ξ), Nu (ν), Gamma (γ), and Alpha (α) Ceti (Menkar),
- Its “body” is the stars Omicron (ο), Zeta (ζ), and Chi (χ) Ceti,
- Its “legs” is the stars Eta (η) Eridanus, Tau (τ) Ceti, and Upsilon (υ) Ceti, and
- Its “tail” is the stars Theta (θ), Eta (η), and Beta (β) Ceti (Diphda).

This Barasana (Vaupés region) asterism is stars in the IAU constellation Cetus (Hugh-Jones 2006).

This Kalina asterism “Kaitusiyuman” is made up of stars of the IAU constellations Corona Borealis and Boötes (Kemp et al 2022). Corona Borealis forms the “head” and part of Boötes the “body”. NOTE: Some Kalina place this asterism near Andromeda.

This Carib asterism “Kaitusiyuman” or “Kaitusi” represents the Jaguar (Pantera onza) and there are two versions (Magaña, and Jara, 1982):

- One is made up of the stars of the IAU constellations Boötes and Corona Borealis. Corona Borealis is the “head”. The “body” is the stars Delta (δ) Boötis, Mu (μ) Boötis, Beta (β) Boötis (Nekkar), and Gamma (γ) Boötis. One “leg” runs from Gamma (γ) Boötis through Lambda (λ) Boötis, to Theta (θ) Boötis. The other “leg” runs from Mu (μ) Boötis through Chi (χ) Boötis to Zeta (ζ) 1 Coronae Borealis. The “tail” runs from Sigma (σ) Boötis through Epsilon (ε) Boötis to Psi (ψ) Boötis.
- One is made up of stars of the IAU constellations Andromeda, Pisces, and Triangulum.

Jaguarmundi:

The stars of this Kogi asterism “Neb-sˇkizˇ i abaxse” are currently unidentified (Kelley & Milone 2011). A jaguarmundi is a wild cat, slightly larger than domesticated cats.

Jaguar’s Testicles:

This Barasana asterism is a cluster of stars around Zeta (ζ) 1 and 2 Scorpii in the IAU constellation Scorpius (Hugh-Jones 2006). It is part of their asterism “Iya Yai” (see Caterpillar Jaguar, above) and is also described as the eggs of a snake.

Jail of Sky:

This Korean asterism “Haneul-ui Gam-og” (하늘의 감옥) is a rough hexagon of stars in the IAU constellation Ursa Major: 36, 37, 39, 43, and 44 Ursae Majoris and HIP 52136.

Jamadangi:

This Vedic star “Jamadangi” is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia.

James:

This German asterism "James" or "Saint James the Younger" is the IAU constellation Virgo and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is incorrectly listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Jacobus minor Alias Virgo". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

This German asterism "James" or "St. James the Elder" is the IAU constellation Gemini and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Janagan:

This Gumbayngirr asterism is the Pleiades cluster in the IAU constellation Taurus as listed by Morelli in 2015. Morelli recorded these variations: "Daarril", "Ganay", and "Wirriiga".

January Salt and Pepper Cluster:

See Salt and Pepper, below.

Jar:

This Latin asterism "Hydria" is the IAU constellation Crater. John Hill listed this name in his *Urania* in 1754.

Jason:

This Greek asterism is the IAU constellation Ophiuchus. Jason is the Argonaut who sought the golden fleece.

Jason's Keel:

Roman poet Sextus Propertius (1st century B.C.E.) called Ptolemy's asterism Argo's Ship (see above) "Iasonia Carina" ("Jason's Keel").

Jason's Ship:

This Latin asterism "Navis Jasonis" is Ptolemy's asterism Argo's Ship (see above). Johann Bayer's *Uranometria* (1603) lists "Navis Iasonis". The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Navis Iasonis".

Jason's Yacht:

This Latin asterism "Celox Jasonis" is Ptolemy's asterism Argo's Ship (see above).

Javelin Bearer:

This Seleucid star "Κονταράτος" or "Kontarátos" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. R. H. Allen lists this as a name from "Greco-Persian Tables" in his *Star Names* in 1899.

Javelin of Sky:

This Korean asterism "Haneul Chang" (하늘 창) is a line of three stars in the IAU constellation Boötes: Epsilon (ε), Sigma (σ), and Rho (ρ) Boötis.

Jamardba:

This Wardaman star is 71 Tauri in the Hyades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Jaw:

This ancient Egyptian asterism "Aret" is the Hyades cluster in the IAU constellation Taurus.

Jaw of a Whale:

This is the star Alpha (α) Ceti (Menkar) in the IAU constellation Cetus. Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Ceti Mandibula" ("jaws of a whale").

Jaw of the Tapir:

This Lokono or Arawak asterism "Kama Tâla" or "Kamatala" is the Hyades cluster in the IAU constellation Taurus (Rybka 2018). Its rising marks the beginning of the hunting season. NOTE: R. H. Allen in his *Star Names* in 1899 mentions that explorer Yañez Pinzon in 1500 listed the "Tapüra Rayoaba" as a name for Taurus used by the natives living on the banks of the Amazon River, without specifying the people involved.

This Tupi Guarani asterism "Queixada da Anta" or "Tapi'I rainhyka" is the Hyades cluster in the IAU constellation Taurus.

This Tupi asterism "Sembiara Rajyguara" is the Hyades cluster in the IAU constellation Taurus (De Freita Mourão 2009).

Jaw of the Wild Bull:

This Babylonian asterism from the MUL.APIN tablets "Is-le" is the Hyades cluster in the IAU constellation Taurus. The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) list it as "MUL.is-le-e" (Hunger 1992) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period list it as "mul is li-e" (Bartel van der Waerden 1974, Koch-Westenholz 1995). The IAU constellation Taurus is called "Bull of Heaven" ("GU.AN.NA") by the Babylonians (see above).

This Akkadian asterism "is le e" (Block, Yigal, and Horowitz 2015) listed in the Ura = hubulla XXII tablet is identical to the Babylonian asterism "Is-Le" above.

This Seleucid asterism "MUL" or "al-pi-i[n]" ("single bull") listed in the tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the Pleiades cluster in the IAU constellation Taurus (Foxvog 1993).

This Persian asterism "Gisli" from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the Hyades cluster in the IAU constellation Taurus as listed in Franz Boll's *Ancient Observations of Coloured Stars* in 1918. It appears in the list of Zodiacal Signs in VAT 4956 of this period as "MUL" (Bartel van der Waerden 1974). Ernst Weidner lists it in his

Fixsterne in 1971 as "is-li-e". Hermann Hunger in his *Astronomical Diaries and Related Texts from Babylonia* in 1988 lists "is le" as "jaw of the bull" and only the star Alpha (α) Tauri (Aldebaran).

Jaws:

This **telescopic** asterism, also known as Ty's Oil Can (see below), appears in *Pattern Asterisms* by American astronomer John A. Chiravalle. This is listed on Robert Zebahl's *Faint Fuzzies* website as Pothier 11. It is in the IAU constellation Virgo close to the Sombrero Galaxy, Messier 104. Its size is 25' X 25'. Two 8th magnitude stars and a double star (HIP 61654 and 61656) form the "jaws" of the shark. A curve of six 10th magnitude stars forms the body of the shark. It was American astronomer and author Phil Harrington that named this asterism "Jaws": It is Harrington 21 on his list of asterisms. Size 25' X 25'.

Jegban:

This Wardaman star is Delta (δ) Ursae Majoris (Megrez) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Jellyfish:

There are six **telescopic** jellyfish asterisms:

- One is the globular cluster Messier 30 (NGC 7099) in the IAU constellation Capricornus. It was discovered by French astronomer Charles Messier in 1764. It is listed in John Herschel's General Catalogue of 1864 as GC 4687. This is also known as the Honeycomb.
- One is the reflection nebula NGC 5367 in the IAU constellation Centaurus. John Herschel listed this as h 3548 and later as GC 3706 in his *General Catalogue* of 1864. It is also known as the Space Jellyfish.
- One is the open cluster NGC 2509 in the IAU constellation Puppis. It was discovered by English astronomer William Herschel in 1783 who listed it as "VIII 1" in his catalogue. It is GC 1613 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as a 12-arc minute long jellyfish.
- One is the supernova remnant IC 443 (SH 2-248, LBN 844, PGC 2817561, Ced 73) in the IAU constellation Gemini beside the star Eta (η) Geminorum. This was discovered by German astronomer Max Wolf in 1893. German astronomer Uwe Glahn lists this name in the *Deep Sky Forum* in March 2025.
- One is planetary nebula NGC 1535 in the IAU constellation Eridanus. It was discovered in 1785 by English astronomer William Herschel who listed it as "IV 26" in his catalogue. It is GC 826 in the *General Catalogue* of 1864. It is also known as the Cleopatra's Eye (see above) and the Ghost of Neptune Nebula (see below). Walter Scott Houston gave it this name when he described it as a "bright planetary nebula… which swims like a celestial jellyfish". Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists the name "Celestial Jellyfish" and makes it O'Meara 22.
- One is the globular cluster Messier 3 (NGC 5272) in the IAU constellation Canes Venatici. This was discovered in 1784 by English astronomer William Herschel. English Admiral Henry William Smyth describes it as a "medusa pellucens" ("shining jellyfish") in his *Bedford Catalogue* in 1844. It is listed in the General Catalogue of 1864 as GC 3636 and in John Herschel's catalogue as h 1663. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* that "Admiral Smyth mentions… the curious resemblance to a jellyfish".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply lists it as a "Canes Venatici Nebula".

Jenimate:

This Micronesian star is Gamma (γ) Andromedae in the IAU constellation Andromeda.

Jenn's Confluence:

This **telescopic** asterism is two chains of stars merging at the northwest edge of the Sagittarius Star Cloud (Messier 24) in the IAU constellation Sagittarius. It was discovered by American amateur astronomer Jennifer Polakis.

Jenywen:

This Micronesian asterism is the belt of Orion in the IAU constellation Orion.

Jeong:

This Korean star is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major.

Jerom:

This German asterism is the IAU constellation Boötes as listed by German astronomer Wilhelm Schickard (1592 – 1635). John Hill lists this asterism in his *Urania* in 1754.

Jerome:

This asterism "Jerome" or "Saint. Jerome" is the IAU constellation Auriga and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). Edward Sherburne lists his in is *Sphere of Marcus Manilius* in 1675 and R. H. Allen lists this in his *Star Names* in 1899.

Jesus:

This asterism "IHS" was made up of the stars of the IAU constellation Cancer by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted by the capital letters "IHS".

Jewel Box:

This **telescopic** asterism is the open cluster NGC 4755 (Caldwell 94) in the IAU constellation Crux. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751. It was named by English astronomer John Herschel (1792 – 1871), who described it as "a superb piece of fancy jewelry" and where he listed it as h 3435. It is GC 3275 in the *General Catalogue* of 1864. It is also known as "Herschel's Jewel Box". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Jewel Box".

Jewel Box of the Scorpion:

This **telescopic** asterism is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius, also known as the Anchor, the False Comet, The Table of Scorpius, the Northern Jewel Box, and the

Crocodile. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654, who called it "Luminosae" (Italian for "bright"). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. American astronomer Tom Bryant gave it this name in his observations in 2010 at Little Bennett Regional Park.

Jewel Bug Nebula:

This **telescopic** asterism is the planetary nebula NGC 7027 in the IAU constellation Cygnus. It was discovered by British astronomer Rev. Thomas Webb (1807 – 1885). It is also known as the Pink Pillow Nebula, the Magic Carpet Nebula, the Green Rectangle Nebula, and the Sugar Pops Nebula.

Jewel Market:

This Chinese xing guan "Lièsì" (列肆) is a line of two stars in the IAU constellations Ophiuchus and Serpens: Lambda (λ) Ophiuchi and Sigma (σ) Serpentis (the determinative star). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Lièsì" is two stars in the IAU constellation Hercules: Omega (ω) and 29 Herculis.

Jeweled Belt of Al Jawza':

This Arabic asterism "mintaqat al-jawza'" is the belt of Orion in the IAU constellation Orion. It is also known as the String of Pearls (see below) or the Belt of Al Jawza' (see above).

Jeweled of Virgo:

This **telescopic** asterism "Gemmátus Vírginis" is the barred spiral galaxy NGC 5584 in the IAU constellation Virgo. It was discovered by E. E. Barnard in 1881. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "many bright HII regions make this multiple-armed beautiful galaxy resemble a body adorned with jewels."

Jeweled Ring:

This **telescopic** asterism is the quasar RX J1131-1231 in the IAU constellation Crater. This was discovered by a team led by Rubens Reis at the University of Michigan using the Chandra X-Ray Observatory and the XXM-Newton telescope in 2014. This was later photographed by the Hubble Space Telescope and the James Webb Space Telescope, recording the gravitational lensing which resulted in multiple images of the quasar which in turn led to the name.

Jewels of the Teapot:

This **telescopic** asterism is in the IAU constellation Sagittarius and is on John Raymond's list of asterisms. Jeffrey Corder lists it as Corder 3566. This is the triangle of double stars HIP 90575, 90478A, and 90510A.

Jewish Cross:

This Tzotzil (of Chamula) asterism is the IAU constellation Crux (Milbrath 1999). They associate it with evil.

Jiang Lou:

This Chinese asterism “Jiang Lou” from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Aries (Kotyk 2017).

Jilijoaibu:

This Pemon asterism “Jilijoaibu”, “Jilizoaibu” or “Jilikawai” is made up of stars of the IAU constellations Orion and Taurus, specifically the Hyades and Pleiades clusters and the main part of Orion (Berezkin 2005, Lima and De M. Figueirôa, 2007). The Pleiades are his head. This appears to be similar to the Tupi Guarani asterism “Homem Velho” (see Old Man with a Stick, below). Jilijoaibu is a one-legged man whose leg was cut off by his adulteress wife. An alternate name for this asterism is “Jilike Pupai” (“starred head”).

Jigirri-jigirri:

This Wardaman star is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Jimi Hendrix’s Broken Guitar:

This **telescopic** asterism “ ” (“Jimi Hendrix’s Broken Guitar”) is in the IAU constellation Pegasus. German astronomer René Merting describes it thus: “6 stars form the guitar body- the stars of the neck are sometimes only recognizable in averted vision… it looks like the guitar was smashed on the [globular cluster] M 15.” The “guitar body” includes HIP 106157, 106243, and 106222. The “broken neck” runs out to HIP 106361. Size 60’ X 30’.

Jìn:

This Chinese star “Jìn” from the 3 Kingdoms and Ming Dynasty Period is the star Kappa (κ) Herculis in the IAU constellation Hercules and is part of their xing guan Heavenly Market West Wall (see above).

Jinnenikak:

This Micronesian asterism is the IAU constellation Virgo.

Jirdij:

This Wardaman star is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Jirijin:

This Wardaman star is Beta (β) Delphini (Rotanev) in the IAU constellation Delphinus (Cairns and Harney 2003).

Jishui:

This Chinese star is Omicron (o) Geminorum in the IAU constellation Gemini, and this name was approved by the IAU in 2016.

Jǐuhé:

This Chinese star “Jǐuhé” from the 3 Kingdoms and Ming Dynasty Period is the star Mu (μ) Herculis in the IAU constellation Hercules and is and is part of their xing guan Heavenly Market East Wall (see above).

Jizhin:

This Tibetan gyukar "Jizhin" is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Johnson-Groh 2013).

Joachim and Anna:

This German asterism "Joachim and Anna" or "Saint Joachim and Saint Anna" is the IAU constellation Cetus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Ioachimus et Anna Al Cetus". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Joash:

This Italian asterism is the IAU constellation Sagittarius as listed by Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?). Joash (Jehoash- 836 – 796 B.C.E.) was the king of Judah and appears in the Bible.

Job:

This German asterism is the IAU constellations Indus and Pavo and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Job Al Pavo". Job later appears in John Hill's *Urania* in 1754.

Job's Coffin:

This Western asterism consists of a diamond of four bright stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Gamma (γ) Delphini and Delta (δ) Delphini. R. H. Allen lists it in his *Star Names* in 1899, but comments "the date and name of the inventor of this title I have not been able to learn". Size 150'. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name for this asterism but vaguely attributes the name to "some modern". *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Job's Coffin" for this asterism. The SAC database lists this as "Job's Coffin". Gene Hanson lists it on his *Beginner's Guide* website as the "Mini Kite". Jeffrey Corder lists it as Corder 4226.

John:

There are two German asterisms named "John" or "St. John the Baptist":

- One is the IAU constellation Cancer and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Joannes". Edward Sherburne attributes it to Schiller but calls it "Saint John the Evangelist" in his *Sphere of Marcus Manilius* in 1675. It later appears in John Hill's *Urania* in 1754.

- One is the IAU constellation Aquarius. Aquarius is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Johannes Baptista". In his Star Names in 1899, R. H. Allen reports that "New Testament Christians of the 16th and 17th centuries" identified the IAU constellation Aquarius as "John the Baptist".

Joined:

This Latin asterism "Jugula" or "Jugulae" as the IAU constellation Orion. R. H. Allen attributes this to Roman playwright Titus Maccius Plautus (c. 254 – 184 B.C.E.) and Roman polymath Marcus Terentius Varro (116 – 27 B.C.E.). Allen explains this as a reference to the two bright stars in the "shoulders" of Orion, which Allen writes they called the "Umeri" ("upper arm"). Allen also points out that French astronomer Jérôme Lalande wrote that the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis "look like a set of three nuts, which has caused this constellation to be called Nux [Latin for "nut"], or Juglans, Stella jugular".

- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "IVGLA A OR" for Betelgeuse and "IVGVLA B OR" for Gamma (β) Orionis (Bellatrix).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Jugula" and attributes it to Plautus as Allen does.
- R. H. Allen lists this Latin asterism "Jugula" or "Jugulae" in his *Star Names* in 1899
- Johann Bayer's *Uranometria* (1603) lists "Jugula"

Jointly:

This Latin star "Coniuncte" is the star Mu (μ) Ursae Majoris as listed on the Sloane astrolabe BM SL 54 (Dekker 2000).

Joints of the Vertebrae:

This Arabic asterism "Ḥarazāh" is the stars Lambda (λ) and Upsilon (υ) Scorpii in the IAU constellation Scorpius as listed by Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050) and in R. H. Allen's *Star Names* in 1899.

Jolly Roger:

This telescopic asterism is the small open cluster NGC 1502 in the IAU constellation Camelopardalis. It was discovered by William Herschel in 1787 who listed it in his catalogue as "VII 47". It is GC 802 in the *General Catalogue* of 1864. The Jolly Roger (skull and crossbones symbol on a flag) was first used in the 1710s, so it would have been known to Herschel, but I do not yet know who first named this open cluster after it. This is listed as O'Meara 20 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), who lists the name "Jolly Roger". It is also known as the Golden Harp Cluster.

Jonah's Whale:

This German asterism is the IAU constellation Cetus as listed by German astronomer Wilhelm Schickard (1592 – 1635). "Cetus Jonah" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists "Jonah's Whale" in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "the whale of Johah".

Jonathan's Arrow:

This German asterism "Telum Ionathae" is the IAU constellation Sagitta as listed by German astronomer Wilhelm Schickard (1592 – 1635). "Telum Ionathae" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754.

Jonumas:

This Micronesian asterism is the IAU constellation Crater.

Jopherud:

This "Persian" asterism is the IAU constellation Cygnus as listed in John Hill's *Urania* in 1754.

Jordan River:

This Dutch asterism "Jordanus", "Jordanis", or "Jordanus Fluvius" was created in 1612 by Flemish astronomer Petrus Plancius (1552 – 1622). One end started in the IAU constellation Canes Venatici, then it flowed through the IAU constellations Leo Minor and Lynx and ended near the IAU constellation Camelopardalis: Thus it "runs" along under the "feet" of Ursa Major. Plancius' celestial globe (1613) of published in Amsterdam by Pieter van der Keere depicts "Jordanis Fluvius". German astronomer Jacob Bartsch (1600 – 1633) listed Jordanus in his *Planisphaerium Stellatum* (1613) as "Jordanus vel Jordanus Fluvius Judaeae".

This German asterism "Jordan" or "River Jordan" is the IAU constellation Hydra and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) lists "Jordan" and depicts it as a river running between Ursa Major and Leo.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this "Iordanus Fluv" and depicts this asterism and even depicts it as a river running underneath Ursa Major. It labels the Lebanese mountains that are source of the headwaters of this river on this celestial chart, labelling them "Dan" and "Tor", situated behind Ursa Major's tail.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label "Jordanuis Flu".

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "La Fleuve Jourdan", "Jordanus Fluvius", as well as a Greek translation (which runs off the edge of the image I am using).

"Jordan River" later appears in John Hill's *Urania* in 1754. Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675.

This German asterism is the IAU constellation Eridanus as listed by German poet Philipp von Zesen (1619 – 1689).

This Atacameño asterism "Río Jordan" is the IAU constellation Crux (Moyano 2011).

Joromoj:

This Micronesian star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Joseph:

This German asterism "Joseph" or "Saint Joseph" is the IAU constellation Orion and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Josephus Al. Orion". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

This German asterism is the IAU constellation Taurus as listed by German poet Philipp von Zesen (1619 – 1689).

Joseph's Chariot:

This German asterism is the IAU constellation Ursa Major as listed by German poet Philip von Zesen (1619 – 1689). Zesen also described it as one of the bears sent by Elisha to punish his persecutors. John Hill lists this as the Little Dipper in his *Urania* in 1754 but does not identify his source and R. H. Allen lists this in his *Star Names* in 1899, but later suggests that Zesen used this for Ursa Minor. Edward Sherburne lists it as "Chariot of Joseph" in his Sphere of Marcus Manilius in 1675 and attributes it to German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658).

Joseph's Cup:

This German asterism is the IAU constellation Crater as listed by German astronomer Wilhelm Schickard (1592 – 1635) and German poet Philipp von Zesen (1619 – 1689). John Hill lists this asterism in his *Urania* in 1754 as does R. H. Allen in his *Star Names* in 1899. Crater is labelled "Josphi vel Saulus" in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists this both as "Joseph's Cup" and "Saul's Cup" in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "cup of Joseph" and attributes it to Schickard.

Joshua:

This German asterism is the IAU constellation Orion as listed by German astronomer Wilhelm Schickard (1592 – 1635) and German poet Philipp von Zesen (1619 – 1689). "Orion vel Josua" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754.

Joy:

This Greek star "Chara" (χαρά) is Beta (β) Canum Venaticorum in the IAU constellation Canes Venatici:

- Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum,* depicts "Bootes" (sic) holding the leashes of two hunting hounds, named "Chara" and "Asterion". Asterion contains Beta (β) Canum Venaticorum, and Chara contains Alpha (α) Venaticorum.

- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this as the name of one of two "jagdhunde" on leashes held by Boötes.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Chara" it in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 writes that "Hevelius had already made this the lucida of Chara's collar": Hevelius was the first to list Canes Venatici as a separate constellation (see Canes Venatici, above).
- The IAU approved the name Chara for Beta (β) Canum Venaticorum Aa in 2016. The star Alpha (α) Canum Venaticorum has now become "Cor Caroli" (see Charles' Heart, above). The name Asterion is .

Joyful:

This asterism "Iouisales" is the IAU constellation Aquila. This name is listed in Johann Bayer's *Uranometria* (1603).

Joyful Players of Eridanus:

This **telescopic** asterism "Ludibúndi Erídani" is the spiral galaxy NGC 1614 (Arp 186) in the IAU constellation Eridanus. It was discovered by American astronomer Lewis Swift in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Joykexo:

This Tupi Guarani asterism is the belt of Orion in the IAU constellation Orion which is part of their asterism "Homem Velho" (see Old Man, below).

Joyous Glittering:

This Kiribati asterism "Raiti ni bure" is the IAU constellation Coma Berenices (Trussel and Groves 1978). They also called it "String of Shells" (see below).

Ju Zi:

This Chinese asterism "Ju Zi from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Pisces (Kotyk 2017).

Judah's Lion:

This German asterism is the IAU constellation Leo as listed by German astronomer Wilhelm Schickard (1592 – 1635). "Leo de triba Iuda" ("Lion of the Tribe of Judah") is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Edward Sherburne lists it as "the Lion of the Tribe of Juda" in *his Sphere of Marcus Manilius* in 1675 and attributes it to Schickard. John Hill lists this asterism in his *Urania* in 1754. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "the Lion of Judah" and attributes it to Schickard.

Judas Thaddaeus:

This asterism is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Judas Thaddaeus Alias Aquarius and is the IAU constellation Aquarius. In his *Star Names* in 1899,

R. H. Allen reports that "New Testament Christians of the 16th and 17th centuries" identified the IAU constellation Aquarius as "Judas Thaddaeus the Apostle" but did not give any other details as to who these people were.

Jude:

This German asterism "Jude" or "St. Jude" is the IAU constellation Aquarius and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675 and it later appears in John Hill's *Urania* in 1754.

Judge:

This Korean asterism "Pansa" (판사) is a line of two stars in the IAU constellation Centaurus: Theta (θ) and Eta (η) Centauri.

Judge Directing:

This Akkadian asterism "Dayan Shisha" star is Alpha (α) Draconis (Thuban) in the IAU constellation Draco as listed by R. H. Allen in his *Star Names* in 1899.

Judge Fault:

This Korean asterism "Simpan" (심판) is a line of two stars in the IAU constellation Lacerta: 11 and 15 Lacertae.

Judge for Estimating the Age of Animals:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star 12 Hydrae in the IAU constellation Hydra.

This Chinese xing guan "Tiānjì" (天记) is the star Gamma (γ) Velorum in the IAU constellation Vela.

This Chinese Chenzhuo xing guan "Tianji" is the star Gamma (γ) Pyxidis in the IAU constellation Pyxis.

Judge for Nobility:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a box of four stars tucked inside the dipper of the Big Dipper in the IAU constellation Ursa Major (see Big Dipper, above): HIP 57477 (the determinative star), 66 Ursae Majoris, HIP 56944 and HIP 56083.

This Chinese xing guan "Tiānlǐ" (天理) is a box of four stars tucked inside the dipper of the Big Dipper in the IAU constellation Ursa Major (See Big Dipper, above): 66 Ursae Majoris, HIP 55797, 55060, and 58259. Compare this to the Korean asterism "Judge Prison" (see below).

This Chinese Chenzhuo xing guan "Tiānlǐ" is a "box" of four stars in the IAU constellation Ursa Major: HIP 57477, 66 Ursae Majoris, HIP 56944, and HIP 56083.

Judge of Heaven:

This Assyrian star "Dayan-same" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. Compare this to Life of Heaven (below).

Judge Prison:

This Korean asterism “Gam-og Pansa” (감옥 판사) is an “L” of stars in the bucket of the Big Dipper in the IAU constellation Ursa Major (see Big Dipper, above): HIP 56035, 66 Ursae Majoris, and HIP 57477. Compare this to the Chinese xing guan “Judge for Nobility” (see above).

Judge’s Stick:

This Hungarian asterism “Bírópálca” is the belt of Orion in the IAU constellation Orion.

Judging:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hydra: Gamma (γ) Hydrae (the determinative star) and HIP 66400A.

This Chinese xing guan Píng (平), also known as “Justice”, is a line of two stars in the constellation Hydra: Gamma (γ) and Eta (η) Hydrae.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Hydra: Gamma (γ) Hydrae and HIP 65835.

Judinan:

This Wardaman star is Epsilon (ε) Delphini in the IAU constellation Delphinus (Cairns and Harney 2003).

Jug:

This Greek asterism “Υδρία” (“Ydría”) is the IAU constellation Crater.

July Salt and Pepper Cluster:

See Salt and Pepper, below.

Jumper:

This Celtic (Gaulish) asterism “Lingonis” (“jumper”, “dancer”, or “fetcher”) is the IAU constellation Scorpius (Boutet 2017) and is abbreviated as “Ling” in the *Book of Ballymote*.

Junction:

This Arabic star “Al Wazl” is Gamma (γ) Sagittarii in the IAU constellation Sagittarius as listed in R. H. Allen’s *Star Names* in 1899.

Junior Officers:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of four stars in the IAU constellations Leo and Leo Minor: 60 Leonis (the determinative star), 54 Leonis, 44 Leonis Minoris, and 42 Leonis Minoris.

This Chinese xing guan Shàowēi (少微) is a triangle of stars in the IAU constellation Leo Minor: 41, 51, 52, and 54 Leonis Minoris.

This Chinese Chenzhuo xing guan “Shàowēi” is a bending line of four stars in the IAU constellation Leo: 52, 53, 54, and 60 Leonis.

Junk Star:

This Thai asterism “Dao Sam Pao” is made up of stars of the IAU constellations Canis Major, Canis Minor, and Gemini (Nitiyanant 2015). The “keel” of the junk is Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Alpha (α) Canis Majoris (Sirius) and Alpha (α) Canis Minoris (Procyon).

Juno’s Star:

This Latin star “Junonis astrum” is Alpha (α) Aquarii (Sadalmelik) in the IAU constellation Aquarius and is listed in R. H. Allen’s *Star Names* in 1899.

Jupiter and Juno Constellation:

This Latin asterism “Jovis et Junonis Sidus” is the IAU constellation Leo as listed by 1st century Roman poet Marcus Manilius.

Jupiter’s Armour:

This Latin asterism “Jovis Armiger” is the IAU constellation Aquila. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “Armiger Jovis”.

Jupiter’s Bird:

This Latin asterism “Jovis Ales” or “Alea Jovis” is the IAU constellation Aquila:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Iovis Ales” as an alternate name for Aquila.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists “Jovis Ales” as a name for Aquila.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Jovis Ales”.
- “Alea Jovis” is listed in R. H. Allen’s *Star Names* in 1899.

Jupiter’s Butler:

This German asterism “Jovis Pincera” is the IAU constellation Aquarius as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Jupiter’s Nurse:

This Latin asterism “Jovis Nutrix” is the IAU constellation Auriga. This is a reference to the Amalthean goat.

Jurrpan:

This Yolgnu star, “Jurrpan”, is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Clarke 2009, 2015). Jurrpan is a mythical ancestor of the Yolgnu who went to the sky to live in the heavens. It’s rising at sunrise in the eastern sky marked the time to harvest spike rushes.

Just Married of Hydra:

This **telescopic** asterism “Neógames Hýdrae” is the elliptical galaxy NGC 4105 in the IAU constellation Hydra. It was discovered in 1791 by William Herschel who listed it as “II 865”. It became GC 2720 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Mic hel Berger (2010): They called it this as ”together with NGC 4106, NGC 4105 has just started the formation of a couple”.

Justice:

This Chinese star “Zheng” from the Three Kingdoms to the Ming Dynasty is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Zheng” is the star Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

This Latin asterism “Justicia” is the IAU constellation Virgo.

- “Justicia” is listed as a name for Virgo in the11th century *De signis caeli (“of the signs of heaven*”).
- Johann Bayer’s *Uranometria* (1603) lists “Iusta, rectius Isutitia” (“Just, more correctly Justice”) as a name for Virgo
- Justicia is later listed by John Hill in his *Urania* in 1754.
- R. H. Allen also lists Justicia in his *Star Names* in 1899 and adds the variation “Justa”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Justicia”.

Juta:

This Estonian asterism “Juta” is a cross of stars in the IAU constellation Cygnus: Alpha (α) Cygni (Deneb), Epsilon (ε) Cygni, Gamma (γ) Cygni, Delta (δ) Cygni, and Eta (η) Cygni. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.

Juta’s Hair:

This Estonian asterism “Juta Juuksed” is the IAU constellation Coma Berenices. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.

Juta’s Veil:

This Estonian asterism is made up of stars of the IAU constellation Leo Minor. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.

K:

There are two **telescopic** “K” asterisms:

- One is Kernya 10 from the observing list of Hungarian astronomer Gábor János Kernya, and is in the IAU constellation Cepheus. Kernya describes it as “a very small group of at least 10 stars, which draw a twisted letter ‘K’… members are only 14-18 magnitude.”
- One is the open cluster NGC 6819 in the IAU constellation Cygnus. This was discovered by English astronomer Caroline Herschel in 1784. It is GC 4511 in the *General Catalogue* of 1864. Size 5’ X 5’. It is also known as the Octopus (see above), or the Fox Head (see above) and has also been described as a letter “U” or “X”.

Ka-li-tum:

See Star Star, below.

Ka Ma Tu:

This Semitic asterism from Elba, "ka` -ma-tu`", is the oldest asterism name known and is the Pleiades cluster in the IAU constellation Taurus.

KA.MUSH.Ì.KÚ.E:

This Babylonian star "KA.MUSH.Ì.KÚ.E" or "Pashittu" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda.

Ka'ahupahau:

This Hawaiian asterism is the IAU constellation Piscis Austrinus.

Kabairekereke:

This Kiribati asterism is made up of stars of the IAU constellation Scorpius (Trussel and Groves 1978). NOTE: This name is related to the name of one of their stars in this asterism, see "Baireke" above.

Kabairua:

This Kiribati star is an unidentified star in the IAU constellation Scorpius (Trussel and Groves 1978).

Kabanei:

This Kiribati star "Kabanei", "te kabanei", or "Na Kabanei" is an unidentified star in the IAU constellation Serpens (Trussel and Groves 1978). NOTE: This name is used by the Kiribati for two animals: One is the leather jacket (Alutera scripta), a swallow that lives only on the land. The other is the trigger fish (Amanses sandwichiensis).

Kabibi:

This Kiribati star "Kabibi" or "Na Kabibi" is currently unidentified (Trussel and Groves 1978).

Kachina Doll Cluster:

This **telescopic** asterism, also known as the Owl Cluster, Dragonfly Cluster, Massed Jewels, and the E.T. Cluster, is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. Two bright stars (HIP 6229 and Phi (ϕ) Cassiopeiae) are the eyes.

Káčje:

This Kaykavian asterism is the IAU constellation Ophiuchus.

Kadri's Sieve:

This Estonian asterism is the side by side open clusters known as the Double Cluster (NGC 869 and 884) in the IAU constellation Perseus (Kuperjanov 2006).

Kaffa:

This Arabic star "Kaffa" is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major (Hafez 2010).

Kagili:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing a young woman and is part of their asterism “Murabibi” (see Teenagers and Little Ones, below).

Kahe:

This Hawaiian star is Pi (π) Scorpii in the IAU constellation Scorpius.

Kai ni kabeti:

This Kiribati asterism is made up of stars of the IAU constellation Scorpius (Trussel and Groves 1978).

Kai ni Katine:

This Kiribati asterism is made up of stars of the IAU constellation Sagittarius (Trussel and Groves 1978). It is described as “trapeze in Sagittarius”.

Kaiwaka:

Māori star, “Kaiwaka”, is an unidentified star of the winter sky (Thompson 2019).

kak-kab ti-nu-ri al-ma-na-a-ti:

This Akkadian asterism “kak-kab ti-nu-ri al-ma-na-a-ti” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mulim-šu-rin-na nu-kúš-ù-e-ne

Kakkab:

This star is Alpha (α) Lupi in the IAU constellation Lupus. R. H. Allen suggested in his *Star Names* in 1899 that the Babylonian name for the star was “Kakkab Su-gub Gud Elim” (“star left hand of the horned bull”). The IAU is considering this name for the star.

Kakuhihewa:

This Hawaiian star is Beta (β) Pegasi (Scheat) in the IAU constellation Pegasus.

Kalausi:

See Whirlwind, below.

Kalev and his Children:

This Estonian asterism “Kalev” is the Hyades cluster in the IAU constellation Taurus. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique. This is a reference to Kalevi or Kaleva, an ancient Finnish ruler mentioned in Friedrich Reinhold Kreutzwald’s epic poem *Kalevipoeg*.

Kaleva’s Star:

This Finnish star “Kalevan tähti” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Kaleva’s Sword:

This Finnish asterism “Kalevanmiekka” or “Kalevan miekka” is the belt of Orion. NOTE: R. H. Allen lists this as “Kalevan Miekka” and as a “Lapland” asterism in his *Star Names* in 1899 and identifies it as Orion’s belt.

Kalidi:

This !Kung asterism is the Southern Cross in the IAU constellation Crux (Alcock 2014) plus the Pointer Stars (see Pointers below). The stars all bear men's names, with those in the Southern Cross being the names of the son's of their sky God ≠Gao N!a:

- Alpha (α) Centauri (Rigil Kentaurus): ≠Toma
- Beta (β) Centauri (Hadar) /Gaishay
- Alpha (α) Crucis (Acrux): Kxoma
- Gamma (γ) Crucis: Khan//a

Kallisto:

This Latin asterism is the IAU constellation Ursa Major. This is a reference to the myth of Kallisto and Arcas.

Kalomatu's Family:

This Tami asterism is the Pleiades cluster in the IAU constellation Taurus. Kalomatu and his family escaped up a ladder of arrows to escape the anger of this brother. When the cluster sets it marks a season where food is scarce.

Kalpeny:

This Hindu star is Beta (β) Aquarii (Sadalsuud) in the IAU constellation Aquarius. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kalpeny". This star is part of the Vedic asterism Hundred Cures (see above).

Kama Rube:

This Kiribati asterism is a quadrilateral of stars in the IAU constellation Draco (Trussel and Groves 1978). They do not specify which stars.

Kama te Irariki:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978). Compare to the Kiribati asterism "Kama" (see Rainbow Runner, above).

Kama te Kinaka:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978). Compare to the Kiribati asterism "Kama" (see Rainbow Runner, above).

Kamaiaki:

This Kiribati asterism is the IAU constellation Crux (Trussel and Groves 1978).

Kamailehope:

This Hawaiian star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus.

Kamailemua:

This Hawaiian star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Kambalia:

See Crookedness of Talons, above.

Kambar:

This Kazakh asterism is the IAU constellation Leo.

Kameang:

This Kiribati asterism is the IAU constellation Ursa Major (Trussel and Groves 1978). NOTE: Kameaang is also listed as the name of an unidentified star in this constellation.

Kameio Rariki:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978). Compare to their asterism “Kameio” (see Troublesome, below).

Kamparl-Kamparl:

This Murruwarri asterism is the Pleiades cluster in the IAU constellation Taurus (Fuller et al 2014).

Kamuy:

This Ainu star “Kamuy” is HIP 79219 (HD 145457) in the IAU constellation Corona Borealis and was given this name in the IAU NameExoWorlds campaign. Kamuy is a supernatural entity in Ainu culture. NOTE: It is listed on Stellarium as “Kamui”. It has an exoplanet named Chura: In the Ryukyuan/Okinawan language this means “natural beauty”.

Kan:

This Myanmar yathi (zodiac constellation) “Kan” (ကန့်) is the IAU constellation Virgo.

Kandaon:

This Boeotian asterism “Κανδάων” (“Kandáon”) is the IAU constellation Orion. This was their name for Ares, the God of war.

Kang:

This Kala Lagaw Ya star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. Kang is the mate of their mythical figure Thoegay and is part of their asterism Canoe (see above).

For the star Kang, see Neck, below.

Kangaroo:

This Kamilaroi/Euahlayi asterism “Bandaarr” or “Bundar” (“grey kangaroo”) is located under the belly of their asterism “Gawarrgay” (see Emu in the Sky, above) in the Milky Way, looking away from the Emu (Fuller et al 2014). This is in the IAU constellation Corona Australis. Note: This is known to the Kamilaroi/Euahlayi as the Crocodile (see above), as crocodiles are found in northern Australia. The peoples in other parts of Australia call it the Kangaroo, and the Kamilaroi/Euahlayi probably were influenced by this in using this alternate name. In 1875 William Ridley originally identified four stars in the IAU constellation Corona Australis as Bundar, but later changed this to the IAU constellation Corvus with this asterism, as did Parker in 1905.

This Gundungurra asterism “Muruai” is the Pointer stars, Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Mathews 1908).

This **telescopic** kangaroo is 19 stars tucked inside the corner of the "kite" of the IAU constellation Boötes 3.1 degrees west of Delta (δ) Boötis (Thiba). A triangle of 9th – 10th magnitude stars form the "head" with HIP 73586 at the top of the "neck" and HIP 73657 as the tip of an "ear". A line of stars forming the "back" runs from there through two 9th magnitude stars to HIP 73375 and on through a curving line of 5 9th magnitude stars forming a "tail". A shallow curve of 8th – 10th magnitude stars forms a "leg". Size 113'.

Kant of Ursa Major:

This **telescopic** asterism "Kántius Úrsae Majóris" is the face-on spiral galaxy Messier 101 (NGC 5457) in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781. The 1864 *General Catalogue* lists this as GC 3770 and John Herschel's catalogue as h 1744. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor Immanuel Kant (1724 – 1804). It is also known as the "Pinwheel" (see below).

Kantoa:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978). Kantoa was a giant son of Nao and Neiko, husband of Nei Uamumuru.

Kanya:

This Vedic rashi "Kanya" is the IAU constellation Virgo (Bhagwath 2019, Rath 2022). R. H. Allen lists "Kanya" in his *Star Names* in 1899 and translates it as "maiden". W. Brennan lists it as "Canya" in his *Hindu Astronomy* in 1896. Kanya was the mother of Krishna. The Chinese phonetically translated "Kanya" from the Vedic *Candragarbha-parivarta* in 566 as "Jiaruo" (Kotyk 2017). Bhagwath (2019) writes that it represents the energy of the God Vivasvan.

Kanyala:

This Kokatha and Ngalea star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Leaman and Hamacher 2014).

Kapakau-o-Tafahi:

See Wing of Tafahi, below.

Kapaumeta:

This Netwar star "Kapaumeta" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Ramik 2019).

Kappa:

There are two **telescopic** "kappa" asterisms:

- One is in the IAU constellation Draco and was listed as Corder 2375 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes it to John Raymond. Size 80' X 35'. This resembles the Greek letter Kappa (κ). It includes the stars 4, 6, and Kappa (κ) Draconis and HP 61564.
- One made up of stars of the IAU constellations Hercules and Ophiuchus and was listed as Corder 3179 on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida.

Corder attributes it to John Raymond. Size 20'. This resembles the Greek letter Kappa (κ) and includes the stars Iota (ι) and Kappa (κ) Ophiuchi, HIP 83342A, and 43 and 47 Herculis.

Kappas:

This **telescopic** asterism is made up of a pair of stars of the IAU constellation Taurus: Kappa (κ) 1, and 2 Tauri. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels these the "Kappas".

Kapteyn's Star:

This **telescopic** variable star is VZ Pictoris (HIP 24186, HD 33793) in the IAU constellation Pictor (magnitude 8.85). It was discovered by Dutch astronomer Jacobus Kapteyn in 1898. It is an M1 red subdwarf star and the closest halo star to Earth. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Kapteyn's Star". Two exoplanets were discovered orbiting this star in 2014.

Kapuahi:

This Hawaiian star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Kara:

This Kiribati star "Kara" or "Na Kara" is currently unidentified (Trussel and Groves 1978). This name has several translations, including "layer of hard soil", "large packet of fish", or "old person" and I'm unsure which refers here.

Karajema's Will:

This Estonian asterism "Karajema Tähed" is made up of stars of the IAU constellation Andromeda (Kuperjanov 2006).

Karaka:

This **telescopic** Māori star is HIP 76351A (HD 137388) in the IAU constellation Apus (magnitude 8.70). It was given this name in the IAU NameExoWorlds campaign. It is named for a plant that produces orange fruit. It has an exoplanet named Kererū, which is their name for the bush pidgeon.

Karakat:

This Myanmar yathi (zodiac constellation) "Karakat" (ကရကဋ်) is the IAU constellation Cancer.

Karakurt:

This Kazakh asterism is the IAU constellation Cassiopeia.

Karambal:

This Yolngu star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. Karambal made off with one of the Mayi Mayi (see Seven Young Sisters, below). He was pursued and climbed a tree, which was set on fire, and the flames carried him up into the sky where he retains the color of the fire.

This Bunjalung star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. Karambal fell in love with one of the Wareenggary (see Seven Young Women, below) and for this was burnt by Bullabogabun,

a great warrior, whose wife Karambal seduced once the Wareenggary fled into the sky. This was listed in Folklore of the Australian Aborigines, Science of Man, Vol. 1, 1898, p. 119.

Karantika:

This Banjar and Meratus Dayak asterism is the Pleiades cluster in the IAU constellation Taurus.

Karatgurk:

This Kulin Nations asterism "Karatgurk" is the Pleiades cluster in the IAU constellation Taurus (Massola 1968).

Karbana:

This Egyptian star "Karbana" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. A poet in the time of Thutmose III mentions it as "the star which pours his light in a glance of fire, when he disperses the morning dew". In his *Star Names* in 1899, R. H. Allen writes that this appears as "Kabarnit" in the time of Assyrian king Ashurbanipal (669 – 631 B.C.E.).

Karduna:

This Kokatha and Ngalea star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Leaman and Hamacher 2014).

Kareke uouan Nei Auti:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Karekea te Baraitoa:

The stars of this Kiribati asterism are currently unidentified (Trussel and Groves 1978).

Karma Goleb:

This Tibetan asterism is made up of stars of the IAU constellation Perseus (Johnson-Groh 2013).

Karma Mar:

This Tibetan asterism is made up of stars of the IAU constellation Scorpius (Johnson-Groh 2013). Johnson-Groh names one of the stars as Alpha (α) Scorpii (Antares).

Karma Mindrup:

This Tibetan khyim (zodiac constellation), also known as "Karma Karchen" or "Torang Karchen" (see Big Early, above), is probably the Big Dipper asterism in the IAU constellation Ursa Major (Johnson-Groh 2013).

Karma Rikchu:

This Tibetan khyim (zodiac constellation), also known as "Karma Rikche", is the Northern Cross asterism in the IAU constellation Cygnus (see Northern Cross below).

Kārtavīrya:

This Vedic star is "Kārtavīrya" or "Kartavirya" is Kappa (κ) Orionis in the IAU constellation Orion.

Kārtikeya:

This Vedic star “Kārtikeya” or “Kartikeya” is Gamma (γ) Orionis in the IAU constellation Orion.

Kasapa:

“Kasapa” is a Vedic name for the IAU constellation Cassiopeia (Bhagwath 2019).

Kàške:

This Chakavian asterism is the IAU constellation Ophiuchus.

Katakora:

This Kiribati asterism “Katakora” is made up of stars of the IAU constellation Canis Minor (Trussel and Groves 1978).

Kathaca:

This Sinhalese asterism is the IAU constellation Cancer.

Kathryn’s Wheel:

This **telescopic** asterism is PGC 58985, an interacting galaxy in the IAU constellation Ara. This was discovered in 2015 and is the closest collisional ring galaxy to the Milky Way (~ 30 million light years).

Kaua-mea:

This Hawaiian asterism is the IAU constellation Corona Borealis.

Kaukupenga:

This Tongan asterism is the IAU constellation Corona Borealis. There is some discussion as to whether the name of this asterism is Ao-o-Uvea.

Kaus Australis:

See Southern Bow, below.

Kaus Borealis:

See Northern Bow, below.

Kaus Media:

See Middle Bow, below.

Kaveh:

This telescopic Iranian star “Kaveh” or “Kāve” is HIP 92895 (HD 175541) in the IAU constellation Serpens (magnitude 8.00). It was given this name in the IAU NameExoWorlds campaign. It is the name of a hero of Ferdowsi’s epic poem *Shahnameh*. It has an exoplanet named Kavian: This is a reference to a banner called Derafsh Kaviani (“banner relating to Kaveh”).

Kayeb’s Pets:

This Palikur asterism is two dark clouds in the Milky Way near the IAU constellation Scorpius (Green and Green 2011). They are two jaguars hunting a deer, whose horns (“gituw”) appear in the tail of Scorpius. Some Palikur refer to these jaguars simply as “Two Jaguars” (see below).

Kealohalani-po-keao:

This Hawaiian star is Beta (β) Cassiopeiae (Caph) in the IAU constellation Cassiopeia.

Keawe:

This Hawaiian star is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus.

Keen-Eyed One:

This Greek asterism "Χάρωψ" ("Chárops") is the IAU constellation Hercules.

Keenan's System:

This **telescopic** asterism Arp 104, is a pair of interacting galaxies in the IAU constellation Ursa Major:

- Spiral galaxy NGC 5216, and
- Globular galaxy NGC 5218.

These two galaxies were discovered by English astronomer William Herschel in 1790. This system is named after the American astronomer Philip C. Keenan who studied them in 1935 and published a paper on the bridge of galactic material connecting the two galaxies.

Keeper of Goats:

This constellation "Custos Caprarum" is the IAU constellation Auriga. Johann Bayer's *Uranometria* (1603) lists the name "Custos Caprarum" for Auriga. The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Custos Caprarum".

Keeper of Heaven:

This Arabic star "ħāris al-samā'" (حارس السماء) or "Al Ḥāris al Samā" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo. R. H. Allen translates this as "Guardian of the North" in his *Star Names* in 1899 and lists it as a name of Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. Allen may be confusing this with their star Keeper of North (see below).

Keeper of North:

This Arabic star "ħāris al-shamāl'" (حارس الشمال), later latinized to "Haris-el-sema", is Alpha (α) Virginis (Spica) in the IAU constellation Virgo. John Hill lists this as "Huzme" in his *Urania* in 1754.

Keeper of the Goats:

This Latin asterism "Custos Caprarum" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below) and appears in Ovid's *Metamorphoses*.

Keeper of the Ostriches:

This Persian star "Rai al Naaim" is Lambda (λ) Sagittarii in the IAU constellation Sagittarius as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650 and is part of the asterism Going Ostriches (see above). listed it as "Rāʿi al Naʿāïm". Edward Sherburne attributes "Al Naâim" ("the ostriches") to Persian astronomer Ulugh Beg Mirza (1394 – 1449), and cites "Dr. Hyde" translating this as "cattle" which is absurd: Apparently he made this assumption as Mohammed Tizinus showed them in his tables with a shepherd nearby. Of course this "shepherd" is the "keeper" of the ostriches.

This Arabic star “Rāʿi al Naʿāïm” (ألراع آلنعم) is Lambda (λ) Sagittarii in the IAU constellation Sagittarius and was listed under this name by the 16th century Arabic astronomer Al Tizini and is part of the asterism Going Ostriches (see above).

This Latin asterism “Pastor Struthionum” is Lambda (λ) Sagittarii in the IAU constellation Sagittarius.

Keeper of the Oxen:

This asterism “Custos Boum” is the IAU constellation Boötes as described by 2nd century Roman poet Juvenal and as listed by French astronomer Jérôme Lalande.

Keeper of the Underworld:

This Latin asterism “Janitor Lethaeus” is the IAU constellation Canis Major and is a reference to Cerberus, the three headed dog that guarded the entrance to the underworld.

Keeper of the Wain:

This Latin asterism “Plaustri Custos” is the IAU constellation Boötes. It is derived from the Greek asterisms Bear Watcher (see below) and Guardian of the Bear (see below) and related to the various asterisms listed in this handbook that refer to the IAU constellation Ursa Major as a “wain”. 1st century Roman poet Publius Ovidius Naso (Ovid) suggested the wain when he wrote “interque Triones Flexerat obliquo plaustrum temone Bootes” (“and among the Bears, I turned my cart obliquely from the Dipper”. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Custos Plaustri” as an alternate name for Boötes. Johann Bayer’s *Uranometria* (1603) lists “Plaustri Custos” as an alternate name for Boötes.

Keepers:

This French asterism is the stars Alpha (α) Ursae Majoris (Dubhe) and Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major as listed by French astronomer Dominique François Jean Arago (1786 – 1853).

Keid:

See Broken Egg Shells, above.

Kemble's Cascade:

This **telescopic** asterism, Kemble 1 in the asterism list of RASC member Father Lucien Kemble (1922 – 1999), is a chain of about 20 7th to 9th magnitude stars: One end of the chain is the star HIP 18172, and the line runs through HIP 18406, 18395, 18505, 18525, double stars HIP 18818 and 18884 and ends in open cluster NGC 1502 in the IAU constellation Camelopardalis (which is another **telescopic** asterism, see Jolly Roger, above). NGC 1502 is the “pool” that the cascade runs into. Size 180’ X 180’. American astronomer and author Phil Harrington reports that once Kemble found it, he told American astronomer Walter Scott Houston about it, and Walter made the rest of the world aware of it. Harrington made it Harrington 3 on his list. This is O’Meara 20 on astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Kemble’s Kite:

See Kite below.

K'empapi:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Kenmu:

This Egyptian decan "Kenmu" was in the IAU constellation Sagittarius. In later Hellenistic texts it was named "ⲕⲟⲛⲓⲙⲉ" ("Konime"). In the Testament of Solomon, it became "Axesbyth" or "Phêth", Aristobulus of Paneas called it "Satan", in Greek Hermeticism it became "Chthisar", in Latin Hermeticism "Renethis", Roman astrologer Julius Firmicus Maternus called it "Chenene" or "Chenem", Cosmas of Maiuma (d. 760) called it "Ananke", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Chenen" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲧⲉⲣⲁⲫ" ("Teraph"). Variations include "Khthisar". It has been depicted as a crowned elderly man wrapped from chest to heels with a flask in his right hand and a scepter in his left.

Kenmut:

This Egyptian decan "Kenmut" was in the IAU constellation Cancer. In later Hellenistic texts it was named "ϫⲛⲟⲩⲙⲓⲥ" ("Knum"). In the *Testament of Solomon*, it became "Saphthorael" or "Saphathoraél", Aristobulus of Paneas (2nd century B.C.E.) called it "Hellors", in Greek Hermeticism it became "Chnouphos", in Latin Hermeticism "Charmine", 4th century Roman astrologer Julius Firmicus Maternus called it "Thiumis" or "Thumus", Cosmas of Maiuma (d. 760) called it "Hekate", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Thuimis" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲙⲉⲣⲕⲟⲫϯ" ("Mercophta"). Variations include "Khnouphos". It has been depicted as a torso on a pedestal with two female faces turned away from each other, one with a hat, one with a necklace of dragons.

Kenós:

This Selk'nam star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. Kenós is the creator of the Selk'nam world.

Keoe:

This Hawaiian star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. This is one of the three stars of the Navigator's Triangle (see below). Note: Some researchers believe that this name was originally applied to the entire constellation of Lyra, not just Vega.

Képeci:

This Kaykavian asterism is the Hyades cluster in the IAU constellation Taurus.

Kepheus:

This Greek asterism Κηφεύς is the IAU constellation Cepheus as it appeared in the 2nd century in Ptolemy's *Almagest*:

- The "body" is a line of stars from Epsilon (ε) Cephei through Zeta (ζ) Cephei to "shoulders" at Xi (ξ) Cephei and "hips" at Beta (β) Cephei,
- One "arm" runs from Xi (ξ) Cephei to Iota (ι) Cephei,
- One "arm" runs from Xi (ξ) Cephei through Alpha (α) Cephei (Alderamin) and Eta (η) Cephei to Theta (θ) Cephei,
- One "leg" runs from Beta (β) Cephei to Gamma (γ) Cephei, and

- One “leg” runs from Beta (β) Cephei to Kappa (κ) Cephei.

Kepler’s Supernova:

This **telescopic** asterism is supernova remnant Kepler’s Supernova, Kepler’s Nova, or Kepler’s Star, SN 1604, is in the IAU constellation Ophiuchus. It is the remnants of a type 1a supernova recorded by German astronomer Johannes Kepler in 1604.

Ker-khept-sert:

This Egyptian decan “Ker-khept-sert” was in the IAU constellation Aquarius. In later Hellenistic texts it was named “Xu”. In the Testament of Solomon, it became “Ichthion”, Aristobulus of Paneas called it “Anafa”, in Greek Hermeticism it became “Sosomo”, in Latin Hermeticism “Luxois”, Roman astrologer Julius Firmicus Maternus called it “Cratero” or “Astiro”, Cosmas of Maiuma (d. 760) called it “Phobos”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Astiro” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “вογκογλѧ” (“Vucula”).Variations include “Sosomno”. It has been depicted as a crowned man wrapped from chest to heels, holding an ankh.

Kermit the Tadpole:

This **telescopic** asterism is the open cluster NGC 6633 (Caldwell 10) in the IAU constellation Ophiuchus. It was discovered by English astronomer Caroline Herschel and recorded by her brother William Herschel in 1788: William listed it as “VIII 72”. It is GC 4410 in the *General Catalogue* of 1864. It was given this name by American astronomer John Chiravalle. Size 45’ X 30’. This is also known as the Tweedledum Cluster (see below), Captain Hook Cluster (see above), the Otter and Ball (see below), and the Wasp Waist Cluster (see below). This is named for Jim Henson’s character Kermit the Frog, who first performed in 1955. Jeffrey Corder lists this as Corder 3571.

Ketpholtsuman:

This star is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671). We’ve no idea what the origin of this name was.

Kewatino Achak:

This Ininew (Cree) star (Buck 2016) is Alpha (α) Ursae Minoris (Polaris).

Key:

This Greek lunar mansion is possibly the stars of the IAU constellation Aquila and is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

This **telescopic** asterism Sánta 72, listed in 2007 by Hungarian astronomer Sánta Gábor, is a group of 10th – 12th magnitude stars in the IAU constellation Canis Major. Gábor describes it as a “key-like asterism [including] doubles”.

Keyhole Nebula:

There are two **telescopic** “Keyhole” asterisms:

- One is the HII region NGC 3372 (Caldwell 92) in the IAU constellation Carina. It was discovered by French astronomer Nicolas Louis de Lacaille in 1752 and listed in his catalogue as “III 6”. It is GC 2197 in the *General Catalogue* of 1864. American astronomer Sherburne Wesley Burnham

(1838 – 1921) lists it under the name "Keyhole Nebula" in *Burnham's Celestial Handbook*. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Keyhole Nebula". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Keyhole Nebula" as a name for this nebula. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists it as the "Keyhole" and makes it O'Meara 30. It is also known as the Eta Carina Nebula, the Gabriela Mistral Nebula and the Homunculus Nebula.

- One is reflection nebula NGC 1999 (vdB 46, LBN 979, Ced 55i) in the IAU constellation Orion. This was discovered by English astronomer William Herschel in 1785: Herschel described it as "a star with milky chevelure or vB nucleus with milky nebulosity" and listed it as "IV 33" in his catalogue. It is GC 1202 in the *General Catalogue* of 1864. The Helwan Observatory Bulletin No. 21 of 1920 describes it as a "dense glove with an absolutely dark triangular hole cutting into it." Robert Zebahl lists NGC 1999 as the Keyhole on his *Faint Fuzzies* website. It is also known as the Black Eye Nebula (see above), the Rubber Stamp Nebula (see above), the Thirteenth Pearl Nebula (see below) and "Africa" (see above).

Keystone:

There is, of course, a Keystone asterism in the IAU constellation Hercules (see Keystone of Hercules below), but there is another **telescopic** keystone in the IAU constellation Cetus. The corners are the stars HIP 1660, 1915, 1765, and 1957. This appears in *Pattern Asterisms* by American astronomer John A. Chiravalle and is Corder 84 on the list of American astronomer Jeffrey Corder.

Keystone of Hercules:

The four central stars in the IAU constellation Hercules form a wedge-shaped quadrilateral resembling the keystone of an arch: Epsilon (ε) Herculis, Zeta (ζ) Herculis, Eta (η) Herculis, and Pi (π) Herculis. Compare this to Cornerstone, above.

Khabasiranu:

This Seleucid asterism is in the IAU constellations Eridanus and Fornax. It is a rough oval of stars with a single star line projecting from one end. The oval of stars is made up of Tau (τ) 3, 4, 5 and 6 and Upsilon (υ) 2, 3 and 4 Eridani, and Alpha (α) Fornacis (Dalim). From Tau (τ) 3 Eridani a line goes out to the star Tau (τ) 1 Eridani. Compare this to the Akkadian asterism Habasiranu (see above).

Khambalia:

See Crookedness of Talons, above.

Khan//a:

This !Kung star is Gamma (γ) Crucis in the IAU constellation Crux (Alcock 2014). Khan//a is one of the sons of their sky God ≠Gao N!a and is part of their asterism Kalidi (see above).

Khanish:

This Seleucid star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus. Compare this to the Babylonian star Hanis. It is part of the "foot" of their asterism Numushda (see below).

Khanuwy Fish:

This ancient Egyptian asterism “Khenwy” is made up of the stars of the IAU constellation Sagittarius. It is a quadrilateral of four stars: the double star Beta (β) 1 and 2 Sagittarii (Arkab), a, and i Sagittarii, and HIP 97749. Nearby is their “Net” asterism (see below).

Khem:

This asterism is the IAU constellation Perseus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807), who claimed this was the name of an Egyptian God. This is probably a reference to the Egyptian God Khnum, who was God of the Nile River. NOTE: Khem is derived from the Egyptian “kmt”, which means “Egypt”, which became the Greek “Χημία “ (Khēmía) or Bohairic Coptic “ϧⲏⲙⲓ” (khēmi, “Egypt”).

Khent-heru:

This Egyptian decan “Khent-heru” was in the IAU constellation Pisces. In later Hellenistic texts it was named “ⲧⲡⲏⲃⲓⲟⲩ” (“Xont-har”). In the *Testament of Solomon*, it became “Phtheneoth” or “Phthenoth”, Aristobulus of Paneas (2nd century B.C.E.) called it “Larvata”, in Greek Hermeticism it became “Sopphi”, in Latin Hermeticism “Flugmois”, 4th century Roman astrologer Julius Firmicus Maternus called it “Tepibui” or “Tepabiu”, Cosmas of Maiuma (d. 760) called it “Dolos”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Thopibui” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲥⲟⲟⲩⲣⲟⲩⲧ” (“Sourut”). This has been depicted as a naked man with a coat on his shoulders, flask in his right hand, and his left index finger at his lips.

Khent-kheru:

This Egyptian decan “Khent-kheru” was in the IAU constellation Aries. In later Hellenistic texts it was named “ϧⲟⲛⲧⲁⲣⲉ” (“Xont-har”). In the *Testament of Solomon*, it became “Rhyax” or “Ruax”, Aristobulus of Paneas (2nd century B.C.E.) called it “Bendonc”, in Greek Hermeticism it became “Chenlachori”, in Latin Hermeticism “Aulathamas”, 4th century Roman astrologer Julius Firmicus Maternus called it “Senator” or “Asiccan”, Cosmas of Maiuma (d. 760) called it “Aidoneus”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Asiccan”, and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲁⲣⲟⲩⲉⲣⲓⲥ” (“Arueris”). Variations include “Khenlakhori”. It has been depicted as a young child holding a scepter above its head.

Khentet-hert:

This Egyptian decan “Khentet-hert” was in the IAU constellation Libra. In later Hellenistic texts it was named “ϧⲟⲛⲧⲁⲣⲉ” (“Xont-har”). In the *Testament of Solomon*, it became “Alath”, Aristobulus of Paneas (2nd century B.C.E.) called it “Pieret”, in Greek Hermeticism it became “Phou”, in Latin Hermeticism “Psamiatois”, 4th century Roman astrologer Julius Firmicus Maternus called it “Senta” or “Aepiten”, Cosmas of Maiuma (d. 760) called it “Loimos”, French scholar Joseph Justus Scaliger (1540 - 1609) called it “Arpien” and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it “ⲟⲫⲓⲟⲛⲓⲟⲥ” (“Ophionius”). It has been depicted as a crowned man with a serpent face.

Khentet-khert:

This Egyptian decan “Khentet-khert” was in the IAU constellation Scorpius. In later Hellenistic texts it was named “ϧⲟⲛⲧⲁϧⲣⲉ” (“Spt-χne”). In the *Testament of Solomon*, it became “Audameoth”, Aristobulus of Paneas (2nd century B.C.E.) called it “Haziza”, in Greek Hermeticism it became “Name”, in Latin Hermeticism “Necbeuos”, 4th century Roman astrologer Julius Firmicus Maternus called it “Sentacer” or “Asente”, Cosmas of Maiuma (d. 760) called it “Nymphs”, French scholar Joseph Justus

Scaliger (1540 - 1609) called it "Sentacer" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲁⲣⲓⲙⲁⲛⲓⲟⲥ" ("Arimanius").

Kher-khept-Kenmut:

This Egyptian decan "Kher-khept-Kenmut" was in the IAU constellation Leo. In later Hellenistic texts it was named "ϧⲁⲣϧⲛⲟⲩⲙⲓⲥ" ("Xar-Knum"). In the *Testament of Solomon*, it became "Phobothel" or "Bobêl", Aristobulus of Paneas (2nd century B.C.E.) called it "Jarea", in Greek Hermeticism it became "Chnoumos", in Latin Hermeticism "Zaloias", 4th century Roman astrologer Julius Firmicus Maternus called it "Craumonis" or "Abruicois", Cosmas of Maiuma (d. 760) called it "Hephaistos", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Aphruimis" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲧⲟⲩⲫⲱⲉⲟⲩⲥ" ("Typhon"). Variations include "Khnoumos". It has been depicted as a lion with a serpent's body.

Khongjom Nubi:

This Meitei asterism "Khongjom Nubi" is the Pleiades cluster in the IAU constellation Taurus.

Khukhu:

This Egyptian decan "Khukhu" was in the IAU constellation Aquarius. In later Hellenistic texts it was named "ⲧⲡⲏϧⲩ" ("Tpa-Biu"). In the *Testament of Solomon*, it became "Achoneoth" or "Agchoniôn", Aristobulus of Paneas (2nd century B.C.E.) called it "Simos", in Greek Hermeticism it became "Chonoumous", in Latin Hermeticism "Crauxes", 4th century Roman astrologer Julius Firmicus Maternus called it "Tepis" or "Amasiero", Cosmas of Maiuma (d. 760) called it "Osiris", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Tepisatras" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲡⲣⲟⲧⲉⲟⲩⲥ" ("Proteus"). Variations include "Khonoumous". It has been depicted as a crowned man wrapped from chest to heels, holding a flask in the right hand and a scepter in the left.

Kiblat:

This Banjar asterism "Kiblat" or "Qiblah" is the belt of Orion in the IAU constellation Orion. For the Banjar, these stars point toward the Kaaba in Mecca.

Kick the Can Cluster:

This **telescopic** asterism is the globular cluster NGC 4147 in the IAU constellation Coma Berenices. It was discovered by English astronomer William Herschel in 1784 who listed it as "I 19". It is GC 2752 in the *General Catalogue* of 1864. NOTE: Kick the Can was a popular kid's game in the 1930s.

Kid:

This Latin star "Haedus" or "Haedus II" is Eta (η) Aurigae in the IAU constellation Auriga. It is part of the asterism Capra and Haedi (See Kids, below).

This Turkish asterism "oğlak" is the IAU constellation Capricornus. Edward Sherburne lists it as "Uglack" in his *Sphere of Marcus Manilius* in 1675, as does John Hill in his *Urania* in 1754.

Kid of the Sea:

This Latin asterism "Aequoris Hircus" is the IAU constellation Capricornus. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Aequoris Hircus" as an alternate name for Capricornus. Compare this to Hill's "Sea Goat", below.

Kidney:

This Babylonian asterism "MUL.BIR" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and listed in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul bir" (Koch-Westenholz 1995) is the IAU constellation Puppis.

This Babylonian star "BIR" or "kalitu" as listed by Anthony Hope in his *A Guide to Ancient Near Eastern Astronomy* in 1996 is Zeta (ζ) Puppis in the IAU constellation Puppis.

This Akkadian asterism "Kalitu" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Puppis.

Kidney Bean:

This **telescopic** asterism is NGC 4774, a ring galaxy in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1787 who listed it as "III 526". It is GC 3284 in the *General Catalogue* of 1864.

Kidron:

This German asterism is the IAU constellation Eridanus as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Kidron is a valley near Jerusalem.

Kids:

This Greek asterism "Ερι φοι" or "Érifoi" is in the IAU constellation Auriga and was first described by Aratus in the 3rd century B.C.E. The Romans gave it the name "Capra et Haedi" Capra is the Roman name for Alpha (α) Aurigae (Capella- see She-Goat, below) and Haedi is "kids". It is a triangle of stars near the star Alpha (α) Aurigae (Capella), the "she goat". The three "goatlings" or "Haedi" are the stars Zeta (ζ) Aurigae (Saclateni or Haedus I), Eta (η) Aurigae (Haedus), and Epsilon (ε) Aurigae (Almaaz).

Propertius (50 – 15 B.C.E.) called them "Haedus" ("the kid").

This asterism was known to Pliny the Elder (24 – 79) and 1st century Roman astrologer Marcus Manilius as "the Goatlings,".

Ptolemy (c.100 – c.170) merged the Charioteer and the Kids in his 2nd century *Almagest*. The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") lists "Hedulo" ("kids").

Dorn (1829) lists this as "Goat and He-Goats" as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

Robert Hues lists this asterism "young kids" in his *A Learned Treatise of Globes* in 1659 and refers to the star Capella as "the little goat".

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) labels this asterism "Capra".

German astronomer Johann Bayer (1572-1625) gave them the plural name "Capellae".

This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Capella seu Capra".

John Hill gives them the name "Hoedi" in this *Urania* in 1754.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels this asterism "la Chevre" and depicts it as a goat being held by "le Cocher" (Auriga).

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Haedi, or two stars Zeta and Eta in the arm of Auriga".

This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "duo Haedi": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism as "the Kids".

Compare this to the Norwegian "Kittens", below. This asterism is often listed on modern observing lists as a **telescopic** asterism but obviously it was known long before the invention of the telescope.

This asterism is found in Romanian sky lore, where it is called "She-Goat and Three Kids" (see below).

This Arabic asterism "Al 'Ināz" is this Greek asterism as listed by Persian astronomer Zakariya al-Qazwini (1203 – 1283).

This Lithuanian asterism "Hoedi" is the stars Zeta (ζ) Aurigae (Saclateni or Haedus I), Eta (η) Aurigae (Haedus), and Epsilon (ε) Aurigae (Almaaz) in the IAU constellation Auriga.

Kikianalia:

This Hawaiian star is Alpha (α) Virginis (Spica) in the IAU constellation Virgo.

Kill:

This Chinese xiù (lunar mansion) "Liu" (𣍐)from the from the Tang Dynasty (618 – 907 C.E.) is in the IAU constellation Hydra (Kotyk 2017) and is compared to the Vedic nakshatra Ashlesha (see Embracer, above). Compare to the later Chinese xiù "Zhāngxiù" (see Extended Net, above) and their xing guan "Zhéwēi" (see Executions, above).

Killing:

This Chinese star "Sha" from the Three Kingdoms to the Ming Dynasty is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major.

Kîmāh:

This Hebrew asterism "Kîmāh", "Kimah", or "Kim'oh" (Rubin 2019) from their Tanakh, (כִּימָה), may be the Pleiades cluster, the star Alpha (α) Tauri (Aldebaran), the star Alpha (α) Boötis (Arcturus), or the star Alpha (α) Canis Majoris (Sirius). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Chimah" as a name for Taurus and the Pleiades cluster.

Kimono Sleeve Stars:

This Japanese asterism "Sode Boshi" is the IAU constellation Orion.

Kindly Disposed of Tucana:

This **telescopic** asterism "Phílophron Túcanae" is the interacting galaxies IC 5250 in the IAU constellation Tucana. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One*

Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “IC 5250 consists of a quiet pair of closely interacting galaxies, like a kindly kissing couple”.

Kindness:

This Chinese star “Shan” is Sigma (σ) Sagittarii in the IAU constellation Sagittarius and is part of their xiù (lunar mansion) “Dǒuxiù” (斗宿) – see Dipper, above.

This Chinese Chenzhuo xing guan “Shan” is the star Sigma (σ) Sagittarii in the IAU constellation Sagittarius.

King:

This Hawaiian asterism “Ka Mō’i” is the IAU constellation Cepheus.

This Babylonian star “MUL.LUGAL” (Hunger 1992) or “LUGAL” (Hunger and Sachs 1988, Anthony 1996) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and listed as “mul lugal” in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo. This also appears in later Seleucid sky lore. R. H. Allen lists the name “Sharru” in his *Star Names* in 1899 as does Anthony Hope in his *A Guide to Ancient Near Eastern Astronomy* in 1996.

This Babylonian asterism “LUL.LA” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996, translates it as “false” and describes it as “probably not a real star”. It has been identified in other lists as Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This Sumerian asterism “mullul-la” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

This Persian star “Sarru” from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo in Franz Boll’s *Ancient Observations of Coloured Stars* in 1918. Boll also lists “Pa” and “lugal” as “not yet identified. Ernst Weidner lists it as “lugal” in his *Fixsterne* in 1971.

This Akkadian asterism “sa-ar-ri” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is Alpha (α) Leonis (Regulus) in the IAU constellation Leo. Anthony Hope lists it as “sarru” in his *A Guide to Ancient Near Eastern Astronomy* in 1996 but describes it as “probably not a real star”. It is listed as “Sarru” *Astrological Reports to the Kings* of the late Assyrian period (Parpola 1993, Hunger 1992).

This Egyptian Dendera star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Hoffman 2017) and part of their asterism Lion (see below).

This Latin star “Rex” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo in R. H. Allen’s *Star Names* in 1899.

King Arthur:

Several British authors make references to the IAU constellation Orion as King Arthur:

- English author Sir Walter Scott mentions him in his *Lay of the Last Minstrel* (1805), which also refers to the IAU constellation Ursa Major as “the Northern Bear”, and

- Scottish author William Sharp (1855 – 1905, writing as Fiona MacLeod) refers to Arcturus in the IAU constellation Boötes as King Arthur.

King Cobra:

This **telescopic** asterism, also known as the Pac-Man Cluster and the Golden Eye Cluster, is the open cluster Messier 67 in the IAU constellation Cancer. It was discovered by German astronomer Johann Gottfried Koehler in 1779. The General Catalogue of 1864 lists it as GC 2682 and John Herschel's catalogue lists it as h 531.

King David's Chariot:

This Irish asterism is the Big Dipper Asterism in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899, which Allen describes as "from one of that island's early kings". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "David's Car". Compare to David's Chariot, above.

King David's Harp:

This Welsh asterism is the IAU constellation Lyra. R. H. Allen attributes it to Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?) in his *Star Names* in 1899.

King Fish:

This Kiribati star "Urua" is currently unidentified (Trussel and Groves 1978). This is a fish of the family Carangidae.

King Hamlet's Ghost:

This **telescopic** asterism is NGC 3628, a spiral galaxy with a prominent dust lane in the IAU constellation Leo. This was discovered by English astronomer William Herschel in 1784 who listed it as "V 8" in his catalogue. It is GC 2378 in the *General Catalogue* of 1864. It is also known as Sarah's Galaxy (see below), the Hamburger Galaxy (see above), the "Northernmost of Leo" (see below), and the Vanishing Galaxy (see below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 58 and lists the names "Hamburger Galaxy" and "Sarah's Galaxy".

King of Babylon:

This German asterism is the IAU constellation Cepheus as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and later in John Hill's *Urania* in 1754. Both attributes this to "Harsdorf" or "Harsdorfius", which would be German poet, jurist and translator Georg Philipp Harsdörffer (1607 – 1658).

King of the Stars:

This Micronesian asterism from the Marshall Islands is the Pleiades cluster and is part of their asterism Creation of the Sky (see above). This represents the youngest son of Ligedaner (see Mother of the Stars, below). The oldest son is Dümur (see above).

King Trishanku:

This Vedic asterism is the IAU constellation Crux (Bhagwath 2019). Trishanku was a king of the Ishvaku dynasty mentioned in the Valmiki Ramayana who was a disciple of Vishwamitra.

King Vulture:

This Shipibo asterism is made up of stars of the IAU constellations Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Green and Green 2011).

This Carib asterism "Anuwanayuman" or "Anuwana" represents the King Vulture (Gypagus papa), but its present location is unknown (Magaña, and Jara, 1982). This is the vulture that brought Epietembo (see One-Legged Hunter) into the sky.

King Yama:

This Chinese translation "Yánluó wáng" (閻羅王) or "King Yama" of the Vedic asterism Yama from the *Xiuyao jing* (宿曜經) (759 and revised 764) is the IAU constellation Gemini (Kotyk 2017). Compare to the Hindu asterism Lord Yama (below).

Kingdoms:

This Belarussian asterism "каралеўствaў" is in the IAU constellation Gemini. The "kingdoms" are the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux), which represent the Great Lithuanian Princedom and the Polish Kingdom.

Kingfisher:

This Palikur asterism "Tavara" is made up of stars of the IAU constellations Aquila: Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Green and Green 2011).

This Samoan asterism "Ti'otala" is the IAU constellation Delphinus (Fitisemanu 2022). This kingfisher is stalking "Sē" (see Grasshopper, above).

This Carib asterism "Sagasagayuman" or "Sagasaga" represents a kingfisher bird (Megaceryle alcyon) and is the IAU constellation Delphinus (Magaña, and Jara, 1982).

Kingly:

This Arabic star "Malikiyy" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Meliki, or kingly"
- "Malikiyy" is listed in R. H. Allen's *Star Names* in 1899.

This star is Alpha (α) Ursa Minoris (Polaris) in the IAU constellation Ursa Minor as listed in Edward Sherburne's Sphere of Marcus Manilius in 1675. Sherburne also calls it "Rex" and explains "quia olim erat prope polum immobilis, quam Reli|quae Omnes Stellae venerabantur" ("once upon a time, he was near the immovable pole, which the rest of all the stars worshipped"). Sherburne attributes this name to the German Jesuit missionary and polymath Johann Schreck Terrentius (1576 – 1630). NOTE: The Chinese names for this star are the "Origin of All Things" (see below), "Curved Array 1" or the "Northern Star" (see below).

Kings:

This Korean asterism "Wang" (왕) is a long line of stars in the IAU constellation Taurus: 103, 98, Chi (χ), Psi (ψ), and 41 Tauri, and HIP 17954A.

King's Belt:

This Romanian asterism “Cingătoarea Regelui” is the belt of Orion in the IAU constellation Orion (Ottescu 2009).

Kings from the East:

This Romanian asterism “Craii de la Răsărit” is the belt of Orion in the IAU constellation Orion (Ottescu 2009). Their names are Saul, David, and Solomon.

King’s Horse:

This German asterism is the IAU constellation Equuleus and was named by German poet Philipp von Zesen (1619 – 1689). He described it as the horse that Haman in the Book of Esther hoped for.

King’s Ring:

This American **telescopic** asterism is the planetary nebula IC 1454 in the IAU constellation Cepheus. This name was posted by American astronomer Dragan Nikin on the *Deep Sky Forum* in October 2019.

Kings of Ammon:

This asterism “Ταμετοῦρο Αμοῦν”, “Tametoúro Amoún”, or “Regum Ammonis” is the IAU constellation Aries as listed by German Jesuit scholar Athanasius Kircher (1602 – 1680). This related to a belief that to the Egyptians it represented the King of Gods and related to their God Amen.

Kip-pat:

This Babylonian and Sumerian ziqpu from the Babylonian star catalogue BM 78161 (Liechty 1988, Leitz 2019) is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis, is the third ziqpu on this list and is part of their asterism Dignity (see above). Compare this to Kipparti (see below).

Kipparti:

This Babylonian ziqpu “mulGAM-ti” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis. Compare this to Kit-pat (see above).

Kiss Me Star:

This Tswana star “Ntshune” is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus (Slotegraaf 2013). Its appearance was a warning to lovers to part before their parents discovered them.

Kiss Nebula:

See Albino Butterfly Nebula, above.

Kissed of Centaurus:

This **telescopic** asterism “Osculáta Centaúri” is the elliptical galaxy NGC 5090 in the IAU constellation Centaurus. John Herschel listed it as h 3487 and later as GC 3496 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this galaxy forms a physical pair with [the spiral galaxy] NGC 5091. The elliptical galaxy seems to be gently touched or kissed by the partner”.

Kissin:

This Latin star “Kissin” is 21 Comae Berenices in the IAU constellation Coma Berenices. This is a species of ivy or convolvulus (bindweed).

Kissing Crescents Nebula:

This **telescopic** asterism is the planetary nebula NGC 2022 in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1785 who listed it as “IV 34” in his catalogue. It is GC 1225 in the *General Catalogue* of 1864. It is also known as Orion’s Collarbone Nebula.

Kitalpha:

See Part of the Horse, below.

Kitchen of Sky:

This Korean asterism “Haneul-ui Bueok” (하늘의 부엌) is an irregular pentangle of stars in the IAU constellation Draco: Delta (δ), Eta (η), Rho (ρ), Epsilon (ε), and Sigma (σ) Draconis.

Kite:

This German asterism “Milvius” is the IAU constellation Cygnus. This alternate name is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This Western asterism is made up of the principal stars of the IAU constellation Boötes: Alpha (α) Boötis (Arcturus), Epsilon (ε) Boötis, Delta (δ) Boötis, Beta (β) Boötis (Nekkar), Gamma (γ) Boötis, and Rho (ρ) Boötis.

This American asterism is the IAU constellation Scorpius. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 describes the “paper kite” as the star Alpha (α) Scorpii (Antares), Beta () 1 Scorpii (Acrab), Delta (δ) Scorpii, and Pi (π) Scorpii, with the rest of the stars in this constellation forming the “string”. R. H. Allen lists this in his *Star Names* in 1899. Allen describes it as being listed in “some popular books of the present day”.

For another large-scale “kite”, see the Hawaiian asterism “Ka Lupe O Kawelo” (see Kite of Kawelo below).

One “Mini Kite” asterism consists of a diamond of four bright stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Gamma (γ) Delphini and Delta (δ) Delphini. R. H. Allen lists it in his *Star Names* in 1899, but comments “the date and name of the inventor of this title I have not been able to learn”. Size 150’. Gene Hanson lists it on his Beginner’s Guide website as the “Mini Kite”. It is also known as “Job’s Coffin” (see above).

There are twenty-two **telescopic** “kite” asterisms:

- One is the open cluster NGC 1664 in the IAU constellation Auriga. It was discovered by English astronomer William Herschel in 1786 who listed it as “VIII 59” in his catalogue. It is GC 907 in the *General Catalogue* of 1864. This is called the kite by some as the primary stars form a roughly diamond-shaped outline with a trail of stars extending off one of the corners like a tail. It is also known as the 4-H Cluster or the Four-Leaf Clover.
- One is Kemble’s Kite, Kemble 3 on the asterism list of RASC member Father Lucien Kemble (1922 – 1999), also known as the Measuring Scoop: This is a diamond shaped kite with a tail in the IAU constellation Cassiopeia near its border with the IAU constellation Camelopardalis. A 6th magnitude star, HIP 16319, forms the apex of one side of the diamond-shaped kite with the

star HIP 16048 at the other. The top of the kite is the star HIP 16420. The "tail" is a row of stars: HIP 15959, 15796, and 15754. Size 90' X 30'. This is Harrington 15 on American astronomer and author Phil Harrington's list. NOTE: This is right next to the asterism Earring of the Dragon (see above).

- One in the IAU constellation Cassiopeia is the Queen's Kite, a rough pentagon formed by the star Chi (χ) Cassiopeiae and the stars HIP 7251, 7617, 7963, and 7812. The string is the stars HIP 8115A and HIP 8148. It is called the "Queen's Kite" as it is close to Cassiopeia (who was a queen). This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011. Size 120'. It has the name "Queen's Kite" as it is part of Cassiopeia.
- One, also known as the Frigate Bird or Pirate Bird, is the open cluster NGC 6866 in the IAU constellation Cygnus. It was discovered by Caroline Herschel in 1783 in the IAU constellation Cygnus and recorded by her brother William in 1790 as "VII 59. It is GC 4544 in the *General Catalogue* of 1864. American astronomer Tom Lorenzin describes this "kite": "8M; 8' diameter; 50-plus 10M and dimmer members; main body is diamond shaped with tail coming out of the E and arcing S; don't let go of that string!"
- One circular style "Chinese Kite" from *Pattern Asterisms* by American astronomer John A. Chiravalle is found in the constellation Hercules with nine stars including HIP 88030, 87877, 87691, 87694, and 87840 forming the circular "kite" and four stars (HIP 88122, 88239, 88006, and 88089) forming two "strings". Size 90'. Jeffrey Corder lists this as Corder 3408.
- One is Sánta 137, listed in 2008 by Hungarian astronomer Sánta Gábor, which is made up of 9 – 12th magnitude stars in the IAU constellation Capricornus. Gábor describes it as "very nice, kite-shaped asterism".
- One is Leiter 15 from the list of astronomer Frank Leiter, which is a group of 13th magnitude stars in the IAU constellation Scutum. It is about 2.5 arcminutes l ong. Leiter writes that it "appears in an 8" as a suspicious glow at 90X magnification. Magnification of 130X or higher reveals the shape". Its size is 3' X 1'.
- One is Sánta 140, in the IAU constellation Gemini, listed in 2007 by Hungarian astronomer Sánta Gábor, which is described by Gábor as a "kite-shaped asterism of 8 – 12 [magnitude] stars, nice".
- One is Kernya 8, listed by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Cygnus. Kernya describes it as the "FSR 0317 cluster" and as a "loose group, its shape is similar to a paper kite… it should be able to be examined with 8-10 cm binoculars."
- One is Kernya 46, listed by Hungarian astronomer Gábor János Kernya, which is six stars in the IAU constellation Monoceros. Kernya describes it as a "deltoid or kite-shaped arrangement."
- One is Hay-Merting 2, the "Kite" or "Kite Rhombus" in the IAU constellation Sagitta. This was discovered by German astronomer René Merting in 2015 and listed by Robert Zebahl on his *Faint Fuzzies* website. Zebahl describes it as "about 30 arcminutes north of the cluster Roslund 3… four brighter stars of 9th to 10th magnitude form a perfect rhombus and inside three fainter, 11 to 12 [magnitude] bright stars form a curved chain with makes the whole thing look like an octahedron when seen in three dimensions. Another interpretation would be a kite without a string, broken by the pirate's hook (Leiter 4) about 1° south." For Leiter 4 see "Hook" above.
- One is the cluster Berkeley 90 in the IAU constellation Cygnus. Size 5' X 5'. René Merting describes it on the *Faint Fuzzies* website as a "nice kite rhombus".
- One is Dunlop 319 in the IAU constellation Tucana, listed by Scottish astronomer James Dunlop in his catalogue of 1828. A group of four 11th – 12th magnitude stars form the "kite" and a string of three 12th – 13th magnitude stars the "tail".

- One is Streicher 7 in the IAU constellation Carina. It was discovered by South African astronomer Magda Streicher, who describes it as being 1.5° south of NGC 2516 and that "the asterism stars display a long axis pointing south-east, where the brightest star in this grouping is located- it has magnitude 7.7 and is a beautiful yellow color." Size 6'.
- One is Ennis 8 in the IAU constellation Cetus, listed by Canadian astronomer Charles Ennis. The "kite" is made up of the stars 60 and 61 Ceti and HIP 9827 and 9911. The "tail" is the stars 63 and 66 Ceti and HIP 10382.
- One is Ennis 15 in the IAU constellation Canis Major listed by Canadian astronomer Charles Ennis. The "kite" is made up of the stars HIP 30711, 30461, 30436, 30390, and 30288. The "tail" runs from HIP 30288 through HIP 30263, and 30203, to HIP 30066.
- One is in the IAU constellation Pisces and is Ennis 24 on the observing list of Canadian astronomer Charles Ennis.
    - A parallelogram of four stars forms the "kite": Double star H°IP 1900A, HIP 1648, HIP 1691, and HIP 1873.
    - From HIP 1648 a line of stars forms the "tail": HIP 1587, HIP 1470, HIP 1424, the double star HIP 1365, and HIP 1321. Some of the stars involved in the "tail" of the kite are a cascade listed by American astronomer Jeffrey Corder as Corder 71.
- One, also known as the "Paper Kite", is NGC 4762, which is an edge-on lenticular galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1784 who listed it as "II 75". It is GC 3278 in the *General Catalogue* of 1864. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a "paper kite".
- One is in the IAU constellation Cetus and is Ennis 60 on the observing list of Canadian astronomer Charles Ennis. Size 90' X 20'. The "kite" is five 6^{th} – 7^{th} magnitude stars including HIP 12313, the double star 12399, HD 16622, and HIP 12170. The "tail" runs from this last star to HIP 11907. This is Corder 412 on Jeffrey Corder's list: Corder describes it as "a parallelogram of four stars…with one of the 6^{th} magnitude stars at the SW corner."
- One is made up of stars of the IAU constellation Cygnus and was listed in July 2024 by American astronomer "The Ardent" on *Cloudy Nights*. This is in the North American Nebula, NGC 7000. The "kite" is the stars 57 Cygni, HIP 103519, HIP 103637, and HIP 103371. The "tail" is the stars 57 and 56 Cygni.
- One is the Chi (χ) Cygni Kite made up of stars of the IAU constellation Cygnus and was listed in July 2024 by American astronomer "The Ardent" on *Cloudy Nights*. The "kite" is made up of the stars Chi (χ) Cygni, HIP 97485, 17 Cygni, and HIP 97307. The "tail" runs from 17 Cygni through HIP 97087, HIP 97142, HIP 97242, and HIP 97228 to 15 Cygni.
- One is made up of stars of the IAU constellation Sagittarius: 24 and 25 Sagittarii, HD 171097, HD 171056, and HIP 90953. Spanish astronomer "Takuan" posted this on *Cloudy Nights* in July 2024.

Kite of Kawelo:

This Hawaiian star line "Ka Lupe O Kawelo" involves stars in the IAU constellations Andromeda, Cetus, Cassiopeia, Pegasus, and Piscis Austrinus. It starts with the asterism 'Iwakeli'i (Chief Frigate Bird), which to Western astronomers is the "W" of the constellation Cassiopeia (see W below). The center of the star line is the Kite of Kawelo, which is the Great Square of Pegasus (see Great Square, above). The four stars of the kite are Manokalanipo (Alpha (α) Andromedae (Alpheratz)), Kakuhihewa (Beta (β) Pegasi (Scheat)), Pi'ilani (Gamma (γ) Pegasi (Algenib)), and Keawe (Alpha (α) Pegasi (Markab)). The star

line then connects south to the stars Pi'ikea (Beta (β) Ceti (Diphda)) and Kukanilako (Alpha (α) Piscis Austrini (Fomalhaut)). The northern pointer is found by connecting the stars Manokalanipo (Alpheratz) and Kealohalani-po-keao (Beta (β) Cassiopeiae (Caph)). The southern pointer is found by connecting the stars Keawe (Alpha (α) Pegasi (Markab)) and Kukaniloko (Alpha (α) Piscis Austrini (Fomalhaut)).

Kite Stars:

This Banjar and Bugis asterism is the IAU constellation Crux.

This Temuan asterism "Bintang Layang Petek" is the IAU constellation Crux (Jaafar and Khairuddin 2014).

Kitten:

There are two Arabic stars with this name:

- One is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283). Dorn (1829) describes it as "the star at the extremity of the tail".
- One is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

Kittens:

This Norwegian asterism "Killingene" is in the IAU constellation Auriga. This is a triangle of stars near the star Alpha (α) Aurigae (Capella): Zeta (ζ) Aurigae, Eta (η) Aurigae, and Epsilon (ε) Aurigae. Compare this to the Greek asterism Kids (see above).

Kleeia:

This Greek star is Delta (δ) 3 Tauri in the Hyades cluster in the IAU constellation Taurus. It was later latinized to Cleeia. Kleeia is one of the Hyades sisters.

Klemola's Star:

This variable star is DN Leonis (HIP 52123) in the IAU constellation Leo. It was named for American astronomer Arnold Klemola (1931 – 2019).

Klingon Battlecruiser:

There are four **telescopic** "Klingon battlecruiser" asterisms:

- One is the open cluster NGC 1662 (Collinder 55) in the IAU constellation Orion, which resembles the running lights of a D 7 class Klingon battlecruiser. This was discovered by English astronomer William Herschel in 1784 who listed it as "VII 1" in his catalogue. It is GC 905 on the *General Catalogue* of 1864. American astronomer Russell Sipe (Sky and Telescope February 2005) gave this name to this asterism.
- One is open cluster NGC 7209 in the IAU constellation Lacerta. This is also known as the Drunken Lizard Cluster or Star Lizard Cluster. It was discovered by William Herschel in 1787 who listed it as "VII 53". It is GC 4755 in the *General Catalogue* of 1864. Blake Nancarrow of the RASC Toronto Centre came up with this asterism: Nancarrow sees it as viewed from above. Nancarrow informed us of this in March 2023.

- One is the open cluster NGC 2301 in the IAU constellation Monoceros. It was discovered by William Herschel in 1786 who listed it as "VI 27" in his catalogue. It is GC 1465 in the *General Catalogue* of 1864. In the 19th century it was known as Copeland's Golden Worm, later named the Great Bird Cluster (see above) by Phil Harrington and as the "Sparrow" by South African astronomer Carol Botha. More recently astronomers who are fans of J. K. Rowling's *Harry Potter* series named it Hagrid's Dragon. This is O'Meara 36 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), which lists the names "Hagrid's Dragon", "Romulan War Bird", and "Klingon Battle Cruiser".
- One is Lorenzin 9 on American astronomer Tom Lorenzin's asterism list in the IAU constellation Taurus. René Merting describes it on the Faint Fuzzies website:" Everything sparkles and glitters beautifully – especially the star 119 Tau appears golden yellow, and the star 117 Tau has a beautiful, warm amber hue. I see the Blade Cruiser a little more expansive than Tom described it back then; the southern wing runs south of the star 116 Tau and is thus right in the center of Cr 65... The outline of the body of the cruiser starts at 120 Tauri and runs through 119 Tauri, HIP 25702, 115 Tauri, 111 Tauri, 110 Tauri, 116 Tauri, and HIP 25790.

Knee:

There are two Arabic "knee" asterisms:

- One, "ar-Rukbah" (الركبة), is Delta (δ) Cassiopeiae in the IAU constellation Cassiopeia:
  - This was later latinized to "Rukbah", "Ruchbah", "Rucba", "Rucbar", or "Ruchbar".
  - This also had the longer name "Al Rukbah al Dajājah" ("one who kneels on both knees"), which was later latinized to "Elgeziale rulxbachei", "Alcheti hale rechabatih", "Elzegeziale", "Elhathi", "Alchete", "Alcheti", and "Algethi". Johann Bayer's *Uranometria* (1603) incorrectly lists "Algiethi", "Algethi", and "Elgeziale rulxbachi" as names for Hercules.
  - In the 1515 edition of the *Almagest* and the 1521 edition of the *Alfonsine Tables* it appeared as "Algiethi incurvati super genu ipsius" ("Algiethi knelt on his knees").
  - This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Ruchbah": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
  - American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) lists this star as "Ruchbah".
  - The IAU approved the name Ruchbah for the star Delta (δ) Cassiopeiae Aa.
- One is the star "Ruchba" or "Rucba" is Omega (ω) 1 Cygni in the IAU constellation Cygnus:
  - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "rukbat al-dajāja"
  - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Rukbat al dajálah, the hen's knee"

Knee of the Archer:

This Arabic star "Rukbat ur-Rāmī" (ركبة الرامي) is Alpha (α) Sagittarii in the IAU constellation Sagittarius as listed by the Persian astronomer Ulugh Beg Mirza (1394 – 1449).

- This was later latinized to "Rukbat", "Rucba", "Rucbah", "Rukbah", "Rucbar"
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "Rukbat al-rāmī al-yusrā" and the Hebrew name "berekh ha-qeshet ha-semoli".

- Dorn (1829) lists this as “the Archer’s Tendon” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “Rukbat al-rāmī al-yusrā” (“the left knee of the archer”).
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “ruchbah er ramih”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- The *Standard Dictionary of Facts* (1908 – 1924) lists “Ruchbar ur Ranich”.
- The IAU approved the name Rukbat for Alpha (α) Sagittarii.

Kneeler:

This Greek asterism “Engonasin” (’Ενγόνασιν) is the IAU constellation Hercules as it appeared in the 2nd century in Ptolemy’s *Almagest,* and it incorporated stars of the IAU constellations Boötes and Hercules. Variations include “Engonasi” and “Engonasis”. Eudoxus (408 – 355 B.C.E.) called it “Ἐνγούνασι” (“En'goúnasi”), Hipparchus (190 – 120 B.C.E.) called it “Ἐνγόνασι” (“En'gónasi”) and Aratus (315 – 240 B.C.E) called it “Ὀκλάζων” (“Oklázon”, “the kneeling one”). Eratosthenes (d.194 B.C.E.) referred to this asterism as “οὐτός, φασὶν, Ἡρακλής ἐστίν” (“standing upon the Dragon”), this dragon being the constellation Draco next to the constellation Hercules. The11th century *De signis caeli* (Santoni 2017) lists it as “qui stans genu flexu” (“who stood with his knee bent”). 1st century Roman architect Vitruvius called it “Ingeniculatus” (“ingenuated”), 4th century Roman astrologer Julius Firmicus Maternus called it “Ingeniculus” (“ingenious”) and 1st century Roman poet Marcus Manilius called it “Ingenicla Imago” (“ingenious image”) and “Ignota Facies” (“you will face the unknown”). The *Aratus Latinus* lists “Ingeniculo… quod in genu laborat” (“Ingenius… that’s working on his knee”).

This constellation was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) as “al-Jāthī” and “’ala Rukbateh”.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This lists the name “Engonasin” as well as “Hercules” and depicts a nude beaded male running to the left with a lion skin draped over his left forearm and a club raised in his right hand. He is running towards a tree around which is wound a serpent.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the “Kneeler”.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Engonasis qui et Hercules” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this constellation as “Engonasin” with the subtitle “Hercules”. He is depicted as a very long-haired, bearded male kneeling on his left knee with a serpent wound around his extended left arm.

Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists the name “Engonasi” for Hercules.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Engonasi” and Ingeniculus” as names for Hercules.

Johann Bayer’s *Uranometria* (1603) lists these names for this asterism: “Engonasi, Ingeniculus, Prociduus in genua, Incuruatus in genu, Genu flexus”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Engonasi” as an alternate name for Hercules.

“Engonasi”, “Ingeniculus”, “Geniculatus”, “Geniculatur”, “Genibus Inixus” (“resting on his knees”), “prociduus vel incurvatus ingenua” (“prostrate or stooped”), “Rectius in Genu” (“right in the knee”) and “Flexus Gunu” (“bending the knee”) are all listed as an alternate names for Hercules in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Hercules” and “Enconaso” and depicts a nude bearded male kneeling on his right knee with his back to us. He had an animal skin draped over his left arm and is holding aloft a club in his right hand.

French astronomer Ismaël Boulliau (Ismaël Bullialdus, 1605 – 1694) translated it as “Ο εn Γonacín” (“O en Gonacín”), which led to the variations “Genuflexus”,”Genunixus”, “Geniculatus”, (all of which mean “kneeling”) and “Ingeniclus” (“Ingenous”). Other names include “Incurvatus in Genu” (“bent over on one knee”), “Procidens” (“falling down”), “Prociduus” (“prociduous” or “falling from its proper place”), “Procumbens in genua” (“bend down on your knees”), “Incumbens in genibus” (“leaning on your knees”), and a 1551 translation of Ptolemy’s *Tetrabiblos* has “Qui in genibus est” (“who is on your knees”).

Edward Sherburne lists “Engonast” is the IAU constellation Hercules in his *Sphere of Marcus Manilius* in 1675 but translates it as “he is dying”.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this constellation “Engonasi” with the subtitle “Hercules” and depicts it as a nude male viewed from the rear, kneeling on his right knee, holding aloft a club in his right hand and a branch in his left hand.

German astronomer Johann Bayer (1572-1625) inaccurately quoted the 8th century B.C.E. poet Homer as listing “Γνύξ ἐριπών” (“Gnýx eripón” or “on bended knee”) and “Ἴδωλον ἄπευθος” (“Éidolon ápefthos”) as well as “Imago laboranti similis” as “the unknown image”.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Engonasin” as a male dressed in a tunic and sandals, walking to our right, with a crook in his right hand and a lion’s skin draped over his left arm.

“Engonasin” is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Robert Hues lists its Arabic name as “Alcheti hale resembleth” and translates this as “one falling upon knees” in his *A Learned Treatise of Globes* in 1659.

In his *Star Names* in 1899, R. H. Allen lists “Cernuator” as “wrestler” but this is probably derived from the rare verb “cernuo” (“to throw or fall head foremost”).

It wasn't until a Venetian edition of the fables of Hyginus was published in 1485 that the mythological figure of Hercules was associated with this IAU constellation. Ptolemy's constellation incorporated the "keystone" that most modern amateur astronomers are familiar with, but it was a much larger constellation than the one shown on modern star maps.

- The "keystone" of Hercules is the lower half of the "body",
- The upper half of the "body" is a pentagon of the stars Zeta (ζ) Herculis, Beta (β) Herculis (Kornephoros), HIP 82764, Delta (δ) Herculis, and Epsilon (ε) Herculis,
- From the "neck" at HIP 82764 a line goes out to the "head" at Alpha (α) 1 Herculis (Rasalgethi),
- From one "shoulder" at Beta (β) Herculis an "arm" runs out through an "elbow" at Gamma (γ) Herculis to a "hand" of the stars 8 and Kappa (κ) Herculis,
- From the other "shoulder" at Delta (δ) Herculis an "arm" runs out through Lambda (λ) and Mu (μ) Herculis to a "hand" of the stars Xi (ξ), Nu (ν) and Omicron (ο) Herculis,
- From one "hip" at 67 Herculis a "leg" runs out to a "knee" at Theta (θ) Herculis to a "shin" at Iota (ι) Herculis and a "foot" of the stars 77, 82 and 88 Herculis,
- From the other "hip" at Eta (η) Herculis a "leg" runs out through Sigma (σ) Herculis to a "knee" at Tau (τ) Herculis and then through the stars Phi (φ), and Chi (χ), to a foot at Psi (ψ) 2 Herculis, and
- From this "foot" at Psi (ψ) 2 Herculis, a "staff" runs through the star Mu (μ) Boötis to the stars Psi (ψ), 46 and 45 Boötis.

This "Persian" asterism "Bersanu Nicbeste" or "Ber zanū nisheste" is the IAU constellation Hercules. German astronomer Johann Bayer (1572-1625) listed the latter name, as did R. H. Allen in *Star Names* in 1899. John Hill listed the former in his *Urania* in 1754 as did Edward Sherburne "Bersanu Nisheste" in his *Sphere of Marcus Manilius* in 1675.

This Egyptian asterism "Gonasin" is one of the paranatellonta of the decans of Pisces as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Hercules.

Kneeler's Left Shoulder:

This Arabic star "Menkib al Jathi al Aisr" is Delta (δ) Herculis in the IAU constellation Hercules as listed in the Calendarium of Al Achsasi al Mouakket in 1650.

Kneeling Man:

This Arabic asterism "Alrajul Alraakie" (الرجل الراكع) is the IAU constellation Hercules. This is a reference to the original Greek name for this asterism, "Ἐγγόνασιν" (see Kneeler, above).

Kneeling Terrace:

This Peruvian asterism is the IAU constellation Aries.

Knife:

This asterism is the "sickle" at the front of the IAU constellation Leo (see Sickle of Leo, below). R. H. Allen writes in his *Star Names* in 1899 that it dates to the "earliest records".

This proposed Egyptian (Upper Egypt) asterism "mdnỉt" or "Mendenit" from the Old Kingdom (3100 B.C.E.) is related to their nome (district) of that name and is made up of stars of the IAU constellation Delphinus (Berio 2014).

This **telescopic** asterism is Ennis 9 in the IAU constellation Sagittarius, listed by Canadian astronomer Charles Ennis. It is the cluster Simonic 41. The "handle" is the stars HIP 99448 and 99426. The "blade" is the curve of stars starting at HIP 99465 and running through HD 191253, HD 191188, and HIP 99364 to 99305.

Knife Edge:

This **telescopic** asterism NGC 5907 is a spiral galaxy in the IAU constellation Draco. It was discovered in 1788 by English astronomer William Herschel who listed it as "II 759". John Herschel listed it as h 1917 and it became GC 4087 in his *General Catalogue* of 1864. It is viewed edge-on with a spiraling tidal stream of stars. NOTE: Lord Rosse thought he was looking at two objects separated by the dust lane, and created the name NGC 5907, but this was later discovered not to be a separate object. It is GC 4086 in the *General Catalogue* of 1864. NGC 5906 now refers to the fainter part of the galaxy west of the dust lane, which was recorded by George Johnstone Stoney in 1850. It is also known as the Cat Scratch Galaxy (see above), the Enveloped of Draco (see above), and the Splinter Galaxy (see below).

Knife Edge of Indus:

This **telescopic** asterism "Cultráta Índi" is the edge-on spiral galaxy NGC 7123 in the IAU constellation Indus. This was discovered in 1835 by John Herschel who listed it as h 3886 and later as GC 4696 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the dust band, thin and sharp as a knife".

Knife of Draco:

This **telescopic** asterism "Cúlter Dracónis" is the edge-on spiral galaxy NGC 3735 in the IAU constellation Draco. It was discovered in 1801 by William Herschel who listed it as "I 287". It became GC 2452 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Knight with a Drawn Sword:

This German asterism "Eques cum districto gladio" was made up of stars of the IAU constellation Hercules by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This is labeled "Polonia" on Weigel's chart and represents the coat of arms of Poland.

Knights:

This Arabic asterism is a bending line of stars in the IAU constellation Cygnus: Zeta (ζ) Cygni, Epsilon (ε) Cygni, Gamma (γ) Cygni, Delta (δ) Cygni, and Kappa (κ) Cygni. The star Alpha (α) Cygni (Deneb) is the "Rear Knight". Dorn (1829) lists this as "horsemen" and describes this as appearing depicted on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283):

- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "Rukbat al-dajāja" and the Hebrew name "arkovet ha-tarnegolet" for Gamma (γ) Cygni.

- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "Rukbat al-dajāja" and Hebrew name "arkovet tarnegolet" for Alpha (α) Cygni (Deneb).

Knight's Badge:

This **telescopic** asterism is the open cluster NGC 1513 in the IAU constellation Perseus. This was discovered by English astronomer William Herschel in 1790 who listed it in his catalogue as "VII 60". It is GC 809 in the *General Catalogue* of 1864. English Admiral Henry William Smyth described it as "formed like a badge of knighthood" in his *Bedford Catalogue* in 1844. It is also known as "D".

Knitting Needle:

This **telescopic** asterism is NGC 3432 (Arp 206), an edge-on spiral galaxy in the IAU constellation Leo Minor. This was discovered by English astronomer William Herschel in 1787 who listed it as "I 172" in his catalogue. It is GC 2238 in the *General Catalogue* of 1864. It is also known as the "Pretty One of Leo" (see below).

Knock at the Door:

"iNquonqoli" is a Zulu star rises before the Morning Star (Venus) and is currently unidentified (Alcock 2014).

Knot:

This Greek star "Δεσμός" ("Desmós"), meaning "knot" or "bond" is Alpha (α) Piscium (Alrescha) in the IAU constellation Pisces as listed by Aratus (315 – 240 B.C.E) and Geminus. This was latinized by the Roman general Germanicus (15 B.C.E. – 19 C.E.) to "Sundesmos" and "Desmos".

This Latin star "Nodus" or "Nodus Coelestis" ("knot of heaven") is Alpha (α) Piscium (Alrescha) in the IAU constellation Pisces as listed by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.). The 1515 edition of the *Almagest* listed "Nodus Duorum Filorum" ("a knot with two threads"). "Nodus" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661. Edward Sherburne lists "Nodus" and "Commissura Piscium" ('fish junction") in his *Sphere of Marcus Manilius* in 1675.

There are three Arabic asterisms with the name "al-ʿUqdah" (العقدة):

- One is the stars Iota (ι) Hydrae (Ukdah), Tau (τ) 1 Hydrae (Ukdah I), Tau (τ) 2 Hydrae (Ukdah II), and 33 Hydrae (Ukdah III):
    - R. H. Allen writes in his *Star Names* in 1899 that 13th century Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) used this name for just the star Tau (τ) 1 Hydrae.
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 mentions both versions.
- One is the star Alpha (α) Piscium (Alrescha) in the IAU constellation Pisces:
    - This was later latinized to "Okda".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as "Okda, from the 'Okdah al Khaïtaïn, or 'knot of the two threads".
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Okda".

- One, latinized to “Ukdah”, is the star Iota (ι) Hydrae. The IAU approved the name Ukdah for the star Iota (ι) Hydrae.

This Arabic star “ʿUḳd al Ḥaiṭain” is Alpha (α) Piscium in the IAU constellation Pisces:

- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Kaitain”.
- R. H. Allen lists “Kaitain” as a variation of this in his *Star Names* in 1899.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists “Kaitain” and “Okda” for this star, but his 14th edition (1959) only lists “Kaitain” for this star.
- Robert Burnham lists “Ukd al Haitain” in his *Burnham’s Celestial Handbook* in 1978 and translates this as “flaxen cord”.

This Latin name “Nodus” is two stars in the IAU constellation Draco:

- Zeta (ζ) Draconis: Nodus I
- Delta (δ) Draconis: Nodus II or Nodus Secundus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Nodus Secundus” for this star.

Knots:

This Arabic asterism is a quadrilateral of stars in the IAU constellation Delphinus: Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Delta (δ) Delphini, and Gamma (γ) Delphini. Dorn (1829) lists this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). Compare this to their asterism Young Camel (see below).

Knotty One of Leo:

This **telescopic** asterism “Nodósus Leónis” is the barred spiral galaxy NGC 3367 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as “II 78”. It became GC 2193 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Ko Bird:

Mayan Ritual of the Bacabs speaks of “Ix Ko-ti-tzab” (“ko bird in the rattles constellation”). This asterism, the Rattlesnake Rattle (see below) is the Pleiades cluster in the IAU constellation Taurus which would mean this is a star in the Pleaides cluster.

Kochab:

See Star, below.

Koeia:

See Star, below.

Kogamasigo:

This Tswana star which is in the sky all night is currently unidentified (Alcock 2014).

//kohai stars:

This /Xam asterism, also known as the //Xwhai stars, is the three stars Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae (Tarazed) in the IAU constellation Aquila. Altair is their "Great Star" "//Xwhai", or "!Gaunu" (see Great Star, above), which is Altair (Alcock 2014). The other two stars are !Gaunu's sisters !Guonni (see above) and ≠ku-kyam (see Cape Daisy, above), although it is uncertain which star represents each sister.

Kohamasiu:

This Lovedu star "Kohamasiu" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Kohi:

This Māori asterism "Kohi" or "Te Kohi" may be made up of stars of the IAU constellation Carina (Robertson et al 2016).

Koi Fish:

This **telescopic** asterism is NGC 4559 (Caldwell 36), an intermediate spiral galaxy with a weak inner ring structure in the IAU constellation Coma Berenices. This was discovered by English astronomer William Herschel in 1785 who listed it as "I 92". It is GC 3101 in the *General Catalogue* of 1864. This is also known as the Club (see above).

Koiki:

This star is SSSC 803504 in the IAU constellation Crux (magnitude 5.97). It was named after indigenous Australian land rights campaigner Eddi Koiki Mabo on 3 June 2015, the 23rd anniversary of the Mabo decision, which overturned the notion of terra nullius in Australia. It is also part of the Meriam Mir and Kala Lagaw Ya asterism "Tagai" (see below).

Koirught:

This "Turkish" asterism is the IAU constellation Scorpius as listed in John Hill's *Urania* in 1754.

Kokirikiri:

This Māori asterism is the Large Magellanic Cloud (Orchiston 2017).

Kokopelli:

Kokopelli is a Hopi fertility/trickster deity usually depicted as a humpbacked flute player. There are two in the sky:

- One listed on the Gourmet Garlic Gardens website by Bob Anderson on 12 July 2024 describes it as made up of the stars of the IAU constellations "Ursa Major, Ursa Minor and Boötes" but is not specific as to which stars.
- One listed by Gwen Wells-Wittwer on 7 November 2024 is the IAU constellation Orion. NOTE: Gwen's husband is part Cherokee.

Kokotea:

This Māori asterism "Kokotea" is one of the Magellanic Clouds (Orchiston 2017).

Kokouri:

This Māori asterism “Kokouri” is one of the Magellanic Clouds (Orchiston 2017).

K’olli:

This Quechua asterism from Sonqo is unidentified dark nebulosity (Urton 1981).

Kollü Pal:

This Mapuche star “Kollü Pal” is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Menares 2008).

Komomari:

The stars of this Kaurna asterism have not yet been identified (Hamacher 2015).

Komondor:

This telescopic Hungarian star “Komondor” is the K type star HAT-P-12 in the IAU constellation Canes Venatici (magnitude 12.84). It received this name in the IAU’s NameExoWorlds competition in 2022. The Komondor is a breed of herding dog. It has an exoplanet, HAT-P-12 b, “Puli”. The Puli is another breed of herding dog.

Kon:

This Myanmar yathi (zodiac constellation) “Kon” (ကုံ) is the IAU constellation Aquarius.

Kookaburra:

This Wiradjuri asterism “Kukuburra” or “Gugubarra” is the IAU constellation Corona Australis (Howitt 1905, Grant and Rudder 2010, Kemp et al 2022). The Kookaburra is a terrestrial tree kingfisher.

Koraiapom:

This Netwar and Nahwal star is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Ramik 2019).

Kornephoros:

See Cudgel Bearer, above.

Kosjenka:

This **telescopic** Croatian star is the G8 type star WASP-63 in the IAU constellation Columba (magnitude 10.9). It received this name in the IAU’s NameExoWorlds competition in 2022. Kosjenka is the protagonist of a Croatian fairy-tale, Regoč. It has an exoplanet, WASP-63b, “Regoč”, which is named for another protagonist in that tale.

Kosthagara:

This ancient Vedic asterism is made up of 4 stars of the IAU constellation Leo, but it is no longer known precisely which stars these are (Leitz 2019).

Kotógoik:

This Toba star “Kotógoik” is unidentified at present (Gómez 2011).

Kowal’s Object:

See Sagittarius Dwarf Irregular Galaxy.

Kozlÿtje:

This Chakavian asterism is the IAU constellation Auriga.

Krampâč:

This Kaykavian asterism is the IAU constellation Corvus.

Kratu:

This Vedic star “Kratu” (“rishi” or “sage”) is Alpha (α) Ursae Majoris in the IAU constellation Ursa Major (Allen 1899, Bhagwath 2019). R. H. Allen also lists the name “Jamadagni” in his *Star Names* in 1899. This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Kraz:

This Czech star is Beta (β) Corvi in the IAU constellation Corvus and was listed in Czech astronomer Antonín Bečvář’s *Atlas Coeli* in 1951. The IAU approved the name Kraz for Beta (β) Corvi.

Kriya:

This Hindu asterism is the IAU constellation Aries as listed in R. H. Allen’s *Star Names* in 1899.

Kronberger’s Triangle:

This **telescopic** asterism is a pair of galaxies in the IAU constellation Virgo: PGC 53047/53046 (MCG+01-38-006). The pair was named for the late Deep Sky Hunter Group member Matthias Kronberger by German astronomer Uwe Glahn. Uwe posted it on the *Deep Sky Forum* in May 2012.

Krzeminski's Star:

This **telescopic** blue supergiant star, is part of the pulsar Centaurus X-3 in the IAU constellation Centaurus. It was discovered by the Polish astronomer Wojciech Krzemiński in 1974.

Ksora:

This Arabic star “Ksora” is Delta (δ) Cassiopeiae in the IAU constellation Cassiopeia.

Ku of the Misty Heavens:

This Hawaiian asterism Kukalani’ehu is the IAU constellation Aries. Ku is a Hawaiian God of war.

Ku That Resounds Within:

This Hawaiian star Kukaniloko is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus. Kukaniloko was a famous Hawaiian Queen of O’ahu.

Kua:

This “Euphratian” star “Kakkab Kua” is Delta (δ) Leonis in the IAU constellation Leo as listed by R. H. Allen in his *Star Names* in 1899. “Kua” is listed as a Babylonian star in Bartel van der Waerden’s *Birth of Astronomy* in 1974, though the particular star is not identified. Kua was an oracle God.

Kugha:

This Turkish asterism is the IAU constellation Gemini as listed in John Hill’s *Urania* in 1754.

Kulira:

This Hindu asterism is the IAU constellation Cancer.

Kuma:

The star “Kuma” is Nu (ν) 2 Draconis in the IAU constellation Draco.

Kumete:

This Kiribati asterism is an unidentified quadrilateral of stars in the IAU constellation Delphinus (Trussel and Groves 1978).

Kummim Bieetch:

This Mara and Mopoor asterism is the stars Lambda (λ) Scorpii and Upsilon (υ) Scorpii in the IAU constellation Scorpius (Dawson 1881, Hamacher 2011).

Kumu Palm:

This Carib asterism “Kumukumuyuman” or “Kumukumu” represents the Kumu Palm (Oenocarpus batava). This is known to rise when its fruits begin to ripen but its present location is unknown (Magaña, and Jara, 1982).

Kunar:

This Mabuiag asterism is the Magellanic Clouds.

Kunei n Auti:

This Kiribati asterism is three small stars in the IAU constellation Taurus (Trussel and Groves 1978).

Kunkun Tuuromballank:

This Marra and Moporr asterism is the Coal Sack Nebula (see Coal Sack above). It is also part of their asterism “Torong” (see Emu in the Sky, above).

Kunnawarra:

This Kulin Nations star “Kunnawarra” is Lambda (λ) Aquilae in the IAU constellation Aquila as listed by Massola (1968).

Kurhah:

See Mark on the Horse Hide, below.

Kurtz's Light Variable Star:

This **telescopic** variable star is HIP 98757 (HD 188136) in the IAU constellation Octans (magnitude 7.97). I believe that this was named for the astronomer Donald Wayne Kurtz.

Kuruman:

This Carib star is believed to cause the waves and tides. Its present location is unknown (Magaña, and Jara, 1982).

Kurumul:

This Dharawal star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (King 1790).

Kusuvwi the Older Brother:

This Palikur asterism Kusuvwi Eggutye" is a small group of stars near the Pleiades cluster in the IAU constellation Taurus (Green and Green 2011). He is being followed by Kusuvwi Isamwitye (see Kusuvwi the Younger Brother, below).

Kusuvwi the Younger Brother:

This Palikur asterism "Kusuvwi Isamwitye" is the Pleiades cluster in the IAU constellation Taurus (Green and Green 2011). He is following his older brother Kusuvwi Eggutye (see Kusuvwi the Older Brother, above). The belt and sword of Orion represent the one-legged man Mahuwkaye, who is helping Kusuvwi Isamwitye. The other stars of Orion are parts of Kusuvwi Isamwitye's boat, his children, and the Transporting Star (see below).

Kutner's Cloud:

This **telescopic** asterism is dark nebula is Barnard 18 in the IAU constellation Taurus. I believe that this was named for American astronomer Marc L. Kutner.

Kuurn Kuuronn:

This Marra and Moporr asterism is the Large Magellanic Cloud (Hamacher 2011).

Kuwano's Object:

This name has been used for two stars named for Yoshiyuki Kuwano (1931 – 1998):

- One is the **telescopic** star PU Vulpeculae in the IAU constellation Vulpecula (magnitude 8.7 – 16.6), and
- One is V1407 Aquilae in the IAU constellation Aquila (magnitude 12.2 – 15.6).

Kuwano's Star:

This telescopic star name has been used for two stars named for Yoshiyuki Kuwano (1931 – 1998):

- One is PU Vulpeculae in the IAU constellation Vulpecula (magnitude 8.7 – 16.6),.
- One is V4021 Sagittarii in the IAU constellation Sagittarius.

Kuwi:

This Omani star "Kuwi" or "Kuwɪ¯" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

K'uzhaghalen:

This is an alternate Dena'ina name for their asterism "Yéhda" (see Traveler, below (Cannon 2021)).

Kuzi:

This Turkish asterism is the IAU constellation Aries. John Hill lists it in his *Urania* in 1754 as does R. H. Allen in *Star Names* in 1899.

Kwányip:

Kwányip is a popular forebear in Selk'nam mythology, who took over the duties of the creator Kenós. There are two versions of this Selk'nam star:

- One is the star Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.
- One is the star Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Scorpius and Orion are in the sky in different seasons.

Kwányip's Wives:

These are the wives of the shaman Kwányip in Selk'nam mythology. There are two different versions of this Selk'nam asterism:

- One is the stars Sigma (σ) and Tau (τ) Scorpii in the IAU constellation Scorpius. They flank the star Antares, which represents Kwányip (see above).
- The other is the stars Gamma (γ) Orionis (Bellatrix) and Delta (δ) Orionis (Mintaka). In this version a sister of Kwányip, represented by the star Epsilon (ε) Orionis (Alnilam) and one of her two sons, the nephews of Kwányip (the Sasán) made the belt of Orion. This son is the star Zeta (ζ) Orionis (Alnitak). The identity of the star of the other Sasán is unknown.

Kwankaio:

This Netwar star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Ramík 2019).

Kwota Tepas:

This Nahwal star "Kwota Tepas" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Ramík 2019).

Kxoma:

This !Kung star is Alpha (α) Crucis (Acrux) in the IAU constellation Crux (Alcock 2014). Kxoma is one of the sons of their sky God ≠Gao N!a and is part of their asterism Kalidi (see above).

L:

This asterism is in the IAU constellation Lupus and is Corder 2970 on the observing list of American astronomer Jeffrey Corder. Size 140' X 50'. This is four stars including Eta (η) and Theta (θ) Lupi, HIP 78754, 79000, and 78655, and the double stars HIP 78747 and 78970.

There are eighty-six **telescopic** "L" asterisms:

- One is Cseh 12 listed by Hungarian astronomer Viktor Cseh, which is a group of 7 stars between 9^{th} – 10^{th} magnitude in the IAU constellation Puppis. Cseh describes them as a "beautiful group" that forms "a regular upside-down letter 'L'".

- One is “Carl’s L” from the asterism list of Dutch astronomer Carl Vehmeyer, which is in the IAU constellation Scorpius. This consists of stars 10th – 12th magnitude and the top of the “L” is the Tom Thumb cluster (see below).
- One is Lacaille II:11 in the IAU constellation Centaurus, which was recorded in 1755 by Abbé Nicholas Louis de Lacaille. Lacaille described it as “seven or eight small stars compressed in a right line”. There are two lines of stars at right angles to one another: One line includes the 7th magnitude star HIP 54830, the rest of the stars being between 8th and 11th magnitude: If you extend it out to the next 8th magnitude star this could be interpreted as a “T”. The other slightly longer line includes the 8th magnitude star HIP 54790 and other stars between 8th and 11th magnitude.
- One is Corder 181 in the IAU constellation Pisces and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This consists of HIP 5216, 5231, 5209, and 5103. Size 45’ X 30’.
- One is Corder 564 in the IAU constellation Taurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. This includes HIP 17018. Size 15’.
- One is Corder 1859 in the IAU constellation Ursa Major and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 30’ X 15’. This includes HIP 46692, 46748, and 46964A.
- One is Corder 2005 in the IAU constellation Leo and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 10’. This is made up of 4 9th magnitude stars.
- One is Corder 2127 in the IAU constellation Hydra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 70’ X 25’. This includes HIP 54570, 54468, 54430, 54400, and 54332.
- One is Corder 2504, a backwards “L” in the IAU constellation Centaurus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 35’ X 20’. This is 5 7th – 8th magnitude stars including HIP 65808, 65738, and 65601.
- One is Corder 2561, a backwards “L” in the IAU constellation Ursa Minor and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45’ X 20’. The four stars include HIP 67512, 67925, 68029, and 67959A.
- One is Corder 2651 in the IAU constellation Boötes and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 15’. This includes HIP 70591 and 70579 and 22 Boötis.
- One is Corder 2928, a backwards “L” in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 6’. This is four 9th magnitude stars, oriented NNW/SSE.
- One is Corder 3033, a backwards “L” in the IAU constellation Scorpius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 15’. This includes the stars HIP 80146A, 80066, 80010, and 80035.
- One is Corder 3099 in the IAU constellation Scorpius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 50’ X 25’. This includes the stars HIP 81523, 81803A, 81819, and 81904.
- One is Corder 3276 in the IAU constellation Ara and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45’. This includes the stars HIP 85147, 85363, 85480, and 85448.

- One is Corder 3595, a backwards “L” in the IAU constellation Lyra and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 45’. This includes the stars HIP 90999, 90908, 90831, and 90886.
- One is Corder 3623 in the IAU constellation Draco and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 20’. This includes the stars HIP 91784, HIP 91735, and 46 Draconis.
- One is Corder 3851, a backwards “L” in the IAU constellation Octans and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 15’. This includes the stars HIP 95335 and 95344.
- One is Corder 4772 in the IAU constellation Grus and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size40’ X 20’. Includes HIP 113034, 112938, 112832, and 112922.
- One is in the IAU constellation Cassiopeia and is Corder 249 on the observing list of American astronomer Jeffrey Corder. Size 45’. This includes HIP 7339, 7318, and 7166.
- One is in the IAU constellation Andromeda and is Corder 289 on the observing list of American astronomer Jeffrey Corder. Size 20’. This includes HIP 8684.
- One is in the IAU constellation Cassiopeia and is Corder 448 on the observing list of American astronomer Jeffrey Corder. Size 35’. This is five stars and includes HIP 13853, the double star HIP 13677A, HIP 13428, and HIP 13621.
- One is in the IAU constellation Perseus and is Corder 449 on the observing list of American astronomer Jeffrey Corder. Size 35’. This includes HIP 13521, 13550, 13592, 13625, and 13640.
- One is in the IAU constellation Cepheus and is Corder 598 on the observing list of American astronomer Jeffrey Corder. Size 10’. This is four 8^{th} to 10^{th} magnitude stars including HIP 18209. Corder describes it as “a tiny V-shaped or L-shaped asterism”. I believe it looks more like an “L”.
- One in the IAU constellation Camelopardalis is Corder 894 on the observing list of American astronomer Jeffrey Corder. Size 10’. This is five stars of 9^{th} – 10^{th} magnitude arranged NW/SE with optical triples at each end.
- One is in the IAU constellation Auriga and is Corder 916 on the observing list of American astronomer Jeffrey Corder. Size 20’. This is ten stars between 8^{th} – 10^{th} magnitude including the double stars HIP 27214 and 27205A, and the star HIP 27120.
- One is in the IAU constellation Camelopardalis and is Corder 1000 on the observing list of American astronomer Jeffrey Corder. Size 10’. This includes a row of three 9^{th} magnitude stars and the double star HIP 28842A.
- One is in the IAU constellation Lynx and is Corder 1095 on the observing list of American astronomer Jeffrey Corder. Size 30’. This includes HIP 30661, 30578, 30605, 5 Lyncis, and two other 8^{th} magnitude stars.
- One is in the IAU constellation Lynx and is Corder 1571 on the observing list of American astronomer Jeffrey Corder. Size 15’. This is four stars between 8^{th} – 10^{th} magnitude including HIP 40867 and 40829.
- One is in the IAU constellation Cancer and is Corder 1650 on the observing list of American astronomer Jeffrey Corder. Size 50’ X 20’. This is four 8^{th} magnitude stars including HIP 42326, 42356, and 42243.

- One is in the IAU constellation Ursa Major and is Corder 1882 on the observing list of American astronomer Jeffrey Corder. Size 35' X 25'. This is four 7th – 9th magnitude stars including HIP 47380.
- One is in the IAU constellation Ursa Major and is Corder 2087 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is six 8th – 9th magnitude stars and one 6th magnitude star including HIP 52984, 53128, and the double star HIP 53257.
- One is in the IAU constellation Cetus and is Corder 51 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th - 10th magnitude stars including HIP 1160.
- One is in the IAU constellation Cetus and is Corder 225 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is five 6th – 9th magnitude stars including HIP 6606 and the double star HIP 6564A.
- One is in the IAU constellation Sculptor and is Corder 282 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 8206 and 8187.
- One is in the IAU constellation Dorado and is Corder 989 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is 5 8th – 10th magnitude stars including HIP 28400 and 28465.
- One is in the IAU constellation Columba and is Corder 1140 on the observing list of American astronomer Jeffrey Corder. Size 3'. This is four 9th – 10th magnitude stars.
- One is in the IAU constellation Puppis and is Corder 1408 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 6th – 9th magnitude stars including HIP 37616 and 37594.
- One is in the IAU constellation Pyxis and is Corder 1680 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 42894.
- One is in the IAU constellation Carina and is Corder 1703 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 8th magnitude stars including HIP 43292 and 43298.
- One is in the IAU constellation Chamaeleon and is Corder 2036 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 8th – 10th magnitude stars including a pair of optical doubles.
- One is in the IAU constellation Antlia and is Corder 2066 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 6th – 9th magnitude stars including HIP 53550.
- One is in the IAU constellation Centaurus and is Corder 2305 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 9th magnitude stars.
- One is in the IAU constellation Centaurus and is Corder 2329 on the observing list of American astronomer Jeffrey Corder. Size 30' X 20'. This is four 8th magnitude stars including HIP 60113, 60026, and 60003.
- One is in the IAU constellation Virgo and is Corder 2452 on the observing list of American astronomer Jeffrey Corder. Size 110' X 35'. This is five stars including HIP 64122, 64181, 64308, and 50 and 49 Virginis.
- One is in the IAU constellation Hydra and is Corder 2464 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is six 10th – 11th magnitude stars.

- One is in the IAU constellation Virgo and is Corder 2508 on the observing list of American astronomer Jeffrey Corder. Size 40' X 25'. This is five 7th – 9th magnitude stars including HIP 65943 and the double stars HIP 65982A and 66097.
- One is in the IAU constellation Centaurus and is Corder 2528 on the observing list of American astronomer Jeffrey Corder. Size 60' X 35'. This is five 6th – 7th magnitude stars including HIP 66917, 66733, 66722, 66566, and 66427.
- One is in the IAU constellation Boötes and is Corder 2648 on the observing list of American astronomer Jeffrey Corder. Size 85' X 60'. This is five 7th – 8th magnitude stars including HIP 70310, 70401, 70548, 70605, and 70800.
- One is in the IAU constellation Norma and is Corder 2895 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 9th magnitude stars including HIP 76549 and the double star HIP 76497A.
- One is in the IAU constellation Serpens and is Corder 2925 on the observing list of American astronomer Jeffrey Corder. Size 60'. This includes 30 Serpentis and the double stars d and Mu (μ) Serpentis and HIP 77542.
- One is in the IAU constellation Libra and is Corder 2952 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is four 4th – 8th magnitude stars including HIP 78059, 78204, and 48 Librae.
- One is in the IAU constellation Serpens and is Corder 2958 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 10th magnitude stars.
- One is in the IAU constellation Triangulum Australe and is Corder 3080 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is nine 8th – 10th magnitude stars.
- One is in the IAU constellation Triangulum Australe and is Corder 3144 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 6th – 7th magnitude stars including HIP 82764, 82566, and 82505, and the double star HIP 82654A.
- One is in the IAU constellation Draco and is Corder 3216 on the observing list of American astronomer Jeffrey Corder. Size 45' X 20'. This is four 6th – 7th magnitude stars including HIP 84183, 84130, 84171, and 94342.
- One is in the IAU constellation Ophiuchus and is Corder 3219 on the observing list of American astronomer Jeffrey Corder. Size 5'. This is four 9th – 10th magnitude stars.
- One is in the IAU constellation Ophiuchus and is Corder 3220 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is five 9th – 10th magnitude stars.
- One is in the IAU constellation Ophiuchus and is Corder 3222 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 7th – 9th magnitude stars including the double star HIP 84269.
- One is in the IAU constellation Octans and is Corder 3252 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 7th – 11th magnitude stars including HIP 84461.
- One is in the IAU constellation Ophiuchus and is Corder 3304 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 10th magnitude stars including HIP 85920 and 85899.
- One is in the IAU constellation Ara and is Corder 3344 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7th – 8th magnitude stars including HIP 86628, 86674, 86598, and 86589.

- One is in the IAU constellation Apus and is Corder 3355 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 8th – 10th magnitude stars including HIP 86783.
- One is in the IAU constellation Draco and is Corder 3378 on the observing list of American astronomer Jeffrey Corder. Size 15' X 10. This is five 7th – 8th magnitude stars including HIP 87572.
- One is in the IAU constellation Scorpius and is Corder 3388 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 7th – 8th magnitude stars including HIP 87505.
- One is in the IAU constellation Sagittarius and is Corder 3465 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 9th magnitude stars.
- One is in the IAU constellation Sagittarius and is Corder 3725 on the observing list of American astronomer Jeffrey Corder. Size 50' X 20'. This is four 7th – 8th magnitude stars including HIP 93336, 93077, and the double star HIP 93224.
- One is in the IAU constellation Pavo and is Corder 3772 on the observing list of American astronomer Jeffrey Corder. Size 20' X 10'. This is four 8th – 9th magnitude stars including HIP 94060.
- One is in the IAU constellation Aquila and is Corder 3825 on the observing list of American astronomer Jeffrey Corder. Size 60' X 45'. This includes Omega (ω) 1 and 2 Aquilae, 28 Aquilae, and HIP 94999.
- One is in the IAU constellation Sagitta and is Corder 3836 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 7th – 8th magnitude stars including HIP 95060, 95078, and the double star HIP 95116A.
- One is in the IAU constellation Pavo and is Corder 3985 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th magnitude stars including HIP 97975 and 97939.
- One is in the IAU constellation Sagittarius and is Corder 4066 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is four 8th – 9th magnitude stars including the double star HIP 99350A.
- One is in the IAU constellation Cygnus and is Corder 4093 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is seven 3rd – 9th magnitude stars including Omicron (o) Cygni, HIP 99781 and 99785.
- One is in the IAU constellation Cygnus and is Corder 4107 on the observing list of American astronomer Jeffrey Corder. Size 25'. This is six 7th – 9th magnitude stars including the double stars HIP 100058A and 100127A.
- One is in the IAU constellation Pavo and is Corder 4179 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is four 8th magnitude stars including HIP 101322 and 101286.
- One is in the IAU constellation Cygnus and is Corder 4267 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is eight 6th – 10th magnitude stars including HIP 103126, 103163 and the double star HIP 103189.
- One is in the IAU constellation Cygnus and is Corder 4401 on the observing list of American astronomer Jeffrey Corder. Size 30' X 25'. This is five 8th – 9th magnitude stars including HIP 105596 and 105586.
- One is in the IAU constellation Cepheus and is Corder 4527 on the observing list of American astronomer Jeffrey Corder. Size 10'. This is four 9th – 10th magnitude stars including HIP 108047.

- One is in the IAU constellation Pegasus and is Corder 4578 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including the double star 109182.
- One is in the IAU constellation Pegasus and is Corder 4776 on the observing list of American astronomer Jeffrey Corder. Size 35'. This is four 7th – 8th magnitude stars including HIP 113086 and 113173.
- One is in the IAU constellation Grus and is Corder 4843 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is five 8th – 10th magnitude stars.
- One is in the IAU constellation Grus and is Corder 4893 on the observing list of American astronomer Jeffrey Corder. Size 55' X 50'. This is five 5th – 8th magnitude stars including HIP 115537, 115531, 115577, and 115942 and the double star Omicron (o) Gruis.
- One is in the IAU constellation Pegasus and is Corder 4917 on the observing list of American astronomer Jeffrey Corder. Size 70' X 25'. This is five 6th – 7th magnitude stars including HIP 115465, 116383, 116265, 116117, and 116187.
- One is in the IAU constellation Cepheus and is Corder 4929 on the observing list of American astronomer Jeffrey Corder. Size 45' X 10'. This is six 8th – 10th magnitude stars including HIP 116503 and 116308. Corder lists this as an "L" or "J" and elsewhere on his list calls it Corder 4924, "a chain of 6 stars".
- One is in the IAU constellation Aquarius and is Corder 4933 on the observing list of American astronomer Jeffrey Corder. Size 45'. This is six 6th – 9th magnitude stars including HIP 116566, 116537, and 116446 and the double star HIP 116591.
- One is in the IAU constellation Tucana and is Corder 4985 on the observing list of American astronomer Jeffrey Corder. Size 80' X 30'. This is six 7th – 8th magnitude stars including HIP 117716, 117760, 117794, 117688, and 117600.

La Superba:

See Superb, below.

Labor Women:

This Chinese Chenzhuo xing guan is a bent line of four stars in the IAU constellation Aquarius: Epsilon (ε) Aquarii, Mu (μ) Aquarii, 5 Aquarii, and 3 Aquarii.

Labrys:

This American asterism is made up of stars of the IAU constellation Orion. One end of the handle shaft is the "belt of Orion" asterism: Zeta (ζ), Epsilon (ε), and Delta (δ) Orionis. The handle then runs down to the star Alpha (α) Canis Majoris (Sirius), which is the jewel on the labrys' handle. One blade is defined by the stars Alpha (α) Orionis (Betelgeuse), and Gamma (γ) Orionis. The other is defined by Kappa (κ) Orionis and Beta (β) Orionis (Rigel). The Uppsala Archaeoastronomical Project proposed this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne's Tribe in Tacoma, Washington in November 2023.

Lacerated of Canes Venatici:

This **telescopic** asterism "Lacerátus Cánum Venaticórum" is the irregular galaxy NGC 4485 (Arp 269) in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1788

who listed it as “I 198”. It is GC 3042 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it “is obviously being eaten by its voracious neighbour, NGC 4490”. It is also known as the “Cocoon” (see above) and the “Rhinoceros and its Infant” (see below). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists it without a name.

Lacerater of Canes Venatici:

This **telescopic** asterism “Lacerátor Cánum Venaticórum” is the barred spiral galaxy NGC 4490 (Arp 269) in the IAU constellation Canes Venatici. It was discovered by English astronomer William Herschel in 1788 who listed it as “I 198”. It is GC 3042 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as NGC 4485 “is obviously being eaten by its voracious neighbour, NGC 4490”. It is also known as the “Cocoon” (see above) and the “Rhinoceros and its Infant” (see below). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists it without a name.

Lacerta:

None of the stars of Lacerta are on the list of 90 brightest stars and the stars of this constellation show up in 59 asterisms in this handbook.

This IAU constellation (IAU abbreviation Lac), “Lacerta” (Latin “lizard”), was created by the Johannes Hevelius (1611 – 1687) in 1687. Hevelius named it “Stellio” for the stallion or stellion, a lizard found on the Mediterranean coast. In Hevelius’ *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, “Lacerta” is depicted as a long-tailed lizard: On one chart it is simply labelled “Lacerta” but on another it is labelled “Lacerta sive Stellio” (“Lacerta or Stellio”). To the French it is “Lézard”, to the Italians “Lucertola”, and to the Germans “Eideschse”.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Lacerta” in his Celestial Atlas in 1822.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Lacerta as a running creature with a very long tail.

Lacerta is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a running creature that looks to me more like a dog with a long tail than a lizard.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) labels this constellation “Lacerta Stellio” and depicts it as a lizard running to our right.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) listed it as “Eidexe” and Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “der Eidexe” and depicts it as a long-tailed dog running to our right.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Lacerta in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a lizard with a curly tail.

Lacerta is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Lacerta as a creature running to our left that looks more like a dog with a long tail.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Le Lezard Marin" as a running creature that looks more like a dog with a long tail than a lizard, as does the 1778 edition. Closeup charts in the 1776 edition label it "le Lezard".

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Lacerta" as a lizard walking to our left.

"Lacerta" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a lizard.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Lacerta" as a lizard.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Lacerta" as a lizard.

"Lacerta" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a lizard walking to our right.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Lacerta, The Lizard" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Lacerta" in his *Star Atlas* (1893) and describes it as "The Lizard".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Lacerta" and describes it as a "Lizard".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists it as "Lacerta… the Lizard".

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists this as "Lacerta (Lizard)".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows this constellation as a quadrilateral of the stars Alpha (α), Beta (β), 4, and 5 Lacertae, with a line running from this last star through 6 Lacertae to 1 Lacertae. Rey keeps the aforementioned quadrilateral as the "head", then adds another made up of 5, 2, 11, and 6 Lacertae to form a "body" with a "tail" a line running from 6 Lacertae to a bend at the double star HIP 109754A to 1 Lacertae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Lacerta in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a single bending line of stars running from Beta (β) Lacertae through Alpha (α) Lacertae, 5 Lacertae, 11 Lacertae, and 6 Lacertae, ending at 1 Lacertae.

Lacework Nebula:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as "V 15". It is GC 4600 in the *General Catalogue* of 1864. This is also known as the West Veil Nebula, Filamentary Nebula, Cirrus Nebula, Witch's Broom Nebula, and Pickering's Triangular Nebula.

Lachesis of Draco:

This **telescopic** asterism "Láchesis Dracónis" is the elliptical galaxy NGC 5982 in the IAU constellation Draco. It was discovered in 1788 by William Herschel and listed as "II 764". It became GC 4128 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is "the middlemost member… of a beautiful trio, which is reminiscent of the three Fates (Greek Moirai)." Lachesis ("measurer") was one of those three Fates. This is part of the NGC 5982 Cluster which is also known as the Dragon Slayer Group.

Lachishinaxanaxat:

This Mocoví asterism "Lachishinaxanaxat" is the IAU constellation Crux (Lopez 2021).

Laconian Dogs:

This German asterism "Canes Laconicae" is the IAU constellations Ursa Major and Ursa Minor as listed by German poet Philip von Zesen (1619 – 1689). It is probably a corruption of the asterism Cynosura (see Dog's Tail, above). This is a reference to dogs of Sparta. Compare this to Zesen's asterism "Puppy" (below).

Laconian Key:

This Greek asterism is the IAU constellation Cassiopeia and was given this name as it resembled the key used for Laconian locks.

Ladder:

This Ikoots asterism "Eskalera" is the Pointer stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers below). They view this as the ladder the Roman centurions used when they crucified Christ.

There are four Quechua asterisms with the name "Chakana", "Chaccana", or "Chakanuay" ("ladder", "bridge", "crossbeam"):

- One found in Misminay, "Chaccana", is the belt of Orion in the IAU constellation Orion (Urton 1980).
- One from Misminay, named "Chakana", represents the five extremities of the body and may be a being described by Cobo as a celestial being related to lightning and thunder:
    - The belt of Orion is the "head and arms",
    - One "leg" is Theta (θ) Orionis, and
    - One "leg" is Eta (η) Orionis.
- One, "Chakana", is the IAU constellation Crux (Urton 1980).
- One from Sonqo, "Chakanuay", is the stars Delta (δ), Epsilon (ε), and Eta (η) Canis Majoris in the IAU constellation Canis Major (Urton 1981).

Ladle:

This Lithuanian asterism “Samtis” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Belarussian asterism “Koushyk” is the IAU constellation Ursa Major (Avilin 2009).

This Filipino asterism “Tabo” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Kiribati star “Kai Ni Moi” is in the IAU constellation Delphinus (Trussel and Groves 1978) and is described as “slightly apart from four others”, which would make it Epsilon (ε) Delphini.

There are three **telescopic** “ladle” asterisms:

- One, “kleine Kelle” (“small ladle”), is AI J2340 6+0756 in the IAU constellation Pisces. René Merting lists it on the *Faint Fuzzies* website and describes it as “4 stars form a flat star arc moving north-south- on closer inspection three more faint stars can be seen to the north-east of the arc, which… represent the dipper.” Size 15’ X 15’. The star at the end of the “handle” is HIP 116816.
- One is in the IAU constellation Sextans and is Corder 1974 on the observing list of American astronomer Jeffrey Corder. Size 40’ X 20’. This is seven 7^{th} – 9^{th} magnitude stars including 21 Sextantis, HIP 50055, and 50029.
- One is in the IAU constellation Sagittarius and is Corder 3530 on the observing list of American astronomer Jeffrey Corder. Size 20’. This is five 8^{th} – 9^{th} magnitude stars.

Ladon:

This Greek asterism is the IAU constellation Draco and appears in the *Argonauticae* of Apollonius of Rhodes (b. 295 B.C.E.). Ladon is a prominent river in Arcadia and the estuary bounding the Garden of the Hesperides, which Draco guarded. Compare this to Guardian of the Hesperides, below.

Lady Gaga:

This **telescopic** asterism is made up of dust clouds in the IAU constellation Cepheus. Her “head” and “torso” is the dust clouds in front of galaxy PGC 65053 (ESO 528-25). Her raised left arm is the dust clouds stretching up towards galaxy PGC 65150 (UGC 11618). Her “knees and lower legs” are formed by dust clouds LDN 1094 and LDN 1100. Her “cape” is LDN 1089. This is Ennis 95 on the asterism list of Canadian astronomer Charles Ennis, who spotted in in an photo of this part of the sky by Benoit de Mulder on the Astrophotography page on Facebook on 19 August 2025.

Lady in the Chair:

This Arabic asterism “Sayidat Ladayha Kursiun” سيدة لديها كرسي) or the “Dhāt al-Kursīy” listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (also translated as “Lady Has Chair” and “Who Has Chair”) is the IAU constellation Cassiopeia (Hafez 2010):

- Persian astronomer Ulugh Beg Mirza (1394 – 1449) listed “Al Dhāt al Kursiyy”.
- John Chilmead listed it as “Dhath Alcursi” in his *A Learned Treatise of Globes* in 1889, which he derived from Robert Hues’ *A Learned Treatise of Globes* (1659), where Hues listed “Dhath Aleursi”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) as “Dath Elkarti”.

- English Admiral Henry William Smyth lists it as “Dhát-al-Kursa, the Lady of the Throne” in his *Bedford Catalogue* in 1844.

Lady Liberty:

This asterism is NGC 6996 in the IAU constellation Cygnus. This was discovered by French astronomer Guillaume Bigourdan (1851 – 1932). It is GC 4619 in the *General Catalogue* of 1864. German astronomer Robert Zebahl writes that “the German-American Udo Schlegel noted this star island surrounded by dark nebulae regularly since 1990… [and] named it “Lady Liberty” because of its location in [the] North America [nebula]”. It is also known as the “Bird’s Nest” (see above).

Lady of Heaven:

See Hippopotamus, above.

Lady of the Flame:

This Latin asterism “Domina Flammae” is the IAU constellation Cepheus. Compare this to the Arabic asterism On Fire (below).

This Hebrew asterism “Baalath Halab” is the IAU constellation Cepheus. John Hill lists it as “Baalath” in his *Urania* in 1754.

Lady’s Footstool:

This **telescopic** asterism is in the IAU constellation Cassiopeia. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 mentions the “Lady’s footstool” and suggests that it is near Gamma (γ) Cassiopeiae: I believe this to be the open cluster NGC 225, which is also known as the Broken Heart, the Igloo, and the Sailboat.

Lady’s Wain:

This Old Icelandic asterism “kvenna-vagn” (**“**Lady’s Wagon” or “Lady’s Wain”) is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper below) as listed by Cleasby and Vigfusson in 1874. Compare this to the Norse asterism “Woman’s Wagon” (see below).

Laelaps:

This asterism is the IAU constellation Canis Major. This name is listed in Johann Bayer’s *Uranometria* (1603). The Greeks associated this constellation with Laelaps, a dog which was a gift to Europa from the God Zeus.

Lafitte’s Grand Isle:

This **telescopic** asterism is emission nebula NGC 281 (SH 2-184, LBN 616, Ced 3) in the IAU constellation Cassiopeia. It was discovered in 1883 by American astronomer Edward Emerson Barnard. Size 35’ X 35’. It is number 3 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007). It is also known as the “Pacman Nebula” (see below).

Lagoon Nebula:

This asterism is the emission nebula and HII region Messier 8 (NGC 6523), discovered by Italian astronomer Giovanni Hodierna before 1654 in the IAU constellation Sagittarius. It is listed in John Herschel’s *General Catalogue* of 1864 as GC 4361. It is one of two nebulae visible to the unaided eye in

the northern hemisphere (the other being the Orion Nebula). It is also known as the Hourglass Nebula (see above), the Dragon Nebula (see above), and the Oyster (with Mignonette Dressing). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) simply describes it as "Sagittarius, Nebula". The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Lagoon Nebula". *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Lagoon Nebula".

Láheci:

This Kaykavian asterism is the Pleiades cluster in the IAU constellation Taurus.

Lalande 21185:

This **telescopic** star is HIP 54035 (HD 95735) in the IAU constellation Ursa Major (magnitude 10.49). It was listed in 1801 by French astronomer Jérôme Lalande in the star catalog *Histoire céleste française*. It is the brightest red dwarf star in the northern hemisphere.

Lamb:

This Arabic asterism "al-hamal" (الحمل) is made up of the stars of the IAU constellations Aries, Perseus, and Triangulum:

- The "head" is the triangle of stars Alpha (α) Arietis (Hamal), Beta (β) Arietis (Sheratan) and Lambda (λ) Arietis with a line running from Sheratan to Gamma (γ) 1 Arietis forming a "horn". NOTE: Hamal and Sheratan are the Arabic manzil Two Signs (see below), also known as Horns of the Lamb (see below), Butting (see above), or Sign (see below).
- The "body" of starts at the "neck" at Hamal and runs around through Delta (δ) Arietis, Zeta (ζ) Arietis, 64 Arietis, HIP 15549, 39 Arietis, and 21 Arietis.
- The "little belly" is the triangle of stars 39, 35, and 41 Arietis (although there are two other versions of this (see Little Belly of the Lamb, below),
- The "back leg" is a line running from HIP 15549 to a "hoof" of the two stars Rho (ρ) Persei and Beta (β) Persei (Algol).
- The "Two Forelegs" are two lines of stars running out from 21 Arietis:
    - One goes to Beta (β) Trianguli, and
    - One goes to Alpha (α) Trianguli.

"Al-Hamal" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name for Aries (Hafez 2010).

NOTE: The Arabic word "hamal" refers to a first-year lamb but is sometimes translated as "ram" or "sheep" by people assuming it was influenced by the Greek constellation Aries, the ram.

This Hebrew asterism "T'leh" or "Taleh" ("lamb" or "lamb of the world") is the IAU constellation Aries and is related to their month Nisan and to Simeon or Gad.

Lambda:

There are seven **telescopic** "Lambda" asterisms:

- One is Corder 338 in the IAU constellation Cassiopeia and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. It includes the star HIP 10141. Size 20'.

- One is Corder 1110 in the IAU constellation Gemini and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder describes it as "four 8th and 9th magnitude stars in the shape of a Greek letter Lambda [λ]. The letter has its top to the NW. It includes the double star Otto Struve 141 at the southern end." Size 15'.
- One is in the IAU constellation Antlia and is Corder 2047 on the observing list of American astronomer Jeffrey Corder. Size 40'. This is four 6th – 9th magnitude stars including HIP 51977 and 51924.
- One is in the IAU constellation Hercules and is Corder 3205 on the observing list of American astronomer Jeffrey Corder. Size 15'. This is four 8th – 9th magnitude stars including HIP 83771 and 83705.
- One is in the IAU constellation Hercules and is Corder 3427 on the observing list of American astronomer Jeffrey Corder. Size 30'. This is five 6th – 8th magnitude stars including 97 Herculis, HIP 88261 and 88208.
- One is the open cluster IC 4665 in the IAU constellation Ophiuchus. It was discovered in 1745 by Swiss astronomer Phillipe Loys de Chéseaux. Despite its brightness, it was not catalogued by Charles Messier or William Herschel. American astronomer Edward Emerson Barnard (1857 – 1923) recorded it, which resulted in it becoming IC 4665 in the *Index Catalogue*. This was listed by American astronomer Lew Gramer (1997), who described it as "a tiny 'Grus-like' or Lambda shaped asterism". It is also known as the Summer Beehive, Poseidon's Trident, Mini Grus, "Q", or the Black Swallowtail Butterfly.
- One is the Hyades cluster (Caldwell 41, Collinder 50, Melotte 25, see above) in the IAU constellation Taurus. This is an ancient Greek asterism.

Lambda-Lambda Cluster:

This **telescopic** asterism, also known as the "Lambda (λ) Ori Cluster" and "Orion Cluster", Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion, now known as star cluster Collinder 69. It is called this because it contains the star Lambda (λ) Orionis, and the asterism resembles the Greek letter Lambda (λ), which was first noted by 13th century Persian polymath Nasir al-Din al-Tusi and Persian astronomer Ulugh Beg Mirza (1394 – 1449), indicating that this was originally an unaided eye asterism and not telescopic.

Lambs:

This Latin asterism "Agni" is the Haedi asterism (see Kids above).

Lame:

This Shona asterism "Chirema" ("lame" or "abnormal") is the Pleiades cluster in the IAU constellation Taurus.

Lame Hut:

This Hungarian asterism "Sánta búdús" is likely the stars of the IAU constellation Crater. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a man with a wooden leg pulling a small, covered cart full of belongings. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky.

Lamma:

This Seleucid star from the MUL.APIN tablets is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra and is part of their asterism She-Goat (see below). It is named for their Goddess Lamma, the "Lady of Life", who appears in earlier Akkadian culture as Lama, Lamma, or Lamassu. Compare this to the Babylonian asterism Lamssatu, below.

Lamont's Star:

This is a peculiar star near the nucleus of the Andromeda Galaxy (Messier 31) in the IAU constellation Andromeda.

Lamp:

This "Euphratian" asterism is the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899. Allen writes that J. N. Strassmaier, an expert in Babylonian culture, translated "an inscription as die Lampe als Nuru, the Solar Lamp".

Lamp Holder:

This telescopic asterism is in the IAU constellation Lacerta. Brazilian astronomer Bruno Alessi lists it on his BDCC 7.6 list. It is made up of the stars HIP 111627, 111567, 111307, 111041, and 111032. Size 36'.

Lamp of the North:

This star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Pinard 2022) as described by Scottish author William Sharp (writing under the pseudonym Fiona MacLeod (1855 – 1905)).

Lamplightus:

This American asterism is the IAU constellation Lyra and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Lamp Stand:

This Inuit asterism "Pituaq" ("stones supporting lamp" or "three-legged pot stand"), also known as "Uqsuutaattiaq" (see Blubber Container, above), is the stars Alpha (α) Cassiopeiae (Shedar), Beta (β) Cassiopeiae (Caph) and Gamma (γ) Cassiopeiae (Navi) in the IAU constellation Cassiopeia (MacDonald 1998).

Lamssatu:

This Babylonian star from the MUL.APIN tablets is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra and is part of their asterism She-Goat (see below). She appears in earlier Akkadian culture as Lama, Lamma, or Lamassu. It is named for their Goddess Lamassu. Compare this to Lamma, above. Lamassu is a protective deity.

Lance of Christ Crucified:

This German asterism "Lance of Christ Crucified" is the IAU constellation Sagitta and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in

John Hill's *Urania* in 1754 under the name "Lance and Nails", and as "the Nails and Lance that Wounded our Saviour" in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

Lance of the Lance Bearer:

See Spear of the Spear Bearer, below.

Lancer:

This asterism "Lanceator" is the IAU constellation Boötes. This name is listed in Johann Bayer's *Uranometria* (1603). This is probably derived from "Uplifted One of the Lancer" (see below).

Land Crab:

This Kiribati asterism "Manai" or "Nei te M'anai" is made up of the stars of the IAU constellation Cancer (Trussel and Groves 1978). This crab is of the species Cardisoma.

Land of Windows:

This Chumash asterism is the "W" asterism in the IAU constellation Cassiopeia (see W below).

Land Tortoise:

This Bororo asterism "Geriguigui" is the IAU constellation Corvus (Green and Green 2011).

This Palikur asterism "Wayam" is made up of stars of the IAU constellations Vela and Carina (Green and Green 2011). Wayam's "head" is near Omicron (o) and Delta (δ) Velorum, his left foot near Kappa (κ) Velorum, and his right foot near Epsilon (ε) Carinae.

Landing Eagle:

This Arabic asterism is a triangle of stars in the IAU constellation Lyra: Alpha (α) Lyra (Vega- see Falling Eagle, above), Zeta (ζ) 1 Lyrae, and Epsilon (ε) 2 Lyrae. Next to this is the stars Landing Eagle Claws (see below).

Landing Eagle Claws:

This Arabic asterism is stars in the IAU constellation Lyra: Kappa (κ) and Mu (μ) Lyrae.

Landlord:

This Estonian asterism is the IAU constellation Orion (Kuperjanov 2006). It was first recorded by Robert Livländer in 1923.

Lang:

See Long, below.

Languid of Puppis:

This **telescopic** asterism "Hébes Púppis" is the intermediate Magellanic spiral galaxy NGC 2427 in the IAU constellation Puppis. It was discovered in 1835 by John Herschel who listed it as 3091 and later as GC 1555 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "does not demonstrate much activity".

Laocoön:

This Greek asterism is the IAU constellation Ophiuchus. In Greek much Laocoön was a Trojan priest. He and his sons were attacked by serpents. This is an alternate name for the IAU constellation Ophiuchus listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. Bartsch attributes this to Kepler, who Bartsch claims in turn was citing 1st century B.C.E. Roman poet Virgil.

Lap Dog:

This Latin asterism "Catellus" is the IAU constellation Canis Minor.

Lapilalaxachi:

This Mocoví asterism is the Pleiades cluster in the IAU constellation Taurus (Lopez 2021). Lapilalaxachi is a powerful ancestor of the Mocoví who challenges the Mañic (see Rhea, below).

Larawag:

See Clear Sighting, above.

Larder:

This Palawa asterism is the Coal Sack Nebula in the IAU constellation Crux (Gantevoort et al 2016).

Large Candle:

This Tzotzil (of Chamula) star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Large Cart:

This Estonian asterism "Suur Vanker" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Belarussian asterism "Vialiki Voz" is the Big Dipper asterism in the IAU constellation Ursa Major (Avilin 2009). Compare this to "Voz" (see Cart, above), and "Voz Faraonski" (see Pharaoh's Cart, below).

Large Cloud:

This French asterism "le Grande Nuage" is the Large Magellanic Cloud as listed by French astronomer Nicolas Louis de Lacaille (1713 – 1762). The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists it as "le Gd Nuage".

Large Clouds:

This German asterism "nubecula major" is the Large Magellanic Cloud as listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* in 1603:

- "Nubecula major" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Gores for a celestial globe Bibliothèque Nationale de France, Department Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts a cloud labelled "Nubecula Maior".
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Nubecula Major" and depicts it as a cloud.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Nubecula Major" as a cloud.

- It is listed as “Nubecula Major” in the third edition of Rev. Thomas William Webb’s *Celestial Objects for Common Telescopes* in 1873.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this as “Nebula Major” in his *Celestial Atlas* in 1822.
- This asterism is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated title “Nubec Major”: He indicates the borders of this constellation on the chart but offers no illustration of it.
- “Nubecula Major” appears as a name for the Large Magellanic Cloud in Johan Dreyer’s 1888 *New General Catalogue*.
- William Denning’s *Telescopic Work for Starlight Evenings* (1891) lists “Nubecula Major” as a name “marked…on celestial globes and charts”, but lists it himself as a Magellanic Cloud.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Nubecula Major” as an alternate name for the LMC.

Large Cluster:

This Kaykavian asterism “Vélka Kola” is the IAU constellation Ursa Major.

Large Cross:

There are two versions of this Quechua asterism “Hatun Cruz” (Urton 1981):

- One found in Misminay is made up of stars of the IAU constellations Canis Major, Canis Minor, and Orion: Alpha (α) Orionis (Betelgeuse), Beta (β) Orionis (Rigel), Alpha (α) Canis Majoris (Sirius), Alpha (α) Canis Minoris (Procyon). This is also known as the “Northern Cross” in the Quechua community of Misminay. The star Sirius is called “Hatun Collyur” (see Large Star, below).
- One found in Sonqo is made up of stars of the IAU constellations Canis Minor and Gemini: Alpha (α) Canis Minoris (Procyon), Alpha (α) Geminorum (Castor), and Beta (β) Geminorum (Pollux).

Large Cup:

This Latin asterism “Poculum Magnum” is the IAU constellation Crater.

Large Horned Oxen:

This Welsh asterism is the IAU constellation Gemini as listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909).

Large Magellanic Cloud:

This dwarf galaxy is located in the IAU constellation Dorado. Persian astronomer ‘Abd al Rahman al Sufi recorded this in 964. Italian merchant explorer Amerigo Vespucci recorded it in 1504. Portuguese explorer Ferdinand Magellan recorded it in 1519, and it now bears his name. It is also known as Nubecula Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) as “Nímbus Magellánicus Dorádus”.

Large Male Animal:

This Venda star "Mhobo" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. The term Mhobo can be used to refer to a boar, bull, or stallion.

Large Star:

This Quechua star "Hatun Collyur" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Urton 1981). It is part of their asterism "Hatun Cruz" (see Large Cross, above).

Large Umari Fruit Fence:

This Barasana asterism "Wamu Saniro Haigu" is the line of stars Gamma (γ), Lambda (λ), and Omicron (ο) Tauri in the IAU constellation Taurus. Hugh-Jones (2006) describes this as "a cluster on the other side of the Hyades near [Pi] π of Taurus and also circular in shape".

Larger Cart:

This Latin asterism "Plaustrum Majus" is the Big Dipper asterism in the IAU constellation Ursa Major: 5th century writer Martianus Capella called it "Plaustriluca". The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) lists the name "Plaustrum" ("cart") for this asterism. NOTE: A plaustrum was originally a two-wheeled cart, a plaustrum maius" or "plaustrum Majus" a four-wheeled cart.

- Edward Sherburne's *Sphere of Marcus Manilius* (1675) lists "Plaustrum Magnus".
- English alchemist and translator Richard Eden (c.1520 – 1576) called it "Plastrum" and "Charles' Wayne".
- German astronomer Petrus Apianus in his *Cosmographicus Liber* ("cosmographic book") in 1524 listed it as "Plaustrum".
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists the names "Plaustrum" and "Ursa Major" for this constellation.
- German astronomer Jacob Bartsh (1600 - 1633) lists the names "Plaustrum" and "Ursa Major".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Plaustrum Majus".
- Johann Bayer's *Uranometria* (1603) lists the names "Plaustriluca" and "Plaustrum seu Plostrum Maius" for Ursa Major.
- "Plaustrum Majus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch. On Bartsch's polar chart this asterism is labelled "Plaustrum".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Plaustrum".
- R. H. Allen lists it as "Plaustrum Magnum" or "Plostrum Magnum" in his *Star Names* in 1899.

Larger Horse:

This Arabic asterism "Al faras al a'dham" is the IAU constellation Pegasus as listed by English Admiral Henry William Smyth's *Bedford Catalogue* in 1844.

Larks:

This Arabic asterism is a line of stars in the IAU constellation Eridanus, Grus, and Phoenix: Chi (χ) Eridani, Delta (δ) Phoenicis, Beta (β) Phoenicis, Epsilon (ε) Phoenicis, HIP 116602, and Iota (ι) Gruis.

Lasso Loop:

This **telescopic** asterism Leiter 11 from the list of American astronomer Frank Leiter is a loop of 9 – 10th magnitude stars in the IAU constellation Gemini. A line of faint stars between this loop and Epsilon (ε) Geminorum is the "rope". Its size is 223' X 21'.

Lasso Thrower of Cetus:

This **telescopic** asterism "Laqueária Céti" is the interacting galaxies NGC 1142 and 1144 (Arp 118) in the IAU constellation Cetus. They were discovered by German astronomer Albert Marth in 1864. They became GC 5289 and GC 5290 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Last of the Mohicans:

This **telescopic** asterism is made up of stars of the IAU constellation Puppis. It is Lorenzin 22 on Tom Lorenzin's list of asterisms. This is a group of stars around HIP 31962.

Last Star:

This Hawaiian star **"**Nanahope", also translated as "looking back", is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini.

Last Tent:

This Arabic star "akhir al-khibāʾ", later latinized to "Achr al Achbiya" is Zeta (ζ) Aquarii in the IAU constellation Aquarius listed in the *Calendarium* of Mohammad Al Achasasi Al Mouakket in 1650.

Last Year's Theme:

This American asterism is made up of stars of the IAU constellation Cygnus and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). It is basically the Northern Cross asterism repurposed.

Late:

This Belarussian asterism "Poznia" is one of the stars in the belt of Orion asterism in the IAU constellation Orion (Avilin 2009). The other two stars are known as "Zahodnia" (see Western, below) and "Svetovaia" (see World below). I believe this to be Zeta (ζ) Orionis, as this would be the one of those three stars that rises last.

Latent of Ursa Major:

This **telescopic** asterism "Adélus Úrsae Majóris" is the lenticular galaxy NGC 5473 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "I 231". It became GC 3782 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called it this because of "the obscure semi-visible bar in the central region".

Later:

This Bedouin asterism "al-Ḫilj al-Tuwalī" (الخلج الاولات) is the stars Gamma (γ) Ursae Majoris and Delta (δ) Ursae Majoris in the IAU constellation Ursa Major.

Latham's Planet:

This small red dwarf star or massive brown dwarf star is HD 114762 b in the IAU constellation Coma Berenices. It was unofficially named “Latham's planet” in 1989 after its discoverer astronomer David Latham: It was originally thought to be a massive exoplanet.

Latter:

The Bedouin star “al-Twailī” (التويلي), which means “the latter”, is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Latter Footstool:

This Vedic asterism “Úttarā Prósthapadā is a line of two stars in the IAU constellations Andromeda and Pegasus: Gamma (γ) Pegasi and Alpha (α) Andromedae (Alpheratz) and appears in the *Taittiriya Samhita* (Ivanković 2021). It appears in the *Taittiriya Brahmana* as “Úttare” (Ivanković 2021). It is an older name for their nakshatra Uttara Bhadrapada (see Second of the Blessed Feet, below).

Latter Fruitful:

This Vedic moon station consists of the stars Beta (β) Leonis (Denebola) and 93 Leonis in the IAU constellation Leo.

Latter Invincible One:

This Vedic asterism, also known as “Latter Victory” or “Latter Unconquered” is made up of stars of the IAU constellation Sagittarius:

- The main part is a triangle of stars: Tau (τ), Rho (ρ) 1, and b Sagittarii,
- From b Sagittarii a short line runs out to c Sagittarii,
- From Tau (τ) Sagittarii a line runs out to Omicron (ο) Sagittarii, where it splits into another two lines:
- One going to Eta (η) Sagittarii, and
- One going to Xi (ξ) 2 Sagittarii.

Laughing Cyclops:

This **telescopic** asterism Zürn 1 is in the IAU constellation Perseus. It was discovered by German astronomer Katharina Zürn in the middle of the open cluster NGC 869, which is part of the Double Cluster (see above). Robert Zebahl lists it on his *Faint Fuzzies* website and writes "In the center of this cluster a small, fine star pattern is visible. Around the 6m5 bright star V520 Per five stars with magnitudes from 8 mag form a narrow, outward (resp. southeast) curved arc.” V520 Persei is the “eye” and the curve is the “smile”. This is also known as the Parachutist (see below). Compare this to the Glum Cyclops (see above).

Laughing Skull:

This **telescopic** asterism is the HII region LBN 406 in the IAU constellation Draco.

Launched Bolas:

This Mapuche asterism “Lükay” (“bolas”) or “Xana Lükay” (“launched bolas”) is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Menares 2008). Compare this to the Mapuche asterism Melipal (see Bolas, above).

Law:

This Chinese star “Fa” from the Three Kingdoms to the Ming Dynasty is Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Fa” is the star Beta (β) Ursae Majoris (Merak) in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

This Bedouin star “Al Kanooon” or “aal-Kanūn” (الكانون) or “Al Kanoon”, mentioned in the poetry of al-Ḫalāwī, is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila.

Lawman:

This Wardaman asterism is the Coal Sack Nebula in the IAU constellation Crux (see Coal Sack, above). This represents the head of their lawman.

Lawn Sprinkler:

There are three “Lawn Sprinkler” asterisms:

- One is Streicher 49 in the IAU constellation Aquila. It was discovered by South African astronomer Magda Streicher. René Merting lists it on the *Faint Fuzzies* website as the “Rasensprenger” (“lawn sprinkler”).
- One, the Lawn Sprinkler Nebula, is the planetary nebula NGC 4361 in the IAU constellation Corvus. This was discovered by English astronomer William Herschel in 1785 who listed it as “I 65”. It is GC 2917 in the *General Catalogue* of 1864. Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this nebula but does not name it.
- One is NGC 7479 (Caldwell 44) which is a barred spiral galaxy in the IAU constellation Pegasus. It was discovered by English astronomer William Herschel in 1784 who listed it as “I 55”. It is GC 4892 in the *General Catalogue* of 1864. It is also known as the Superman Galaxy (see below), “V” (see below), and the Propeller (see below). American astronomer Steve Coe (1949 – 2018) wrote that it “looks like a two-armed garden sprinkler in action”.

Lawnmower:

There are two **telescopic** “Lawnmower” asterisms:

- One is the open cluster NGC 663 (Caldwell 10), located in the IAU constellation Cassiopeia. It was discovered by English astronomer William Herschel in 1787, who listed it as “VI 31”. It is GC 392 in the *General Catalogue* of 1864. It resembles a letter “S” (see S below) and contains about 400 stars and spans about a quarter of a degree of sky. Note: The lawnmower was invented and patented in 1830 in Gloucestershire, England, by Edwin Budding, so the name cannot precede this date.
- One is made up of stars of the IAU constellation Sculptor. It is Ennis 90 on the asterism list of Canadian astronomer Charles Ennis and Dezsi 1 on the list of Hungarian astronomer Attila Dezsi. Ennis posted it in July 2025. Size 9’. A wedge of 6 stars forms the “mower” and a line of three stars the “handle”.

Lawway:

This Nuenone star is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Gantevoort 2015).

Lazy One:

This Kokatha and Ngalea star “Mumba” is Alpha (α) Geminorum (Castor) in the IAU constellation Gemini (Leaman and Hamacher 2014). It is part of their asterism “Wati Kutjera” (see below), the other part being Kuruka’di (“the Wise One”, see below).

Lazy Team:

This asterism is the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899.

L.E. Cluster:

This **telescopic** asterism resembling the letters “LE”, also known as the 37 Cluster (see above), the Shopping Cart Cluster (see below), or the Little Pleiades (see below), is in the open cluster NGC 2169 in the IAU constellation Orion. This was discovered by William Herschel in 1784 who listed it as “VIII 24” in his catalogue. It is GC 1361 in the General Catalogue of 1864. It includes the stars HIP 29106, 29126A and B, 29127, and 29121.

Leader:

This Kamilaroi asterism “Beraiberai” is the IAU constellation Orion. Beraiberai is the leader of the Miyay Miyay (see Seven Young Women (Sisters) below). His belt is “ghutur” (see Belt, above) and his boomerang is “burran” (see Boomerang, above).

This Sogdian asterism “Sarwa” is the stars Iota (ι), Kappa (κ), and Theta (θ) Virginis in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

This Khorasmian asterism “Shushak” is the stars Iota (ι), Kappa (κ), and Theta (θ) Virginis in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Leader of a Wealthy Flock:

This Latin asterism “Dux opulenti gregis” is the IAU constellation Aries. Johann Bayer’s *Uranometria* (1603) lists “Dux Gregis” for this constellation.

Leader of Boötes:

This **telescopic** asterism “Hégemon Boótis” is the spiral galaxy IC 4566 in the IAU constellation Boötes. It was discovered by American astronomer Edward Barnard in 1890. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “an exemplary spiral system,… situated at the head of a small row of galaxies and could be considered the leader or guide of the group”.

Leader of Cranes:

This Hungarian asterism “Darvak veze’re” appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), which depicts this as three cranes in flight. This is related to their asterism “Crane’s Nest” (see above). NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Leader of Five of Telescopium:

This **telescopic** asterism “Pentadarchúsa Telescópii” is the barred elliptical galaxy IC 4797 in the IAU constellation Telescopium. It was discovered by American astronomer Royal Harwood Frost in 1903. This

name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "IC 4797 is the brightest galaxy in a linear group of five containing, from north to south, NGC 6708, NGC 6707, IC 4769, IC 4797, and ESO183-30."

Leader of Leo:

This **telescopic** asterism "Coryphaéus Leónis" is the spiral galaxy NGC 3800 (Arp 83) in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "II 103". John Herschel listed it as h 936 and h 3356 and later as GC 2488 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "NGC 3800 and NGC 3799… are comparable to a pair of dancers… Being the largest, NGC 3800 can be considered to be the leader of the dance".

Leader of the Herd:

This Latin asterism "Princeps Armenti" is the IAU constellation Taurus.

Leader of the Mourning Maidens:

This Arabic star "al-Qā'id (banāt naʿash)" (القائد بنات نعش) or "Ḳāʾid Banāt al Naʿash" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major This is part of the Bedouin asterism Daughters of Na'sh (see above) and "Benetnasch" (see Daughters of the Bier, above) and sometimes given this name:

- "al-Qāīd" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Sābi' banāt na'sh yusammā al-qā'id" ("the seventh of banāt na'sh, called the leader" appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).
- This was later latinized to "Al Ḳā'id", "Alcaid", "Alkaid", "Alchayr", "Akiar", and "Alcaide".
- Dorn (1829) lists it as "Alcaïd" and "Alcaide", translates it as "leader" or "governor", and describes it as appearing on on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-qā'id huwa sābi' banāt na'sh" ("the leader, the seventh of the banāt na'sh").
- The *Alfonsine Tables* list "Elkeid" (Kuntisch 1986).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "bennenatz".
- German astronomer Johann Bayer (1572-1625) lists "El Keid" or "Elekeid".
- Johann Bayer's *Uranometria* (1603) lists "Elkeid" as a name for this star.
- Catholic librarian Giuseppe Simone Assemani (1687 - 1768) listed it as "Alcatel", translating this as "destroying".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Benetnasch".
- French astronomer Dominique François Jean Arago (1786 – 1853) listed "Ackaïr".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Alkaid" and his *Bedford Catalogue* in 1844 lists "Alkaid, or Benetnasch, both of which are from its Arabian denomination, Al Káyid al benát al na'sh, the governor of the mourners".

- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alkaid" and "Benetnasch".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alcaid" and describes it as "the chief".
- R. H. Allen lists it as "ʿAnāḳ al Banāt" and translates it as "Chief One" in his *Star Names* in 1899.
- The 1st edition (1910) and the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) list "Alkaid" and "Benetnasch" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alcaid" and "Benatnasch" for this star.
- The IAU approved the name Alkaid for Eta (η) Ursae Majoris.

Leader of the Zodiac:

This Latin asterism "Ductor exercitus zodiaci" is the IAU constellation Aries. This relates to its position as the indicator of the vernal equinox thousands of years ago. Around 420 C.E. this moved into Pisces.

Leader of Three Villages of Leo:

This **telescopic** asterism "Tricomárchus Leónis" is the barred spiral galaxy NGC 2964 in the IAU constellation Leo. It was discovered in 1785 by William Herschel who listed it as "I 114". It became GC 1896 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "NGC 2964 is the brightest member of a trio of galaxies."

Leading Ox:

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Capricornus. The "body" is a diamond of the stars Beta (β) Capricorni (Dabih, which forms the "head"), Pi (π) Capricorni, Omicron (ο) Capricorni, and Rho (ρ) Capricorni. From Beta (β) Capricorni two lines run out to Alpha (α) Capricorni (Algedi) and Nu (ν) Capricorni, forming the "horns".

Leaf:

This **telescopic** asterism is the open cluster NGC 7050 in the IAU constellation Cygnus. René Merting describes it on the Faint Fuzzies website: "At 45x, the pattern looks a bit like the Arrowhead Cluster NGC 7510 - some faint stars form a condensation with a tip to the southwest - directly, the area appears foggy, in averted, the faint stars twinkle beautifully - at 103x, eight stars form a beautiful leaf oval, which is pointed to the southwest and appears more rounded to the northeast - in the northeast, three more stars are in a row, the stem to the leaf".

Leaflike of Aries:

This **telescopic** asterism "Foliácea Aríetis" is the spiral galaxy NGC 697 (and 674) in the IAU constellation Aries. It was discovered in 1786 by English astronomer William Herschel who listed it as "III 179". It became GC 416 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Lean number of stars

This Hungarian asterism “Leán szömü csillaq” appears on the celestial map of Hungarian uranographer Sandor Nagy (1915), who depicts it as the upper half of a possibly female figure facing us who appears to have a knife in her right hand. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Lean One of Boötes:

This **telescopic** asterism “Mácer Boótis” is the edge-on galaxy UGC 9242 in the IAU constellation Boötes. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Leaning:

See Efforts, above.

Leaper:

This Vedic asterism is the IAU constellation Pisces.

Leapers:

This Latin asterism “Ludentes” or “Ludiones” is a group of stars in the IAU constellation Ursa Minor: Alpha (α) Ursae Minoris (Polaris), Beta (β) Ursae Minoris (Kochab), Gamma (γ) 1 and 2 Ursae Minoris, Delta (δ) Ursae Minoris, and Epsilon (ε) Ursae Minoris. This is listed in the 11th century *De signis caeli (“of the signs of heaven*”). This is listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 and in R. H. Allen’s *Star Names* in 1899. Smyth translates it as “dancers”.

The Uppsala Archaeoastronomical Project proposed the IAU constellation Gemini for this Minoan asterism. This asterism was passed on to me by Dana Corby of Ariadne’s Tribe in Tacoma, Washington in November 2023. The Leapers are Thaena (“wisdom”) and Sydaili (“joy”), represented by Alpha (α) and Beta (β) Geminorum; Eshuumna (the Unseen Rainbow) is the dark space between them.

Leaping Dolphin:

This **telescopic** asterism “Émbole Dracónis” is the interacting galaxies NGC 6670 in the IAU constellation Draco. This name appeared in *Amazingspace* in November 2017. It was discovered by Lewis Swift in 1886. It is also known as “Ramming Ships of Draco” (see below) and the “Poster Girl”.

Leaping Minnow:

See Mini Delphinus, below.

Leashed a Gracious Antelope and its Milk:

This Hittite asterism is the IAU constellation Virgo as listed in the KUB XII 62 tablets (Boutet 2014).

Leashed a Leopard in a Lost Land:

This Hittite asterism is the IAU constellation Gemini as listed in the KUB XII 62 tablets (Boutet 2014).

Leashed a Proud Lion:

This Hittite asterism is the IAU constellation Leo as listed in the KUB XII 62 tablets (Boutet 2014).

Leashed a Wolf in a High Place:

This Hittite asterism is the IAU constellation Cancer as listed in the KUB XII 62 tablets (Boutet 2014).

Leashed the Bearded Serpents Intertwined:

This Hittite asterism is the IAU constellation Pisces as listed in the I KUB 1, KBO III 8 and 14/KUB XXV tablets (Boutet 2014)

Leashed the Throne of the Tutelary Divinity:

This Hittite asterism is the IAU constellation Libra as listed in the KUB XII 62 tablets (Boutet 2014).

Leashed the Wings of the Eagle:

This Hittite asterism is the IAU constellation Aquarius as listed in the I KUB 1, KBO III 8 and 14/KUB XXV tablets (Boutet 2014)

Leashed were the Fish in Position:

This Hittite asterism is the IAU constellation Sagittarius as listed in the I KUB 1, KBO III 8 and 14/KUB XXV tablets (Boutet 2014)

Leather Bucket:

This Arabic star "Salm", "Sagma", or "Salma", is Tau (τ) Pegasi in the IAU constellation Pegasus:

- R. H. Allen translates this as "leathern bucket" in his *Star Names* in 1899.
- The IAU approved the name Salm for Tau (τ) Pegasi in 2016.

Leavitt's of Centaurus:

This **telescopic** asterism "Leavíttius Centaúri" is the spiral galaxy NGC 4603 in the IAU constellation Centaurus. John Herschel listed it as h 3406 and later as GC 3141 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this to honor "Henrietta Leavitt (1868 – 1921)".

Leda Brothers:

This Latin asterism "Ledaei Fratres" is the IAU constellation Gemini. Castor and Pollux were the sons of Leda.

Ledaean Stars:

This Latin asterism "Ledaeum Sidus" is the IAU constellation Gemini. Castor and Pollux were the sons of Leda. Johann Bayer's *Uranometria* (1603) lists the name "Ledaeum Sidus". English poet Abraham Cowley (1618 - 1667) called them "Ledaean Stars", English author Robert Bulwer-Lytton (1831 – 1891, writing as Owen Meredith) called them "Ledaean Lights", and English author William Morris (1834 – 1896) called them "Twin Laconian Stars".

Ledarri:

This Wardaman star is Zeta (ζ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Leda's Bird:

This Latin asterism "Ales Ledaeus" is the IAU constellation Cygnus. This is a reference to Leda, Queen of Sparta, who was said to have been raped by the God Zeus in the form of a swan.

- Johann Bayer's *Uranometria* (1603) lists the name "Ledae Adulter".
- R. H. Allen's *Star Names* in 1899 lists name "Ales Ledaeus".

Leech:

This English asterism "Hirudo" was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* in 1754. It is a bent horn-shaped group of the stars of the IAU constellation Taurus: 111, 122, 126, 133, 134, 130, 119, and 115 Tauri.

Left Conductor:

This Chinese xing guan Zuǒshètí (左攝提) is a triangle of stars in the IAU constellation Boötes: Zeta (ζ), n Boötis, and Omicron (ο) Boötis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Zuǒshètí" is a triangle of stars in the IAU constellation Boötes: Omicron (ο) Boötis, Pi (π) 1 Boötis, and Zeta (ζ) Boötis.

Left Crown:

This Hebrew asterism "Kir Schetall" is the IAU constellation Corona Borealis as listed in John Hill's *Urania* in 1754. He provides the translation "left crown".

Left Dog:

This Latin asterism "Canis Sinister" is the IAU constellation Canis Minor, so called as it is north of Canis Major, so called as it rises before Canis Major, so called as it appears to the left of Canis Major. This name is listed in Johann Bayer's *Uranometria* (1603).

Left Elm:

This Korean asterism "Neuleubnamu" (느릅나무) is a diamond of stars with a line running off one end in the IAU constellation Aries:

- The "diamond" is the four stars Eta (η), 15, 19, and Theta (θ) Arietis.
- From Eta (η) Arietis a line runs off to Nu (ν) Arietis.

Next to this is the similar Korean asterism Right Elm (see below).

Left Eye:

This Spanish star" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as listed by 12th century Spanish Rabbi Abraham ibn Ezra. R. H. Allen writes in his *Star Names* in 1899 that he derived this from the name "Oculus Tauri" (see Eye of Taurus, above).

Left Flag:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a jagged line of stars in the IAU constellations Aquila and Sagitta: Starting at HIP 100256 it runs through Rho (ρ) Aquilae, HIP 100276, Theta (θ) Sagittae, Eta (η) Sagittae, Gamma (γ) Sagittae (the determinative star), Delta (δ) Sagittae, 11 Sagittae, and 14 Sagittae.

This Chinese xing guan Zuǒqí (左旗) is a jagged line of stars in the IAU constellations Boötes and Sagitta: Alpha (α) Sagittae (Sham), Beta (β), Delta (δ), Zeta (ζ), Gamma (γ), 13, 11, 14, and Rho (ρ) Sagittae.

This Chinese Chenzhuo xing guan "Zuǒqí" is three lines of stars radiating out of a central star in the IAU constellations Aquila and Sagitta: The central star is Delta (δ) Sagittae, from which three lines run out:

- One to Beta (β) Sagittae,
- One to Alpha (α) Sagittae (Sham), and
- One through Gamma (γ) Sagittae, HIP 98738, 13 Sagittae, 15 Sagittae, and 14 Sagittae to Rho (ρ) Aquilae.

Left Foot:

This Chinese star "Zuozu" from the 3 Kingdoms and Ming Dynasty Period is Kappa (κ) Orionis in the IAU constellation Orion and is part of their xing guan Send Armed Forces to Suppress (see below).

This Chinese Chenzhuo xing guan "Zuozu" is the star Kappa (κ) Orionis in the IAU constellation Orion.

Left Foot of al Jauzah:

This Arabic star "Rijl Jauzah al Yusrā", later latinized to "Rigel" is Beta (β) Orionis in the IAU constellation Orion, which is known to the Arabs as "Jauzah":

- This star is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) as "Rijl al-jawzā al-yusrà".
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists this star as "rijl jawzā".
- The rete of the 14th century Spanish astrolabe NMM AST0570 lists "Rigel" (Dekker 2000).
- This star is listed on the 14th century astrolabe #4560 from Christian Spain as "Rigel" (King 2002).
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists this star as "Rigil".
- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "Rigel".
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this star as "Rigel".
- The name Rigel appears in the *Alfonsine Tables* of 1521.
- The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) lists "Rigel".
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as "Rigel".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed this star as "Regel".
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as "Riglori".
- Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this star "Rigel Algebar".
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists "Rigel".
- A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) labels this star "Orion Riegel" (this being a Dutch spelling of Rigel).
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Rigel".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Rigel".

- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this star as "Rigel" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Rigel".
- American uranographer William Croswell (1760 – 1834) lists "Rigel" on his *Mercator Map of the Starry Heavens* in 1810.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Rigel".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Rigel".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Rigel".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Rigel".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Rigel" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Rigel" and translates it as "foot".
- In his *Star Names* in 1899, R. H. Allen reports that it is listed it as "Rigel Algeuze" by John Chilmead in his *A Learned Treatise on Globes*, 1889, which was a translation of the Latin work by English geographer and mathematician Robert Hues (1553 – 1632).
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Rigel" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Rigel" for this star.
- The IAU approved the name Rigel for Beta (β) Orionis.

Left Foot of Kambugudha:

This Kokatha and Ngalea star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. Kambugudha is the Hyades (see Eldest Mingarri Sister, above and Hyades, above) and is guarding her sisters "Yugarilya", the Pleiades cluster (see Thorny Devil Lizard, below).

Left General:

This Chinese star "Zuojiangjun" from the Three Kingdoms to the Ming Dynasty is Beta (β) Aquilae (Alshain) in the IAU constellation Aquila and is part of their asterism Drum at the River (see above).

Left Hand of Al Jawza:

This Arabic star "Yad al-jawzā' al yusrà" is Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Left-Handed Brother:

This Kokatha and Ngalea asterism "Oimbu" or "Kurulba" is the Small Magellanic Cloud, which is part of their asterism "Boolbarradu" or "Balbaradu" (See Brothers, above) which is both Magellanic Clouds. The "right-handed brother" is "Mugaru" or "Badhu-Wudha" the Large Magellanic Cloud.

Left Law Administrator:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Zuozhifa” is the star Eta (η) Virginis in the IAU constellation Virgo and is part of their xing guan Supreme Palace Left Wall (see below).

This Chinese Chenzhuo xing guan “Zuozhifa” is the star Eta (η) Virginis in the IAU constellation Virgo. It is part of the Supreme Palace Left Wall.

Left Linchpin (Adjunct to Chariot):

This Chinese Chenzhuo xing guan “Zuoxia” is the star Eta (η) Corvi in the IAU constellation Corvus. It is part of their xing guan “Chariot”.

Left Linchpin (Vassal of Chariot):

This Chinese xing guan Zuǒxiá (**左**辖(附轺宿)) is a line of two stars in the IAU constellation Corvus: In one corner of the xing guan Chariot (see above) you find these two stars: Delta (δ) and Eta (η) Corvi. This is also known as Vassal of Chariot. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Left Pivot:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Zuoshu” is the star Iota (ι) Draconis in the IAU constellation Draco and is part of their xing guan Purple Forbidden Left Wall (see below).

Left Shoulder:

This Chinese star “Zuojian” from the Three Kingdoms and Ming Dynasty is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

This Chinese Chenzhuo xing guan “Zuojian” is the star Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Left Shoulder of the Barking Dog:

This Persian star “mankibu lʿawwaaʾi lʾaysar” (منكب العواء الأيسر –), later latinized to Menkib al Aoua al Aisr”, is Gamma (γ) Boötis in the IAU constellation Boötes, as listed in the *Calendarium* of Al Achsasi al Mouakket in 1650.

Left Shoulder of the Kneeler:

This Arabic star “Menkib al Jathi al Aisr”, later latinized to “Humeris Sinister Ingeniculi” is Delta (δ) Herculis in the IAU constellation Hercules as listed by Persian astronomer Al Achsasi al Mouakket in his *Calendarium* in 1650.

Left Side:

This star “Sinistra” is Nu (ν) Ophiuchi in the IAU constellation Ophiuchus. The IAU is considering this as an official name for the star.

Leftward of Canes Venatici:

This **telescopic** asterism “Scaévus Cánum Venaticórum” is the one-armed Magellanic Spiral galaxy NGC 4618 (Arp 23) in the IAU constellation Ursa Major. William Herschel listed this as “I 178” and “I 179”.

John Herschel originally listed it as h 1385 but later as GC 3151 and 3152 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the eastern arm of this galaxy is much more developed than the western one". It is also sometimes called the "Magellanic Spiral Galaxy" (see below).

Leg:

This Arabic star "as-Sāq" (الساق) or "Al Ṣāk" ("leg" or "shin bone") is Delta (δ) Aquarii in the IAU constellation Aquarius:

- It was later latinized to "Al Sak", "Saak", or "Skat".
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Sceac" (Dekker 2000).
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Scheat".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Skat".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Skat".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Skat", "Sheat", and "Scheat", but the 14th edition (1959) only lists this star as "Skat".
- NOTE: An alternate derivation of "Skat" is "Wish" (see below).
- The IAU approved the name Skat for the star Delta (δ) Aquarii A.

The Kalinago see the Pleiades cluster in the IAU constellation Taurus as a woman who cuts off her husband's leg, which is the belt and sword of Orion and runs away with a tapir, which is the Hyades cluster in the IAU constellation Taurus.

The Amahuaca see the Hyades cluster in the IAU constellation Taurus as the jaw of a caiman that bit off the leg of a man who mistook it for a canoe. His leg is the Pleiades cluster in the IAU constellation Taurus and the belt and sword of Orion is the man's brother holding a spear to kill the caiman.

Leg of Set:

This ancient Egyptian asterism "Meskhetyu" or "Meskhetiu" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper above). Krupp (1983) translates this as "leg of Set", though others have translated it as "Bull's Foreleg" (see above). It appears as the "Foreleg of Set" in the *Papyrus Jumilhac* (Hardy 2003).

Legs:

This Chinese xiù (lunar mansion) "Kuíxiù" (奎宿) is made up of stars in the IAU constellations Andromeda and Pisces. One side of this oblong starts at the star Chi (χ) Piscium and runs through Phi (ϕ), 90, 91, 83, 76, and Beta (β) Piscium (Fumalsamakah) and Mu (μ) Piscium, ending at 35 Andromedae . The other side runs from 84 Piscium through Psi (ψ) 1 Piscium, Eta (η) and Zeta (ζ) Andromedae, 65 Piscium, Epsilon (ε), Delta (δ), and Eta (η) Andromedae, ending at Nu (ν) Andromedae. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù "Kui" was associated to matters concerning the Xuzhou territory. This xiù appears in the Tang Dynasty (618 – 907 C.E.) as "Kuí" (奎) and is compared to the

Vedic nakshatra Revati (Kotyk 2017, see Wealthy, below). This xing guan was used in the Three Kingdoms to Ming Dynasty period.

This Chinese Chenzhuo xing guan "Kuíxiù" is an oval of stars in the IAU constellations Andromeda and Pisces: Beta (β) Andromedae (Mirach), Mu (μ) Andromedae, Nu (ν) Andromedae, Messier 31, 32 Andromedae, HIP 2942, Pi (π) Andromedae, Delta (δ) Andromedae, Epsilon (ε) Andromedae, Zeta (ζ) Andromedae, Eta (η) Andromedae, Psi (ψ) Piscium, Phi (φ) Piscium, 90 Piscium, Tau (τ) Piscium, and 82 Piscium.

Legs Added XXI:

This Chinese xing guan Kuíxiù Zēng XXI (奎宿增廿一) is the Andromeda Galaxy (Messier 31, NGC 224).

Lemon Galaxy:

This **telescopic** asterism VV 786 is a galaxy in the IAU constellation Centaurus.

Lemon Slice Nebula:

This **telescopic** asterism is planetary nebula IC 3568 in the IAU constellation Camelopardalis. It was discovered in 1900 by American astronomer Robert Grant Aitken at the Lick Observatory. It was given this name by American astronomer and science writer Jim Kaler due to its appearance in one false-color image from the Hubble Space Telescope. It is also known as the Theoretician's Nebula and the Sliced Lime Nebula. Size 0.2' X 0.2'. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists it without a name.

Lemraxi:

This Ayt Xebbac star (Arabic: eddxinat) is Gamma (γ) Leonis (Algieba) in the IAU constellation Leo (Souag 2019).

Length of the River:

This Arabic star "Masāfat al-nahr" is Gamma (γ) Eridani in the IAU constellation Eridanus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Lens of Indus:

This **telescopic** asterism "Phacoïdes Índi" is the lenticular galaxy NGC 7041 in the IAU constellation Indus. It was discovered in 1834 by John Herschel who listed it as h 3859 and later as GC 4647 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this edge-on galaxy looks like a biconcave lens". It is part of the Indus Triplet (see above).

Lens of Leo Minor:

This **telescopic** asterism "Léns Leónis Minóris" is the lenticular galaxy NGC 3245 in the IAU constellation Leo Minor. It was discovered in 1785 by English astronomer William Herschel who listed it as "I 86". It became GC 2104 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Lenticular of Lynx:

This **telescopic** asterism "Lentifórmis Lýncis" is the lenticular galaxy NGC 2549 in the IAU constellation Lynx. It was discovered in 1831 by John Herschel who listed it as h 495 and later as GC 1638 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Lentil of Virgo:

This **telescopic** asterism "Phácus Virginis" is the lenticular galaxy NGC 4442 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 156. It became GC 2999 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Leo:

The brightest stars of Leo are Regulus (1st magnitude) and three of 3rd magnitude. The stars of Leo appear in 456 asterisms of the sky cultures of the world. The Romanians do call this "Leul" ("lion") but more commonly refer to it as the Horse (see above).

The IAU constellation Leo (IAU abbreviation Leo), the lion, was mentioned by Aratus in his poem *Phaenomena* (270 B.C.E.) and Ptolemy (c.100 – c.170) listed as one of his 48 original constellations: In the *Almagest* he calls it "Λέων" ("Léon" -see Lion, below). Greek mythology tells of the hero Hercules slaying the Nemean lion and this is commemorated in this constellation.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Leo as a lion walking to our right (Bullinger 1882, Seiss 1882).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Leo facing to our left.

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Leo is shown walking to the left,
- In two editions (St Gall 250, St Gall 902) Leo's tongue is hanging out.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Leo leaping to the left with his tail raised. The Vat Reg lat 309 manuscript of the *De ordine ac positione stellarum in signis* depicts Leo facing left with his head lowered. The Paris BN, 12117 manuscript of the *De ordine ac positione stellarum in signis* depicts his head and left paw raised.

Leo appears in the Leiden *Aratea* (816) as a lion leaping to our left (Katzenstein & Savage-Smith, 1988).

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Leo as a lion in profile: One page shows the left profile and the other the right.

The Oxford Laud 644, Padua 27, Montecassino 3, and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depicts Leo rushing to the left. The Klosterneuberg 685 and Zwettl 296 manuscripts of *De signis caeli* depict a ivy leaf at the tip of Leo's tail. The Laon 422 and

Rouen 26 manuscripts of *De signis caeli* depict Leo walking to the right with his left paw raised. The Freiburg im Breisgau 35 manuscript of *De signis caeli* depicts Leo walking to the left.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Leo as a lion walking to our left.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Leo as a lion.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Leo as a lion running to our left.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists "LEO" (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Leo as a lion facing to our right.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Leo" as a lion facing to our left who appears to be ready to spring upon its prey. Its tail is curled under its left rear leg.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts "Leo" as a lion running to our left whose tail is coiled under its left rear leg.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Leo as a lion facing to our left. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Leo as a snarling lion walking to our right. His tail is curled under his right rear leg.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Leo" as a lion walking to our left looking over its left shoulder.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Leo as a long-tailed lion walking to our left. Its tail is raised up across its back.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts "Leo" as a long-tailed lion walking to our left. Its tail is raised up across its back.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts "Leonem" ("a lion") running to our left. His tail is curved like the "sickle" of stars above Regulus in Leo.

Leo appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a lion walking to our right with his tail curled to overlap his rear quarters and is labelled with the astrological sign for Leo.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Leo" as a lion standing on its hind legs as if jumping.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Leo" as a lion facing to our left, crouching as if ready to spring on something. Its tail is curved behind its left rear leg.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Leo as a lion walking to our right. It is not labelled.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Leo" as a lion facing to our left, crouching as if ready to spring on something. Its tail is curved behind its left rear leg.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Leo" as a lion crouching as if about to leap, facing towards our left. The lion's tail is coiled under and around his left rear leg.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Leo as a lion running to our left.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Leo as a lion laying down facing to our right.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Leo in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Leo" as a lion running to our left.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Leone". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Lion".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Leo as a lion about to jump to our left. His tail is wrapped under his left rear leg.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Leo in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Leo as a lion running to our left and only labels it with the astrological symbol for Leo.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Leo" as a lion laying down facing to our left with its tail curled around its left rear leg.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Lion” as a roaring lion running to our right.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Leo” as a roaring lion facing to our left. His tail is wound under his left rear leg.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Leo” as a lion running to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Leo” as a lion leaping to our left. His tail curls under his left rear leg.

“Leo” is depicted on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a lion running to our left.

Leo is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German uranographer Johann Bayer (1572 – 1625) depicts this constellation as a lion running to our right in his *Uranometria* in 1603. Bayer lists these names for Leo: “Leo, Herculeius, Cleonaeus, Nemeaeus, Löw, Alezet, Alasid, Asitvel Asid”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Leo” and “Leo Herculeus” and depicts it as a roaring lion facing to our left.

“Leo” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a lion leaping to our right. Batsch gives the name “Der Lōw” (“the lion”)

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Leo” for this constellation”.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts “Leo” as a lion running to our right.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Leo as a roaring lion.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Leo” as a lion walking to our right.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Leo” as a lion running to the left.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Leo Major” as a lion running to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Lion”, “Leo”, and “Λέων” and depicts it as a lion running to our left.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Leo” as a lion running to our left.

Leo is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as “Leo”.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Leo as a lion running to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Leo” as a lion running to our right.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Leo as a lion walking to our left.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Leo as a lion running to our right.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Leo” as a lion walking to our left.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Der Lōwe“.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Leone” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Leo” as a running lion.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Lion” as a roaring lion.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Lion” as a lion running to our right, as does the 1778 edition.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Leo” as a lion running to our left.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Löwe”. This name also appears in the various editions of Bode’s *Jahrbuch*.

American uranographer William Croswell (1760 – 1834) depicts “Leo the Lion” on his *Mercator Map of the Starry Heavens* in 1810 as a running lion.

Scottish uranographer Alexander Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts Leo as a running lion.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Leo” as a lion running to our left.

This constellation is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Leo Major”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.

"Leo" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a lion running to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Leo" as a lion facing to our right.

"Leo" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a roaring lion running to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes "Leo" as a "rampant lion" but labels it "Lion" on the charts.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Leo, The Lion" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Leo, the Lion".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Leo" in his *Star Atlas* (1893) and describes it as "The Lion".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Leo" and describes it as a "Lion".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Leo".

The Normans called this constellation "Leun".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Leo in his book *The Stars - A New Way to See Them* (1952):

- His "head" is the quadrilateral of the stars Mu (μ), Kappa (κ), Lambda (λ), and Epsilon (ε) Leonis,
- His "mane" is the five stars Epsilon (ε), Eta (η), Gamma (γ) 1 and 2, Zeta (ζ), and Mu (μ) Leonis,
- His "body" is the five stars Eta (η), Theta (θ), Delta (δ), b, and Gamma (γ) 1 and 2 Leonis,
- From Eta (η) Leonis two lines form "front legs":
    - One running to Omicron (ο) Leonis, and
    - One running to Alpha (α) Leonis (Regulus),
- From Theta (θ) Leonis two lines form "back legs":
    - One running to Rho (ρ) Leonis, and
    - One running through Iota (ι) Leonis to Sigma () Leonis, and
- From Delta (δ) Leonis a line runs to Beta (β) Leonis (Denebola) forming a "tail".

Sky and Telescope Magazine, founded in 1941, depicts Leo in their magazine and publications in the same manner as Reyersbach.

Leo Minor:

None of the stars of this constellation are brighter than 4th magnitude and they show up in 46 of the asterisms in this handbook. This IAU constellation (IAU abbreviation LMi) was noted by Ptolemy (c.100 – c.170) as an "undefined region".

Polish astronomer Johannes Hevelius (1611 – 1687) created this constellation. In his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*. It is depicted as a lion lying down, facing to our left.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Leo Minor” as a lion facing to our right.

Leo Minor is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Leo Minor as a lion running to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Leo Minor” as a lion running to our right above Leo.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Leo Minor as a lion walking to the left.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) does not show Leo Minor on his chart.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Leonis Minor” as a lion facing to our left.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le petit Lion” as a lion running to our right in the northern hemisphere chart, and as a lion laying down in a later close up chart. The 1778 version depicts the lion running to our right.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “der Kleine Löwe” and depicts it as a roaring lion laying down facing to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Leon Minore” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Leo Minor” as a lion reclining facing to our left.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Leo Minor” in his *Celestial Atlas* in 1822. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts it as a running lion.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this with the abbreviated label “Kl. Löwe”.

“Leo Minor” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a lion lying down facing to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Leo Minor” as a lion facing down facing to our left.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Leo Minor" as a lion running to our right.

Leo Minor is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Leo Minor" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a lion lying down facing to our right.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Leo Minor, The Lesser Lion" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Leo Minor" in his *Star Atlas* (1893) and describes it as "The Little Lion".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Leo Minor" and describes it as the "Lesser Lion".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Leo Minor".

Leo Minor is depicted on standard IAU charts as a triangle of the stars Omicron (o) Leonis Minoris, Beta (β) Leonis Minoris, and 21 Leonis Minoris, with a line running out from this last star to 10 Leonis Minoris.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depicts Leo Minor in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a single bending line of the stars Omicron (o) Leonis Minoris, Beta (β) Leonis Minoris, 21 Leonis Minoris, and 10 Leonis Minoris.

Sky and Telescope Magazine, founded in 1941, depicts Leo Minor in their magazine and publications as a quadrilateral of the stars 30, Omicron (o), Beta (β), and 21 Leonis Minoris with a line running out from this last star to 10 Leonis Minoris.

It is known to the French as "Petit Lion" and the Italians as "Leoncino". English astronomer Richard A. Proctor changed the name of this constellation to "Leana" in 1870 (see Lioness, below).

Leo Triplet:

This **telescopic** asterism is three galaxies in the IAU constellation Leo:

- Spiral galaxy NGC 3628,
- Intermediate spiral galaxy M 65
- Intermediate spiral galaxy M 66

Leo Quartet:

This **telescopic** asterism, the "Leo Quartet" or "Hickson 44" is a quartet of galaxies in the IAU constellation Leo:

- Edge-on spiral galaxy with distinctive dust lanes NGC 3190,
- S-shaped galaxy NGC 3187
- Elliptical galaxy NGC 3193, and
- Spiral galaxy NGC 3185.

Hickson 44 was listed by Canadian astronomer Paul Hickson. It is also known as the Gamma Leonis Group.

Leopard:

This Latin asterism "Leopardis" is the IAU constellation Lupus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).

This Greek lunar mansion is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). Mosenkis describes this as "Camelopardalis or rather Leo Minor, cf. the goddess with a lion and a leopard."

This Tupi asterism "Jauareté" is the IAU constellation Ursa Major (De Freita Mourão 2009).

Leopold's Orb:

This German asterism "Globus Cruciger" ("the orb and the cross"), "Pompum Imperiale" ("imperial pomp"), "Reichsapfel", ("orb") or "Leopold's Orb" was created by German astronomer Gottfried Kirch and appeared in the scientific journal *Acta Eruditorum* in 1688 to honor the Holy Roman Emperor Leopold I. This was made up of stars of the IAU constellation Aquarius: 1, 3, 4, 69, 70, and 71 Aquarii and HIP 100672.

Lepis:

This Palawan star is Beta (β) Orionis (Rigel) in the IAU constellation Orion. This is a name from the 1831 journals of George Augustus Robinson, a missionary.

Leprous Hand:

This Arabic asterism is part of their asterism Al-Thurayya (see Little Abundant One, below) and is made up of stars of the IAU constellation Cetus.

- From a "wrist" at the star Alpha (α) Ceti (Menkar), a "thumb" is the line of stars Lambda (λ) Ceti and Mu (μ) Ceti.
- From Menkar the "fingers" are two lines running out to the "knuckles" at Gamma (γ) and Delta (δ) Ceti, then coming together at "fingertips" at Xi (ξ) 2 Ceti.

Compare this to their asterism Cut Short Hand (see above), which is another version of this.

Lepu:

This Bukidnon asterism "Lepu" is an unidentified creature, or a "kite" made up of the stars of the IAU constellation Aquila (Santos et al 2019). Santos suggests that it may be a hare, derived from the name of the IAU constellation Lepus, but there is no agreement on this:

- A diamond of stars forms the main part, with the stars on the corners being Gamma (γ), Zeta (ζ), Delta (δ), and Theta (θ) Aquilae, and
- A "tail" runs down from Delta (δ) Aquilae to Lambda (λ) Aquilae.

Lepus:

None of the stars of this constellation are brighter than 2nd magnitude and they show up in 74 asterisms in this handbook.

This IAU constellation (IAU abbreviation Lep), the hare, is one of Ptolemy's 48 original constellations, although it does not represent any particular identifiable figure in Greek mythology. Ptolemy (c.100 – c.170) listed it as "Λαγῶς" ("Lagõs"- see Hare, above) in his *Almagest*. Its Sicilian name was "Λέπορις" ("Léporis") which became the Latin name "Lepus" or "Lepus Auritus" ("eared hare"), "Lepus Dăsypus" ("rough-footed hare"), "Lepus Levipes" ("light-footed hare"), and "Lepus Velox" ("swift hare"). Aratus (315 – 240 B.C.E) described it with the adjective "γλαυκός" ("glafkós") which means "glaucous" by which he meant "powdery" as it had few faint stars.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Lepus as a rabbit (Bullinger 1882, Seiss 1882).

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a hare running to the left as does the Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.).

This constellation is depicted in editions of the 8th century *Revised Aratus Latinus* (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) leaping to the left. The Los Angeles, Getty Ludwig XII, 5 manuscript of the *De ordine ac positione stellarum in signis* depicts Lepus as a lion.

Lepus appears in the Leiden *Aratea* (816) as a rabbit leaping to our left, looking over its left shoulder (Katzenstein & Savage-Smith, 1988)

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Lepus leaping to the left.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Lepus as a hare leaping to our left.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Lepus as a hare.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Lepus as a hare running to our left.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Lepus as a hare running to our right.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Lepus" as a hare running to our left.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Lepus as some sort of four legged animal running to our left. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Lepus as a hare leaping to our left.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Lepus as a hare leaping to our right.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Lepus as a hare running to our left.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Lepus as a hare running to our left.

Lepus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a hare leaping to our right.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Lepus" as a rabbit running to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Lepus" as a hare running to our left.

The early 16th century Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Lepus as a hare leaping to our right.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Lepus as a rabbit running to our left.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Lepus as a hare running to our left.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "LEPVS" as a hare running to our left.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Lepus" as a hare running to our left.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "de la Lepre". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Hare".

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Lepus as a hare running to our left, looking over its left shoulder.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Lepus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Lepus" as a rabbit running to our left.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Lepus" as a hare running to our left.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Lievre” as a hare standing facing to our right under Orion’s feet.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Lepus as a hare between the legs of Orion, running to our left. It is not labelled.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Lepus” as a hare jumping to our left.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts Lepus as a rabbit running to the left. NOTE: It also depicts Lepus as a rabbit running to our right between Orion’s legs and looking over its right shoulder in his depiction of Orion but does not label it in that picture.

“Lepus” is listed on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) and depicted as a hare leaping to our left.

Lepus is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts this in his *Uranometria* in 1603 as a hare leaping to our right. Bayer lists these names for this constellation: “Lepus, Leuipes, apertis oculis dormiens, Harneb, Elarneb”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Lepus” as a rabbit leaping to our left.

“Lepus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a rabbit lying down facing to our right.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name “Lepus” for this constellation.

“Lepus” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a rabbit running to our right.

Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Lepus” as a hare leaping to our left.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Lepus Alias nebet”.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Lepus as a running hare.

English astronomer Edmund Halley’s chart of 1678 depicts Lepus as a hare running to our left.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Lepus” as a hare running to our left.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Lepus” as a hare which is prone facing to our left.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Lepus" as a running hare.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Lievre", "Lepus", and "Λαγῶς" and depicts it as a hare running to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Lepus as a hare running to our right.

Lepus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a rabbit running to our right.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Lepus" as a hare running to our right.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Lepus as a rabbit crouching facing to our left.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Lepus as a hare getting ready to leap to our right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Lievre" ("the hare") as a hare running to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Lepre" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Lepus" as a jumping hare.

Lepus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Haas" ("hare") and depicted as a hare running to our right.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Lepus" as a rabbit running to our left.

American uranographer William Croswell (1760 – 1834) depicts "Lepus the Hare" on his *Mercator Map of the Starry Heavens* in 1810 as a running rabbit.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Haase" ("rabbit"). Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Haase".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Lepus in his *Celestial Atlas* in 1822.

"Lepus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a hare running to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Lepus" as a rabbit running to our left.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Lepus" as a hare running to the right.

Lepus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Lepus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): as a hare running to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "the Hare".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Lepus, The Hare" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Lepus, the Hare".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Lepus" in his *Star Atlas* (1893) and describes it as "The Hare".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Lepus" and describes it as a "Hare".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Lepus" as "the Hare".

Standard IAU charts depict Lepus as follows:

- His "body" is two interconnecting quadrilaterals made up of the stars Alpha (α) Leporis (Arneb), Mu (μ) Leporis, Epsilon (ε) Leporis, Beta (β) Leporis (Nihal), Gamma (γ) Leporis, and Delta (δ) Leporis,
- His "tail" is a line of stars running from Arneb through Zeta (ζ) and Eta (η) Leporis to Theta (θ) Leporis, and
- His "ears" are two lines running from Mu (μ) Leporis:
- One through Lambda (λ) Leporis to Nu (ν) Leporis, and
- One through Kappa (κ) Leonis to Iota (ι) Leporis.

Sky and Telescope Magazine, founded in 1941, depicts Lepus in their magazine and publications in this fashion:

- Its "head" is the quadrilateral of stars Alpha (α) Leporis (Arneb), Mu (μ) Leporis, Epsilon (ε) Leporis and Beta (β) Leporis (Nihal),
- Its "ears" are two lines running out from Mu (μ) Leporis:
    - One to Lambda (λ) Leporis, and
    - One to Kappa (κ) Leporis,
- Its "body" is the loop of stars formed by Arneb, Nihal, Gamma (γ) Leporis, Delta (δ) Leporis, Theta (θ) Leporis, Eta (η) Leporis, and Zeta (ζ) Leporis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Lepus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as four star lines radiating out of Mu (μ) Leporis:

- One running to Lambda (λ) Leporis,
- One running to Kappa (κ) Leporis,
- One running through Alpha (α) Leporis (Arneb) and Zeta (ζ) Leporis to Eta (η) Leporis, and
- One running through Epsilon (ε) Leporis, Beta (β) Leporis (Nihal), and Gamma (γ) Leporis to Delta (δ) Leporis.

This constellation is known to the Germans as “Hase” and the French as “Lièvre”.

Lerna:

This **telescopic** Greek star is HAT-P-42 in the IAU constellation Hydra (magnitude 12.2). It was given this name in the IAU NameExoWorlds campaign. Lerna is the lake where the mythical Hydra lived. It has an exoplanet named Iolaus: Iolaus was the nephew of Heracles.

Lernaeus:

This Latin asterism is the IAU constellation Cancer as described by Roman writer Lucius Junius Columella.

Lesath:

See Sting, below

Lesser Bear:

This Arabic asterism “Aldubu Al'asghar” (الدب الأصغر) or “Al Dubb al Aṣghar” is the IAU constellation Ursa Minor:

- “Al-Dub al-Asghar” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010).
- Robert Hues (1659) listed it as “Dub Alasgar”.
- German astronomer Johann Bayer (1572-1625) listed it as “Dhub Elezguar” in his *Uranometria* (1603).
- John Chilmead (1899) listed it as “Dub Alasgar”.

This Italian asterism “Orsa Minore” is the IAU constellation Ursa Minor

This French asterism “Petite Ourse” is the IAU constellation Ursa Minor

This German asterism “Kleine Bar” is the IAU constellation Ursa Minor

Lesser Bier:

John Hill lists the Latin name “Feretrum Minor” for the IAU constellation Ursa Minor in his *Urania* in 1754. This is probably influenced by the Arabic asterism Daughters of the Bier (see above).

Lesser Cross:

This French asterism is the IAU constellation Delphinus and appears in *De cursu stellarum* of Saint Gregory of Tours (573).

Lesser Dog:

This Arabic asterism “Alkalb Alsaghir” (الكلب الصغير) or “Al Kalb al Asghar” is the IAU constellation Canis Minor:

- “Al Kalb al-Asghar” was listed for this constellation by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Johann Bayer’s *Uranometria* (1603) lists it as “Kelbelazguar”.
- Robert Hues *A Learned Treatise of Globes* in 1659 lists it as “Alcheleb Alasgar”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists it as “Kelbelazguar”.
- John Hill lists it as “Kelbasgher” in his *Urania* in 1754, which Hill translates as “little dog”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Al kelb al asghar, the lesser dog”.
- John Chilmead (1899) lists it as “Alcheleb Alasgar”.
- NOTE: Arabic astronomers called Alpha (α) Canis Minoris (Procyon) “the Northern Shining One” (“Alsaatie Alshamaliu”, الساطع الشمالي).

Lesser Seven Bulls:

This Persian asterism “Hafturengh Kihin”, “Heft Averengh Kihin”, or “Heft Rengh Kihin” is the Little Dipper asterism in the IAU constellation Ursa Minor as listed by R. H. Allen in his *Star Names* in 1899.

Letter Pi (π) Cluster:

This **telescopic** asterism, also known as the Starfish (see below) and the Oblique Cross (see below) is the open cluster Messier 38, discovered by the Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Auriga. This was listed in the General Catalogue of 1864 as GC 1119. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham’s Celestial Handbook* that cluster’s brightest stars form what is known as the Letter Pi Cluster, as they resemble the Greek letter π. The cluster’s brightest stars resemble the Greek letter π.

Level:

This German asterism “Libella” is the IAU constellation Triangulum Australe. German uranographer Johann Bayer (1572-1625) gave it this name in his *Uranographia* in 1603.

This French asterism “Niveau” is the IAU constellation Norma as listed in the French edition of English astronomer John Flamsteed's *Atlas* of 1776. Belgian astronomer Jean-Charles Houzeau (1820 – 1888) listed it as “Libella”.

Leviathan:

This German asterism is the IAU constellation Delphinus as listed by German astronomer Wilhelm Schickard (1592 – 1635) and German poet Philipp von Zesen (1619 – 1689). Edward Sherburne lists this in his Sphere of Marcus Manilius in 1675, attributing it to German poet, jurist, and translator Georg Philipp Harsdörffer (1607 – 1658). John Hill lists this asterism in his *Urania* in 1754.

Leya:

This Hindu asterism “Leya” or “Leyaya” is the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899.

Liáng:

This Chinese star “Liáng” from the 3 Kingdoms and Ming Dynasty Period is the star Delta (δ) Ophiuchi in the IAU constellation Ophiuchus and is part of their xing guan Heavenly Market West Wall (see above).

Liar:

See Sting, below.

Libertas:

See Liberty, below.

Liberty:

This Latin star "Libertas" is Epsilon (ε) Aquilae A in the IAU constellation Aquila. The IAU approved the name Libertas for Epsilon (ε) Aquilae A in 2015. This has an exoplanet named "Fortitudo" ("fortitude").

Libra:

None of Libra's stars are brighter than 2nd magnitude, but the stars of this constellation do appear in 192 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Lib), the balance or scales, originated with the Babylonian asterism "the Scales" (see below). It was actually the Romans that gave this constellation its current name "the scales" because at the time they named it, it was the constellation in which the Sun entered this part of the ecliptic at the autumnal equinox, when days and nights were equal in length: However, it ceased to be the location of the autumnal equinox in 730 B.C.E. Ptolemy (c.100 – c.170) listed it in his *Almagest* as "Χηλαί" ("Chilaí") which means claws of the scorpion (see Claws of the Scorpion, above) and became the Latin "Chelae" and this is reflected in the Arabic names of its two brightest stars:

- Zubenelgenubi (Alpha (α) Librae) "southern claw", and
- Zubeneschamali (Beta (β) Librae) "northern claw".

This constellation first appeared under the name Libra in Julius Caesar's calendar in 46 B.C.E. which was created by Flavius and the astronomer Sosigenes. 4th century scholar Theon of Alexandria listed it under the Sicilian dialect as "Λίτρα" ("Lítra") and "Λίτραι" ("Lítrai"). It appears in the *Daressy Zodiac* of the Roman Imperial Period as a man carrying scales next to a goat or gazelle.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Libra as a figure holding a set of scales (Bullinger 1882, Seiss 1882).

Libra and Virgo are merged in editions of the 8th century *Revised Aratus Latinus*.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Libra as a set of scales. There are two views, basically the same, representing views from the earth and the sky.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Libra as a set of scales.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Libra as a set of scales.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Libra as a set of scales. One of the claws of Scorpius overlaps the scales.

A quadrans novus found at the House of Agnes site in Canterbury in 2005 in soil dated to c 1375-1425 lists “LIBRA” (Dekker 2007).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Libra as a set of scales.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Libra” as a set of scales.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.70v-71r depicts “Libra” as a set of scales.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Libra as a set of scales. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Libra as a set of scales in one place but in another as a male in an ankle length robe and skull cap holding a set of scales in front of him in his right hand.

A translation of The *Liber de signis* of Scottish polyglot Michael Scot (1175 – c.1232) in the second half of the 15th century, Darmstadt, Hessische Hochschulebibliothek, Ms 266, depicts Libra as a naked boy, turned slightly to our right, holding scales in his right hand and pointing at something ahead of him with his left hand.

Libra appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as the lower half of a set of scales (the upper half being out of the projection) and labelled with the astrological sign for Libra.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) omits Libra.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Libra” as a set of scales.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Libra as a set of scales. It is not labelled.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Libra” as a set of loose scales. The claws of Scorpius bracket the scales.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Libra as a set of loose scales.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts “Libra” as a set of scales.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Libra as a set of loose scales.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Libra in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Libra” as a set of loose scales.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del la Libra”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Libra as a set of loose scales.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Libra in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Libra as a set of loose scales but only labels this with the astrological sign for this constellation.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts “Libra” as a set of loose scales.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “le Balance” as a set of scales.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Libra” as a set of scales.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Libra” as a set of loose scales.

“Libra” is listed on the *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) as a set of scales.

“Libra” was depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a set of scales with the subtitle “Chelae”.

Libra is listed in Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer Johann Bayer (1572-1625) listed this constellation in his *Uranometria* in 1603 as a set of loose scales. Bayer lists these names for Libra: “Libra, Iugum Ciceroni, Chelae, Noctipares, Azubene, Wag (“scales”), Mizan, Zubeneschemali, Zubenelgenubi”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Libra” as a set of scales.

“Libra” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a set of scales. Bartsch lists the name “dei Wag” (“the scales”).

Libra is listed by German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe’s catalogue, in 1627.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Libra" for this constellation.

"Libra" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a set of loose scales.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Libra" as a set of loose scales.

Libra is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Libra as a set of scales.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Libra" as a set of loose scales.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Libra" as a set of loose scales.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Libra" as a set of loose scales.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Balance", "Libra", and "Χηλαί" ("claws") and depicts it as a loose set of scales.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Libra as a set of scales.

Libra is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a set of loose scales.

A wooden precession globe (1730) by German uranographer Johann Georg Puschner (Dekker 2003) lists this constellation as "Libra".

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Libra" as a set of scales.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Libra" as a loose set of scales.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Libra as a set of scales.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Libra as a loose set of scales.

John Hill lists this constellation as "Litra" in his *Urania* in 1754.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "La Balance" as a set of scales.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Bilancia" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

American uranographer William Croswell (1760 – 1834) depicts “Libra the Balance or Scales” on his *Mercator Map of the Starry Heavens* in 1810 as a set of loose scales.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Balance” as a set of loose scales, as does the 1778 edition.

Libra is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Balans”: It is depicted as a set of loose scales.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Waage”, as does the various editions of his *Jahrbuch*. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “die Waage“ and depicts it as a set of loose scales.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Lybra” as a set of loose scales.

“Libra” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a set of loose scales.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Libra” as a loose set of scales.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Libra in his *Celestial Atlas* in 1822: It is depicted as a set of loose scales.

Libra is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

“Libra” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a set of loose scales.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Libra, The Balance” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Libra, the Balance”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Libra” in his *Star Atlas* (1893) and describes it as “The Balance”.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Libra”.

Libra is known in Germany as “Wage”. The old Saxon name was “Wæge” or “Pund” and the Norman name was “Peise”.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children’s book *Curious George* (1941) redesigned the lines of Libra in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows this constellation as a quadrilateral of the stars Alpha (α) Librae (Zubenelgenubi), Beta (β) Librae (Zubeneschamali), Gamma (γ) Librae, and Sigma (σ) Librae, with a

line running out from Gamma (γ) Librae to Theta (θ) Librae. Rey depicts this as the triangle of stars Zubenelgenubi, Zubeneschamali, and Gamma (γ) Librae forming a "balance bar". Two lines run out to form the scales:

- One from Gamma (γ) Librae through Upsilon (υ) Librae to Tau (τ) Librae, and
- One from Zubenelgenubi to Sigma (σ) Librae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Libra in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in the same way as Rey as does *Sky and Telescope Magazine* publications.

Lich:

This **telescopic** IAU star is the neutron star PSR B1257+12 in the constellation Virgo. A lich is a fictional undead creature who controls other undead creatures with magic, first appearing in Old English but more recently in Clark Aston Smith's *The Empire of the Necromancers* in 1932. This has three exoplanets named Draugr (a undead creature from Norse mythology), Poltergeist ("noisy ghost"), and Phobetor (a character from Ovid's *Metamorphoses*, one of the sons of Sleep).

Lid of Coma Berenices:

This **telescopic** asterism "Opérculum Cómae Bereníces" is the Magellanic spiral galaxy NGC 4173 in the IAU constellation Coma Berenices. It was discovered by William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). This galaxy is part of Hickson 61, also known as "the Box" (see above) and Bodifee and Berger consider it to be the "lid" of this box.

Liesma:

See Fire, above.

Life of Heaven:

This Akkadian star "Tir-anna" or "Tir-An-na" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra. Compare this to Judge of Heaven (above). This refers to it being the pole star around 11,000 B.C.E. This is listed as "man-za-tu[um]" in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015).

This Sumerian star "multir-an-na" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra as listed as in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015).

Ligedaner:

This Micronesian (Marshall Islands) star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga and is part of their asterism Creation of the Sky (see above). Ligedaner was the mother of the stars, and her sons were Dümur (see above) and the King of the Stars (see above).

Light Bearer of Cetus:

This **telescopic** asterism "Phósphorus Céti" is the galaxy merger IC 1623 (Arp 236) in the IAU constellation Cetus. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this

because “this system consists of two galaxies in the final stage of a merger. At the southern side a dark, infrared emitting regions seems to embrace a brighter region in the north”.

Light Bearer of Ursa Major:

This **telescopic** asterism “Lucífera Úrsae Majóris” is the lenticular galaxy NGC 2681 in the IAU constellation Ursa Major. William Herschel listed this as “I 242”, John Herschel as “h 530” and it is GC 1711 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Light of the Hero:

This Sumerian asterism “mul ĝišgán-ùr” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the stars Delta (δ) Scorpii, Beta (β) Scorpii (Acrab), and Pi (π) Scorpii in the IAU constellation Scorpius. R. H. Allen lists this in his *Star Names* in 1899 as “Gis-gan-gu-tur”, translated as “light of the hero” or “tree of the garden of light” and calls it a “Euphratian” asterism.

This Akkadian asterism “maš-ka-ka-tum” from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the stars Delta (δ) Scorpii, Beta (β) Scorpii (Acrab), and Pi (π) Scorpii in the IAU constellation Scorpius.

Lighthouse:

This Greek asterism “Farus” is the IAU constellation Ara. This is the name of the famous lighthouse in Alexandria:

- “Farus” is listed in the 11th century *De signis caeli (“of the signs of heaven*”).
- Johann Bayer’s *Uranometria* (1603) lists “Capellae Pharus”.
- “Phares” is listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- “Pharos” and “Pharus” are listed in John Hill’s *Urania* in 1754.
- “Pharos” and “Pharus” are listed in R. H. Allen’s *Star Names* in 1899.

Lightless of Virgo:

This **telescopic** asterism “Aphénges Vírginis” is the barred spiral galaxy NGC 5334 (IC 4338) in the IAU constellation Virgo. It was discovered in 1787 by William Herschel who listed it as “III 665”. It became GC 3680 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the surface brightness of this galaxy is very low”. NOTE: Lewis Swift recorded it as IC 4338 in 1897.

Lightening of Grus:

This **telescopic** asterism “Astrápticus Grúis” is the spiral galaxy IC 5179 in the IAU constellation Grus. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this “refers to the two supernovae that were observed in this galaxy… from October to November 1999.”

Lightning:

This Korean asterism “Beongae” (번개) is a line of three stars with a fork at the end in the IAU constellation Pegasus. The three stars are Sigma (σ), Rho (ρ), and 55 Pegasi. At 55 Pegasi two lines run off to 59 and 58 Pegasi.

This Greek lunar mansion is possibly the IAU constellation Serpens and is listed in the Magical Papyrus 121, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k).

Lightning Bolt:

This Western asterism spans the IAU constellations Aquarius, Pegasus, and Capricornus. It is made up of the stars Epsilon (ε) Pegasi, Alpha (α) Aquarii (Sadalmelik), Beta (β) Aquarii (Sadalsuud), and Delta (δ) Capricorni.

Lightning Hurler of Draco:

This **telescopic** asterism “Fulgurátor Dracónis” is the interacting spiral galaxies NGC 6621 and 6622 (Arp 81) in the IAU constellation Draco. It is named “Edward’s Galaxy” after American astronomer Edward D. Swift, who with Lewis A. Swift discovered this in June 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to “large arcing structures… surrounding this galaxy”.

Lightning Men:

This Walpiri asterism is the stars Alpha (α) Centauri (Rigel Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Taurus (Fuller and Bursill 2021). These men make lightning and thunder when they fight with their stone axes.

Lights of the Two Calves:

See Brighter of the Two Calves (above).

Lightsome:

This star with the Arabic name “Munir” (منير) or “al-Munīr Min al-Fakka” is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis:

- “al-Munīr Min al-Fakka” It was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “munīr al-fakka”.
- “Munir” and “Mumir” are listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* (1603).
- It is listed by John Chilmead as “Munic” in 1899, which he derived from Robert Hues’ *A Learned Treatise of Globes* in 1659.

Like a Lion of Leo:

This **telescopic** asterism “Leónidas Leónis” is the dwarf spheroidal galaxy UGC 6253 (Leo II) in the IAU constellation Leo. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named “Leo A, Leo B, and Leo I” with related names (see Lion’s Son, below, and Belonging to a Lion, above).

Likla Saphaba:

This Meitei asterism “Likla Saphaba” is the IAU constellation Orion.

Lilac Garden:

This Lithuanian asterism “Alyvų darželis” is the IAU constellation Corona Borealis.

Lilith:

This asterism is the Medusa’s Head (see below) in the IAU constellation Perseus and is listed in R. H. *Allen’s Star Names* in 1899 and by Robert Burnham in his *Burnham’s Celestial Handbook* in 1978.

Liller's Star:

This is a star near the pulsar Centaurus X-3 in the IAU constellation Centaurus. It is after American astronomer William Liller (1927 – 2021).

Lily:

This asterism “Lilium” (the full title being “quasi Rosa redolens Lilium” or “resembling a rose like a lily”) is the IAU constellation Cygnus as described by German astronomer Johann Bayer (1572-1625) in his Uranometria (1603). Dekker and Lippincott (1999) write that this name appears in the Latin West in Arabic translations.

Lily of Carina:

This **telescopic** asterism “Lilium Carinae” is the barred spiral galaxy NGC 3059 in the IAU constellation Carina. It was discovered by John Herschel in 1835. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “this pair of galaxies has the appearance of an animal and its newborn whelp”.

Limpet:

This English asterism “Patella” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* in 1754 and is made up of stars in the IAU constellation Ophiuchus: 66, 67, 68 and 70 Ophiuchi. Compare this to the asterism Poniatovii’s Bull (see below).

Limping Kata:

This Horotbágy Hungarian “Sánta Kata” star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. The celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism. This is a female hurrying to feed the Reapers (see above), but no matter how fast she hobbles, she cannot catch up to them. The twinkling of Sirius is associated with limping.

Limping of Ara:

This **telescopic** asterism “Claúdus Árae” is the barred spiral galaxy NGC 6221 in the IAU constellation Ara. It was discovered in 1835 by John Herschel who listed it as h 3649 and later as GC 4239 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the eastern arms in particular look like being crippled”.

Lindsay-Shapley Ring:

See Ring, below.

Line:

This Arabic asterism “Al Nasak” is the Belt of Orion in the IAU constellation Orion:

- Iranian lexicographer Fairuzabadi (1329 – 1414) lists the name “Al Nusuḳ”.
- R. H. Allen lists “Al Nasak” and “Al Nusuk” in his *Star Names* in 1899.

Line of Fish:

In 1590 English mathematician, physician, and astronomer Thomas Hood (1556 – 1620) named the cord connecting the two “fish” in the IAU constellation Pisces “Linum Piscium”. Later the Polish astronomer Johannes Hevelius (1611 – 1687) expanded this and divided the constellation of Pisces into 4 sectors (see Pisces, below).

Line of Ramparts:

This rather complex Chinese xing guan Lěibìzhèn (垒壁阵) is a star line in the IAU constellations Aquarius, Capricornus, and Pisces with a rectangle at one end and a quadrilateral at the other:

- The quadrilateral is the stars 27, 29, 30, and 33 Piscium, and
- The line runs from 27 Piscium through Phi (ϕ), Lambda (λ), Sigma (σ), and Iota (ι) Aquarii to a quadrilateral of stars: Delta (δ), Gamma (γ), Epsilon (ε), and Kappa (κ) Capricorni (with Epsilon Capricorni being the determinative star).

This Chinese Chenzhuo xing guan “Lěibìzhèn” is a bent line of stars with diamond formations at each end in the IAU constellations Aquarius, Cetus, and Pisces:

- The line of stars runs from HIP 1421 through HIP 417, 2 Piscium, HIP 115106, 96 Aquarii, and Lambda (λ) Aquarii to Sigma (σ) Aquarii.
- The “diamond” shape at one end is Sigma (σ) Aquarii, 42 Aquarii, 39 Aquarii, and 45 Aquarii.
- The “diamond” shape at the other end is HIP 1421, 44 Piscium, 14 Ceti, and 10 Ceti.

This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Lines of the Clinging Ones:

This Hawaiian asterism “Na-lalani-a-Pili-lua”, also known as “Na Mahoe”, “Mahau”, “Mahana”, or “Na Hoku-Mahana” (“the twins”) is two stars in the IAU constellation Gemini:

- “Nanamua” (“First Star” or “Look Forward”), the star Alpha (α) Geminorum (Castor) and
- “Nanahope” (“Last Star” or “Looking Back”), the star Beta (β) Geminorum (Pollux).

The Hawaiians gave these two stars these names because “Nanamua” is the first of the pair of stars to appear in the sky as “Na Mohe” rises, and “Nanahope” always follows.

Link:

This Greek asterism "Syndesmus" is the IAU constellation Pisces as listed in John Hill's *Urania* in 1754. Elsewhere in *Urania* Hill lists the term "Knot" as an old name of this constellation, which is clearly a reference to the Arabic "al-'Uqdah" (see Knot, above) which is the star Alpha (α) Piscium.

Link of Fishes:

This Greek star "Σύνδεσμος τῶν Ἰχθύων" ("Sýndesmos tón Ichthýon") or "τῶν Λίνων" ("tón Línon") is Alpha (α) Piscium (Alrescha) in the IAU constellation Pisces. John Hill lists this as "Linon" in his *Urania* in 1754.

Linus Exodus:

This American asterism is the IAU constellation Scorpius and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Lion:

This Greek asterism "Λέων" ("Léon") is the IAU constellation Leo as originally described by Ptolemy (c.100 – c.170) in his *Almagest*:

- The "head" starts in the "neck" with the star Gamma (γ) 1 Leo and runs around through Zeta (ζ) Leo, Mu (μ) Leo, Epsilon (ε) Leo, and Eta (η) Leo before running back to Zeta (ζ) Leo,
- The "body" runs from Zeta (ζ) Leo to a backside at Delta (δ) Leo, then down to Theta (θ) Leo, across the "belly" to Alpha (α) Leo (Regulus) then up to Eta (η) Leo,
- A "tail" runs from Delta (δ) Leo to Beta (β) Leo,
- One "leg" runs from Theta (θ) Leo to a "knee" at Iota (ι) Leo and a "foot" at Sigma (σ) Leo,
- One "leg" runs from Regulus to a "knee" at 29 Leo and a "foot" at Omicron (ο) Leo,
- From Mu (μ) Leo an "ear" is a line out to Kappa (κ) Leo, and
- From Epsilon (ε) Leo an "ear" is a line out to Lambda (λ) Leo.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists ""Λέων" ("Léon") as a name for Leo.

NOTE: This is listed as a Greek lunar mansion in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). This Greek asterism also appears on the Daressy Zodiac of the Roman Imperial Period next to a donkey or ass. On the *Daressy Zodiac* the Greek asterism Maiden (see below) appears next to a walking lion.

This Egyptian asterism "Mai" ("the (divine) lion between them") is the IAU constellation Leo.

This Egyptian Dendera asterism is the IAU constellations Leo and Coma Berenices (Hoffman 2017). The lion is Leo, with a woman standing behind with her head at Coma Berenices.

This large Arabic asterism "al Asad" (أسد) is made up of stars of the IAU constellations Canis Major, Coma Berenices, Gemini, Leo, Lynx, Ursa Major, and Virgo. This Arabic asterism has the body of the lion laid out as viewed from above:

- The "body" starts at the "nostrils", Gamma (γ) and Delta (δ) Leonis and the "mouth" at open cluster Messier 44 and runs around through Omicron (ο) Leonis to "the Bend" at Gamma (γ), Delta (δ), and Epsilon (ε) Virginis, then back through 93 Leonis and Mu (μ) Leonis to the "nostrils".

- The “tail” starts at Delta (δ) Virginis and runs through Sigma (σ) Virginis, 59 Virginis, 42 Coma Berenices and 35 Comae Berenices to their asterism “Tassel” (see below).
- The “mane” is their manzil “Al-Zubrah” (see Mane, below).
- The “forehead” is their manzil “Al-Ğabhah” (see Forehead of the Lion , above).
- The “eyes” are the stars Epsilon (ε) and Omicron (ο) Leonis.
- One “front leg” runs from Omicron (ο) Leonis to a “paw” at Alpha (α) Canis Majoris (Sirius) and Beta (β) Canis Majoris (Mirzam) and is called “The Retracted Arm”.
- One “front leg” runs from Mu (μ) Leonis to a “paw” at Beta (β) Geminorum (Pollux) and Alpha (α) Geminorum (Castor) and is called “The Extended Forearm” or “Extended Arm”.
- One “back leg” runs from 93 Leonis through 54 Leonis, Alpha (α) Lyncis, and HIP 44700, ending at 10 Ursae Majoris.

Variations of “al-Asad” (“the Lion”) appear throughout history:

- “al-Asad” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- Variations include the names include “Alasid”, “Aleser”, “Asis”, and “Assid”.
- “Al asad” is listed on a 14th century Christian Spanish astrolabe #4560 (King 2002).
- German astronomer Wilhelm Schickard (1592 – 1635) listed it as “Alasado” and “Asedaton”.
- Johann Bayer’s *Uranometria* (1603) lists “Alezet”, “Alasid”, “Astivel”, and “Asid”.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Aleset vel Alasid” and “Asit vel Asid”.
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed “Asid” and “Ellesed” and cautioned his readers against the erroneous “Alatid” and “Alezet”.
- “Alesid”, “Alezet”, and Alasado” are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as names for the constellation Leo.
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Leo Alased” and is used as a name for the constellation Leo.
- Robert Hues lists it as “Alased” in his *A Learned Treatise of Globes* in 1659.
- NOTE: R. H. Allen in his *Star Names* in 1899 claimed that the legs of this Arabic asterism included the stars Alpha (α) Boötis (Arcturus) and Alpha (α) Virginis (Spica), describing these as “Arcturus as the second calf of the lion… Spica being the first calf”, citing the Iranian astronomer Abu Rayhan Muhammad ibn Ahmad al-Biruni (973 – c. 1050).

This Seleucid asterism from as “UR” (see Urgulu Demon, below) or “UR.MAH” (“lion”) from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Leo (Foxvog 1993).

This Persian asterism “Ser” or “Sher” is the IAU constellation Leo. John Hill lists the name as “Shir” in his *Urania* in 1754.

This Turkish asterism “Artān”, “Artan” or “Arslan” is the IAU constellation Leo.

This Syrian asterism “Aryō” or “Aryo” is the IAU constellation Leo.

This Hebrew asterism “Aryē”, “Arye”, “Aryeh”, or “Ari” is the IAU constellation Leo as listed in their list of constellations of the zodiac (mazzaroth) in their Talmud and is related to their month Av.

This Babylonian asterism “Arū” is the IAU constellation Leo as listed in R. H. Allen’s *Star Names* in 1899. This is listed in the BM 78161 tablet under the name “ur-a” (Liechty 1988, Leitz 2019). Allen describes the following parts:

- Two stars of the head (ziqpu 21): Mu (μ) Leonis and Epsilon (ε) Leonis,
- Four stars of the chest (ziqpu 22): Zeta (ζ) Leonis, Gamma (γ) Leonis, Eta (η) Leonis and Alpha (α) Leonis (Regulus).
- Two stars of the rump (ziqpu 23): Delta (δ) Leonis and Theta (θ) Leonis,
- Single star of the tail (ziqpu 24): Beta (β) Leonis (Denebola).

This Vedic rashi "Simha" is the IAU constellation Leo as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022). R. H. Allen lists it as "Sinha" in his *Star Names* in 1899, as does W. Brennan in his *Hindu Astronomy* in 1896. The Chinese phonetically translated "Simha" from the Vedic *Candragarbha-parivarta* in 566 as "Xinghe" (Kotyk 2017). Bhagwath (2019) lists it as "Shimha" and writes that it represents the energy of the God Indra.

This Tamil zodiac asterism "Simham" is the IAU constellation Leo. R. H. Allen lists it as "Sinha" in his *Star Names* in 1899.

This German asterism "Löwe" is the IAU constellation Leo as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

In Nama sky lore the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus represents the husband of the daughters of the sky god (the Pleiades cluster in the IAU constellation Taurus). When the husband shot his arrow (Orion's sword) at three zebras (the belt of Orion) it fell short. He didn't recover his arrow as a lion (Alpha (α) Orionis (Betelgeuse)) was watching in ambush.

Lion Being:

The stars of this Gwich'in asterism "ɔemǫ́ǫhdzí" are unidentified at present (Cannon 2021). This is a malevolent being only partially controlled by Yahdii (see Traveler, below).

Lion Deity:

The Chinese translation of the Sūryagarbha-parivarta from 585 describes the IAU constellation Cancer as "Shīzi shén" (師子之神) or "lion deity" (Kotyk 2017).

Lion Nebula:

This HII region is SH 2-132 (LBN 473) in the IAU constellation Cepheus.

Lioness:

This Arabic asterism "Al Asadah" is the IAU constellation Lupus and appears on a Turkish planisphere:

- German astronomer Johann Bayer (1572-1625) lists this as "Asida" and gives the Latin name "Leaena" in his Uranometria (1603).
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Asida" and "Leana".
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Asida" and "Leaena".
- Robert Hues lists it as "Fera" and "Asida" in his *A Learned Treatise of Globes* in 1659 and describes it as "the Wild Beast" or "a Lionesse".

This asterism "Leaena" is the IAU constellation Leo Minor and was given this name by English astronomer Richard A. Proctor in 1870 as he believed that shortening the name would make more room

on astronomical charts. However, it is listed as “Leo Minor” in Proctor’s *A New Star Atlas* (1887) as an official constellation “recognized in the catalogue of the British Association”.

Lionrock:

This **telescopic** Hong Kong star is HIP 110813 (HD 212771) in the IAU constellation Aquarius (magnitude 7.60). It was given this name in the IAU NameExoWorlds campaign. It is named for a culturally important peak in Hong Kong. It has an exoplanet named Victoriapeak, which is a peak overlooking Victoria Harbour.

Lions:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is made up of stars in the IAU constellation Cepheus: The central star is 16 Cephei, from which three lines of stars emerge:

- One bending line runs through Xi (ξ) Cephei to Alpha (α) Cephei (Alderamin),
- One runs to Beta (β) Cephei, and
- One runs to Eta (η) Cephei.

This San asterism is the Pointers (see Pointers, below). It is two brothers who were turned into lions. R. H. Allen mentions this asterism in *Star Names* in 1899.

Lion’s Back:

This Arabic star “Al Ṭhahr al Asad” is Delta (δ) Leonis in the IAU constellation Leo as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449). “Al Thahr al Asad” is listed in R. H. Allen’s *Star Names* in 1899. Allen writes that this became “Duhr and Dhur of modern catalogues”, but “Dhur” (ظهر) or “Back” is another name for this star (see Back, above).

Lion’s Haunches:

This Arabic star “Warak al Asad” is Beta (α) Virginis (Zavijava) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899. It is part of the Arabic asterism Two Haunches (see below).

Lion’s Heart:

This Babylonian star “MUL.LI.SI” (Hunger 1992) and Akkadian star “Lisi” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.

This Persian star “Us.si” from the list of Masu stars from the lists K 250 and VAT 9418 from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Boll 1918). Hermann Hunger lists it as “lisi” in his *Astronomical Diaries and Related Texts from Babylonia* in 1988.

This English star is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed by Wyllyam Salysbury in 1552: “The Lyon’s herte is called of some men, the Royall Starre”:

- Johann Bayer’s *Uranometria* (1603) lists “Cor Leonis” (“Lion’s Heart”) and “Pectus Leonis” (“Lion’s Chest”) for this star.

- Gores for a celestial globe Bibliothèque Nationale de France, Département Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this star "Cor Leonis".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Cor Leonis".
- "Cor Leonis" is listed under this name in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Cor Leonis" for this star.
- R. H. Allen's *Star Names* in 1899 lists the Lion's Heart.

Lion's Nose:

This Arabic star "Al-minħar al-asad" is the double star Kappa (κ) 1 & 2 Leonis in the IAU constellation Leo:

- This was later latinized to "Al Minhar al Asad" or "Al Minlear al Asad" as listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- Frank Schlesinger's *Yale Bright Star Catalogue* of 1930 corrupted this to "Al Minliar al Asad".
- NOTE: Al Minliar al Asad is not approved by the IAU.

Lion's Skin:

This Arabic asterism is the stars Omicron (ο) 1 and 2 Orionis, Pi (π) 1, 2, 3, 4, 5, and 6 Orionis and 6 Orionis according to R. H. Allen's *Star Names*.

Lion's Son of Leo:

This **telescopic** asterism "Leónidas Leónis" is the irregular galaxy UGC 5364 (Leo A or Leo III) in the IAU constellation Leo. It was discovered by Fritz Zwicky in 1942. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They named "Leo A, Leo B, and Leo I" with related names (see Belonging to the Lion, above, and Like a Lion, above).

Lion's Testicles:

This Khoikhoi asterism "xam ≠kxarakxa" is the Magellanic Clouds (Alcock 2014).

Lion's Tongue:

This asterism is the barred spiral galaxy NGC 2903 in the IAU constellation Leo. It was discovered by English astronomer John Herschel in 1784, who listed it as "604.1" in his catalogue. It is GC 1861 in the *General Catalogue* of 1864. Herschel mistook it for a double nebula, listing the other part as "604.2". It was the William Parsons, the Third Earl of Rosse, that determined that it was a single spiral. It was given this name by Canadian astronomer and RASC member Chris Vaughan due to its position in relation to Leo: Vaughn reported this in 2023. This is O'Meara 51 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), who does not assign a name to it.

Lip:

This Arabic star "Al Jaḥfalah" is Epsilon (ε) Pegasi in the IAU constellation Pegasus as listed in R. H. Allen's *Star Names* in 1899. Allen reports that this asterism is "found on one of their globes" but doesn't

specify which one. Later in *Star Names* Allen lists it as a name for Nu (ν) Pegasi without providing a translation.

Lipstick Marks on a Mirror:

This is an alternate name for the Incredible Shrinking Nebula, NGC 6804, (see Incredible Shrinking Nebula, above). This was discovered by English astronomer William Herschel in 1791 who listed it as "VI 38". It is GC 4499 in the *General Catalogue* of 1864. It was given this name by Stephen O'Meara in his 2011 book *The Secret Deep.* It is also known as the Snowball (see below).

Literary Star:

This Chinese star "Wenqu" from the Three Kingdoms to the Ming Dynasty is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Wenqu" is the star Delta (δ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Little Abdomen:

This Arabic manzil is the stars 35, 39, and 41 Arietis in the IAU constellation Aries, which matches the Vedic nakshatra Bearer (see above), and which was the stars listed by Ibn Qutayba. This is part of the Arabic asterism Lamb (see above). Compare to Little Belly of the Lamb (below). The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts these three stars connected to Delta (δ) Arietis, and the illustration resembles a penis with testicles. Dorn (1829) lists this as the "Little Belly" which appears on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

Little Abundant One:

This Arabic manzil "ʾAth-Thurayyā" (اَلثُّرَيَّا) or "Al-Thrayyā" (الثريا) is the Pleiades cluster in the IAU constellation Taurus. The Arabic name "Thuraya" is ancient, and is a diminutive, so its meaning would be akin to "the Little Abundant One". This is clearly a term of endearment, and in Arabic legends it is anthropomorphized as female. It is also associated with moisture, and this is because it was an indicator of the rainy season al-wasmi. This asterism is part of a larger asterism by this name, made up of stars of the IAU constellations Cetus, Perseus, and Taurus: The poet Dhu r-Rumma (d. 735 C.E.) wrote of the hands of Al Thurayya, as did philologist Ibn Qutayba (d. 889 C.E.). This is how it is viewed:

- From the Pleiades one "arm" runs out through "The Shoulder of Al-Thurayya", which is the stars Omicron (ο) and Xi (ξ) Persei with Zeta (ζ) Persei being the "Shoulder Blade",
- From this "shoulder" this "Arm" runs up through Epsilon (ε) Persei "The Arm" and Nu (ν) Persei,
- The "Elbow" is the star Alpha (α) Persei (Mirfak) with the "Tip of the Elbow" being Delta (δ) Persei,
- The "Forearm" is the star Gamma (γ) Persei,
- From Gamma (γ) Persei a line runs through Eta (η) Persei to "The Wrist" or "Tattoo on the Wrist" which is the Double Cluster, which is the pair of open clusters NGC 869 and 884 (see Double Cluster, above). The end of this arm is the Arabic asterism "Tinted Hand" (see below).
- From the Pleiades another "arm" runs out through the stars 5 Tauri, Xi (ξ) Tauri and Omicron (ο) Tauri to a "wrist" at Alpha (α) Ceti. At the end of the arm is their asterism "Leprous Hand" (see above) or Cut Short Hand (see above).

The Tinted Hand and Leprous Hand were referred to as the Two Hands ("yada al-jawza'"). The arc of Thuraya's arms encompass the "auspicious" or "lucky" stars and asterisms of the Arabs and represent her role as a mediator between east and west, with the middle finger of the "Leprous Hand" pointing to the star Antares, and the middle finger of the "Henna Hand" pointing to the star "Aldebaran" (Steiner 2017).

Here is how it appeared in other cultures:

- "al-Thurayyā" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This appears on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) labels "al-thurayyā" in silver.
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-thurayyā" and Hebrew name "zenav benot 'ayish" for Eta (η) Ursae Majoris.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Athoray".
- German astronomer Johann Bayer (1572-1625) lists it as "Athoraie".
- The Spencer manuscript Pers. 6 (c1630) of al-Sufi's *Book of Fixed Stars* depicts her as the top half of a female. Both of her arms are raised skyward, but there is no hand on one of the arms.
- Robert Hues (1659) lists "Atauria"
- Italian astronomer Giovanni Batista Riccioli (1598 – 1671) lists it as "Athoraiae", "Atarage", "Altorieh", "Athorace", and "Altorich"
- The 15th century *Alfonsine Tables* list "Atorage", and still another variation is "Turanyā".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Al Thuraiyá" as originally being a name for "Cassiopeia's chair" and goes on to explain that it is "a name more exclusively appropriated by the Pleiades" and also lists "Ath-thurayya, or the little ones".
- W. Brennand lists this as "Al-Thuraiya" in his *Hindu Astronomy* in 1896.
- John Chilmead (1899) and Robert Hues (1659) as "Atauria".

This Yemeni manzil "Thurayyā" is the Pleiades cluster in the IAU constellation Taurus (Varisco 1995). This appears in the *Kitāb al-Tabşira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296

Little and Disturbed of Centaurus:

This **telescopic** asterism "Turbídulus Centaúri" is the galaxy ESO 383-87 (PGC 49050) in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Little Auger:

There are two Romanian "Sfredelul Mic" or "Burghiul" asterisms:

- One is in the IAU constellation Canis Minor (Ottescu 2009). Alpha (α) Canis Minoris (Procyon) is the "handle" and Beta (β) Canis Minoris (Gomeisa) is the "point".
- One is the three stars Epsilon (ε), Eta (η), and Zeta (ζ) Aurigae in the IAU constellation Auriga (Ottescu 2009). Compare this to Earth's Auger, above.

Little Bear:

This asterism is the IAU constellation Ursa Minor:

- *The safegarde of saylers*, of Cornelius Antoniszoon (b. ca. 1499) translated out of Dutch into English by Robert Norman hydrographer in 1605 lists "Little Bear" for this constellation.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Little Bear" for this constellation.

This German asterism "Kleine Beer" is the IAU constellation Ursa Minor as listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

This Basque asterism "Harzkume" is the IAU constellation Ursa Minor and is part of their Bear Son saga which has parallels such as the John Bear or John Little Bear in other sky cultures. Harzkume is the son of the Great Bear (see above) which is Ursa Major (Frank 2021).

This Romanian asterism "Ursul Mic" is the IAU constellation Ursa Minor (Ottescu 2009).

Little Beaver:

This Tse'khene asterism "Dzauya" is cognate with the Gwich'in asterism "Yahdii" (see Traveller, below (Cannon 2021)).

Little Beehive:

See Beehive, above.

Little Belly of the Lamb:

There are two Arabic manzils with the name "al-Buṭayn" (بطين) which means "belly" or "batn al-hamal", a diminutive which means "little belly of the lamb". 16th century Arabic astronomer Al Tizini listed the name "Nāʾir al Buṭain):

- One, later latinized to "Al Butain", is the stars Epsilon (ε), Zeta (ζ), Pi (π), and Rho (ρ) Arietis in the IAU constellation Aries (Al Butain I, II, III, and IV).
- One is the stars Delta (δ), Epsilon (ε), and Rho (ρ) Arietis in the IAU constellation Aries.
    - This was later latinized to "Botein".
    - This group of stars was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) as he felt they were located closer to the path of the moon across the sky.
    - Scottish uranographer Alexander Jamieson (1782 – 1850) lists this asterism as "Botenim" in his *Celestial Atlas* in 1822.
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this manzil as "Botein, from al-botaïn, the little belly".
    - W. Brennand lists this in his Hindu Astronomy in 1896 as Al-Botein and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
    - The IAU has approved the name Botein for the star Delta (δ) Arietis.
    - NOTE: This is part of their Asterism Al-Hamal (see Lamb below), hamal being the name for a first-year lamb, not a ram or sheep (as some have translated it). Compare this to Little Abdomen of the Lamb (above).

Little Bison:

This is one of the asterisms found on the cave ceiling in Armintxe, Spain, estimated to be between 12,000 and 14,000 years old. It is a spiral of stars made up of the stars of the IAU constellations Cepheus and Lacerta: It starts at Nu (ν) Cephei and runs through Mu (μ) Cephei, Beta (β) Lacertae, and HIP 115990, ending at Delta (δ) Cephei.

Little Bitch:

This Romanian star "Căţelusa" is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). Ottescu writes that the Slavic term "Paloșchiţa" (which has the same meaning" is also used. Ottescu reports that some Romanians use this name for Epsilon (ε) Ursae Majoris or 78 Ursae Majoris.

Little Book of Head:

This French asterism "Orbiculus Capitis" was a name given to the IAU constellation Corona Australis by the 18th-century French astronomer Joseph Jérôme Lefrançois de Lalande (1732 –1807).

Little Bull:

"Torito" is an unidentified Quechua zenith star (Urton 1981).

Little Camels:

See Female Camel, above.

Little Canoe:

This Chinook asterism is the sword of Orion in the IAU constellation Orion. It is in a race with the Big Canoe (see above). The river is the Milky Way, and the fish is the star Alpha (α) Canis Majoris (Sirius).

Little Cart:

This Serbian asterism "Mala kola" is the Little Dipper asterism in the IAU constellation Ursa Minor.

Little Castle:

The IAU assigned the Latin name "Castula" to the star Upsilon (υ) 2 Cassiopeiae in the IAU constellation Cassiopeia in 2016. R.H. Allen writes in his *Star Names* in 1899 that this name is "from Nonius", which would be 5th century grammarian Nonius Marcellus.

Little Chariot:

This Romanian asterism "Mic Car" or "Carul Mic" is the Little Dipper asterism (see below) in the IAU constellation Ursa Minor (Ottescu 2009, Lite, Lodina, and Ignat 2018). One Romanian legend describe this as Yahweh's chariot.

Little Cloud:

This Greek asterism "Νεφέλιον", "Nephelion" or "Nefélion" is the open cluster Messier 44 (Beehive Cluster- see Beehive above) in the IAU constellation Cancer. This is the name that Hipparchus (190 – 120 B.C.E.) gave to this open cluster.

This German asterism "Nubecula Minor" is the Small Magellanic Cloud (NGC 292) in the IAU constellation Tucana. This is listed as GC 165 in the 1846 *General Catalogue*:

- "Nubecula Minor" was listed by German astronomer Johann Bayer (1572 – 1603) in his *Uranometria* 1603. Nubecula is Latin for "little cloud", so this name seems to translate as "minor little cloud" (see Nubecula Minor, above).

- "Nubecula Minor" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts a cloud labelled "Nubecula Minor".
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Nubecula Minor" on his chart as a cloud.
- English astronomer John Herschel listed it under this name in his observations.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Nubecula Minor" as a cloud.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists it as "Nebula Minor" in his *Celestial Atlas* in 1822.
- This is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated label "Nubec Minor": He indicates the borders of this constellation on the chart but offers no illustration of it.
- "Nubecula Minor" appears as a name for the Small Magellanic Cloud in Johan Dreyer's 1888 *New General Catalogue*.
- William Denning's *Telescopic Work for Starlight Evenings* (1891) lists "Nubecula Minor" as a name "marked… on celestial globes and charts", but lists it himself as a Magellanic Cloud.
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Nubecula Minor".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Nubecula Minor" as an alternate name for the SMC.
- *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) lists this as "Nímbulus Magellánicus Túcanae".

Little Cloud of Pirates:

This **telescopic** asterism is the open cluster Melotte 20/Collinder 39, the Alpha Perseus Cluster in the IAU constellation Perseus, a cluster of 50 bright stars to one side of the star Alpha (α) Persei (Mirfak). It is also known as the Saxophone, the Secret Garden Cluster and the Royal Council of Stars.

Little Cock:

See Little Cocoon Nebula.

Little Cocoon Nebula:

This **telescopic** asterism is HII region is SH 2-82 (LBN 129) in the IAU constellation Sagitta. Astrophotographer Jose Francisco Hernandez listed it on Facebookon 18 July 2024 as "the Little Cock".

Little Crab:

This Ikoots asterism "Pilaw" is the stars Gamma (γ) and Delta (δ) Cancri in the IAU constellation Cancer.

This is also an alternate name for the asterism Cancer Minor (see above).

Little Cross:

This Romanian asterism "Cruce Mică" or "Crucea Mică" is the IAU constellation Delphinus (Ottescu 2009, Lite, Lodina, and Ignat 2018).

Little Crown:

This German asterism "Corolla" was a name given to the IAU constellation Corona Australis by the 18th-century German poet Philipp von Zesen (1619 – 1689).

Little Daughter:

This Khoikhoi star "/gõaros" is currently unidentified (Alcock 2014).

Little Dipper:

The Little Dipper asterism is a dipper made up of stars in the northern IAU constellation Ursa Minor. Alpha (α) Ursae Minoris (Polaris- 48th brightest star) is the end of the dipper handle. From there it runs through the stars Lambda (λ), Delta (δ), and Epsilon (ε) Ursae Minoris, reaching the edge of the dipper at Zeta (ζ) Ursae Minoris. The four stars of the "dipper" are Zeta (ζ) Ursae Minoris, Eta (η) Ursae Minoris, Gamma (γ) Ursae Minoris (Pherkad) and Beta (β) Ursae Minoris (Kochab- 58th brightest star).

There is also a Chinese xing guan by this name in the southern IAU constellation Chamaeleon, "Xiǎodǒu" (小斗):

- The bent handle starts at the star HIP 36982 and runs through Theta (θ) Chamaeleontis, HIP 43012, Iota (ι) and Zeta (ζ) Chamaeleontis and reaches the "dipper" at Delta (δ) Chamaeleontis.
- The "dipper" is the four stars Delta (δ), Gamma (γ), Epsilon (ε), and Beta (β) Chamaeleontis.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists the name "Little Dipper" for this asterism.

Little Dog:

This asterism "Canicula" is the IAU constellation Canis Major. Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Canicula" as a collared dog walking to our left. This name is listed in Johann Bayer's *Uranometria* (1603).

This asterism "Canis Parus" is the IAU constellation Canis Minor. "Canis Parus" is listed in Johann Bayer's *Uranometria* (1603). "Kleiner Hund" is listed in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

This Romanian asterism "Caine Mic" or "Căţelul" is the IAU constellation Canis Minor (Ottescu 2009, Lite, Lodina, and Ignat 2018).

This Latin star "Canicula" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major:

- A variation of this name is "Canicula Cadens" ("shining little dog").
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Canicula".
- The 11th century *De signis caeli ("of the signs of heaven*") lists "Canicula"
- The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict a halo and rays around it.
- It is listed as "Canicula" in the *Palladium of Husbandry* in 1420.
- *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists "Canicula" as a name for Canis

Minor. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Canicula" as a name for Canis Minor and as a name for Alpha (α) Canis Majoris.
- The *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch lists "Canicula" as a name for Sirius.
- John Hill lists "Canicula" in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Canicula" as a name for Sirius.

This Latin asterism "Canicula" is the IAU constellation Canis Minor. Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Canicula". English astronomer Edmund Halley's chart of 1678 labels this constellation "Canicula" and depicts it as a dog. English uranographer John Seller's *A coelestiall planisphere* (1678) depicts this constellation as a dog and labels it "Canicula". This constellation is listed as "Canicula" by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Litel Dogge" and attributes this to the English Mathematician Leonard Digges (1515 – 1559).

Little Dogs:

This **telescopic** asterism is Ennis 4 in the IAU constellations Sculptor and Piscis Austrinus, listed by Canadian astronomer Charles Ennis. It has two parts:

- Little Dog 1: This part is in Sculptor. Ennis observed it while looking for the cluster Simonic 34. The brightest star, which forms the "dog's ear" is magnitude 12.9. A small triangle of stars nearby, the brightest being magnitude 13.4 is the "nose". To one side a rectangular formation of 13th to 14th magnitude stars forms the "body" and "feet". A 14.8 magnitude star is the "tail".
- Little Dog 2: This part is in Piscis Austrinus. Ennis observed it while looking for the cluster Simonic 35. The body is a parallelogram of 5 13th magnitude stars, with the "back foot" a 13.1 magnitude star a little further west. The "front foot" is a 13.7 magnitude star at the other end of the parallelogram, and the "head" is a triangle of two 13th magnitude stars and one 15th magnitude star, with a 14th magnitude star for an "ear".

Little Dumbbell Nebula:

This **telescopic** asterism is the planetary nebula Messier 76 (NGC 650/651) in the IAU constellation Perseus. It was discovered by French astronomer Pierre Méchain in 1780 and included in Charles Messier's catalogue. William Hershel listed this as "I 193". It was listed in the General Catalogue of 1864 as GC 385/6. It was first recognized as a planetary nebula in 1918 by American astronomer Heber Doust Curtis. The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) describes this as "like the Dumb-bell Nebula". Robert Burnham lists this name in his *Burnham's Celestial Handbook* in 1978. This name results from its resemblance to the Dumbbell Nebula, Messier 27. It is also known as the Butterfly Nebula, the Cork Nebula, and the Barbell Nebula.

Little Exuberant of Camelopardalis:

This **telescopic** asterism "Luxuriósulus Camelopardális" is the dwarf irregular galaxy NGC 1569 (Arp 210) in the IAU constellation Camelopardalis. William Herschel listed this as "II 768". It became GC 847 in the

General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Little Eye of Pavo:

This **telescopic** asterism "Ommátium Pavónis" is the barred lenticular galaxy NGC 6684 in the IAU constellation Pavo. It was discovered in 1836 by John Herschel who listed it as h 3757 and later as GC 4431 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "it looks like an eye in the tail of a peacock."

Little Eyes:

This Hawaiian asterism "Makali'i'" ("chief's eyes" or "little eyes" or "little stars") is the Pleiades cluster in the IAU constellation Taurus.

Little Finger of Ursa Major:

This **telescopic** asterism "Digitulátus Úrsae Majóris" is the spiral galaxy NGC 3549 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "I 220". It became GC 2317 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to the "extending spiral arm at the northeastern edge" which to them resembles a "little finger".

Little Fish:

This Wardaman star "Wurren" is Zeta (ζ) Phoenicis in the IAU constellation Phoenix (Cairns and Harney 2003). The IAU approved Wurren as a name for the star Zeta (ζ) Phoenicis Aa in 2017. Compare this to Little Fishes, below.

Little Fisher Stars:

This Ininew (Cree) asterism "Ochakatakos-iskewew" is the Little Dipper in the IAU constellation Ursa Minor (Lee et al 2014).

This Anishinaabe asterism "Odjig Anungonse" is the Little Dipper in the IAU constellation Ursa Minor (Lee et al 2014).

Little Fisher's Tail:

This Anishinaabe star "Keewatin Anung" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Lee et al 2014).

Little Fishes:

This Wardaman asterism is the Hyades cluster in the IAU constellation Taurus. Each star represents a different fish:

- Guamba or Guwamba (Alpha (α) Tauri (Aldebaran)) is the Barramundi,
- Narong (Theta (θ) Tauri) is the Perch (see below),
- Gamakba (Gamma (γ) Tauri) is the Red-tail (see below),
- Ourtba (Delta (δ) 1 Tauri) is the Nailfish (see below),
- Lawara (Delta (δ) 3 Tauri) is the Rival Fish (see below), and
- Galin or Jalin (Epsilon (ε) Tauri) is the Crayfish (see above).

Little Flame Nebula:

This **telescopic** asterism is IC 2087 (LBN 813, Ced 83) in the IAU constellation Taurus.

Little Flame of Centaurus:

This **telescopic** asterism "Ignículus Centaúri" is the intermediate spiral galaxy NGC 5253 in the IAU constellation Centaurus. It was discovered by English astronomer William Herschel in 1787 who listed it as "I 34". It is GC 3615 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has "the shape of a flame".

Little Flame of Ursa Major:

This **telescopic** asterism "Phlógium Úrsae Majóris" is the irregular dwarf galaxy UGC 4305 (Arp 268) in the IAU constellation Ursa Major. It was discovered by Erik Bertil Holmberg, and is known as Holmberg II. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "violent star formation activity".

Little Flower Cluster:

This **telescopic** asterism is the open cluster NGC 3228 in the IAU constellation Vela. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "II 7" in his catalogue. It is GC 2090 in the *General Catalogue* of 1864. This is also known as the Queen's Cache (see below) and "V" (see below). South African astronomer Magda Streicher (2006) listed it as the Little Flower Cluster. Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this without a name.

Little Follower:

The Bedouin star "al-Twaibi'" (التويبع) is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. It is called this as it is part of their manzil Follower (see above).

Little Gem Nebula:

This **telescopic** asterism is planetary nebula NGC 6818 in the IAU constellation Sagittarius. It was discovered by English astronomer William Herschel in 1787 who listed it as "IV 51". It is GC 4510 in the *General Catalogue* of 1864. American astronomer John Mallas (1927 – 1975) gave it this name in an article in Astronomy Magazine in August 1977. NOTE: Robert Zebahl lists NGC 6445 as the "Little Gem" on his *Faint Fuzzies* website and NGC 6818 as the "Kleiner Edelstein" ("small gem"). It is also known as Faint Uranus (see above). It is also known as the Box Nebula or the Coffin Nebula.

Little Ghost Nebula:

This **telescopic** asterism is planetary nebula NGC 6369 in the IAU constellation Ophiuchus. It was discovered by English astronomer William Herschel in 1784 who listed it as "IV 11". It is GC 4302 in the *General Catalogue* of 1864. American astronomer Mark Friedman listed this name on the *Deep Sky Forum* in July 2017. It is also known as the Ghost of Mars Nebula (see above) and the TIE Fighter (see below).

Little Goat:

This Arabic star is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major and is part of their asterism Daughters of Na'sh (see above).

This English star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as listed by Robert Hues in his *A Learned Treatise of Globes* in 1659.

Little Heart of Fornax:

This **telescopic** asterism "Córdula Fornácis" is the barred lenticular galaxy NGC 1302 in the IAU constellation Fornax. It was discovered by Edward Barnard in 1885. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Little Heaven:

This Latin asterism "Parvum Coelum" is the IAU constellation Corona Australis.

- Johann Bayer's *Uranometria* (1603) lists "Parvum Coelum".
- Edward Sherburne lists "Parvum Coelum" in his *Sphere of Marcus Manilius* in 1675.

Little Hercules:

This **telescopic** asterism is in the IAU constellation Cassiopeia and is Leiter 13 on astronomer Frank Leiter's list of asterisms. Its size is 19' X 17'.

Little Herdsman:

This Romanian star "Văcarul Mic" is 80 Ursae Majoris in the IAU constellation Ursa Major (Ottescu 2009). He is driving the Seven Oxen (see below).

Little Heron:

This Carib asterism "Savakuyuman" or "Savaku" represents a variety of heron (Ardeidae). A man by the name Savaku was turned into this bird. It appears to be related to when the herons begin to migrate to the coast. Its present location is unknown (Magaña, and Jara, 1982).

Little Horn Star:

This Sotho and Tswana star "Senakane" ("hornlet")is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Slotegraaf 2013).

This Venda star "Tshinanga" or "Tshinananga" is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Slotegraaf 2013).

Little Horse Stud:

This Romanian asterism "Gavădul Mic" is the IAU constellation Pegasus (Ottescu 2009). Compare to Great Horse Stud (above).

Little House of Little Stars:

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists the Pleiades cluster in the IAU constellation Taurus the "Plejades" and gives the alternate name "ein Häuslein Kleiner Sterne" ("a little house of little stars").

Little Jewel Box:

This **telescopic** asterism is open cluster NGC 3293, discovered by French astronomer Nicolas Louis de Lacaille in 1751 in the IAU constellation Carina. Lacaille described it in his 1755 catalogue as a "small heap of 4 small stars forming a lozenge." It is GC 2144 in the *General Catalogue* of 1864. It is also

known as the Spider Spit Cluster (see below), Hubbly Bubbly Pipe (see below), "U" (see below), the Horseshoe (see above), and the Gem Cluster (see above).

Little Joe (from Kokomo):

This **telescopic** asterism in the IAU constellation Pisces is a colorful trapezium of the stars 27, 29, 30 and 33 Piscium. It is from a list by American astronomer and musician Stephen Saber. Its size is 120'. The name "Little Joe" is a reference to shooting dice: it is a pair of twos. Saber also refers to it as the "chicklet".

Little Knee:

This Latin asterism "Ingeniculus" is the IAU constellation Hercules (in his original form as the Kneeler, see above) as listed by Edward Sherburne in his *Sphere of Marcus Manlius* in 1675 and by John Hill in his *Urania* in 1754.

Little Leo:

This **telescopic** asterism in the IAU constellation Gemini is also known as Lovett 1 and resembles the IAU constellation Leo: Eight stars close to the star Beta (β) Geminorum (Pollux) in the shape of a number "7" (including HIP 38231, 38261, 38363, and 38101) with two stars in the middle for a body, and two more angled at the end (HIP 38055A and 38101). I believe this is from a catalogue of E. O. Lovett of the Astronomical and Astrophysical Society of America in 1895. Size 60'.

Little Lion:

This **telescopic** Singaporean star "Parumleo" is WASP 32 in the LAU constellation Pisces (magnitude 11.26). It was given this name in the IAU NameExoWorlds campaign. This Latin name represents Singapore's struggle for independence. It has an exoplanet named Viculus, which is a Latin term for "little village".

Little Lips Nebula:

See Albino Butterfly Nebula, above.

Little Lute:

This is a name given to Alpha (α) Lyrae (Vega) in the *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus, who also calls it the "Lyre".

Little Mati:

This Woleaian star "Maishig" is a star in the IAU constellation Hercules (Holton et al 2015). It lends its name to a month in their calendar.

This Chuukese star "Mááchik" is a star in the IAU constellation Hercules (Holton et al 2015). It lends its name to a month in their calendar.

Little Mist:

This Greek asterism "Ἀχλύς", "Achlýs", or "Achius" is the open cluster Messier 44 (see Beehive, above) in the IAU constellation Cancer. It was given this name by Greek poet Aratus (c. 310 – 240 B.C.E.) in his poem *Phaenomena*. In the 16th to 17th centuries, it was often listed as "Nebulosa, in pectore Cancri" ("mist in Cancer's breast").

Little Ones:

This Hungarian asterism “Fiastyúk” (“little ones”) is the Pleiades cluster in the IAU constellation Taurus. R. H. Allen lists it as “Fiastik” in his *Star Names* in 1899 but translates it as “boys”. The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as a hen and chicks, which is a very common theme in European skies.

Little Ones Whose Hair is Growing:

This Ukrainian asterism “Volosozhary” (Волосожари) is the Pleiades cluster in the IAU constellation Taurus.

Little Orion:

This **telescopic** asterism Leiter 9 was discovered by American astronomer Frank Leiter in the IAU constellation Cygnus. It consists of seven stars resembling the constellation Orion close to the star Alpha (α) Cygni (Deneb) in the “Mexican Gulf” of the North America Nebula (NGC 7000). Its size is 34’ X 13’. The four brightest stars on the corners are HIP 103341, 103282, 103268 and 103356 and a line of three 8^{th} – 9^{th} magnitude stars form the “belt”. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011.

Little Pan of Sculptor:

This **telescopic** asterism “Paníscus Sculptóris” is the barred spiral galaxy NGC 7713 in the IAU constellation Sculptor. This was discovered in 1836 by John Herschel who listed it as h 4000 and later as GC 4992 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the two small extensions at the northern side of the galaxy, in combination with the broader shape at the southern side make this little galaxy look like the head of the God Pan with his two horns and beard.

Little People Who Are Dead:

This Ahtna asterism “Dastnaey Ggaay” is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021). They are messengers of Nek’eltaeni (see That Which Moves Over Us, below) which remind their people of the work he did.

Little Pimpled One of Eridanus:

This **telescopic** asterism “Pustulósulus Erídani” is the barred spiral galaxy NGC 1359 in the IAU constellation Eridanus. It was discovered in 1836 by English astronomer John Herschel who listed it in his catalogue as 2550 and later in his *General Catalogue* of 1864 as GC 729. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as “the central region looks like being pimpled due to the many star formation regions”.

Little Pincushion:

See Pincushion, below.

Little Pinwheel:

This **telescopic** asterism NGC 3180 is a spiral galaxy in the IAU constellation Ursa Major. It is GC 2049 in the *General Catalogue* of 1864. It has this name due to its resemblance to the Pinwheel Galaxy, Messier 101. It is also known as the Sower of Ursa Major (see below). NOTE: Due to an error, it appears as both NGC 3180 and 3184 in the NGC Catalogue.

Little Pleiades:

See "37" above.

Little Plough:

This Romanian asterism "Plug Mic", "Rariţa", or "Rariţele" ("little ploughs") is made up of stars of the IAU constellation Orion (Ottescu 2009, Lite, Lodina, and Ignat 2018). The "plough" is a quadrilateral created by Orion's belt and the stars Beta (β) Orionis (Rigel) and Kappa (κ) Orionis (Saiph), with the handle being a line from Delta (δ) Orionis (Mintaka) to Gamma (γ) Orionis (Bellatrix). Sometimes this is just called the Plough (see below) or the Rake (see below).

This Irish asterism is the IAU constellation Ursa Minor. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015).

Little Plough Handle:

This Welsh asterism is the Little Dipper Asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Little Plough Tail:

This Welsh asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (Freer 2004).

Little Ring Nebula:

See Ring (below).

Little Rosette Nebula:

This **telescopic** asterism is HII region is SH 2-170 (LBN 577) in the IAU constellation Cassiopeia.

Little Rudder Stars:

This Vietnamese asterism "Sao Bánh lái nhỏ" is the Little Dipper Asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Little Sagitta:

This **telescopic** asterism is in the IAU constellation Virgo and is listed on the *Faint Fuzzies* website by German astronomer René Merting. Its size is 8' X 4'. This includes the star HP 61656.

Little Salmon Weir:

This Finnish asterism "Vähä Otawa" or "Pikku Otava" ("little salmon weir") is the IAU constellation Ursa Minor. R. H. Allen lists "Vähä Otawa" in his *Star Names* in 1899. Allen incorrectly translates this as "Little Bear". In Finnish mythology Ilmarinen hung this and the larger net "Otava" (see Salmon Weir, below) on the firmament to dry when the world was just being created. Ilmarinen used these fishnets to drag the shards of eggs from the initial waters so that he could forge the world from a bird's eggs.

Little Scorpion:

See Scorpion, below.

Little Shield of Leo:

This **telescopic** asterism “Aspidíscus Leónis” is the barred lenticular galaxy NGC 3412 in the IAU constellation Leo. It was discovered in 1784 by William Herschel and listed “I 27” in the Herschel 400 catalogue. It became GC 2229 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as “its conspicuous central region looks like an ancient shield with a boss”.

Little Shrimp:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. It was given this name by American astronomer Ronald Morales as recorded by Walter Scott Houston. This is also known as the Antennae Galaxies (see above), the Ring Tail Galaxy (see below), the Snorter (see below), the “Little Shrimp”, the “Celestial Comma” (see above), the “Doughnut with a Bite Taken Out of It” (see above) and the Mosquito Larvae (see below). It is Arp 244 in Arp’s *Atlas of Peculiar Galaxies*. American astronomer Steve Coe (1949 – 2018) also used this name.

Little Sieve:

This Belarussian asterism “Maloe Sita” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2009). It is also known as the Sieve (see below).

This Lithuanian asterism “Sietynėlis”, “Sietinukas”, “Sietelis”, or “Sietukas” is the Pleiades open cluster in the IAU constellation Taurus. Phonemic versions of the diminutive name include: “Sietinėlis”, “Sitinėlis”, “Sėtynėlis”, “Sitelis”, “Sytelis”, and “Sytukas”.

Little Sisters:

This is an alternate name for the **telescopic** asterism Cooling Tower, which is the open cluster Messier 29 (NGC 6913) in the IAU constellation Cygnus (see Cooling Tower, above).

Little Sombrero Galaxy:

This **telescopic** asterism is NGC 7814 (Caldwell 43), an edge-on spiral galaxy in the IAU constellation Pegasus. It was discovered in 1784 by English astronomer William Herschel who listed it as “II 240”. It is GC 5046 in the *General Catalogue* of 1864. It bears this name due to its resemblance to the Sombrero Galaxy, Messier 104 (see Sombrero Galaxy, below). It is also known as the “Electrically Glowing of Pegasus” (see above).

Little Spindle:

This **telescopic** asterism is NGC 584, an elliptical galaxy in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in September 1785 who listed it as “I 100” in his catalogue. It is GC 342 in the *General Catalogue* of 1864. It is also known as the “Bright Belly of Cetus” (see above).

Little Square of Sextans:

This **telescopic** asterism “Zwíckius Úrsae Majóris” is the dwarf irregular galaxy UGCA 205 (Sextans A) in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its square shape.

Little Starry Horseman:

This Latin star “Eques Stellula” is 80 Ursae Majoris in the IAU constellation Ursa Major as listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 and by R. H. Allen in his *Star Names* in 1899.

Little Stars:

This Naron, !Xo, and !Kõ asterism “!xwe” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014). They see them as people sitting around a fire beside which their God Huwe tells stories.

This G/wi asterism “!xwe” or “xwedzi” is the Pleiades cluster in the IAU constellation Taurus (Alcock 2014). They see it as a group of stars crowded together.

This /Xam asterism “//xwhai” is the Pleiades cluster in the IAU constellation Taurus.

This Hawaiian asterism “Makali’i’” (“chief’s eyes” or “little eyes” or “little stars”) is the Pleiades cluster in the IAU constellation Taurus.

Little Swarm of Sagittarius:

This telescopic **asterism** “Sménium Sagittárii” is the dwarf galaxy PGC 63287 (ESO 594-4) in the IAU constellation Sagittarius. Id was discovered by Cesarsky et al in 1977 and by Longmore et al in 1978. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Sagittarius Dwarf Irregular Galaxy and as Kowal’s Object.

Little Sword of Cetus:

This **telescopic** asterism “Gladiólus Céti” is the edge-on galaxy IC 18 (Arp 100) in the IAU constellation Cetus. It was discovered by American astronomer Lewis Swift in 1887. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “its long straight tail looks like a little sword, just as the leaf of the well-known gladiolus flower”.

Little Tarantula:

This **telescopic** asterism is HII region NGC 3576 in the IAU constellation Carina. It was discovered by English astronomer John Herschel in 1847, who listed it as h 3324 in his catalogue. It is GC 2333 in the *General Catalogue* of 1864. The name refers to its resemblance to the Tarantula Nebula (see below). It is also known as the Torch Bearer Nebula (see below) and the Statue of Liberty (see below).

Little Teapot:

See Ship (Leiter 10) below.

Little Three Stars:

This Japanese asterism “Ko Mitsu Boshi” is the sword of Orion in the IAU constellation Orion. Since they are seen to “follow” the stars of the belt of Orion, “Mitsu Boshi” (see Three Stars, below), they are sometimes called “Mitsu Boshi no Tomo” (“Mitsu Boshi’s Companions”).

Little Twins:

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) "Tu'amu Sehrutu", listed in *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul mas.tab.ba.tur.tur" (Koch-Westenholz 1995), and depicted on the K 8538 planisphere as "mulmaš-tab-ba-tur-tur" is the lower half of the IAU constellation Gemini. It is a box containing the four stars Gamma (γ), Xi (ξ), Lambda (λ), and Zeta (ζ) Geminorum. The upper half is Tu'amu Rabutu (see Great Twins above). In later Seleucid star lore "Tu'amu Rabutu" and "Tu'amu Sehrutu" are combined to form "the Twins" (see Twins, below). NOTE: The BM 78161 tablet (Liechty 1988) lists "mul mas.tab.ba.tur.tur" as just the star Zeta (ζ) Geminorum in the IAU constellation Gemini.

This Babylonian asterism "MASH.TAB.BA.TUR.TUR" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is Zeta (ζ) and Lambda (λ) Geminorum in the IAU constellation Gemini.

This Persian asterism "Tu'amu sihruti" from the list of Masu Stars from the K 250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) is the lower half of the IAU constellation Gemini (Boll 1918, Jeremias 1929). Ernst Weidner lists it as "mas-tab-ba-tur-tur" in his *Fixsterne* in 1971. It is a box containing the four stars Gamma (γ), Xi (ξ), Lambda (λ), and Zeta (ζ) Geminorum. The Stars Gamma (γ) and Tau (τ) Geminorum were called the "Twin Stars" (see below).

This asterism "Mas-tab-ba-tur-tur" is the stars Lambda (λ) Orionis (Meissa), and Phi (φ) 1 and 2 Orionis in the IAU constellation Orion, which R. H. Allen lists in his *Star Names* in 1899 as a "Euphratian lunar station" and says that it was "also found for [Gamma] γ and [Eta] η Geminorum", indicating that he knows of the Babylonian asterism by this name (see above).

Little Valley:

This Polynesian asterism "Faa-iti" from the Society Islands is the IAU constellation Perseus.

Little Wagon:

This German asterism "Plaustrum vel plostrum minus" or "Kleine Wagen" is the Little Dipper asterism in the IAU constellation Ursa Minor:

- Johann Bayer's *Uranometria* (1603) lists the name "Plaustrum seu Plostrum Minus" as an alternate name for the Little Dipper.
- "Plaustrum vel plostrum minus" and "Kleine Wagen" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this "Plaustrum".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "der kleine Wagen".

This Danish and Icelandic asterism "Litli Vagn" ("little wagon" or "little chariot") is the Little Dipper asterism in the IAU constellation Ursa Minor (Bender in 2020).

This Swedish asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (Bender 2020).

Little Water Jar:

This **telescopic** asterism, “Little Water Jar”, is Corder 4860 in the IAU constellation Pisces and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Corder attributes this asterism to John Raymond. Size 30’. This is a “Y” shaped asterism of four stars, including HIP 115012A, 114914A, and 114864.

Little Wolf’s Jaws:

This Old Icelandic asterism is the Hyades cluster in the IAU constellation Taurus. Compare this to the Icelandic asterism “Mouth of the Wolf” (below).

This Saxon asterism “Kleiner Wolfsrachen” is the Hyades cluster in the IAU constellation Taurus.

Little Woodpecker:

This Lacandon star “Tunsel” is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Milbrath 1999).

Little Worm:

This **telescopic** asterism is Hay-Merting 11 in the IAU constellation Cepheus. Robert Zebahl lists it on his *Faint Fuzzies* website. Its size is 5.2’ X 1.7’. Zebahl lists it as “a prominent group of 11^{th} to 13^{th} magnitude stars looking like a little worm with two antennae” which is “4 arcminutes east of the planetary nebula NGC 7139”.

Little Worm of Columba:

This **telescopic** asterism “Vermículus Colúmbae” is the edge-on barred spiral galaxy NGC 2188 in the IAU constellation Columba. It was discovered by English astronomer John Herschel in 1836, who listed it as 3022 and later as GC 1378 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Little Wreath:

This Belarussian asterism “Venočok” is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Little Wrestler of Ursa Major:

This **telescopic** asterism “Luctatórculus Úrsae Majóris” is the spiral galaxy NGC 5279 (Arp 239) in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as “II 798”. His son John Herschel listed it as h 1665 and h1665a and later as GC 3639 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “NGC 5278 and his partner NGC 5279 seem to be a wrestling pair”.

Little Yida:

This T’atsaol’ine and Wiidiideh star “Yìda tsòa” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga (Cannon 2021). It is related to their asterism “Yida” (see Traveler, below).

Little Yoke:

This Belarussian asterism “Koromyselko” is the belt and sword of Orion.

Littoral:

This Latin asterism "Litoreus" is the IAU constellation Cancer as described by 1st century Roman poet Marcus Manilius and 1st century Roman poet Publisu Ovidius Naso (Ovid, b. 43 B.C.E.).

Liver of the Lion:

This Arabic star "Al Kabd al Asad" is Alpha (α) 2 Canum Venaticorum in the IAU constellation Canes Venatici:

- "Kabd al-Asad" and "Kibd al-Asad" are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- "Al Kabd al Asad" is listed by the Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Kabd al asad, liver of the lion".
- Compare this to Viscera of the Lion (below).

Livestock:

This early Celtic (Gaulish) asterism "Ecu" is made up of stars of the IAU constellations Virgo and Libra (Boutet 2017). This appears as "Ech" in the *Book of Ballymote*. Compare this to their asterism Fawn (see above), Deer (see above), and Livestock Yoke (see below).

Livestock Yoke:

"Eqouos Uedon" or "Aecuon Uedon" ("livestock yoke" or "equal yoke") is a proposed early Celtic name for the IAU constellation Virgo from the Book of Ballymote through an etymological reconstitution (Boutet 2014).

Liwin:

This Wardaman star is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion (Cairns and Harney 2003).

Lizard:

This **telescopic** asterism, also known as the Drunken Lizard Cluster, Klingon Battlecruiser, or Star Lizard Cluster is the open cluster NGC 7209 in the IAU constellation Lacerta. It was discovered by William Herschel in 1787 who listed it as "VII 53". It is GC 4755 in the *General Catalogue* of 1864.

This Diné asterism is made up of stars of the IAU constellations Andromeda, Pegasus, Pisces, Perseus, and Triangulum (Childrey 2008):

- The lizard's "nose" is Theta (θ) Persei,
- The "body" runs back to the "tail" at Beta (β) Pegasi (Scheat),
- One "leg" runs from Beta (β) Andromedae (Mirach) to Tau (τ) Piscium,
- One "leg" runs from the double star Gamma (γ) Andromedae to Beta (β) and Gamma (γ) Trianguli,
- One "leg" runs from Upsilon (υ) Persei to 4 Persei, and
- Another "leg" runs from Mu (μ) Andromedae to Theta (θ) Andromedae.

Lizard Head Nebula:

This **telescopic** asterism is part of IC 5067 in the IAU constellation Cygnus. It is located between 57 Cygni and HIP 103144. Canadian astrophotographer Ron Brecher gave it this name on 6 September 2023 on

his astrodoc website. Brecher wrote: “I gave it this nickname after Gail pointed it out in a wide-field image of the North America Nebula region in Cygnus, tucked in to the left of the Pelican’s beak. It has no catalogue number that I am aware of.”

Lizard Pillar:

This **telescopic** asterism is HII region LBN 438 in the IAU constellation Lacerta. It is listed under this name on Astrobin by astronomer Łukaz Zieliński.

Llama Corral:

This Quechua asterism “Llama Cancha” is an unidentified group of 56 stars (Urton 1981, Kemp et al 2022).

Llama Herder:

This Quechua asterism “Llamero” is dark nebulosity in the Milky Way (Ciancia 2018). Alternate names include “Tatalito” (see Father, above) and “Hondero” (see Slinger, below).

Llama Wallows:

This Atacameño asterism is the Magellanic Clouds (Moyano 2011). It refers to muddy places where llamas wallow.

Llew Llaw Gyffes:

This Welsh asterism, named for a mythical hero, is the IAU constellation Perseus.

Lo-an-tuka:

This Kulin Nations star “Lo-an-tuka” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Massola 1968, Hamacher 2011).

Loafer:

The stars of this Kiribati asterism “Taumangang” are unidentified at present (Trussel and Groves 1978).

Lobster:

This Latin asterism “Astacus”, “Cammarus”, or “Nepa” is the IAU constellation Cancer. Nepa is a name assigned by Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.).

- Johann Bayer’s *Uranometria* (1603) lists “Nepa”, “Cammarus”, and “Astacus” as an alternate name for Cancer.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Nepa” as an alternate name for Scorpius.
- “Nepa” is listed in John Hill’s *Urania* in 1754 as an alternate name for Cancer.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Nepa” for Cancer and attributes it to Cicero and Manilius.

This asterism “Homar” is the IAU constellation Cancer. It was given this name by German astronomer Jakob Bartsch (1600 – 1633). Polish astronomer Stanislaus Lubienitzki (1623 – 1675) listed “Homar” in his *Theatrum Cometicum* (1667) and depicted this constellation as a lobster.

Lobster Claw Nebula:

This **telescopic** asterism is HII region is SH 2-157 (LBN 537) in the IAU constellation Cassiopeia. It is also known as the Californietto Nebula.

Lobster Nebula:

There are two **telescopic** lobster nebulae:

- One is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161) in the IAU constellation Sagittarius. It was discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764. It is listed in John Herschel's *General Catalogue* of 1864 as GC 4403. It is also known as the Checkmark Nebula, Omega Nebula, Swan Nebula, War and Peace Nebula, and Horseshoe Nebula.
- One is HII region NGC 6357 in the IAU constellation Scorpius. John Herschel listed it as h 3682 and later as GC 4297 in the *General Catalogue* of 1864. It is also known as the War and Peace Nebula.

Loch Ness Monster Cluster:

This **telescopic** asterism is the open cluster Collinder 463, catalogued by Swedish astronomer Per Collinder (1890 1974) in the IAU constellation Cassiopeia. It is listed under this name in *Pattern Asterisms* by American astronomer John A. Chiravalle. The main part of the cluster is the body with a small group of stars off to one side being the "head". Size 35' X 20'.

Loch Ness Monster Nebula:

This **telescopic** asterism is dark nebula LDN 772 in the IAU constellation Vulpecula. This is in the catalogues of American astronomer Beverly Turner Lynds (1929 – 2024)

Loch Ness Monster of Virgo:

This **telescopic** asterism "Nessiteras Vírginis" is the barred spiral galaxy NGC 4536 in the IAU constellation Virgo. William Herschel listed this as "V2". John Herschel listed it as h 1337 and later as GC 3085 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Lock of Hair of Virgo:

This **telescopic** asterism "Plócamus Vírginis" is the intermediate spiral galaxy NGC 4569 (Messier 90, Arp 76) in the IAU constellation Virgo. It was discovered by Charles Messier in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "the galaxy… with the soft texture of the spiral arms, looks like a lock of hair".

Lock (Adjunct of Room):

This Chinese Chenzhuo xing guan "Gōuqián" is the stars Omega (ω) 1 & 2 Scorpii in the IAU constellation Scorpius. It is part of their xing guan "Room".

Lock (Vassal of Room):

This Chinese xing guan "Gōuqián" (钩钤(附房宿)) is a line of three stars in the IAU constellation Scorpius: Omega (ω) 1 and 2 Scoprii (the determinative star) and Beta (β) Scorpii (Acrab). This xing

guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

Lode Star:

This Norse star “leiðarstjarna” (“guiding star”) or “leiðar stjarna” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cleasby and Vigfusson 1874). In Middle High German it became “leitsterne”. to the Vikings, this star was the pivot that anchored Yggsdrasil (the World Tree) to the heavens.

Around 800 C.E. the star 32 Camelopardalis in the IAU constellation Camelopardalis would have been within 7° of the north celestial pole and was mentioned in 10th century sagas by Oddi Helgason and Einar Eyolfsson, as a faint second lode star. 32 Camelopardalis is mentioned again as a second lode star by Olaus Magnus of Uppsala in 1500.

This Old English star “Lode Sterre” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed by 14th century author John Mandeville in his *Travels of Sir John Mandeville*. English poet Edmund Spenser (1552 – 1599) called it “Loadstar”, and William Shakespeare (1564 – 1616) called it “Lodestar”.

Log and the Line:

This German asterism “Logleine”, later latinized to “Lochium Funis” is an extension of the IAU constellation Pyxis and was created by the German astronomer Johann Ehlert Bode in 1800 to accompany the constellation Argo Navis (see Ship of Argo, below). English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists it as “Lochium Funis”.

Loins:

This Arabic star “al-maraqq'” (المراق), later latinized to “Mirak” is Epsilon (ε) Boötis in the IAU constellation Boötes. Compare to “al-Mi'zar” (see Apron, above).

Loins of the Bear:

This Arabic star “Al-Maraaqq”, “’al-Marāqq” (المراقّ), or “Al Marāḳḳ” is Beta (β) Ursae Majoris in the IAU constellation Ursa Major:

- “al-Mirāq” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Merak” or “Mirak”.
- American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) lists this star as “Merak”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Merak, from the Arabian Merák al dub al akbar, the loins of the Greater Bear”.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as “Merak”.
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as “Merak”.

- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Merak": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Merak".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Merak".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Merak" and describes it as the "Flank".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list "Merak" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Merak".
- The IAU approved the name Merak for Beta (β) Ursae Majoris.

Loiterer:

This Latin asterism "Emansor" ("one who stays beyond his time") is the IAU constellation Corvus and relates to the myth of Corvus loitering at a fig tree (see Corvus, above).

Loki's Brand:

This Norse and Icelandic star "Lokabrenna" or "Loka Brenna" ("Loki's torch", "Loki's brand", or "burning done by Loki") is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Cleasby and Vigfusson 1874).

This Saxon star is Alpha (α) Canis Majoris in the IAU constellation Canis Major as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Lonely One of Microscopium:

This **telescopic** asterism "Solitárius Microscópii" is the spiral galaxy NGC 6925 in the IAU constellation Microscopium. John Herschel listed this as h 3834 and later as GC 4581 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "rather isolated position".

Long:

This is a Dutch name "Lang" given to the IAU constellation Tucana on a celestial globe created by Dutch uranographer Willem Jansz Blaeu (1571 – 1638).

Long Arms of Leo:

This **telescopic** asterism "Longibrachiátus Leónis" is the barred spiral galaxy NGC 2903 (2905) in the IAU constellation Leo. It was discovered by William Herschel in 1784: He mistook it as a double nebula, which resulted in it being catalogued as both NGC 2903 and 2905). William Parsons, the 3rd Earl of Rosse, resolved it into a spiral form in his observations in the 19th century. NGC 2905 now refers to a luminous knot in the northeastern spiral arm. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 51 without these names.

Long Basket:

This Tupi asterism “Panacu” is the belt of Orion plus the stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) in the IAU constellation Orion (De Freita Mourão 2009).

Long Crested Eagle of Pavo:

This **telescopic** asterism “Lopháëtus Pavónis” is the barred spiral galaxy NGC 6943 in the IAU constellation Pavo. It was discovered in 1835 by John Herschel who listed it as h 3838 and later as GC 4593 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “it’s plume like spiral arms somewhat resembles the head of a long-crested eagle.”

Long Hair of Camelopardalis:

This **telescopic** asterism “Capillátus Camelopardális” is the intermediate spiral galaxy NGC 2715 in the IAU constellation Camelopardalis. It was discovered by Alphonse Borrelly in 1871. It became GC 5443 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Long John Silver Cluster:

This **telescopic** asterism is the open cluster NGC 6400 in the IAU constellation Scorpius. It was discovered in 1826 by the Scottish astronomer James Dunlop who listed it as ‘Dunlop 568”. John Herschel listed it as h 3696 and later as GC 4313 in the *General Catalogue* of 1864. The name is a reference to a character in Robert Louis Stevenson’s 1883 novel *Treasure Island*. It is also known as the Phantom Cluster. This is listed in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Long Legged Spider:

This English asterism “Aranea” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* in 1754 and is made up of stars in the IAU constellation Virgo. The central star is 69 Virginis. From this “legs” run out to the stars 87, 83, 75, 68, 53, 61, 57, and Gamma Virginis and HIP 67555.

Long Necked Tortoise:

This Boorong asterism is stars in the IAU constellation Gemini:

- Beta (β) Geminorum (Pollux) is the base of the tortoise’s “neck”,
- The “body” is a quadrilateral of stars with the sides defined by 69 and 83 Geminorum and the “tail” the star Kappa (κ) Geminorum, and
- The “head” is 60 Geminorum at the end of a string of faint stars.

Note: Pollux is also the star Wanjel in the Two Hunters (see below).

Long Pointed Hat:

This **telescopic** asterism is Pothier 8 and is in the IAU constellation Cassiopeia. René Merting lists it on the *Faint Fuzzies* website and describes it as a “long pointed hat” and describes the point on top as an “obelisk”. The hat includes the stars HIP 15983, 15843, 15615, 15135, 14947, 15073, 15009, with the tip of the “cap” being HIP 14862. From this tip a line of stars including HIP 14948 and 14902 runs out and it is this line that Merting refers to as the “obelisk”. Size 41’ X 20’.

Long Shark (Boat):

This Māori asterism is the name of a boat the God Kiho-tumu sailed across the sky and is made up of the dark nebulosity in the Milky Way from the Coal Sack Nebula (see Coal Sack, above) to the galactic bulge in the IAU constellation Scorpius and the stars surrounding these dark nebulae are waves of water around the ship. Compare this to their asterism Māngō (see Shark below).

Long Tail of Boötes:

This **telescopic** asterism "Macrúrus Boótis" is the interacting disk galaxies NGC 5514 in the IAU constellation Boötes. It was discovered by Heinrich d'Arrest in 1865. It became GC 5758 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this interacting pair is producing a long tidal tail to the east".

Long Tongue of Grus:

This **telescopic** asterism "Macroglóssus Grúis" is the barred spiral galaxy NGC 7412 in the IAU constellation Grus. This was discovered in 1836 by John Herschel who listed it as h 3961 and later as GC 4861 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the eastern spiral arm of this galaxy is split at its end and a long curved arm is extending from it like the tongue from the mouth of a snake."

Long Wall:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of four stars in the IAU constellations Leo and Leo Minor: 53 Leonis (the determinative star), 52 Leonis, 51 Leonis, and 41 Leonis Minoris.

This Chinese xing guan "Chángyuán" (长垣) is a quadrilateral of four stars in the IAU constellation Leo: 46, 48, 52, and 53 Leonis.

This Chinese Chenzhuo xing guan is a line of four stars in the IAU constellation Leo and Leo Minor: 40, 41, and 42 Leonis Minoris and 51 Leonis.

Long Wings of Piscis Austrinus:

This **telescopic** asterism "Macrópterus Píscis Austríni" is the barred spiral galaxy NGC 7214 in the IAU constellation Piscis Austrinus. This was discovered in 1834 by John Herschel who listed it as h 3926 and later as GC 4758 in his *General Catalogue* of 1864. This galaxy is part of a group of interacting galaxies including NGC 7173, 7174, and 7176. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its "long extending spiral arms."

Long Yoke:

This Netwar asterism "Kasulia Asap" is a quadrilateral formed by the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) and the stars of the belt of Orion (Ramík 2019).

This Nahwal asterism "Kasulia Apam" (Ramík 2019) is identical to the Netwar asterism "Kasulia Asap" (see above).

Longtail:

This **telescopic** asterism is the open cluster NGC 4103 in the IAU constellation Crux. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3377 and later as GC 2718 in his *General Catalogue* of 1864. It is called this because it resembles the White-tailed Tropicbird (the "Longtail") or Bermuda Longtail (Phaethon Lepturus Catsbyii) of the tropical Atlantic, western Pacific, and Indian Oceans.

Looking Ironically:

See Smiley Face, below.

Loon:

This Ojibwe asterism "Maang" is the Little Dipper asterism in the IAU constellation Ursa Minor (Lee et al 2014).

This Anishinaabe asterism "Maung Anungonse" is the IAU constellation Delphinus (Lee et al 2014).

This Ininew (Cree) asterism "Mokwachak" is the IAU constellation Delphinus (Buck 2016).

Loons:

This Klamath asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Loop of the Wreath:

This Arabic asterism "Al Malf al Khatar" (translated as "loop of the wreath" or "junction of the crown" is the IAU constellation Corona Borealis:

- French scholar Joseph Justus Scaliger (1540 – 1609) lists this as "Al Malif al Kurra".
- German astronomer Johann Bayer (1572-1625) lists it as "Malphecarre", which Bayer describes as "Malphelcarre quod est sertum pupillae" or "Malphelcarre who is the pupil's wreath" (meaning the pupil of the eye) and attributes it to the "Chaldeans".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists it simply as the "Wreath".

Loosen Stars:

This Orang Asli asterism "Bintang Lunga" is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairuddin 2014).

Lopsided Leg of Eridanus:

This **telescopic** asterism "Plagióscela Erídani" is the intermediate spiral galaxy NGC 1622 in the IAU constellation Eridanus. It was discovered by astronomer George Stoney in 1850. It became GC 878 and 881 in John Herschel's *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as the galaxy's southern arm has "an asymmetric shape".

Lord:

This Korean asterism "Junim" (주님) is a line of two stars attached to one corner of the asterism "Chariot of Emperor" (see above) in the IAU constellation Corvus: Epsilon (ε) Corvi and Alpha (α) Corvi (Alchiba).

This Islamic star “aš-ši'rā” or “ash-shira” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. It is mentioned in Surah, An-Najm ("The Star"), of the *Qur'an*.

Lord Jesus’ Chair:

This Belarussian asterism “Kreselca Pana Jezusa” is the constellation Orion (Avilin 2009). It is also known as “Grabli” (see Rake, below), “Kastsy” (see Mowers, below), “Try Karali” (see Three Kings, below), “Kasar” (see Mower, below), “Karomyselko” (see Small Yoke, below), “Tri Siostry” (see Three Sisters, below), “Prahi” or “Prapradki” (see Yarn Spinners, below), “Traiko” (see Three Times, below), “Asilki” (see above), “Matawila” (see Wheel, below), “Kosy” (see Scythes, below), “Kigachi ragachy” (see Shaft of a Plough, below), Kryzhe (see Cross, above), “Lisa” (see Fox, above), and “Trohkutnaia” (see With Three Corners, below).

Lord of Light:

This Chinese Chenzhuo xing guan “Guangbo” is the star Phi (ϕ) Draconis in the IAU constellation Draco. It is part of their xing guan Purple Forbidden East Wall.

Lord of the Sun:

This Latin asterism “Dominus Solis” is the IAU constellation Cepheus. It probably originated in a Latinization of the Arabic asterism On Fire (see below). Johann Bayer’s *Uranometria* (1603) lists “Dominus Solis”.

Lord Yama:

This Hindu asterism is the IAU constellation Orion (Bhagwath 2019). Compare to the Chinese asterism King Yama (above). Lord Yama was the God of death and ruled the underworld Naraka and it was his task to direct souls to a heaven (Swarga) or return it to Earth (Bhoomi).

Lords:

This Greek asterism “Ἄνακες” (“Ánakes”) is the IAU constellation Gemini as listed by the Greek philosopher Plutarch (c.46 – 119). Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) listed them as “Anaces”.

This Vedic asterism “Invakās” from the 4th to 3rd millennium B.C.E. and “Invakā” in the *Taittirīya Brāhmana* is Lambda (λ) Orionis, and Phi (ϕ) 1 and 2 Orionis in the IAU constellation Orion (Ivanković 2021). It is also known as the Deer’s Head (see above).

Lords of the Sun:

This Latin asterism “Dominis Solis” is the IAU constellation Cepheus. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Dominis Solis” for this constellation. Compare this to Domicilium Solis” (Home of the Sun, above).

Lorenepenner:

This Paredarerme star is Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Gantevoort 2015). Lorenepenner is the wife of Packarnepenne (Mars).

Lorikeet Ashes:

This Kaurna asterism “Ngakallamurro” is the Magellanic clouds (Hamacher 2015). This would be a reference to the Adelaide Crimson Rosella, a form of parakeet. The birds are gathered and roasted there by another asterism not yet unidentified (Teichelman 1841). Compare this to the Boorong asterism Totyarguil (see Purple Crowned Lorikeet, below).

Lost Baby:

This Central Arrernte asterism is the IAU constellation Corona Australis. Eight women were dancing the dooroboree in the stars and one put her baby in a wooden basket while dancing. The baby rolled out of the crib and fell to earth and the wooden basket fell on top of the baby creating what they call Tnorala. The morning and evening star, the baby’s parents, search for the baby to this day. Tnorala (Gosse Bluff) is an enormous meteor impact crater formed millions of years ago. Nearby there is a smaller meteor impact field which was formed 4,500 years ago, and it is believed that the meteor that created this inspired this story.

Lost Children:

This Blackfoot asterism is the Pleiades cluster in the IAU constellation Taurus. These were thought to be orphaned brothers adopted by the Sun.

Lost Galaxy:

This **telescopic** asterism is NGC 4526, a lenticular galaxy with a prominent dusty disk in the IAU constellation Virgo. It is also known as the Hairy Eyebrow Galaxy (see above). It was discovered by English astronomer William Herschel in April 1784 who listed as two objects: “I 31” and “I 38”. It is GC 3075 in the *General Catalogue* of 1864. Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists it without a name.

Lost Galaxy of Copeland:

This **telescopic** asterism is NGC 4535, a barred spiral galaxy in the IAU constellation Virgo. This was discovered by English astronomer William Herschel in 1785 who listed it as “II 500” It is GC 3080 in the General Catalogue of 1864. Amateur astronomer Leland S. Copeland called it his “Lost Galaxy” in the 1950s as it has such a hazy, ghostly appearance.

Lost Hunters:

This Cherokee asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Lost in Space Galaxy:

This **telescopic** asterism is NGC 6503, a field dwarf spiral galaxy in the IAU constellation Draco. It is GC 4351 in the *General Catalogue* of 1864. This was named by O’Meara, who listed it as number 85 on his list. It is also known as the “Wandering Alone of Draco” (see below).

Lost Jewel of Orion:

This **telescopic** asterism is the open cluster and emission nebula NGC 1980 (LBN 977, Cr 72, Ced 55f) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as “V 31”. It is GC 1183 in the *General Catalogue* of 1864. It is located in the sword of Orion asterism. Astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) makes it O’Meara 29 on his list but does not refer to any name.

Lost Pearl:

This **telescopic** asterism NGC 404 is a field galaxy in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1784, who recorded it as "II 221". It is listed as GC 218 in the 1864 *General Catalogue*. It is located within 7 arcminutes of Beta (β) Andromedae (Mirach), making it a difficult object to observe, which is why it is also known as "Mirach's Ghost" (see below).

Lost Pleiad:

This asterism is the star double star 23 Tauri (Merope) in the Pleiades cluster in the IAU constellation Taurus. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this as either the star "Electra [who] left her place in order not to behold the ruin of Troy, which was founded by her son Dardanus…" or that "Other myths relate that the Lost Pleiad was Merope, who married a mortal." Since Electa is magnitude and Merope is magnitude 4.18 and the magnitude of Electra is 3.70, I am guessing that this is more likely to be Merope.

Lotus:

This Yolgnu star is probably Alpha (α) Virginis (Spica) in the IAU constellation Virgo (Clarke 2015). This is the red lily (Nelumbo nucifera).

Lounge Chair:

This telescopic asterism is in the IAU constellation Ursa Major and is Corder 1676 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 7^{th} – 9^{th} magnitude stars including HIP 42688, 42731, and 42801.

Love:

This **telescopic** Makua star "Emiw" is HIP 5529 (HD 7199) in the IAU constellation Tucana (magnitude 8.03). It was given to this star in the IAU NameExoWorlds campaign. It has an exoplanet named Hairu ("unity").

Loved One of Canis Major:

This **telescopic** asterism "Erástes Cánis Majóris" is the spiral galaxy IC 2163 in the IAU constellation Canis Major. It was discovered by American astronomer Herbert Alonzo Howe (1858 – 1926). This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it is colliding with the larger NGC 2207. They named NGC 2207 the "Lover of Canis Major" (see below).

Lover of Canis Major:

This **telescopic** asterism "Erástes Cánis Majóris" is the spiral galaxy NGC 2207 in the IAU constellation Canis Major. It was discovered in 1835 by English astronomer John Herschel who listed it as 3032 and later as GC 1393 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it is colliding with the smaller IC 2163. They named IC 2163 the "Loved One of Canis Major" (see above).

Lover of Pasiphae:

This Latin asterism “Amasius Pasiphaes” is the IAU constellation Taurus as listed in R. H. Allen’s *Star Names* in 1899. Pasiphae was seduced by the God Zeus, who appeared in the form of a bull.

Lover of the Stars:

This Elvish asterism “Telumendil” is probably the IAU constellation Boötes, appearing in the works of J. R. R. Tolkien (1892 – 1973).

Loving the Dance of Indus:

This **telescopic** asterism “Philóchorus Índi” is the interacting galaxies ESO 077-IG014 in the IAU constellation Indus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “resembles an enthusiastically dancing couple.”

Low Fence:

This Korean asterism “Danjang” (단장) is a line of stars in the IAU constellations Leo and Leo Minor: 37 and Beta (β) Leonis Minoris, and 54, and 60 Leonis.

Lower Crossbar of the Bucket:

This Arabic asterism “‘arquwat ad-dalw as-sufla” (عرقوة الدلو السفلى) is two stars in the IAU constellations Andromeda and Pegasus: Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi. It is also known as the Second Spout (see below) or the Rear Two Crossbars of the Bucket (see below).

Lower Step:

This Chinese xing guan is a line of two stars in the IAU constellation Ursa Major and is part of their xing guan “Sāntái” (see Three Steps, above): Nu (ν) Ursae Majoris and Xi (ξ) Ursae Majoris.

Lower’s Nebula:

This **telescopic** asterism is HII region is SH 2-261 (LBN 863) in the IAU constellation Orion. It is named for American astronomers Harold and Charles Lower who discovered it in 1939.

Lozenge:

This asterism is a small diamond of stars in the IAU constellations Draco and Hercules: Gamma (γ) Draconis (Eltanin), Xi (ξ) Draconis (Grumium), Beta (β) Draconis (Rastaban), and Iota (ι) Herculis. It is also known as the Diamond Head.

Lucillinburhuc:

This **telescopic** Luxembourger star is HIP 30860 (HD 45350) in the IAU constellation Auriga (magnitude 7.88). It was given this name in the IAU NameExoWorlds campaign. It is named after the Fortress of Luxembourg. It has an exoplanet named Peitruss, which is derived from the name of their river Pétrusse, which bends around this fortress.

Luck of Lucks:

See Auspice of Auspices, above.

Luckiest of the Lucky Stars:

See Auspice of Auspices, above.

Lucky Hen:

This asterism is the Pleiades cluster in the IAU constellation Taurus. This is listed as a common name for this cluster in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Lucky Star of Rain:

See Auspice of Rain, above.

Lucky Star of the Camel Striving to Get Pasture:

This Arabic star "saʿd al-nāziʿ" is the stars Lambda (λ) and Mu (μ) Pegasi in the IAU constellation Pegasus:

- This was later latinized to "Sadalnazi".
- This is also translated as "Lucky Star of the Camel Striving to Get Pasture" or "Good Luck of the Camel Striving to Get Pasture".
- Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283) listed "saʿd al-nāziʿ".
- R. H. Allen's *Star Names* in 1899 lists "saʿd al-nāziʿ".
- Compare this to Lucky Star of the Splendid One, below.
- NOTE: The name "Sadalnazi" is often assigned to the star Lamba (λ) Pegasi alone and appears under this name in Stellarium.

Lucky Star of the Excellent One:

See Auspice of the Exalted One, above.

Lucky Star of the Hero:

See Auspice of the Aspiring One, above.

Lucky Star of the High Minded:

See Auspice of the Aspiring One, above.

Lucky Star of the King:

See Auspice of the King, above.

Lucky Star of the One with Great Endeavor:

See Auspice of the Aspiring One, above.

Lucky Star of the Ostriches:

This Arabic asterism "Saʿd al Naʿamah" is Zeta (ζ) Pegasi in the IAU constellation Pegasus as listed by 16th century Arabic astronomer Al Tizini:

- R. H. Allen lists "Saʿd al Naʿamah" in his *Star Names* in 1899
- Robert Burnham lists "Saʿd al Naʿamah" in his *Burnham's Celestial Handbook* in 1978.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sa'd al nu'ám, the ostrich's lucky star".

Lucky Star of the Slaughterer:

This Arabic asterism “Saʿad udh-Dhābiḥ” (سّعد الذّابح) or “Al Saʿd al Dhābiḥ” is a bent line of three stars in the IAU constellation Capricornus: One is the five-star system Beta (β) Capricorni, and the other stars are Nu (ν) and Alpha (α) 2 Capricorni:

- This was later latinized to “Dabih”, “Dahabeh”, and “Dschäbbe”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Sa’d adh dhábih, the lucky star of the slaughterer”. The name Dabih was approved for the star Beta (β) 1 Capricorni Aa by the IAU.
- NOTE: “Dabih Minor” is the star Beta (β) 2 Capricorni in the five-star system Beta (β) Capricorni. It got this name as Beta (β) 1 Capricorni Aa is “Dabih” or “Dabih Major”. Compare this to the earlier asterism Auspice of the Slaughterer, above.

Lucky Star of the Splendid One:

See Auspice of the Exalted One, above.

Luck of the Young Beasts:

See Auspice of Lambs, above.

Lucky Star of the Young Sheep:

See Auspice of Lambs, above.

Lucky Stars:

This Arabic star “al-suʿūd al-najūm”, later latinized to “Suudalnujum” is Xi (ξ) Pegasi in the IAU constellation Pegasus.

Lucky Stars of the Lucky Ones:

See Auspice of Auspices, above.

Lucky Star of the Tents:

See Auspice of the Wooden Tents, above.

Lucky Stars of the Swallower:

This Arabic manzil “Saad Bulaa”, “Saʿdu ʾl-Bulʿa” (سَعْدُ ٱلْبُلْعَ), or “ʾAl-Bulʿa” (ٱلْبُلْعَ) is in the IAU constellation Aquarius and is translated as “lucky stars of the swallower” or “good fortune of the swallower”. This is the stars Mu (μ) Aquarii, Nu (ν) Aquarii, and Epsilon (ε) Aquarii (Albali):

- “Al Saʿd al Bulaʿ” is the name listed by Persian astronomer Zakariya al-Qazwini (1203 – 1283).
- “Al Sa’d al Bula” is listed in R. H. Allen’s *Star Names* in 1899. Allen reports that Qazwini also called Mu (μ) and Nu (ν) Aquarii “Al Bulāān”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “sa’d al bula, the fortunate swallower or absorber”.
- W. Brennand lists this as “Sad-Al-Bula” in his *Hindu Astronomy* in 1896.
- Compare this to their earlier asterism Voracious Auspice (see below).

This Yemeni manzil "Sa'd bula'" is the stars Mu (μ) Aquarii and Epsilon (ε) Aquarii in the IAU constellation Aquarius (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Lucky Stars of the Tent Dwellers:

This Arabic and Bedouin manzil "Saad Al-Akhbiah", "Saʿd al-aḫbiyah" (سعد الأخبية), "Saʿdu ʾl-ʾAkhbiyyah" (سَعْدُ ٱلْأَخْبِيَّه), or "ʾAl-ʾAkhbiyyah" (ٱلْأَخْبِيَّه), translated as "lucky stars of the tent dwellers" or "lucky star of the tents", is in the IAU constellation Aquarius and is the stars Gamma (γ) Aquarii (Sadachbia), Pi (π) Aquarii, Zeta (ζ) 2 Aquarii, and Eta (η) Aquarii. This was originally the Auspicious Asterism Auspice of the Wooden Tents (see above).

This Yemeni manzil "Sa'd al-akhbiya" is the stars Gamma (γ) Aquarii, Pi (π) Aquarii, Zeta (ζ) 2 Aquarii, and Eta (η) Aquarii in the IAU constellation Aquarius (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Ludwig's Star:

This star "Sidus Ludovicianum" or "Sidus Ludoviciana" is a 7.55 magnitude star alongside the stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) listed in 1691 by German engraver Georg Christoph Einmart (who built the first observatory in Nuremburg). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Sidus Ludovicianum". *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Sidus Ludovicianum". R. H. Allen writes in his *Star Names* in 1899 that "another German" (whom he does not identify) in 1723 "thinking that he had discovered a new planet, named it after his sovereign, Ludwig V, Landgrave of Hesse-Darmstadt".

Lugh's Sling:

This Irish asterism is the IAU constellation Draco. This asterism is found in Julie Ormonde's *Constellation Stories of Ancient Ireland* (2015). This is a reference to the myth of the God Lugh Lámhfhada.

Lulal and Latarak:

These two Babylonian stars from MUL.APIN are Pi (π) 3 & 4 Orionis in the IAU constellation Orion. Lulal is a Mesopotamian protective God associated with Inanna, usually as a servant or bodyguard: His name translates as "syrup man". Latarak is a lesser-known protective God often associated with Lulal.

These two Seleucid stars Pi (π) 3 & 4 Orionis in the IAU constellation Orion.

Luminosae:

This **telescopic** asterism, also known as the False Comet, the Northern Jewel Box, Table of Scorpius, and the Crocodile, is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius. It is located a half a degree north of Zeta (ζ) Scorpii. It was discovered by Giovanni Battista Hodierna before 1654, who called it "Luminosae" (Italian for "bright"). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. Jeffrey Corder lists it as Corder 3156.

Luminous and Small of Andromeda:

This **telescopic** asterism "Lucídula Andrómedae" is the dwarf galaxy Messier 32 (NGC 211) in the IAU constellation Andromeda. It was discovered by French astronomer Guillaume Le Gentil in 1749. It is GC

5115 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Lump Star:

This **telescopic** asterism is the reflection nebula NGC 2023 (vdB 52, LBN 954, Ced55o) in the IAU constellation Orion. It contains a B star (B1.5) HD 37903. German astronomer Max Wolf observed this in 1909, describing it as the "fuzzy star".

Lunar Star:

This Chinese xing guan "Yuè" (月) is the star 37 Tauri in the IAU constellation Taurus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Yuè" is the star 37 Tauri in the IAU constellation Taurus.

Lüneburg Horse:

This asterism is the IAU constellation Pegasus as listed by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents the horse of This is labelled "Lüneburg" and represents the horse coat of arms of Lüneburg. This is listed in R. H. Allen's *Star Names* in 1899.

Lupus:

The brightest star of Lupus, Alpha (α) Lupi, is the 75th brightest star on the list of 90 brightest stars and this constellation's stars appear in 110 asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Lup) was originally identified by Eratosthenes (d.194 B.C.E.) as a wineskin held by Centaurus. It was Hipparchus of Bithynia that named it "Therion" (Medieval Latin – "the beast") in the 2nd century B.C.E. It probably originated in the Babylonian asterism "Mad Dog" (see below). Aratus (315 – 240 B.C.E) and Hipparchus (190 – 120 B.C.E.) listed it as "Θηρίον" ("Thiríon" -see Beast, above) and so did Ptolemy (c.100 – c.170) in his *Almagest*.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Lupus as a wolf running to our left.

Sudias, a Greek lexicographer of 970, called it "Κνηκίας" ("Knikías"), which was a Greek term for wolf back then. This constellation appeared as "Lupus" in the 15th century *Alfonsine Tables* and "Fera Lupus" ("wild wolf") in translations of the *Almagest*. It is known to the French as "Loup" and to the Italians as "Lupo".

This constellation appears in a 10th century copy of the Leiden *Aratea* (Boulogne-sur-Mer, Bibliotèque municipal MS 188) but is missing from the 9th century edition.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Lupus as a wolf whose rear leg is being held by Centaurus. One page shows him in left profile and the other page shows him in right profile.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Lupus as a beast resembling a lion. Centaurus has a hold of his left rear leg.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Lupus as a lion.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Lupus as some sort of four-legged animal with spots on its back. Centaurus is holding its left rear leg.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Lupus as a wolf whose right rear leg is being held by Centaurus.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Lupus" as a wolf being stabbed in the mouth by Centaurus.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Lupus as a four-legged creature being stabbed in the mouth by Centaurus. It is not labelled and poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts only the head and front legs of Lupus: The rest of this constellation is off the edge of the astrolabe. It is not labelled.

The Paris manuscript of al-Sufi's *Book of Fixed Stars* (Bibliothèque nationale de France, Ms. Arabe 5036), from Ulugh Beg's library (c 1430 – 1440) depicts Lupus as a lion. Centaurus the centaur is holding the rear right leg of Lupus in his left hand.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Lupus as a wolf that has been spitted end to end by the spear of Centaurus.

Lupus appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a wolf being speared by Centaurus and is labelled "Fera".

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Lupus" as a wolf being speared by Centaurus.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Lupus as a wolf being speared in the abdomen by Centaurus. It is not labelled.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Lupus as a wolf being speared by Centaurus.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Lupus" as a wolf being speared in the mouth by Centaurus.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Lupus as a wolf being speared by Centaurus.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Lupo". The

charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Lupus as a wolf being speared in the mouth by Centaurus.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Lupus" as a wolf being speared by Centaurus.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Bestia Centauri siue Lupis" as a wolf with a spear point in its jaws. Centaurus is not depicted in this illustration: He appears in another illustration where Lupus is off the edge of the page.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "le Loup" as a wolf being speared by Centaurus.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius labels this "Fera Lupus" and depicts it as a wolf being speared in the mouth by Centaurus.

"Lupus" is depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a wolf being speared by Centaurus, having the subtitle "Fera".

Lupus is omitted from Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

Dutch navigator Frederick de Houtman's catalogue of fixed stars (1603) lists this constellation as "Lupus, den Wolf".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Lupus" as a wolf being speared by Centaurus.

"Lupus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as a wolf being speared by Centaurus.

German uranographer Johann Bayer (1572 – 1625) depicts this constellation in his *Uranometria* in 1603 as a wolf being stabbed by a spear carried by Centaurus. Bayer lists these names for this constellation: "Lupus, Bestia, Bestiola, Hostiola, Fera, Ciceroni Quadrupes, Panthera, Equus Masculus, Asida, Laeana, Persis Bridemis".

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Lupus" and "Lupo" for this constellation.

"Lupus" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a wolf being speared by Centaurus.

"Lupus" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as well as the alternate name "Fera".

Italian astronomer Giovanni Batista Riccioli (1598 – 1671) listed it as "Lupa" and "Lycisca".

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Fera Lupus” as a wolf being speared in the throat by Centaurus.

This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Lupus” and “Fera”.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this constellation “Fera” with the subtitle “Lupus” and depicts it as a wolf that has been speared by a lance brandished by Centaurus.

English uranographer John Seller’s *A coelestiall planisphere* (1678) lists “Lupus” but it is mostly below the edge of the planisphere.

Lupus is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 as a wolf being speared by Centaurus.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Lupus” as a wolf running to our left being speared by Centaurus.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Le Loup”, “Lupus”, and “ΑΥΚΟΣ” and depicts it as a snarling wolf being speared by Centaurus.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Fera al Lupus et Panthera” as a wolf being speared by Centaurus.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Lupus as a wolf being speared by Centaurus, but does not label it.

Lupus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a wolf being speared by Centaurus.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Lupus” as a wolf being speared by Centaurus.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Lupus” as a wolf being speared by Centaurus.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Lupus as a wolf being speared by Centaurus.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “le Loup” as a wolf being speared by Centaurus.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Lupus as a wolf being speared by Centaurus.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Le Loup” as a wolf being speared by Centaurus.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Lupus” as a wolf being speared by Centaurus.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “le Loup” as a wolf being speared by Centaurus, as does the 1778 edition.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”Der Wolff” in the text and “Wollf“ on the charts, depicting it as a wolf being speared by Centaurus.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Lupo” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Fera Lupus” as a wolf being speared by Centaurus.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Lupus” as a wolf being speared by Centaurus.

Lupus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Wolf”: It is depicted as a wolf being speared by Centaurus.

American uranographer William Croswell (1760 – 1834) depicts “Lupus the Wolf” on his *Mercator Map of the Starry Heavens* in 1810 as a wolf being speared by Centaurus.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Lupus it in his *Celestial Atlas* in 1822.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Wolf”.

American uranographer Elijah Burritt’s *Southern Circumpolar Map for each Month in the Year* (1835) depicts Lupus as a wolf being speared by Centaurus.

“Lupus” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Lupus” as a wolf being speared by Centaurus.

“Lupus” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a wolf.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on the chart as “Wolf”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Lupus, The Wolf” as an official constellation “recognized in the catalogue of the British Association”.

German astronomer Hermann Joseph Klein (1844 – 1914) lists “Lupus” in his *Star Atlas* (1893) and describes it as “The Wolf”.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Lupus" and describes it as a "Wolf".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Lupus in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows Lupus this way:

- With a "body" of the stars Alpha (α), Zeta (ζ), Omega (ω), Gamma (γ), Delta (δ), and Beta (β) Lupi,
- With a "head" formed by the triangle of stars Eta (η), Theta (θ), and Chi (χ) Lupi, with a line between Eta (η) Lupi and Gamma (γ) Lupi forming a "neck",
- With a "front leg" formed by a line from Delta (δ) Lupi to Phi (φ) 1 Lupi,
- With one "back leg" formed by a line from Alpha (α) Lupi to Tau (τ) 1 Lupi, and
- With one "back leg" formed by a line from Zeta (ζ) Lupi to Rho (ρ) Lupi.

Rey's version turns it to face in the opposite direction and looks like this:

- His "body" is a loop of the stars Rho (ρ), Pi (π), Lambda (λ), Delta (δ), k, Phi (φ) 1 and 2, Beta (β), Omicron (ο), and Alpha (α) Lupi.
- Two lines run out from Alpha (α) Lupi forming "ears":
- One to Iota (ι) Lupi, and
- One to Tau (τ) 1 and 2 Lupi,
- A line from Rho (ρ) to Sigma (σ) Lupi is a "nose",
- One "front leg" runs from Pi (π) Lupi through Kappa (κ) 1 Lupi to Zeta (ζ) Lupi,
- One "front leg" runs from Lambda (λ) Lupi through Mu (μ) Lupi to Epsilon (ε) Lupi,
- One "back leg" runs from k Lupi through Gamma (γ) and Omega (ω) Lupi to g Lupi,
- One "back leg" runs from Phi (φ) 1 Lupi through h Lupi to Eta (η) Lupi, and
- His "tail" runs from Phi (φ) 1 Lupi through Psi (ψ) 1 and Chi (χ) Lupi to Theta (θ) Lupi.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Lupus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a bent enclosed shape formed by the line of stars Alpha (α) Lupi, Zeta (ζ) Lupi, Kappa (κ) 1 Lupi, Epsilon (ε) Lupi, Gamma (γ) Lupi, Eta (η) Lupi, Chi (χ) Lupi, Psi (ψ) 1 Lupi, Theta (θ) 1 Lupi, Delta (δ) Lupi, and Beta (β) Lupi.

Sky and Telescope Magazine, founded in 1941, depicts Lupus in their magazine and publications like this:

- Its "head" is the triangle of stars Eta (η), Chi (χ), and Phi (φ) Lupi,
- Its "body" is the quadrilateral formed by Eta (η), Gamma (γ), Epsilon (ε), Zeta (ζ), and g Lupi,
- Its "back leg" is a line between Zeta (ζ) and Alpha (α) Lupi, and
- Its "front leg" starts at Gamma (γ) Lupi and runs through Delta (δ) Lupi to Beta (β) Lupi.

Luritja Camp:

This large Luritja asterism is made up of the stars east of the Milky Way as viewed from central Australia (Clarke 2009). The Arrernte and Luritja peoples divided the sky between them, with this being the Luritja camp. The Milky Way divides the sky into these two camps. See Arrernte Camp (above) for the other.

Luritja Cousin:

This Luritja star is Beta (β) Centauri (Hadar) in the IAU constellation Centaurus as listed by Maegraith in 1932. Maegraith writes that this represents a Luritja man who is the cousin of Alpha Centauri (see Arrernte Boy, above) who belongs to the class Mbitjana.

Luritja Man:

This Luritja star is Alpha (α) Crucis (Acrux) in the IAU constellation Crucis as listed by Maegraith in 1932. Maegraith writes that this represents a Luritja man "belonging to the marriage class corresponding to Knaria" and "Father of Alpha Centauri" (see Arrernte Boy, above).

Luritja Woman:

This Luritja star is Beta (β) Crucis (Mimosa) in the IAU constellation Crucis as listed by Maegraith in 1932. Maegraith writes that this represents a Luritja woman "belonging to the marriage class Ngala" and that she is "wife of Acrux, mother of Alpha Centauri (see Luritja Man, above and Arrernte Boy, above).

Lusitânia:

This **telescopic** Portuguese star is HIP 30905 (HD 45652) in the IAU constellation Monoceros (magnitude 8.13). It was given this name in the IAU NameExoWorlds campaign. It is a name for the ancient region that makes up most of modern Portugal. It has an exoplanet named Viriato: Viriato was a legendary Lusitanian leader who resisted the Roman invaders in the 2nd century B.C.E.

Lusong:

This Samarnon asterism is the IAU constellation Crux (Ambrosio 2008).

Lustre:

This Lithuanian asterism "Setynas" or "Setinys" is the Pleiades open cluster in the IAU constellation Taurus. Linguistic variants include: Sietynas, Sietimas, Sietinis, Sietinys, Sityns, Sytynas, Sytinys, Sėtinys, Setynas, Sėtinas, Sėtinas, Sėtynas, and Satynas.

Lute:

This **telescopic** asterism, known as Poskus 1, is in the IAU constellation Delphinus, and is made up of 11th to 12th magnitude stars next to the star Gamma (γ) Delphini. American astronomer Sue French calls it the mandolin, and others call it the flyswatter. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011.

Luyten's Flare Star:

This **telescopic** binary star is Luyten 726-8 (Gliese 65), composed of the stars BL Ceti and UV Ceti in the IAU constellation Cetus (magnitude 11.401). This was named for Dutch-American astronomer Willem Jacob Luyten in 1948.

Luyten's Star:

This **telescopic** double star is HIP 36208 in the IAU constellation Canis Minoris (magnitude 9.87). This red dwarf was named for Dutch-American astronomer Willem Jacob Luyten, who, in collaboration with Edwin G. Ebbighausen, first determined its high proper motion in 1935.

Lycaon:

This asterism is the IAU constellation Boötes. Johann Bayer's *Uranometria* (1603) lists "Lycaon" as an alternate name for this constellation. The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Lycaon" as a name for Boötes. Lycaon was the king of Arcadia and the father of Callisto, who was later turned into a Bear (Ursa Major).

Lycaonia:

This Latin asterism "Lycaonia", "Lycaonia Puella" ("Lycaon's Girl"), or "Lycanonia Arctos" ("Lycaon's Bear") is the IAU constellation Ursa Major. This is a reference to Lycaon, the King of Arcadia and the father of Callisto. This appears in the Leiden *Aratea* (816) as Lycaon's Bear. Johann Bayer's *Uranometria* (1603) lists the name "Licaonia".

Lycaon's Bear:

See Lycaonia, above.

Lycaon's Girl:

See Lyacaonia, above.

Lying on His Feet:

See Crocodile, above.

Lying Shield:

This **telescopic** asterism is in the IAU constellation Pegasus and is Leiter 14 on astronomer Frank Leiter's list of asterisms. Its brightest star is magnitude 11.1. and it is near HIP 116783. Leiter describes it as a medieval knight's shield laying on its side. Its size is 10' X 5'.

Lynx:

None of the stars of Lynx are on the list of 90 brightest stars and the stars of this constellation show up in 116 asterisms in this handbook.

This IAU constellation (IAU abbreviation Lyn) was made up of the stars of the obsolete constellation Jordan River (see above). It is listed on the *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999). German astronomer Jakob Bartsch (1600 – 1633) also called it "Tigris".

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a lynx facing to our right. It is not labelled.

Polish astronomer Johannes Hevelius (1611 – 1687) named it "Tigris" ("tiger") in his original catalogue but when he put it in his *Prodromus Astronomiae* (1690) it is labelled "Lynx" and is depicted as a lynx running to our left.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Lynx" as a lynx running to our left.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Lynx as a running lynx.

Lynx is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: It is depicted as a classical lynx running to our right.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Lynx as a lynx running to our right.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) labels this constellation "Lynx Tigris" and depicts it as a lynx running to our right.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Lynx running to our left.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Lynx" as a lynx running to our left.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782 lists this constellation as "Der Linx oder das Tieger-Thier" ("The lynx or the tiger-beast") and it is depicted on his charts as a lynx running to our right, labelled "Linx".

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Lince" ("lynx") in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) does not include Lynx.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778 lists it as "le Lynx".

American uranographer William Croswell (1760 – 1834) depicts Lynx on his *Mercator Map of the Starry Heavens* in 1810.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Lynx" in his *Celestial Atlas* in 1822. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts this as a running lynx.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "the Lynx" as a running lynx.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Lynx" as a lynx running to our right.

Lynx is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Luchs" and shows the lynx running to our right.

"Lynx" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a lynx running to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Lynx" as a lynx running to our left.

"Lynx" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a lynx running to our right.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Lynx, The Lynx" as an official constellation "recognized in the catalogue of the British Association".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Lynx" in his *Star Atlas* (1893) and describes it as "The Lynx".

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Lynx".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Lynx" and describes it as a "Lynx".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Lynx".

Standard IAU charts depict Lynx as a wavy line starting at the star Alpha (α) Lyncis and running through 38 Lyncis, HIP 44700, 10 Ursae Majoris, 31 Lyncis, 21 Lyncis, and 15 Lyncis, ending at 2 Lyncis.

It is known to the Italians as "Lince" and the Germans as "Luchs" and Linx".

This Estonian asterism "Ilves" is the IAU constellation Lynx and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Lyra:

Lyra's stars appear in 215 asterisms in this handbook. Its brightest star is Vega.

This IAU constellation (IAU abbreviation Lyr) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and in the 2nd century became one of Ptolemy's 48 original constellations, associated to the lyre of Orpheus in Greek myths. Ptolemy's original name in the *Almagest* was "Λύρα" ("Lýra"), "Λύρη" ("Lýri") or "Λύρα κατοφερής" ("Lýra katoferís" or "pendant lyre"), and it was shown with a semi-circle of stars around the parallelogram associated with it on modern star maps, starting at Eta (η) Lyrae and running through Theta (θ) Lyrae, 18 Lyrae, 17 Lyrae, HIP 93720, HIP 91883, HIP 91235, Alpha (α) Lyrae (Vega) to Epsilon (ε) Lyrae. Lyra is one of the paranatellonta of the decans of Gemini as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k).

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Lyra as a lyre.

The globe of the 2nd century Farnese Atlas depicts this constellation as a lyre made from a tortoise shell (Stevenson 1921).

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Lyra" and "Lira".

Lyra is depicted in the Leiden *Aratea* (816) as a lyre (Katzenstein & Savage-Smith, 1988).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (St Gall 250, St Gall 902) the lyre's strings are depicted as looping lines,
- In two editions (Gottweig 7 (146), Siena L. IV. 25) the strings are fixed to the fret-bar with nails,

- In several editions (Dresden DC 183, Paris BN 12597, Gottweig 7 (146), Siena L. IV. 25, St Gall 250, St Gall 902) this lyre has a zither-like base and ox horn side supports,
- In the Prague IC C 6 edition the lyre has rectangular base with an animal head decorating one edge of the fret bar,
- In the Vat Reg lat 1324 edition this is depicted as a traditional Irish harp.

The Los Angeles, Getty Ludwig XII, 5 manuscripts of the *De ordine ac positione stellarum in signis* depicts an Irish harp. The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Lyra upside down.

The 11th century *De signis caeli (“of the signs of heaven*”) lists “Lira” and “Lyra”. The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli (“of the signs of heaven*”) depict Lyra as a peculiar lobed lyre. The Dijon 448 manuscript of *De signis caeli* depicts some sort of key or plectrum attached to the lyre.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Lyra as a drinking cup.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts “Vultur Cadens” as a lyre decorated as an eagle.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Lyra as an eagle with wings folded. It is not labelled and poorly drawn and does not look like a lyre.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Lyra as a lyre, but is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Lyra as a lyre.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Lyra as a Lyre.

De Astronomica (“the astronomy”), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts “Lyra” as a lyre.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts “Vultur Cadens” as a bird with a short, crooked beak.

The early 16th century Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Lyra as a tortoise or turtle as viewed from above. It is unlabelled. This is a reference to the myth of Orpheus, who made his lyre from a tortoise shell. Real Academia de Historia, manuscript D-97, f.101v partially depicts this turtle at the edge of the circular chart.

The “Nuremburg Maps” *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts “Vultur Cadens” as an eagle with wings outstretched as if about to land.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by

Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts Lyra as a harp decorated with an eagle's head and wings.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Lyra in the same manner as Dürer et al.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Lyra" as a lyre in front of an eagle.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Lyra as a sort of violin in front of an eagle.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Lyra" as a sort of violin in front of an eagle.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "De la Lira". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Lyra as a violin or cello decorated with eagle's wings and feet.

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Lyra" as a violin.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "la Lyre" as what appears to be a violin.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Lyra" as a lyre.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts "Lyra" as a lyre in front of an eagle.

German uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a harp in front of an eagle. Bayer lists the following names for this constellation: "Lyra, Apollinus, Orphica, Vultur Cadens, Arabum, Fides, Fidicula, Testudo, Cirhara, Fidicen, Canticum, Testudo lutaria, Marina, Deferens Psalterium, Pupillam, Aquila marina, Nesrussakat, Alohore, Mesanguo, Asangue, Brinek, Albegala, Nablon".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Lyra" as a lyre in front of an eagle.

"Lyra" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a lyre in front of an eagle.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Lira" and "Vultur Cadens" and depicts it as a six stringed instrument such as a violin.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Lyra” and “Vultur Cadens” for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts “Lyra” as a lyre in front of an eagle.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Lyra” as a lyre made to look like an eagle.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Lyra as a lyre made to look like an eagle.

Lyra is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: It is depicted as a lyre in front of an eagle.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) labels this constellation “Lira” and depicts it as a harp with the shape of an eagle with spread wings.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts “Lyra” as a lyre in front of an eagle.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “lyra” as a lyre in front of an eagle.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Lyra” as a lyre being carried in front of an eagle.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “La Lyre”, “Lyra”, and “Λύρα” and depicts it as a lyre in front of an eagle.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Lyra” as an eagle shaped harp.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Lyra as a lyre decorated as an eagle.

Lyra is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts “Lyra” as a harp with the shape of an eagle.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Lyra as a harp with the shape of an eagle.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Lyra as a harp decorated to look like an eagle.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Lyre” as a lyre with an eagle behind it.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Lyra” as a harp in the shape of an eagle.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Lyre” as a lyre in front of an eagle with wings outstretched on its northern hemisphere chart, but on a later close-up chart it is simply depicted as a lyre.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Lira” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Lyra” as a lyre in front of an eagle.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Lyra” as an eagle shaped harp.

American uranographer William Croswell (1760 – 1834) depicts “Lyra” on his *Mercator Map of the Starry Heavens* in 1810 as a lyre.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Leyer” and depicts it as a harp in front of an eagle. Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as ”die Leyer“ and depicts it as a lyre.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Lyra in his *Celestial Atlas* in 1822. Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts this as a lyre.

“Lyra” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as a harp shaped like an eagle.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict “Lyra” as a lyre.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Lyra” as a lyre.

Lyra is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

“Lyra” is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a lyre.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as “Lyra, the harp”.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Lyra, The Lyre” as an official constellation “recognized in the catalogue of the British Association”.

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as “Lyra, the Harp”.

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Lyra" and describes it as a "Harp".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Lyra".

Lyra's brightest star Alpha (α) Lyrae (Vega) is the 5th brightest star in the sky and appears in the Summer Triangle and Navigator's Triangle (see Summer Triangle below, and Navigator's Triangle, below). The stars of this constellation appear in 191 of the asterisms of the sky cultures of the world. It is "Leier" in Germany, "Lira" in Italy, and "Lyre" in France. R. H. Allen writes in his *Star Names* in 1899 that 1st century Roman poet Marcus Manilius "seems to have made two distinct constellations of this, Lyra and Fides, although we do not know their boundaries" (see Fidicula, above).

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Lyra in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows this constellation as the parallelogram of stars Beta (β) Lyrae (Sheliak), Gamma (γ) Lyrae, Delta (δ) 1 and 2 Lyrae, and Zeta (ζ) 1 and 2 Lyrae, with a line running out from this last double star to Alpha (α) Lyrae (Vega). Rey retains the parallelogram but removes the line to Vega and runs a loop of stars around from Gamma (γ) Lyrae through Theta (θ), Eta (η), 13, Epsilon (ε) 1 and 2, Alpha (α), and Kappa (κ) Lyrae to Beta (β) Lyrae.

Sky and Telescope Magazine, founded in 1941, depicts Lyra in their magazine and publications as a parallelogram of Zeta (ζ) 1 Lyrae, Beta (β) Lyrae (Sheliak), Gamma (γ) Lyrae and Delta (δ) 1 and 2 Lyrae attached to a triangle formed by the stars Zeta (ζ) 1 Lyrae, Epsilon (ε) 1 and 2 Lyrae, and Alpha (α) Lyrae (Vega).

The parallelogram has the corner stars Gamma (γ), Delta (δ) 1 and 2, Zeta (ζ) 1, and Beta (β) Lyrae (Sheliak). A short line runs out from Zeta (ζ) 1 Lyrae to Alpha (α) Lyrae (Vega).

Lyre:

This Greek asterism "Κιθάρα" ("lyre" or "guitar") or "Kithara" is the IAU constellation Lyra. This was translated by Qadizade al-Rumi (1364 – 1436) as "Al Sanj", which was later latinized to "Asange", "Asenger", "Asanges", "Asangue", "Al Sangue", "Sangue", and "Mesanguo".

- In the 15th century *Alfonsine Tables* it is listed as "Alsanja".
- Johann Bayer's *Uranometria* (1603) lists the names "Mesanguo", "Asangue", and "Brinek".
- Italian translator Giuseppe Simone Assemani (1687 – 1768) believed that these terms were derived from German astronomer Wilhelm Schickard's "Azzango" ("Cymbal").
- Translations of Reduan's Commentary list "Arnig" and "Aznig".
- German astronomer Christian Ludwig Ideler (1776 – 1846) listed it as "Brinek".
- John Hill lists it as "Sangue", "Al Sangue", and "Sengi" in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Lyre" and "Brinek" and attributes the latter to Riccioli.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Lyre". Copernicus lists Alpha () Lyrae (Vega) as the "Little Lyre" or the "Lute".

This German asterism "Leyer" is the IAU constellation Lyra as depicted in the *Nördliche Sternhimmel* sky map of O. S. Reuters based on the work of German astronomer Johann Elert Bode (1747 – 1826).

Lyre of Zurah:

This Persian asterism is the IAU constellation Lyra.

Lyricist:

This Latin asterism "Fidicen" is the IAU constellation Lyra.

M:

There are seven **telescopic** "M" asterisms:

- One is Sánta 145, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a group of 8th – 12th magnitude stars in the IAU constellation Puppis. Gábor describes it as an "M-shape [asterism]… nice… along EW, 38' SSE from 10 [Puppis]".
- One is Kernya 2, listed by Hungarian astronomer Gábor János Kernya, which is in the IAU constellation Leo. Kernya describes it as a "Spectacular group in the western part of the Leo constellation. About ten stars of magnitude 8 – 11 draw a rotated "M" or "Σ" shape… This asterism works very well in the field of view that is poor in stars."
- One is Kernya 84, listed in 2015 by Hungarian astronomer Gábor János Kernya, which is a group of 11th – 14th magnitude stars in the IAU constellation Pegasus. Kernya describes this as a "distorted 'W' or 'M' shape." The photo accompanying this listing shows it as an "M", so that's how we're listing it here.
- One is Corder 4117 in the IAU constellation Sagittarius and is on the observing list of Jeffrey Corder of the Ancient City Astronomy Club in Florida. Size 25'. This includes HIP 100278, 100270, and 100123.
- One is in the IAU constellation Fornax and is Corder 378 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is five 7th – 9th magnitude stars including HIP 11359, 11339, and 11306.
- One is HII region NGC 2359 (SH 2-298. RCW 5, LBN 1041, Ced 94b)in the IAU constellation Canis Major surrounding the Wolf Rayet star WR7. Size 10' X 15'. It was discovered by English astronomer William Herschel in 1785 who listed it as "V 21" in his catalogue. It is GC 1511 in the *General Catalogue* of 1864. American astronomer Dave Mitsky (1997) describes it in the DOCdb database as"an M turned on its side". It is also known as the "Duck Nebula", the "Duck Head Nebula", the "Flying Eye Nebula", the "Bust Silhouette", "Thor's Helmet", or the "Whistle Nebula".
- One is in the open cluster the Theta (θ) Carinae cluster, IC 2602 (Melotte 102, Caldwell 102) in the IAU constellation Carina. It was recorded in Abbé Nicholas Louis de Lacaille's original catalogue of 1755. Later it was recorded by American astronomer Solon Irving Bailey (1854 – 1931) and became IC 2602. This is six 4th – 7th magnitude stars including HIP 52701, 52736, 52678, 52799, and the double star HIP 52815A. This was created in 2016 by South African astronomer Pierre de Villiers: This "M" is clearly visible.

M 35 Guy:

This **telescopic** asterism is in the open cluster Messier 35 (NGC 2168) in the IAU constellation Gemini. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745.It is also known as the Sky Rocket Burst, Nested Bells, and the Shoe Buckle Cluster. American amateur astronomer "Fiske" listed this in March 2022 on *Cloudy Nights*. The "eyes" are HD 252197 and 252153. His "nose" is the line of

stars HD 252199, HD 252198, HD 252176, Gaia DR3 3426281165064377984 and HD 252126. His smiling "mouth" is the curve of stars HD 41996, HD 252353, Gaia DR3 3426271338180113536, Gaia DR3 3426270066868843520, Gaia DR3 3426270685344143488, and HIP 29148.

M 73 Lookalike:

There are three **telescopic** "M 73 lookalike" asterisms:

- One is in the IAU constellation Hercules and is Ferrero 51 on Laurent Ferrero's list of asterisms. It is a triangle of three stars with a blue star in the middle.
- One is Cseh 8 listed by Hungarian astronomer Viktor Cseh, which is a group of 10^{th} – 11^{th} magnitude stars in the IAU constellation Capricornus. Cseh describes it as "at first glance, it looks very similar to the M 73".
- One is Kernya 24, listed by Hungarian astronomer Gábor János Kernya, which is a group of six stars of magnitude 11.5-14.5 in the IAU constellation Triangulum. Kernya describes it as "somewhat reminiscent of M 73."

M & M Double Cluster:

This **telescopic** asterism is the pair of open clusters NGC 1528 and 1545 in the IAU constellation Perseus. These were discovered by the English astronomer William Herschel in 1790: Herschel lists the first as "VII 61" and the second as "VIII 85" in his catalogue. They are GC 820 and GC 831 in the *General Catalogue* of 1864. I'm not sure who named these side by clusters after M & M candies, but the Mars Company first released these in 1941, so it must have been named after that date and possibly refers to the many different coloured stars in these clusters. NGC 1545 is also known as the Magic Pentagram Cluster. It is also known as thee "Pride Double Cluster" (see below).

ma-šu!-u:

This Akkadian asterism "ma-šu!-u" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mulmaš-maš.

Maacik:

This Micronesian asterism is the IAU constellation Hercules.

Maalu:

This Kokatha and Ngalea star is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Leaman and Hamacher 2014).

Ma'afulele:

This Tongan star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. NOTE: They also used this name for the Large Magellanic Cloud.

Ma'afutoka:

This Tongan star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. NOTE: They also used this name for the Small Magellanic Cloud.

Maasym:

See Wrist, below.

Ma'at:

This Egyptian star is Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus as listed in the 19th dynasty Cairo Calendar (Hardy 2003). Ma'at or Ma't is Goddess of truth, justice, and harmony, who set the stars in the sky and regulates the seasons: Her name means "that which is straight".

Maazein:

This Arabic asterism is the stars Eta (η) and Zeta (ζ) Aurigae in the IAU constellation Auriga:

- "Maazein" is listed in John Hill's *Urania* in 1754. Hill describes them as "two bright stars in the arm of Auriga" who are "two young goats".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Maaz": The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- NOTE: These two stars are part of the asterism Capra and Haedi (see Kids, above).

Macaw's Egg:

This Tupi star "Ararasopiá" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (De Freita Mourão 2009) and is part of their asterism "Boiunaçu" (see Big Black Snake, above).

Mace:

One is in the IAU constellation Eridanus and is Ennis 63 on the observing list of Canadian astronomer Charles Ennis. Size 16' X 3'. The "handle" of mace is the stars HIP 21409 and Gaia DR3 2978436369533432960. The "head" of the mace is a diamond of four 9th – 10th magnitude stars including Gaia DR3 2978248932863246720 and Gaia DR3 2798248662282638976. This includes stars of Corder 711 on Jeffrey Corder's list.

Maceris:

This asterism "Maceris" is the IAU constellation Hercules and is listed in R. H. Allen's *Star Names* in 1899. Allen identifies it as a Libyan name.

Macondo:

This **telescopic** Columbian star is HIP 52521 (HD 93083) in the IAU constellation Antlia (magnitude 8.33). It was given this name in the IAU NameExoWorlds campaign. It is named for a mythical village in Gabriel Garcia Márquez's novel *Cien anos de soledad (One Hundred Years of Solitude).* It has an exoplanet named Melquíades, which is a fictional character which walks around Macondo.

Mad Dog:

This Babylonian asterism "Uridimmu" from the MUL.APIN tablets and listed as "mul ur.idim" in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Lupus.

- The "body" is an irregular oval of stars: Alpha (α), Beta (β), Delta (δ), Phi (ϕ), Psi (ψ), Gamma (γ), and Kappa (κ) Lupi, with lines running out:
- One line runs out from Gamma (γ) Lupi to HIP 78323
- One line runs out from Kappa (κ) Lupi to Zeta (ζ) Lupi.

- One line runs out from Alpha (α) Lupi to Rho (ρ) Lupi, and
- One line runs out from Psi (ψ) Lupi to Chi (χ) Lupi and then splits:
    - One line goes to Eta (η) Lupi, and
    - One line goes to Theta (θ) Lupi.

This Babylonian asterism "UR.DIM" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Lupus.

This Babylonian and Sumerian asterism "ur-idim" from the BM 78161 tablets (Liechty 1988) includes the stars Eta (η) Lupi in the IAU constellation Lepus and Zeta (ζ) 2 Scorpii in the IAU constellation Scorpius.

This Seleucid asterism identical to the Babylonian asterism Mad Dog.

Mad Goat Stars:

This Latin asterism "insana Caprae sidera" ("mad goat stars") is the Haedi asterism (see Kids above) as described by Horace. Compare this to Horrid and Insane Stars above.

Mad Star:

This Kamilaroi star "Wamba" or "Wumba" (Ridley 1875) or Euahlayi star "Womba" (Parker 1905) or "Wamba" (Fuller et al, 2014) is Alpha (α) Carinae (Canopus) in the IAU constellation Carina. This word means "crazy" and refers to a character named Weedah, who went crazy when he lost his loves and was sent into the sky.

This Euahlayi star "Wamba Wamba" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Fuller et al 2014).

Madin:

This Wardaman star is Epsilon (ε) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Maffei's Galaxies:

This telescopic asterism is two galaxies in the IAU constellation Cassiopeia which are heavily obscured by interstellar dust: Maffei 1 (SH 2-191, LBN 659, PGC 9892) and Maffei 2 (SH 2-197, PGC 1-217). They were discovered by Paolo Maffei (1926 – 2009) in 1968.

Belgian astronomers Gerard Bodifee and Michel Berger turned this into two separate **telescopic** asterisms in *The Catalogue of One Thousand Named Galaxies* (2010):

- One "Mafféia Cassiopéiae" ("Maffei's of Cassiopeia") is the interacting galaxy Maffei 1, and
- One "Mafféius Cassiopéiae" ("Maffei's of Cassiopeia") is the interacting galaxy Maffei 2.

Magellanic Clouds:

The Large and Small Magellanic Clouds are minor galaxies orbiting our Milky Way galaxy and are visible to anyone south of 20 degrees North latitude and feature prominently in 59 asterisms of the sky cultures of the world. They were first mentioned by Ibn Qutaybah (828 - 889) in his book on lunar stations. Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) mentioned them in his *Book of Fixed Stars* in 964. The first mention in Europe was in *Decades of the New World* by Italian authors Peter Martyr d'Anghiera and Andrea Corsali in the 16th century, both basing this on Portuguese voyages. This name originates in

the records of Antonio Pigafetta, who accompanied Magellan on his voyages 1519 – 1522. Robert Hues calls them the "Magellanus Clouds" in his *A Learned Treatise of Globes* in 1659. R. H. Allen lists them as "Nubeculae Magellani" ("little clouds") in his *Star Names* in 1899 and writes that the "earliest navigators" called them the "Cape Clouds". American astronomer Maria Mitchell (1818 - 1889) called them "the Magellan Patches". English astronomer John Herschel listed them as "Nubecula Major" (see below) and "Nubecula Minor" (see below). American astronomer Harlow Shapley (1885 – 1972) listed them as the Magellanic Clouds, as did Peter Doig FRAS later in the Journal BAA, 36 (3), December 1925.

Magellanic Spiral Galaxy:

This **telescopic** asterism is the one-armed Magellanic Spiral galaxy NGC 4618 (Arp 23) in the IAU constellation Canes Venatici. William Herschel listed this as "I 178" and "I 179". John Herschel originally listed it as h 1385 but later as GC 3151 and 3152 in his *General Catalogue* of 1864. The term Magellanic Spiral Galaxy is a term used to describe all one-armed spiral galaxies, which are classified as type Sm. This particular galaxy is sometimes referred to by this name.

Magellan's Spot:

"Macula Magellani" an alternate name for the Coal Sack Nebula (see Coal Sack Nebula, above). It is listed in R. H. Allen's *Star Names* in 1899 as originating "before Rear Admiral Sir. John Narborough described it in 1671", though how long before and by whom Allen does not specify.

Magic Carpet Nebula:

See Jewel Bug Nebula, above.

Magic Fountain:

See Waterfall, below.

Magic Wand:

This **telescopic** asterism is made up of stars of the IAU constellation Camelopardalis. It is Ennis 92 on the asterism list of Canadian astronomer Charles Ennis and Dezsi 10 on the list of Hungarian astronomer Attila Dezsi. It is the four stars HD 29739, Gaia DR3 500989041520393472, Gaia DR3 500988663563278848, and Gaia DR3 500985296308927744. The spiral galaxy NGC 1573 is at one end of the line next to HD 29739. Size 8'.

Magical Fish:

This German asterism is the IAU constellation Pisces. It relates to the story of Antenteh, who met two magical fish that granted her wishes. Antenteh's "tub" is the Great Square of Pegasus (see Tub, below).

Magic Mushroom:

This **telescopic** asterism is in the IAU constellation Cassiopeia. It is Laurelai 2 on the observing list of Canadian astronomer Laurel Ennis. One corner of the "mushroom cap" is the star HIP 11166A.

Magic Mushroom of Ursa Major:

This **telescopic** asterism "Psilócybe Úrsae Majóris" is the galaxy merger UGC 8696 (Markarian 273) in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the resemblance of this long-tailed galaxy with a mushroom of the genus Psilocybe”.

Magic Pentagram:

This **telescopic** asterism is the pair of open clusters NGC 1528 and 1545 in the IAU constellation Perseus. These were discovered by the English astronomer William Herschel in 1790: Herschel lists the first as “VII 61” and the second as “VIII 85” in his catalogue. They are GC 820 and GC 831 in the *General Catalogue* of 1864. This is also known as the M & M Double Cluster (see above). NGC 1545 is O’Meara 24 in Astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Magician’s Hat:

There are two **telescopic** Magician’s Hat asterisms:

- One is open cluster Pismis-Moreno 1 (Pi-Mo 1) in the IAU constellation Cepheus. Robert Zebahl lists it on his *Faint Fuzzies* webpage as the “Zaubererhut” (“Magician’s Hat”). Size 7’ X 7’. A star at the tip of the hat is HIP 110125A. This is listed on the Irish Federation of Astronomical Societies site as the “Witch’s hat”.
- One is Pothier 3 in the IAU constellation Draco. René Merting describes it on the Faint Fuzzies website: “At 45x the star pattern is immediately recognizable, around 20 medium bright stars form a pointed hat with a wide brim, three faint stars in the west stand out slightly - the tip of the hat becomes narrower mainly towards the north and ends with two stars, the brim extends from east to west, the brightest stars are in the west and north, in the south 2-3 stars are missing from the center of the brim to complete the impression - reminiscent of Pi-Mo 1, the magician's hat.” The principal stars appear to be Gaia DR3 1651501997186160896, SAO 8815, Gaia DR3 1651884485497357440, Gaia DR3 1651878167600855552, Gaia DR3 1651884313698666204, Gaia DR3 1651129606340931968 and Gaia DR3 1651124624178853888.

Magnitude Scale:

This **telescopic** asterism Ferrero 36 from the asterisms list of French astronomer Laurent Ferrero is a line of four stars of ascending magnitude in the IAU constellation Pictor: HIP 28498 (magnitude 7.4) is the brightest star at one end and the other three stars are magnitude 10.25, 10.60, and 11.55. NOTE: Hungarian astronomer Gábor János Kernya claims that his asterism Kernya 62 “the HD 22597 group… is also known as Ferrero 36”, but Kernya 62 is in Reticulum not Pictor.

Magnus Hydra:

This **telescopic** asterism “Mágnus Hýdrae” is the large spiral galaxy NGC 3200 in the IAU constellation Hydra. It was discovered by American astronomer Edward Singleton Holden in 1882. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its large size.

Mago:

This German star is HIP 24003 (HD 32518) in the IAU constellation Camelopardalis and was given this name in the IAU NameExoWorlds campaign. It was a German proposal, but the name refers to Mago

National Park in Ethiopia which is noted for its giraffes (and related to the name of the constellation). It has an exoplanet named Neri, which is a reference to the Neri River in Ethiopia.

Maggot:

This Chaldean asterism "mul tul-tum" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Magnificent Seven:

This **telescopic** asterism is HII region is NGC 249 in the IAU constellation Tucana. It was discovered by English astronomer John Herschel in 1847. This is listed as GC 134 in the 1846 *General Catalogue*. It is named for a 1960 American western film by this name, which features seven characters hired to protect a small village. These are nebulae within the Small Magellanic Cloud.

Magum:

This Wardaman star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Major (Cairns and Harney 2003).

Mahasim:

See Wrist, below.

Mahi:

This Persian asterism is the IAU constellation Pisces as listed in John Hill's *Urania* in 1754.

Mahsati:

This **telescopic** Azerbaijani star is HIP 82651 (HD 152581) in the IAU constellation Ophiuchus (magnitude 8.35). It was given this name in the IAU NameExoWorlds campaign. It is named for the poet Mahsati Ganjavi. It has an exoplanet named Ganja, which was an ancient capital of Azerbaijan.

Mahua Tree:

This Kolam asterism "Irukmara" or "Ipamaka" is the IAU constellation Crux (Vahia 2014).

This Gond asterism is the IAU constellation Crux (Vahia 2014).

NOTE: This is the Madhuca longifolia, a tropical tree found in India, Nepal, Myanmar, and Sri Lanka.

Mahuwkaye:

This Palikur asterism is the belt and sword of Orion in the IAU constellation Orion (Green and Green 2011). He is the pilot of Kusuvwi Isamwitye (see Kusuvwi the Younger Brother, above) and the rest of Orion is his boat.

Maia:

This Greek star is 20 Tauri in the Pleiades cluster in the IAU constellation Taurus. Maia is one of the Pleiades sisters in Greek mythology:

- Variations include "Mea", "Maja", and "Majja".

- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Maia" for this star.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Maia" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Maia".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Maia" for this star.
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Maia".
- The IAU approved the name Maia for the star 20 Tauri.

Maia Nebula:

This **telescopic** asterism is HII region is NGC 1432 (vdB 21, LBN 771, Ced 19f) in the Pleiades cluster in the IAU constellation Taurus. It is named this as it contains the star Maia (see above).

Maiawa:

This Kiribati star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Trussel and Groves 1978). Maiawa is a female mythological character.

Maid:

This star "Ancilla" (Latin for "maid") is Eta (η) Ursae Majoris (Alkaid) in the IAU constellation Ursa Major and is part of the asterism Bier of Lazarus, which appears in the star atlas Coelum Stellatum Christianum by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in John Hill's *Urania* in 1754.

Maiden:

This Greek asterism "Παρθένος" or "Parthenos" ("maiden" or "virgin") is the IAU constellation Virgo as originally described by Ptolemy (c.100 – c.170) in his *Almagest*. Indian astrologer Varāhamihira (c. 505 – c. 587) listed it as "Parthena", "Partina", and "Pathona". 5th century Greek poet Nonnus called it "σταχυώδης Κούρη" ("stachyódis Koúri" or "wheat bearing maiden"), later latinized to "Spicifera Virgo Cereris", and the "Virgo spicea munera gestans" ("Maiden carrying spicy gifts") of 1st century astrologer Marcus Manlius. Johann Bayer's *Uranometria* (1603) lists "Spicifera Dea"

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Parthenos as a name for this constellation. This is how Ptolemy imagined her:

- Her "head" is the quadrilateral of stars 8 Virginis, Omicron (ο) Virginis, Xi (ξ) Virginis, and Nu (ν) Virginis,
- Her upper "body" is a pentagon of the stars 8 Virginis, Eta (η) Virginis, Gamma (γ) Virginis, Delta (δ) Virginis, and 32 Virginis,
- Her lower "skirt" is a quadrilateral of the stars Delta (δ) Virginis, Gamma (γ) Virginis, 76 Virginis, and Zeta (ζ) Virginis,
- One "leg" runs from Zeta (ζ) Virginis to a "knee" at Phi (φ) Virginis and a "foot" at Mu (μ) Virginis,
- One "leg" runs from 76 Virginis to a "knee" at Kappa (κ) Virginis and a "foot" at Lambda (λ) Virginis,
- One "wing" is the four stars 32 Virginis, Rho (ρ) Virginis, Epsilon (ε) Virginis, and Tau (τ) Virginis,

- Another “wing” is the three stars Eta (η) Virginis, Psi (ψ) Virginis, and Beta (β) Virginis, and
- She has one “arm” that runs from Eta (η) Virginis to Alpha (α) Virginis (Spica), which Ptolemy calls the “ear of grain”.

NOTE: This Greek asterism appears on the *Daressy Zodiac* of the Roman Imperial Period next to a walking lion. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “chimar in the Almagest” as the stars Theta (θ), Iota (ι), and Kappa (κ) Virginis and calls this “the skirt of the garment”.

There are two Arabic asterisms with the name “Maiden”:

- One, “Qabl Alzawaj” (قبل الزواج), is the IAU constellation Virgo.
- One, “al-ʿadhārā”, later latinized to “Al Zara” is the star Omicron (ο) 2 Canis Majoris in the IAU constellation Canis Major. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “El Zára, the virgins”.

This Seleucid asterism, also known as “Shala” is made up of stars in the IAU constellations Coma Berenices, Crater, and Virgo and replaces an earlier and much smaller asterism in Babylonian sky lore, “AB.SIN” (see Furrow, above). Shala is a Mesopotamian Goddess of weather and grain and the wife of their weather God Adad. This is a large asterism with several parts:

- The “head” is an irregular oval of stars roughly resembling a head: The “chin” is Epsilon (ε) Virginis and then the line runs around through HIP 64823, Alpha (α) Comae Berenices (Diadem), 36, 27, and 29 Comae Berenices, to 34 Virginis and Rho (ρ) Virginis the last three stars resembling a fall of hair,
- The “neck” is the quadrilateral of stars HIP 63221A and 63081A, and 41 and 33 Virginis,
- The “upper torso” is an oval of stars: HIP 63221A, 33 Virginis, HIP 61103, 16 Virginis, Eta (η) Virginis, Gamma (γ) Virginis, and Delta (δ) Virginis,
- Her “lower torso” is a five-sided figure of the stars 25, Gamma (γ), and Eta (η) Virginis and HIP 57791 and 59273,
- Her “skirt” is a quadrilateral of stars: HIP 57791 and 59273 and 14 and Zeta (ζ) Crateris,
- Her “left leg” is a line between two stars: Gamma (γ) Crateris and HIP 56901,
- Her “right leg” is a line between two stars: Delta (δ) and Kappa (κ) Crateris,
- Her “arm” runs from Delta (δ) Virginis to an “elbow” at Theta (θ) Virginis and a “hand” at 74 Virginis, and
- From the “hand’ at 74 Virginis four lines of stars run out to form an “ear of grain” that she is holding:
    - One line runs out through Zeta (ζ) Virginis to 78 Virginis,
    - One line runs to 89 Virginis,
    - One line runs to 69 Virginis, and
    - One line runs through Alpha (α) Virginis (Spica) to 55 Virginis.

This Egyptian Dendera asterism is made up of stars of the IAU constellation Virgo (Hoffman 2017) and is influenced by the earlier Seleucid asterism Shala (see Maiden), although it is oriented differently:

- Her “head” is the quadrilateral of the stars Pi (π) Virginis, Omicron (ο) Virginis, Xi (ξ) Virginis, and Nu (ν) Virginis.
- Her “upper body” is a pentagon starting at the “neck”, Pi (π) Virginis, and running through a “shoulder” at Eta (η) Virginis to a “waist” of the stars Gamma (γ) and Delta (δ) Virginis, to a “shoulder” at 32 Virginis and then back to the “neck”.
- Her “lower body” is the quadrangle of the stars Gamma (γ) Delta (δ), 76 and Zeta (ζ) Virginis,

- One “leg” runs from a “hip” at Zeta (ζ) Virginis to a “knee” at Phi (ϕ) Virginis to a “foot” at Mu (μ) Virginis.
- One “leg” runs from a “hip” at 76 Virginis to a “knee” at Kappa (κ) Virginis to a “foot” at Lambda (λ) Virginis.
- One “arm” is the triangle of stars Eta (η) Virginis, Beta (β) Virginis (Zavijava), and Psi (ψ) Virginis.
- One “arm” is the quadrilateral of stars 32 Virginis, Rho (ρ) Virginis, Epsilon (ε) Virginis, and Tau (τ) Virginis.
- Near her “left hand” (Psi (ψ) Virginis) is the “Ear of Grain”, Alpha (α) Virginis (Spica).

This Anglo-Saxon asterism “Mæden” is the IAU constellation Virgo.

This Anglo-Norman asterism “Pulcele” is the IAU constellation Virgo.

This Attic asterism “Κόρη” (“Kóri”) is the IAU constellation Virgo.

This Tamil asterism “Kauni” is the IAU constellation Virgo as listed in R. H. Allen’s *Star Names* in 1899. English orientalist Thomas Hyde (1636 – 1703) listed it as “Kannae”.

Maiden in the Ring Dance:

There are two Romanian stars callled “Fata Mare din Horă” (“Maiden in the Ring Dance” or “Maiden from the Ring Dance”):

- One is Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis (Ottescu 2009). This is part of their asterism Ring Dance (see above).
- One is Gamma (γ) Coronae Borealis in the IAU constellation Corona Borealis (Ottescu 2009). This constellation is called the Ring Dance (see below).

Maiden Star:

This Lithuanian star “Mergaitė” or “Žvaigždė Mergos” (“Maiden Star”) is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Maidenhead of Al Jawza’:

This Arabic asterism “‘udhrat al-jawza’” (عذرة الجوزاء) is a group of stars with a reddish one in the middle in the IAU constellation Canis Majoris, which next to their asterism Al Jawza’ (see above). It was listed as far back as the poetry of Muhalhil (d. 553 C.E.). This is the stars Delta (δ), Epsilon (ε), Eta (η), Omicron (ο) 2, and Sigma (σ) Canis Majoris (Adams 2016).

Maids in Waiting:

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty using the name “i Yunü “:

- One is a quadrilateral of stars in the IAU constellation Draco: 35, 50, and 59 Draconis and HIP 90647.
- One is the star 31 Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

This Chinese xing guan “Yùnǚ” (御女） is a quadrilateral of stars in the IAU constellation Draco: Tau, 44, 50, and 29 Draconis.

This Chinese Chenzhuo xing guan “Nuyu” is the star 31 Leonis in the IAU constellation Leo.

Mailap:

This Satawalese, Puluwatese, and Woleaian, star “Mailap” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Holton et al 2015). It is also used to describe the three stars Altair, Gamma (γ) Aquilae and Beta (β) Aquilae (Alshain). NOTE: This has been translated by several in the past as “big bird”, but Holton et al showed that this isn’t correct and that it is more likely to refer to the navel.

Maire:

This Kiribati asterism is the IAU constellation Ursa Major (Trussel and Groves 1978). NOTE: This is also listed as the name of an unidentified star in this constellation. It is also a Kiribati word meaning “mile”.

Maisie’s Galaxy:

This telescopic asterism is the galaxy CEERS J141946.36+525632.8 in the IAU constellation Boötes. It was discovered in 2022 by the James Webb Space Telescope and existed 390 million years after the beginning of the universe. It was names after the nine year old daughter of the person who discovered it, Steven Finklestein.

Maiwi:

This Carib star represents a kidnapped girl who ends up in the sky. Its present location is unknown (Magaña, and Jara, 1982).

Majestic of Boötes:

This **telescopic** asterism “Augústa Boótis” is the barred spiral galaxy IC 983 (Arp 117) in the IAU constellation Boötes. It was discovered by French astronomer Stéphane Javelle in 1891. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this distant giant galaxy dominates its entire neighbourhood.”

Major Cross:

This asterism “Crux Maior” is made up of stars of the IAU constellation Cygnus. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. The upright of the cross runs from Alpha (α) Cygni (Deneb) through Gamma (γ) Cygni to Beta (β) Cygni (Albireo). The crosspiece runs from Epsilon (ε) Cygni through Gamma (γ) Cygni to Delta (δ) Cygni. As in early Christian art the Greek letters Alpha (α) and Omega (ω) are often depicted to either side of the cross, Gregory has placed the asterisms “Alpha” (see above) and “Omega” (see below) to either side of this asterism. Compare this to the Northern Cross (see below).

Major Little Cloud:

In 1603 German astronomer Johann Bayer (1572-1625) gave the name “Nubecula Major” to the Large Magellanic Cloud.

This German asterism “nubecula major” is the Large Magellanic Cloud as listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* in 1603. Nubecula is Latin for “little cloud”, so this name seems to translate as “major little cloud”:

- "Nubecula major" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Nubecula Major" and depicts it as a cloud.
- It is listed as "Nubecula Major" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this as "Nebula Major" in his *Celestial Atlas* in 1822.
- This asterism is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) with the abbreviated title "Nubec Major": He indicates the borders of this constellation on the chart but offers no illustration of it.
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Nubecula Major".

Major Wild Beast:

This French asterism "Fera Major" is the IAU constellation Ursa Major as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Makahea:

This Māori star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Makali'i's Rainbow Nets Hung Above:

This Hawaiian asterism "Huihui-koko-a-Makali'i-kau-i-luna", also known simply as "Makali'i'" ("chief's eyes" or "little eyes" or "little stars") is the Pleiades cluster in the IAU constellation Taurus.

Makarajyoti:

This Malayalam star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Makgala:

This Tswana star is probably Alpha (α) Leonis (Regulus) in the IAU constellation Leo.

Making Sound:

This Latin asterism "Sonans" is the IAU constellation Cepheus. Compare this to Shouter (below) and Singing (below).

Male Brolga:

This Boorong asterism "Kourt-chin" refers to the brolga (a species of wetland bird) and was listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010). This asterism is made up of stars of the IAU constellations Tucano and Hydrus with the Small Magellanic Cloud in the middle. The wing tips are the stars Beta (β) Hydri and Kappa (κ) Tucanae. See Female Brolga (above) for the other half and compare this to the Kamilaroi asterism Brolga (see above).

This Weilwan asterism is the IAU constellation Orion. It was put into the sky by the hero Baayami after a fight in which the Sun was created.

Male Camel:

This Arabic star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. The Hyades cluster of which this star is a corner is the "Young She Camels" (see below). It is also known as The Camel Herder (see above).

Male Genitals:

This Ainu Nociw ("asterism") "ci neno an nociw" (チ ネノ アン ノチゥ) is made up of stars of the IAU constellation Virgo. Alpha (α) Virginis (Spica) is the tip of the penis.

Male Eland:

This /Xam star is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (Slotegraaf 2013, Alcock 2014).

Male Giraffe:

This G/wi and //Gana asterism is Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Alcock 2014).

Male Giraffes:

To the Venda this asterism "Thuda" is the stars Alpha (α) Crucis (Acrux) and Beta (β) Crucis (Mimosa) in the IAU constellation Crux. It is part of their asterism Little Giraffes (see above).

This Nyae Nyae !Kung asterism is the Pointer Stars, Alpha (α) Centauri (Rigil Kentaurus) and Beta (α) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers below).

Male Hartebeest:

This /Xam star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Slotegraaf 2013). He is the mate of the Female Hartebeest (see above).

Male Horse:

This Latin asterism "Equus Masculus" is the IAU constellation Lupus as listed by German astronomer Johann Bayer (1572-1625) in his *Uranometria* (1603).

Male Hyena:

There are two Arabic stars with the name "Al Dhih":

- One is the star Alpha (α) Draconis (Thuban) in the IAU constellation Draco and was listed under this name by the 16th century Arabic astronomer Al Tizini.
- One is the star Iota (ι) Draconis in the IAU constellation Draco as named by Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).

Male Lions:

This /Xam asterism is the Pointers, Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (Slotegraaf 2013). They were once men, named !Gu and !Haue ta ≠ hou, but a magical girl turned them into stars.

Male Llama:

This Inca asterism “Urcochillay”, “Urcuchillay”, or “Urquchillay” is supposed to be near their asterism “Catachillay” (“Female Llama”, see above). It is described in ancient documents as an asterism with a “T” form. Some ethnoastronomers have suggested that it is the IAU constellation Lyra: Brosseder (2010) suggests that it is Alpha (α) Lyrae (Vega). Gamarra (2009) suggests that it is the star Alpha (α) Lyrae (Vega) and that Catachillay is Alpha (α) Cygni (Deneb). However, this is about 90 degrees away in the sky, so it is more likely to be the Southern Cross in Crux (see Southern Cross below) as this would put it next to one version of Catachillay. It is also described as a llama (or sheep) of many colours.

Male Revolving One:

This Diné asterism “Náhookǫs Bi’ką” or “Na´hookos bika’ii” is part of their three-part asterism “Náhookǫs”, the other two parts being “Náhookǫs Bi’áád” (see Female Revolving One, above), and Náhookǫs Bikǫ’ (see Central Fire of Náhookǫs, above). It is made up of stars of the IAU constellations Draco, Ursa Major, and Canes Venatici (Childrey 2008):

- His “body” is the “bucket” of the Big Dipper asterism (see Big Dipper, above) extended out to the stars Epsilon (ε) Ursae Majoris (Alioth) and 5 Canum Venaticorum,
- His “head” is a rectangle of stars with Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor) in one corner, 86 Ursae Majoris in the next corner, Eta (η) Ursae Majoris (Alkaid) in the next corner, and 21 Canum Venaticorum in the last corner,
- His “hands” are the stars Alpha (α) Canum Venaticorum (Cor Caroli) and Alpha (α) Draconis (Thuban), and
- His “feet” are the stars Theta (θ) and 4 Ursae Majoris.

Of course, this asterism has this name because it revolves around the Hearth Fire “Náhookǫs Bikǫ’” (see Central Fire of Náhookǫs, above) represented by the star Alpha (α) Ursae Minoris (Polaris).

Male Steenbok:

This G/wi star “g≠eikxaoma” is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Slotegraaf 2013, Alcock 2014, Holt and Slotegraaf 2022). This is part of their asterism Steenboks (see below).

Male Tortoises:

This /Xam (San) asterism is the belt of Orion in the IAU constellation Orion.

Male Twin of Cetus:

This **telescopic** asterism “Geméllus Céti” is the lenticular galaxy NGC 275 (Arp 140) in the IAU constellation Cetus, which is interacting with NGC 274. It was discovered in 1785 by English astronomer William Herschel who listed it as III 429. It is GC 157 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Mali:

This Lokono (Arawak) star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Majoris (Rybka 2018).

Malin 1:

This **telescopic** asterism is a giant low surface brightness spiral galaxy in the IAU constellation Coma Berenices. It was discovered by British-Australian astronomer David Malin in 1986 and was the first LSB galaxy identified.

Malirubana:

This Carib star "Malirubana" or "Maliroubana" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Magaña, and Jara, 1982). It is believed to cause hurricanes. It is also known as the Star of the Spaniards (see below).

Mallee Fowl:

This Boorong star "Neilloan" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra as listed by Stanbridge (1857), Morieson (1999), Hamacher and Frew (2010), and Hamacher and Norris (2011). The Boorong used this star to indicate the breeding season of this bird (Leipoa ocellata). Neilloan is considered to be the mother of Totyarguil (see Purple Crowned Lorikeet, below). The rising of this star marks the time when these birds are nesting, and when these people collect their eggs.

This Wotjobaluk star "Neil-loan" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra (Hamacher 2011).

Malmok:

This **telescopic** Aruban star is WASP 39 in the IAU constellation Virgo (magnitude 12.11). It was given this name in the IAU NameExoWorlds campaign. It is an indigenous name for Palm Beach, a popular resort there. It has an exoplanet named Bocaprins, which is a secluded beach with white dunes in Arikok National Park.

Malnga:

This Wardaman star is Zeta (ζ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Malphelearti:

This Chaldean asterism is the IAU constellation Corona Borealis as listed in John Hill's *Urania* in 1754.

Malta:

This asterism "Malta" is made up of the stars of the IAU constellation Musca by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. This represents Malta and is depicted as a Maltese cross.

Malus:

See "Mast" (below).

Malus Cluster:

This asterism is the open cluster NGC 2547 in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1751 who listed it as Lac III 2 in his catalogue. It is GC 1636 in the *General Catalogue* of 1864. It is also known as the Golden Earring (see above), "T" (see below), and Saint Peter's Cross (see below). NOTE: It got this name as it is near the obsolete constellation "Pyxis Nautica" created by Lacaille: "Malus" is Latin for "mast" (see Mast, below). Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 40.

Malÿtje:

This Chakavian asterism is the Hyades cluster in the IAU constellation Taurus.

Mamahi Magrib:

This Sama navigational star has not yet been identified (Ambrosio 2008).

Mamahi Satan:

This Sama navigational star has not yet been identified (Ambrosio 2008).

Mamahi Uttara:

This Sama star "Mamahi Uttara" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Ambrosio 2008, Santos et al 2019).

Mamangi-Halahu:

See O-nga-tangata below.

Mammoth of Leo:

This **telescopic** asterism "Mammúthus Leónis" is the spiral galaxy NGC 3646 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "III 15". It became GC 2389 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its size.

Man:

This Romanian asterism "Omel" or "Omul" is the IAU constellation Hercules (Ottescu 2009, Lite, Lodina, and Ignat 2018). He is a "Făt-Frumos" ("Beautiful Boy"): The Beautiful Boys are the only ones with enough strength to fight the Balaurul (see Dragon, above).

This Kiribati star "Nonoaba" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Trussel and Groves 1978).

This American asterism is made up of stars of the IAU constellation Boötes and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). This is an "hourglass" shaped figure which represents the "burning man" of this event:

- One side is the line of the three stars Zeta (ζ), Epsilon (ε) and Delta (δ) Boötis,
- One side is the line of the three stars Eta (η), Rho (ρ), and Gamma (γ) Boötis, and
- The "fire" under the "burning man" is the star Alpha (α) Boötis (Arcturus).

Man, a Dog, and a Buck:

This San (!Xõ, !Xu) asterism is the belt of Orion in the IAU constellation Orion (Slotegraaf 2013).

Man and His Family:

This Asháninka asterism is the Pleiades cluster in the IAU constellation Taurus (Urton 2016). His brother-in-law is the belt and sword of Orion (see Brother in Law, above).

Man Ati:

This Kiribati star “Man Ati” is Beta (β) Orionis (Rigel) in the IAU constellation Orion (Trussel and Groves 1978).

Man Atop a Dragon:

This Japanese sei shuku or lunar station “Nuriko Boshi” appears in the “Painting of the Deities Forms of the Five Planets and Twenty-Eight Lunar Stations” (五星二十八宿神形図) as a man atop a dragon (Kotyk 2018). See Willow, below.

Man Atop Two Fish:

This Japanese sei shuku or lunar station “Hatsui Boshi” appears in the “Painting of the Deities Forms of the Five Planets and Twenty-Eight Lunar Stations” (五星二十八宿神形図) as a man atop two fish (Kotyk 2018). See Encampment, above.

Man Eating Bird:

This Hawaiian asterism “Halulu” is the IAU constellation Phoenix. Halulu was a man-eating bird in the mythology of the heiau at Kuanolū, Lāna’I, and Puna in Hawaii.

Man Eating Serpent:

See Dragon, above.

Man in a House:

This Palikur asterism “Uwakti” is the Great Square of Pegasus in the IAU constellation Pegasus (Green and Green 2011). The square of Pegasus is the “house” and the stars inside the are the man.

Man of Death:

This Euphratian star “Nitaχ-bat” is Epsilon (ε) Ophiuchi in the IAU constellation Ophiuchus as listed in R. H. Allen’s *Star Names* in 1899.

This Akkadian asterism “Muluabat” is the stars Epsilon (ε) and Zeta (ζ) Ophiuchi in the IAU constellation Ophiuchus as listed by R. H. Allen in his *Star Names* in 1899.

Man of Fire:

This Akkadian asterism “Mulu-izi” is two stars in the IAU constellations Libra and Virgo: Delta (δ) Librae and Mu (μ) Virginis. This is listed in R. H. Allen’s *Star Names* in 1899.

Man on a Horse:

This Japanese sei shuku or lunar station “Mi Boshi” appears in the “Painting of the Deities Forms of the Five Planets and Twenty-Eight Lunar Stations” (五星二十八宿神形図) as a man mounted on a horse (Kotyk 2018). See “Basket” above.

Man Pursued:

The Asháninka see the IAU constellation Orion as a man with an arrow in his leg pursued by a warrior wasp (Urton 2016).

Man Shot in the Back (For Stealing Rabbit Snares):

This Dene asterism “Yehdaa” is made up of the stars of the IAU constellations Boötes and Ursa Major:

- The man's "head" is the bucket and his "body" the handle of the Big Dipper asterism (see Big Dipper, above),
- An "arm" runs from Alpha (α) Ursae Majoris (Dubhe) out to Omicron (ο) Ursae Majoris,
- Another "arm" runs out from Beta (β) Ursae Majoris (Merak) to Theta (θ) Ursae Majoris,
- Two legs run out from Eta (η) Ursae Majoris:
    - One runs to a "knee" at Gamma (γ) Boötis and a "foot" at Rho (ρ) Boötis, and
    - One runs to a "knee" at Beta (β) Boötis (Nekkar) and a "foot" at Delta (δ) Boötis.

Compare this with the Gwich'in asterism, "Yahdii" (see Tailed Man, below).

Man Striding:

This Arabic star "sieu Goei" or "Kwei" ("man striding" or "striding legs") is Beta (β) Andromedae (Mirach) in the IAU constellation Andromeda as listed in R. H. Allen's *Star Names* in 1899. He gives the older name "Kwet".

Man Throwing Spears Into the Sky:

This Kaurna asterism "Monana" was listed by Hamacher in 2015, although the stars involved have not yet been positively identified. Clarke (2009) lists Monana and his brother Waiyungari as throwing spears into the sky to create a ladder to ascend to the stars (see Waiyungari, above).

Man with Animal:

This Egyptian Dendera asterism is the stars of the IAU constellation Cassiopeia (Hoffman 2017). It depicts a man in an Egyptian kilt with his hand on the head of a four-legged animal beside him.

Man With Club:

This "Greek" asterism "Corynetes" or "Corynepheros" is the IAU constellation Hercules as listed in John Hill's *Urania* in 1754.

Man With Solid Stance:

This Diné asterism "Hastiin Sik'ai'ı́" or "Hastiin Sik' Aíí" ("man with solid stance", "man with feet apart" or "man with legs ajar") is a figure made up of the stars of the IAU constellations Crater, Centaurus, Corvus, Hydra, and Virgo (Childrey 2008):

- His "body" is an hourglass shape made up of the stars Beta (β) Corvi (Kraz), Epsilon (ε), Delta (δ), and Gamma (γ) Corvi and 14 and 26 Virginis,
- One "arm" runs from 26 Virginis to an "elbow" at Theta (θ) Virginis and a "hand" at Gamma (γ) Virginis,
- His other "arm" runs from 14 Virginis to Theta (θ) Crateris, and
- His "head" is the faint stars between Gamma (γ) Virginis and his "shoulders".

Man With Spear:

The Amahuaca see the Hyades cluster as the jaw of a caiman that bit off the leg of a man who mistook it for a canoe. His leg is the Pleiades cluster and the belt and sword of Orion is the man's brother holding a spear to kill the caiman.

Man With Yoke Carrying Crops:

This Sesivi (Daakaka) asterism, "Évévéo an man" is the IAU constellation Orion (Ramík 2019).

This Olal (Abrym) asterism is the IAU constellation Orion.

Man Without a Thigh:

This Lokono or Arawak asterism "Mabukuli" is the IAU constellation Orion (Rybka 2018).

Managé a Trois:

See "3" (Pakan's 3), above.

Managed Three:

This is Randy Pakan's name for Pakan 3 on his list of **telescopic** asterisms. It usually is listed on telescopic asterism lists as "Pakan's 3" (see above) but in his notes in his Midnight Ramblings 1A notebook on 24 February 1989 he called it "Managé a Trois". It is a backwards "3" made up of 8th to 9th magnitude stars 3 degrees southwest of the open cluster Messier 50 in the IAU constellation Monoceros.

Manako-tea:

This Māori asterism is the Large Magellanic Cloud. Orchiston (2017) lists it as one of the Magellanic Clouds.

Manako-uri:

This Māori asterism is the Coal Sack Nebula (see Coal Sack Nebula, above) or the Small Magellanic Cloud (Orchiston 2017).

Manannán mac Lir:

This Celtic (Irish) asterism may be the IAU constellation Pegasus. Manannán mac Lir, who appears in Welsh mythology as Manawydan fab Llŷr is a warrior king of the Tuatha Dé Danaan who is viewed as a God of the Sea (Mosenkis, date N/K).

Manatee:

This Múra asterism is the Coal Sack Nebula in the IAU constellation Crux (Urton 2016). They see it as a fisherman riding a manatee.

This Tupi asterism "Juaraúa" is the IAU constellation Crux (De Freita Mourão 2009). The manatee is being chased by their asterism "Piracaçaras" (see Fishermen, above).

This Tupi Guarani asterism "Peixe-Boi" (Amazonian manatee) is the Coal Sack Nebula in the IAU constellation Crux (Lima and De M. Figueirôa, 2007. It is being chased by two fishermen (see Fishermen, above).

Manatee Nebula:

This **telescopic** asterism is supernova remnant W50 (SNR G039.7-02.0) is in the IAU constellation Aquila.

Mandolin:

See Poskus 1 under Flyswatter, above.

Mandrill Nebula:

This **telescopic** asterism is the HII region NGC 2467 (SH 2-311, RCW 16, LBN 1065, Cr 164, Ced 103) in the IAU constellation Puppis. This was discovered by English astronomer William Herschel in 1784 who

listed it as "IV 22" in his catalogue. It is GC 1589 in the *General Catalogue* of 1864. It is also known as the Chained Broach Nebula (see above). This is O'Meara 39 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007), where the names "Skull and Crossbones Nebula" and "Mandrill Nebula" are listed. It is also known as the "Chained Broach Nebula" (see above) and the "Death's Head Nebula" (see above).

Mane:

There are three Arabic asterisms with this name:

- One is the Arabic and Bedouin manzil "Al-Zubrah" (الزبرة) or "ٱلزُّبْرَة) and is in the IAU constellation Leo: This is the stars Delta (δ) Leonis (Zosma) and Theta (θ) Leonis (Chertan). This was also known as Space Between the Shoulders of the Lion (see below):
    - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name "faqār al-asad" and the Hebrew name "shidrat ha-ari" for Delta (δ) Leonis.
    - An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "faqār al-asad" and the Hebrew name "shidrat ha-aryeh".
    - Dorn (1829) lists this as "Hair of the Lion's Mane" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-zubra" for Delta (δ) Leonis.
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al zubra, the mane or hair on the lion's back".
    - W. Brennand lists this as "Al-Zubra" in his *Hindu Astronomy* in 1896.
- One is the Arabic star "Zubrah" is 72 Leonis in the IAU constellation Leo.
- A latinized version of this name, "Subra", was approved by the IAU for the star Omicron (ο) Leonis.

This Yemeni manzil "Zubra" is the stars Delta (δ) Leonis and Theta (θ) Leonis in the IAU constellation Leo (Varisco 1995). This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Maned Snake:

This Boorong asterism "Mindi" is the dark nebulosity between the IAU constellations Crux and Vela in the Milky Way.

Manes of Crater:

This **telescopic** asterism "Jubátus Cratéris" is the lenticular galaxy NGC 3511 in the IAU constellation Crater. It was discovered in 1786 by William Herschel who listed it as "V 39". It became GC 2294 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as the "apparent extensions at the northern edge [look] like manes flowing in the wind".

Mangali:

This Wardaman star is Eta (η) Tauri in the Pleiades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Manger:

This asterism is the open cluster Messier 44 (NGC 2632), found in the IAU constellation Cancer (see Beehive, above). The ancient Greeks saw it as a manger from which two donkeys, the adjacent stars (Delta (δ) Cancri (Asellus Borealis) and Gamma (γ) Cancri (Asellus Australis)) are eating. Other ancient cultures saw it as the Gate of Men:

- This Greek asterisgum "Φάτνη" or "Fátni" appeared in the writings of Aratus (315 – 240 B.C.E) and Eratosthenes (d.194 B.C.E.) and as "Φάτνης" or "Fátnis" by Ptolemy (c.100 – c.170).
- It was later latinized to "Praesepe" or "Asselli and Praesepe" "Praesaepe", "Praesaepes", "Praesaepis", "Praesaepia", and "Praesaepium".
- The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Praesepium".
- It was translated as "al-Mi'laf" by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- It appears in the 15th century *Alfonsine Tables* as "Presepe"
- "Praesepe" appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "middle star in the cloud in the chest [of Cancer]".
- German astronomer Johann Bayer (1572-1625) lists it as "Pesebre".
- "Praesepe" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Edward Sherburne lists it as "Praesepe" in his *Sphere of Marcus Manilius* in 1675.
- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) lists this star as "Præsepe".
- John Hill lists this asterism as "Aselli", "Phatra", and "Himaran" in his *Urania* in 1754.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this cluster as "Praesepe". Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this cluster as "die Krippe" ("the manger") and "Praesepe".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Praesepe" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Praesepe".
- The 1864 General Catalogue lists this as GC 1681, and John Herschel lists it on his catalogue as h 517.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Praesepe": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- It is listed as "Praesepe" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as "Praesepe".
- Dreyer lists it in the New General Catalogue of 1888 as NGC 2632 and labels it "Praesepe Cancri".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Manger" and as "Praesepe".
- William Denning's *Telescopic Work for Starlight Evenings* (1891) lists this as "Praesepe".

- American astronomer Winslow Upton's *Star Atlas* (1896) lists "Praesepe" as a "cluster in Cancer".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this as "Presepe".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) lists this cluster as "Praesepe".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this cluster as "Praesepe".

There are two Arabic asterisms with this name:

- One, "Ma'laf" is open cluster Messier 44 in the IAU constellation Cancer:
    - "Ma'laf" is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-ma'laf".
    - Dorn (1829) lists this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - "Mellef vel Mallephon" are names listed for this cluster in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "al ma'laf, a stall or den".
- One is, "al-ma'laf", later latinized to "Al Malaf" which is the stars Gamma (γ), Delta (δ), Epsilon (ε), Zeta (ζ), Eta (η), and Theta (θ) Crateris in the IAU constellation Crater:
    - German astronomer Johann Bayer (1572-1625) listed it as "Mellef".
    - Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Meeleph".
    - John Hill listed "Malaph" in his *Urania* in 1754.
    - German astronomer Wilhelm Schickard (1592 - 1635) listed it as "Mellephon".
    - John Chilmead (1899) listed it as "Melef".
    - NOTE: John Hill also lists it as "Alphun" (Latin for "alpha") in his *Urania* in 1754: Hill identifies it as the constellation Crater and a name used by German Jesuit astronomer Athanasius Kircher (1602 – 1680). Elsewhere in *Urania* Hill gives the name "Malaph" as "the Arabic name… [which] signifies, in that language, a manger", which is clearly a reference to the other version of this asterism above. Edward Sherburne also identifies the name "Alphun" with the constellation Crater and not the asterism in his *Spheres of Marcus Manilius* in 1675.

This "Chaldean" asterism "Pesebre" is the IAU constellation Cancer as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

This Lithuanian asterism "Manege" is the IAU constellation Ursa Major.

This **telescopic** asterism is the cluster NGC 1881 in the IAU constellation Dorado. It was discovered by English astronomer William Herschel in 1838. It is GC 1090 in the General Catalogue of 1864. It was listed as a "Telescopic Praesepe" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.

Manger Donkeys:

This Hungarian asterism “Jászol szamárkák” is probably the open cluster Messier 44 (NGC 2632), found in the IAU constellation Cancer The celestial map of Hungarian uranographer Sandor Nagy (1915) depicts this asterism as two donkeys eating from a raised feeding trough. NOTE: Nagy’s 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky.

Manger of the Infant Saviour:

This German asterism “Praesepe Salvatoris” is the IAU constellation Lyra as listed in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. He saw it as the Manger of the infant Jesus with an Ass and Ox standing by. It was part of his asterism “St. John the Baptist” (see John, above). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Praesepe XPI Alias Lyra”. John Hill lists it in his *Urania* in 1754, as does R. H. Allen in his *Star Names* in 1899. Edward Sherburne simply lists it as “Manger” in his Sphere of Marcus Manilius in 1675. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 also simply lists “Manger”.

Manokalanipo:

This Hawaiian star is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda.

Man’s Rack:

This Barasana asterism “Masu Ya Kasabo” is the Hyades cluster in the IAU constellation Taurus (Hugh-Jones 2006). It is also known as “Wai Kasabo” (see Fish Grill, above) and “Timia Ya Kasabo” (see Otter’s Rack, below).

Mansion of Acclamation:

This Coptic lunar mansion “Akubia” is made up of stars in the IAU constellation Virgo. W.B. Yeats lists it as “Mansion of Acclamation” in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, where Kircher lists it as “statio latrantis” (“barking station”) and “forsan à Canicula” (“perhaps from Sirius”), probably because of the name, but both list it as stars in Virgo. In his *Star Names* in 1899 R. H. Allen listed it as identical to the Arabic manzil “al-ʿAwwāʾ” (whose meaning is uncertain, but may be “barking dog” or “the bend”), which is the stars Beta (β) Virginis (Zavijava), Gamma (γ) Virginis, Eta (η) Virginis, Delta (δ) Virginis, and Epsilon (ε) Virginis (see Howling Dogs above) and “Al Nahrān” (see Two Rivers, below). Allen translated the name as “two rivers” as a result.

Mansion of Chastity:

This Coptic lunar mansion “Aggia” or “Angia” is the stars Theta (θ) and Xi (ξ) Ophiuchi in the IAU constellation Ophiuchus. It is identified under the name “magician” in R. H. Allen’s *Star Names* in 1899. Aggia is now used as a name for the star Xi (ξ) Ophiuchi.

This Sogdian asterism “Wajrik” is the stars Theta (θ) and Xi (ξ) Ophiuchi in the IAU constellation Ophiuchus. It is identified by this name in Richard H. Allen’s *Star Names* in 1899.

Mansion of Delight and Favour:

This Coptic asterism “Ni-mamreh” is made up of stars in the IAU constellation Sagittarius as listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as “Statio Gratiae” (“Station of Grace”) and “Statio Iucunditatis” (“Station of Mirth”). R. H. Allen listed it in his *Star Names* in 1899 as ““Πιμάηρε” (“Pimáire”) and translated that as “Haven of Pleasantness”.

Mansion of Height and Depth:

This Coptic lunar mansion “Choritos” is stars in the IAU constellation Libra as listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as “Statio Altitudinis”.(“Altitude Station”).

Mansion of the First Budding:

This Coptic lunar mansion “Artulos” is Alpha (α) Andromedae (Alpheratz) and Gamma (γ) Pegasi (Algenib) as listed by R. H. Allen in his *Star Names* in 1899. Allen vaguely translates this as “something pertaining to water”. However, it was listed by W. B. Yeats in *A Vision* in 1917, which was derived from German Jesuit astronomer Athanasius Kircher’s *Lingua Aegyptiaca Restituta* in 1636, in which Kircher described it as “Statio Prioris Germinationis” (“station of the first budding”).

Manta Ray:

This Kiribati star “Awanei” is unidentified at present (Trussel and Groves 1978).

Mantis:

This /Xam star “/Kaggen” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Alcock 2014). /Kaggen is a trickster God.

Mantle:

This German star “Mantellum” (“mantle”) or “Mantile” (“tablecloth”, “napkin”, or “towel”) is the star Epsilon (ε) Aquarii in the IAU constellation Aquarius as listed by German astronomer Johann Bayer in his *Uranometria* in 1603*,* by Dutch astronomer Hugo Grotius (1583 – 1645), and R. H. Allen in *Star Names* in 1899*.*

Mântre:

This Chakavian asterism is the IAU constellation Hydra.

Manubrian Nebula:

See Handlebar Nebula, above.

Manu’s Boat:

This Hindu asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Bhagwath 2019). Manu was warned by Vishnu of a great flood and built a large boat which he filled with animals and seeds as well as seven sages (compare this to Seven Sages, below) which came to rest on Mount Himavat.

Many:

This Armenian asterism “Բազումք” (“many”) or “Boyl-k” (“group”) is the Pleiades cluster in the IAU constellation Taurus.

This Tzotzil, Mixe, Totonac, and Nahua asterism is the Pleiades cluster in the IAU constellation Taurus.

Many Arms of Aquila:

This **telescopic** asterism “Multibrachiátus Áquilae” is the intermediate spiral galaxy NGC 6814 in the IAU constellation Aquila. William Herschel listed this as “III 744”. John Herschel listed this as h 2045 and later as GC 4507 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its “many arms.”

Many Branched of Antlia:

This **telescopic** asterism “Multirámis Ántliae” is the spiral galaxy NGC 3223 in the IAU constellation Antlia. It was discovered in 1835 by John Herschel who listed it as h 3243 and later as GC 2085 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its many arms and arm fragments.

Many Clods of Eridanus:

This **telescopic** asterism “Polybólus Erídani” is the spiral galaxy NGC 685 in the IAU constellation Eridanus. This was discovered in 1834 by John Herschel who listed it as 2438 in his catalogue. It became GC 407 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of the “many bright knots in the arms of this galaxy”.

Many Eyelashes of Leo Minor:

This **telescopic** asterism “Polyblépharis Leónis Minóris” is the intermediate spiral galaxy NGC 3486 in the IAU constellation Leo Minor. William Herschel listed it as “I 87”. John Herschel listed it as h 805 and later as GC 2274 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Many Fingered of Centaurus:

This **telescopic** asterism “Polydáctylus Centaúri” is the spiral galaxy NGC 5161 in the IAU constellation Centaurus. This was discovered in 1836 by John Herschel who listed it as h 3511 and later as GC 3551 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the many, thin and angular arms of this system look like fingers extending in many directions”.

Many Footed of Serpens:

This **telescopic** asterism “Pólypus Serpéntis” is the spiral galaxy NGC 6070 in the IAU constellation Serpens. It was discovered by William Herschel in 1786. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the many arms of this spiral galaxy”.

Many Gates of Centaurus:

This **telescopic** asterism "Polýpylae Centaúri" is the galaxy ESO 269-57 (PGC 45683) in the IAU constellation Centaurus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "two outer spiral arms of this galaxy form a pseudoring, i.e. a ring that is not completely closed".

Many Rings of Hydra:

This **telescopic** asterism "Multianuláta Hýdrae" is the barred lenticular ring galaxy NGC 3081 in the IAU constellation Hydra. It was discovered in 1786 by William Herschel who listed it as "III 596". It became GC 1985 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of its many rings.

Many Stars:

This ancient Egyptian asterism "Sebau Ashau" is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and is the IAU constellation Coma Berenices.

This Tzotzil (of Zinacantán) asterism "'Epal K'analetik" is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

Manzana:

This **telescopic** asterism "Manzana" ("apple") is the planetary nebula PN G250.4-01.3 in the IAU constellation Puppis.

Maple Leaf:

This Canadian **telescopic** asterism is emission nebula NGC 2024 (SH 2-277, LBN 953, Ced 55p) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 28" in his catalogue. It is GC 1227 in the *General Catalogue* of 1864. Size 30' X 30'. It is also known as the Tank Tracks (see below) and the Flame Nebula (see above). The source of this name is the 5th episode of The Finest NGC Minutes by Chris Vaughan, 17 February 2023.

Mapping:

This Kaykavian asterism "Kosjéri" is the IAU constellation Leo.

This Chakavian asterism Kosÿre is the IAU constellation Leo.

Maqui Maqui:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Maquingamita:

The stars of this Quechua asterism are unidentified at present (Ciancia 2018).

Marbarungal:

This Northern Queensland asterism is the belt of Orion in the IAU constellation Orion. Marbarungal was a great hunter (Palmer 1903). Variations include "Kombinegherry" and "Kumbainggin".

Marden:

This Wardaman star is Alpha (α) Delphini (Sualocin) in the IAU constellation Delphinus (Cairns and Harney 2003).

Mare of Libra:

This **telescopic** asterism "Équa Líbrae" is the galaxy MCG-01-39-003 (PGC 54817) in the IAU constellation Libra. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "NGC 5917 and its southern companion MCG-01-39-003 bring to mind a charioteer and his horse, the long tidal bridge being the reins" (See Charioteer of Libra, above). It is also known as the "Hooked Galaxy" (see above).

Marfak:

See Elbow, above.

Marfik:

See Elbow, above.

Marīci:

This Vedic star "Marīci", "Mārīchi", "Marichi", or "Gautama" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major as listed in R. H. Allen's *Star Names* in 1899 and by Boutet (2014). This is one of the sons of Brahma, who appears as Vashishtha (the star Zeta (ζ) Ursae Majoris). The other sons of Brahma are the other stars in the Big Dipper asterism (see Seven Sages, below).

Marine Bear:

This German asterism "Ursus Marinus" is the IAU constellation Cetus. German astronomer Johann Bayer (1572-1625) lists "Draco Leo ursus marinus" in his Uranometria (1603). The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Ursus Marinus" as an alternate name for Cetus.

Marine Compass:

This German asterism "See Compass" is the IAU constellation Pyxis.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "See Compass".

This French asterism "la Boussole" or "Compas de Mer" is the IAU constellation Pyxis.

This Italian asterism "Bussola" is the IAU constellation Pyxis.

Marine Lion:

This Latin asterism "Leo Marinus" is the IAU constellation Lupus as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

Marine Sparrow:

See Sparrow.

Marinyan:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing a young woman and is part of their asterism “Murabibi” (see Teenagers and Little Ones, below).

Mark on the Horse Hide:

This Arabic and Bedouin manzil “Al-Hekaah”, “al-Haqʿah” (الهقعة), or “ʾAl-Haqʿah” (ٱلْهَقْعَة), Al-Hakah, or “Al Kurhah”, translated as “mark on the horse hide”, “blaze on the horse’s hide”, “white spot on the horse’s hide” or “the circular mark”. This is three stars in the IAU constellation Orion: Lambda (λ) Orionis (Meissa), and Phi (ɸ) 1 and 2 Orionis:

- This is listed by Abu Muhammad ‘Abdallah b. Muslim al-Dinawari (d. 889).
- “al-Haq’a” and “Haq’a al-Jauzā” are listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986).
- This is listed by Muhammad al-Mukri (1852 – 1957).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Heka, from al hek’ah, a white spot”.
- R. H. Allen lists it as “Al Haḳʿah” in his *Star Names* in 1899 and gives the variations “Heka” and “Hika”.
- W. Brennand lists it as “Al-Hekah” in his *Hindu Astronomy* in 1896 and attributes it to Persian astronomer Ulugh Beg Mirza (1394 – 1449).
- Kunitzsch lists it in his *A Dictionary of Modern Star Names* in 1989.

This Persian asterism “al-qurhah” (القرحة), later latinized to “Kurhah”, “Al Kurkah”, “Alkirdah”, or “Al Kirdhu” is the star Xi (ξ) Cephei in the IAU constellation Cepheus as listed by the Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283). This appears on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of al-Qazwini (Dorn 1829): Dorn translates this as “fissure”. R. H. Allen lists “Al Kurhah” in his *Star Names* in 1963. The IAU approved the name Kurhah for the star Xi (ξ) Cephei Aa in 2016. NOTE: This star is also known as “Alkurah” (see Blaze, above).

This Yemeni manzil “Haq’a” is made up of stars of the IAU constellation Orion (Varisco 1995): Lambda (λ) Orionis (Meissa), and Phi (ɸ) 1 and 2 Orionis. This appears in the *Kitāb al-Tabṣira Fī’ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf ‘Umar ibn Yūsuf (d 1296).

Markab:

See Saddle of the Horse, below.

Markarian’s Chain:

This **telescopic** asterism is a line of galaxies in the IAU constellation Virgo that form part of the Virgo Cluster:

- Giant elliptical or lenticular galaxy M 84 (NGC 4374),
- Elliptical or lenticular galaxy M 86 (NGC 4406),
- Barred lenticular galaxy NGC 4477,
- Elliptical galaxy NGC 4473,
- Lenticular galaxy NGC 4461,
- Elliptical galaxy NGC 4458,

- Lenticular galaxy NGC 4438, and
- Barred lenticular galaxy NGC 4435.

This was named for American astrophysicist Benjamin Markarian, who discovered their common motion in the early 1960s.

Markarian's Eyes:

See Eyes (above).

Markeb:

See Saddle of the Horse, below.

Markesand:

This Ikoots asterism is the IAU constellation Scorpius. A markesand is a sacred rectangular wooden object.

Market:

This Aztec asterism "Tianquiztli" is the Pleiades cluster in the IAU constellation Taurus (Milbrath 2014). To the Aztecs this resembles a crowd of people around market stalls.

Market for Army:

This Korean asterism "Gundaeleul Wihan Sijang" (군대를 위한 시장) is a rough oval of stars in the IAU constellations Canis Major and Lepus: Theta (θ), 17, and 19 Leporis, HIP 29941, Nu (ν) 2 Canis Majoris, and HIP 31827, 31084, and 30457. Compare this to the Chinese xing guan "Market for Soldiers" (below).

Market for Soldiers:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellations Canis Major and Lepus: Starting at the determinative star Theta (θ) Leporis it runs around through 17 Leporis, 19 Leporis, HIP 29150, Xi (ξ) 1 and 2 Canis Majoris, Nu (ν) 2 and 3 Canis Majoris, HIP 31827, HIP 31084, HIP 30457, and FR Canis Majoris.

This Chinese xing guan "Jūnshì" (军市) is made up of five stars in the IAU constellation Canis Major: Beta (β) Canis Majoris (Mirzam), Xi (ξ) 1, Omicron (ο) 1, 17, and 8 Canis Majoris. Compare this to the Korean asterism "Market for Army" (above).

This Chinese Chenzhuo xing guan "Jūnshì" is an oval of stars in the IAU constellations Canis Major and Lepus: Xi (ξ) 1 & 2 Canis Majoris, Nu (ν) 1, 2 & 3 Canis Majoris, HIP 31827, HIP 31084, HIP 30457, HIP 30214, HIP 29735, HIP 29205, Theta (θ) Leporis, 17 Leporis, 19 Leporis, and HIP 29150.

Market Officer:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bending line of stars in the IAU constellation Aquila and Scutum: Starting at the determinative star Alpha (α) Scuti it runs through Delta (δ) Scuti, HIP 92488, Eta (η) Scuti, 12 Aquilae, 14 Aquilae, Lambda (λ) Aquilae, and HIP 94149, ending at HIP 93580.

This Chinese xing guan “Tiānbiàn” (天弁) is a bent “W” of stars in the IAU constellations Aquila and Scutum: 12, 14, and 15 Aquilae and Lambda (λ), Eta (η), Beta (β), Epsilon (ε), Delta (δ), and Alpha (α) Scuti. This is identical to the Korean asterism “Head of Town” (see above).

Marnaal:

This Wardaman star is Pi (π) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Márohu:

This **telescopic** Dominican Republic star is WASP 6 in the IAU constellation Aquarius (magnitude 11.9). It was given this name in the IAU NameExoWorlds campaign. It is the name of the God of drought and protector of the Sun. This has an exoplanet named Boinayel, who is the God of rain.

Marrinyin:

This Wardaman star is 20 Tauri in the Pleiades cluster in the IAU constellation Taurus (Cairns and Harney 2003).

Marsic:

See Elbow, above.

Martha:

This star is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major and is part of the asterism Bier of Lazarus (see above).

Martini Glass and Cocktail Drink Umbrella:

This asterism was created by Brian Fenerty and Roland Deschesne of the Calgary Centre of the RASC circa 2000. It is made up of stars of the IAU constellations Boötes, and Corona Borealis. Brian spotted the Martini Glass and as they discussed it, Roland came up with the Cocktail Drink Umbrella. They also came up with the asterism Grandma’s Dentures (see above).

- The “bowl” of the “Martini Glass” is the triangle of stars Alpha (α) Coronae Borealis (Alphecca), Epsilon (ε) Boötis, and Gamma (γ) Boötis.
- The “base” of the “Martini Glass” is the curve of stars Zeta (ζ) Boötis, Alpha (α) Boötis (Arcturus), and Eta (η) Boötis.
- The “stem” of the “Martini Glass” runs from Epsilon (ε) Boötis to Alpha (α) Boötis
- The “handle” of the “Cocktail Umbrella” is a line from Delta (δ) Boötis to Mu (μ) 1 Boötis.
- The “umbrella” is the triangle of stars Kappa (κ) Coronae Borealis, Beta (β) Boötis (Nekkar) and the double star 52 and 53 Boötis (V1 and V2 Boötis), with this double star being the apex of the “umbrella”.

Martial Star:

This star is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

Martius:

This asterism Martius is the IAU constellation Lupus as listed by Italian astronomer Giovanni Battista Riccioli (1598 – 1671), who saw it as being sacred to the God Mars.

Martyrs:

This is listed in *De Natura Rerum Liber ("book on the nature of things*") by Isidori Hisapensis (Isidore of Seville, ca 560 – 636 C.E.), who writes "the Orions signify the martyrs, for as they are born in the sky in wintertime, so in the Church the martyrs emerge in the time of persecution": Isidore refers to "Orion" as both a single star and stars in this text.

Mary:

This star is Epsilon (ε) Ursae Majoris (Alioth) in the IAU constellation Ursa Major and is part of the asterism Bier of Lazarus (see above).

This asterism is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Allen describes this only as appearing "in the Middle Ages" as the "Virgin Mary with the child Jesus" without identifying the source. This appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 as "Virgin Mary" and attributes it to German astronomer German astronomer Wilhelm Schickard (1592 – 1635).

Mary, Her Sister, and Her Cousin:

This asterism "Maria, su Hermana, y su Prima" from the German Volga Community of Argentina is the belt of Orion in the IAU constellation Orion (Mudrik 2011).

Mary Magdalene:

This German asterism "Saint Mary Magdalene" is the IAU constellation Cassiopeia as listed in the *Coelum Stellatum Christianum* of German uranographer Julius Schiller (c. 1580 – 1627). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Maria Magdalena Alias Cassiopeia". *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name for Cassiopeia, but only identifies the source as "theologians" who did this " about a thousand years ago". R. H. Allen's *Star Names* in 1899 lists "Mary Magdalene" but does not identify the source. Edward Sherburne lists "Mary Magdalene" in his Sphere of Marcus Manilius in 1675 and attributes it to Schiller.

Mary's Distaff:

This West Gothland asterism "Maria Rok" is the belt of Orion in the IAU constellation Orion.

Mary's Garden:

This Basque asterism "Mariaren Baratzea" is the IAU constellation Cassiopeia (Knörr 1999, Frank 2021).

Mary's Stars:

This Lithuanian asterism "Marijos žvaigždės" is the IAU constellation Cassiopeia.

Mary's Wreath:

This Lithuanian asterism "Marijos vainikas" is the IAU constellation Corona Borealis.

Masatho:

This Syrian asterism is the IAU constellation Libra as listed in John Hill's *Urania* in 1754.

Masikila:

This Tawi-Tawi star is Epsilon (ε) Orionis (Alnilam) in the IAU constellation Orion and represents one of the brothers in their asterism Tanggong (see below).

Mask Wearer of Ursa Major:

This **telescopic** asterism "Personátus Úrsae Majóris" is the edge-on spiral galaxy NGC 5201 in the IAU constellation Ursa Major. It was discovered in 1789 by William Herschel who listed it as "II 797". It became GC 3578 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "due to its enormous distance its true nature is not evident".

Mass of Hens:

This Latin asterism "Massa Gallinae" is the Pleiades cluster in the IAU constellation Taurus as listed in R. H. Allen's *Star Names* in 1899. Allen writes that this was common in the Middle Ages.

Massed Jewels:

This **telescopic** asterism is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by the English astronomer William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. Two bright stars (HIP 6229 and Phi (ϕ) Cassiopeiae) are the eyes. Size 13' X 13'. American astronomer Charles Howard Barns gave it the name "Massed Jewels" in his *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931). It is also known as the Kachina Doll Cluster, Dragonfly Cluster, and the E.T. Cluster.

Mast:

This English asterism "Malus" was the mast of Ptolemy's asterism Argo's Ship (see above):

- It became part of Abbe Louis Nicolas de Lacaille's new constellation Pyxis Nautica in 1752 (see Pyxis, below).
- English astronomer Francis Baily (1774 – 1844) assigned it the name Malus on the suggestion of English astronomer John Herschel in 1844 (see Pyxis below).
- American astronomer Benjamin Gould (1894 – 1896) restored the name to Pyxis.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists Pyxis Nautica.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Malus, the Mast" as an official constellation "recognized in the catalogue of the British Association".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Malus" and describes it as the "Mast (of Ship Argo)".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Malus", but the 14th edition (1959) notes "Malus replaced by Pyxis".

Master of Andromeda:

This **telescopic** asterism "Erus Andrómedae" is the spiral galaxy NGC 169 (Arp 282) in the IAU constellation Andromeda. It was discovered by R. J. Mitchell, an assistant to the 3rd Earl of Rosse, in 1857. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as in ancient Rome an Erus was the

master of a household and this galaxy is accompanied by the smaller galaxy IC 1559. NOTE: IC 1559 was also recorded by William Parsons, the 3rd Earl of Rosse.

Master of Constructions (in Chariot Mansion):

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of four stars in the IAU constellations Crater and Hydra: Beta (β) Hydrae (the determinative star), 22 Crateris, Xi (ξ) Hydrae, and 18 Crateris.

This Chinese Chenzhuo xing guan is a bent line of stars in the IAU constellations Crater and Hydra: Starting at Beta (β) Hydrae, it runs through Omicron (o) Hydrae, and Zi (ζ) Hydrae, to 18 Crateris.

Master of Constructions (in Legs Mansion):

This Chinese xing guan "Tǔsīkōng" (土司空) is the star Beta (β) Ceti (Diphda) in the IAU constellation Cetus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan "Tǔsīkōng" is the star Beta (β) Ceti (Diphda) in the IAU constellation Cetus.

Master of Pavo:

This **telescopic** asterism "Ánax Pavónis" is the barred spiral galaxy IC 4769 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "from its outside position this big spiral galaxy, like an imposing male elephant, roams the outer region of the herd."

Master of Pegasus:

This **telescopic** asterism "Magister Pégasi" is the spiral galaxy NGC 7331 (Caldwell 30) in the IAU constellation Pegasus. It was discovered in 1784 by William Herschel who listed it as "I 53". It became GC 4815 in the *General Catalogue* of 1864. This galaxy is part of a group of galaxies including NGC 7335, 7336, 7337, and 7340, the Deer Lick Group. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is the predominant system in its neighbourhood" which is a reference to the Deer Lick Group.

Mastiff:

This Romanian asterism "Mastin" or "Dulăul" is the IAU constellation Canis Major (Ottescu 2009, Lite, Lodina, and Ignat 2018). It is also known simply as the Dog (see above).

Masu:

This Akkadian asterism "Masu", "Māšu", or "dma-a-si" (Parpola 1993) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is the IAU constellation Gemini. NOTE: R. H. Allen lists "Masu" as a "Turanian" name for the IAU constellation Leo in his *Star Names* in 1899 and translates it as "Hero".

Mata:

This Māori asterism is the Hyades cluster in the IAU constellation Taurus.

Mataatau:

This Polynesian star is Beta (β) Orionis (Rigel) in the IAU constellation Orion.

Mata-kaheru:

This Māori asterism is the Hyades cluster in the IAU constellation Taurus.

Matan:

This Dunghutti asterism is the Pleiades cluster in the IAU constellation Taurus (Lissarrague 2007).

Matar:

See Auspice of Rain, above.

Matarekinaka:

This Kiribati star "Matarekinaka" is currently unidentified (Trussel and Groves 1978).

Mataroa:

This Kiribati asterism "Mataroa" is listed by Trussel and Groves (1978) as "false Southern Cross" but then attribute the stars to Virgo. The False Cross (see above) which is sometimes mistaken for the IAU constellation Crux is in the IAU constellations Carina and Vela, not Virgo.

Materials for Making Tents:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star Beta (β) Piscis Austrini in the IAU constellation Piscis Austrinus.

This Chinese xing guan "Tiāngāng" (天纲) is a line of two stars in the IAU constellation Piscis Austrinus: Delta (δ) and Gamma (γ) Piscis Austrini. It is attached to the larger xing guan Decayed Mortar (see above).

This Chinese Chenzhuo xing guan "Tiāngāng" is the double star Gamma (γ) Piscis Austrini in the IAU constellation Piscis Austrinus.

Matinaba:

This Kiribati asterism is three stars in a line in the IAU constellation Capricornus (Trussel and Groves 1978).

Matoroniwi:

This Kiribati asterism "Matoroniwi" is made up of stars of the IAU constellation Virgo (Trussel and Groves 1978).

Matron of Centaurus:

This **telescopic** asterism "Matróna Centaúri" is the elliptical galaxy NGC 4696 in the IAU constellation Centaurus. This was discovered by James Dunlop. John Herschel listed it as h 3424 and later as GC 3226 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is "located in the middle of the Centaurus cluster, as if she were the respected matron in her large family".

Matthew:

This German asterism “Matthew” or “Saintt Matthew the Apostle” is the IAU constellation Sagittarius and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Mathaeus Al Sagittarius.” Edward Sherburne lists it in his Sphere of Marcus Manilius in 1675 it later appears in John Hill’s *Urania* in 1754.

Matthias:

This German asterism “Matthias” or “Saint Matthias the Apostle” is the IAU constellation Pisces and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Matthias Al Pisces”. It later appears in John Hill’s *Urania* in 1754.

Mattinyi:

This Kaurna asterism was listed by Hamacher in 2015. The precise stars involved have not yet been identified.

Mattress of the Emperor:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of three stars in the IAU constellation Boötes: Xi (ξ) Boötis (the determinative star), 26 Boötis, and 22 Boötis.

This Chinese xing guan “Dìxí” (帝席) is a bent line of three stars in the IAU constellation Boötes: 9, 11 and 12 Boötis.

Mau-kuo-mau:

See O-nga-tangata below.

Maui’s Monster:

This Tongan (Pukapuka Island) asterism is the dark nebulae between the IAU constellations Scorpius to Cygnus. This is the monster that Maui killed and hurled into the sky and his spear (“te tao”) is a small dark triangular nebula near Scorpius.

Mausoleum:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a curving line of stars in the IAU constellation Perseus: Starting at 11 Persei it runs through Tau (τ) Persei, Iota (ι) Persei, Kappa (κ) Persei, Beta (β) Persei (the determinative star), Rho (ρ) Persei, and 16 Persei, ending at 12 Persei. Inside this xing guan is their xing guan “Heap of Corpses” (see above).

This Chinese xing guan “Dàlíng” (大陵) is a curving line of stars in the IAU constellation Perseus: 12 Persei, 16 Persei, Rho (ρ) Persei, Beta (β) Persei (Algol), Kappa (κ) Persei, Iota (ι) Persei, Tau (τ) Persei, and 9 Persei. Inside this xing guan is their xing guan “Heap of Corpses” (see above).

This Chinese Chenzhuo xing guan “Dàlíng” is a hooked line of stars of the IAU constellation Perseus: Starting at Eta (η) Persei it runs through Tau (τ) Persei, Iota (ι) Persei, Kappa (κ) Persei, Beta (β) Persei (Algol), and 16 Persei to 12 Persei.

This Korean asterism “Ungjanghan Mudeom” (웅장한 무덤) is identical to the Chinese xing guan of this name, including the “Heap of Corpses”.

Mavors:

This Spanish asterism is the IAU constellation Auriga as described by Isidore of Seville (560 – 636). This is a name for the God Mars, father of Romulus, and therefore associated to shepherds according to R. H. Allen in *Star Names* in 1899. Variations include “Marfutius” and “Maforte” (listed by German astronomer Johann Bayer (1572-1625)).

Mayall’s Object:

This **telescopic** asterism is Arp 148 (PGC 33423), a pair of colliding galaxies in the IAU constellation Ursa Major. It was discovered by American astronomer Nicholas U. Mayall (1906 – 1993) at the Lick Observatory in March 1940 using the 36” Crossley reflector telescope. It appears to be a ring galaxy with a tail emerging from it. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) “Mayállium Úrsae Majóris”. It is also known as the “Question Mark” (see below).

Mayuyu:

This Tawi-Tawi star is Delta (δ) Orionis (Mintaka) in the IAU constellation Orion and represents one of the brothers in their asterism Tanggong (see below).

Mazalaai:

This **telescopic** Mongolian star “Mazalaai” is HAT-P-21 in the IAU constellation Ursa Major (magnitude 11.46). It received this name in the IAU NameExoWorlds Campaign. Mazalaai is an endangered species of Gobi bear. It has an exoplanet named Bambaruush (“bear cub”).

Mazisius’ Stick:

This Lithuanian asterism “Maižiešiaus lazda” or “Mažišiaus lazda” is currently unidentified.

McDonald’s Logo:

There are two **telescopic** “McDonald’s Logo” asterisms:

- One is made up of 8th to 9th magnitude stars 3 degrees southwest of the open cluster Messier 50 in the IAU constellation Monoceros. American astronomer and author Phil Harrington describes it as a “McDonald’s M” after the restaurant chain logo and made it Harrington 18 on his list. It is also known as “Pakan’s 3” (see 3 above) and the “Tooth” (see below).
- One is open cluster NGC 6025 (Caldwell 95) in the IAU constellation Triangulum Australe. This was was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1755. South African astronomer Magda Streicher (2009) described it as a “MacDonald’s [sic] sign”. It is also known as the “Japanese Fan” (see above), “Pakan’s 3” (see 3 above) and the Tooth (see below).

McLeish’s Object:

This **telescopic** asterism PGC 74180 is a barred spiral galaxy in the IAU constellation Pavo. It was discovered by Argentinian astronomer David McLeish in 1946.

McNeil’s Nebula:

This telescopic asterism is a variable nebula surrounding the star V1647 Orionis in the IAU constellation Orion. This was discovered by amateur American astronomer Jay McNeil in 2004 using a 3" telescope.

Meal Drying Bowl:

This Tewa asterism is the IAU constellation Corona Borealis.

Mealie:

This **telescopic** asterism is NGC 4699, an intermediate spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as "I 129". It is GC 3229 in the *General Catalogue* of 1864. South African astronomer Richard Ford (2013) describes it as having "the shape of a tiny mealie". It is also known as the Vinyl LP (see below). This is listed in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Mean Little Ones:

This Arabic star "al-awlād al-nadhlāt" or "Al Aulād al Nadhlāt", later latinized to "Aulad Alnathlat", is Psi (ψ) Boötis in the IAU constellation Boötes.

Measure Amount:

This Korean asterism "Cheugjeong Geum-aeg" (측정 금액) is a line of two stars in the IAU constellation Hercules: 101 Herculis and HIP 90067.

Measure Cereal:

This Korean asterism "Silieol-eul Cheugjeonghada" (시리얼을 측정하다) is a quadrilateral of stars in the IAU constellations Hercules and Serpens: Sigma (σ) and Lambda (λ) Serpentis and Omicron (ο) and 9 Herculis.

Measuring Cup:

This **telescopic** asterism is Ennis 7 in the IAU constellation Gemini, listed by Canadian astronomer Charles Ennis. It is the cluster Simonic 37. Four 8^{th} – 9^{th} magnitude stars form the "cup": HD 51186, HD 266810, HD 266943, and Gaia DR3 3367925272614089216. A loop of four 9^{th} – 10^{th} magnitude stars form the "handle": Gaia DR3 3367926921881503488, Gaia DR3 3367932110201971840, Gaia DR3 3367931800964331392, and Gaia DR3 3367925650571191680.

Measuring Scoop:

See Kite (Kemble's Kite) above.

Meat Ant:

This Boorong asterism "Marpeankurrk" ("meat ant" or "treecreeper") was listed by Stanbridge (1857), Morieson (1999), Clarke (2009), and Hamacher and Frew (2010). It is made up of the stars of the IAU constellation Boötes:

- Alpha (α) Boötis (Arcturus) is the "head" of the ant,
- An arc of faint stars forms the "antennae" (5, 8, and 29 Boötis and HIP 71759), and
- A triangle of stars forms the "body": Beta (β) Boötis (Nekkar), Delta (δ), Epsilon (ε) and Rho (ρ) Boötis.

Note: The children of Marpeankurrk are Djuit (Alpha (α) Scorpii (Antares), see Red-Rumped Parrot, below) and Weekurrk (Eta (η) Boötis (Murphrid), see Weekurrk, below).

They used these stars to determine when the larvae of this ant (which they called bittur) were coming into season, as this was a major food source. To the Boorong Marpeankurrk was a wise woman who showed her people how to harvest these eggs.

This Wotjobaluk star "Marpean-kurrk" is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Hamacher 2011).

Meat Hook:

This **telescopic** asterism is NGC 2442 and NGC 2443, a single intermediate spiral galaxy in the IAU constellation Volans. It is also known as the Cobra Galaxy (see above), the Cobra and Mouse (see above), or the "S" (see below). NGC 2442 and 2443 are two parts of the same galaxy: John Louis Emil Dreyer (1852 – 1926) assumed it was two separate objects from William Herschel's earlier observations that this was a "double nebula". It is entered in the General Catalogue of 1864 as GC 1568 and 1569. English astronomer John Herschel, William's son, confirmed that it was a single "nebula" in December 1834.

Mebsuta:

See Outstretched Paw, below.

Mediterranean Star:

This Macedonian star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Medusa:

This Greek asterism "Medusa" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899.

Medusa Galaxy:

This **telescopic** asterism is NGC 4194 (Arp 160), a pair of interacting galaxies in the IAU constellation Ursa Major known as the "Medusa Merger" or "Medusa Galaxy". English Astronomer William Herschel discovered it in 1791 and listed it as "II 867". It is GC 2788 in the *General Catalogue* of 1864. Its central gas-rich star forming region is what is known as the "Eye of Medusa" (see above). The "hair" of Medusa is a tidal tail of stars.

Medusa Merger:

See Medusa Galaxy, above.

Medusa Nebula:

This planetary nebula is Abell 21 and Sharpless 2-274 in the IAU constellation Gemini. It was discovered by American astronomer George O. Abell in 1955.

Medusa of Coma Berenices:

This **telescopic** asterism "Medúsa Cómae Bereníces" is the barred spiral galaxy NGC 4921 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as II 393. It is 1516 on John Herschel's catalogue and 3368 in the *General Catalogue*. This name appears in *The*

Catalogue of One Thousand Named Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the smooth disk with the pale spiral structure makes this galaxy look like a translucent jellyfish. A Medusa is the adult stage in the life cycle of a jellyfish."

Medusaeus:

This Latin asterism is the IAU constellation Pegasus:

- "Medusaeus" is listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- "Medusaeus" is listed in John Hill's *Urania* in 1754.

Medicine Men's Rattle:

This Lokono star "Maraka" is currently unidentified.

Medium Bull:

This **Telescopic** asterism is a "V" shape of six 7th – 9th magnitude stars in the IAU constellation Ophiuchus including HIP 87790, HIP 87860, and HIP 87901. Size 24'. It is about 1° away from Poniatowski's Bull (see below) and 18' away from the Minor Bull asterism (see below).

Medusa's Head:

This asterism "Caput Medusa" is the group of stars at the end of the "arm" of the IAU constellation Perseus and was listed as a separate asterism by Hipparchus (190 – 120 B.C.E.) and Pliny the Elder (24 – 79). 1st century Roman architect Vitruvius called it "Gorgoneum Caput", Gaius Julius Hyginus (64 - 17 B.C.E.) called it "Caput Gorgonis" in his *De Astronomica*, 1st century Roman poet Marcus Manilius called it "Gorgonis Ora", and 14th century Greek geographer and astronomer Georgius Chrysococcas called it "Γοργόνιον" ("Gorgónion").

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists "Caput Gorgonis".

The "hand" holding the head is Beta (β) Persei (Algol). Algol is also known as Gorgonea Prima or Gorgona, a reference to Medusa, who was a Gorgon. The "head" includes the stars Algol, Gorgonea Secunda (Eta (η) Persei), Gorgonea Tertia (Rho (ρ) Persei), and Gorgonea Quarta (Omega (ω) Persei).

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Caput Algol".

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r labels this asterism "Caput Algol".

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Caput Algol" for the star Beta (β) Persei.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts this asterism as "CAPUT ALGOL".

"Caput Meduse" is listed on the *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern*

Celestial Hemisphere chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999).

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts only the severed head of Medusa and NOT Perseus.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al also lists this as "Caput Meduse" and depicts in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) labels this asterism "cap. Meduse".

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) labels this asterism "Caput Medusae".

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) labels this "C de Meduse", which is an abbreviation for "Caput de Meduse".

German astronomer Johann Bayer (1572-1625) depicts this asterism in his *Uranometria* in 1603: It is unlabeled in the chart, but the following names appear in the text: "Capitis Algol, Aloue, Medusae, Gorgonea prima". Bayer's *Uranometria* assigns the names "Gorgonea Prima" to Beta (α) Persei (Algol), assigns "Gorgonea Secunda" to Pi (π) Persei, "Gorgonea Tertia" to Sigma (ς) Persei), and "Gorgonea Quarta" to Omega (ω) Persei).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Caput Medusae sive Gorgonus".

This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Caput Medusae seu Gorgonis".

"Caput Meduse" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633).

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Caput Meduse" as a severed head held by Perseus.

"Caput Medusae" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this asterism "Caput Medusae".

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk lists this asterism as "Caput Medusae".

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Teste de Meduse".

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts "Caput Medusae".

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) lists this as "La Tete de Meduse".

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this asterism as "Kopf der Medusa".

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Caput Medusae".

American uranographer William Croswell (1760 – 1834) lists "Caput Medusae, Medusa's Head" on his *Mercator Map of the Starry Heavens* in 1810.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Caput Medusae" it in his *Celestial Atlas* in 1822.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Medusa" as Medusa's head being held by Perseus

"Caput Medusae" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

The French edition of Flamsteed's work, the *Atlas Céleste,* which was revised in 1778, lists this asterism as "La Téte de Meduse".

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this asterism as "Medusas hoost".

This asterism was always part of the constellation Perseus, as it fit into the Greek myth of Perseus, but was frequently labeled as this asterism on charts in the 18th and 19th centuries. Compare this to the Arabic asterism Head of the Ghoul (see above).Size 120'.

Mee:

This Polynesian (Marquesas Islands) asterism is the IAU constellation Corvus.

Meen:

This Micronesian star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

Meerschaum Pipe:

This **telescopic** asterism is found in the IAU constellation Cygnus. Look 2.6 degrees northwest of the star 15 Vulpeculae to find the open cluster NGC 6834: this asterism is 0.75 degrees northwest of this open cluster. Five stars in line form the stem and three stars the bowl. This is listed in *Asterisms: Small Star Patterns for Telescopes and Binoculars* by Dutch astronomer Demelza Ramakers in 2011. Size 22'.

Meghayanti:

This Vedic star from the *Taittiriya Brahmana* is 17 Tauri (Electra) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, above).

Megisto:

See Callisto, above.

Megrez:

See Base of the Bear's Tail, above.

Mehton:

This Myanmar yathi (zodiac constellation) "Mehton" (ဧမထုန်) is the IAU constellation Gemini.

Mein:

This Myanmar yathi (zodiac constellation) "Mein" (မိန်) is the IAU constellation Pisces.

Meissa:

See Shining One, below.

Meittha:

This Myanmar yathi (zodiac constellation) "Meittha" (မိဿ) is the IAU constellation Aries.

Mekbuda:

See Outstretched Paw, below.

Melanippe:

This Greek asterism is the IAU constellation Pegasus as listed by Euripides (480 – 408 B.C.E.). In Greek mythology Melanippe was the daughter of Chiron, the boatman who ferried the dead into Hades. Her other name was Euippe and she was turned by the Goddess Artemis into a black horse and placed in the sky.:

- "Melanippe" is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- "Menalippe" is listed in Johann Bayer's *Uranometria* (1603).
- "Melanippe" is listed in R. H. Allen's *Star Names* in 1899.
- German astronomer Johann Bayer (1572-1625) listed it as "Menalippe".

Melichi:

This star "Melichi" is Alpha (α) Leonis (Regulus) in the IAU constellation Leo as listed in John Hill's *Urania* in 1754. He does not identify the source.

Melikertes:

This Greek asterism is the IAU constellation Hercules. Melikertes or Melicertes was a child sea god who came to the aid of sailor in distress. Variations include "Malica", "Melica","Melicartus", and "Melicerta". He later became known as Palaimon or Palaemon.

Men:

This Seleucid asterism "SIPA u MAS.MAS" (see True Shepherds of Heaven, below) or "a-me-lu" ("men") from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is stars of the IAU constellations Orion and Gemini.

Men in a Line:

This Tlingit asterism is the Belt of Orion in the IAU constellation Orion.

Menaechmus of Virgo:

This **telescopic** asterism "Menaéchmus Vírginis" is the barred spiral galaxy NGC 4981 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as II 189. It is GC 3418 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is paired with NGC 4995, and they saw this as one of the twins in the comedy *the Menaechmi* by Roman author Plautus.

Menalippe:

This asterism is the IAU constellation Pegasus as listed in John Hill's *Urania* in 1754. Hill does not identify a source.

Menhir of Pavo:

This **telescopic** asterism "Megálithus Pavónis" is the spiral galaxy IC 4831 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the shape of this very big galaxy is reminiscent of a menhir, a megalith."

Menkalinan:

See Shoulder of the Rein Holder, below.

Menkar:

See Nostril, below.

Menkent:

See Shoulder of the Centaur, below.

Menkib:

See Shoulder, below.

Men's Wagon:

This Saxon and asterism "Carlswæn" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This German asterism "Churlswagen" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Norse asterism **"**Karlvagn" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Norwegian asterism "Karlsvognen" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Scandinavian asterism “Karlsvogna”, or “Karlsvognen”, is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Swedish asterism “Karlavagnen” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

This Gothic asterism “Karl Wagen” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) as listed in R. H. Allen’s *Star Names* in 1899.

Compare this to the English “Charles’ Wain” (see above) and Thor’s Wagon (see below).

Men’s Wagon Star:

This star “Carlwaynesterre” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes. This is related to the Saxon asterism “Carlswaen” (see Men’s Wagon, below). R. H. Allen lists this in his *Star Names* in 1899.

Mensa:

None of the stars of Mensa are brighter than 5th magnitude and only show up in 12 asterisms in this handbook.

This IAU constellation (IAU abbreviation Men) is one of the constellations created by French astronomer Abbé Nicolas Louis de Lacaille in 1750. He originally called it “Mons Mensa” after Table Mountain, a South African mountain overlooking Cape Town where de Lacaille spent some years making observations. Variations include “Mons Mensae” in R. H. Allen’s *Star Names* in 1899. It shows up in German catalogues as “Tafelberg”, in Italian catalogues as “Monte Tavola”, and in French catalogues as “Montagne de la Table”. English astronomer John Herschel (1792 – 1871), recommended shortening the name to Mensa.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Montagne de la Table” as a mountain peak.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Tafelberg“ and depicts it as a mountain peak.

Mensa is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) as “Mons Mensae”: He indicates the borders of this constellation on the chart but offers no illustration of it.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Mensa, The Table Mountain” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists “Mensa” and “Mons Mensae” and describes it as “Table (mountain)”.

The 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) lists “Mensa” and gives the “original form” as “Mons Mensae”, describing it as the “Table Mountain”.

The Facts of File Dictionary of Astronomy, 2nd edition, 1985, by Valerie Illingworth, ed., lists this constellation as “Mensa (Table Mountain)”.

Standard IAU charts depict Mensa as a line of the three stars Mu (μ) Mensae, HIP 22717, and Gamma (γ) Mensae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Mensa in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a line of two stars: Gamma (γ) Mensae and Alpha (α) Mensae.

Sky and Telescope Magazine, founded in 1941, depicts Mensa in their magazine and publications as a line between Alpha (α) and Beta (β) Mensae.

Merak:

See Loins of the Bear, above.

Mercedes Emblem:

There are two **telescopic** "Mercedes Benz" asterisms:

- One is the globular cluster Messier 13 in the IAU constellation Hercules. This was discovered by English astronomer Edmund Halley in 1714. Finnish astronomer Timo Karhula (1996) describes it as a "Mercedes Star" in his observations noted in the DOCdb database, as does South African astronomer Magda Streicher (1998).
- One is Cseh 42, listed by Hungarian astronomer Viktor Cseh, is in the IAU constellation Capricornus. Cseh describes it as a "5 member star group that forms a shape similar to a Mercedes emblem. The brightest star in the center is TYC 6599-1875 and shines with a magnitude of 8.7".

Merchant:

This Italian (Piedmont and Ligurian Alps) star "Tupiniero" or "Blot" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major: this was the merchant who held the water pitcher at the harvest feast.

Merga:

See Chained Woman, above.

Meridian of Centaurus:

This **telescopic** asterism "Meridianáta Centaúri" is the peculiar lenticular galaxy NGC 5266 in the IAU constellation Centaurus. It was discovered in 1834 by John Herschel who listed it as h 3529 and later GC 3631 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it has "a polar ring of dust material".

Meridiana:

See South, below.

Merleng:

This Wardaman star is Delta (δ) Delphini in the IAU constellation Delphinus (Cairns and Harney 2003).

Mermaid:

This Hungarian asterism "Sello" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Mermaid Nebula:

There are two **telescopic** Mermaid Nebula asterisms:

- One is the nebula NGC 1977 and open cluster IC 1805 (SH 2-190, LBN 654, Mel 15, Ced 7) in the IAU constellation Cassiopeia. NGC 1977 was discovered by English astronomer William Herschel in 1787 and listed as V 30. IC 1805 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). It is GC 1180 in the *General Catalogue* of 1864. This is also known as the Heart Nebula (see above), the Running Man Nebula (see above) and the Valentine Nebula (see below).
- One is the supernova remnant G296.5+10.0 (ESO 217-25) in the IAU constellation Centaurus, discovered in 1974 and photographed by Australian astrophotographer Andrew Murrell. It is also known as the Betta Fish (Siamese Fighting Fish).

Merope:

This Greek star is 23 Tauri in the Pleiades cluster in the IAU constellation Taurus and was named for one of the Pleiades sisters in Greek mythology:

- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Merope" for this star.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "Merope" in his *Star Atlas* (1893).
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Merope".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list this star as "Merope".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Merope".
- The IAU approved the name Merope for the star 23 Tauri Aa.

Merope Nebula:

This **telescopic** asterism is reflection nebula NGC 1435 in the Pleiades cluster in the IAU constellation Taurus. It has this name as it surrounds the star Merope (see Merope, above). It was first recorded by German astronomer Wilhelm Tempel (1821 – 1889) in 1859. It is GC 768 in the *General Catalogue* of 1864. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), labels this nebula surrounding the star Merope the "Merope Nebula". It is also known as Tempel's Nebula or Barnard's Merope Nebula.

Merops:

This Greek asterism is the IAU constellation Aquila as listed in John Hill's *Urania* in 1754. Merops is a character that shows up in multiple Greek myths.

Merrerrebena:

This Wardaman star is Tau (τ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Merrill's Star:

This **telescopic** star is the high-velocity Wolf-Rayet star WR 124, situated in the ejecta nebula PK 50+3 1 in the IAU constellation Sagitta (magnitude 11.17 – 11.25). It is one of the fastest runaway stars in our galaxy. It is named after the American astronomer Paul W. Merrill (1887 – 1961).

Merzem:

This Merazig asterism is the stars of the IAU constellations Canis Major and Canis Minor, which they use to predict weeks of hot weather.

Mesa:

This Vedic rashi "Mesa" or "Mesha" Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022) is the IAU constellation Aries. Bhagwath (2019) lists it as "Mesha" as does R. H. Allen in his *Star Names* in 1899 and W. Brennan lists it as "Mesha" in his *Hindu Astronomy* in 1896. Bhagwath writes that it represents the energy of the creator God Dhatar. The Chinese phonetically translated "Mesa" from the Vedic *Candragarbha-parivarta* in 566 as "Misha" (Kotyk 2017).

Mesarthim:

See Servants, below.

Mesham:

This Tamil asterism is the IAU constellation Aries as listed in R. H. Allen's *Star Names* in 1899.

Messenger of Light:

This Babylonian star "Dilgan" is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

This Akkadian star "Dil-gan I-ku" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as listed by R. H. Allen in his *Star Names* in 1899.

This Babylonian star "Dil-gan Babili" is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as listed by R. H. Allen in his *Star Names* in 1899.

Messier, Le:

This French asterism "le Messier" is an alternative name for the asterism Custos Messium (see Harvest Keeper, above).

Messier's Monogram:

This **telescopic** asterism is open cluster NGC 1981 in the IAU constellation Orion. It was discovered by English astronomer John Herschel in 1827, becoming h 362 on his list and GC 1184 in the *General Catalogue* of 1864. South African astronomer Auke Slotegraaf described it in 2010 as an "M" shape and writes "How nice of Charles Messier to put his signature on his most famous deep sky discovery" (this discovery being the Great Orion Nebula). It is also known as the Coal Car Cluster and the Crocodile Cluster.

Metcher-Sah:

This Egyptian decan "Metcher-Sah" was in the IAU constellation Gemini. In later Hellenistic texts it was named "ϴοcoλκ" ("Θosalk"). In the Testament of Solomon, it became "Sphandor", 2nd century Jewish philosopher Aristobulus of Paneas called it "Farsan", in Greek Hermeticism it became "Xocha", in Latin Hermeticism "Manuchos", 4th century Roman astrologer Julius Firmicus Maternus called it "Thesogar" or "Tensogar", Cosmas of Maiuma (d. 760) called it "Thetys", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Thesogar" and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "τοογϴ" ("Tautus"). It has been depicted as a man with a donkey head with a key in his right hand.

Methuselah Nebula:

This **telescopic** asterism is the planetary nebula PK 080-10.1 in the IAU constellation Cygnus.

Methuselah Star:

This telescopic star is the metal-poor subgiant star HD 140283 in the IAU constellation Libra. The press gave it this name in as it is one of the oldest stars known: One article appeared in Science Daily in 2013 (*Hubble Finds 'Birth Certificate" of Oldest Known Star*) and Space.com in 2019 (*How Can a Star Be Older Than the Universe*?).

Metronome:

This **telescopic** asterism is Do Dz 17 or Stratton 2 on the asterism list of Troy Stratton, Observing Program Coordinator of The Astronomical League. It is in the IAU constellation Orion near the star Gamma (γ) Orionis (Bellatrix). It resembles a capital Greek letter Sigma (Σ) with the middle star being the 7th magnitude star HIP 25073. Size 17'.

Mexican Jumping Star Cluster:

This **telescopic** asterism is the open cluster NGC 2362 (Caldwell 64), discovered by Italian astronomer Giovanni Battista Hodierna in 1654 in the IAU constellation Canis Major. English astronomer William Herschel listed it as "VII 17. It is GC 1513 in the *General Catalogue* of 1864. It is also known as the Pirate's Jewels Cluster. It got this name as the central star Tau (τ) Canis Majoris (magnitude 4.4) can appear to "jump around" with respect to other stars in the cluster due to its marked contrast in brightness.

Miaplacidus:

See Placid Water, below.

Mićakrÿš:

This Chakavian asterism is the IAU constellation Perseus.

Mice Galaxies:

This **telescopic** asterism NGC 4676 A and B (Arp 242) is a pair of interacting spiral galaxies in the IAU constellation Coma Berenices. These were discovered in 1785 by English astronomer William Herschel who listed it as II 326". It became GC 3207 in the *General Catalogue* of 1864. They bear this name as they both have long "tails" created by the tidal action between the two. Size 2.2' X 0.8'. In *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010) name these two galaxies "Minnie" and "Mickey".

Michael:

This German asterism “Michael” or “Saint Michael the Archangel” is the IAU constellation Ursa Minor and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “S. Michael al Vrsa minor”. It later appears in Edward Sherburne’s Sphere of Marcus Manilius in 1675 and in John Hill’s *Urania* in 1754. R. H. Allen writes in his *Star Names* in 1899 that Schiller used this for Ursa Major.

This is one of the Archangel Stars (see above), Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus.

Mickey of Coma Berenices:

This **telescopic** asterism “Michael Cómae Bereníces” is the interacting galaxy NGC 4676B (Arp 242) in the IAU constellation Coma Berenices. These were discovered in 1785 by English astronomer William Herschel who listed it as II 326”. It became GC 3207 in the *General Catalogue* of 1864. The interacting galaxies NGC 4676 A and B are known as the “Mice” (see above) as they both have long “tails” created by the tidal action between the two. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Microscopium:

None of the stars of Microscopium are brighter than 4th magnitude and only show up in 24 asterisms in this handbook.

This IAU constellation (IAU abbreviation Mic) is one of twelve created by the French astronomer Abbé Nicolas Louis de Lacaille in 1751. He originally called it “le Microscope” but latinized the name by 1763. Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts this as a box with a door on the front on top of which is a microscope on a stand.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Microscopium” as a microscope.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists it as “Mikroscop” and Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Mikroscop“ and depicts it as a microscope.

“Microscopium” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Microscopium” as a microscope.

English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists “Microscopium, The Microscope” as an official constellation “recognized in the catalogue of the British Association”.

American astronomer Winslow Upton’s *Star Atlas* (1896) lists this constellation as “Microscopium” and describes it as a “Microscope”.

Standard IAU charts depict Mensa as a bent line of the four stars Epsilon (ε) Microscopii, 2 Piscis Austrini, Gamma (γ) Microscopii and Alpha (α) Microscopii.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Microscopium in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a bending line of stars starting at Alpha (α) Microscopii and running through Gamma (γ) Microscopii, 2 Piscis Austrini, Epsilon (ε) Microscopii, and Theta (θ) 1 Microscopii, to Iota (ι) Microscopii.

Sky and Telescope Magazine, founded in 1941, depicts Microscopium in their magazine and publications as a line between Alpha (α) and Beta (β) Microscopii.

Middle:

This Arabic star "Wasat" (وسط) or "Al Wasat" ("middle" or "central one") is Delta (δ) Geminorum in the IAU constellation Gemini:

- Variations include "Wesat".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists Microscopium in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Wasat, from the Arabic al wasat, the middle or centre".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Wesat".
- NOTE: R. H. Allen writes in his *Star Names* in 1899 that Wasat was given to Eta (η) Tauri (Alcyone) and writes that Persian astronomer Ulugh Beg Mirza (1394 – 1449) assigned it to 17 Tauri (Electra).
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list the name "Wasat" for Delta (δ) Geminorum.
- The IAU approved the name Wasat for the star Delta (δ) Geminorum Aa in 2016.

Middle Bow:

This Latin star "Kaus Media" is Delta (δ) Sagittarii in the IAU constellation Sagittarius. This name is derived from the Arabic "gaws" ("bow" قوس) and Latin "media" ("middle"). The IAU approved the name Kaus Media for Delta (δ) Sagittarii in 2016.

Middle Positioned of Eridanus:

This **telescopic** asterism "Mediánus Erídani" is the flocculent spiral galaxy NGC 1353 in the IAU constellation Eridanus. It was discovered in 1784 by English astronomer William Herschel who listed it as "III 246". It became GC 724 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it "is classified roughly in the middle position in the Hubble sequence".

Middle Precursor:

This Anutan star "Taki Roto" is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda which forms one corner of the Great Square (see Great Square, above).

Middle Star of the Head of the Scorpion:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "MUL MURUB sa SAG GIR-TAB" is Delta (δ) Scorpii in the IAU constellation Scorpius (Hunger and Sachs 1988).

Middle Step:

This Chinese xing guan is a line of two stars in the IAU constellation Ursa Major and is part of their xing guan "Sāntái" (see Three Steps, above): Lambda (λ) Ursae Majoris and Mu (μ) Ursae Majoris.

Midland Star:

This Macedonian star "Sredozemna Dzvezda" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cenev 2014).

Midnight Cross:

This Romanian asterism "Crucea Miezului Nopţii" is the IAU constellation Cygnus (Ottescu 2009).

Might of the Abode of Life:

This Babylonian star "Emuku tin-tir-Ki" is Alpha (α) Virginis (Spica) in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899.

Miku's Shimapan:

This **telescopic** asterism "Maas 1" from the asterism list of American astronomer Steve Maas is in the IAU constellation Aquarius. Its size is 19' X 14'. The brightest star is HD 197659 (magnitude 8.81). Shimapan is a name for striped panties. This is listed on the SOCO (Sentinel of the Caprock Observatory) list.

Milinus:

This Latin asterism is the IAU constellation Cygnus as listed in John Hill's *Urania* in 1754.

Mili'opu:

This Hawaiian star is Delta (δ) Scorpii in the IAU constellation Scorpius.

Militant:

This Latin asterism "Pugnans" is the IAU constellation Hercules as listed in John Hill's *Urania* in 1754.

Military Breaking Star:

This Japanese star "Hagunsei" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

Military Gate:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Hydra: HIP 57613 (the determinative star) and 58082.

This Chinese Chenzhuo xing guan is two stars in the IAU constellation Hydra: HIP 57613 and 58082.

Military Post Commander of Leo:

This **telescopic** asterism "Telárches Leónis" is the spiral galaxy NGC 3883 in the IAU constellation Leo. It was discovered in 1785 by William Herschel who listed it as "III 372". It became GC 2551 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is “a giant spiral galaxy at a great distance.”

Military Star:

This Chinese star “Wuqu” from the Three Kingdoms to the Ming Dynasty is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan “Wuqu” is the star Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Military Well:

This Chinese xing guan “Jūnjǐng” (军井) is a rectangle made up of stars in the IAU constellation Lepus: Iota (ι), Kappa (κ), Lambda (λ), and Nu (ν) Leporis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Jūnjǐng” is two stars in the IAU constellation Lepus: Iota (ι), Kappa (κ), Lambda (λ) and Nu (ν) Leporis.

Milk Can:

This **telescopic** asterism is the open cluster IC 2488in the IAU constellation Vela. It was discovered by French astronomer Abbé Nicolas Louis de Lacaille in 1752. It ended up on the Index Catalogue after being recorded by American astronomer Solon Irving Bailey (1854 – 1931). Vela. It is located 30 arcminutes west of N Velorum, a 3rd magnitude star located near the False Cross asterism (see False Cross above). South African astronomer Magda Streicher described it as a “Milk Can shape pouring out faint stars”. It is also known as the Hoopskirt (see below), Chinese Hat (see above), and Strings of Pearl (see below).

Milk Dipper:

The bowl of this “dipper” is made up of the four stars of the handle of the Teapot in the IAU constellation Sagittarius (See Teapot below): Sigma (σ) Sagittarii (Nunki), Phi (ϕ) Sagittarii, Tau (τ) Sagittarii, and Zeta (ζ) Sagittarii (Ascella). The handle of the “dipper” is formed by the star Lambda (λ) Sagittarii (Kaus Borealis), which is close to the globular cluster Messier 28 (NGC 6626). *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this asterism. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), also describes it and lists this name. Compare this to Milk Ladle (below).

Milk Ladle:

This Norwegian asterism “Melkeøsen” is in the IAU constellation Sagittarius. The bowl of this “ladle” is made up of the four stars of the handle of the Teapot in the IAU constellation Sagittarius (See Teapot below): Sigma (σ) Sagittarii (Nunki), Phi (ϕ) Sagittarii, Tau (τ) Sagittarii, and Zeta (ζ) Sagittarii (Ascella). The handle of the “ladle” is formed by the star Lambda (λ) Sagittarii (Kaus Borealis), which is close to the globular cluster Messier 28 (NGC 6626). Compare this to Milk Dipper (above).

Milkmaids of the Sky:

This Danish and Icelandic asterism “Fiosakonur ā lopti” is the IAU constellation Ursa Minor as listed in R. H. Allen’s *Star Names* in 1899.

Millet Stars:

This Japanese asterism “Awainya Boshi” is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

Millet and Rice Stars:

This Japanese asterism “Awaine Boshi” is the belt of Orion in the IAU constellation Orion (Renshaw and Ihara 2001).

Mimburi:

This Jinibara Asterism is the Coal Sack Nebula in the IAU constellation Crux (see Coal Sack Nebula, above).

Mimir:

This Norse asterism “Mimir” or “Mímir” is made up of the stars of the IAU constellation Centaurus and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) are Mimir’s feet, Epsilon (ε) Centauri his “left knee”, Theta (θ) Centauri the top of Mimir’s “head”. One arm runs from Nu (ν) Centauri through d Centauri to a “hand” at Iota (ι) Centauri (where Jónsson depicts a horn in Mimir’s hand) and the other arm runs from Phi (ϕ) Centauri through Eta (η) Centauri. Mímir or Mim was renowned in Norse mythology for his wisdom. Mimir was beheaded in the Æsir–Vanir War and Odin, finding Mimir’s head, carries it around so that it can recite secret knowledge and wisdom to counsel him.

Mimosa:

See Actor, above.

Min:

This Egyptian Dendera asterism is made up of stars of the IAU constellation Centaurus (Hoffman 2017): It is depicted as bull-headed man carrying a scythe. In the 19th dynasty Cairo Calendar (Hardy 2003) it is the star Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus. The Dendera image appears to be a merger of the Babylonian God of agriculture, Ningirsu, with the Egyptian God Min, who was merged with the Greek God Pan. Min is an ancient fertility God from the Predynastic Period (c. 6000 – 3150 B.C.E.) who guarded travelers.

Mina:

This Vedic rashi “Mina” or “Meena” as listed in the Vedic *Candragarbha-parivarta* (Kotyk 2017, Rath 2022) is the IAU constellation Pisces. The Chinese translated this as “Mina” in their phonetic translation of this work (Kotyk 2017). W. Brennan lists it as “Mina” in his *Hindu Astronomy* in 1896. Bhagwath (2019) lists it as “Meena” and writes that it represents the energy of the God Parjanya.

This Tamil asterism “Mina” or “Minam” is the IAU constellation Pisces as listed in R. H. Allen’s *Star Names* in 1899.

Minchir:

See Nostril of the Brave One, below.

Minelauva:

See In the Manzil Awwa, above.

Minerva:

This Roman asterism "Minerva" is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Minerva was the Goddess of wisdom, war, art, schools, justice, and commerce.

Mini Cassiopeia:

There are two **telescopic** asterisms by this name:

- One is the Canadian asterism Kemble 2: See W, below.
- One is Ferrero 19 (see W, below).

Mini Cepheus:

This **telescopic** asterism Sánta 131, listed in 2008 by Hungarian astronomer Sánta Gábor, is in the IAU constellation Cassiopeia and includes 6 stars between magnitude 6 – 9 including HIP 857 and 1023 with HIP 951 in the middle. Gábor describes this as "HD 725 group" (a reference to HIP 951) and "Cepheus like". NOTE: This contains a "W" shape that could also be seen as a mini-Cassiopeia.

Mini Corona Borealis:

This **telescopic** asterism is a curve of stars within open cluster NGC 2420 in the IAU constellation Gemini. American astronomer Steve Coe (1949 – 2018) and South African astronomer Magda Streicher both refer to it as having the shape of Corona Borealis, though Streicher also compares it with Corona Australis.

Mini Cross:

This **telescopic** asterism is a miniature version of the Northern Cross of Cygnus (see Northern Cross below). It is found in the IAU constellation Pegasus near the star Gamma (γ) Pegasi (Algenib). It contains five 8th to 10th magnitude stars including HIP 856.

Mini Canis Major:

This **telescopic** asterism is in the IAU constellation Centaurus and is Corder 2501 on the observing list of American astronomer Jeffrey Corder. Size 45' X 25'. This is five 8th magnitude stars and HIP 66454 (magnitude 5.9).

Mini Cygnus:

This **telescopic** asterism is in the IAU constellation Virgo and is on Chris Vaughan's observing list. Size 95' X 60'. This is four 7th – 8th magnitude stars including HIP 61977, 61992, 61711, and 61672.

Mini Delphinus:

There are two **telescopic** "Mini Delphinus" asterisms:

- One, also known as "Delphinus Minor", is Patchick 100, a miniature version of the constellation Delphinus discovered by Dana Patchick and reported in *Sky and Telescope* magazine in December 2007 by Sue French. Size 70' X 30'. Jeffrey Corder lists it as Corder 4729. It is made up of 7th magnitude stars in the IAU constellation Pegasus on the western edge of the Great Square (see Great Square, above):

    - The "head" is the four stars HIP 113869, 113800, 113766 and 113692.
    - The "tail" starts at HIP 113692 and runs through HIP 113645 and 113651.
- One, also known as the Leaping Minnow or Flying Minnow, is found in the IAU constellation Auriga and includes the stars 16, 18, and 19 Aurigae, with magnitudes between 4.5 and 6.5 and is part of the cluster Melotte 31. It is between open cluster NGC 1893 and the emission/reflection nebula IC 405 (the Flaming Star Nebula). Size 60' X 45'. This is Harrington 4 on American astronomer Phil Harrington's list of asterisms. René Merting lists it on the *Faint Fuzzies* website.

Mini Dumbbell:

This **telescopic** asterism is planetary nebula NGC 2371-2 in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1785, who described it as "Two. Sp-nf, distance 1', chevelure mixed. Both faint, small, equal, having a nucleus". Herschel listed it as "II 316 and II 317" in his catalogue. It is GC 1519 and 1520 in the *General Catalogue* of 1864. It seemed to English astronomer John Louis Emil Dreyer (1852 – 1926) to be two objects and so was entered as NGC 2371 and 2372 in the *New General Catalogue* of 1888. It is actually a single planetary nebula. It is also known as the Double Bubble Nebula, the Ant Nebula, the Figure Eight, the Mini Dumbbell, the Doughnut (Cut in Half), or the Gemini Nebula. Size 1' X 1'. American astronomer Walter Scott Houston described it as a "miniature version of the Dumbbell".

Mini Grus:

There are two **telescopic** "Mini Grus" asterisms:

- One is in the IAU constellation Corona Borealis and is Corder 2935 on the observing list of American astronomer Jeffrey Corder. Size 70' X 30'. This is ten 8^{th} – 10^{th} magnitude stars including HIP 77828, 77721, 77748, 77715, 77743, and 78001, and the double stars HIP 77875A and 77671A.
- One is the open cluster IC 4665 in the IAU constellation Ophiuchus. It was discovered in 1745 by Swiss astronomer Phillipe Loys de Chéseaux. Despite its brightness, it was not catalogued by Charles Messier or William Herschel. American astronomer Edward Emerson Barnard (1857 – 1923) recorded it, which resulted in it becoming IC 4665 in the *Index Catalogue*. This was listed by American astronomer Lew Gramer (1997), who described it as "a tiny 'Grus-like' or Lambda shaped asterism". It is also known as the Summer Beehive, Poseidon's Trident, Lambda, "Q", or the Black Swallowtail Butterfly.

Mini Hercules:

This **telescopic** asterism is the open cluster IC 4996 in the IAU constellation Cygnus. This was discovered by English astronomer Frank Arthur Bellamy (1863 – 1936). It was given this name by American astronomer Wayne Schmidt, who describes it as a miniature version of the IAU constellation Hercules.

Mini Messier 3:

This is the globular cluster Messier 75 (NGC 6864) in the IAU constellation Sagittarius. This was discovered by French astronomer Pierre Méchain in 1780. English astronomer William Herschel described it as "a miniature of M3 and pale to the gaze". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a "miniature of 3 Messier". John Herschel's General Catalogue of 1864 lists it as GC 4543. It is also known as the "Snowball" (see below).

Mini Messier 53:

This is the globular cluster Messier 9 (NGC 6333) in the IAU constellation Ophiuchus. French astronomer Charles Messier listed this in 1764. English astronomer William Herschel noted in the Philosophical Transactions in 1814 that this globular cluster "is a miniature of the 53rd [Messier]". It is listed in the *General Catalogue* of 1864 as GC 4287. John Herschel's catalogue lists it both as h 1917 and 3677.

Mini Orion Nebula:

This German **telescopic** asterism is the bipolar emission and reflection nebula NGC 1931 in the IAU constellation Auriga. This was discovered in 1793 by English astronomer William Herschel who listed it as "I 261". It became GC 1137 in the *General Catalogue* of 1864. This name was posted on the *Deep Sky Forum* in January 2024 by Uwe Glahn. It is also known as the "Fly Nebula".

Mini Perseus:

This telescopic asterism is open cluster Messier 36 (NGC 1960) in the IAU constellation Auriga. It was discovered by Giovanni Battista Hodierna before 1654. It is listed in the 1864 General Catalogue as GC 1166 and in John Herschel's catalogue as h 2866. American astronomer Phil Harrington notes that "to Kenneth Jones… it looks like the constellation Perseus in miniature": This would be Welsh amateur astronomer Kenneth Glyn Jones (1915 – 1995)

Mini Piscis Austrinus:

This **telescopic** asterism Sánta 46, listed in 2007 by Hungarian astronomer Sánta Gábor, which is a group of stars in the IAU constellation Boötes.

Mini Pleiades:

There are two **telescopic** "Mini Pleiades" asterisms:

- One is Sánta 129, listed in 2008 by Hungarian astronomer Sánta Gábor, is a group of stars in the IAU constellation Camelopardalis. Gábor describes it as "an M45 shaped asterism made by five 10 – 11 [magnitude] and some fainter."
- One is open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius discovered by Italian astronomer Giovanni Battista Hodierna before 1654. It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. American astronomer Sherburne Wesley Burnham (1838 – 1921) noted in *Burnham's Celestial Handbook* that it "resembles a miniature edition of the Pleiades, with a central knot of 7 or 8 bright stars".

Mini Ring Nebula:

This **telescopic** asterism is planetary nebula Wray 16-169 in the IAU constellation Circinus.

Mini Scorpius:

See Scorpion, below.

Mini Sombrero Galaxy:

This **telescopic** asterism NGC 5746 is a barred spiral galaxy in the IAU constellation Virgo. It was discovered by English astronomer William Herschel in 1786 who listed it as "I 126". It is GC 3987 in the *General Catalogue* of 1864. It is also known as the Blade and Pearl Galaxy (see above) and the Boxy

Bulge Galaxy (due to the boxy nature of its bulge).). This is O'Meara 74 in Stephen James O'Meara's *Hidden Treasures Catalogue* (2007).

Mini Taurus:

See "Poniatowski's Bull" (below).

Mini Wild Duck Cluster:

This **telescopic** asterism Sánta 193, listed in 2007 by Hungarian astronomer Sánta Gábor, which is in the IAU constellation Ursa Minor. It is described by Gábor as a "V-shaped asterism headed by Eta [η] UMi, stars 5 – 10 [magnitude] formed asterism like flying wild duck group". The star at the apex of the "V" is Eta (η) Ursae Minoris.

Miniature Dog:

This Tsilhqot'in asterism "Lhìndèsch'ósh" may be cognate with the Gwich'in asterism "Yahdii" (see Traveler, below (Cannon 2021)).

Miniature Spiral:

This telescopic asterism NGC 3928 is a lenticular galaxy in the IAU constellation Ursa Major. It was discovered by English astronomer William Herschel in March 1788 who listed it as "II 740" in his catalogue. It is GC 2590 in the *General Catalogue* of 1864.

Minister of Justice:

There are two Chinese stars from the Three Kingdoms to the Ming Dynasty with this name in the IAU constellation Ursa Major in their xing guan "Wénchāng" (see Administrative Center, above):

- One, "Taichang", is Phi (ϕ) Ursae Majoris.
- One, "Dali", is HIP 44504

This Chinese Chenzhuo xing guan "Dali" is the star 15 Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan "Administrative Centre".

Minister of Works:

This Chinese Chenzhuo xing guan "Silong" is the star Beta (β) Tauri (Elnath) in the IAU constellation Taurus. It is part of their xing guan Five Chariots.

Minkowski's Butterfly Nebula:

This **telescopic** asterism is planetary nebula Minkowski 2-9 (M 2-9) in the IAU constellation Ophiuchus, discovered by German American astronomer Rudolph Minkowski in 1947. It is also known as the Twin Jet Nebula, Wings of a Butterfly Nebula, or just the Butterfly Nebula.

Minkowski's Footprint:

See Footprint Nebula (above).

Minkowski's Object:

This **telescopic** asterism Arp 133 is an irregular dwarf galaxy 45 arcseconds northeast of the lenticular galaxy NGC 541 in the IAU constellation Cetus (magnitude 12.08). It was discovered by Prussian

astronomer Heinrich d'Arrest and became GC 5178 in the *General Catalogue* of 1864. It is named after American astronomer Rudolph Minkowski (1895 – 1976). This name appears as "Minkowskiána Céti" in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Minnie of Coma Berenices:

This **telescopic** asterism "Minérva Cómae Bereníces" is the interacting galaxy NGC 4676A (Arp 242) in the IAU constellation Coma Berenices. These were discovered in 1785 by English astronomer William Herschel who listed it as II 326". It became GC 3207 in the *General Catalogue* of 1864. The interacting galaxies NGC 4676 A and B are known as the "Mice" (see above) as they both have long "tails" created by the tidal action between the two. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Minoan Crown:

This Latin asterism "Minoia Corona" is the IAU constellation Corona Borealis.

Minoan Virgin:

This Latin asterism "Minoia Virgo" is the IAU constellation Corona Borealis as listed by Roman general Germanicus (15 B.C.E. – 19 C.E.).

Minor Bull:

This **telescopic** asterism is made up of six 10^{th} – 13^{th} magnitude stars in the IAU constellation Ophiuchus. Size 3'. It resembles the triangular Hyades cluster. It is 18' away from the Medium Bull asterism and 38' away from Poniatowski's Bull.

Minor Concubine:

There are two Chinese xing guans from the Three Kingdoms to the Ming Dynasty with the name "Qie" in the IAU constellation Scorpius and both are part of their xing guan Tails (see below):

- One is the star Lambda (λ) Scorpii.
- One is the star Upsilon (υ) Scorpii.

Minor Imperial Consort:

Twelve stars in the Chinese xing guan "Xuanyuan" (see below) from the Three Kingdoms to the Ming Dynasty are labelled "Cifei":

- 10 Ursae Majoris,
- HIP 44700,
- 38 Lyncis
- Alpha (α) Lyncis,
- HIP 47168
- 15 Leonis,
- Kappa (κ) Leonis,
- Lambda (λ) Leonis,
- Epsilon (ε) Leonis,
- Mu (μ) Leonis, and

- Zeta (ζ) Leonis.

Minotaurus:

There are two Latin asterisms by this name:

- One is the IAU constellation Centaurus. Johann Bayer's *Uranometria* (1603) lists "Minotaurus" for this constellation.
- One is the IAU constellation Sagittarius. This is sometimes shortened to "Taurus".

Mintaka:

See Belt, above.

Minyardin:

This Wardaman star is Delta (δ) Orionis (Mintaka) in the IAU constellation Orion (Cairns and Harney 2003).

Mira:

See Wonderful, below.

Mirach:

See Waist Cloth, below.

Mirach's Ghost:

This **telescopic** asterism NGC 404 is a field galaxy in the IAU constellation Andromeda. It was discovered by English astronomer William Herschel in 1784, who recorded it as "II 221". It is listed as GC 218 in the 1864 *General Catalogue*. It is located within 7arcminutes of Beta (β) Andromedae (Mirach), making it a difficult object to observe, which is why it is known as "Mirach's Ghost". Size 3.5' XX 3.5'. It is also known as the Lost Pearl (see above) and "Comet Komorowski". Astronomer Stephen James O'Meara's Hidden Treasures Catalogue (2007) lists this as O'Meara 5 and "Mirach's Ghost". "Mirachumbra Andromedae" ("Ghost of Mirach") appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Mirage:

This Sotho star "Diphalane Matsantsabana" is currently unidentified and appears in October (Alcock 2014). It has this name as it "looks like water on the ground".

Miram:

This star is Eta (η) Persei in the IAU constellation Perseus. This name appeared in the mid-20th century, but it's source and meaning are unknown. The IAU approved the name Miram for Eta (η) Persei A in 2017.

Mircea's Man:

This telescopic asterism is Földvári 37 in the IAU constellation Virgo from the observing list of Hungarian astronomer István Zoltán Földvári. It is listed on Brazilian astronomer Bruno Alessi's BDCC 7.6 list. It is

listed by Ziridava on *Cloudy Nights* in June 2017, who writes that he had his friend Istvan register it for him. Size 72'. Here is how it is made up:

- The "head" is the triangle of stars HIP 64917, 64983 and 64954A.
- The "body" is the line of stars HIP 65067, 65119A, 65192 and 65225.
- The "feet" are the stars HIP 65352 and 65198
- An "arm" runs out from HIP 65067 through 64984 to a "hand" at LR Virginis.

Mirfak:

See Elbow, above.

Mirganda:

This Darkinjung asterism is the Pleiades cluster in the IAU constellation Taurus (Jones 1993).

Miriti Fruit:

This Barasana asterism is unidentified stars in the area of the IAU constellation Corvus (Hugh-Jones 2006). This is the fruit of the Mauritia flexuosa, a type of palm.

Mirrilyn Manday:

This Birpai asterism is the Pleiades cluster in the IAU constellation Taurus (Lissarrague 2010).

Mirror:

This **telescopic** asterism Messier 100 (NGC 4321) is a grand design spiral galaxy in the IAU constellation Coma Berenices. It was discovered by French astronomer Pierre Méchain in 1781 and English astronomer William Herschel described it in the *Philosophical Transactions* in 1814. It is listed in the General Catalogue of 1864 as GC 2890 and in John Herschel's catalogue as h 1211. It is also known as the Blowdryer Galaxy (see above).

Mirror of Sirius:

The Māori called Alpha (α) Canis Majoris "Rehua" so their asterism "Taumata-o-Rehua" or "Pukawanui" ("the Mirror of Rehua") was a group of stars in Canis Major.

Mirzam:

See Herald, above.

Mirzam of the Arm:

This Arabic star is Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Minor.

Misam:

See Wrist, below.

Misha:

This Chinese phonetic translation of "Mesa" from the Vedic *Candragarbha-parivarta* in 566 is the IAU constellation Aries (Kotyk 2017).

Missile:

This Latin asterism is the IAU constellation Sagitta.

Missile of Andromeda:

This **telescopic** asterism "Míssile Andrómedae" is the barred spiral galaxy NGC 7640 in the IAU constellation Andromeda. This was discovered in 1786 by William Herschel who listed it as "II 600". It became GC 4950 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Mist:

This Polynesian (Cook Islands) asterism "Mahu" is the Magellanic clouds as listed in R. H. Allen's *Star Names* in 1899. Allen writes that English missionary William Ellis (1794 — 1872) reported these people has "distinguishing them as Upper and Lower" and gave the additional name "Nga Maū".

Mistake Morning Star:

This Blackfoot star is unidentified at present (Chamberlain 2019). It is also known as "Star Boy" (see below).

Mistaking a Person for Someone Else:

This Hawaiian star "Kakuhihewa" is Beta (β) Pegasi (Scheat) in the IAU constellation Pegasus. This is a name for Mō'I of O'ahu who created harmony and prosperity for his people.

Mister Q's Lost Sock:

This **telescopic** asterism is DSH J1725.0-3430, a line of stars in the IAU constellation Scorpius inside NGC 6357 (see Lobster Nebula, above). It is listed on Brazilian astronomer Bruno Alessi's BDCC 7.6 list. Size 40. It starts at HIP 85372, takes a bend at the next 7.1 magnitude star, then runs through a line of four stars including HIP 85250 and HIP 85237, where it bends again and ends at HIP 85158

Mistress of Hydra:

This **telescopic** asterism "Cýria Hýdrae" is the elliptical galaxy NGC 3091 in the IAU constellation Hydra. It was discovered in 1785 by William Herschel who listed it as "II 293". It became GC 1992 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is the dominant member of a group of galaxies".

Mistress of Pavo:

This **telescopic** asterism "Dómina Pavónis" is the elliptical galaxy IC 4765 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "from her central position this giant elliptical galaxy majestically dominates the surrounding swarm of galaxies (cluster AS805)."

Mistress of the Horizon:

See Hippopotamus, above.

Mistress Ursula:

This English asterism is the IAU constellation Ursa Major as listed by Ben Johnson in his *Epicoene* in 1609. This is a reference to Kallisto and her son Arcas.

Misty Belt:

This English asterism "Nebulosa Cinguli" is the Andromeda Galaxy, Messier 31, in the IAU constellation Andromeda as listed by English Astronomer John Flamsteed (1646 – 1719). He also called it "Nebulosa Supra Cingulum" ("misty belts above").

Misty Belts Above:

See Misty Belt, above.

Misty Clover Nebula:

This **telescopic** asterism is the nebula IC 1396 (SH 2-131, LBN 451, Cr 439, Ced 195, Tr 37) in the IAU constellation Cepheus. Inside this is the Elephant's Trunk Nebula (see above). IC 1396 was first recorded by American astronomer Edward Emerson Barnard (1857 – 1923). This is also known as the Misty Clover Cluster.

Misty Rolling:

This Latin asterism "Revolutio Nebulosa" is the Double Cluster (see above) as listed in the 15th century *Alfonsine Tables*.

Mithras:

This asterism is the IAU constellation Perseus. Robert Burnham lists this as a Persian name for Perseus in his *Burnham's Celestial Handbook* in 1978. Mithra is a Zoroastrian deity which became the Roman God Mithras.

Mithuna:

This Vedic rashi "Mithuna" or "Mithun" from the Vedic *Candragarbha-parivarta* (Kotyk 2017, Bhagwath 2019, Rath 2022) is the IAU constellation Gemini. The Chinese phonetically translated "Mithuna" from the Vedic *Candragarbha-parivarta* in 566 as "Mutouna" (Kotyk 2017). W. Brennan lists it in his *Hindu Astronomy* in 1896 as "Mit'huna", and "Mithuna". Bhagwath writes that it represents the energy of the God Mitra.

Mitre:

This German asterism "Mitre", "Mitre of Saint Peter", or "Saint Peter's Tiara" is the IAU constellation Triangulum and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

Mixture:

This asterism “Al Atha” is the IAU constellation Coma Berenices as listed by 10th century Arab astrologer Abū l-Ḥasan 'Alī ibn Abī l-Rijāl al-Shaybani (also known as Haly). Dutch orientalist and mathematician Jacob Golius (1596 – 1667) listed it as “Al Utha”.

Mixture of Serpens:

This **telescopic** asterism “Sýmmiges Serpéntis” is the peculiar spiral galaxy IC 4553 and IC 1127 (Arp 220) in the IAU constellation Serpens. IC 1127 was discovered by American astronomer Lewis Swift. IC 4553 was discovered by American astronomer Truman Safford in 1866. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it “is a complex of two recently merged galaxies”.

Mizar:

See Apron, above.

Moana-‘ohu-noa’ei-ha’a-moe-hara:

This Polynesian (Society Islands) asterism is the IAU constellation Crater.

Mochos:

This Latin asterism “Mochos” is the IAU constellation Libra as named by 2nd century author Lucius Ampelius. Mochos is the name of the person Ampelius identifies as the inventor of scales.

Modest of Sextans:

This **telescopic** asterism “Modéstus Sextántis” is the spiral galaxy NGC 3423 in the IAU constellation Sextans. It was discovered in 1784 by William Herschel who listed it as “IV 6” and as “II 31”. It became GC 2234 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Moiety:

The Xerente practice moiety exogamy and see the belt of Orion and Kappa (κ) Orionis (Saiph) as one moiety, and the Pleiades cluster in the IAU constellation Taurus as the other.

Moinee:

This Palawa star “Moinee” or “Mohinee” (Hamacher 2011, Gantevoort 2016) is the Alpha (α) Carinae (Canopus) in the IAU constellation Carina and represents one of the brothers in their asterism Star Brothers (see below). The Palawa called it the “star that never moved”. This was because at the time that this story line originated (~12,000 years ago) Canopus was within 10˚ of the south celestial pole.

Moist One:

This Vedic nakshatra (lunar mansion) “Ardra” or “Ārdrā” (“green”, “succulent”, or “moist one”) is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. Ivanković (2021) lists it as “Ārdrā” and associates it with the Vedic storm God Rudra or Rutra. R. H. Allen lists it as “Ardra” in his *Star Names* in 1899. In 2019 Leitz listed it as appearing in the *Atharveda* and on the nakshatra list of the scholar Varahamihir. Other sources have listed it as Gamma (γ) Geminorum (Alhena). It is related to their deity Rudra or Shiva. A variation found in the *Taittirīya Brāhmana* is “Bāhu” (Ivanković 2021, see Arm above). W.

Brennand lists this as “Ardra” in his *Hindu Astronomy* in 1896 and translates this as “a gem”. Bhagwath (2019) lists it as “Aridra” and lists its symbols as a teardrop, diamond, or a human head.

This Myanmar nekkhat (lunar mansion) “Adra” (အဒြာ) is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion.

This Tibetan gyukar (lunar house) “Lag” or “Lak” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Johnson-Groh 2013).

Moldoveanu:

This **telescopic** Romanian star is XO-1 in the IAU constellation Corona Borealis. It given this name in the IAU NameExoWorlds campaign. It is named for the highest peak in the Făgăras mountain range. It has an exoplanet named Negoiu, which is the name of the second highest peak in that range.

Molestina:

This Northern Andean asterism is a triangle of stars in the IAU constellations Aquila, Lyra, and Scorpius (Quinatoa 2018): Alpha (α) Aquilae (Altair), Alpha (α) Scorpii (Antares) and Alpha (α) Lyrae (Vega).

Moment of the Universe:

This Vedic asterism “Brahma Muhurta” is the IAU constellation Cygnus (Bhagwath 2019). The God Brahma is seen riding a swan.

Momonapikowalu:

This Hawaiian star is Gamma (γ) Cygni (Sadr) in the IAU constellation Cygnus.

Mon Gru:

This Tibetan gyukar (lunar house) “Mon Gru” or “Möndru” (Johnson-Groh 2013) is the star Gamma (γ) Aquarii (Sadachbia). It is part of the Vedic asterism Hundred Cures (see above) and is identical to the Vedic asterism Satabhishak (see below).

Mönch:

This **telescopic** Swiss star is HIP 72339 (HD 130322) in the IAU constellation Virgo (magnitude 8.04). It was given this name in the IAU NameExoWorlds campaign. It is named for a prominent Swiss peak in the Bernese Alps. It has an exoplanet named Eiger, which is another prominent peak in the Bernese Alps.

Moniee:

This Nuenone star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Gantevoort 2017). Compare this to the Palawa star Moinee (see above).

Mongoose:

This Babylonian asterism “dNIN.KILIM” or “shikkû” is listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 but the stars have not been identified.

Monkey:

This Northern Andean asterism “Mercedes Cotacachi” is made up of the stars of the IAU constellations Aquila, Scutum, and Ophiuchus (Quinatoa 2018):

- The “body” is between 64 Ophiuchus and Beta (β) Scuti,
- The “head” is an arc of stars: Eta (η) Scuti and 12, 14, 15, and Gamma (γ) Aquilae, and
- The rounded “tail” is formed by the faint stars 6 Sagittarii and HIP 88981 and 87074.

Monkey Face Nebula:

This **telescopic** asterism is planetary nebula NGC 1514 in the IAU constellation Taurus. It was discovered by English astronomer William Herschel in 1790 who listed it in his catalogue as “IV 69”. It is GC 810 in the *General Catalogue* of 1864. It is also known as the Pansy Nebula and Crystal Ball Nebula. RASC member Frankie Sowa posted on Facebook 2023 December 23 that it “looks like a monkey’s face”. Size 2.2’ X 2.2’.

Monkey Head Nebula:

This **telescopic** asterism is the open cluster NGC 2175, embedded in a diffusion nebula in the IAU constellation Orion, discovered by Italian astronomer Giovanni Batista Hodierna before 1654. It is GC 1366 in the *General Catalogue* of 1864. Size 40’ X 30’. NOTE: Simbad uses NGC 2174 for the nebula and NGC 2175 for the cluster, and this overlaps IC 2159 (recorded by French astronomer Guillaume Bigourdan (1851 – 1932)) and is also classified as SH 2-252. This is O’Meara 34 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) and he lists the name “Monkey Head Nebula”.

Monkeys:

This Tupi Guarani asterism is near their asterism Palm Tree (see below) but the stars are unidentified at this time (Lima and De M. Figueirôa, 2007).

Monoceros:

None of the stars of Monoceros are brighter than 4th magnitude, but these stars do appear in 97 of the asterisms listed in this handbook.

This IAU constellation (IAU abbreviation Mon), the unicorn, was created by Dutch astronomer Petrus Plancius in 1612, though R. H. Allen in his *Star Names* in 1899 attributes its creation to German astronomer Jacob Bartsch (1600 – 1633), who listed it as “Unicornu” in the *Planisphaerium Stellatum* (1613), which depicts it as a unicorn riding to our right. Allen mentions that Heinrich William Matthias Olbers (1758 — 1840) “and others” found passages alluding to it in “the work of 1564” as “the other Horse south of the Twins and the Crab” and claims that French scholar Joseph Justus Scaliger (1540 – 1609) found it on a “Persian sphere”. Plancius’ celestial globe (1613) published in Amsterdam by Pieter van der Keere depicts “Monoceros”.

“Monocerros” is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a unicorn striding to our right.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Monoceros Unicornu” as a unicorn facing to our left.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Monoceros Unicornis”.

Edward Sherburne lists this as “Monoceros or Unicornus” in his *Sphere of Marcus Manilius* in 1675.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Monoceros” as a unicorn running to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts Monoceros as a unicorn galloping to our left.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels the “La Licorne”, “Unicornu”, and “monókeros” and depicts it as a unicorn trotting to our left.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Unicornis Monoceros” as a unicorn.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Monoceros as a unicorn.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this constellation “Unicornus al Monoceros” and depicts it as a unicorn.

Monoceros is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as a unicorn.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Monoceros” as a unicorn running to our right.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Monoceros as a unicorn.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Monoceros as a unicorn galloping to our right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “la Licorne” as a unicorn walking to our right.

German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as “Einhorn” and depicts it as the front half of a unicorn. Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Das Einhorn“ in the text and “Einhorn“ on the charts, depicting it as a unicorn trotting to our right.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as “Leoncorno” in his *Della Specola Astronomica De’ Regj Studj Di Palermo* (1792).

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Monoceros” as a unicorn trotting to our left.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Monoceros in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): It is depicted as a galloping unicorn.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Monoceros” as a unicorn running to our right.

Monoceros is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*.

"Monoceros" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a unicorn running to our right.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Monoceros" as a unicorn trotting to our left.

"Monoceros" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as a unicorn walking to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes this constellation as "Monoceros or Unicorn".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Monoceros, The Unicorn" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Monoceros, the Unicorn".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Monoceros" in his *Star Atlas* (1893) and describes it as "The Unicorn".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Monoceros" and describes it as a "Unicorn", incorrectly attributing it to Hevelius.

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Monoceros… the Unicorn".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Monoceros in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart depicts this with Delta () Monocerotis as the central star with three star lines running out:

- One through Zeta (ζ) Monocerotis to Alpha (α) Monocerotis,
- One through Beta (β) Monocerotis to Gamma (γ) Monocerotis, and
- One through Epsilon (ε) Monocerotis to the double star HIP 29151A.

Rey depicts Monoceros differently:

- His "head" is the triangle of stars Epsilon (ε) Monocerotis, 18 Monocerotis, and 13 Monocerotis, with a single line running out from this last star to 15 Monocerotis forming its "horn",
- The "body" is the line of stars 18, Delta (δ), and Zeta (ζ) Monocerotis, with a single line running from this last star to 30 Monocerotis forming a "tail",
- A "front leg" runs from Delta (δ) Monocerotis through Beta (β) Monocerotis to Gamma (γ) Monocerotis, and
- A "back leg" runs from Zeta (ζ) Monocerotis to Alpha (α) Monocerotis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Monoceros in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as three lines of stars radiating out of the star Delta (δ) Monocerotis:

- One runs through Alpha (α) Monocerotis to Zeta (ζ) Monocerotis,
- One runs through 18 Monocerotis to Epsilon (ε) Monocerotis A, and
- One runs through Beta (β) Monocerotis to Gamma (γ) Monocerotis.

Sky and Telescope Magazine, founded in 1941, depicts Monoceros in their magazine and publications like this:

- Its "head" is the triangle of stars 18, Epsilon (ε), and 13 Monocerotis, with a line from this last star to 15 Monocerotis forming a "horn",
- Its "neck" is the line between 18 and Delta (δ) Monocerotis with the line continuing to Zeta (ζ) Monocerotis forming the "body",
- The "front leg" is a line from Delta (δ) Monocerotis through Beta (β) Monocerotis to Gamma (γ) Monocerotis, and
- The "back leg" is a line between Zeta (ζ) Monocerotis and Alpha (α) Monocerotis.

Monoceros is known in France as "la Licorne" and in Italy as "il Unicorno" or "Licorno".

Monster Water:

This Kaurna asterism "Yurakauwe" ("yura water" or "monster water") is the dark spaces in the Milky Way (Wodliparri), which they see as dark ponds which are the dwelling place of the dangerous monster Yura, who punishes those who break sacred law (Clarke 2009, Hamacher 2015).

Monster with Three Heads:

The stars of this Lakota asterism "Pa Yamini Pa" are currently unidentified.

Month of Chanting Guiding Stars:

The Celtic PRIN or guiding stars in the Sequani Calendar in the twelfth month, Cantlos, is the IAU constellation Eridanus. (Benigni)

Month of Fumigations Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the second month, Dumannios, is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Benigni). Compare to their asterism Darkening, above.

Month of Invocations Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the sixth month, Cutios, is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus (Benigni).

Month of Ritual Ablutions Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the fourth month, Antagios, is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Benigni).

Month of the Stag Guiding Star:

The Celtic PRIN or guiding star in the Sequani Calendar in the tenth month, Elembivios, is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. When Capella is rising, Vega is at the zenith, and Coma Berenices is setting (Benigni). Compare this to their asterism Elembiui Prinnios (see Arbitration, above).

Montuno:

This **telescopic** Panamanian star is WASP 79 in the IAU constellation Eridanus (magnitude 10.1). It was given this name in the IAU NameExoWorlds campaign. A Montuno is a man's traditional Panamanian dancing costume. It has an exoplanet named Pollera, which is the name of the woman's dancing costume.

Monuafe:

This Tongan star is Lambda (λ) Orionis (Meissa) in the IAU constellation Orion.

Moon:

This Korean star (yes star, NOT our Moon orbiting the Earth) is 37 Tauri in the IAU constellation Taurus.

Moon Dog:

This Inuit (Alaska) asterism is the IAU constellation Canis Major.

Moon's Dog:

This Iñupiat star "I-gha-lum Ki-mukh-ti" ("moon's dog") is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

Mooring Post:

This ancient Egyptian asterism "Menit" is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and is a triangle of stars from the IAU constellations Ursa Major and Boötes: Eta (η) Ursae Majoris (the end of the handle of the Big Dipper), and Alpha (α) Boötis (Arcturus) and Eta (η) Boötis. The earliest known example is on a sky map on the ceiling of the tomb of 18th Dynasty Egyptian official Senenmut, adviser of Hatschepsut, in Thebes. It also shows up in the *Dendera Zodiac* (Krupp 1983).

Moose:

This Ojibwe asterism "Mooz" is made up of the stars of the IAU constellations Lacerta and Pegasus (Lee et al 2014):

- The "body" is the Great Square of Pegasus (see Great Square, above),
- The "back leg" runs from Alpha (α) Pegasi (Markab) to Zeta (ζ) Pegasi,
- The "front leg" runs from Beta (β) Pegasi (Scheat) to an "knee" at Lambda (λ) Pegasi and a "foot" at Kappa (κ) Pegasi, and
- The "neck" is from Beta (β) Pegasi (Scheat) to Eta (η) Pegasi, where it takes a turn to a wavy line of stars that form the "antlers": 6, 2, 5, 4 and Alpha (α) and Beta (β) Lacertae.

There are two Belarussian "Sahachy" ("moose") asterisms:

- One is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor, which is part of their asterism "Small Cart" (see below).
- One is the IAU constellation Ursa Major (Avilin 2009).

Moose and Dogs:

The stars of this Tsilhqot'in asterism are unidentified at present (Cannon 2021).

Mopane Worm:

This Tswana asterism "Gakala" is the IAU constellation Delphinus (Slotegraaf 2013).

Moranang:

This Basotho (Northern Sotho) star is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus. Another Sotho name for it is "Senakane" see Little Horn Star, above).

Morava:

This **telescopic** Serbian star is WASP 60 in the IAU constellation Pegasus (magnitude 12.18). It was given this name in the IAU NameExoWorlds campaign. It is named after the longest river system in Serbia. It has an exoplanet named Vlasina, which is the name of one of the most important tributaries.

Mordborrongo:

This Wardaman star is Alpha (α) Ursae Majoris (Dubhe) in the IAU constellation Ursa Major (Cairns and Harney 2003).

More Impetuous of Sextans:

This **telescopic** asterism "Veheméntior Sextántis" is the interacting galaxy NGC 3169 in the IAU constellation Sextans, which is interacting with NGC 3166. This was discovered by English astronomer William Herschel in 1787 who listed it as "I 163" in his catalogue. It is GC 2008 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). These two galaxies are also known as the "Galactic Couple" (see above).

More Southern Dog:

This asterism "Canis Australior" is the IAU constellation Canis Major. This name is listed in Johann Bayer's *Uranometria* (1603). R. H. Allen lists the name "Canis Australior" in his *Star Names* in 1899.

Moriah:

This **telescopic** Palestinian star is HIP 55664 (HD 99109) in the IAU constellation Leo (magnitude 9.06). It was given this name in the IAU NameExoWorlds campaign. This is an ancient name for the Temple Mount in Jerusalem. It has an exoplanet named Jebus, which was a name for Jerusalem in the 2nd millennium B.C.E. when populated by the Canaanite tribe of Jebusites.

Mormyrus Fish:

This proposed Egyptian asterism "wꜣbwy" from the Old Kingdom (3100 B.C.E.) is related to their 19th nome (district) and the IAU constellation Pisces, particularly the circle of stars Theta (θ), Gamma (γ), Kappa (κ), Lambda (λ) and Iota (ι) Piscium (Berio 2014). This is the Nile Perch (Lates niloticus).

Morning Crews:

This Atacameño asterism “Cuadrillas de la Mañana” is the Pleiades cluster in the IAU constellation Taurus (Moyano 2011). This specifically refers to their heliacal rising in June.

Morning Star:

This Upper Tanana star “ikaay k’adeht’ąą’a” is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila (Cannon 2021).

This T’atsaol’ine and Wiidiideh star is either is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila or Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cannon 2021).

This Upper Kuskokwim star “Mihoyolkole” is unidentified at present (Cannon 2021).

This Blackfoot star is unidentified at present (Chamberlain 2019).

Morning Stars:

This Koyukon asterism “kk’odehun’ huk’etlun’” is Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae in the IAU constellation Aquila (Cannon 2021).

Morning Star’s Younger Brother:

This Dakota star “Anpo Wicanhpi Sunkaku” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

This Lakota star “Wichapi Sunkaku” is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes.

Moroitch:

This Mara and Moporr star is Alpha (α) Orionis (Betelguese) in the IAU constellation Orion (Dawson 1881, Hamacher 2011).

Mortar:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a triangle of stars in the IAU constellation Pegasus: Iota (ι) Pegasi (the determinative star), 23 Pegasi and 32 Pegasi.

This Chinese xing guan “Jiù” (臼) is a quadrilateral of stars in the IAU constellations Cygnus and Pegasus: 32 Pegasi, 24 Pegasi, Kappa (κ) Pegasi, and Mu (μ) 1 and 2 Cygni. The xing guan “Pestle in Rooftop Mansion” (see below) is alongside.

This Chinese Chenzhuo xing guan “Jiù” is a bent line of four stars in the IAU constellation Pegasus: 32 Pegasi, HIP 109602, Iota (ι) Pegasi, and 23 Pegasi.

This Korean asterism “Baggyeogpo” (박격포) is identical to the Chinese xing guan Mortar. Nearby is the Korean asterism “Inner Pestle” (see above).

Mortar Trowel:

This **telescopic** asterism is in the IAU constellation Virgo and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 2492. Size 60’. This includes the stars 65 and 66 Virginis and HIP 65265, 65392, 65414A, and 65540.

Moses:

In his *Star Names* in 1899 R. H. Allen reports that "New Testament Christians of the 16th and 17th centuries" identified the IAU constellation Aquarius as "Moses".

This German asterism is the IAU constellation Ophiuchus as described by German poet Philipp von Zesen (1619 – 1689).

Moses' Staff:

This Finnish asterism "Mooseksen sauva" is the Belt of Orion asterism in the IAU constellation Orion.

Mosque of Al-Thurayya:

This Bedouin asterism "Masğid al-Thrayyā" (مسجد الثريا) is a triangle of stars in the IAU constellations Aries and Triangulum: Alpha (α) Arietis (Hamal), Alpha (α) Trianguli, and Beta (β) Trianguli. They rise just before their asterism Al-Thurayya (see above) which is the Pleiades cluster.

Mosquito Larvae:

This **telescopic** asterism is NGC 4038 and NGC 4039 (Caldwell 60/61), a pair of colliding galaxies in the IAU constellation Corvus. These galaxies were discovered by English astronomer William Herschel in 1785 who listed them as "IV 28.1" and "IV 28.2". They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. They got this name because of the two long "tails" of stars, gas, and dust ejected from the collision, resembling an insect's antennae. This is also known as the Ring Tail Galaxy (see below), the Snorter (see below), and the Antennae or Antennae Galaxies (see above).

Mosquito Net:

This French asterism "Cousinière" is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899. Allen describes this as used by "French peasantry".

This Languedoc asterism "Cousigneiros" is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Most Corner Star:

This Korean star "Mukokseong" is Eta (η) Ursae Majoris in the IAU constellation Ursa Major.

Most Beautiful One of Canes Venatici:

This **telescopic** asterism "Callista Cánum Venaticórum" is the barred spiral galaxy NGC 5350 in the IAU constellation Canes Venatici. It was discovered in 1788 by William Herschel who listed it as "II 713". It became GC 3688 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "without any doubt spiral galaxy NGC 5350 is the most beautiful member of the Hickson 68 Group".

Most Famous:

This Vedic nakshatra (lunar mansion) "Dhanishtha" (Devanagari: धनिष्ठा, Tamil: அவிட்டம், Malayalam: അവിട്ടം, Telugu: ధనిష్ఠ and Kannada: ಧನಿಷ್ಠಾ), translated as "most famous" or "richest one", also known as "Shravishthā" or "Shravista" (see Swiftest, below) is in the IAU constellation Delphinus and is the stars Alpha (α) Delphini (Sualocin) and Delta (δ) Delphini. In 2019 Leitz lists "Dhanistha" as appearing

in the *Atharveda* and “Dhanishta” as appearing on the nakshatra list of the maharshi Varahamihir but identifies this as “the star Delphini”: Of course, Delphini is a suffix which could be applied to any star in the constellation Delphinus. Leitz lists an alternate name from Varahamihir’s list as “Sheravishtha”. Leitz writes that the maharshi Parasara listed this as Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Delta (δ) Delphinus, Gamma (γ) Delphinus, and Epsilon (ε) Delphinus, while in the *Taittiriya Brahmana* only four stars are listed, but oddly at one point lists the star Regulus as part of this asterism. W. Brennand lists this as “Dhanishta” in his *Hindu Astronomy* in 1896 and translates this as “a tabor”. Bhagwath (2019) lists its symbols as either a drum or a flute.

This Myanmar nekkhat (lunar mansion) “Danatheikda” (ဓနသိဒ္ဓ) is in the IAU constellation Delphinus and is the stars Alpha (α) Delphini (Sualocin) and Delta (δ) Delphini.

Moth:

This Chaldean asterism is the Pleiades cluster in the IAU constellation Taurus as listed in John Hill’s *Urania* in 1754. He gives it the name “Phaleana”, which is Latin for “phalanx”.

Moth Wing Cluster:

This **telescopic** asterism is the open cluster NGC 6281 in the IAU constellation Scorpius. It was discovered by Scottish astronomer James Dunlop in 1826. John Herschel listed it as h 3664 and later as GC 4265 in the *General Catalogue* of 1864. This is listed in Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007).

Mothallah:

See Head of the Triangle, above.

Mother:

This **telescopic** Ininew star “Nikawiy” is HIP 74961 (HD 136418) in the IAU constellation Boötes (magnitude 7.88). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Awasis, which is their word for “child”.

Mother and Daughter Giraffe:

This G/wi and //Gana asterism is made up of the stars of the IAU constellation Crux. Alpha (α) Crucis (Acrux) and Beta (β) Crucis are the mother, and Delta (δ) Crucis and Gamma (γ) Crucis are the daughter.

Mother Bear:

This Estonian asterism “Emakaru” is the IAU constellation Ursa Major and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Mother Camel:

This Tuareg asterism “Tâlemt” is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above(Holbrook 2020). It is part of a larger asterism Black Woman (see above).

Mother Camels:

This Arabic asterism “al-ʿawāʾid” (العوائد) is made up of stars in the IAU constellation Draco. Compare this to the Bedouin asterism Mother Camels (see below). This Arabic asterism has several parts:

- Two “hyenas” are Eta (η) and Zeta (ζ) Draconis (see Two Hyenas, below),
- Two “wolves” are 27 and Omega (ω) Draconis (see Wolf’s Nails, below),
- They are attacking a “baby camel” represented by a dim star next to Beta (β) Draconis (Rastaban),
- This “baby” is being protected by four female camels, represented by Rastaban, Gamma (γ) Draconis, Nu (ν) Draconis, and Xi (ξ) Draconis, and
- The “camel herders” who own these camels are next to a “cooking tripod” of the stars Upsilon (υ), Tau (τ), and Sigma (σ) Draconis.

This appears in several places:

- The Bedouin call it “al'iibil al'umu” (الإبل الأم) or “al-ʻAwā’idh” (“protecting mother camels” , الربع العوائذ).
- The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts four camels in this location.
- English Admiral Henry William Smyth’s Prolegomena of 1844 lists “Alwaid” and his *Bedford Catalogue* in 1844 lists “al ‘awáyid, the sucking camels” as well as “Alwaid” for just the star Beta (β) Draconis.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists the star Beta (β) Draconis as “Alwaid”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list “Alwaid” for Beta (β) Draconis.
- NOTE: Petrus Apianus created an asterism Five Dromedaries (see above) in 1533 which may have been influenced by this Bedouin asterism.

Mother Elk and Calf:

This Ukrainian asterism “losyatyna ta telyatko” (лосятина та телятко) is the IAU constellations Ursa Major and Ursa Minor.

Mother Hen:

This Macedonian asterism “Kvachka” or “QuatʃKa” is the Pleiades cluster (see below) in the IAU constellation Taurus (Cenev 2004). It is right next to the asterism “Petal” (see Rooster below) and the asterism “Jastreb” (see Hawk above).

This Serbian and western and southwestern Bulgarian asterism “Vlach”, “Vlasi”, “Vlashichi”, or “Aromani” is the Pleiades cluster in the IAU constellation Taurus (Cenev 2014).

This Ibibio star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is part of their asterism Mother Hen and Her Chicks (see below).

Mother Hen and Her Chicks:

This Ibibio and Annang asterism “unen eka ndito” has the star Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus as the hen and the Pleiades cluster as the chicks (Slotegraaf 2013), although Holbrook (2020) lists just the Pleiades cluster without Aldebaran.

This Hausa asterism “kaza da yaya” (Holbrook 2020) is the Pleiades Cluster in the IAU constellation Taurus. It is also called “kaza Maiyaya” (“hen with chickens”) by the Hausa (Urama 2007).

Mother of All Stars:

This Inca asterism is the Pleiades cluster in the IAU constellation Taurus. They also called it “Colla” (see Storehouse, below) “Oncoy” (see Disease, above), “Larilla”, “Fur”, and “Pugllaiguaico”. They considered the Pleiades to be the mother of all stars and used this cluster as a signal regarding their maize harvest.

Mother of Andromeda:

This asterism “Mater Andromedae” is the IAU constellation Cassiopeia as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Mother of Corn:

This Inca asterism “Mama Huaco” is the Pleiades cluster in the IAU constellation Taurus. It was identified with Mama Huaco, sister of Manco Capac, the mythical Inca conqueror of Cuzco.

Mother of Dog-Child with Basket of Burning Coals:

This Dakelh star is an unidentified morning star at present (Cannon 2021).

Mother of Dog Children:

This Dena’ina star is an unidentified morning star at present (Cannon 2021).

Mother of Gods:

This Vedic star “Mātā Devānām” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus in the Rig-Veda (Ivanković 2021). Aditi, whose name means “boundless”, “limitless”, or “innocence”, is a Goddess of motherhood, unconsciousness, the past, the future, and fertility. She is the mother of Indra, Varuna, Parjanya, Mitra, Ansh, Pushan, Dhatri, Aryaman, Surya, Bhaga, Vishnu, Savitr, and Lord Varama.

Mother of the Moon:

This /Xam star is Gamma (γ) Crucis in the IAU constellation Crux (Alcock 2014).

Mother of the Stars:

This Micronesian (Marshall Islands) star “Ligedaner” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga and is part of their asterism Creation of the Sky (see above).

Mother of Tinniinyaranna:

This Kaurna star “Madletaltami” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Hamacher 2015) and is related to their asterism “Tinniinyaranna” or “Kukukurkurra” (see Young Hunters, below).

Mother of Ursa Major:

This **telescopic** asterism “Gaéa Úrsae Majóris” is the interacting galaxy NGC 5216 in the IAU constellation Ursa Major. The two galaxies NGC 5216 and 5218 were discovered in 1790 by English astronomer William Herschel who listed them as “II 841” and “II 842”. They became GC 3590 and GC 3592 in the *General Catalogue* of 1864. This system is named Keenan’s System after the American astronomer Philip C. Keenan who studied them in 1935 and published a paper on the bridge of galactic material connecting the two galaxies. This name appears in *The Catalogue of One Thousand Named*

Galaxies by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "of the tidal extension at the south side, this system looks like a mother in labour". In Greek mythology Gaia, later latinized as Gaea, was the mother of the Titans.

Mother of Virgo:

This **telescopic** asterism "Matércula Vírginis" is the lenticular galaxy NGC 4933B (Arp 176) in the IAU constellation Virgo. It was discovered in 1789 by William Herschel who listed it as II 191. It is 3377 in the General Catalogue. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this lenticular galaxy is accompanied by two smaller ones, an elliptical… NGC 4933A and a late type… system NGC 4933C, like a mother and her two children".

Mother of Water:

This Tupi asterism "Suici" or "Ceucy" is the Pleiades cluster in the IAU constellation Taurus (De Freita Mourão 2009). They used this to indicate the arrival of the first rains and its setting indicated the end of the river flooding season.

This Estonian asterism "Vee Ema" is made up of the stars of the IAU constellation Capricornus. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.

Mother of Wind:

This Estonian asterism "Tuule Ema" is made up of the stars of the IAU constellation Aquarius. It is found on the *Taeiva Kaart* of Estonian cartographer Ado Grenzstein (1886) which was created for the Estonian language *Olevik* newspaper and printed using the wood engraving technique.**Mother Rosary:**

This Quechua asterism "Mama Rosario" is unidentified bright stellar clouds in the southern Milky Way (Urton 1981).

Mother Star:

This Naron star is possibly Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Alcock 2014) and is part of their asterism Finish Fire (see above). The other star in this asterism is her son and is possibly a star in Scorpius.

Mother Star's Son:

This Naron star is an unidentified star in the IAU constellation Scorpius (Alcock 2014) and is part of their asterism Finish Fire (see above).

Motionless Star:

This Chukchi star "Hogoras" for Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Dechend 1975). Dechend describes Hogoras as "master of the game" or "motionless star".

Mothra:

There are two **telescopic** "Mothra" asterisms:

- One is the open cluster NGC 6940 in the IAU constellation Cygnus. It was discovered by the English astronomer William Herschel in 1784 who listed it as "VII 8". It is GC 4591 in the *General Catalogue* of 1864. Mothra is a fictional giant moth that appeared in a 1961 Japanese film *Mothra* who reappears in later Godzilla films.
- One is the binary star EMO J041608.838-240358.60 in the IAU constellation Eridanus. It is gravitationally lensed behind the galaxy cluster MACS J0416.1-2403. This is two supergiant stars.

Motuliki:

This Tongan asterism is the Pleiades cluster in the IAU constellation Taurus.

Mouhoun:

This **telescopic** Burkina Faso star is HIP 22491 (HD 30856) in the IAU constellation Eridanus (magnitude 7.91). It was given this name in the IAU NameExoWorlds campaign. It is named after the Black Volta, their largest river. It has an exoplanet named Nakanabé, after the second largest river in this country, the Volta Blanche.

Mound Top:

This Tongan asterism "Fungasia" is the Pointers (see Pointers below), the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Mount Maenalus:

This Polish asterism "Mons Maenalus" was created by Polish astronomer Johannes Hevelius in 1687 and published in his *Firmamentum Sobiescianum*). It lies between the IAU constellations Boötes and Virgo. It is a bent oval of stars: 14, 18, and 31 Boötis, 71 Virginis, and HIP 68498, and 70327A. In Hevelius' *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, it is labelled "M. Menalis" on one page and "Mons Maenalus" on another. It depicts Boötes is standing on its peak.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this "Mons Maenalus" and depicts it as a mountain peak.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts this asterism as a mountain peak with Boötes standing on it, but one chart labels it "Mons Mænalus" and another "Mons Menalus".

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this asterism "M. Maenalus" and depicts it as a mountain peak.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) listed this asterism as "Berg Maenalus". Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Berg Mänalus" and "Der Berg Maenalus".

Italian charts listed it as "Menalo".

Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Mons Maenalus" in his *Celestial Atlas* and on his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): These depict Boötes is depicted as standing on its peak.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 mentions "Mons Maenalus" and attributes it to Hevelius.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Mons Maenalus" as a mountain peak on which Boötes is standing.

Mount Oeta:

This Latin asterism "Oetaeus" is the IAU constellation Hercules as listed in R. H. Allen's *Star Names* in 1899 and is a reference to the place Hercules died.

Mountain Bull:

This proposed Egyptian asterism from the Old Kingdom (3100 B.C.E.) is related to the names of their 10th, 11th, and 12th nomes (districts) and is related to the IAU constellations Corona Australis and Taurus (Berio 2014). Taurus rises as Corona Australis sets, and Corona Australis resembles the curved horns of a bull (Berio 2014)

Mountain Sheep:

This Paiute star "Nah-Gah" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Neilson 2021) and represents the Mountain Sheep or Big Horn Sheep (Gillard 2021). Nah-Gah, son of the Mountain Sheep Shinoh, climbs a high mountain but becomes stuck and becomes the north star.

This Diné asterism "Tsetah Dibé" is the IAU constellation Cancer (Childrey 2008).

This Yokuts asterism is the belt of Orion in the IAU constellation Orion.

This Chemehuevi asterism is the belt of Orion in the IAU constellation Orion. The stars Alpha (α) Orionis (Betelgeuse) and Beta (β) Orionis (Rigel) are the hunters (see Hunters, above) and the sword of Orion their arrow.

Mounted Hunters and Dogs:

This Chuvash asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

Mouse:

This Canadian asterism is the IAU constellation Leo (Vaughan 2023). This has Beta (β) Leonis (Denebola) as the mouse's "nose" and the Sickle of Leo (see below) as the tail Epsilon (ε), Mu (μ), Zeta (ζ), Gamma (γ) Leonis and Eta (η) Leonis to the star Alpha (α) Leonis (Regulus).

The stars of this Kogi asterism "Sinsi" are currently unidentified (Kelley & Milone 2011).

This **telescopic** asterism is Vastagh 4, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Gemini. Its size is 27.5' X 15.5'. Vastagh describes it as "mouse cartoon character, seen from above, with large, splayed ears. The nose of the mouse is marked by the star TYC 1356-00393-1. The [asterism] consists of 10 brighter and a few fainter members." Vastagh gave an alternate description of this, see Dragon Lizard, above.

Mouse Deer's Dung:

This Semelai asterism "Bintang Keran Cong" is the Pleiades cluster in the IAU constellation Taurus (Jaafar and Khairuddin 2014).

Mouse-Rat:

This Wardaman asterism is the IAU constellation Sagittarius (Cairns 1999).

Mouse Star:

This Japanese star "Ne no Hoshi" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Renshaw and Ihara 2000).

Moustache of Draco:

This **telescopic** asterism "Mýstax Dracónis" is the spiral galaxy NGC 5987 in the IAU constellation Draco. It was discovered in 1788 by William Herschel who listed it as "II 765". It became GC 4130 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the thick dust bands of this galaxy resemble a moustache (but rather the coat-hanger moustache of Salvador Dali…)"

Mouth:

This Chaldean asterism "mul ka" is listed in the *Great Star List* (Koch-Westenholz 1995) but the stars have not been identified.

Mouth of the Fish:

There are two Arabic stars with the name "mouth of the fish":

- One, "Fam Alsamaka" (فم السمكة), is the star Beta (α) Piscis Austrini in the IAU constellation Piscis Austrinus. Dorn (1829) describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- One, bearing the latinized name "Fumalsamakah" or "Fum al Samakah", is the star Beta (β) Piscium in the IAU constellation Pisces. The IAU approved the name Fumalsamakah for Beta (β) Piscium.

NOTE: John Hill lists the names "Samaca" and "Al Samaca" as names for the IAU constellation Pisces in his *Urania* in 1754.

Mouth of the Fish of the South:

This Latin star "Os Piscis Meridani" is Alpha (α) Piscis Austrinus (Fomalhaut) in the IAU constellation Piscis Austrinus.

Mouth of the Horn:

This English asterism is the stars Beta (β) Ursae Minoris (Kochab) and Gamma (γ) 1 and 2 Ursae Minoris in the IAU constellation Ursa Minor as listed by English alchemist and translator Richard Eden (c.1520 - 1576).

Mouth of the Horse:

There are two Arabic stars with the name "Fum al Faras":

- One is the star Epsilon (ε) Pegasi (Enif) in the IAU constellation Pegasus.

- “Fum al-Faras” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Fom” or “Fumalfaras”.
- This is listed as “Fam al-faras” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Hebrew name “savar ha-sus”.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “fam-al-faras”.
- English astronomer John Flamsteed (1646 – 1719) latinized this as “Os Pegasi” (“mouth of Pegasus”).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Fom, or Fam al faras, the horse’s lip.”
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Fom” for this star.

- One is Nu (ν) Pegasi.

Mouth of the Lion:

This Arabic asterism “Al Fum al Asad” is the open cluster Messier 44 (see Beehive, above) in the IAU constellation Cancer. It is located between the two stars forming the “nose” of their asterism “Lion” (see Lion above, and Tip of the Nose, below). NOTE: Robert Hues lists the “Arabic” name “Molef” in his *A Learned Treatise of Globes* in 1659.

Mouth of the Sea Monster:

This Arabic star “Fam al-qītus” is Gamma (γ) Ceti in the IAU constellation Cetus as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

Mouth of the Southern Fish:

This Latin asterism “Os Piscis Meridiani” is the IAU constellation Piscis Austrinus as listed by R. H. Allen in his *Star Names* in 1899. Allen writes that this appears in a “manuscript almanac of 1340”.

Mouth of the Toad:

This Quechua asterism “Boca del Sapo” is the Hyades cluster in the IAU constellation Taurus (Urton 1981).

Mouth of the Whale:

There are two Arabic stars with the name “Fum al-Ḥūt” (فم الحوت):

- One, later latinized to “Fomalhaut”, is the star Alpha (α) Piscis Austrini in the IAU constellation Piscis Austrinus:
  - “Fam al-Hūt al-Janūbī” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
  - The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists this star as “pi ha-dag ha-deromi” and lists the Arabic name as “fūm al-hūt al-janūbi”.
  - The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name “fam al-hūt” and the Hebew name “pi ha-dag”.

- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "fam al-hūt al-janūbī".
- A 14th century Christian Spanish astrolabe #4560 lists "al hūt" (King 2002).
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Fomahaut" for this star.
- German astronomer Johann Bayer (1572-1625) listed "Haut", "El Haut", and "Elhautine" for this star and another variation is "Fom Alhout Algenubi".
- This star is listed on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as "Fomahant" and "Cardan"
- Johann Bayer's *Uranometria* (1603) lists "Fumahant", "Fumahaut", and "Fumalhaut".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Fomahand".
- Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this star "Fomahent".
- This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Fomalhaut".
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists Fomalhaut.
- English astronomer Edmond Halley lists "Fomalhaut" on his southern star chart of 1678.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) lists it as "Fomalhant" as does French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760).
- The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) lists "Fomahand".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Fomalhaut".
- Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists "Fomalhaut" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Fomahand".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Fomalhant".
- A celestial pocket globe created by English uranographer Dudley Adams circa 1795 lists this star as "Fomalhaut".
- "Fomalhaut" is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801).
- American uranographer William Croswell (1760 – 1834) lists "Fomalhaut" on his *Mercator Map of the Starry Heavens* in 1810.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Fomalhaut" in his *Celestial Atlas* in 1822.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Fomalhaut" for "α Piscis Australis" and his *Bedford Catalogue* in 1844 lists "Fom-al-hút, the fish's mouth" and "fom al hút al jenúbi".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Fom Alhaut".

  - Robert Burnham lists “Fum al Hut” and “Fomalhaut” for this star in his *Burnham’s Celestial Handbook* in 1978 and translates it as “Mouth of the Fish”.
  - *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) incorrectly lists “Fomalhaut” as the alpha star in “the Southern Fish”, i.e. Piscis Austrinus.
  - English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Fomalhaut”.
  - American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Fomalhaut” and describes it as the “Mouth of the fish”.
  - *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as “Fomalhaut”.
  - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists “Fom-al-hut, the Fish’s mouth”.
  - The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list “Fomalhaut” for this star.
  - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists “Fomalhaut” for this star.
  - The IAU approved the name Fomalhaut for Alpha (α) Piscis Austrini A.
- One is the star Beta (β) Piscis Austrini in the IAU constellation Piscis Austrinus, as named by 16th century Arabic astronomer Al Tizini, later latinized to “Fum al Hui”:
  - German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as “Fomahand”.

An unbelievable number of variations of this name have shown up over the years:

- 14th century Greek geographer and astronomer Georgius Chrysococcas called it “Fumahaud”.
- The 1521 edition of the *Alfonsine Tables* incorrectly locates Fomalhaut in the constellation Aquarius and calls it “Fomahant” (Kunitzsch 1986) as did Longomontanus (Danish uranographer Christian Longberg) in his *Astronomica Danica* in 1640.
- Johannes Kepler (1571 – 1630) also placed it in Aquarius in his *Tabulae Rudolphinae* and calls it “Fomahandt”.
- Johann Bayer (1572-1625) calls it “Fumahant” and “Fumahaut rectius Fumalhaut”.
- Robert Hues (1659) and John Chilmead (1899) call it “Phom Ahut” in *A Learned Treatise on Globes*.
- German poet Philipp von Zesen (1619 – 1689) calls it “Fomahand” and “Fontabant”.
- Giovanni Battista Riccioli (1598 – 1671) calls it “Fomauth”, “Phomaut”, “Phomault”, “Phomant”, “Phomaant”, “Phomhaut”, and “Phomelhaut”.
- Edward Sherburne lists it as “Fomalhaut” in his *Sphere of Marcus Manilius* in 1675.
- French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) lists it as “Phomalhaut”.
- French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807) lists it as “Fumalhant”, “Fomahaut”, and “Phomahant”.
- German astronomer German astronomer Wilhelm Schickard (1592 – 1635) calls it “Fomalcuti”.
- George Costard calls it “Fomahout” in his *History of Astronomy* in 1767.
- Sir William Herschel (1738 – 1822) called it “Fomalhout” in a letter to his sister Caroline.

- American uranographer Elijah Burritt had the current name in his Atlas in 1833, but his planisphere labelled the star "Fomalhani".
- In his *Star Names* in 1899 R. H. Allen writes that English orientalist Thomas Hyde (1636 – 1703) called it "Pham Al Hut".
- NOTE: Fomalhaut A has an exoplanet named Dagon after the Levantine God of fertility.

Mouth of the Wolf:

This Norse asterism "Ulf's Keptr" is the Hyades cluster in the IAU constellation Taurus (Etheridge, 2012, Langer 2018, Bender 2020, Persson 2022). In Norse mythology two wolves are hunting the Sun and the Moon. This asterism is close to the ecliptic and can be interpreted as one of these wolves, probably Fenrir. There is an alternate story describing this as a wolf with its mouth held open by a sword, the foam from the wolf's mouth being the Milky Way, which would make it Garm, the wolf guarding the entrance to Hel (Persson 2022). In 1860 Gislason described another Mouth of the Wolf in the area of the IAU constellation Andromeda or Pisces, but we do not know the precise stars involved (Persson 2022).

This Icelandic asterism "Ulf's Keptr" from the manuscript GKS 1812 4th, De ordine ac positone stellarum in signis, is the Hyades cluster in the IAU constellation Taurus. Compare this to Old Icelandic "Little Wolf's Jaw" (see above).

Moving Steadily Star:

This Orang Asli asterism "Bintang Lerek" is the belt of Orion in the IAU constellation Orion (Jaafar and Khairuddin 2014).

Mowaimawuk:

This Netwar star "Mowaimawuk" is unidentified at present (Ramik 2019) but is said to be close to the Moon or rise close to it.

Mower:

This Belarussian asterism "Kosiarom", "Kasar", or "Kosar" is the IAU constellation Orion (Avilin 2009, 2018). This is also known as "Kreselca Pana Jezusa" (see Lord Jesus' Chair, above), "Grabli" (see Rake, above), "Kastsy" (see Mowers, below), "Try Karali" (see Three Kings, below), "Karomyselko" (see Small Yoke, below), "Tri Siostry" (see Three Sisters, below), "Prahi" or "Prapradki" (see Yarn Spinners, below), "Traiko" (see Three Times, below), "Asilki" (see above), "Matawila" (see Wheel, below), "Kosy" (see Scythes, below), "Kigachi ragachy" (see Shaft of a Plough, below), Kryzhe (see Cross, above), "Lisa" (see Fox, above), and "Trohkutnaia" (see With Three Corners, below).

Mowers:

This Italian (Piedmont and Ligurian Alps) asterism "Seitour" or "Li Seytu`r" is the belt of Orion in the IAU constellation Orion. It is related to their asterism Rakers (see below). Compare this to the Old High German asterism "Three Reapers" (see below).

There are two Belarussian asterisms called "каслкі" ("Katstsy" – "mowers"):

- One is Orion's belt in the IAU constellation Orion (Avilin 2009). The mower's "rake" ("Grabli") is the sword of Orion (see Rake, above).
- One is the IAU constellation Cassiopeia.

This German asterism “the Three Mowers” is the belt of Orion in the IAU constellation Orion as listed in R. H. Allen’s *Star Names* in 1899. Allen only identifies the source as “upper Germany”.

This Welsh asterism is the Belt of Orion asterism in the IAU constellation Orion. Marie Trevelyan’s *Folk-lore and Folk-stories of Wales* (1909) lists this as originating with farmers in the Vale of Glamorgan and speculates that it got this name as it is rising during the hay harvest.

Mowing Area:

This Italian (Piedmont and Ligurian Alps) asterism “Se´ita” or “Siteita” is the IAU constellation Orion and is related to their asterism Mowers (see above).

Mpingo:

This **telescopic** Tanzanian star is WASP 71 in the IAU constellation Cetus (magnitude 10.56). It was given this name in the IAU NameExoWorlds campaign. It is a tree (Dalbergia melanoxylon) used for making musical instruments and curios. It has an exoplanet named Tanzanite, which is the name of a precious stone mined in Tanzania.

Mrs. Black Snake:

This Tharumba star “Moodtha” is Delta (δ) Canis Majoris (Alwazn) in the IAU constellation Canis Major. It is part of their asterism “Wunbula” (see Bat and His Wives, above).

Mrs. Brown Snake:

This Tharumba star “Murrumbool” is Beta (β) Canis Majoris (Mirzam) in the IAU constellation Canis Major. It is part of their asterism “Wunbula” (see Bat and His Wives, above).

Mu-ri-in:

This Persian (Achaemenid Period 539 – 311 B.C.E.) asterism “mu-ri-in” is listed in Ernst Weidner’s *Fixsterne* in 1971 and the stars involved have not been identified.

Muan Bird:

This Mayan asterism is made up of star in the IAU constellation Gemini.

Mug:

This Italian asterism “Tazza” is the IAU constellation Crater.

Mugamzah:

This Arabic asterism is the IAU constellation Ara as listed in John Hill’s *Urania* in 1754.

Muia:

This asterism is either the IAU constellation Apus or Musca as listed in in John Hill’s *Urania* in 1754. He describes it as “the Bee, or Fly” which indicates he is not aware that these are two different constellations. I assume by the similarity in names that this is Musca.

Muin and the Seven Hunters:

This Mi’kmaq asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above) with a line of stars going off the end of the “handle” to the star Muphrid in the IAU

constellation Boötes. The “bucket” represents the bear Muin, and the stars of the handle and onwards refer to the “Seven Hunters”, each a bird associated with a star:

- Epsilon (ε) Ursae Majoris (Alioth) is “Jipjawej” (robin),
- Zeta (ζ) Ursae Majoris (Mizar) is “Jiji’kes” (chickadee) and 80 Ursae Majoris (Alcor) is “Wow” (the pot that Jiji’kes is carrying),
- Eta (η) Ursae Majoris (Alkaid) is “Mikjaqoqw” (grey jay),
- Gamma (γ) Boötis (Seginus) is “Ples” (passenger pigeon),
- Epsilon (ε) Boötis (Izar) is “Tities” (blue jay),
- Alpha (α) Boötis (Arcturus) is “Ku Ku We” (barred owl), and
- Eta (η) Boötis (Muphrid) is “Kupkwe’j” (saw whet owl).

MUL.AN.TA.SUR.RA:

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.).is part of the IAU constellation Sagittarius.

mul dnin-si-an-na:

This Sumerian asterism “mul dnin-si-an-na” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is dIš-tar MUL.MEŠ.

mul lúsa-gaz:

Sumerian asterism “mul lúsa-gaz” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is ḫab-ba-tum.

MUL.IN.DUB.AN.NA:

This Babylonian asterism from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Sagittarius.

mul mulmes sa SAG.DU mulUR.GU.LA:

This Babylonian ziqpu “mul mulmes sa SAG.DU mulUR.GU.LA” from cuneiform text AO 6478 (Schaumberger 1952) is Epsilon (ε) and Mu (μ) Leonis in the IAU constellation Leo.

mul sa mulLU.LIM:

This Babylonian ziqpu “mul sa mulLU.LIM” from cuneiform text AO 6478 (Schaumberger 1952) is the stars Pi (π), Omicron (ο), Xi (ξ), and Nu (ν) Cassiopeiae in the IAU constellation Cassiopeia.

mulA.EDEN:

This Babylonian ziqpu “mulA.EDEN” from cuneiform text AO 6478 (Schaumberger 1952) is Gamma (γ) Comae Berenices in the IAU constellation Coma Berenices.

mula-si-di:

This Babylonian ziqpu “mula-si-di” from cuneiform text AO 6478 (Schaumberger 1952) is Sigma (σ) Andromedae in the IAU constellation Andromeda.

Mule:

This Arabic asterism “Al Baghl” is the IAU constellation Lyra:

- German astronomer Johann Bayer (1572-1625) listed it as “Albegala” and “Albegalo” in his *Uranometria* (1603).
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as “Albegala” and “Albegalo”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 attributes “Albegala” to Riccioli.

Mule Deer:

This Seri star “Hap” is Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion.

[mule-tu-r]a-am-me:

This Sumerian asterism “[mule-tu-r]a-am-me” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is SUKKAL dA-nu-ni-tum.

Mule with Panniers:

This Arabic asterism “Mumsek al-‘Inān”, “al-‘Inān” or “Mumsek al-A’ina” is the IAU constellation Auriga as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

A Turkish planisphere shows the IAU constellation Auriga as a mule:

- John Hill lists the name as “Memschiath”, “Mumsik”, or “Mumsikal Ainna” in his *Urania* in 1754. Hill translates this as “mule with a bridle”, and elsewhere in the text gives the name “Mule” as an Arabic name for Auriga.
- German astronomer Johann Bayer (1572-1625) listed the name as “Mulus clitellatus” (“mule with panniers”) in his *Uranometria* (1603).

Mulehu:

See Twilight, below.

mulim-šu-rin-na nu-kúš-ù-e-ne:

This Sumerian asterism “mulim-šu-rin-na nu-kúš-ù-e-ne” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is kak-kab ti-nu-ri al-ma-na-a-ti.

Muliphein:

See Oath Star, below.

mulkin-su:

This Babylonian ziqpu “mulkin-su” from cuneiform text AO 6478 (Schaumberger 1952) is 15 Lacertae in the IAU constellation Lacerta.

mulku-ma-ri sa PIRIG.KA.DU.A:

This Babylonian ziqpu “mulku-ma-ri sa PIRIG.KA.DU.A” from cuneiform text AO 6478 (Schaumberger 1952) is Beta (β) Cygni (Albireo) in the IAU constellation Cygnus.

mulmaš-maš:

This Sumerian asterism “mulmaš-maš” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is ma-šu!-u.

mulMU.BU-kéš-da:

This Sumerian asterism “mulMU.BU-kéš-da” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is ni-i-ri.

mulna-as-ra-pi:

This Babylonian ziqpu “mulna-as-ra-pi” from cuneiform text AO 6478 (Schaumberger 1952) is b Persei and c Persei (48 Persei) in the IAU constellation Perseus.

mulni-bi-i sa:

This Babylonian ziqpu “mulni-bi-i sa” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Persei (Mirfak) in the IAU constellation Perseus.

mulni-bi sa irti-su:

This Babylonian ziqpu “mulni-bi sa irti-su” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Cygni (Deneb) in the IAU constellation Cygnus.

mulnu-muš-da:

This Sumerian asterism “mulnu-muš-da” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is nam-maš-šu-ú.

mulritti GAM

This Babylonian ziqpu “multritti GAM” from cuneiform text AO 6478 (Schaumberger 1952) is Beta (β) Aurigae (Elnath) in the IAU constellation Auriga.

mulsa mas-a.ti:

This Babylonian ziqpu “mulsa mas-a.ti” from cuneiform text AO 6478 (Schaumberger 1952) is Beta (β) Herculis (Kornephoros) in the IAU constellation Hercules.

mulsa tas-ka-a-ti:

This Babylonian ziqpu “mulsa tas-ka-a-ti” from cuneiform text AO 6478 (Schaumberger 1952) is Alpha (α) Herculis (Rasalgethi) in the IAU constellation Hercules.

mulSUDUN.ANSU:

This Babylonian ziqpu “mulSUDUN.ANSU” from cuneiform text AO 6478 (Schaumberger 1952) is Nu (ν) Boötis in the IAU constellation Boötes.

Multiplex of Pegasus:

This **telescopic** asterism “Múltiplex Pégasi” is the spiral galaxy NGC 7769 in the IAU constellation Pegasus. It was discovered in 1784 by William Herschel who listed it as “II 230”. It became GC 5020 in

the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "NGC 7769 shows two different spiral patterns, a tightly wrapped and patching inner one and an open and smooth outer one."

mulud-al-tar:

This Sumerian asterism "mulud-al-tar" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian name is dŠul-pa-è-a

muludu-til:

This Sumerian asterism "[mu]lueriduki" or "muludu-til" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Akkadian names are "ŠU", "dSal-bat-a-nu", or "bi-ib-bi".

mulugamušen:

This Babylonian asterism from the star names and constellations on planisphere K 8538 (Koch 1989) and from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is part of the stars of the IAU constellation Corvus. The Akkadian name in this list is "a-ri-bi".

mulum-mu-lu-ti:

This Babylonian ziqpu "mulum-mu-lu-ti" from cuneiform text AO 6478 (Schaumberger 1952) is 5 Persei in the IAU constellation Perseus.

Mulumulung:

This Dharawal asterism **"**Mulumulung" or "Murrumwirugan" is the Magellanic clouds (Bursill 2014). Variations include "Mullamullung" (Mathews 1903), "Mullymoola" (Peck 1933), "Dhinburi" and "Dhungagil" (Mathews 1901), "Mungudia" (Organ 1993).

This Dharug asterism "Mulumulung" is the Pleiades cluster in the IAU constellation Taurus (Collins 1798). Variations include "Dhinburi" (Collins 1798 & Mathews 1903), "Mirrinmurrin" and "Mullamullu" (Ridley 1875).

Mungali:

This Wardaman star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Cairns 1999) representing an 11-year-old child and is part of their asterism "Murabibi" (see Teenagers and Little Ones, below).

Municipal Office:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Ophiuchus: 47 Ophiuchi, HIP 84524, HIP 84574, Mu (μ) Ophiuchi, HIP 86768, and HIP 85922.

This Chinese xing guan "Shìlóu" (市楼) is a group of three lines of two stars in the IAU constellation Serpens:

- One line is Tau (τ) Ophiuchi and Nu (ν) Serpentis,
- One line is Mu (μ) Serpentis and Omicron (ο) Serpentis, and

- One line is HIP 86768 and 85397.

This Chinese Chenzhuo xing guan “Shìlóu” is an oval of stars in the IAU constellations Ophiuchus and Serpens: 41 Ophiuchi, 47 Ophiuchi, Mu (μ) Ophiuchi, Tau (τ) Ophiuchi, Zeta (ζ) Serpentis, and HIP 85537.

Munin:

This Wardaman star is Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Cairns and Harney 2003).

Munquentaúa:

This Tupi star “Munquentaúa” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (De Freita Mourão 2009).

Muphrid:

See Solitary One of the Lancer, below.

Mural:

This French asterism “Le Mural” was created by French astronomer Jérôme Lalande in 1795 between the IAU constellations Boötes and Ursa Major to commemorate the wall mounted quadrant at l’Ecole Militaire Observatory in Paris with which he and his nephew Michel Le Français observed the sky. The name was later latinized to “Quadrans Muralis”. It is roughly triangular, and the corner stars are HIP 78286, 77738, and 75043 and it includes the stars Beta (β) Boötis (Nekkar) and Eta (η) Ursae Majoris (Alkaid). Scottish uranographer Alexander Jameison’s *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts “Quadrans Muralis” as a quadrant.

German astronomer Johann Elert Bode (1747 – 1826) renamed it “Quadrans Muralis” (see Mural Quadrant, below).

Mural Quadrant:

This German asterism is a repurposing of “le Mural” created by French astronomer Jérôme Lalande in 1795 (see Mural, above) by German astronomer Johann Bode, who in 1801 removed the stars Beta (β) Boötis (Nekkar) and Eta (η) Boötis (Alkaid) and gave it this Latin name.

American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) depicts the “Mural Quadrant” as a quadrant.

German uranographer Adolf Stieler (1775 – 1836) listed it on his planisphere as “Mauer Quadrant” (“wall quadrant”).

Scottish astronomer Alexander Jamieson (1782 – 1850) listed “Mural Quadrant” in his *Celestial Atlas* in 1822.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts “Quadrans Muralis” as a quadrant.

It was listed on some Italian charts as “Quadrante”. It is roughly triangular, and the corner stars are HIP 78180 (CL Draconis), 77738, and 75043.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this asterism as "Mauer Quadrant".

Note: Even though this constellation is out of use, the Quadrantid meteor shower is still named for it.

Muri:

This Wardaman star is Kappa (κ) Scorpii in the IAU constellation Scorpius (Cairns and Harney 2003).

Murlugurru:

This Wardaman star is Alpha (α) Cygni in the IAU constellation Cygnus (Cairns and Harney 2003).

Murrardi:

This Wardaman star is Gamma (γ) Ursae Majoris (Phecda) in the IAU constellation Ursa Major (Cairns and Harney 2003).

Murrawurra:

This Gumbayngirr star is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus (Morelli 2015).

Murray Nowey:

This Dharug star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (King 1790).

Murrgay:

This Worimi asterism "Murrgay" is the Magellanic clouds (Lissarrague 2010).

This Worimi asterism is the Pleiades cluster in the IAU constellation Taurus (Lissarrague 2010).

This Birpai asterism is the Magellanic clouds (Lissarrague 2010).

Murrijin:

This Wardaman star is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius (Cairns and Harney 2003).

Murzim:

See Herald, above.

Mutterer:

This asterism "Musator" is the IAU constellation Sagitta as listed by 12th century Spanish Rabbi Abraham ibn Ezra. "Missore Ciceroni, Musator" ("Mutterer, sent to Cicero") is listed in Johann Bayer's *Uranometria* (1603). "Musator" is listed in John Hill's *Urania* in 1754. R. H. Allen in his *Star Names* in 1899 lists "Musator" as a name for Sagitta. Allen speculates that Ezra got this from Cicero's "Missore" ("the sender"), which is a term Cicero (106 – 43 B.C.E.) used to describe the one who shot the arrow which is Sagitta.

Musca:

None of the stars of Musca are brighter than 3rd magnitude and show up in 35 asterisms in this handbook.

This IAU constellation (IAU abbreviation Mus) was one of 12 constellations created by Flemish astronomer Petrus Plancius (1552 - 1622) in 1597 from the observations of Dutch uranographer Pieter Dirkszoon Keyser (1540 1596) and Dutch navigator Frederick de Houtman (1571 – 1627). De Houtman called it “De Vlieghe” (“the fly”).

Musca is depicted depicted on gores of the globe of Petrus Plancius published in 1598 by Jodocus Hondius as a fly but not labelled.

Dutch uranographer Willem Blaeu (1571 – 1638) listed it under the Latin name “Musca” on his globes of 1602/3.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Musca but I cannot make out the label.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Musca” as a fly.

This constellation was later named “Apis” (see Bee, above) by German astronomer Johann Bayer (1572-1625).

German astronomer Johannes Kepler (1571 – 1630) in his *Tabulae Rudolphinae*, a new edition of Brahe’s catalogue, in 1627, named this constellation “Apis” and “Musca”.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this constellation “Muca” and depicts it as a fly.

This constellation was named “Musca Apis” by English astronomer Edmund Halley in 1679.

This constellation was named “Apis seu Musca” (“the bee or the fly”) by Italian astronomer Giovanni Battista Riccioli (1598 – 1671).

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Musca as a fly.

Edward Sherburne lists both “Musca” and “Apis” in his *Sphere of Marcus Manilius* in 1675. Sherburne also lists the variation “Muia” and “Crabro Indicus” (“Indian crab”).

English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679 lists this constellation as “Musca Apis”.

The 1688 celestial globe of Italian priest and uranographer Vincenzo Maria Coronelli (1650-1718) lists this constellation (Stevenson 1921).

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Musca” as a bee facing to our left next to Chamaeleon. Hevelius’ *Firmamentum Sobiescianum sive Uranographia* (1690) depicts “Musca Australis” as a bee and on the chart it is a quadrilateral of the stars Alpha (α), Beta (β), Delta (δ) and Gamma (γ) Muscae.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Musca” as a fly.

American uranographer William Croswell (1760 – 1834) depicts “Musca” on his *Mercator Map of the Starry Heavens* in 1810 as a fly: This is clearly meant to be this asterism.

Dutch uranographer Carel Allard’s *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts “Musca” as a fly.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Musca as a fly. NOTE: Senex also lists Musca Apis as “Musca” (see Bee, above).

Musca is depicted in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729.

German engraver and cartographer Tobias Conrad Lotter’s *Planisphaerium Coeleste* (1750) depicts Musca as a fly.

John Hill lists this constellation as the “Fly” in his *Urania* in 1754.

French astronomer Abbé Nicolas Louis de Lacaille’s *Planisphère des Étoiles Ausralea* (1756) depicts “la Mouche” as a fly.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “La Mouche” as a fly.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Musca” as a fly.

The French edition of Flamsteed’s work, the *Atlas Céleste,* which was revised in 1778 lists it as “la Mouche”.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “Sudl Fliege” and depicts it as a fly.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts “Musca” as a fly.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts “Musca” as a fly.

Musca is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as “Vlieg” (“fly”): It is depicted as a fly.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Musca” in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt’s *The Constellations for each Month in the Year* (1835) depicts “Musca Apis” as a fly.

“Musca” is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Musca, The Bee" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Musca" and describes it as a "Fly".

R. H. Allen listed it in his *Star Names* in 1899 as "Musca Australis vel Indica, the Southern, or Indian Fly".

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "la Mouche" ("the fly") as a fly as does the 1778 edition. It appears on French charts as "Mouche Australe ou Indiene".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Musca" and gives its "original form" as "Apis Musca Australis", describing it as "The [Southern] Fly".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Musca in his book *The Stars - A New Way to See Them* (1952). On standard IAU charts this is depicted as a bent triangle formed of the stars Alpha (α) Muscae, Beta (β) Muscae, Lambda (λ) Muscae, and Gamma (γ) Muscae. Rey changes this to the triangle of stars Alpha (α), Delta (δ), and Gamma (γ) Muscae, with two lines running out from Alpha (α) Muscae:

- One to Beta (β) Muscae, and
- One through Epsilon (ε) Muscae to Lambda (λ) Muscae.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Musca in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a bent "question mark" shape starting at the star Beta (β) Muscae and running through Delta (δ), Gamma (γ), and Alpha (α) Muscae to Epsilon (α) Muscae.

Sky and Telescope Magazine, founded in 1941, depicts Musca in their magazine and publications in the same manner as Hlad et al, except that they connect the stars Alpha (α) and Beta (β) Muscae.

This appears on German charts as "Südliche Fliege", and Italian charts as "Mosca Australe".

Muscae Borealis:

See Northern Fly, below.

Muscida:

See Muzzle, below.

Muscle:

"The Muscle" is a Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) and is currently unidentified.

Muscle Man:

This **telescopic** asterism is the open cluster Stock 2 in the IAU constellation Cassiopeia and was listed on the asterisms list of American astronomer John Davis in 2006. Robert Zebahl lists it on his *Faint Fuzzies* website. Size 60' X 60'.

Muscovi Duck:

This Carib asterism “Oponoyuman” or “Opono” resembles a row of Muscovi ducks (Cairina moschata) swimming. Its present location is unknown (Magaña, and Jara, 1982).

Mushroom:

There are three **telescopic** “mushroom” asterisms:

- One is in the IAU constellation Delphinus and is Ennis 3 on the list of Canadian astronomer Charles Ennis. Ennis observed it while looking for the cluster Simonic 22. The “mushroom cap” is the curve of stars starting at Gaia DR3 1758246159423371776, and running through SAO 106804, SAO 106801, HIP 103878, SAO 106787, SAO 106780, Gaia DR3 1758140881185129728, SAO 106781, and SAO 106783 to SAO 106785. The “stem” is the stars Gaia DR3 1757481994545303808, Gaia DR3 1757483545030282368, HIP 103989, 104057, 104067, and Gaia DR3 1757489111307843200. Size 40’.
- One is in the IAU constellation Ursa Major and is Ennis 53 on the observing list of Canadian astronomer Charles Ennis. Size 40’ X 30’. The “stem” of the mushroom is the triangle of stars HIP 54442, HD 96495, and SAO 7299. The curve of the “top” of the mushroom is a line of 7^{th} – 9^{th} magnitude stars starting at HIP 54935 and running through HD 97419, HIP 54773, HD 97084, and SAO 7298 to HD 96611. This includes stars of Corder 2143 on Jeffrey Corder’s observing list.
- One, the “Missing Mushroom”, is in the IAU constellation Delphinus. This is twelve 8^{th} – 11^{th} magnitude stars. The base of this “mushroom” is next to the galaxy NGC 7025. South African astronomer Magda Streicher mentions this on the DOCdb database. Size 12 X 10’.

Music:

This Greek star “Musica” is 18 Delphini in the IAU constellation Delphinus. This is the Latin word for “music” and is related to the myth regarding Arion, whose life was saved by Dolphins after attracting them by playing his kithara. It has an exoplanet named Arion.

Musical Sign:

This Greek asterism “Μουσικόν ζώδιον” (“Mousikón zódion”), later latinized to “Musicum Signum”, is the IAU constellation Delphinus. This is related to the story of Arion and his lyre. “Musicum Signum” is listed in Johann Bayer’s *Uranometria* (1603).

Muskox:

This Dëne Suhne asterism is the Pleiades cluster in the IAU constellation Taurus (Cannon 2021).

Muspelheim:

This **telescopic** Danish star is HAT-P-29 in the IAU constellation Perseus (magnitude 11.83). It was given this name in the IAU NameExoWorlds campaign. It is named after the mythological Norse realm. This has an exoplanet named Surt, which is the name of the ruler of Muspelheim.

Mussel:

This English asterism “Pinna Marina” (“mussel” or “pen shell”) was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* and

overlaps his other asterism Anguilla (see Eel, above). It is made up of the stars of the IAU constellations Aquila and Scutum: 12 Aquilae, Beta (β) Scuti, Eta (η) Scuti, Delta (δ) Scuti, and Alpha (α) Scuti. Compare this to the asterism Antinous, above.

This French asterism "Mus" or "Musculus" is the IAU constellation Lyra as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807). He was probably mistranslating the Greek ""Χέλυς ὀλίγη" ("Chélys olígi"- see Tortoise Shell, below) which was a common early name for this constellation. NOTE: "Mus" is also the Latin name for a rodent, but that is clearly not what Lalande meant here.

Mussel of Coma Berenices:

This **telescopic** asterism "Mýtilus Cómae Bereníces" is the intermediate spiral galaxy NGC 4192 (Messier 98) in the IAU constellation Coma Berenices. It was discovered by Pierre Méchain in 1781. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called it this because "the spiral arms of this galaxy are fragmented, and the overall structure is rather asymmetric".

Mutator:

This star "Mutatrix" is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed by English orientalist Thomas Hyde (1636 – 1703) as listed by R. H. Allen in his *Star Names* in 1899.

Mutouna:

The Chinese phonetically translated "Mithuna" from the Vedic *Candragarbha-parivarta* in 566 (which is the IAU constellation Gemini) as "Mutouna" (Kotyk 2017).

Mutton:

This Italian asterism "Montone" is the IAU constellation Aries as named by Dante Alighieri (1265 – 1321). *Dele Stelle Fisse* ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Del Montone, o vero Ariete".

Muzzle:

This German star "Muscida" is Omicron (o) Ursae Majoris in the IAU constellation Ursa Major. The name is derived from the post classical Latin "musus" ("muzzle") and was introduced by the German astronomer Johann Bayer (1572-1625), who claimed that this was a name used by "barbarians". The IAU approved the name Muscida for the star Omicron (o) Ursae Majoris A. Compare this to "Snout" (below).

Muzzle of the Lion:

This Arabic asterism "Al Anf al Asad" is the open cluster Messier 44 (see Beehive, above) in the IAU constellation Cancer. It is located between the two stars forming the "nose" of their asterism "Lion" (see Lion above, and Tip of the Nose, below) and is also called "Mouth of the Lion" (see above).

Mweriker:

This Micronesian asterism is the Pleiades cluster in the IAU constellation Taurus.

Myōken:

This Japanese star “Myōken” (妙見) or “Myōken Bosatsu” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Kotyk 2017, 2018). Myōken was a Buddhist bodhisattva mainly worshipped in the Shingon, Tendai, and Nichiren schools (Kotyk 2018). He is often depicted as a warrior with an upraised sword in his hand. He is also known as “Venerable Star King” (see below).

My Horse Also Fell:

This asterism is the IAU constellation Virgo as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page. It got this name as it is next to their asterism “I’ve Fallen and Need Help”.

Myrtilus:

This Greek asterism “Myrtilus” is the IAU constellation Auriga. Myrtilus was the divine son of the Greek God Hermes:

- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Myrtilus” as an alternate name for Auriga.
- Johann Bayer’s *Uranometria* (1603) lists “Myrtilus” as a name for Auriga, but also as an alternate name for Cygnus.
- “Myrtilus” is listed in in John Hill’s *Urania* in 1754
- “Myrtilus” is listed in English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844.
- “Myrtilus” is listed in R. H. Allen’s *Star Names* in 1899. Allen notes that this name has occasionally also been used for Cygnus.

Mysterious:

This German asterism “Arcanus” is the IAU constellation as named by German poet Philipp von Zesen (1619 – 1689).

Mysterious Nebula

This **telescopic** asterism is the HII region SH 2-124 (LBN 426) in the IAU constellation Cygnus. This name appeared in a post on the *Astrophotography* Facebook page by astrophotographer Patrick A. Cosgrove of *Gosgrove’s Cosmos* on 23 August 2025. It is also known as the “Hidden Nebula”.

Mysterious of Camelopardalis:

This **telescopic** asterism “Arcánus Camelopardális” is the lenticular galaxy NGC 2655 (Arp 225) in the IAU constellation Camelopardalis. It was discovered in 1802 by William Herschel who listed it as “I 288”. It became GC 1691 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007) lists this as O’Meara 48 without these names but comments that “the galaxy is defined as a low surface brightness galaxy, and as such is difficult to discern from the background.”

Mystic Mountain:

This American asterism is in the Eta Carina Nebula (NGC 3372) in the IAU constellation Carina. It was imaged by the Hubble Space Telescope’s Wide Field Camera 3 in 2010. Washington Post journalist Joel Achenbach gave it this name in his article *Mystic Mountain: Is this the Hubble Telescope’s greatest*

image? (2015 Apr 16). The name originated in the book *At the Mountains of Madness* by H. P. Lovecraft. It contains the Wolf-Rayet star WR 25.

Mystic Rose:

This German asterism with the Latin name "Rosa Mystica", "Mystica Rosa", or simply "Rose" is the IAU constellation Equuleus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Rosa Mystica Al Equuleus". It later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and John Hill's *Urania* in 1754.

Mystical Black Pearl:

This **telescopic** Māori (Cook Islands) star "Poerava" is HIP 116084 (HD 221287) in the IAU constellation Tucana (magnitude 7.81). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Pipitea, which is a small white and gold pearl found in Penrhyn lagoon in the northern Cook Islands.

Na-at-tu-lum:

This Babylonian and Sumerian ziqpu from the BM 78161 tablet is Nu (ν) Boötis in the IAU constellation Boötes (Liechty 1988, Leitz 2019), is ziqpu 26 on this list, and would be part of their asterism SHU-PA (see Bright, above).

Na-at-tul-lum 2:

This Babylonian and Sumerian from the BM 78161 tablet is Xi (ξ) Boötis in the IAU constellation Boötes and the 2nd ziqpu on this list (Liechty 1988, Leitz 2019).

Na Kabiri:

This Kiribati star "Na Kabiri" is currently unidentified (Trussel and Groves 1978).

Na Kamoto:

This Kiribati star "Na Kamoto" is currently unidentified (Trussel and Groves 1978).

Na Kaua-ki-tokerau:

This Polynesian asterism from the Tuamotu archipelago is the IAU constellation Corona Borealis.

Na Kaua-ki-Tonga:

This Polynesian asterism from the Tuamotu archipelago is the IAU constellation Corona Australis.

Na Kuhi:

This Hawaiian asterism is the IAU constellation Cetus.

Na Lua-mata-o-ma-Velo:

See Na Mata-o-te-tokolua below.

Na Mata-o-te-tokolua:

This Tongan (Pukapuka Island) asterism, also known as “Na Lua-mata-o-ma-Velo”, is the IAU constellation Centaurus.

Na-pai-ka:

This Polynesian (Marquesas Islands) asterism is the IAU constellation Aries.

Na Taki-tolu-a-Mataliki:

This Tongan (Pukapuka Island) asterism is the IAU constellation Cassiopeia.

Naa:

This Micronesian asterism is made up of the star Alpha (α) Piscis Austrinis (Fomalhaut) in the IAU constellation Piscis Austrinus and the stars of the Great Square of Pegasus (see Great Square, above).

Nabilum:

This asterism is the IAU constellation Lyra. This is the name of the Phoenician harp, and this name also appeared as the Greek “Νάβλα” (“Návla”) and the Latin “Nabon”.

Naga Snake:

This Buddhist asterism is the IAU constellation Draco. It is the serpent of creation.

Nahi:

This Pahlavi asterism “Nahi” is the IAU constellation Capricornus as listed in R. H. Allen’s *Star Names* in 1899.

Nahn:

See Nose below.

Náhokosé:

This asterism appears in Western Apache and Chiricahua Apache culture as “Náhokosé”, in Jicarilla Apache culture as “Naahakosee”, and in Mescalero Apache culture as “Náaakusí”. It is similar to the Diné asterism “Náhookǫs” (see below)

Náhookǫs:

This Diné asterism “Náhookǫs” (Childrey 2008) is made up of three other asterisms, “Náhookǫs Bi’ką” (see Male Revolving One, above), “Náhookǫs Bi’áád” (see Female Revolving One, above), and “Náhookǫs Bikǫ’” (see Central Fire of Náhookǫs, above). Compare this to the Apache asterism Náhokosé (see above).

Nail:

This Syrian star “Mismār” (“needle” or “nail”), later latinized to “Mismar”, is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Hafez 2010).

This Belarussian star “Гвоздь” (“Gvozd”) is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Avilin 2009), which is part of their asterism “Small Cart” (see below). Compare this to the Estonian asterism “Põhjanael” (see North Nail, below).

Nail of the Sky:

This Finnish star “Taivaannaula” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Nail Star:

This Chukchi star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Krupp 1983). Compare this to the Estonian “North Nail” (see below), the Belarussian “Nail” (see above), and the Old Icelandic “World Nail” (see below).

Nailfish:

This Wardaman star “Ourtba” is Delta (δ) 1 Tauri in the IAU constellation Taurus and one of the stars in their asterism “Little Fishes” (see above).

Nakara:

This Kiribati star “Nakara” is Alpha (α) Leonis (Regulus) in the IAU constellation Leo (Trussel and Groves 1978).

Naked Raver:

This American asterism is the IAU constellation Hercules and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006).

Naledi:

See Star, below.

nam-maš-šu-ú:

This Akkadian asterism “nam-maš-šu-ú” from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mulnu-muš-da.

Namaan:

This German asterism is the IAU constellation Aquarius as listed by German astronomer Wilhelm Schickard (1592 – 1635). Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675 and John Hill lists this asterism in his *Urania* in 1754. Namaan was a Syrian general mentioned in the Bible.

Name of a Murdered Man:

This Inuit star “Sikuliaqsiujuittuq” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor (MacDonald 1998). It is also known as “He Who Never Goes Out on Newly Formed Ice” (see above).

Nanaya:

This Mesopotamian asterism is the IAU constellation Corona Borealis and is associated to their Goddess “Nanaya” ("Nanāy", "Nanaja", "Nanāja", '"Nanāya", or "Nanai"; antiquated transcription: "Nanâ"), a Goddess of love closely associated with Inanna.

Nánhǎi:

This Chinese star “Nánhǎi” from the 3 Kingdoms and Ming Dynasty Period is the star Xi (ξ) Serpentis in the IAU constellation Serpens and is and is part of their xing guan Heavenly Market East Wall (see above).

Nâno:

This “Persian” name for the IAU constellation Pisces was listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

Naos:

See Ship, below.

Napoleon:

This German asterism is the belt and sword of Orion in the IAU constellation Orion and was created by staff at the University of Leipzig in 1807. English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this and attributes it to this University. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this attribute and attributes it to the aforementioned university. R. H. Allen’s *Star Names* in 1899 lists this asterism and Allen writes that the English retaliated by renaming it “Nelson” (see Below).

Napoleon's Hat:

There are two **telescopic** Napoleon’s Hat asterisms:

- One, Picot 1, was discovered by French astronomer Fulbert Picot. It is seven 9th to 11th magnitude stars in the IAU constellation Boötes, located immediately south of the star Alpha (α) Boötis (Arcturus). Its size is 20’ X 7’. American astronomer Phil Harrington calls it a “flying saucer”. It is also listed as Leiter 10.
- One is Kronberger 44 in the IAU constellation Cygnus. René Merting describes it on the Faint Fuzzies website: “At 45x, I first see a flat, curved semicircle of six stars. On closer inspection, the star group resembles Picot 1. At 144x, some faint stars can be seen to the east of the arc, producing a slight glow and flashing alternately. Within and around the arc, some other faint stars can be seen.” Picot 1 is listed elsewhere in this handbook as Napoleon’s Hat and by Harrington as a “Flying Saucer”. The two most prominent stars are Gaia DR3 2087697363949159040 and Gaia DR3 2087886411227488768.

Narayana:

This Chinese translation “Nārāyana” or “Narayana” of the Vedic asterism Visnu from the *Xiuyao jing* (宿曜經）(759 and revised 764) is the IAU constellation Aquila (Kotyk 2017).

Narrow Cloudy Train of Female Stars:

This Latin asterism is the Pleiades cluster in the IAU constellation Taurus as described by 1st century Roman poet Marcus Manilius and listed in R. H. Allen’s *Star Names* in 1899.

Narrows:

This Arabic asterism “al-ḍayqa”, later latinized to “al Dayqa”, is the stars Kappa (κ) 1 and 2 and Upsilon (υ) Tauri in the IAU constellation Taurus.

Nash:

See Arrowhead, above.

Nashira:

See Scattering Auspice, below.

Nasti:

See Star, below.

Natem Tree:

This Netwar star "Natem" is Alpha (α) Centauri (Rigil Kentaurus) in the IAU constellation Centaurus (Ramík 2019). This is a reference to Pometia pinnata, and the name refers to their belief that when it touches this tree in the evening, it is time to plant yams.

Nathrachain:

This Celtic asterism is the IAU constellation Draco. Nathrachain is a Celtic snake deity.

Natiati:

This Kiribati star "Natiati" or "te Natiati" is currently unidentified (Trussel and Groves 1978).

Native American Bird:

This German asterism "Indianischer Vogel" is the IAU constellation Apus as listed in an abridged edition (1720) of German astronomer Johann Bayer's *Uranometria,* which came out in 1603.

Nau:

The stars of this Kiribati asterism "Nau" are unidentified at present (Trussel and Groves 1978).

Nautilus Galaxy:

This **telescopic** asterism is NGC 772 (Arp 78), an interacting spiral galaxy in the IAU constellation Aries. It was discovered by English astronomer William Herschel in 1785, who listed it as "I 112". It is GC 463 in the General Catalogue of 1864. Astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists it as O'Meara 8 and states that it is "nicknamed the Nautilus Galaxy… named after its resemblance to a nautilus seashell". It is also known as the "Fiddlehead" (see above).

Navel:

This Hebrew asterism "Genash" is the IAU constellation Ursa Minor as listed in John Hill's *Urania* in 1754 and as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

This Chaldean asterism "Kinush" as listed in Edward Sherburne's *Sphere of Marcus Manilius* in 1675.

This Kiribati star "Buto" ("navel" or "boundary stone") is an unidentified star in the IAU constellation Scorpius (Trussel and Groves 1978).

This Estonian star "Naba" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Navel of Draco:

This **telescopic** asterism "Umbilícus Dracónis" is the barred spiral galaxy NGC 5678 in the IAU constellation Draco. It was discovered in 1789 by William Herschel who listed it as "II 894". It became GC 3937 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it "is located near what could be imagined as the belly of the dragon."

Navel of the Mare:

This Arabic star "(Surrat) al-Faras" (سُرَّة الفرس) or "Al Surrat al Faras" is Alpha (α) Andromedae in the IAU constellation Andromeda:

- "Surrat al-Faras" was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists "Alferaz" and "Rigilasabie" (Dekker 2000).
- "Surrat al-Faras" is in the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).
- This was later latinized to "Alpheras" by German astronomer Johann Bayer (1572-1625), who listed it in his Uranometria (1603) and also gave it as an alternate name for Pegasus.
- "Alpheras" and "Alpharaso" are listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- John Chilmead in his *A Learned Treatise on Globes* (1899) listed "Alfaras Alathem", which he derived from Robert Hues' *A Learned Treatise of Globes* (1659).
- French astronomer Jerome Lalande (1732 – 1807) lists it as "Alpharès".
- Other variations include "Alpheratz", "Alperat", or "Sirrah".
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Alpheratz" in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822)
- "Sirrah", "Alpherat", and "Sirrat-al faras" are listed by English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and "Sirrah" appears in his *Prolegomena* in the same year.
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Alpheratz".
- "Sirrah" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alpheratz".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Alpheratz".
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Alpheratz".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Alpheratz" and describes it as "the horse".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Alpheratz".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list both "Alpheratz" and "Sirrah" for this star.

- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Alpheratz" for this star.
- The IAU approved the name Alpheratz for Alpha (α) Andromedae Aa.

This Latin star Umbilicus Andromedae" is the is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda.

NOTE: Alpha (α) Andromedae (Alpheratz) is a star common to both the IAU constellations Andromeda and Pegasus, and this goes back a long way. Aratus (315 – 240 B.C.E) called it a "ξυνός ἀστήρ" ("xynós astír") or "common star" for this reason.

Navel of the True Shepherd of Anu:

This Babylonian star "LI.DUR SIPA.ZI.AN.NA" is listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996. Anthony describes it as "probably Alpha [α] Orionis [Betelgeuse]". This would be part of the asterism True Shepherd of Anu (see below) and seems unlikely when you look at how it is described: It seems more likely to be Epsilon (ε) Orionis as Betelgeuse is one of the "shoulders" of this "shepherd".

Navi:

This American star is Gamma (γ) Cassiopeiae in the IAU constellation Cassiopeia. It was given this name by American astronaut Gus Ivan Grissom: It is Grissom's middle name reversed. It is believed that Grissom was influenced by the stars Sualocin and Rotanev which were reversed Latinized names of Giuseppe Piazzi's assistant Nicolo Cacciatore and decided to name some other stars in this area with reversed names. This star is also known as "Chi" (see Whip, below).

Navi-Matâne:

This Chakavian asterism is the ancient asterism Argo Navis (see Ship Argus below).

Navigation:

This star "Navigatoria" ("Navigation") is the Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. This name is listed in Johann Bayer's *Uranometria* (1603).

Navigators:

This Latin star "Navigatoria" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed in R. H. Allen's *Star Names* in 1899.

Navigator's Triangle:

This Hawaiian asterism "Huinakolu" is the Summer Triangle (see Summer Triangle below). It's three stars represent the Polynesian triangle:

- "Pira'etea" (Alpha (α) Cygni - Deneb) represents Hawaiki (Hawaii),
- "Keoe" (Alpha (α) Lyrae - Vega) represents Rapanui (Easter Island), and
- "Humu" (Alpha (α) Aquilae - Altair) represents Aotearoa (New Zealand).

Nawa:

The stars of this Kiribati asterism "Nawa" are unidentified at present (Trussel and Groves 1978).

NE-gun:

This Persian (Achaemenid Period 539 – 311 B.C.E.) star "NE-gun" is Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius as listed in Ernst Weidner's *Fixsterne* in 1971.

Near the Sword of Orion:

This **telescopic** asterism "Perixíphius Oriónis" is the spiral galaxy IC 421 in the IAU constellation Orion. It was discovered by American astronomer Williamina Fleming in 1888. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Nearby Dweller of Leo:

This **telescopic** asterism "Áccola Leónis" is the lenticular galaxy NGC 3489 in the IAU constellation Leo. It was discovered in 1784 by William Herschel who listed it as "II 101". It became GC 2276 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it is close to us (30 million light years).

Nearest Centaur:

This Scottish star "Proxima Centauri" is Alpha (α) Centauri C and is the closest star to Earth. It was discovered in 1915 by Scottish astronomer Robert Innes, who gave it the name "Proxima Centaurus". Since the 1920s this has been changed to Proxima Centauri. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Proxima Centauri". Kunitzsch and Smart (2006) listed it as "Proxima". The IAU approved the name Proxima Centauri for Alpha (α) Centauri C in 2016.

Neatest:

This Italian star "Bellissima" is Delta (δ) Virginis in the IAU constellation Virgo as listed by Italian astronomer Father Angelo Secchi and as listed in R. H. Allen's *Star Names* in 1899.

Nebuchadnezzar:

This German asterism is the IAU constellation Centaurus as listed by German poet Philipp von Zesen (1619 – 1689), who gave the name "Nebuchadrezzar".

Nebular:

This Greek asterism "Νεφελοειδής" or "Nefeloeidís" ("nebular" or "cloudy one") is open cluster Messier 44 in the IAU constellation Cancer.

Nebulous:

This Greek asterism "νεφελοειδής" ("Nefeloeidís") is the stars Lambda (λ) Orionis (Meissa), and Phi (φ) 1 and 2 Orionis in the IAU constellation Orion as listed by Ptolemy (c.100 – c.170):

- It was translated as "Sahābi"("nebula") by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

- "Nefeloeidís" as R. H. Allen's *Star Names* in 1899. Allen writes that this was a name commonly found "in early catalogues".
- This appeared in the Altas of English astronomer John Flamsteed (1646 – 1719) as "in capite Orionis nebulosa" ("the misty head of Orion").
- NOTE: Per Collinder later catalogued this as Cr 69.

Nebulous Mass in the Breast of Cancer:

This Greek asterism is the open cluster Messier 44 in the IAU constellation Cancer (see Beehive, above). This was Claudius Ptolemy's name for it in the *Almagest* (2nd century)":

- This was translated as "al-Ishtibāk al-Sahābi" by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This Latin asterism "Nebulosa, in pectore Cancri" is open cluster Messier 44 in the IAU constellation Cancer as listed in 16th and 17th century charts and translations of the *Almagest*.

Nebulous Smear on the Camel's Thigh:

This Arabic asterism "al-Latkhā al-Sahābiya" is the double clusters NGC 869 and 884 in the IAU constellation Perseus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Nebulous Star:

This Arabic asterism is the open cluster IC 2391 (Omicron Velorum Cluster) in the IAU constellation Vela. Arabic astronomer ʿAbd al-Rahman ibn ʿUmar al Sufi (903-986) recorded this as a "nebulous star" above the 37th star of Argo Navis. French astronomer Abbé Nicolas Louis de Lacaille (1713 – 1762) catalogued it as Lac II 5. It later became Caldwell 85.

Necht:

This Egyptian asterism "Necht" is located in the IAU constellation Draco, but its exact composition is unknown. R. H. Allen lists this in his *Star Names* in 1899.

Nechtan:

This Celtic (Irish) asterism may be the IAU constellation Aquarius. Nechtan was the husband of a goddess of the River Boyne (Mosenkis, date N/K).

Neck:

This Chinese xiù (lunar mansion) "Kàngxiù" (亢宿) is a shallow quadrilateral of stars in the IAU constellation Virgo: Phi (φ), Iota (ι), Kappa (κ), and Lambda (λ) Virginis. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Yanzhou territory. It appears in the Tang Dynasty (618 – 907 C.E.) as "Kàng" (亢) and was compared to the Vedic nakshatra Svati (Kotyk 2017, see Very Good, below) which is in the nearby constellation Virgo. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese star "Kang" is HIP 69427 (HD 124294) in the IAU constellation Virgo. The IAU approved the name Kang for this star in the IAU NameExoWorlds campaign.

This Chinese Chenzhuo xing guan “Kàngxiù” is a curved line of four stars in the IAU constellation Virgo: Phi (ϕ) Virginis, Iota (ι) Virginis, Kappa (κ) Virginis, and Lambda (λ) Virginis.

This Japanese sei shuku or lunar station “Ami Boshi” (“neck” or “throat”) is a bent line of four stars in the IAU constellation Virgo: Phi (ϕ), Iota (ι), Kappa (κ), and Lambda (λ) Virginis.

This **telescopic** asterism is Vastagh 20, listed in 2009 by Hungarian astronomer László Vastagh, which is in the IAU constellation Cassiopeia. Its apparent diameter is 40’. Vastagh describes it as a “Neck-shaped [asterism] made of bright stars. The shape is opened by a V-shaped formation. At the intersection of the stems of the letter AV, the set continues and turns into an ellipse with a twist. The lower end of the ellipse is pointed… [this asterism has] 15 bright members, but a total of 50 stars can be admired in the 40’ area.”

Neck of Dragon:

This Korean asterism “Haang” is identical to the Chinese xing guan “Neck” (see above).

Necks of the Maidens:

This Arabic star “ʿAnāḳ al Banāt” is Epsilon (ε) Ursae Majoris in the IAU constellation Ursa Major and is part of their asterism Daughters of the Bier (see above):

- Catholic librarian Giuseppe Simone Assemani (1687 - 1768) listed this as “Alhaic” and translated that as “ostrich”. The Arabs had several ostriches in the sky, but none of them anywhere near Ursa Major.
- R. H. Allen writes in his *Star Names* in 1899 that “in some editions of [Ulugh Beg Mirza’s] Tables it was written Al Inak – correctly Al Inz” and translates this as “goat of the mourners.

Neck of the Snake:

There are two Arabic stars by this name:

- One is “ʿUnuq ul-Ḥayyah” (عنق الحية) or “ʿUnḳ al Ḥayyah” which is the star Alpha (α) Serpentis in the IAU constellation Serpens:
    - This is listed as “ʿUnq al-hayyah” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “ʾunuq al-hayya”.
    - It was later latinized to “Unukalhai”, “Unuk Elhaia”, or “Unuk al Hay”.
    - The 14th century astrolabe #4560 from Christian Spain lists “ON9E”, the “9” representing a hard “C” sound, making it “ONCE” which is derived from “Unuq” (King 2002).
    - English Admiral Henry William Smyth’s *Bedford Catalogue* and *Prolegomena* of 1844 lists “Unukalhay, from ‘unk-al-hayyah, the serpent’s neck”.
    - This has been abbreviated in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Unuk”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
    - German astronomer Johann Elert Bode’s *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists the abbreviated name “Unuk” for this star.
    - English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Unukalhai”.

    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this star as "Unukalhay".
    - The *Standard Dictionary of Facts* (1908 – 1924) lists "Uunk al Hay".
    - The IAU approved the name Unukalhai for Alpha (α) Serpentis.
- One is "'Unuk al-Shujā'" and is Alpha (α) Hydrae in the IAU constellation Hydra:
    - "'Unuk al-Shujā" It was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
    - The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "'unuq al-shujā' wa huwa al-fard" ("the neck of the snake; it is the solitary one".
    - "Al 'Unk al Shujā'" was listed by Persian astronomer Ulugh Beg Mirza (1394 – 1449).
    - Dorn (1829) lists this as "Hydra's Neck" and describes this as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Unuk al Shugja" and "Unk-esh-shujá, the serpent's neck".
    - "Al 'Unk al Shujā'" was listed in R. H. Allen's *Star Names* in 1899.

Neck of the Whale:

This Latin asterism "Collum Ceti" is Omicron (ο) Ceti in the IAU constellation Cetus.

Necklace:

This Arabic asterism "al-kilāda" is a curve of stars in the IAU constellation Sagittarius: Xi (ξ), Omicron (ο), Pi (π), 43, Rho (ρ) 1, and Upsilon (υ) Sagittarii. Note The star Psi (ψ) Sagittarii received the latinized name "Al Kiladah" or "Alkiladah". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "el keládah, or necklace".

This Ainu Nociw ("asterism") is the IAU constellation Corona Borealis.

This Spanish **telescopic** asterism is made up of stars of the IAU constellation Cygnus. It runs from 29 Cygni through HIP 99777, HIP 99769, HIP 99719, HD 228438, HD 228426, HIP 99667, and HD 192556 to HD 192603. This was posted by Spanish astronomer "Takuan" on *Cloudy Nights* in October 2024.

Necklace Nebula:

This **telescopic** asterism is planetary nebula is PN G54.2-03.4 in the IAU constellation Sagitta. It was discovered in 2005 in the Isaac Newton Photometric H-Alpha Survey.

Necklace with Three Pendants of Corvus:

This **telescopic** asterism "Trióttis Córvi" is the lenticular galaxy IC 829 in the IAU constellation Corvus. It was discovered by French astronomer Guillaume Bigourdan in 1888. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the trio IC 829 and its neighbours MCG-2-33-36 and MCG-2-33-37… jointly resemble a triottis [which is] a necklace with three eye-like pendants".

Nectar and Sacrifice:

This Greek asterism “Νέκταρ ἡ Θυτήριον” or “Néktar i Thytírion” is the IAU constellation Ara as described by Eratosthenes (d.194 B.C.E.).

Needle Galaxy:

This **telescopic** asterism is NGC 4565 (Caldwell 38), an edge-on spiral galaxy in the IAU constellation Coma Berenices. It was discovered in 1785 by English astronomer William Herschel who listed it as “V 24”: Herschel described it as a “lucid ray 20’ long or more, 3’ or 4’ broad”. It is GC 3106 in the *General Catalogue* of 1864. It is also known as “Berenice’s Hair Clip”.

Needle’s Eye:

This **telescopic** asterism NGC 247 (Caldwell 62) is an intermediate spiral galaxy in the IAU constellation Cetus. It was discovered by English astronomer William Herschel in 1784. This is listed as GC 131 in the 1846 *General Catalogue*. It is also known as the Claw Galaxy and the Black Bottomed Galaxy (see above).

Needle of Canes Venatici:

This **telescopic** asterism “Belónis Cánum Venaticórum” is the edge on spiral galaxy NGC 5023 in the IAU constellation Canes Venatici. William Herschel listed this as “II 664”. John Herschel listed it as h 1559 and later as GC 3452 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Needlewood Hakea and Willie Wagtails:

This Boorong asterism “Tourchingboiongerra” is made up of the stars of the IAU constellation Coma Berenices. Beta (β) Comae Berenices (Diadem) forms the “stem” with one “branch” going off through 31 Comae Berenices to a cluster of faint stars as “leaves” and another “branch” going up through 35 and 40 Comae Berenices to another faint cluster of faint stars as “leaves”.

Nefertiti’s Headpiece:

This **telescopic** asterism is the open cluster NGC 6811 in the IAU constellation Cygnus. It was discovered by English astronomer John Herschel in 1829 who listed it as h 2044. It is GC 4505 in the *General Catalogue* of 1864. It is also known as the Hole in a Cluster, “83”, the Smoke Ring, the Bicycle, or the Reliquary.

Nei Auti te Mabubu:

This Kiribati asterism “Nei Auti te Mabubu” is the open cluster Messier 44 in the IAU constellation Cancer (Trussel and Groves 1978).

Neith:

This Egyptian star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as listed in the 19th dynasty Cairo Calendar (Hardy 2003). Neith is one of the oldest Egyptian Goddesses, dating back to the Predynastic Period (c. 6000 – 3150 B.C.E.). She was a Goddess of war, a creatrix, and a mother Goddess. Compare to White One of Heaven (below).

Nekkar:

See Cattleman, above.

Nelikanda:

This Estonian asterism is the Great Square asterism in the IAU constellation Pegasus (Kuperjanov 2006).

Nelson:

This English asterism is the belt and sword of Orion in the IAU constellation Orion (see Orion, below). English Admiral Henry William Smyth writes in his *Bedford Catalogue* in 1844 that this English asterism is "a disciple of the unhappy Lieutenant Brothers". *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists "Nelson" but does not identify the source. R. H. Allen writes in his *Star Names* in 1899 that staff at the University of Leipzig had used these stars to create the asterism "Napoleon" (see above) and that "a retaliating Englishman" renamed this asterism "Nelson", though Allen does not identify that Englishman.

Nembus:

This star is 51 Andromedae in the IAU constellation Andromeda. It was listed under this name in German astronomer Johann Bayer's *Uranometria* in 1603 and later in German astronomer Johann Bode's *Uranographia* in 1801. Its origin is unknown. The IAU approved the name Nembus for this 51 Andromedae in 2017.

Nemean Lion:

This Latin asterism "Nemeaeus", "Nemeas Alumnus", "Nemees Terror", "Nemeaeum Monstrum", "Violentus Leo", and "No Animal Nemaeo truculento " is the IAU constellation Leo. The Nemean Lion was a monster killed by Hercules.

- Johann Bayer's *Uranometria* (1603) lists "Nemaeus" as an alternate name for Leo.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "the Nemean Lion".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Nemeas alumnus".

Nemesis:

This **telescopic** asterism surrounds the galaxy NGC 6118 in the IAU constellation Serpens. It is a quadrilateral whose corner stars are Gaia DR2 4358705989360395136, Gaia DR2 4358695470983042688, TYC 5038-309-1 and TYC 5038-230-1. In the middle of this quadrilateral is the galaxy NGC 6118, the Blinking Galaxy. American amateur astronomer "Aznuge" listed this in May 2025 on *Cloudy Nights*.

Nenque:

See Sun, below.

Neon Sign Galaxy:

This Cypriot **telescopic** asterism is the spiral galaxy NGC 278 in the IAU constellation Cassiopeia. It was discovered in 1786 by English astronomer William Herschel who listed it as I 159. It is GC 158 in the General Catalogue of 1864. This name was posted on the *Deep Sky Forum* in October 2015 by Rolandos Constantinides. It is also known as the "Ninja Star Galaxy" and the "Flower Like of Cassiopeia".

Neper:

This is an alternate name for the asterism Terebellum (see Drill, above). R. H. Allen describes this in his *Star Names* in 1899 as a name "referred to, in a German astronomical work of 1564 from Frankfurt" but does not identify the author.

Nephews:

This Selk'nam asterism "Sasán" represents the nephews of their mythical shaman Kwányip (see above). One of the Sasán is the star Zeta (ζ) Orionis (Alnitak) in the IAU constellation Orion. The identity of the other star is unknown at this time.

Nephews/Nieces:

This Inuit asterism "Qangimmaariik" is the sword of Orion in the IAU constellation Orion (MacDonald 1998).

Nephîlā:

This Aramaic asterism is the IAU constellation Orion.

Nephte:

This asterism is the IAU constellation Sagittarius as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a centaur archer. This is probably a reference to the Egyptian Goddess Nephthys, twin sister of Isis. One of the aspects of Isis is Sopdet, who was an archer Goddess and the name of an ancient Egyptian asterism in the IAU constellation Canis Major (see Sopdet, below). Nephthe is a name for the Egyptian asterism "Pehui-tchat" (see below) in the IAU constellation Leo assigned by German Jesuit astronomer Athanasius Kircher (1602 – 1680). Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

Neptune:

There are two Latin asterisms with the name "Neptunus":

- One is the IAU constellation Delphinus.
- One is the IAU constellation Eridanus. This is related to the myth of Nereus (see Nereus, below).

Neptune's Offspring:

This Latin asterism "Neptuni Proles" is the IAU constellation Capricornus.

Neptune's Star:

This Latin asterism "Neptuni Sidus" is the IAU constellation Pisces as listed by 1st century Roman poet Marcus Manilius and in R. H. Allen's *Star Names* in 1899.

Nereides Nebula:

This **telescopic** asterism is supernova remnant G107.5-5.2 in the IAU constellation Cassiopeia. It is the nebulosity surrounding the open cluster NGC 7438. It was the first supernova remnant discovered by amateur astronomers including Marcel Drechsler, Bray Falls, Nicolas Martino, and Yann Sainty. The

Nereides were sea nymphs who were the daughters of the Sea God Nereus and the Oceanid Doris in Greek mythology.

Nereus:

This Greek asterism is the IAU constellation Eridanus. Nereus was a sea God who was the son of the Earth goddess Gaia and was a parent of the Nereids.

This Egyptian asterism is one of the paranatellonta of the decans of Capricornus as listed in *the Sphaera Barbarica* described by Teucros (Mosenkis, date n/k) and is the IAU constellation Telescopium.

Nervia:

This **telescopic** Belgian star is HIP 32916 (HD 49674) in the IAU constellation Auriga (magnitude 8.10). It was given this name in the IAU NameExoWorlds campaign. It was named for the Nervii, a Celtic tribe. It has an exoplanet named Eburonia, which was named for the Eburones, a prominent Belgic tribe.

Nescher:

This Hebrew asterism is the IAU constellation Aquila as listed in John Hill's *Urania* in 1754.

Nest:

This Belarussian asterism "Hniazdo" is the Pleiades cluster in the IAU constellation Taurus (Avilin 2018).

Nest of Leda:

This Italian asterism "Nido di Leda" is the IAU constellation Gemini as listed by Dante Alighieri. Castor and Pollux were the sons of Leda.

Nested Bells:

This **telescopic** asterism is the open cluster Messier 35 (NGC 2168) in the IAU constellation Gemini. It was discovered by Swiss astronomer Philippe Loys de Chéseaux in 1745.It is also known as the Sky Rocket Burst and the Shoe Buckle Cluster. American amateur astronomer "Aznuge" listed this in May 2025 on *Cloudy Nights*.

Net:

This ancient Egyptian asterism "Qedty" is the IAU constellation Corona Australis. It is next to their Khanuwy Fish asterism (see above).

This Chinese xiù (lunar mansion) "Bìxiù" (毕宿) is the Hyades cluster in the IAU constellation Taurus. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù was associated to matters concerning the Jizhou territory. In the Tang Dynasty (618 – 907 C.E.) this xiù "Bi" (畢) was compared to the Vedic nakshatra Rohini (Kotyk 2017, see Red One, below). This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is made up of stars of the IAU constellation Taurus, including the Hyades cluster: The central star is Gamma (γ) Tauri, from which three lines run out:

- One runs to Lambda (λ) Tauri,

- One runs through Delta (δ) 1, 2 & 3 Tauri to Epsilon (ε) Tauri, and
- One runs through 71 Tauri, Theta (θ) 1 & 2 Tauri, and Alpha (α) Tauri (Aldebaran, "Tiangao" ("Celestial High Terrace")), to Sigma (σ) 2 Tauri ("Fuer" ("Whisper (Adjunct to Net")).

This Japanese sei shuku or lunar station "Amefuri Boshi", sometimes translated as "rain", is the Hyades star cluster in the IAU constellation Taurus.

This Anutan asterism "Te Rakau Tapu" ("the net" or "the sacred timber") is the IAU constellation Crux. The handle "Te Rua Tangata" is the Pointer Stars (see Pointers below, and see Double Man, above).

This Micronesian asterism "Ceew" is the IAU constellation Corona Borealis.

Net Fisher of Hydra:

This **telescopic** asterism "Dictyúlcus Hýdrae" is the galaxy ESO 508-45 (PGC 46461) in the IAU constellation Hydra. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this double system consists of a spiral galaxy in front of an elliptical galaxy. The spiral galaxy projects a large arc of dust bands in the direction of its companion, like a fisher throwing his net".

Net For Catching Birds:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a swastika of stars in the IAU constellation Phoenix and Sculptor. The central star is HIP 2240 and from this star four bent lines run out:

- One runs through the determinative star Alpha (α) Phoenicis to HIP 966,
- One runs through HIP 133 to Theta (θ) Sculptoris,
- One runs through HIP 2663A to HIP 5042A, and
- One runs through Lambda (λ) Sculptoris to HIP 3521.

This Chinese xing guan "Bākuí" (八魁) is made up of six stars in the IAU constellation Cetus. 6 Ceti is the middle star. One line runs through it between 3 and 7 Ceti. Another line crossing the first runs down from 9 Ceti through 6 Ceti to 2 Ceti, where it takes a bend to 1 Ceti.

This Chinese Chenzhuo xing guan "Bākuí" is a lattice of stars in the IAU constellations Grus, Phoenix, and Sculptor. The center line runs from Alpha (α) Phoenicis through Iota (ι) Phoenicis to Theta (θ) Gruis. From Alpha (α) Phoenicis lines run out to Kappa (κ) Phoenicis and Theta (θ) Sculptoris. From Iota (ι) Phoenicis lines run out to Beta (β) Sculptoris and HIP 116602. From Theta (θ) Gruis lines run out to Iota (ι) Gruis and Nu (ν) Gruis.

Net Stars:

This Hungarian asterism "Háló csillag" appears on the celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism. NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Nets of Makali'i:

This Hawaiian asterism "Na-koko-a-Makali'i", also known simply as "Makali'i'" ("chief's eyes" or "little eyes" or "little stars") is the Pleiades cluster in the IAU constellation Taurus.

Netted Stars:

This Elvish asterism “Remmirath” is the Pleiades cluster in the IAU constellation Taurus in the Sindarin language. It appears in the works of J. R. R. Tolkien (1892 – 1973).

Network Nebula:

This **telescopic** asterism is the supernova remnant NGC 6995 in the IAU constellation Cygnus.

Network of Dykes:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of three stars in the IAU constellation Capricornus: Starting at the determinative star Tau (τ) Capricorni it runs through HIP 102026 to Upsilon (υ) Capricorni.

This Chinese xing guan “Luóyàn” (罗堰) is a line of three stars in the IAU constellation Capricornus: Tau (τ), Upsilon (υ), and 17 Capricorni.

This Chinese Chenzhuo xing guan is a bent line of three stars in the IAU constellation Capricornus: HIP 102026, Tau (τ) Capricorni, and HIP 101507.

Never Setting:

This Latin asterism “Inoccidui” is the Big Dipper asterism in the IAU constellation Ursa Major as listed by 4th century Latin poet Claudius Claudianus.

New Fire:

This Aztec asterism “Mamalhuaztli” is the two wood sticks used to light the new fire in the commemoration “Toxiuh molpilia”, celebrated every 52 years. This coincides with the beginning of their New Year “Xiuhtzitzquilo”. One stick is the belt of Orion, and the other stick is the sword of Orion. Compare this to the Mayan asterism Fire Drill (above).

New God of Egypt:

This French asterism “Novus Aegypti Deus” is the asterism Antinous (see Antinous, above) in the IAU constellation Aquila as listed by French astronomer Joseph Jérôme Lefrançois de Lalande (1732 – 1807).

New Sieve:

This Estonian asterism “Uus Sõel” is the Pleiades cluster in the IAU constellation Taurus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

New Staff Stars:

This Estonian asterism “Uued Sauatähed” is the belt of Orion asterism in the IAU constellation Orion (Kuperjanov 2006).

New Sau Stars:

This Estonian asterism “Uued Sau Tähed” is the IAU constellation Orion.

Nga Patari:

This Māori asterism, also known as “Nga Pataritari-hau” or “Nga Patari-kai-hau” is the Large Magellanic Cloud (Orchiston 2017).

Nga Tokorua a Tai-ngarue:

This Māori asterism is the stars Beta (β) Orionis (Rigel) in the IAU constellation Orion and Alpha (α) Geminorum in the IAU constellation Gemini.

Ngā Whetu Matarau:

This Māori asterism is the Pointers, the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus (see Pointers below).

Ngarlin Bulgwarr:

This Worimi asterism is the IAU constellation Crux (Lissarrague 2010).

Ngilmungngilmung:

This Wardaman star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed by Cairns and Harney in 2003. They used the twinkling of this star as an indicator of windy conditions.

Ngrodo:

This Apinajé asterism "Ngrôdo" is the Pleiades cluster in the IAU constellation Taurus (Lima and De M. Figueirôa, 2007).

Ngurainya:

This Kokatha and Ngalea star is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

ni-i-ri:

This Akkadian asterism "ni-i-ri" from the Ura = hubulla XXII lists (Block, Yigal, and Horowitz 2015) is unidentified currently. The Sumerian name is mulMU.BU-kéš-da.

Nidhoggur:

This Norse asterism "Nidhoggur" or "Níðhöggr" (Old Norse "malice striker") is made up of the stars of the IAU constellation Scorpius (minus the tail) and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Níðhöggr (sometimes Anglicized as Nidhogg) is the dragon gnawing at the roots of the World Tree Yggdrasil.

Niedgierreg:

This Sami asterism "Niedgierreg" is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899. Allen identifies this as a "Lapland" asterism.

Niflheimur:

This Norse asterism "Niflheimur" or "Niflheim" is the Milky Way around the tail of Scorpius and was created by Canadian Bjorn Jónsson (1920 – 1995) who was trying to reconstruct traditional Scandinavian skies (Kuperjanov 2006). Niflheim is a realm of ice and cold where the well of Hvergelmir is located (see Hvergelmir, above).

Night:

This Hawaiian asterism “Po” is the seven brightest stars of the IAU constellation Orion. It was also known as “Ka Hei-Hei o Na Keiki” (see Cat’s Cradle of the Children, above) or “Ku’uku’u” (see Spider, below).

Night Equals:

This Latin asterism “Noctipares” (“the night equals”) is the IAU constellation Libra. This came from an idea that this represented the balance between night and day. Johann Bayer’s *Uranometria* (1603) lists the name “Noctipares”.

Night Owl:

This Scottish asterism “Noctua” is made up of stars of the IAU constellations Hydra and Libra: 4 Librae and 54 to 57 Hydrae. It was created by Scottish schoolmaster Alexander Jamieson in his *A Celestial Atlas* in 1822 and appeared in the star atlas of American astronomer Elijah Burritt (1794 – 1838). It is a repurposing of the constellation Solitaire (see Solitary Thrush, below): Jamieson acknowledges this by labelling it “Avis Solitaria vel Noctua” on one of his charts. Noctua is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as “Owl” on its star chart.

This **telescopic** asterism is in the tail of the IAU constellation Hydra. The stars 47 and 48 Hydrae form the eyes. Brazilian astronomer Bruno Alessi lists this on his BDCC 7.6 list as “Noctus”, as does the SAC. Jeffrey Corder lists it as Corder 2578. It is also on David Ratledge’s asterism list. Size 78’.

Night Star:

This Syrian asterism “Voykodzyun” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Nihal:

See Camels Quenching Their Thirst, above.

Nikawiy:

See Mother, above.

Nile:

There are three Latin asterisms with the name “Nilus” (“river Nile”):

- One is the IAU constellation Eridanus:
  - “Nilus” is listed in the 11th century *De signis caeli (“of the signs of heaven*”).
  - German uranographer Johannes Stöffler’s Constance Celestial Globe (1493) depicts this as a river flowing from Orion’s left foot labelled “Fluvius sive Nilus”.
  - *Dele Stelle Fisse* (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del fiume Eridano, o ver Nilo”. The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

    - Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Fluvius, sive Eridanus, vel Nilus" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).
    - Johann Bayer's *Uranometria* (1603) lists "Gyon vel Nilus".
    - Dutch navigator Frederick de Houtman's catalogue of fixed stars (1603) lists it as "Het Zuyder eyude van den Nyli".
    - The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Gyon vel Nilus".
    - "Nilus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
    - "Nilus" is listed in Robert Hues' *A Learned Treatise of Globes* in 1659.
    - Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels it "Eridanus" with the subtitle "Nylus Orionis".
    - "Nilus" is listed in John Hill's *Urania* in 1754 as "Nile".
- One is the IAU constellation Hydra and is listed in Robert Hues' *A Learned Treatise of Globes* in 1659.
- One is the IAU constellation Triangulum (as it resembles the delta of that river). Johann Bayer's *Uranometria* (1603) lists "Nilus" as an alternate name for Triangulum. "Nilus" is listed in R. H. Allen's *Star Names* in 1899.

Nilometer:

This Scottish asterism "Norma Nilotica", representing a measuring staff of the time, was created by Scottish schoolmaster Alexander Jamieson for his *Celestial Atlas* in 1822. It is made up of stars east of the obsolete constellation Antinous (see above) and north of the head of the IAU constellation Capricornus: 1, 71, and 70 Aquilae. Jamieson depicts Aquarius holding this in his left hand. A nilometer is a graduated pillar or surface that indicates the height reached by the Nile during its annual floods.

Nimbus of Reticulum:

This **telescopic** asterism "Nimbífera Retículi" is the lenticular galaxy NGC 1543 in the IAU constellation Reticulum. It was discovered by James Dunlop in 1826. This became 2627 on John Herschel's list and later GC 830 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as the "cloudy ring around this galaxy is reminiscent of a nimbus".

Nimmer:

This Palawan asterism is the belt of Orion in the IAU constellation Orion. This is a name from the 1831 journals of George Augustus Robinson, a missionary.

Nimrod:

This German asterism is the IAU constellation Boötes and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures. It later appears as an alternate name for Boötes in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch, in Edward Sherburne's Sphere of Marcus Manilius in 1675 and in John Hill's *Urania* in 1754. It is a variation of the old Greek asterisms Bear Watcher (see above) and Guardian of the Bear (see above). English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this and attributes it to "the Mosaicists".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name and attributes it to "the Hebrews".

This Hungarian asterism "Nimród" is the IAU constellation Orion. In Hungarian folk tales Nimród is a great hunter, father of the twins Hunor and Magor. It is also known as Archer (see above) and Reaper (see below).

Nimrod's Horse:

This Hebrew asterism is the IAU constellation Pegasus as listed in R. H. Allen's *Star Names* in 1899.

Nin-Sar u Erragal:

This Babylonian asterism from the MUL.APIN tablets is the two stars Eta (η) and Theta (θ) Lyrae from the IAU constellation Lyra. This appears in later Seleucid sky lore. Compare this to the Chaldean asterism Erragal, above.

This Persian asterism "NIN-SAR" and "IR.RA.GAL" from the list of Masu Stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) tablets is the two stars Eta (η) and Theta (θ) Lyrae from the IAU constellation Lyra (Jeremias 1929). Franz Boll lists this as "Nin.sar" and "Ur.ra.gal" in his *Ancient Observations of Coloured Stars* in 1918. Ernst Weidner lists it as "nin-sar mir-ra-gal" in his *Fixsterne* in 1971.

This Babylonian asterism "Ninsar" is the stars Beta (α) Virginis (Zavijava) and Eta (η) Virginis in the IAU constellation Virgo as listed by R. H. Allen in his *Star Names* in 1899. Allen translates it as "lady of heaven".

Nine Precious Stones:

This Latin asterism "Gemmasque Novem" or "Gemmas que novem transformat in ignes" is the IAU constellation Corona Borealis as listed by the Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.).

Nine Senior Officers:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty, despite the name, is a line of three stars in the IAU constellations Coma Berenices and Virgo: Starting at the determinative star Rho (ρ) Virginis it runs through 34 Virginis to 29 Comae Berenices.

This Chinese xing guan "Jiǔqīng" (九卿), despite the name, is a triangle of three stars in the IAU constellation Virgo: Rho (ρ) and 32 Virginis and HIP 61579.

Nine Territory:

This Korean asterism is an irregular oval of stars in the IAU constellation Eridanus. It starts with the star Nu (ν) Eridani and runs through Xi (ξ), Omicron (ο) 1 and 2, 56, Omega (ω), Mu (μ), and 51 Eridani, and HIP 21297.

Nine Stars:

This Hungarian asterism "Kilenc csillag" appears to be made up of stars of Leo and Virgo. Sandor Nagy (1915) depicts this asterism as a group of nine stars, including Tell Me a Picture (see below). NOTE: Nagy's 1915 chart is beautifully illustrated, but some of the labels are hard to make out and I find it

difficult to match the hand drawn stars on his chart with actual star patterns in the sky. The stars are currently unidentified.

Nine Water Wells:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellations Indus and Microscopium. It is a long line of stars with 6 lines branching off.

- The line starts at the determinative star Alpha (α) Indi and runs through Zeta (ζ) Indi, and HIP 105685 to HIP 107649.
- One line runs from Zeta (ζ) Indi to Nu (ν) Microscopii,
- From HIP 105685 two lines run out:
    - One to T Indi, and
    - One through HIP 105560 to HIP 105425.
- From HIP 107649 two lines run out:
    - One to HIP 107409, and
    - One to HIP 106429.

This Chinese xing guan "Jiŭkăn" (九坎) is the star HIP 104680 in the IAU constellation Microscopium.

This Chinese Chenzhuo xing guan "Jiŭkăn" is a lattice of stars in the IAU constellation Microscopium and Sagittarius: The center line is the stars HIP 105854, Zeta (ζ) Microscopii, and HIP 102497. From HIP 105854 lines run out to HIP 104738 and 104752. From Zeta (ζ) Microscopii lines run out to HIP 103127 and 102916. From HIP 102497 lines run out to Kappa (κ) Sagittarii and HIP 94986.

Ningirim:

This Chaldean asterism "mul.nin.girim" from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period (Koch-Westenholz 1995) is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti. It is associated with the Goddess Ningirim, who is associated with rodents. It is also listed as "dnin.gir.su" ("Ningirsu").

This Sumerian asterism "[mu]l dnin-tu" listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti.

This Akkadian asterism "dbe-let DIĜIR.MEŠ listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti.

Ningišzida:

This Sumerian asterism is the IAU constellation Hydra. This is a character in an ancient myth about the priest Adapa of Eridu and his encounter with the Gods Ningišzida or Gišzida and Dumuzi.

Ninja Star Galaxy:

This American **telescopic** asterism is the spiral galaxy NGC 278 in the IAU constellation Cassiopeia. It was discovered in 1786 by English astronomer William Herschel who listed it as I 159. It is GC 158 in the General Catalogue of 1864. This name was posted on the *Deep Sky Forum* in October 2016 by Jimi Lowrey. It is also known as the "Flower Like of Cassiopeia" and the "Neon Sign Galaxy".

Ninmah:

This Babylonian asterism from the MUL.APIN tablets in the IAU constellation Cetus represents the Goddess "Ninmah" or "Ninmahk". It is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti. It appears in the later Seleucid sky lore.

This Chaldean asterism "mul.nin.mah" or "mul.min" (Koch-Westenholz 1995) from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is a quadrilateral of four stars: Beta (β) Ceti (Diphda), Iota (ι) Ceti, Tau (τ) Ceti, and Upsilon (υ) Ceti.

Ninmah is an aspect of the Sumerian Goddess Ninḫursaĝ, Ninursag, Ninharsag, Ninhursaga, or Damgalnuna, who is a Mother Goddess of the mountains.

Ninmu:

This Chaldean asterism "mul nin.mu" is listed in the *Great Star List* (Koch-Westenholz 1995) and the stars are not identified. Ninmu is the daughter of the God Enki and Goddess Ninhursanga.

Niqirtsuituq:

This Inuit star "Niqirtsuituq" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (MacDonald 1998).

Nitanti:

This Vedic star from the *Taittiriya Brahmana* is 27 Tauri (Atlas) in the IAU constellation Taurus (Leitz 2019). It is part of their asterism Krttika (see Cutters, above).

Njengari:

This Kaurna star was listed by Hamacher in 2015. This is a man who created landscape and was then transformed into a star. The identity of the star is not known at present.

Noah:

This asterism is the IAU constellation Centaurus. R. H. Allen lists this as a name used "in some medieval Christian astronomy" in his *Star Names* in 1899.

Noah's Ark:

This asterism "Arca Noachi" is Ptolemy's asterism Argo's Ship (see above) and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). This is depicted as a ship with a mast with a fish net draped over the side.

- Johann Bayer's *Uranometria* (1603) lists "Archa Nohae".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Arca Nohae".
- This asterism is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Arca Nöe al Argo Navis".
- This asterism later appears in Edward Sherburne's *Sphere of Marcus Manilius* in 1675 and in John Hill's *Urania* in 1754.

- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Argo Navis al Arca Noe" as the front half of a galley with a ram figurehead emerging from a cloud.
- English scholar and mythologist Jacob Bryant (1715 – 1804) described the tale of Jason's argonauts as another form of the tale of Noah.

Noah's Cup:

This German asterism is the IAU constellation Crater. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists this as a "goblet of Noah" but does not identify the source.

Noah's Dove:

This asterism "Columba Noachi" was the name Flemish astronomer Petrus Plancius (1552 – 1622) gave to the IAU constellation Columba in 1592 (see Columba, above). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661. Robert Hues lists this name in his *A Learned Treatise of Globes* in 1659. Scottish uranographer Alexander Jamieson (1782 – 1850) lists "Columba Noachi" in his *Celestial Atlas* in 1822.

Noah's Ship:

This Estonian asterism is the IAU constellation Delphinus (Kuperjanov 2006). This is from the island of Saaremaa.

Noah's Raven:

This asterism is the IAU constellation Corvus. This constellation is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Corb, Elia vel Noa" ("Elijah's Raven or Noah's Raven"). Noah's Raven is listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and in R. H. Allen's *Star Names* in 1899.

Noble Falcon:

This Sumerian asterism "mulmar-dú" as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Aquila.

This Akkadian asterism "a-mur-ru" as listed in the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is the IAU constellation Aquila.

This Persian asterism "Muru" is the IAU constellation Aquila as listed in R. H. Allen's *Star Names* in 1899.

This Sogdian asterism "Shad Mashir" is the IAU constellation Aquila as listed in R. H. Allen's *Star Names* in 1899.

This Khorasmian asterism "Sadmasjij" is the IAU constellation Aquila as listed in R. H. Allen's *Star Names* in 1899.

Compare this to Peregrine Falcon, below.

Noblest of Coma Berenices:

This **telescopic** asterism "Óptimas Cómae Bereníces" is the supergiant elliptical galaxy NGC 4889 (NGC 4884, Caldwell 35) in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "II 391". John Herschel listed it as h 1507 and later as GC 5698 and GC 3351 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is one of the major galaxies in the Coma Cluster, the other being NGC 4874. They describe "the situation… reminiscent of the old divide in Roman society between popular politicians and aristocratic, opulent landlords."

Noisy Footed:

This Latin asterism "Sonipes" is the IAU constellation Centaurus as described by 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil).

Non-Revolving Star:

This Seri star "HIIZOOX CAANOJ HIIMATAAX" or "Estrella que no gira" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above).

Nonoko-tea:

This Māori asterism is the Large Magellanic Cloud. Orchiston (2017) lists it as one of the Magellanic Clouds.

Nonoko-uri:

This Māori asterism is the Small Magellanic Cloud. Orchiston (2017) lists it as one of the Magellanic Clouds.

Nonsensical Installation:

This American asterism is made up of the stars of the IAU constellations Canes Venatici and Ursa Major and was created by Brad and Kathryn Templeton for *The Vault of Heaven* star map for the 2004 Burning Man event held in Black Rock Desert in Nevada (Kuperjanov 2006). The stars making up the back leg of Ursa Major are combined with Canes Venatici to form this.

Norma:

None of the stars of Norma are brighter than 4th magnitude and only show up in 26 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Nor) is one of twelve created by French astronomer Abbé Nicolas Louis de Lacaille in 1751. He called it "l'Équerre et la Règle" ("the Square and the Rule") and it is so labeled on his *Planisphère des Étoiles Ausralea* (1756), which depicts a carpenter's square overlapping a ruler. In 1763 he shortened and latinized the name to its current form.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Équerre et la Règle" as a ruler square.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists this as "Norma Euclides" ("Euclid's Rule") in his *Celestial Atlas* in 1822.

R. H. Allen lists it in his *Star Names* in 1899 as "Norma et Regula".

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Lineal".

"Norma" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts Norma as a square and ruler but does not label it.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Norma, the Rule" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Norma" and describes it as a "Rule".

This constellation is shown on Italian charts as "Riga e Squadra" and on German charts as "Lineal" ("ruler") or "Winkelmass" ("angle measure" or "square").

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Norma in his book *The Stars - A New Way to See Them* (1952). The standard IAU chart shows this constellation as a triangle of the stars Kappa (κ) Normae, Gamma (γ) 1 and 2 Normae, Epsilon (ε) Normae, and Eta (η) Normae, with a line running through the middle from Eta (η) to Gamma (γ) 2 Normae. Rey's version is a quadrilateral of the stars Gamma (γ) 1 and 2 Normae, Epsilon (ε) Normae, Delta (δ) Normae, and Eta (η) Normae. Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Norma in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in the same manner as Reyersbach, as does *Sky and Telescope Magazine* their publications..

Norma's Jewel Box:

This telescopic asterism is NGC 6067 (Caldwell 89) in the IAU constellation Norma. It was discovered by Scottish astronomer James Dunlop in 1827.

Norman's Passing Pair:

This **telescopic** asterism "Norman's Passing Pair" or "NPP" is in the IAU constellation Boötes. It is named for German astronomer Norman Görlitz, who discovered it in 2018. Robert Zebahl lists it on his *Faint Fuzzies* website. Its size is 1.7' X 1'. Zebahl describes it as "located between a true physical double star with components BD+24 2733 and BD+24 2733B and a background star BD+24 2734. In the Hipparcos catalogue the double star is listed as HIP 70529. The pair with the proper motion of 1.37" per year in the southeast direction just passes the background star BD+24 2734, which has a similar brightness… and coloration… as the double star components… In 2005 the three stars formed a straight line, now the line is bent, in 2036 they will form an isosceles triangle. In 2018 the distance of the eastern double star component to the background star was 33" and it widens by about 1" per year."

North America Nebula:

This **telescopic** asterism is the HII region NGC 7000 (Caldwell 20, SH 2-117, LBN 373, Ced 183d) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 37". It is GC 4621 in the *General Catalogue* of 1864. It was German astronomer Max Wolf that

gave it the name “America Nebula” in 1890 after examining its image on a long-exposure photographic plate. Edward Emerson Barnard, writing about Wolf in 1903, said “It was first photographed by Dr. Max Wolf some twelve years ago and has been called by him the ‘America Nebula” from its striking resemblance to North America as shown on maps and globes”. In a footnote, Barnard adds: “The ‘North America Nebula’ would perhaps be more definite, for it is North American to which Dr. Wolf intents the compliment” (Stephen Waldee 2012). Size 120’ X 30’.

North Cord:

This Polish asterism “Linum Boreum” is made up of the stars of the IAU constellation Pisces and was created as one of four subdivisions of this constellation by the Polish astronomer Johannes Hevelius (1611 – 1687). It is the stars Chi (χ) Piscium, Rho (ρ) Piscium, 94 Piscium, 97 Piscium, Eta (η) Piscium, Pi (π) Piscium, Omicron (ο) Piscium, and Alpha (α) Piscium (Alrescha).

North Fish:

This Polish asterism “Piscis Boreus” is made up of the stars of the IAU constellation Pisces and was created as one of four subdivisions of this constellation by the Polish astronomer Johannes Hevelius (1611 – 1687). It is the stars Sigma (σ), 68, 65, Psi (ψ) 1, 2 and 3, Chi (χ), Phi (φ), 91, Tau (τ), 82, and 78 Piscium.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) labels the northern “fish” of Pisces “le Poisson boreal” in a close-up chart and this also appears in the French edition of Flamsteed’s work, the *Atlas Céleste,* which was revised in 1778.

North Gate of the Military Camp:

This Chinese xing guan “Běiluòshīmén” (北落师门) is the star Alpha (α) Piscis Austrini in the IAU constellation Piscis Austrinus. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Běiluòshīmén” is the star Alpha (α) Piscis Austrini in the IAU constellation Piscis Austrinus.

North Major:

This “Persian” asterism “Haphtûrengh Mihîn” is the IAU constellation Ursa Major as listed in Edward Sherburne’s *Sphere of Marcus Manilius* in 1675.

North Nail:

This Estonian star “Põhjanael” (“north nail” or “northern nail”) is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Kuperjanov 2006). Compare this to the Belarussian asterism “Гвоздь” (see Nail, above).

North of Aldebaran:

This Micronesian (Caroline Islands) star “Jefegen Uun”, “Efang Alui”, “evang-el-ul”, or “Iefangel Uul” is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

North Pole:

This Korean asterism “Buggeug” (북극) is a line of five stars in the IAU constellation Ursa Minor: Gamma (γ) Ursae Minoris, Beta (β) Ursae Minoris (Kochab), 5 Ursae Minoris, and 4 Ursae Minoris and HIP 62572A. Despite the name, it does not contain the star Alpha (α) Ursae Minoris (Polaris), which is in their neighboring asterism, “Wound Lodge” (see below).

North River:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a bent line of three stars in the IAU constellation Gemini: Starting at the determinative star Beta (β) Geminorum (Pollux) it runs through Alpha (α) Geminorum (Castor) to Rho (ρ) Geminorum.

This Chinese xing guan “Běihé” (北河) is a line of two stars in the IAU constellation Gemini: Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux).

This Chinese Chenzhuo xing guan is a line of four stars in the IAU constellation Gemini: Beta (β) Geminorum (Pollux), Sigma (σ) Geminorum, Alpha (α) Geminorum (Castor), and Rho (ρ) Geminorum.

This Korean asterism (also called “Northern River”) is identical to the Chinese xing guan North River (see above).

North Seven Stars:

This Japanese asterism is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).

North Side of Second Leap of a Gazelle:

This Latin star “Tania Borealis” is Lambda (λ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their asterism Second Leap of a Gazelle (see below). The IAU approved the name Tania Borealis for Lambda (λ) Ursae Majoris A in 2016.

North Snake:

This Estonian asterism “Põhja Madu” is the IAU constellation Draco.

North Star:

This star is currently Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor. In Hipparchus’ day, Polaris was 12° 24’ away from celestial north: Hipparchus (190 – 120 B.C.E.) described the north celestial pole as a “vacant spot forming a quadrangle with three other stars” which was the “Πόλος” (“Pólos”) of the 1st century B. C. Roman poet Publius Ovidius Naso (Ovid) and the 1st century C.E. Roman poet Marcus Annaeus Lucanus (Lucan):

- Polaris got this name relatively recently, being mentioned as “stella ill aquae Polaris dictur” (“the star which is called polar”) by Dutch mathematician and cartographer Gemma Frisius in 1547: At that date it was 3° 8’ from celestial north. This Latin name “Stella Polaris” got shortened as the shorter name fit better on star charts.
- The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r lists this star as “Alrucaba”.
- The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) lists this star as “Alrukaba” and “Stella Polaris”.

- English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) lists this star as "Stella Polaris".
- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch as "Stella Polaris".
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) called this star "Pollaris".
- Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) lists this star as "Stella Polaris".
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists this star as "Polaire" and "l'Etoile Polaire".
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "der Polarstern".
- The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer lists this star as "Stella Polaris".
- Scottish astronomer Alexander Jamieson (1782 – 1850) listed "Polar Star" in his Celestial Atlas in 1822.
- This star is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Polaris".
- Admiral William Henry Smyth's *Prolegomena* of 1844 lists "Polaris".
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Polar Stern".
- English astronomers Crossley, Gledhill, and Wilson list "Polaris" in *A Handbook of Double Stars with a Catalogue of Twelve Hundred Double Stars and Extensive Lists of Measures* (1879).
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as "Polaris".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Polaris" and "the pole star".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Pole Star".
- American astronomer Winslow Upton's *Star Atlas* (1896) lists this star as "Polaris".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Polaris".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and the 14th edition (1959) list this star as "Polaris".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this star as "Polaris (North Star)".
- The IAU approved the name Polaris for Alpha (α) Ursae Minoris.

NOTE: Around 2600 B.C.E. the north star would have been the star Alpha (α) Draconis (Thuban).

This Dravidian star "vata min" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor as listed by Leitz in 2019.

This Japanese star "Hokushin" or "Hukkyoju-sei" is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Miyajima 2014) as depicted by Japanese Emperor Go-Yozei (1586 – 1611).

This Macedonian star “Severnica” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cenev 2014).

This Lacandon star “Xämän ek’” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Milbrath 1999).

This Ojibwe star “Giwedin’Anung” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Lee et al 2014).

This Finnish star “Pohjantähti” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

North Wagon:

This Old Swedish asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (see Little Dipper, above).

North Winds:

This Latin asterism “Aquilonius” or “Aquilonaris” is the IAU constellation Pisces. It was used as an indicator of rain from the north. NOTE: R. H. Allen notes in his *Star Names* in 1899 that Lucius Ampelius assigned Pisces to the southeast wind (“Eurus” or “Vulturnus”).

Northeastern Nations:

This Korean asterism “Bugdongbu Guggadeul” (북동부 국가들) is a quadrilateral of stars in the IAU constellation Sagittarius: 52, 55, 56, and Chi (χ) 1 Sagittarii.

Northerly Dog:

This Latin asterism “Canis Septentrionalis” is the IAU constellation Canis Minor, so called as it is north of Canis Major. This name is listed in Johann Bayer’s *Uranometria* (1603). The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Canis Septentrionalis”.

Northern and Southern Dogs:

This German asterism “Asterion and Chara” (Greek names for “stars” and “joy”), is two stars in the IAU constellation Canes Venatici: Alpha (α) Canum Venaticorum (Cor Caroli) and Beta (β) Canum Venaticorum (Chara). It was created by Polish astronomer Johannes Hevelius (1611 – 1687):

- The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts “Chara” and “Asterion” next to Boötes.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists “Chara” and “Asterion” as two “jagdhunde” on leashes held by Boötes.
- In his *Urania* in 1754, John Hill lists this as “Astaroth” and “Asterion” for one dog and “Chara” for the other and describes them as “greyhounds” or “hounds” in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists Asterion and Chara as the “Hounds”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists “Asterion” and “Chara” in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Asterion” and “Chara”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.

Northern Antenna of Corvus:

This **telescopic** asterism “Anténna Boreális Córvi” is the barred lenticular galaxy NGC 4038 (Arp 244/Caldwell 60) a pair of colliding galaxies in the IAU constellation Corvus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): This is part of the Antennae Galaxies (see above). These galaxies were discovered by English astronomer William Herschel in 1789 who listed them as “IV 28.1” and “IV 28.2”. They are GC 2670 and GC 2671 in the *General Catalogue* of 1864. They got this name because of the two long “tails” of stars, gas, and dust ejected from the collision, resembling an insect’s antennae. This is also known as the Ring Tail Galaxy (see below), the Snorther (see below), the Antennae or Antennae Galaxies (see above), and the Mosquito Larvae (see above).

Northern Axle:

This Arabic star “Al Ḳuṭb al Shamāliyy” (“northern axle” or “northern pin”) is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor.

Northern Bear:

This is the IAU constellation Ursa Major as it is described in Walter Scott’s *Lay of the Last Minstrel* in 1805 (Pinard 2022).

Northern Bow:

This Latin star “Kaus Borealis” is Lambda (λ) Sagittarii in the IAU constellation Sagittarius. This name is derived from the Arabic “gaws” (“bow” قوس) and Latin “borealis” (“northern”). The IAU approved the name Kaus Borealis for Lambda (λ) Sagittarii in 2016.

Northern Car:

This English asterism is the Little Dipper asterism in the IAU constellation Ursa Minor as listed by Robert Hues in his *A Learned Treatise on Globes* in 1659, who cites a poem by “T. May” which describes it as the “northern carre”.

Northern Claw of Al-Jawza:

This Bedouin (Western Saudi Arabia) star “Zabin al-Ǧawza al-Šimalī” is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. This name appeared in "Ibn Bišir, ʿUṯmān ibn ʿAbd Allah (d. 1873), ʿInwān al-maǧd fi tarīḫ Naǧd, The title of glory on the history of Najd, (Arabic critical edition print by Dr. Muḥammad ibn Nāṣir al-Šiṯrī), Riyadh, Saudi Arabia, 2012, pg. 292." See Giant, above.

Northern Claw of the Scorpion:

This Greek star “Χηλή βόρειος” (“Chilí vóreios”) is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra.

This Arabic star “az-Zubān ush-Shamāliy” (الزبان الشمالي) or “Al Zubān al Shamāliyyah” is Beta (β) Librae in the IAU constellation Libra:

- This was later latinized to “Zubeneschamali”, “Zuben Eschamali”, “Zuben Elschemali”, “Zuben el Chamali”, or “Zubenelschamali”.

- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Hebrew name "ha-me 'ubhar".
- Johann Bayer's *Uranometria* (1603) lists "Zubeneschemali".
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Zubeneschemali".
- Robert Hues lists it as "Zubeneschimali" in his A Learned Treatise of Globes in 1659.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Zubeneschemali".
- Scottish uranographer Alexander Jamieson (1782 – 1850) listed this star as "Zuben es Chimali" in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Zuben El Chimali": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this star as "Zuben Eschamali".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich lists this star as "Zuben el Chamali".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Zuben el Chamali".
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns describes Beta (β) Librae as resembling Uranus.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists this star as "Zubenesch", "Zuben el Chamali", and "Zubenelg", but his 14th edition (1959) only lists this star as "Zuben el Chamali" and "Zubenesch".
- The IAU approved the name Zubeneschamali for Beta (β) Librae.

Northern Coal Sack:

This asterism is a dark nebula, Barnard 348, in the IAU constellation Cygnus. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), names this simply the "Coal Sack". It is listed in R. H. Allen's *Star Names* in 1899 as the "Northern Coal Sack". It is also known as the Cygnus Rift.

Northern Cross:

The Northern Cross is a stellar "swan" which appears in several Greek myths. The "upright" runs from Alpha (α) Cygni (Deneb- 19th brightest star) in the swan's "tail" to the double star Beta (β) Cygni (Albireo) in the "beak". The transverse runs from Epsilon (ε) Cygni in one "wing" to Delta (δ) Cygni in the other "wing" with the star Gamma (γ) Cygni (Sadr- 68th brightest star) in the middle. Deneb forms one of the stars of the Summer Triangle (see below). *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name for Cygnus. *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Northern Cross" for this asterism. *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this asterism as the "Northern Cross". Jeffrey Corder lists this as Corder 4121.

Northern Cross is another name for the Quechua (Misminay) asterism "Hatun Cruz" (see Large Cross, above (Urton 1980)).

Northern Crown:

This Arabic asterism "Altaaj Alshamaliu" (التاج الشمالي) is the IAU constellation Corona Borealis. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists the Greek "Στέφαγς βόρειος" ("northern crown") and does not mention an Arabic connection. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this name exclusively for Corona Borealis.

Northern Dagger:

This Spanish and Piemontese asterism from the Chaco region of Argentina, "Puñal del Norte", is described by Mudrik (2011) as "stars in the region of Theta (θ) and Iota (ι) Orionis" which would place it in the sword of Orion in the IAU constellation Orion.

Northern Dipper:

This Chinese xing guan "Běidǒu" (北斗) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). It first appeared in the *Xia xiao Zheng* (夏小正 *Small Calendar of the Xia Dynasty*) which dates to the 21st to 17th century B.C.E. and in the turtle plastrons and ox scapulae from the reigns of the last few kings of the Shang Dynasty (1250 – 1450 B.C.E.) as well as on tomb goods from the Chu state (433 B.C.E.). It also appeared as a translation of the Vedic asterism "Saptarshis" (see Seven Sages, below) in the *Xiuyao jing* (宿曜經) which appeared in 759 and was revised in 764 (Kotyk 2017). By the 9th century Buddhist astrologers in China believed that the Big Dipper governed longevity and associated each of the seven stars with a Goddess: This appears in the *Beidou qixing yanming jing* or *Sūtra of Life Extension by the Seven Stars of the Big Dipper* (Kotyk 2017). The Goddess representing the star Mizar has an attendant that represents the star Alcor. Their names for the eight stars are:

- Alpha (α) Ursae Majoris (Dubhe): "Tianshu" ("Celestial Pivot"), "Talang" ("Greedy Wolf"), or "Zheng" ("Justice"),
- Beta (β) Ursae Majoris (Merak): "Tianxuan" ("Celestial Rotating Jade"), "Jumen" ("Giant Gate"), or "Fa" ("Law).
- Gamma (γ) Ursae Majoris: "Tianji" ("Celestial Shining Pearl"), "Lucun" ("Good Fortune Star"), or "Ling" ("Command"),
- Delta (δ) Ursae Majoris: "Tianquan" ("Celestial Balance"), "Wenqu" ("Literary Star"), or "Fa" ("Crusade").
- Epsilon (ε) Ursae Majoris: "Yuheng" ("Jade Sighting Tube"), "Lianzhen" ("Clean and Chaste"), or "Sha" ("Killing").
- Zeta (ζ) Ursae Majoris (Mizar): "Kaiyang" ("Opener of Heat"), "Wuqu" ("Military Star"), or "Wei" ("Danger").
- 80 Ursae Majoris (Alcor): "Fu" ("Assistant").
- Eta (η) Ursae Majoris: "Yaoguang" ("Twinkling Balance"), "Pojun" ("Break the Enemy"), or "Bu" ("Army").

This Chinese Chenzhuo xing guan "Běidǒu" is the "Big Dipper" asterism in the IAU constellation Ursa Major: The "handle" starts at Eta (η) Ursae Majoris ("Yaoguang" ("Twinkling Brilliance") or "Pojun" ("Break the Enemy")), and runs through Zeta (ζ) Ursae Majoris ("Kaiyang" ("Opener of Heat") or "Wuqu" ("Military Star") and 80 Ursae Majoris ("Fu" ("Assistant"), and Epsilon (ε) Ursae Majoris ("Yuheng" ("Jade Sighting Tube") to Delta (δ) Ursae Majoris (""Tianquan" ("Celestial Balance") or "Wenqu" ("Literary Star") or "Fa" ("Crusade"). The "dipper" starts at Delta (δ) Ursae Majoris and runs through Gamma (γ) Ursae Majoris ("Tianji" ("Celestial Shining Pearl") or "Lucun" ("Good Fortune Star")), and Beta (β) Ursae Majoris (Merak, "Tianxuan" ("Celestial Rotating Jade") or "Jumen" ("Giant Gate") or "Fa" ("Law"), to

Alpha (α) Ursae Majoris (Dubhe, “Tianshu” (“Celestial Pivot”) or “Tanlang” (“Greedy Wolf” or “Zheng” (“Justice”).

This Korean asterism “Bugduchilseong” (북두칠성) is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). The Korean names for the stars of this asterism are:

- “Jeong”: Alpha (α) Ursae Majoris (Dubhe).
- “Beop”: Beta (β) Ursae Majoris (Merak).
- “Ryeong”: Gamma (γ) Ursae Majoris (Phecda).
- “Beol”: Delta (δ) Ursae Majoris (Megrez).
- “Sal”: Epsilon (ε) Ursae Majoris (Alioth).
- “Wi” (“the helper”): Double stars Zeta (ζ) Ursae Majoris (Mizar) and 80 Ursae Majoris (Alcor).
- “Eung”: Eta (η) Ursae Majoris (Alkaid).

This Japanese asterism is the Big Dipper Asterism in the IAU constellation Ursa Major (Kotyk 2018).

This Vietnamese asterism “Bắc Đẩu thất tinh” is the Big Dipper Asterism in the IAU constellation Ursa Major (see Big Dipper, above).

Northern Donkey Colt:

This Greek star “Asellus Borealis” is Gamma (γ) Cancri in the IAU constellation Cancer and is part of their asterism Donkey Colts (see above):

- This star is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 with the abbreviated label “Asellus Bor”.
- Edward Sherburne calls this the “Northern Asinego” (“northern donkey”) in his *Sphere of Marcus Manilius* in 1675.
- Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this star as ”Asellus Boreus”.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as “Asellus Boreus” in his *Celestial Atlas* in 1822.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Asellus Boreus”: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*.
- The IAU has approved the name Asellus Borealis for the star Gamma (γ) Cancri Aa.

Northern Eye:

This English star “Oculus Boreas” is Epsilon (ε) Tauri in the IAU constellation Taurus. It was given this name by English astronomer John Flamsteed (1646 – 1719).

Northern Fly:

This Polish asterism “Muscae Borealis” is made up of the three stars 35 Arietis, 39 Arietis, and 41 Arietis (Bharani) in the IAU constellation Aries. It was created by the Polish astronomer Johannes Hevelius (1611 – 1687), and the name is a reference to the southern IAU constellation Musca, “the fly” (see Musca, above). R. H. Allen notes in his *Star Names* in 1899 that “Houzeau attributed its formation to Habrecht, but others to Bartschius, who called it Vespa” (Bartschius being the Latin name of German astronomer Jacob Bartsch (1600 – 1633), who actually used the same stars to create his asterism *Vespa*, see Wasp, below).

- A celestial pocket globe created by British uranographer Herman Moll in 1719 labels this "Musca" and depicts it at the feet of Perseus.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "la Mouche" as a fly next to "le Belier" (Aries).
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists it as "Fliege" as does Bode's *Vorstellung Der Gestirne* (1782).
- A celestial pocket globe created by English uranographer Dudley Adams circa 1795 labels this asterism "Musca"
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Musca" as a fly.
- Modern astronomers have adopted it as a **telescopic** asterism in which this line of stars forms the fly swatter, but these stars have been used time and again by sky cultures elsewhere, some predating the telescope. This is identical to the Vedic asterism Bharani (see Bearer, above), the asterism Apes (see Bee, above), and Fleur de Lis (see above).
- French charts listed it as "Mouche", German as "Fliege" and Italian as "Mosca".

Northern Horn of Al-Jawza:

This Bedouin (Western Saudi Arabia) star "Qarn al-Ǧawza al-Šimalī" (قرن الجوزا الشمالي) is Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion. See Giant, above.

Northern Horn of the Bull:

This Arabic star "Al Ḳarn al Thaur al Shamālīyyah" is Beta (β) Tauri (Elnath) in the IAU constellation Taurus.

Northern Jewel Box:

This **telescopic** asterism is the open cluster NGC 6231 (Caldwell 76) in the IAU constellation Scorpius, also known as the False Comet, The Table of Scorpius, and the Crocodile. It is located a half a degree north of Zeta (ζ) Scorpii. It was discovered by Italian astronomer Giovanni Battista Hodierna before 1654, who called it "Luminosae" (Italian for "bright"). It is listed in the *General Catalogue* of 1864 as GC 4245 and in John Herschel's catalogue as h 3652. South African astronomer Gary Lillis came up with the name "Northern Jewel Box" in 2007 in Walmer, Port Elizabeth, as this asterism resembles the Jewel Box (NGC 4755).

Northern Light:

This Babylonian star "Nura sha-Iltānu" is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899. Allen attributes this to German astronomer and Jesuit Joseph Epping (1835 – 1894).

Northern Lagoon Nebula:

This **telescopic** asterism is NGC 7538 (SH 2-158, LBN 542, Ced 209) in the IAU constellation Cepheus. This was discovered in 1787 by English astronomer William Herschel. This name was posted on the *Deep Sky Forum* in January 2023 by American astronomer Dragan Nikin. It is also known as the Brain Nebula (see above), and Dreyer's Object.

Northern Line of al-Nasaqān:

See Two Lines (below).

Northern of Lilium:

This French star "Līliī Boreā" is 39 Arietis in the IAU constellation Aries. French astronomer Nicolas-Louis de Lacaille (1713 – 1762) gave it this name as it was part of the now obsolete constellation Lilium (see Fleur de Lis, above) created by French architect Augustin Royer.

Northern of the Chariot:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "SUR GIGIR sa SI" ("northern [unknown part] of the chariot") is Beta (β) Tauri (Elnath) in the IAU constellation Taurus (Hunger and Sachs 1988).

Northern Part of the Head of the Lion:

This Arabic star "Ras al Asad al Shamaliyy", later latinized to "Rasalas", or "Ressalas" or "Ras Elased Borealis", is Mu (μ) Leonis in the IAU constellation Leo:

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Rasalas, from the Arabian Rás al Asad, and further designated by Al shemáli, or borealis, to denote the northern star in Asad's head".
- R. H. Allen in his *Star Names* in 1899 translates this as "head of the lion towards the south".
- The IAU approved the name Rasalas for Mu (μ) Leonis in 2016.

Northern Part of the Scales:

This Persian (Achaemenid Period 539 – 331 B.C.E.) star "RIN sa SI" is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra (Hunger and Sachs 1988).

Northern Pole:

This Chinese xing guan "Běijí" (北极) is a line of stars in the IAU constellation Ursa Minor. The line starts with Gamma (γ) Ursae Minoris and runs up through Beta (β) Ursae Minoris (Kochab), 5 Ursae Minoris, and 4 Ursae Minoris, ending at HIP 62572A. This xing guan was used in the Three Kingdoms to Ming Dynasty period, was listed in the Han Dynasty (Didier 2009), and remained unchanged in later Chinese sky lore. The names of its stars are:

- Gamma (γ) Ursae Minoris: "Taizi" ("Crown Prince"),
- Beta (β) Ursae Minoris (Kochab): "Di" ("Emperor"),
- 5 Ursae Minoris: "Shuzi" ("Bastard"),
- 4 Ursae Minoris: "Hougong" ("Harem"),
- HIP 62572A: "Tianshu" ("Celestial Pivot") or "Niuxing" ("Ancient Star"). This is the determinative star

This Chinese Chenzhuo xing guan "Běijí" is a line of stars in the IAU constellation Ursa Minor: Starting at Gamma (γ) Ursae Minoris ("Taizi" ("Crown Prince") it runs through Beta (β) Ursae Minoris (Kochab, "Di" ("Emperor")), 5 Ursae Minoris ("Shuzi" ("Bastard") and 4 Ursae Minoris ("Hougong" ("Harem") to HIP 65595 ("Tianshu" ("Celestial Pivot") or "Niiuxing" ("Ancient Star").

Northern Press:

This Latin star “Torcularis Septentrionalis” is Omicron (ο) Piscium in the IAU constellation Pisces and appeared in the 1515 manuscript of the *Almagest*. It was derived from the Greek word “ληνός” ('full'), which was mistranslated as “λίνος" ('linen') and later contracted to “Torcular”. In 2017 the IAU approved the name Torcular for the star Omicron (ο) Piscium A.

Northern Shepherd:

See Shepherd, below.

Northern Shining One:

This Arabic star “Alsaatie Alshamaliu” (الساطع الشمالي) is Alpha (α) Canis Minoris (Procyon).

Northern Shi’ra:

This Arabic Star “al-Shi’ra al-Shāmīya” is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor. It is called “al-Shāmīya” as it sets from the location of “al-Sham” (Greater Syria).:

- “al-Shi’ra al-Shāmīya” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists “al-shi’rā al-sha’āmiya”.
- This is also known as the Bleary-Eyed Woman (see above).

Northern Southern Cross:

This **telescopic** asterism Cseh 3 (Földvári 12) listed by Hungarian astronomer Viktor Cseh is in the IAU constellation Ursa Major. This asterism, which resembles the Southern Cross (see below) includes the stars 51 Ursae Majoris, HIP 54178A, HIP 54235, and HIP 54210.

Northern Streamer:

This **telescopic** asterism is dark nebula is Barnard 218 in the IAU constellation Taurus.

Northern Suhail:

See Solitary, below.

Northern Tail of the Eagle:

This Latin star “Deneb al Okab Borealis” (“northern tail of the eagle”) or “Deneb el Okab”, is Epsilon (ε) Aquilae in the IAU constellation Aquila and is part of their asterism Tail of the Eagle (see below). John Hill lists the name “Okab” as the Arabic name of the constellation Aquila in his *Urania* in 1754, incorrectly translating it as “black eagle”. Hill is confusing it for their asterism Black Eagle (see above). The IAU approved the name Okab for the star Zeta (ζ) Aquilae A in 2018.

Northern Tail of the Sea Monster:

This Arabic star “dhanab qayṭas al-shamālī” (ذنب قيطس الشمالي) is Iota (ι) Ceti in the IAU constellation Cetus:

- This is listed as “Dhanab al-qītus shamāli” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992).

- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r lists "Scudo Kaytoz".
- This was later latinized to "Deneb Kaitos Shemali", "Schemali", "Deneb Kaitos", "Baten Kaitos Shemali", or "Schemali".
- English Admiral Henry William Smyth lists it as "Dheneb Kaïtos shemáli, the northern branch of the Whale' tail in his *Bedford Catalogue* in 1844.
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 as "Deneb Kaitos schemali": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists Deneb Kaitos shemali" for this star but his 14th edition (1959) does not list it.
- Compare this to Southern Tail of the Sea Monster, below.

Northern Tent:

This Arabic asterism is a quadrilateral of stars in the IAU constellations Auriga, Camelopardalis, and Lynx: Delta (δ) Aurigae, 15 Lyncis, Alpha (α) Camelopardalis, and Beta (χ) Camelopardalis.

Northern Tray of the Scale:

This Arabic star "Kiffah shamāli" is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992):

- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists the Latinized name "Kiffa Borealis", from the Arabian al kiffah al shemáliyah, the northern scale".
- R. H. Allen lists "Kiffa Borealis" in his *Star Names* in 1899, describing it as an "Arabic and Latin" star.

Northern Trifid Nebula:

This **telescopic** asterism is HII region NGC 1579 (SH 2-222, vdB 70, LBN 767, Ced 35) in the IAU constellation Perseus. This was discovered by English astronomer William Herschel in 1788 who listed it as "I 217". It is GC 853 in the General Catalogue of 1864.

Northern Weight:

This Arabic star is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra:

- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) listed it as "Vazneschemali".
- "Northern Weight" is listed in R. H. Allen's *Star Names* in 1899.

Northernmost of the Triad of Leo:

This **telescopic** asterism "Triadobórius Leónis" is the spiral galaxy with a prominent dust lane NGC 3628 in the IAU constellation Leo. This was discovered by English astronomer William Herschel in 1784 who listed it as "V 8" in his catalogue. It is GC 2378 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as King Hamlet's Ghost (see below), the Hamburger Galaxy (see above), Sarah's Galaxy (see below), and the Vanishing Galaxy (see below). It is part of the Leo Triplet (see below).

Stephen James O'Meara's *Hidden Treasures Catalogue* (2007) lists this as O'Meara 58 and lists the names "Hamburger Galaxy" and "Sarah's Galaxy".

Northernmost Scale:

This Latin star "Lanx Septentrionalis" is Beta (β) Librae (Zubeneschamali) in the IAU constellation Libra as listed in R. H. Allen's *Star Names* in 1899.

Nose:

This Persian asterism "Nahn" is two stars in the IAU constellations Cancer and Leo: Xi (ξ) Cancri and Lambda (λ) Leonis. Compare this to the Coptic asterism Piautos (see Eye, above). The IAU approved the name Nahn for the star Xi (ξ) Cancri A in 2018.

This Arabic star "al-Anf" (الأنف) is Epsilon (ε) Pegasi in the IAU constellation Pegasus:

- This was later latinized to "Enif", "Enf", and "Enir".
- NOTE: The Sloane astrolabe BM SL 54 in the British Museum which dates to 1290 – 1300 lists the name "MENkEB" as Alpha (α) Cephei, but the location given is for Epsilon (ε) Pegasi (Dekker 2000).
- French scholar Joseph Justus Scaliger (1540 – 1609) listed it as "Enf Alpharas".
- In the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch it is listed as "Enifalpheraz".
- German astronomer Wilhelm Schickard (1592 – 1635) lists this star as "Aniphol Pharasi".
- Johann Bayer's *Uranometria* (1603) lists the names "Enif" and "Enf Alpheras" for this star and attributes the latter to French scholar Joseph Justus Scaliger (1540 - 1609).
- Robert Hues lists it as "Enif Alfaras" in his *A Learned Treatise of Globes* in 1659.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists "Enif" for this star.
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Enif" and his *Bedford Catalogue* in 1844 lists "Enif… from the Arabic word enf, the nose".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists this star as "Enif".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Enif".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list both "Enif" and "Eniph" for this star.
- The IAU approved the name Enif for the star Epsilon (ε) Pegasi.

Nostril:

This Arabic star "al-Minkhar" (المنخر) is Alpha (α) Ceti in the IAU constellation Cetus:

- This was later latinized to "Menkar" in the *Alfonsine Tables* (Kunitzsch 1986), or "Menkab".
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "MENkAR" (Dekker 2000).
- The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r is hard to read but appears to label this star "Mentakarbon"

- The celestial globe (1480) of German mechanic Hans Dorn (c 1430 – 1506) lists "MENTVM" for this star.
- The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) lists "Menckar" for this star.
- Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) lists this star as "Menkar".
- Johann Bayer's *Uranometria* (1603) lists "Menkar" and "Monkarelkeitos".
- It is listed as "Monkar" and "Monkar Elkaitos" by French scholar Joseph Justus Scaliger (1540 - 1609).
- Robert Hues lists it as "Menkar" in his *A Learned Treatise of Globes* in 1659.
- John Hill gives the name "Meukar Alketus" in his *Urania* in 1754, translating it as "Whale's Nose".
- "Menkar" is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.
- Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this star "Ceti Mandibula" ("jaws of a whale").
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this star as "Menkar".
- William Herschel lists "Menkar" in his *Catalogue of 500 new Nebulae* in 1802.
- Scottish uranographer Alexander Jamieson (1782 – 1850) lists this star as "Menkar" in his *Celestial Atlas* in 1822.
- German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists Menkar.
- English Admiral Henry William Smyth's *Prolegomena* in 1844 lists "Menkab" and his *Bedford Catalogue* in 1844 lists this as "Menkab, corrupted from Al minkhir, the nose or snout".
- Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich list this star as "Menkar".
- *An Improved Moveable Planisphere* (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, lists "Menkar".
- This is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852 lists "Menkar": The author is unknown, but it is based on Jamieson's *Celestial Atlas*.
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Menkar".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this star as "Menkar" and translates it as "nose".
- R. H. Allen lists it as "Al Minħar" in his *Star Names* in 1899.
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists "Mekab", "Menkab", and "Menkar" for this star, but his 14th edition (1959) lists only "Mekab" and "Menkar" as names for this star.
- The IAU approved the name Menkar for Alpha (α) Ceti.

Nostril of the Brave One:

This Arabic star "minkhar ash-shujā" (منخر الشجاع) is Sigma (σ) Hydrae in the IAU constellation Hydra:

- This was later latinized to "Minchir" or "Minkalshuja".
- John Hill lists this star as "Minchir Al Asad" in his *Urania* in 1754.

- "Minchir es-schudscha" is listed in Bode's *Uranographia* in 1801
- It appeared in as "Al Minliar al Shuja" in Frank Schlesinger's *Yale Bright Star Catalogue* in 1930
- The IAU approved the name Minchir for Sigma (σ) Hydrae in 2017.

Not Walking Star:

This Apache star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above). Compare this to the Pawnee asterism "Star That Does Not Walk" (see below).

Notches:

This Kamilaroi asterism "Mundewur" or "Mubirr" is an "S" shaped line of stars in the IAU constellation Serpens or Scorpius that to them represented notches cut into the bark of a tree to enable climbing (William Ridley 1875, Fuller et al 2014, Clarke 2015).

Nothing is a Gift:

This Latin asterism "Nili Donum" is the IAU constellation Triangulum as listed in John Hill's *Urania* in 1754.

Nourisher:

This Vedic nakshatra (lunar mansion) "Pushya" or "Pusya" (Ivanković 2021), which means "to nourish", and is also known as "Sidhya" (see Auspicious, above), is in the IAU constellation Cancer and is the stars Gamma (γ), Delta (δ), and Theta (θ) Cancri. It is listed as "Púsya" in the *Atharveda* (Leitz 2019, Ivanković 2021) on the nakshatra list of the scholar Varahamihir but Leitz identifies the star as "Cancri or Cancer": Of course, Cancri is a suffix that could be applied to any star in Cancer. The ancient *Brhad Samhita* text lists three stars. Ivanković (2021) lists it as "Púsya", translates it as "blossom/flower/best of anything", and associates it with the Vedic fire God Brihaspati or Brhaspati. W. Brennand lists "Pushya" as Delta (δ) Cancri in his Hindu Astronomy in 1896 but also lists it as this nakshatra, though he translates it as "an arrow". Bhagwath (2019) lists its symbols as a cow's udder, a lotus, or an arrow and a circle.

This Myanmar nekkhat (lunar mansion) "Hpusha" (ဖုသ္သ) is in the IAU constellation Cancer and is the stars Gamma (γ), Delta (δ), and Theta (θ) Cancri.

This Tibetan gyukar (lunar house) "Rgyal", "Gyal", or "Gyalme" is in the IAU constellation Cancer and is the star 5 Cancri (Johnson-Groh 2013).

Nosaxa:

See Spring, below.

Nu nu ware:

This Kiribati asterism is made up of stars surrounding Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Trussel and Groves 1978). One of their names for Canopus is Te Waro (see below).

Nu Tsir Da:

This Euphratian asterism is the IAU constellation Ophiuchus, perhaps including stars of Serpens, as listed in R. H. Allen's *Star Names* in 1899.

Nuada:

This Celtic (Irish) star may be Alpha (α) Boötis (Arcturus) in the IAU constellation Boötes (Mosenkis, date N.K.). Nuada Airgetlám ("Nuada of the Silver Hand") is a king of the Tuatha Dé Danaan, who lost his arm in battle and had it replaced with a silver one.

Nu'aish:

This Arabic star "Nu'aish" is Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).

Nubecula Major:

See Major Little Cloud, above.

Nubecula Minor:

See Little Cloud (above).

Nukunuku Rope:

This Rapanui asterism "Taura Nukunuku" is Alpha (α) Canis Minoris (Procyon) and Beta (β) Canis Minoris (Gomeisa) in the IAU constellation Canis Minor (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018).

Numushda:

This Babylonian asterism from the MUL.APIN tablets represents the God "Numusda" or "Numushda", a deity of wild nature, which is made up of stars of the IAU constellations Centaurus and Crux:

- His "body" is the rectangle of the stars Theta (θ) Centauri, Iota (ι) Centauri, HIP 65373 and Zeta (ζ) Centauri.
- From his "shoulders" to lines run out to "hands":
    - One from Theta (θ) Centauri to Eta (η) Centauri, and
    - One from Iota (ι) Centauri to n Centauri.
- From his "hips" two lines of stars form "legs":
    - From Zeta (ζ) Centauri to a "knee" at Epsilon (ε) Centauri to a "foot" which is the stars Alpha (α) Centauri (Rigil Centaurus) and Beta (β) Centauri (Hadar), which they call "Shullat and Khanish" (see Shullat, below, and Khanish, above).
    - From HIP 65373 to a "knee" at Gamma (γ) Centauri and a "foot" which is the Southern Cross asterism (see below).

This Chaldean asterism "mul nu.mus.da" from the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period is the IAU constellation Centaurus (Koch-Westenholz 1995).

This Babylonian and Sumerian asterism "nu mus-da" appears in the Babylonian star catalogue BM 78161 (Liechty 1988) but is listed only as the star Eta (η) Centauri.

This appears in later Seleucid sky lore.

Nunki:

See Star of Eridu, below.

Nurong:

This Wurundjeri asterism is the stars Alpha (α) Scorpii (Antares), Tau (τ) Scorpii, and Sigma (σ) Scorpii in the IAU constellation Scorpius. Nurong is the brother of the creator, Bunjil, and is represented by the star Antares, with the stars on either side being his wives.

Nursery:

This French asterism "la Poussiniere" is the Pleiades cluster in the IAU constellation Taurus was listed as a "vulgar name" of this star cluster in the French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719).

Nurturing:

This Coptic lunar station "Ermelia" is the stars Epsilon (ε), Gamma (γ), Delta (δ), Eta (η), and Theta (θ) Cancri in the IAU constellation Cancer.

Nusakan:

See Two Arrays, below.

Nushagak:

This **telescopic** American star is HIP 13192 (HD 17156) in the IAU constellation Cassiopeia (magnitude 8.16). It was given this name in the IAU NameExoWorlds campaign. It is named for a river near Dilingham in Alaska. It has an exoplanet named Mulchatna, which is a tributary of the Nushagak River.

Nut:

Nut is the Egyptian Goddess of the sky, water and fertility. She represents the entire night sky, her husband Geb is the Earth, and her children are the Gods Osiris and Set, and the Goddesses Isis and Nephthys.

This Latin asterism "Nux" as the IAU constellation Orion. R. H. Allen points out that French astronomer Jérôme Lalande wrote that the stars Lambda (λ) Orionis (Meissa), and Phi (ϕ) 1 and 2 Orionis "look like a set of three nuts, which has caused this constellation to be called Nux [Latin for "nut"], or Juglans, Stella jugular". "Nux" is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: This name is shown next to the star Phi (ϕ) 2 Orionis. (See Joined, above).

This Turkish asterism "Kus" is the IAU constellation Gemini as listed in John Hill's *Urania* in 1754. He translates this word as "nut".

Nut of Coma Berenices:

This **telescopic** asterism "Núx Cómae Bereníces" is the lenticular galaxy NGC 4251 in the IAU constellation Coma Berenices. It was discovered in 1785 by William Herschel who listed it as "I 89". It became GC 2836 in the *General Catalogue* of 1864.This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because "the big central bulge makes this edge-on galaxy look like a nut".

Nutshell of Lepus:

This **telescopic** asterism "Cárinus Léporis" is the spiral galaxy NGC 1954 in the IAU constellation Lepus. It was discovered in 1786 by William Herschel who listed it as "III 590". It became GC 1160 in the *General*

Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Nya:

This Tibetan khyim "Nya" is the IAU constellation Pisces (Johnson-Groh 2013). It is their version of the Vedic rashi Mina (see above).

Nyamien:

This **telescopic** Akan star is WASP-15 in the IAU constellation Centaurus (magnitude 10.91). It received this name in the IAU NameExoWorlds Campaign. Nyamien is the supreme creator deity in Akan mythology. It has an exoplanet named Asye: Asye was their Earth Goddess.

O-nga-tangata:

This Tongan asterism, also known as "Tautanga-ufi", "Mamangi-Halahu", and "Mau-kuo-mau" is the IAU constellation Centaurus.

O Rongo's Darkness:

This Rapanui star "Po'o", "Po Rongo", or "Po Orongo" is probably Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus (Edwards and Edwards 2010, Edwards and Edwards 2016, Edwards et al 2018)

Oak Leaf:

This **telescopic** asterism is emission nebula NGC 2024 (SH 2-277, LBN 953, Ced 55p) in the IAU constellation Orion. It was discovered by English astronomer William Herschel in 1786 who listed it as "V 28" in his catalogue. It is GC 1227 in the *General Catalogue* of 1864. Size 30' X 30'. It is also known as the Maple Leaf (see below), the Tank Tracks (see below), the Flame Nebula (see below) and the "Christmas Tree" (see above). This particular name is attributed to Donald J. Ware by the DOCdb database.

Oak Royal:

See Charles' Oak, above.

Oak Tree:

This Yucatec asterism "tin oh bèek" is an unidentified constellation along the Milky Way representing the roble or oak tree (Milbrath 1999).

Oar for Visitor:

This Korean asterism "Bangmunjaui No" (방문자의 노) is a hexagon of stars in the IAU constellation Boötes: 15 Boötis and HIP 68498, 68707, 69389, 70400, and 70327.

Oath Star:

There are seven Arabic stars with this name:

- One, "Al-MuḤlifayn" or "'al-Muḥlifayn" (محلفين) is Gamma (γ) Centauri in the IAU constellation Centaurus:
    - This was later latinized to "Muhlifain".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Muhlifain".

- One, “Al Suhail al-MuḤlifayn” (“Suhail of the Oath”), or “’al-Muḥlifayn” (محلفين), latinized to “Muḥtalīfaïn”, or “Muḥnithaïn” is Gamma (γ) Canis Majoris in the IAU constellation Canis Major:
    - This was later latinized to “Muliphein” and “Mirza”.
    - R. H. Allen lists “Muliphen” in his *Star Names* in 1963. The IAU approved the name Muliphein for Gamma (γ) Canis Majoris.
- One, latinized to Muliphen, is Gamma (γ) Ophiuchi in the IAU constellation Ophiuchus.
- One is the Arabic and Bedouin star “Miḥlif” (محلف), al-Muhlif (المحلف) or al-Muhnith (المحنث) is Alpha (α) Eridani (Achernar) in the IAU constellation Eridanus.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists several variations, including:
    - Alpha (α) Columbae (Phact) and Beta (β) Columbae (Wazn) in the IAU constellation Columbus, listed as “Muliphein, from al muhlefein”, and
    - “ζ [Zeta], λ [Lambda] , and γ [Gamma] Argo” which would be Zeta (ζ) Puppis, Lambda (λ) Velorum, and Gamma (γ) Velorum.
- One, “Muhlifain” or “Muhnithain” is either Alpha (α) Centauri (Rigil Kentaurus) or Beta (β) Centauri (Hadar) in the IAU constellation Centaurus as listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010): Sufi isn’t sure which star is connected to this name.

Obelisk:

This Latin asterism “Obelus” is the IAU constellation Sagitta. Johann Bayer’s *Uranometria* (1603) lists “Obelus” as an alternate name for Sagitta. R. H. Allen’s *Star Names* in 1899 lists “Obelus” and Allen attributes this name to “ancient grammarians”.

Oblate of Hydra:

This **telescopic** asterism “Oblátus Hýdrae” is the lenticular galaxy NGC 3585 in the IAU constellation Hydra. It was discovered in 1784 by William Herschel who listed it as “II 269”. It became GC 2341 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Oblique Cross:

This **telescopic** asterism, also known as the Starfish, is the open cluster Messier 38 (NGC 1912), discovered by Italian astronomer Giovanni Battista Hodierna before 1654 in the IAU constellation Auriga. This was listed in the *General Catalogue* of 1864 as GC 1119. British astronomer Rev. Thomas Webb (1807 – 1885) described it as a “noble cluster arranged as an oblique cross” in the 3rd edition of *Webb’s Celestial Objects for Common Telescopes*, and I agree with this description. The popular American astronomer Walter Scott Houston in his *Sky and Telescope* column *Deep-Sky Wonders* in 1857 also mentions early astronomers describing it as a cross shape. The 14th edition of British schoolmaster Arthur P. Norton’s *A Star Atlas* (1959) describes this as a “striking, loose, cruciform cluster”.

Oblong One of Sextans:

This **telescopic** asterism “Oblóngus Sextántis” is the edge-on spiral galaxy NGC 3365 in the IAU constellation Sextans. It was discovered in 1828 by John Herschel who listed it as h 747 and later as GC

2191 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Obscure One:

This Arabic star is Delta (δ) Ursae Majoris in the IAU constellation Ursa Major as listed by Arabic navigator Ibn Majid (d. ~1500) and is still used by Red Sea fishermen (Khalid AlAjaji).

Obscure One of Camelopardalis:

This **telescopic** asterism "Scotinus Camelopardális" is the barred spiral galaxy UGC 4841 in the IAU constellation Camelopardalis. It was discovered by Erik Bertil Holmberg, and is known as Holmberg III. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it is a "faint and inconspicuous galaxy".

Obsidian:

This Akkadian asterism "Surru" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is an unidentified star in the IAU constellation Scorpius.

This Babylonian asterism "MUL.sur-ru" (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is an unidentified star in the IAU constellation Scorpius.

Obstructor:

This Arabic star "al-cayyūq", "cAyyūq", or "al-Ayyuq" (العيوق) is the star Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as listed by 'Abd al-Rahman al-Sufi (903 – 986) and Ibn Qutayba. This comes from an old Arabic story that Al-Ayyuq is obstructing Aldebaran (see Follower above) from meeting the Pleiades (see Al-Thurayya, above), which is why it is also known as "Aqyuq Al-Thurayya":

- NOTE: "al-'Ayyūq" is given as one of the names of the star Alpha (α) Canis Majoris in the IAU constellation Canis Major rather than Capella by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name of this Capella as "al-'ayyūq" and the Hebrew name of this star as "moshekh ha-resen".
- The star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985) lists the Arabic name "al-ayyūq" and the Hebrew name "ha-nilham".
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "Al-'ayyūq" .
- An anonymous Hebrew star list from 1392 (Goldstein 1985) lists the Arabic name "al-'ayyūq" and the Hebrew name "moshekh ha-resen".
- The Sloane astrolabe BM SL 54 in the British Museum (1290 – 1300) lists "ALhAIOC" (Dekker 2000).
- The rete of the 14th century Spanish astrolabe NMM AST0570 lists "Alhaioc" (Dekker 2000).
- This is listed on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992) as "'Ayyūq" and Savage-Smith calls it "untranslatable".
- Variations of this name appeared in Medieval accounts, including "Alhaior", "Althaiot", "Alhaiset", "Alhatod", "Alhojet", "Alanac", "Alanat", "Ayyūḳ", "Alhajoc", "Alhajoth", "Alathod", "Alkatod", "Alatudo", and "Alioc".

- A celestial globe (1522) of German polymath Johann Schöner (1477 – 1547) lists this star as "Alhajoth".
- Johann Bayer's *Uranometria* (1603) lists "Alhaiot" and "Alharod".
- Robert Hues lists it as "Alhaick" in his *A Learned Treatise of Globes* in 1659 and translates it as "he-goat". Hues also attributes the name "Alatod" to Joseph Justus Scaliger (1540 – 1609).
- Edward Sherburne lists the "Arabic" names as "Aiynk" and "Atud" in 1675 in his *The Sphere of Manilius*.
- Catholic librarian Giuseppe Simone Assemani (1687 - 1768) listed it as "Alchaela".
- John Hill lists the "Arabic" names as "Atud" and "Ayuk" in his *Urania* in 1754.
- The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) lists "Alhatod" as an "Arabic" name for this star.
- Johann Elert Bode's *Vorstellung Der Gestirne* (1782 lists this star as both "Capella" and "Alhajoth".
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "el-'áyyúk, a word of doubtful origin and signification" and writes "the Arabs distinctly termed it the Guardian of the Pleiades", which is clearly a reference to the Arabic asterism Obstructor and the Posts (see below).

Obstructor and the Posts:

This Arabic asterism "al-Ayyuq and the Posts" is made up of stars of the IAU constellation Auriga and Taurus as listed by Ibn Qutayba:

- The star Alpha (α) Aurigae (Capella) is "al-Ayyuq" (see Obstructor, above)
- The star Iota (ι) Aurigae is the "Foot of Al-Ayyuq"
- The "Posts" or "Associates of Al-Ayyuq" are:
    - Post 1: Beta (β) Aurigae (Menkalinan),
    - Post 2: Theta (θ) Aurigae, and
    - Post 3: Beta (β) Tauri (Elnath)

Ocean:

This Latin asterism "Oceanus" is the IAU constellation Eridanus and relates to the 8th century B.C.E. poet Homer's Ocean Stream flowing around the Earth.

- Johann Bayer's *Uranometria* (1603) lists "Oceanis" for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists "Oceanis" as a name for Eridanus.
- "Oceanus" is listed in John Hill's *Urania* in 1754.

Ocean Storm:

This Latin asterism "Pelagi Procella ("ocean storm") is the IAU constellation Capricornus. Johann Bayer's *Uranometria* (1603) lists "Pelagi Procella" as a name for Capricornus. John Hill lists it as "Procella" ("storm") or "Procella Pelagi" in his *Urania* in 1754.

Ocelot:

This postclassic Mayan asterism from the Paris Codex is the IAU constellation Aries.

Oclazos:

This Greek asterism is the IAU constellation Hercules as listed in John Hill's *Urania* in 1754.

Octans:

None of the stars of Octans are brighter than 4th magnitude and only show up in 23 asterisms in this handbook.

This IAU constellation (IAU abbreviation Oct) was created by French astronomer Abbé Nicolas Louis de Lacaille in 1752. He originally named it "l'Octans de Reflexion" ("the reflecting octant" – the octant being a navigational instrument), and some referred to this constellation as "Octans Hadleianus", in honor of English mathematician John Hadley, who invented the octans in 1730. Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "l'Octans de Reflexion" as an octant.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "l'Octans Reflexion" as an octant.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Reflectierender Oktant" and depicts it as an octant.

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts Octans: Unfortunately, the copy of the chart I obtained has blurred the caption to make it unreadable, but it does depict an octant.

"Octans" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875): He indicates the borders of this constellation on the chart but offers no illustration of it.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Octans, the Octant" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Octans" and describes it as an "Octant".

The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists "Octans" and gives the "original form" as "Octans Hadleianus, Hadley's Octant".

This constellation is shown on French charts as "Octant", German charts as "Oktant", and Italian charts as "Ottante".

Standard IAU charts depict Octans as the triangle of stars Gamma (γ) Octantis, Delta (δ) Octantis, and Beta (β) Octantis.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Octans in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in the same manner as on IAU charts except that they add a line from Beta (β) Octantis to Theta (θ) Octantis.

Octans Hadleianus:

See Octans, above.

October Salt and Pepper Cluster:

See Salt and Pepper, below.

Octopus:

This Greek asterism “Οκτάπους” or “Oktápous” is the IAU constellation Cancer.

This Latin name “Octipes” (“eight-footed”) the IAU constellation Cancer as described by Roman poet Publius Ovidius Naso (Ovid) and Roman poet Sextus Propertius (55 – 15 B.C.E.).

- Johann Bayer’s *Uranometria* (1603) lists “Octipes” as an alternate name for Cancer.
- “Octipes” is listed by Edward Sherburne in his *Sphere of Marcus Manilius* in 1675.
- “Octipes” is listed by John Hill in his *Urania* in 1754.

There are three **telescopic** “octopus” asterisms:

- One is the open cluster NGC 6819 in the IAU constellation Cygnus. It was discovered by English astronomer Caroline Herschel in 1784. It is GC 4511 in the *General Catalogue* of 1864. It is situated on the border between the IAU constellations Cygnus and Lyra. It contains about two dozen 10^{th} to 12^{th} magnitude stars with many fainter stars. It is also known as the Fox Head (see above), and has also been described as a letter “U”, “K”, or “X”.
- One is the open cluster NGC 1664 in the IAU constellation Auriga. This was discovered by English astronomer William Herschel in 1786 who listed it as “VIII 59” in his catalogue. It is GC 907 in the *General Catalogue* of 1864. It was given the name “Octopus” by American astronomer Wayne Schmidt. It measures 12 X 8 arcminutes.
- One is the open cluster NGC 3114 in the IAU constellation Carina. It was discovered by Scottish astronomer James Dunlop in 1827 who listed it as h 3224 in his catalogue. It is GC 2007 in the General Catalogue of 1664. South African astronomer Auke Slotegraaf described this in 1994 as a spider or octopus. It is also known as the Hand (see above).

Octopus Tentacle:

This Anutan asterism **“**Kaavei” is a line of three stars in the IAU constellation Aries, starting with the star Beta (β) Arietis (Sheratan), running through Alpha (α) Arietis (Hamal) and ending at the double star c Arietis.

This Hawaiian star “Keawe” is Alpha (α) Pegasi (Markab) in the IAU constellation Pegasus.

Odd One of Andromeda:

This **telescopic** asterism “Insólitus Andrómedae” is the spiral galaxy NGC 523 (Arp 158) in the IAU constellation Andromeda. It was discovered in 1784 by English astronomer William Herschel who listed it as “III 170”. It became GC 306 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its shape.

Odin’s Wagon:

This Norse asterism “Óðins vagn” or “Óðinn's Wagon" is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above). Cleasby, Vigfusson, and Grimm (1874) all suggest that while there is no direct evidence of this name, it is similar to the Dutch asterism Wotan’s Wagon (see below) and Old High German and Anglo Saxon “Wodan’s Wagon” (see below) and in Old Norse poetry one finds kennings (compound expressions) for their God Óðinn such as “vagna verr” (“wagon’s lord”) or “vagna grimnir” (“the wagon of Grimnir”), Grimnir being one of the heiti (synonyms) for Óðinn. In the Eddaic poem Sigrdrífumál verse 17 one finds the kennigs “valdr vagnbrautar” (“ruler of the wagon-road") and

“Reið Rôgnis” (“the conveyance of Rôgnir’ or ‘Rôgnir's wagon’), Rôgnir being another heiti of Óðinn (Eysteinn's Lexicon of Kennings Analytical Glossary). In 1882 Grim lists “vagns-höll” (“wagon’s hall”), “vagn-ræfr” (“wagon’s roof”), and “vagn-braut” (“wagon road”) as names for the sky, so the “road of the wagon” is the Milky Way. R. H. Allen lists “Wagon of Odin, Woden, or Wuotan” in his *Star Names* in 1899.

Oebalus:

This Latin asterism “Oebalii” or “Oebalidae” of the Roman poet Ovid (b. 43 B.C.E.), Statius, and 1st century Roman poet Valerius Flaccus is the IAU constellation Gemini. King Oebalus of Sparta was the grandfather of Castor and Pollux.

Of a Thousand Colours:

This French star “Barāḳish” is Alpha (α) Canis Majoris in the IAU constellation Canis Major as listed by French astronomer Dominique François Jean Arago (1786 – 1853).

Of Special Importance:

This Latin star “Praecipua” is 46 Leonis Minoris in the IAU constellation Leo Minor as named by Polish astronomer Johannes Hevelius (1611 – 1687) and Italian astronomer Giuseppe Piazzi (1786 – 1846) in his *Palermo Catalogue*. American uranographer Elijah Burritt (1794 – 1838) listed it as Leo Minor’s principal star. The IAU has approved the name Praecipua for 46 Leonis Minoris.

Of the Daybreak:

This Romanian star “Zorilă” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major (Ottescu 2009).

Of the Vines:

This Lithuanian asterism “Vergiliae” is the Pleiades open cluster in the IAU constellation Taurus.

Offering:

This **telescopic** asterism is made up of stars of the IAU constellation Ara: Beta (β) Arae and Gamma (γ) Arae. It is Lorenzin 19 on Tom Lorenzin’s list. It is called this, of course, because it represents an offering on Ara, the Altar.

Officer for Cart:

This Korean asterism “Kateu Jang-gyo” (카트 장교) is two lines of stars in the IAU constellation Cygnus which are joined at the star Theta (θ) Cygni. The two lines from this star are:

- One going out through Iota (ι) Cygni to Kappa (κ) Cygni, and
- One going out to HIP 92689.

Officer for Chariot:

This Korean asterism “Jeoncha Jang-gyo” (전차 장교) is made up of stars in the IAU constellation Cassiopeia. The central star is Beta (β) Cassiopeiae (Caph). From this star four lines run out to the four stars Gamma (γ) Cassiopeiae, Eta (η) Cassiopeiae, Alpha (α) Cassiopeiae (Shedar) and Zeta (ζ) Cassiopeiae. The Koreans call the star Gamma (γ) Cassiopeiae “CheonSa” (“the whip”).

Officer for Family:

This Korean asterism “Gajog-eul Wihan Jang-gyo” (가족을 위한 장교) is a quadrilateral of stars in the IAU constellation Ophiuchus: 74 Ophiuchi and HIP 91237, 91217, 90313, and 89772.

Officer for Jewel:

This Korean lunar mansion “Duu” is a line of two stars in the IAU constellation Hercules: 29 and Omega (ω) Herculis.

Officer for Opinion:

This Korean asterism “Uigyeon Damdang-gwan” (의견 담당관) is a series of four lines of stars radiating out from the star HIP 77277 in the IAU constellation Ursa Minor:

- One line goes out to the star HIP 75696,
- One line goes out to the star HIP 75256,
- One line goes out to the star HIP 75260, and
- One line goes out to the star HIP 75974.

Officer of Honour:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star 2 Comae Berenices in the IAU constellation Coma Berenices.

This Chinese xing guan “Xìngchén” (幸臣) is the star GK Comae Berenices in the IAU constellation Coma Berenices.

This Chinese Chenzhuo xing guan “Xingchen” is the star 2 Canum Venaticorum in the IAU constellation Canes Venatici.

Officer of Kitchen:

This Korean lunar mansion “Ryu” in the IAU constellation Hydra is a curling line of stars resembling a letter “P”: Theta (θ), Omega (ω), Zeta (ζ), Epsilon (ε), Delta (δ), Sigma (σ), Eta (η), and Rho (ρ) Hydrae.

Officer of Tomb:

This Korean lunar mansion “Zaang” is in the IAU constellation Hydra and is a diamond shape of five stars with lines running out of either end. The “diamond” is the stars Mu (μ), Lambda (λ), and Upsilon (υ) 1 and 2 Hydrae and HIP 48615. The two lines at either end run:

- From Mu (μ) to Phi (ϕ) Hydrae, and
- From Upsilon (υ) 1 to Kappa (κ) Hydrae.

Officers of the Imperial Guard:

This complex Chinese xing guan from the Three Kingdoms to the Ming Dynasty is made up of stars of the IAU constellation Coma Berenices. A jagged oval of stars starts at the determinative star 4 Comae Berenices and runs around through FM Comae Berenices, HIP 60168, 12 Comae Berenices, 13 Comae Berenices, 17 Comae Berenices, HIP 60880, 16 Comae Berenices, 14 Comae Berenices, Gamma (γ) Comae Berenices, HIP 60018, HIP 59923, HIP 59489, and HIP 59364. Three lines run across the middle of this oval:

- One from HIP 59923 to Gamma (γ) Comae Berenices,
- One from HIP 59489 through 9 Comae Berenices to 14 Comae Berenices,

- One from HIP 59364 through HIP 60170 to 16 Comae Berenices.

This Chinese xing guan “Lángwèi” (郎位) is a jagged line of stars in the IAU constellation Coma Berenices. It starts at Gamma Comae Berenices and then zig-zags through 14, 16, 17, 13, 12, 21, 18, 7, 23, 26, 20 and 5 Comae Berenices, ending at 2 Comae Berenices.

This Chinese Chenzhuo xing guan “Lángwèi” is the open cluster Melotte 111 (Cr 256) in the IAU constellation Coma Berenices.

Official for Earthworks and Buildings:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Pisces: 34 Piscium (the determinative star) and HIP 1465.

This Chinese xing guan “Tǔgōng” (土公) is a line of two stars in the IAU constellation Pisces: 32 and 45 Piscium.

This Chinese Chenzhuo xing guan “Tǔgōng” is a line of two stars in the IAU constellation Pisces: 64 and 57 Piscium.

Official for Irrigation:

This Chinese xing guan “Shuǐfǔ” (水府) is a quadrilateral of four stars in the IAU constellation Orion: Nu (ν), Xi (ξ), 72 and 69 Orionis. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan is a “box” of stars in the IAU constellation Gemini and Orion: HIP 31277, 74 Orionis, 75 Orionis, and HIP 31119.

Official for Materials Supply:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Pegasus: Zeta (ζ) Pegasi (the determinative star) and Xi (ξ) Pegasi.

This Chinese xing guan “Tǔgōnglì” (土公吏) is a line of two stars in the IAU constellation Pegasus: 31 and 36 Pegasi.

This Chinese Chenzhuo xing guan “Tǔgōnglì” is a line of two stars in the IAU constellation Pegasus: Zeta (ζ) Pegasi and Xi (ξ) Pegasi.

This Korean asterism is identical to the Chinese xing guan Official for Materials Supply (above).

Official for the Royal Clan:

This Chinese xing guan “Zōngzhèng” (宗正) is a line of two stars in the IAU constellation Ophiuchus: Beta (β) Ophiuchi (Cebalrai) and Gamma (γ) Ophiuchi. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Zōngzhèng” is two stars in the IAU constellation Ophiuchus: Beta (β) Ophiuchi (Cebalrai) and Gamma (γ) Ophiuchi.

Official in Charge of Pasturing:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a quadrilateral of stars with a line running off one end in the IAU constellation Pisces. The quadrilateral is the stars HIP 7359, 97

Piscium, Eta (η) Piscium, and 105 Piscium. A line runs from HIP 7359 to 107 Piscium (the determinative star).

This wedge shaped Chinese xing guan “Yòugēng” (右更) is made up of stars in the IAU constellation Pisces: 104, 110, 102, Eta (η), and Rho (ρ) Piscium.

This Chinese Chenzhuo xing guan “Yòugēng” is made up of stars of the IAU constellation Pisces: This is an angular loop of the stars HIP 7359, 7 Piscium, Eta (η) Piscium, and 105 Piscium. From HIP 7359 a line runs out to 107 Piscium.

Official in Charge of the Forest:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars with a line running off one side in the IAU constellation Aries. The oval of stars is HIP 10795, Eta (η) Arietis, 15 Arietis, Theta (θ) Arietis, and HIP 10767. From HIP 10795 a line runs to the determinative star, HIP 11670.

This Chinese xing guan “Zuǒgēng” (左更) is a “J” shaped asterism in the IAU constellation Aries: Eta (η), Sigma (σ), Omicron (ο), Mu (μ), and Nu (ν) Arietis.

This Chinese Chenzhuo xing guan “Tiānqūn” is made up of stars of the IAU constellation Aries: This is an angular loop of the stars HIP 10795, Eta (η) Arietis, 15 Arietis, and Theta (θ) Arietis. From HIP 10795 a line runs out to HIP 11670.

Official of Religious Ceremonies:

This Chinese xing guan “Zōngrén” (宗人) is a triangle of stars in the IAU constellation Ophiuchus: 66, 67, 68, and 70 Ophiuchi with 67 Ophiuchi being the determinative star. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Zōngrén” is four stars in the IAU constellation Ophiuchus: From the star 70 Ophiuchi three star lines emerge:

- One to 66 Ophiuchi,
- One to 67 Ophiuchi, and
- One to 68 Ophiuchi.

Official of the Royal Archives:

This Chinese xing guan “Zhushi” from the Three Kingdoms to the Ming Dynasty is the star Chi (χ) Draconis in the IAU constellation Draco.

This Chinese xing guan “Zhùshǐ” (柱史) is the star Phi (φ) Draconis in the IAU constellation Draco.

This Chinese Chenzhuo xing guan “Zhushi” is the star Psi (ψ) Draconis in the IAU constellation Draco.

Offramp:

This asterism from the Saguaro Astronomy Club asterism database is also known as the “thumb” and consists of the Milky Way from Epsilon (ε) Aquilae in the IAU constellation Aquila to Beta (β) Ophiuchi (Cebalrai) in the IAU constellation Ophiuchus.

Ogma:

This **telescopic** star is HIP 80838 (HD 149026) in the IAU constellation Hercules (magnitude 8.14). It was given this name in the IAU NameExoWorlds campaign in 2015. Ogma was a Celtic father God. This has an exoplanet named Smertrios, which was the Gallic God of War.

Ogre:

This Japanese sei shuku or lunar station “Tamahome Boshi”, sometimes translated as “devil” or “ghost”, is a quadrilateral of stars in the IAU constellation Cancer: Delta (δ), Gamma (γ), Eta (η) and Theta (θ) Cancri.

Oisin:

This Irish asterism is the IAU constellation Hercules. This asterism is found in Julie Ormonde’s *Constellation Stories of Ancient Ireland* (2015). Oisin was regarded as the greatest poet of Ireland and a warrior in the Ossianic or Fenian cycle of myths.

Okab:

See Northern Tail of the Eagle, above.

Old Adze:

This Barasana asterism “Sioruhu Bukura” is probably Sigma (σ), Epsilon (ε), and Eta (η) Canis Majoris in the IAU constellation Canis Major (Hugh-Jones 2006).

Old Algarrobo Tree:

This Mocoví asterism “Mapiqo’xoic” is made up of the stars and dark nebulosity in the IAU constellation Sagittarius: Xi (ξ) 1 and 2, Omicron (ο), Pi (π) 1 and 2, Rho (ρ) 1 and 2, and Nu (ν) Sagittarii form the “crown”, Delta (δ), Gamma (γ) and Upsilon (υ) Sagittarii form the “trunk and branches” and the dark nebulosity (dark nebulae Barnard 87 and 90) are the “foliage” (Lopez 2021).

Old Bag of the Night:

This San (Nyae Nyae !Kung) asterism is the Coal Sack Nebula (Alcock 2014, Slotegraaf 2013, Holt and Slotegraaf 2022). Old in this context means “worn out”.

Old Camp:

This Cheyenne asterism is the IAU constellation Corona Borealis.

Old Cart:

This Estonian asterism is the IAU constellation Lyra (Kuperjanov 2006).

Old Dthillar:

This Kamilaroi/Euahlayi asterism is in the IAU constellation Taurus. Old Dthillar is a Wiringin, in this case the Wiringin guarding the Birray Birray, the uninitiated boys in the belt of Orion who pine for the Mai Mai or Miyaay Miyaay (Seven Sisters) in the Pleiades cluster who are Dthillar’s nieces. Old Dthillar is the star Alpha (α) Tauri (Aldebaran), and he stands there to protect the sisters from the Birray Birray. The "V" shape of the Hyades cluster is Old Dthillar's “gunya” (“hut”).

Old Gao:

This Jū/Wãsi and Nama star “ǂN!a” is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus and is part of their asterism Three Zebras (see below).

Old Man:

This Chinese xing guan “Lǎorén” (老人) is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore.

This Chinese Chenzhuo xing guan “Laoren” (“Old Man”) or “Nanjilaoren” (“Southernmost Old Man”) is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

This Japanese star “Nankyoku Rōjin” is Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Miyajima 2014) as listed by Japanese astronomer Shibukawa Harumi (1639 – 1716).

This Babylonian asterism “MUL.EN.ME.SAR” (Hunger 1992) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is part of the IAU constellation Perseus.

This Babylonian asterism from the MUL.APIN tablets “SI.GU” is made up of stars of the IAU constellations Andromeda, Perseus, and Triangulum. This appears in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “MUL.SI.GI” (Hunger 1992). and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul su.gi” (Bartel van der Waerden 1974, Koch-Westenholz 1995, Belmonte Esteve 2018). This is how it is made up:

- The old man’s “head” is a triangle of stars: Gamma (γ) Persei, k Persei, and Eta (η) Persei,
- His “neck” is a line between Gamma (γ) Persei and Alpha (α) Persei (Mirfak)
- An “arm” runs from Mirfak through Iota (ι) Persei to a “hand” formed by a narrow triangle of stars: Theta (θ) Persei, 65 Andromedae, and 64 Andromedae.
- A “walking stick” is a line between 64 and 65 Andromedae and 14 Trianguli.
- His “body” is a line from Mirfak to Delta (δ) Persei.
- From Delta (δ) Persei to lines form “legs”:
    - One runs to a “knee” at Beta (β) Persei (Algol) to a foot formed by Rho (ρ) Persei and 16 Persei.
    - One runs through Epsilon (ε) Persei and Xi (ξ) Persei to a foot formed by Zeta (ζ) Persei and Omicron (o) Persei.

Bartel van der Waerden describes this asterism as the IAU constellation Perseus and the northern part of Taurus in his *Science Awakening II: The Birth of Astronomy* in 1974. This asterism appears in later Seleucid star lore. It is sometimes depicted in their skies as a charioteer.

This Babylonian asterism “SHU.GI” or “shibu” as listed in Anthony Hope’s *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Perseus. Hope also lists it as “EN.ME.SHÁR.RA” and describes it as “Zeta (ζ) and Omicron (o) Persei with, perhaps, the northern stars of Taurus”.

This Assyrian asterism “SHU.GI” (Bartel van der Waerden 1974) is identical to the Babylonian asterism “SI.GU” above.

This Akkadian asterism “Enmessara” or “Enmesara” (Hunger 1992, Sanders 2023) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) and “Šību” or “Sibu” (Hunger 1992, Parpola 1993) from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) is identical to the Babylonian asterism “SI.GU” above.

This Persian asterism "SU.GI" from the list of Lumasi and Tikpi Stars from the K250 and VAT 9418 lists of the Persian (Achaemenid) Period (539 – 331 B.C.E.) as listed in Franz Boll's *Ancient Observations of Coloured Stars* in 1918 and "su-gi" in Ernst Weidner's *Fixsterne* in 1971 is made up of the stars of the IAU constellation Perseus plus some stars north of the Hyades cluster in the IAU constellation Taurus (Jeremias 1929).

This star is Alpha (α) Orionis in the IAU constellation Orion as listed by R. H. Allen in his *Star Names* in 1899. Unfortunately, he only identifies this as an "Amazon River myth" without naming the precise culture or source. Allen writes that the old man chases "Peixi Boi" (see below), which he does not translate.

This Hungarian asterism "Óstoros" is the star 80 Ursae Majoris (Alcor) in the IAU constellation Ursa Major. He is the old man pulling the shaft of Göncöl's Wagon (see above). The celestial map of Hungarian uranographer Sandor Nagy (1915) lists this asterism.

Old Man and a Boy in a Canoe:

This Tupi Guarani asterism is the stars Alpha (α) Orionis (Betelgeuse) and Gamma (γ) Orionis (Bellatrix) in the IAU constellation Orion (Lima and De M. Figueirôa, 2007). They are chasing a peixe-boi (Amazonian manatee) which is represented by a nearby dark spot in the sky (see Manatee, below).

Old Man with a Stick:

This Tupi Guarani asterism "Homem Velho" is made up of the stars of the IAU constellations Eridanus, Orion, and Taurus. This is not the usual "body" associated with the seven brightest stars of Orion:

- His "head" is the Hyades star cluster,
- His "body" is a line between Alpha (α) Tauri (Aldebaran) and Gamma (γ) Orionis (Bellatrix),
- One "foot" is Alpha (α) Orionis (Betelgeuse),
- His other "leg" runs from Bellatrix through the belt of Orion (which they call "Joykexo") to the star Kappa (κ) Orionis (Saiph),
- One "hand" is the stars 11 and 15 Orionis,
- His "arms" are a line from 11 Orionis to Eta (η) 1, 2 and 3 Orionis,
- From the "hand" at Eta (η) 3 Orionis, a "walking stick" extends down through Eta (η) 5 Orionis, and Beta (β) Eridani (Cursa), ending at the tip of the stick with the star Beta (β) Orionis (Rigel), and
- The Pleiades cluster (which they call "Eixu" or "Bees") is the "feather" in the old man's cap.

Compare this to the Pemon asterism Jilijoaibu, above.

Old Marine:

This Latin asterism "Senex Aequoreus" is the IAU constellation Cepheus.

Old Sieve:

This Estonian asterism "Vana Sõel" is the Hyades cluster in the IAU constellation Taurus and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Old Serpent:

This German asterism is the IAU constellation Draco and represents the serpent who tempted Eve.

Old Staff Stars:

This Estonian asterism “Vanad Sauatähed” is three stars in the IAU constellation Aquila (Kuperjanov 2006): Beta (β) Aquilae (Alshain), Alpha (ε) Aquilae (Altair) and Gamma (γ) Aquilae.

Old Star Thing:

This Barasana star “Nyokoaro Bukura” is Lambda (λ) Orionis in the IAU constellation Orion. Hugh-Jones (2006) describes it as Lambda (λ) and Phi (ϕ) 1 and 2 Orionis. It is in the part of the Milky Way that the Barasana call the “Old Star Path”. It is associated with a mythical heroine “Meneridyo” (“Ingá Woman”).

Old Wheels:

This Estonian asterism is the Little Dipper asterism in the IAU constellation Ursa Minor (Kuperjanov 2006). It is from the island of Saaremaa.

Old Wiringin:

To the Kamilaroi/Euahlayi, a Wiringin is a "Clever Man" or Aboriginal doctor. Old Wiringin is in the Small Magellanic Cloud where he controls who can go on to Bulimah after death. If the person who died is not initiated, they are not allowed, because they don't know the rules, so he sends them to Wadhaagudjaaylwan (see Birth Spirit, above) in the Large Magellanic Cloud. This birth spirit will send the uninitiated back to Earth as a new baby, so they can be initiated. This Wiringin is represented in every Aboriginal cemetery as the Wilga tree (Native Willow). Compare with their asterism Wise Man (see below).

Old Wife:

This Russian asterism “Baba” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Old Wives:

This Polish asterism “Baby” is the Pleiades cluster in the IAU constellation Taurus as listed by R. H. Allen in his *Star Names* in 1899.

Old Woman:

This Kamilaroi/Euahlayi star is Alpha (α) Lyrae (Vega) in the constellation Lyra.

This Irish star is one of the stars of the Pleiades cluster in the IAU constellation Taurus (Boutet 2014). She is also known as “Bui” (“yellow”), wife of Lugh, the Sun God.

Old Woman Returning from the Garden with Crop in Her Bag:

This Sesivi (Daakaka) asterism “Éteto an Véavin” is the sword of Orion in the IAU constellation Orion (Ramik 2019). The quadrilateral formed by the stars Kappa (κ) Orionis (Saiph) and Beta (β) Orionis (Rigel) and the stars of the belt of Orion is “Kasulia Kuakua” or “Kasulia Reparep” (see “Short Yoke” below), which is the yoke this stellar woman is using to carry things.

Old Woman’s Cot:

This Gond asterism is a quadrangle of stars in the IAU constellation Ursa Major: Alpha (α) Ursae Majoris (Dubhe), Beta (β) Ursae Majoris (Mirak), Gamma (γ) Ursae Majoris, and Delta (δ) Ursae Majoris (Vahia

2014). Compare this to the Kolam asterism Cot (see above) or the Kolam asterism Cot of the Dead (see above).

Old Woman's Distaff:

This Finnish asterism "ämmänrukki" is the belt of Orion in the IAU constellation Orion (Persson 2022).

Old Woman's Grandchild:

This Apsáalooke star is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (see Little Dipper, above).

Olive Leaf of Antlia:

This **telescopic** asterism "Olivifólium Ántliae" is the spiral galaxy NGC 3281 in the IAU constellation Antlia. John Herschel listed this as h 3269 and later as GC 2136 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Olive of Pisces:

This **telescopic** asterism "Olivia Píscium" is the elliptical galaxy NGC 315 in the IAU constellation Pisces. It was discovered in 1784 by English astronomer William Herschel who listed it as II 210. This is GC 176 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010).

Olive of Virgo:

This **telescopic** asterism "Oliva Vírginis" is the elliptical galaxy NGC 4697 (Caldwell 52) in the IAU constellation Virgo. William Herschel listed this as "I 39". It became GC 3227 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Olwen's Hall:

This Welsh asterism listed by Victorian folklorist Marie Trevelyan (1852 – 1922) in her *Folk-lore and Folk-stories of Wales* (1909) is currently unidentified.

Olympic Rainy Capella:

This Latin asterism "Oleniae sidus pluviale Capellae" is the IAU constellation Auriga and related to the asterism Capra (see Kids, below) and appears in 1st century B.C.E. poet Ovid's *Metamorphoses*. This constellation marked the rainy season.

This Latin asterism "Olenia", "Capra Olenie", "Olenie", is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga. Roman poet Publius Ovidius Naso (Ovid, b. 43 B.C.E.) lists it as "Olenium Astrum" ("Olenium Star") in his *Heroides*. It apparently comes from the Greek poet Aratus' epithet "Ωλενίη" or "Olenií". Compare this to Rainy Goat Star, below.

Omega:

This Gallic asterism is the IAU constellation Lyra. The Gallo-Roman historian and Bishop Gregory of Tours (538 – 594) created this to help monks use certain stars in the sky to determine the time for prayers. It is part of his asterism "Crux Maior" (see Major Cross, above).

Omega Centauri:

This **telescopic** asterism is the globular cluster NGC 5139 (Caldwell 80) in the IAU constellation Centaurus. It is also known as the "Star in the Cloud on the Horse's Back" (see below), which was how it was described by Ptolemy (c.100 – c.170), the Ice Cream Cone (see above) and the 3D Christmas Light Ball (see above). It was first identified as a non-stellar object by English astronomer Edmond Halley in 1677 in his observations from St. Helena. German uranographer Johann Bayer (1572-1625) used Ptolemy's data in his 1603 *Uranometria*, listing it as "Omega Centauri". Swiss astronomer Jean Philippe de Chéseaux listed it as a nebula in 1746, as did French astronomer Abbé Nicolas Louise de Lacaille in 1755, who described it as "like a big diffuse comet". It is listed in the *General Catalogue* of 1864 as GC 3531 and in John Herschel's catalogue as h 3504.Boston meteorologist Todd Gross describes it as a "perfectly symmetrical bright cotton ball" in his observing notes from 1998 in Cancun.

Omega Nebula:

This asterism is the HII region Messier 17 (NGC 6618, SH 2-45, RCW 160, LBN 60, Cr 377, Ced 161), in the IAU constellation Sagittarius, discovered in 1745 by Swiss astronomer Philippe Loys de Chéseaux and catalogued by French astronomer Charles Messier in 1764:

- The shape of the nebula resembles the Greek letter omega (ω): This was noted by English astronomer William Herschel.
- John Herschel lists this in his 1864 *General Catalogu*e as GC 4403.
- German astronomer Hermann Joseph Klein (1844 – 1914) lists the "Omega Nebula" in his *Star Atlas* (1893).
- The Omega Nebula is listed in R. H. Allen in his *Star Names* in 1899.
- The 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959) lists this as the "Omega Nebula".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this both as the "Omega Nebula" and the "Swan Nebula".
- It is also known as the Checkmark Nebula, Swan Nebula, Lobster Nebula, and Horseshoe Nebula.

Omphale of Hercules:

This **telescopic** asterism "Ómphale Hérculis" is the barred spiral galaxy NGC 6166 in the IAU constellation Hercules. William Herschel listed this as "II 875". John Herschel listed this as h 1961 and later as GC 4208 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it dominates the Abell 2199 cluster. Omphale was queen of Lydia, whom Hercules had to serve as a punishment.

Omphta:

This asterism is the IAU constellation Libra as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is

probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a male holding a long staff in his left hand and a set of scales in his right hand. In ancient Egyptian skies some of the stars of Libra were included in their asterism Selkis (see below) and in later Seleucid skies were the "claws" of their asterism Scorpion (see below). Omphta is a name for the Egyptian asterism "Ṭepā-khentet" (see below) in the IAU constellation Libra assigned by German Jesuit astronomer Athanasius Kircher (1602 – 1680). Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennand recognized that the stars of Libra were originally the "claws" of Scorpius, but claims that "Scorpio was converted to Typhoon, and became the Greek Mars". Mars is a Roman name for the Greek God Ares. NOTE: There is a Coptic lunar mansion "Klaria" (see Armlet, above) which was given the name "Bestia seu Statio Typhonis" ("beast or typhoon station") by R. H. Allen in his *Star Names* in 1899, but this was described as Betelgeuse in Orion, not stars in Libra.

On Fire:

This Arabic asterism "Al Yumkin 'Iiqafuh" (لا يمكن إيقافه) is the IAU constellation Cepheus:

- Cepheus was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his Book of the Fixed Stars in 964 (Hafez 2010) as "al-Multaheb".
- This was later latinized to "Inflammatus", "Flammiger", and "Incensus". From these Latin names Arabs translated it back into "Al Multahab".
- Johann Bayer's *Uranometria* (1603) lists "Flammiger" and "Incensus Sonans" as alternate names for Cepheus.
- Robert Hues lists "Flammiger" in his *A Learned Treatise of Globes* in 1659.
- John Hill lists "Multahab" in his *Urania* in 1754.
- English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Inflammatus" and "Flammiger", as well as "al Multahab, the flaming".
- Compare this to the asterism "Lady of the Flame" (above) and "Fire Kindler (above).

On It Daylight Comes:

This Dakelh star "Ukwe'eyəłkaih" is an unidentified morning star at present (Cannon 2021).

One:

This Babylonian asterism is the Great Square of Pegasus (see Great Square, above). It is also known as "Field" (see above).

One Behind:

This Inuit star "Kingulliq" ("the one behind") is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra, which they call "The Old Woman" (MacDonald 1998). It is related to their asterism "Sivulliik" (Two in Front- see below).

This Iñupiat star "A.gru.la.bwuk" ("the one behind") is Alpha (α) Lyrae (Vega) in the IAU constellation Lyra.

One He is Carrying Back In:

The stars of this Dena'ina asterism "Udunuyultali" are unidentified at present (Cannon 2021). This may be a reference to their asterism "Yuq'eltani" (see Traveler, below): Yuq'eltani is said to carry his child (begguya) in a pack.

One Hundred Healers:

See Comprising a Hundred Physicians, above.

One in the Tail:

This Persian star "Avdem" is Beta (β) Leonis (Denebola) in the IAU constellation Leo as listed in R. H. Allen's *Star Names* in 1899.

One-Legged Hunter:

This Carib asterism "Epietembo" is made up of stars of the IAU constellation Orion. This is the stars Alpha (α) Orionis (Betelgeuse), Lambda (λ) Orionis, Gamma (γ) Orionis, and the belt of Orion forming his body and a line from Delta (δ) Orionis to Beta (β) Orionis (Rigel) his leg. He is the one-legged hunter, and the rising of this asterism marks the middle of the hunting season. He is the twin brother of "Macunaimá" the One-Legged Man.

One-Legged Man:

This Athabaskan (Alaskan and Western Canadian) asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Berezkin 2005).

This Carib asterism "Manbokouicayen" or "Macunaimá" is the IAU constellation Orion (Magaña, and Jara, 1982). He is the twin brother of "Epietembo", the One-Legged Hunter.

This Tamanako Carib asterism "Peti-Puni" is the IAU constellation Orion (Magaña, and Jara, 1982).

One Next to the Leader:

This Sogdian lunar station "Fasariva" or "Gasarwa" is two stars in the IAU constellations Libra and Virgo: Delta (δ) Librae and Mu (μ) Virginis. This is listed in R. H. Allen's *Star Names* in 1899.

This Khorasmian lunar station "Sara-fasariva" is two stars in the IAU constellations Libra and Virgo: Delta (δ) Librae and Mu (μ) Virginis. This is listed in R. H. Allen's *Star Names* in 1899.

One of a Duo of Libra:

This **telescopic** asterism "Dúovir Líbrae" is the barred spiral galaxy NGC 5597 in the IAU constellation Libra. It was discovered in 1784 by William Herschel who listed it as "III 122". It became GC 3866 in the General Catalogue of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They state that "the name Douviri, indication a board with two magistrates, is a suitable name for these rather similar looking galaxies. Thus each member deserves to be called Duovir". NOTE: the other galaxy in this pair is NGC 5595 (III 121, GC 3864).

One of Four Racing Horses of Telescopium:

This **telescopic** asterism "Quadrigális Telescópii" is the galaxy NGC 6845A in the four interacting galaxies NGC 6845 the IAU constellation Telescopium. It was discovered in 1834 by John Herschel who listed it as

h 3803 and later as GC 4526 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because it appeared to them as one of four horses pulling a quadriga.

One of Many of Cetus:

This **telescopic** asterism "Unusemúltis Céti" is the edge on spiral galaxy NGC 779 in the IAU constellation Cetus. This was discovered by William Herschel in 1785. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name due to its appearing as a "common individual among many similar ones".

One of Three of Hydra:

This **telescopic** asterism "Triádice Hýdrae" is the elliptical galaxy NGC 3280B in the IAU constellation Hydra. It is part of a triad with NGC 3280A and NGC 3280C. It was discovered by American astronomer Andrew Ainslie Common in 1880. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this due to its large size.

One of Two Stars near Sirius:

This Arabic star "Al-kawkab ahad alladayn 'inda 'l-shi'rā" ("one of two stars near Sirius") is Beta (β) Columbae in the IAU constellation Columba as listed on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003).

One on the Tail:

This Dena'ina star "kala q'edi" is an unidentified star in the handle of the Big Dipper asterism (Cannon 2021).

One Over the Sky:

This is the Dena'ina name, "Yuq'eltani", for the Traveler (see Traveler, below (Cannon 2021)).

One That Rotates Over Us:

This Dena'ina asterism "Naqahdghuqesi" is the Big Dipper asterism in the IAU constellation Ursa Major (Cannon 2021). Variations include "Naq'eltaeni" ("One Above Us"). Another version called "náq'óčkdéldáni" is the IAU constellation Ursa Minor.

One Who Always Does Ingula Dances:

This Yupik star "Ingularturayuli" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. When it does not flicker, fine weather is coming, if it does, it will be windy.

One Who Closes His Eye:

This Hebrew star "ha-soger 'eyno" ("one who closes his eye") is Alpha (α) Canis Minoris (Procyon) in the IAU constellation Canis Minor as listed on the star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985).

One Who Continuously Walks:

This Lower Tanana asterism “Nogheyoli” is cognate with the Gwich’in asterism “Yahdii” (see Traveler, below). He is also known as “Ch’etitadhkanenh” (“one who started paddling among things”) or “Yochwx” (“Big Sky”). He is made up of stars of the IAU constellations Auriga, Camelopardalis, Cancer, Cassiopeia, Draco, Gemini, Hydra, Lynx, Taurus, Ursa Major, and Ursa Minor (Cannon 2021):

- His “tail” (becha’) is the Big Dipper asterism,
- His “torso” (bezrek) is Iota (ι) Ursae Majoris, Kappa (κ) Ursae Majoris, Theta (θ) Ursae Majoris, 23 Ursae Majoris, and Omicron (ο) Ursae Majoris,
- His “heart” (bedraya’) is 21 Lyncis,
- His “nose” (bentsiyh) is the Pleiades cluster,
- His “eyes” (benagha’) is Iota (ι) Aurigae and Beta (β) Tauri (Elnath),
- His “hair” (begho’) is Psi (ψ) 2, 4, 5, 7, and 10 Aurigae,
- His “left ear” (tl’egheyh ts’ena’) is Eta (η) Geminorum, Mu (μ) Geminorum, and Nu (ν) Geminorum,
- His “right ear” (xwzrunh ts’ena’) is Zeta (ζ) Tauri,
- His “left arm” (tl’egheyh ts’ena’bego) is Beta (β) Geminorum (Pollux), Gamma (γ) Cancri, and Delta (δ) Cancri,
- His “left hand” (tl’egheyh ts’ena’ belo’) is Delta (δ) Hydrae, Eta (η) Hydrae, Epsilon (ε) Hydrae, Rho (ρ) Hydrae, Zeta (ζ) Hydrae, and Sigma (σ) Hydrae,
- His “right arm” (xwzrunh ts’ena bego) is Delta (δ) Aurigae, Beta (β) Camelopardalis, HIP 17884, and Epsilon (ε) Cassiopeiae,
- His “right hand” (xwzrunh ts’ena’ belo’) is:
    - His “palm” (belok’a), Gamma (γ) Cassiopeiae,
    - His “fingers” (belots’ula’) are:
        - “little finger”: Beta (β) Cassiopeiae (Caph)
        - “ring finger”: Alpha (α) Cassiopeiae (Shedar),
        - “middle finger”: Eta (η) and Zeta (ζ) Cassiopeiae,
        - “index finger”: Theta (θ) Cassiopeiae,
        - “thumb” (belochetth): Delta (δ) Cassiopeiae,
- His “left leg” (tl’egheyh ts’ena’) is Psi (ψ) Ursae Majoris, Nu (ν) Ursae Majoris, and Xi (ξ) Ursae Majoris,
- His “left foot” (tl’egheyh ts’ena’ beka’) is:
    - “heel” (bekatwtl): Beta (β) Leonis (Denebola),
    - “left toes” (bekalats’ula’):
    - “big toe”: Delta (δ) Leonis
    - “middle toe”: Theta (θ) Leonis,
    - “little toe”: Iota (ι) Leonis,
- His “right leg” (xwzrunh ts’ena’) is Lambda (λ) Draconis, Kappa (κ) Draconis, Beta (β) Ursa Minoris (Kochab), Gamma (γ) Ursae Minoris, and Zeta (ζ) Ursae Minoris (NOTE: his “right knee” (begwt) Kochab and Gamma (γ) Ursae Majoris),
- His “right foot” (xwzrunh ts’ena’ beka’) is Beta (β) Draconis (Rastaban) and Gamma (γ) Draconis,
- His “pack” (beghala’) is Alpha (α) Geminorum (Castor), Beta (β) Geminorum (Pollux), Iota (ι) Cancri, Alpha (α) Lyncis, 38 Lyncis, 10 Ursae Majoris, and 31 Lyncis,

- His “staff” (bedechena’) is the line of stars between Lambda (λ) Geminorum, Beta (β) Cancri (Tarf), and Alpha (α) Hydrae (Alphard).

One Who Crosses the Belt:

This Hebrew star“’over ha-afudda” (“one who crosses the belt”) is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as listed in the star list of Abraham Ibn Ezra in the 12th century (Goldstein 1985). This is a reference to the Arabic story of Suhayl and the sisters.

One Who Eats His Mother:

This Quechua asterism “Mamana Micuc” is made up of a zig zag line of stars in the IAU constellation Puppis (Urton 1981): Xi (ξ), Pi (π), Sigma (σ), Nu (ν), and Tau (τ) Puppis.

One Who is Touched of Canes Venatici:

This **telescopic** asterism “Táctus Cánum Venaticórum” is NGC 5395 (Arp 84), part of a pair of interacting galaxies NGC 5394 and NGC 5395 in the IAU constellation Canes Venatici. These were discovered by English astronomer William Herschel in May 1787, who listed them as “I 191” and “I 191”. They are GC 3730 and GC 3731 on the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “this elegant galaxy gently touches its companion NGC 5395”. It is also known as the “Heron” (see above).

One Who Kneels on Both Knees:

This Arabic asterism is the IAU constellation Hercules:

- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “El játhi ‘ald rukbeteihi, the man who kneels on both his knees” as an Arabic name for this constellation.
- Compare this to “Al Rukbah al Dajājah” (“one who kneels on both knees”) which was a name for Delta (δ) Cassiopeiae (see Knee above).

One Who Paddled Among Things:

This is an alternate Koyukon name, “K’etetaalkkaanee”, for their asterism “Naagheltaale” (see That Which is Revolving, above (Cannon 2021)).

One Who Paddled Around the Edge of the Sky/World:

This is an alternate Dena’ina name, “Yubugh Tayqan”, for their asterism “Yuq’eltani” (see Traveler, below (Cannon 2021).

One Who Stands Still:

This T’atsaol’ine and Wiidiideh star “ʔ ɬǫ wheɔǫ” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Cannon 2021).

One Who Started Out Paddling Among Things:

This Gwich’in asterism “Ch’iteehàakwaii”, “Ch’ataiiyuukaih”, or “Atachuukaii” is a variation of their “Yahdii” asterism (see Traveler, below (Cannon 2021)). Cannon notes that this figure “is sometimes conflated or interchanged with the more comical figure Vasaadihdzak (Variants include Weesagajake,

Vansangitik, Sakeethuk, the Dëne Suhne Wisáketcak, the Sahtúotine Haskitjack, and the Dane-zaa Watc'agic) who appears in presumably borrowing from the analogous [Ininew] figure Wesakidjak" (see Trickster, below).

NOTE: This character shows up in several other First Nations cultures. The Hän called him "Chetatchekih" or "Tsà' Wëzhaa", the Lower Tanana "Ch'etitadhkanenh", the Upper Kuskokwim "Ch'ititazkane", the Koyukon "K'etetaalkkaanee", and the Dena'ina "K'uzhaghalen".

One Who Started Paddling Among Things:

This is an alternate Lower Tanana name, "Ch'etitadhkanenh" for their asterism "Nogheyoli" (see One Who Continuously Walks, above).

One Who Touches of Canes Venatici:

This **telescopic** asterism "Tángens Cánum Venaticórum" is NGC 5394 (Arp 84), part of a pair of interacting galaxies NGC 5394 and NGC 5395 in the IAU constellation Canes Venatici. These were discovered by English astronomer William Herschel in May 1787, who listed them as "I 191" and "I 191". They are GC 3730 and GC 3731 on the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this elegant galaxy gently touches its companion NGC 5395". It is also known as the "Heron" (see above).

One Who Went Angrily Around the Edge of the Water:

This Tanacross name, "Tuumaagh Telch'eegh", is an alternate name for their asterism "Neek'e'elteen" (see That Which Moves Following Us, below (Cannon 2021)).

One Who Went Angrily Around the Sky:

This Tanacross name, "Yaamaagh Telch'eegh", is an alternate name for their asterism "Neek'e'elteen" (see That Which Moves Following Us, below (Cannon 2021)).

One Who Went Around the Edge of Sky:

This Upper Tanana name, "Yamaagn Teeshyaay", is an alternate name for their asterism "Yihdaa" (see Traveler, below).

One Who Went Around the Edge of the Water/Ocean:

This Ahtna name "Yabaaghe Tuu Teeshyaay" is an alternate name for their asterism "Nek'eltaeni" (see That Which Moves Over Us, below (Cannon 2021)). Variations include "Yabaaghe Tezyaann". NOTE: This appears in other First Nations Cultures: Upper Tanana "Yaatu' Maagn Teeshyaay", "Yambaa Teeshyaay", or "Tsa' Ushyaa".

One Who Went Around the World:

This is an alternate Sahtúotine name, "Yámǫréya" ("one who went around the world" or "one who departed to go around the world"), for their asterism "Yidha" (see Traveler, below).

One with Spreading Antlers:

This Ukrainian asterism is the IAU constellation Ursa Major.

Ones on the Dawning:

The stars of this Dena'ina asterism are unidentified at present (Cannon 2021).

Only Son of Life:

This Latin asterism "Athamas" is the IAU constellation Aries as named by Roman writer Lucius Iunius Moderatus Columella (4 – 70 C.E.). R. H. Allen writes that this came from a "Euphratian Tammuz Dum-uzi" in his *Star Names* in 1899.

Open Piercing:

This Rapanui star "Pau" is undetermined at this time (Edwards and Edwards 2016, Edwards et al 2018). It was an ill omen when it appeared in October/November.

Open Up:

This Hawaiian star "Maweke" is Gamma (γ) Cephei (Errai) in the IAU constellation Cepheus.

Opener of Heat:

This Chinese star "Kaiyang" from the Three Kingdoms to the Ming Dynasty is Zeta (ζ) Ursae Majoris (Mizar) in the IAU constellation Ursa Major.

This Chinese Chenzhuo xing guan "Kaiyang" is the star Zeta (ζ) Ursae Majoris in the IAU constellation Ursa Major. It is part of their xing guan Northern Dipper.

Opening the Door Star:

This Venda star "Musasi" is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus. It was unpopular with Venda women as it was the star they saw when they opened their door on winter mornings when they needed to start stamping grain.

Ophiuchus:

The brightest star of Ophiuchus, Alpha (α) Ophiuchi (Rasalhague) is only the 57th brightest star in the sky, but its stars do appear in 253 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Oph) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and is one of Ptolemy's 48 original constellations: Ptolemy (c.100 – c.170) called it "Ὀφιοῦχος" ("Ofioúchos" from "ophis" = "snake" and "okhos" = "holder"). There is no definite asterism that predates it. To the ancient Greeks it represented the God Apollo struggling with a snake. Later Greek myths associate them with Laocoön, the Trojan priest of Poseidon, who was slain by serpents. This later got latinized to "Ophiulchus", "Ophiulcus", "Ophiultus", "Ophiuculus", and "Ophiulculus", and between the 16th and 17th centuries to "Afeichus", "Afeichius", and "Alpheichius".

Ptolemy described the "Serpent Bearer" like this in his *Almagest:*

- His "body" had "shoulders" at the stars Beta (β) Ophiuchi and Kappa (κ) Ophiuchi with the base of his "neck" at HIP 85333 and a "head" at Alpha (α) Ophiuchi (Rasalhague),
- One "arm" ran from Kappa (κ) Ophiuchi through Iota (ι) Ophiuchi to an "elbow" at Lambda (λ) Ophiuchi and a "hand" of the stars Epsilon (ε) and Delta (δ) Ophiuchi,

- The other “arm” runs from Beta (β) Ophiuchi through Gamma (γ) Ophiuchi to a “hand” of the stars Nu (ν) and Tau (τ) Ophiuchi,
- His “hips” are the stars 47 Ophiuchi and HIP 82693,
- One “leg” runs from HIP 82693 to a “knee” at Zeta (ζ) Ophiuchi through the stars Phi (ϕ), Chi (χ), and Psi (ψ) Ophiuchi to a “foot” of the stars Omega (ω) and Rho (ρ) Ophiuchi,
- The other “leg” runs from 47 Ophiuchi to a “knee” at Eta (η) Ophiuchi through Xi (ξ) Ophiuchi to a “foot” of the four stars 51, 44, Theta (θ) and 36 Ophiuchi, and
- He is holding the asterism “Snake” (see below).

1st century Roman writer Lucius Junius Moderatus Collumela called it “Anguifer” (“snake bearer”) and this later appeared as “Anguiger” and Roman statesman Marcus Tullius Cicero (106 – 43 B.C.E.) called it “Anguitenens” (“serpent holding”).

This constellation is typically depicted as a man holding a snake, this “snake” being the IAU constellation Serpens: The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a nude male with his right hand raised as if waving and holding a snake in his left hand. This is how it is depicted by German uranographer Johann Bayer (1572 – 1625) in his *Uranometria* in 1603.

The globe of the 2nd century Farnese Atlas depicts “Serpentarius” as a nude male viewed from the rear, facing to our left, holding a snake in front of him which runs between his legs (Stevenson 1921).

This constellation appears in the 8th century *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Ophiuchus is depicted as standing on Scorpius as well as depicting Scorpius separately,
- In the Vat Reg lat 1324 and Cologne 83 II editions Ophiuchus is shown alone,
- In two editions (St Gall 250, St Gall 902) Ophiuchus is a nude figure holding a flat snake.
- In several editions (Paris BN 12957, Prague IX. C. 6., Gottweig 7 (146), Siena L. IV. 25, Cologne 83 II) Ophiuchus is nude, facing left, with the snake wrapped around his body twice,
- In the Dresden DC 183 edition he is nude, facing away from us, with the snake knotted around his body,
- The Paris BN n.a. 1614 and Vat Reg 1324 editions are the same as the Dresden version except that he is facing right.

This constellation appears in the Leiden *Aratea* (816) as “Serpentarius” and is depicted as a nude male viewed from the rear who is holding a snake in his hands in front of him (Katzenstein & Savage-Smith, 1988): He is shown standing on Scorpius.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depicts Ophiuchus walking to the left, a snake wrapped around his body making an “X” crossing at his waist, with the snake facing him. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, Montecassino 3, and Zwettl 296 manuscripts of *De signis caeli* depict Ophiuchus standing on Scorpius.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi’s son depicts Ophiuchus as a clean-shaven male in knee-length robes, wearing a turban. He is holding Serpens, which runs behind his back with its head on our right on one page. On the other page he is turned slightly the other way with the serpent’s head on his left.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Ophiuchus as a male facing us in knee length clothing and wearing a qalansowa ṭawīla (tall conical hat). He is holding Serpens in front of his body.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Ophiuchus as a male wearing a stacked conical hat.

The BAV *Astronomia* text, Vatican. lat. 3110 - Florence, ca. 1370; owned by Coluccio Salutati (1331-406) and the Madrid texts (Bibl. Nacional, Matritensis 1983, fol. 116v and Vatican, BAV, Vat. lat. 3121, fol. 12r., Bibl. Nacional, Matritensis 1983, fol. 115v and Vatican, BAV, Vat. lat. 3121, fol. 10v.) depict Ophiuchus standing on the back of Scorpio Mc Gurk, Patrick (1966).

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Ophiuchus as a male dressed in a calf length robe and some sort of helmet. He is holding Serpens with both hands: Serpens runs behind his back.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Serpentarius" as a nude male with curly hair as viewed from behind. Serpens is wound around both of his wrists and once around his middle. His left foot is resting on the back of Scorpius.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Ophiuchus as a nude male viewed from behind. Serpens is wrapped around his wrists and three times around his waist. He is looking to his right.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Ophiuchus as a male in a thigh length tunic turned slightly to our left. He is holding Serpens, which is tied in a knot around his waist. His right foot is on the back of Scorpius. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Ophiuchus as a nude male walking to our left, turned so that we can only see his back. He is looking over his left shoulder. He is holding a serpent which coils around his midsection. He is standing with both feet on the back of Scorpius.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels the constellation both "Ophiulcus" and "Serpentarius" and depicts a nude male walking holding a serpent which is wound around his waist.

The *Germanicus Aratea* (Siciliensis, c. 1469) as well as the *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts "Ophiochus" as a nude male facing to our left with a serpent wrapped around his middle, the serpent's head being on the left side of the illustration and with the serpent bearer's hands holding ends of the serpent. He is standing on a scorpion which is facing to our left.

The celestial globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Serpentarius vel Anguitenens" is a male in colorful garments as viewed from behind. His head is turned towards Hercules and he is holding Serpens, which is wound around his lower arms and waist. One of his feet rests on Scorpius.

The early 16th century Real Academia de Historia, manuscript D-97, f.102v – 103r depicts Ophiuchus as a nude male looking to his left. In his hands he holds Serpens, which runs between his legs. It is not labelled. His left foot is on the back of Scorpius.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "OPHIVLCVS" as a nude male striding away from us holding a serpent which is knotted around his midsection and wound around his arms.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius (Dekker & Lippincott, 1999) depicts "Ophiuchus" as a nude male striding away from us holding a serpent which is knotted around his midsection and wound around his arms.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Serpentarius" as a nude male as viewed from behind, holding a serpent which is wound around his waist. On his 1522 globe the name listed is "Ophiuchus".

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "OPHIVCHVS" as a nude male facing away from us holding a serpent which is coiled around his waist.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Ophiuchus in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Ophiuchus" as a nude bearded male viewed from the rear with a serpent around his waist.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as the "Serpent Carrier" and the "Snake Holder".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Ophiuchus as a bearded nude male with his back to us striding to our right. Serpens is wound around his arms and knotted about his waist. His left foot is tucked behind the side of Scorpius.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as "Ophiuchus, seu Serpentarius" in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts Ophiuchus as a male wearing a hat and a kilt-like garment holding a snake labelled "Anguis" which is wrapped around his middle: This male is not labelled.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted "Ophiucus, seu Serpentarius" ("Ophiuchus or Serpentarius") as a nude male viewed from the rear, holding a serpent across his back with both hands.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts this constellation as a nude male facing us, holding a serpent across the front of his body. The label is unintelligible.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Serpentarius” as a nude male viewed from behind, looking to his right. Serpens is wound around his arms and waist.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Serpentarius” as a nude male viewed from the rear who is holding a serpent which is wound twice around his middle.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts “Ophiuchus” as a nude male standing on “Scorpius” holding a serpent in front of him which is labelled “Anguis”.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists this constellation as “Serpentarius” with the subtitle “Ophiuchus” and depicts it as a nude bearded male viewed from behind holding Serpens, which passes between his legs.

This constellation is listed by Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) as both “Ophiuchus” and “Serpentarius”.

On one chart German astronomer Johann Bayer (1572-1625) depicts Ophiuchus in his *Uranometria* in 1603 as a bearded man as viewed from behind holding a serpent in front of him in his hands: The serpent has a barb resembling an arrowhead on its tongue. On another chart in his *Uranometria* Bayer depicts Serpens without Ophiuchus. In Bayer’s Uranometria (1603) he lists these names for Ophiuchus: “Serpentarius, Serpentinarius, Anguitenens, Anguiger Columellae, Effoeminatus, Ophiuchulus, male Ophilutus, Carnabons, Triopas, Hercules, Glaucus, Aesculapius, Alahague, Alangue, Afeic hius, Mauris Grus, Ciconia Serpenti, Elhague, Serpentis lator.”

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Ophiucus, seu Serpentarius” (“Ophiuchus or Serpentarius”) as a nude male viewed from the rear, holding a serpent across his back with both hands.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) labels this constellation “Serpentarius”.

Johann Bayer’s *Uranometria* (1603) lists “Anguitenens” and “Anguiger Columellae” (“Anguiger of Colemella”): This is a reference to Roman writer Lucius Iunius Moderatus Columella (4 – 70 C.E.).

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Ophiuchus” is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as a nude bearded male as viewed from behind holding Serpens, which is wrapped around his waist and running between his legs. Blaeu also lists the name “Serpentarius”, “Anguitenens” and “Anguiger”.

“Ophiuchus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a male in a sort of kilt facing us holding Serpens across the front of his body. Bartsch lists “Anuitenens”, “Anguiger” and “Serpentis Lator” (“the serpent’s bearer”) as alternate names for Ophiuchus.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) labels this constellation "Serpentario" and "Orphicus" and depicts him as a clean-shaven nude male viewed from behind. He is holding a serpent which crosses behind his back.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names "Ophiuchus" and "Serpentarius" for this constellation.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) lists this constellation as "Serpentarius" and depicts him as a male holding Serpens.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius labels this constellation "Ophiuchus" and "Serpentarius".

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts only the upper half of Ophiuchus, depicting the head and shoulders of a bearded man viewed from behind who is looking to his left. You can just see parts of Serpens along the edge of the dome.

This constellation is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "Serpentarius" and "Ophiuchus".

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) labels this constellation "Serpentarius" with the subtitle "Ophiuchus" and depicts him as a nude male viewed from the rear holding a serpent which is wrapped around his waist.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Serpentarius" as a nude male viewed from the rear holding a serpent which passes between his legs.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Serpentarius" as a nude male viewed from the rear holding a serpent in front of him which runs between his legs.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Serpentarius" as a nude bearded male viewed from the rear, holding the serpent Serpens in front of him. He has his left foot on the side of Scorpius.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Le Serpentaire", "Serpentarius", and "Ὀφιοῦχος" and depicts it as a bearded male with drapery wrapped around his midsection. Serpens is coiling around his left forearm and he is holding Serpens with his left hand.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Serpentarius" with the subtitle "Ophiuchus".

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, labels this constellation "Serpentarius" and depicts Ophiuchus as a balding bearded male in a green toga holding the snake Serpens, which is wound around his waist: He is standing on the back of Scorpius.

Ophiuchus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: He is depicted as a bearded male in a toga holding Serpens in both hands, with this snake running between his legs.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 Ophiuchus is depicted as a nude male facing away from us holding a snake which runs between his legs.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Serpentarius" as a male facing away from us holding a snake ("Serpens Ophiuchi") across the front of his body.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) labels this constellation "Serpentarius" and depicts it as a bearded male facing away from us holding a serpent in his hand in front of him.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Ophiuchus as a bearded male viewed from behind. He has a drapery wrapped around him and is looking to his left. He is holding Serpens in front of him

John Hill lists this asterism as "Anguinitens" in his *Urania* in 1754. Hill then relates this figure to "Engonasin, expressing a man kneeling" which is a clear reference to the IAU constellation Hercules as it appeared in the 2nd century in Ptolemy's *Almagest* (see Kneeler, below): from the remarks that follow it appears that he thinks that this term is another name for this asterism involving Ophiuchus.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) labels this constellation "le Serpentaire" and depicts it as a man in a toga facing away from us holding a serpent across the front of his body.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Ophiuchus as a nude male facing away from us holding a serpent which passes between his legs.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Serpentaire" as a male in a toga holding "le Serpent", which passes between his legs.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Schlangenträger und die Schlange" as well as "Ophiuchus".

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Offiuco" his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Der Schlangenträger und die Schlange".

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer labels this constellation "Serpentarius" and depicts him as a nude male viewed from the rear holding Serpens in front of him.

Ophiuchus is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Ophiucus of Slangendrager" ("Ophiuchus or Snake Carrier"): He is depicted has holding a snake which runs between his legs.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Ophiuchus" and depicts it as a man facing away from us holding a serpent in his hands.

American uranographer William Croswell (1760 – 1834) depicts "Serpentarius vel Ophiuchus the Serpent Bearer" on his *Mercator Map of the Starry Heavens* in 1810 as a bearded male in a tunic viewed from the rear holding the serpent Serpens, which runs between his legs.

Scottish uranographer Alexander Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts "Ophiuchus" as a bearded male in a toga holding a snake.

"Ophiuchus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a bearded, long haired male viewed from the rear, holding Serpens in front of him.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Anguitenens of Cicero [and] the Anguifer of Columella". Smyth also lists "Serpentarius", but his is actually a name for Serpens (see above).

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depict "Ophiuchus" as a male in a skirt viewed from the rear. He is holding a snake (Serpens) with four coils which has coiled around his left leg.

"Ophiuchus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): He is depicted as a bearded male facing us in a thigh length tunic holding Serpens in front of him.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation as "Serpentarius, or Ophiuchus, the serpent bearer" and describes it as "a man grasping in both hands a prodigious serpent, which is writhing in his grasp". On Steele's charts it is labelled "Serpentarius".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Ophiuchus, The Serpent-Bearer" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as one: "Ophiuchus et Serpens, the Serpent-bearer and the Serpent".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Ophiuchus" in his *Star Atlas* (1893) and describes it as "Ophiuchus".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Ophiuchus" and describes it as the "Serpent carrier".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Ophiuchus: The Snake Bearer".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) redesigned the lines of Ophiuchus in his book *The Stars - A New Way to See Them* (1952). A standard IAU chart shows this constellation as a loop of the stars Eta (η) Ophiuchi, Beta (β) Ophiuchi (Cebalrai), Alpha (α) Ophiuchi (Rasalhague), Kappa (κ) Ophiuchi, Epsilon (ε) Ophiuchi, and Zeta (ζ) Ophiuchi, with a single line running from Eta (η) Ophiuchi to 51 Ophiuchi. Rey's version has been expanded considerably:

- His "head" is the triangle of stars Beta (β) Ophiuchi (Cebalrai), Alpha (α) Ophiuchi (Rasalhague), and Kappa (κ) Ophiuchi,
- His "body is the rectangle of stars Kappa (κ) Ophiuchi, Zeta (ζ) Ophiuchi, Eta (η) Ophiuchi, and Cebalrai,
- One "arm" runs from Cebalrai to an "elbow" at Gamma (γ) Ophiuchi to a "hand" at 70 Ophiuchi, with a bending line of stars from Theta (θ) 1 Serpentis through 72 Ophiuchi, 70 Ophiuchi, Eta (η) Serpentis, 64 Ophiuchi, 56 Serpentis, Xi (ξ) Serpentis, to Nu (ν) Serpentis forming one side of the "serpent",
- One "arm" runs from Kappa (κ) Ophiuchi to a "shoulder" at Iota (ι) Ophiuchi through Lambda (λ) Ophiuchi to a "hand" at Delta (δ) Ophiuchi, with a bending line of stars from Upsilon (υ) Ophiuchi through Epsilon (ε) Ophiuchi, Delta (δ) Ophiuchi, Mu (μ) Ophiuchi, Epsilon (ε) Serpentis, Alpha (α) Serpentis (Unukalhai), Lambda (λ) Serpentis, and Delta (δ) Serpentis forming the other half of this "serpent" with the "head' being the triangle of stars Gamma (γ), Kappa (κ), Iota (ι), and Beta (β) Serpentis (Nasak Shamiya).
- One "leg" runs from Eta (η) Ophiuchi through Xi (ξ), b, Theta (θ), and 36 Ophiuchi to 45 Ophiuchi, and
- One "leg" runs from Zeta (ζ) Ophiuchi through Phi (ϕ), Chi (χ), and Psi (ψ) Ophiuchi to Omega (ω) Ophiuchi.

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Ophiuchus in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik*, in this manner:

- His "head" is a bent line of the three stars Kappa (κ) Ophiuchi, Alpha (α) Ophiuchi (Rasalhague), and Beta (β) Ophiuchi (Cebalrai),
- His "body" is the oval of stars Cebalrai, Delta (δ) Ophiuchi, Lambda (λ) Ophiuchi, Epsilon (ε) Ophiuchi, Zeta (ζ) Ophiuchi, Eta (η) Ophiuchi, Xi (ξ) Ophiuchi, Nu (ν) Ophiuchi, and Gamma (γ) Ophiuchi,
- One "leg" runs from Eta (η) Ophiuchi to Theta (θ) Ophiuchi,
- One "leg" runs from Zeta (ζ) Ophiuchi through Phi (ϕ) Ophiuchi to Omega (ω) Ophiuchi.

Sky and Telescope Magazine, founded in 1941, depicts Ophiuchus in their magazine and publications like this:

- His "head and body" are a pentagonal of the stars Alpha (α) Ophiuchi (Rasalhague), Kappa (κ) Ophiuchi, Zeta (ζ) Ophiuchi, Eta (η) Ophiuchi, and Beta (β) Ophiuchi (Cebalrai),
- One "arm" runs from Cebalrai through Gamma (γ) Ophiuchi to a "hand" Nu (ν) Ophiuchi,
- One "arm" runs from Kappa (κ) Ophiuchi through Lambda (λ) Ophiuchi to a "hand" at Delta (δ) and Epsilon (ε) Ophiuchi,
- One "leg" runs from Eta (η) through Theta (θ) to 45 Ophiuchi,

- One “leg” runs from Zeta (ζ) through Phi (ϕ), Chi (χ) and Psi (ψ) Ophiuchi to Rho (ρ) Ophiuchi, and
- Serpens runs across in front of Ophiuchi, connecting at Delta (δ), Eta (η), Zeta (ζ) and Delta (δ) and Epsilon (ε) Ophiuchi.

Ophiuchus Nebula:

This **telescopic** asterism is the Rho (ρ) Ophiuchi cloud complex in the IAU constellation Ophiuchus. This consists of the star forming cloud L1688 and two filaments (L1709 and L1755). This name appears in *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed. This is also known as the “Dark River Clouds” or the “Rho Ophiuchi Streamers”.

Ophiultus:

This German star is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga as listed by German astronomer Johann Bayer (1572-1625). R. H. Allen describes the name in his *Star Names* in 1899 as “unintelligible”.

Orb and the Cross:

See Leopold’s Orb, below.

Orc:

This **telescopic** asterism is the planetary nebula NGC 6960 (C 34, LBN 191, PGC 3517;684, Ced 128a) in the IAU constellation Cygnus. It was discovered by English astronomer William Herschel in 1784 who listed it as “V 15”. It is GC 4600 in the *General Catalogue* of 1864. American astronomer Wayne Parker posted a photo of this on the RASC Facebook page on 2 April 2024 and Halifax RASC member Jason Schella posted: “Very nice. Looks like one of the orcs for Lord of the Rings tho.” This is also known as the Filamentary Nebula, Cirrus Nebula, the West Veil Nebula, or Witch’s Broom Nebula.

Order of Sky:

This Korean asterism “Haneul-ui Jumun” (하늘의 주문) is a long, bending line of stars in the IAU constellations Hercules and Lyra. It starts at Delta (δ) Herculis and runs through Lambda (λ), Mu (μ), Xi (ξ), Nu (ν), and 104 Herculis, HIP 88836, and Kappa (κ) Lyrae, ending at Mu (μ) Lyrae.

Orderly of Cetus:

This **telescopic** asterism “Ordinárius Céti” is the spiral galaxy NGC 1070 in the IAU constellation Cetus. It was discovered in 1784 by English astronomer William Herschel who listed it as “II 273”. It became GC 601 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as it “occupies a middle position in the morphological sequence”.

Ordinary of Eridanus:

This **telescopic** asterism “Gregárius Erídani” is the flocculent spiral galaxy NGC 1325 in the IAU constellation Eridanus. It was discovered in 1799 by English astronomer William Herschel who listed it as “IV 77”. It became GC 705 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name as they considered it “a rather inconspicuous member of the Eridanus cluster”.

Ordinary of Virgo:

This **telescopic** asterism "Vulgáris Vírginis" is the lenticular galaxy NGC 4124 (4119) in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "I 33" and "II 60". It became GC 2734 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Oreb:

This Hebrew asterism is the IAU constellation Corvus as listed in John Hill's *Urania* in 1754.

Orendel's Toe:

See Aurvandil's Toe, above.

Orferealem:

This Turkish asterism is the IAU constellation Sagitta as listed in John Hill's *Urania* in 1754.

Oriel:

This is one of the Archangel Stars (see above), Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius.

Origin of All Things:

This Chinese star "Yuanshi" is the star Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor and is part of their xing guan Curved Array (see above).

Orion:

The stars of the constellation Orion appear in the asterisms of 1033 sky cultures around the world.

This IAU constellation (IAU abbreviation Ori) has very ancient roots. The earliest depiction of this constellation appears to be on a mammoth ivory carving found in a cave in the Ach Valley in Germany in 1979 which is believed to be 32,000 years old. It appears in Babylonian skies in the MUL.APIN tablets as "SIPA.AN.NA" (see True Shepherd of Heaven, below). Greek mythology describes Orion as a supernaturally strong hunter. Around 490 B.C.E. the Greek name "Ὠαρίων" ("Oaríon") was used, and it has been pointed out that as its heliacal rising marked the beginning of the harvest and of summer, the name originated in the Indo-European root "⋆ōsar" ("summer") which would make this name mean "Man of Summer" (Guglielmino, Cipolla, and Giudice 2017). The Greek lyric poet Pindar (518 – 438 B.C.E.) named it "Ὠαριώνειος" ("Oarióneios"), but by the time of the Greek tragedian Euripides (480 – 406 B.C.E.) it was "Ὠρίων" ("Oríon"). Roman poet Catullus (84 – 54 B.C.E.) named him "Oarion", which got shortened to "Aorion". Orion is listed in *De Natura Rerum Liber ("book on the nature of things*") by Isidori Hisapensis (Isidore of Seville, ca 560 – 636 C.E.) as both a "star" and "stars". The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a male in a knee length tunic. The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Orion as a nude male facing away from us, walking to the left, with some sort of club raised in his right hand and some sort of fabric concealing his outstretched left arm: Three circles represent the "belt" and another line of five circles the "sword".

This constellation comes up three times in the Bible: Job 9:9 (“He is the maker of the Bear and Orion”), Job 38:11 (“Can you loosen Orion’s belt?”) and Amos 5:8 (“he who made the Pleiades and Orion”).

The 8th century B.C.E. poet Homer spelled it “Ωρίων” or “Orion” (Guglielmino, Cipolla, and Giudice 2017). Variations include “Οὐρίον” (“Ouríon”), “Οὖρον” (“Ouron”), or “Υριών” (“Yrión”). The original *Alfonsine Tables* in 1483 list this constellation as “Urion”. Terms used to describe Orion include “aquosus” (“watery”), “nimbosus” (“stormy”) and “saevus” (“cruel”), which were used by 1st century B.C.E. Roman poet Publius Vergilius Maro (Vergil), “tristis” (“sad”), which was used by Quintus Horatius Flaccus (Horace (65 – 8 B.C.E.)).Pliny the Elder (24 – 79) listed it as “horridus sideribus” (“shivering with the stars”). Compare this to the asterism Hyrieus, above. In the *Fasti*, Roman poet Ovid (b. 43 B.C.E.) relates a later version of Orion’s myth that the God’s Zeus, Poseidon, and Hermes rewarded Orion’s elderly father with a son by pouring their semen into a bull’s hide. Hyrieus named the infant “οὐρέω” or “Ourion” which means “to urinate” (Guglielmino, Cipolla, and Giudice 2017).

Orion appears in Homer’s *Iliad and Odyssey* (8th century B.C.E.), in Hesiod’s poem *Works and Days* (late 8th century B.C.E.), and in Virgil’s *Aeneid* (Book 1). Aratus mentioned it in his poem *Phaenomena* (270 B.C.E.) and Ptolemy (c.100 – c.170) listed him in the *Almagest* as “᾽Ωρίων” (“᾽Oríon”).

This constellation is listed in editions of the 8th century *Revised Aratus Latinus*:

- The St Gall 250 and St Gall 902 editions show him holding a sword aloft in his left hand,
- In the Vat Reg lat 1324 edition shows him with a short cape and holding a book in his right hand.

Orion is depicted in the Leiden *Aratea* (816) as a man in a short exomis tunic standing facing away from us, with a sword and scabbard on his left hip, with a curved stick in his right hand and a leopard skin over his left arm (Katzenstein & Savage-Smith, 1988): He is wearing winged sandals.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Orion facing to the front, with his left hand on his sword scabbard and his right hand raised. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Orion carrying a curved stick in his right hand and having his left arm completely covered by his cloak. The Austin, TX, Ransom Ms 29, Paris BN, n.a. 1614, and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Orion with his right hand on his sword hilt. The Paris BN, 12117 manuscript of the *De ordine ac positione stellarum in signis* depicts Orion carrying a long sword in his right hand. The Los Angeles, Getty Ludwig XII, 5 and Paris BN lat 8663 manuscripts of the *De ordine ac positione stellarum in signis* depict Orion in a cloak with a long sword in his right hand with tufts of hair that look like horns.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli (“of the signs of heaven*”) depict Orion wearing a knee length toga holding a sword upright in his right hand and with his left hand on his scabbard. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict Orion walking to the left with a cape draped over his extended forearm with an empty scabbard at his side. The Laon 422 manuscript of *De signis caeli* depicts Orion holding what looks like a feather duster. The Rouen 26 manuscript of *De signis caeli* depicts Orion holding a flower. The Durham Hunter 100 manuscript of *De signis caeli* depicts Orion walking to the left with a cloak completely covering his right hand and arm. The Montecassino 3 manuscript of *De signis caeli* depicts Orion without a scabbard.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Orion on one page as a clean-shaven male in knee length robes and a turban, kneeling on his left knee facing to our left. He is brandishing a bent club above his head in his left hand and has a sword sheathed on his left hip. He is brandishing what appears to be a skin or cloth with his left hand. The other page has him facing to our right, with the club in his right hand, the cloth in his left hand, and the sword on his right hip.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Orion as a male facing us in thigh length clothing and a turban. He is holding a scimitar over his head in his left hand and holding a length of cloth or a pelt in his right hand.

A Hebrew translation of the Almagest from Catalonia (c1361), Philadelphia (USA), University of Pennsylvania Libraries, Lawrence Schoenberg Collection, ms. ljs057 (old Ms.Sassoon 823), ff.56v, 57r, depicts Orion as a male in a red knee-length tunic. He facing to our left holding a lion's skin in his right hand and is brandishing a club over his head with his left hand. No sword is depicted.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Orion as a male charging to our right. He is dressed in a cap and knee length robes. He is brandishing a club over his head with his right hand and holding a length of cloth or a pelt in his left hand. He has a long sword in his belt.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.170v-171r depicts "Orion" as a armoured male as viewed from behind. His head is tilted back to look straight upwards. He has a sword in his belt. He is holding aloft an animal pelt in his left gauntlet, and brandishing a club in his right hand.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.72v-73r depicts Orion as a figure as viewed from the rear. It seems to be wearing some sort of upper armour but has no helmet. It is holding aloft an animal pelt in its left hand and a scimitar in its right hand, and has a sword sheathed in its belt. It is not labelled and is poorly drawn.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Orion as a male running to our left, looking over his right shoulder. He has a sword in his belt on his left side. His left hand is holding an animal skin aloft and he is brandishing a club over his head with his right hand. It is not labelled.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Orion as a male in a knee length tunic running to our left. He is holding aloft a club in his right hand and a shield in his left hand. He has a sword in his belt.

The Vault of Cappella de'Pazzi of the Basilica di S. Croce in Firenze, Italy (1459-60) depicts Orion as a figure in a knee length tunic running to our left. He is holding aloft a club in his right hand and has an oval shield on his left arm.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Orion as a male in Medieval plate and mail armour wearing a brimmed helmet facing towards our left. He is holding a shield resembling a bearded face in his left hand and brandishing a long sword over his head with his right hand. He has a sword sheath on

his left hip. The *Liber de signis* of Scottish polyglot Michael Scot "Orion" is depicted as holding an ox hide by its head in his raised left hand: This relates to the myth of his birth. Another page depicts a nude male brandishing a club over his head in his right hand and having a lion's pelt draped over his extended left arm.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Orion as a male walking to our right looking over his left shoulder. He is wearing a tunic and cape and has a sword raised in his left hand.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Orion as a male walking to our right. He is wearing a tunic and cape and has a sword raised in his left hand.

Orion appears on the *Imagines constellationum Australium* chart of Romanian theologian Johannes Honter (1498 – 1549) as a bearded, armoured male facing us holding aloft a club in his right hand and a tasseled cloth in his left hand: His helmet has ram's horns and he is standing on the back of Lepus.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Orion" as a male wearing full medieval plate armour but no helmet, with a club raised in his right arm and a shield with the design of a face on his left hand. He is wearing a sword at his hip.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Orion" as a male viewed from the rear in medieval armour, but no helmet. He is looking skyward holding an ox hide by its head in his raised left hand and brandishing aloft a club in his right hand. He has a sword in his belt on his right side.

The early 16th century Real Academia de Historia, manuscript D-97, f.104v – 105r depicts Orion as a nude male with a sword at his waist running to our right. He is brandishing a bent club over his head with his right hand and is holding a pelt of some sort out in front of him with his left hand. It is not labelled.

The "Nuremburg Maps", a pair of celestial hemispheres made in 1503 by Conrad Heinfogel depicts Orion as a male holding aloft a club in one hand and a cloth in the other.

The *Southern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts Orion as an armoured male with no helmet, his back to us. He is looking straight up at the sky holding aloft a club in his right hand and a cloth in his left hand. He has a sword sheathed on his right hip.

The woodcut of the southern sky by Albrecht Dūrer (1515) depicts Orion as an armoured warrior viewed from the back looking upwards, brandishing a cloth aloft in his left hand and a club aloft in his right hand.

Celestial globe gores (1517) of German polymath Johann Schöner (1477 – 1547) depicts "Orion" as a fully armoured knight facing away from us. He is holding up a hide in his left hand and is brandishing a bent club over his head in his right hand. He has a sword sheathed at his left waist. NOTE: On his celestial globe for 1522, Schöner depicts Orion in the same fashion as the 1517 globe, despite changing other figures on his globe that were armoured in 1517 to nude figures.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Orion as a male facing to our left holding a lion's skin in one hand and a club in the other.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Orion as an armoured male facing to our left. He is holding a curved club over his head in his right hand and holding some sort of pelt in his left hand.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Orion" as an armoured male facing away from us. He is holding aloft a club in his right hand and some sort of skin in his left hand.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Di Orione". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Orion".

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Orion in the same manner as Dürer et al.

The Southern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Orion as an armoured male with no helmet as viewed from behind. His legs are concealed beneath the spring from which the river Eridanus is flowing. He is looking straight up at the sky and his holding aloft a cloth in his right hand and a club in his right hand. He has a sword sheathed on his left hip.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Orion in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Orion" as an armoured male viewed from behind holding aloft a club in his right hand and an animal skin in his left hand.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicts "Orion" as an armoured male kneeling. He is viewed from behind. He has a spiky shield raised on his left arum and a club raised aloft in his right hand. A sword is in his belt on his right side.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "Orion" as an armored warrior holding aloft a round shield in his left hand and a club in his right hand.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts Orion as an armoured male facing away from us. Lepus is running between his legs, so only his right leg is visible. He is holding aloft a club in his right hand and an oval shield in his left hand. He has a sword sheathed on his left hip.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Orion" as a male in Roman style armour with a plumed helmet as viewed from the rear. He is looking to

his left and brandishing aloft a club in his right hand and brandishing a slain animal in his left hand. There is a sword sheathed on his left side.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) lists "Orion" as an armoured male viewed from the rear, holding a club over his head in his right hand and having a shield on his left arm.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts Orion as a younger male viewed from behind. He is dressed in a thigh-length tunic and sandals. In his raised right hand he is wielding a hooked stick and he has a lion's skin draped over his left arm.

Orion is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German astronomer and uranographer Johann Bayer (1572-1625) depicts Orion as a bearded male viewed from behind, with a club raised aloft in his left hand and a lion's skin draped over his right arm, wearing a sword at his waist. Bayer lists these names for this constellation: "Orion, Arion, Hyriades, Audax, Furiosus, Sublimatus, Gigas, Bellator Fortissimus, Jugula, Elgeuze, Sugia, Asugia, Elgebar, Algebar, Algebra, Kesil, Geuze".

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Orion" as a bearded male in a short tunic facing away from us to our left. He has a club raised in his right hand and a lion's skin draped over his left arm. Blaeu also lists the name "Arion", which is more often associated with Lyra.

"Orion" and "Urion" are names listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a man in armour facing us, his helmeted head turned to our right. He has a club raised over his head in his right hand and some sort of cloth draped over his left arm.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Orion" for this constellation.

"Orion" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a helmeted male viewed from behind. He has a shield raised on his right arm and a club raised in his left hand.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Orion" as an armoured male facing away from us, turned slightly to our left. His helmet has a rooster design. He is brandishing a club over his head in his right hand and holding up a round shield in his left hand. He does not appear to have a sword sheathed at his waist.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts only the upper half of Orion. He is a bearded male viewed from behind and looking to his right. He is brandishing a club aloft in his left hand and brandishing an animal's pelt in his right hand.

Orion is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661: He is depicted wearing a helmet and holding a shield on his left arm with a club raised in his right hand.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Orion as a male in a toga as viewed from behind holding aloft a club in his right hand and a lion's skin in his left hand.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts Orion as viewed from his left side and only shows him from the waist up. He has a club raised in his right hand and a lion's skin draped over this right arm.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Orion" as a male in armour and feathered helmet as viewed from behind, holding aloft a club in his right hand and a round shield on his left arm.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Orion" and "Ὼαρίων" and depicts it as a bearded male in Roman style armor with no helmet. His left foot is on the ground and his right leg is raised up as if he is trying to step onto or over something. He is brandishing a club over his head with his left hand and is holding aloft an animal skin in his right hand. He has a sword in his belt.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) labels this "Orion" with the subtitles "Orion ex urina Iovis Neptuni et Mercurii netus" ("Orion was born from the urine of Jupiter, Neptune and Mercury") and "Magnus Vinator" ("a great hunter") and depicts him as an armoured male raising a club in his left hand and with a round shield on his right arm.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Orion as a bearded male in a pink toga viewed from behind: He is holding a club aloft in his left hand and an animal skin aloft in his right hand.

Orion is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: He is depicted as a bearded male holding aloft a club in his right hand with a lion's skin draped over his extended left arm.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Orion" as an armoured male facing away from us with a club raised in his left hand and curved shield on his left arm.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Orion as an armoured male holding a round shield in front of him with his left arm and a club raised over his head in his right hand.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Orion" as a bearded male in a toga running to our left with a lion skin draped over his right forearm and a club raised in his left hand.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Orion" as a bearded male holding aloft a club in his right hand with a lion's skin draped over his extended left arm, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Orion".

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Orione" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Orion" as a male viewed from the rear, wearing a helmet, with a shield on his left arm and a club raised in his right hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Orion" as an armoured male holding aloft a round shield in his right arm and holding aloft a club in his left hand.

American uranographer William Croswell (1760 – 1834) depicts Orion on his *Mercator Map of the Starry Heavens* in 1810 as a bearded male viewed from the rear with a club raised in his right hand and a lion's skin draped over his left arm: He is dressed in a kilt-like garment and wearing a sword on his waist.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Orion in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): He is depicted as a bearded, armoured male with a sort of kilt with a lion's skin draped over his extended left arm and brandishing a club with his left hand.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Orion" and depicts it as an armoured male facing away from us wearing a winged helmet holding aloft a club in his left hand and with a shield on his right arm.

"Orion" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a bearded male viewed from behind, holding aloft a lion's skin in his right hand and a club in his left hand. He has a sword on his left hip.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Orion" as a male in a thigh length tunic as viewed from the rear, facing to our left. He has a club raised over his head in his right hand and an animal skin draped over his left arm.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Orion" as a male dressed in tunic, kilt, and boots holding aloft a club in his right hand and having a lion's skin draped over his left arm.

Orion is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: He is depicted kneeling on his right knee, brandishing a club in his right hand and holding a lion's skin in his left hand.

"Orion" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): he is depicted as a bearded male facing us with a club raised in his right hand and an animal skin in his left hand.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) describes Orion as "a hunter attaching Taurus".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Orion, The Giant Hunter" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation simply as "Orion".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Orion" in his *Star Atlas* (1893).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Orion" and does not describe it.

The part of the IAU constellation Orion which most people are familiar with consists of seven of the brightest stars in the sky: These are the stars that make up the shoulders, feet, and belt of Orion.

- The "left shoulder" is the variable star Alpha (α) Orionis (Betelgeuse- 10th brightest star).
- The "right shoulder" is the star Gamma (γ) Orionis (Bellatrix- 26th brightest star).
- The "left foot" is the star Kappa (κ) Orionis (Saiph- 59th brightest star).
- The "right foot" is the star Beta (β) Orionis (Rigel- 7th brightest star).
- The three stars of the "belt" of Orion (the brightest group of three stars in the sky) are, left to right: Zeta (ζ) Orionis (Alnitak- 33rd brightest star), Epsilon (ε) Orionis (Alnilam- 29th brightest star) and Delta (δ) Orionis (Mintaka- 67th brightest star).
- Orion's "sword" consists of the double star 42 Orionis (Mizan Batil I) and 45 Orionis surrounded by the Running Man Nebula (NGC 1977) at the top, the Orion Nebula (Messier 42, NGC 1976) and the star Theta (θ) 1 and 2 Orionis (Becklin's Star and Mixan Batil II) in the middle and the star Iota (ι) Orionis (Hatysa or Nair al Saif) at the bottom.

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) has a similar description of Orion compared to the above in his book *The Stars - A New Way to See Them* (1952), the difference being that the line of stars from Omicron (ο) Orionis through g Orionis, and Pi (φ) 1, 2, 3, 4, 5 and 6 Orionis has become a "shield".

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Orion in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* with the "body" depicted on standard IAU charts minus the arms.

The Orion Nebula is one of the two nebulae in the Northern hemisphere visible to the unaided eye in a dark sky.

In Southeast Asia the spring trap to kill animals of any size from an elephant to a porcupine is seen everywhere. Variations in Malaysia include b'lantek (slapping spring-spear), b'lantek paut (draw-back spring spear), and b'lantek terbang (flying spring-spear), and all these cultures identify Orion with this spring trap.

Orion Nebula:

This asterism the "Orion Nebula" or "Great Orion Nebula" is the HII region Messier 42 (NGC 1976, SH 2-281, LBN 974, Ced 55d) in the IAU constellation Orion. It is one of the two nebulae visible to the unaided eye, the other being the Lagoon Nebula (see above). This nebula isn't mentioned in Ptolemy's *Almagest* in the 2nd century or 'Abd al-Rahman al-Sufi's *Book of Fixed Stars*, nor is it mentioned by Galileo:

- The first mention of the nebulous nature of this nebula is attributed to the French astronomer Nicolas Claude Fabri de Peiresc, who recorded it in November 1610.
- The first recorded observation was by Jesuit astronomer Johann Baptist Cysat of Lucerne in 1619.
- French astronomer Charles Messier added it to his list in 1769.
- English astronomer John Herschel described it in the mid 1800's as a "surface strewn with flocks of wool – or like the breaking up of a mackerel sky".
- It is listed in the 864 General Catalogue as GC 1179.

- John Herschel listed it as h 360.
- It is listed as the "Great Nebula in Orion" in the third edition of Rev. Thomas William Webb's *Celestial Objects for Common Telescopes* in 1873.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this as the "Orion Nebula".
- Johan Dreyer refers to NGC 1976 in the 1888 *New General Catalogue* as "[Theta] θ Orionis and the great nebula".
- English astronomer William Denning's *Telescopic Work for Starlight Evenings* (1891) lists it as the "Great Nebula in Orion".
- *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this as the "Great Nebula" and the "Great Orion Nebula".
- German astronomer Hermann Joseph Klein (1844 – 1914) lists "The Great Nebula in Orion" in his *Star Atlas* (1893).
- *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists this as the "Great Nebula".
- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists this as the "Orion Nebula".

Orion's Backpack:

This is a Canadian name for the IAU constellation Capricornus. Lauri Roche of the Victoria Centre RASC shared this with me in 2023, but I believe that it originated with the Halifax Centre (Judy Black 2023). Compare to Orion's Underpants, below.

Orion's Collarbone Nebula:

See Kissing Crescents Nebula above.

Orion's Cudgel:

This asterism is a five-sided figure in the IAU constellation Orion. It starts at Nu (ν) Orionis and runs around through Xi (ξ) Orionis, 69 Orionis, Chi (χ) 2 and Chi (χ) 1 Orionis.

Orion's Dog:

This Greek star is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major as described by the 8th century B.C.E. poet Homer in the *Iliad* Rhapsody XXII (Theodossiou et al 2011, Guglielmino, Cipolla, and Giudice 2017). The heliacal rising of Sirius was connected with a period of very hot weather in ancient Greece which they called "kynica kavmata" ("canine burnings") and in ancient Rome "dies caniculariae" ("dog days") as they believed that only dogs would be crazy enough to go out in the heat. This is the source of the modern expression "dog days of summer".

This Latin star "Canis Orionis" is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

This asterism "Canis Orionis" is the IAU constellation Canis Minor as listed in the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).

Orion's Head:

This **telescopic** asterism is the star cluster Collinder 69 in the IAU constellation Orion. This is O'Meara 27 in astronomer Stephen James O'Meara's *Hidden Treasures Catalogue* (2007). It is also known as the "Lambda Lambda Cluster" and the "Handgun".

Orion's Shield:

This asterism is a curve of six stars in the IAU constellation Orion: Pi (π) 1, 2, 3, 4, 5, and 6 Orionis.

Orion's Sword:

This asterism is made up of stars of the IAU constellation Orion. It includes the Coal Car Cluster (NGC 1981), the Orion Nebula (Messier 42) and De Mairan's Nebula (Messier 43), and the Lost Jewel of Orion cluster (NGC 1980).

Orion's Underpants:

This is a Canadian name for the IAU constellation Capricornus which was created by Halifax Centre RASC member Quinn Smith. The star line of the "waist strap" runs from Delta (δ) Capricorni to Alpha (α) Capricorni (Prima Geidi). The line then continues down to Omega (ω) Capricorni and back up to Delta (δ) Capricorni. Compare this to Orion's Backpack.

Orkulÿtje:

This Chakavian asterism is the IAU constellation Cetus.

Ornate Hawk-Eagle's Flutes:

This Kalapalo asterism "Kutsu Anangagi" is made up of stars in the IAU constellations Crux and Musca: Alpha (α) and Beta (β) Muscae and Alpha (α) and Kappa (κ) Crucis.

Orpheus:

This Greek asterism is the IAU constellation Hercules. Johann Bayer's *Uranometria* (1603) lists "Orpheus" for Hercules. John Hill's *Urania* in 1754 lists "Orpheus" for this constellation. Orpheus is a legendary musician and prophet in Greek mythology.

This Latin asterism "Orphei" or "Orphica" ("Orphic") is the IAU constellation Lyra. Johann Bayer's *Uranometria* (1603) lists the name "Orphica" for this constellation. This asterism is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Orfis:

This Greek asterism "Ορφίς" ("Orfis"), "Ορφός" and "Ορφώς" ("Órfós"), "Orphas" or "Orphus" is the IAU constellation Cetus. German astronomer Johann Bayer (1672 – 1625) listed Orphas and Orphus. John Hill listed it as "Orphys" in his *Urania* in 1754. This is a term for a species of cetacean (whale, dolphin, porpoise).

Orsilochus:

This Greek asterism "Orsilochus" is the IAU constellation Auriga as listed in John Hill's *Urania* in 1754. Orsilochus is a character in many Greek myths, and in one he is described as the inventor of the quadriga.

Orthrus:

This Greek asterism is the IAU constellation Canis Minor as listed by Hesiod and Mosenkis in his *Mycenaean Oecumene* (date n/k). Orthrus was a two-headed dog who guarded Geryon's cattle and was killed by Heracles. This is related to their asterism Cerberus (see above): Cerberus was the brother of Orthrus.

Oryx:

See Dark Camel, above.

Oryxes:

This Arabic asterism is a quadrilateral of stars in the IAU constellation Cetus, Eridanus, and Taurus: It runs from a corner at the star Lambda (λ) Tauri to a corner at Kappa (κ) 1 Ceti through 10 Tauri to a corner at 32 Eridani to a corner at Mu (μ) Tauri.

Osawa's Star:

This rotating variable star is V436 Cassiopeiae (HIP 116210, HD 221568) in the IAU constellation Cassiopeia. It is named for astronomer Kiwoteru Osawa.

Osiris:

This Egyptian asterism from the *Pyramid Texts* and as depicted in the Ramesseum (c. 3285 B.C.E.), the mortuary temple of Rameses II at Thebes, and the Dendera temple is the IAU constellation Orion (Krupp 1979, Hoffman 2017), depicted at Dendera as a deified Egyptian king holding a staff. In Egyptian mythology Osiris was slain but reanimated by his sister Isis and thus seen as a ruler in the afterlife. They see him in the sky as sailing in a celestial boat and he is absent from the sky for 70 days, representing his journey in the afterlife.

The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Osiris walking to our right (Bullinger 1882, Seiss 1882).

This asterism is the IAU constellation Taurus as listed in an "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896. Brennand has labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This "Ancient Zodiac of Egypt" also lists the name "Apis" for this constellation (See Apis, above), though the Egyptians definitely associated their God Osiris with the IAU constellation Orion, not Taurus. Brennand also associates Osiris with Leo, and attributes this and the association with Taurus to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks.

NOTE: English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 associates Osiris with Alpha (α) Canis Majoris (Sirius).

Osiridis:

This Latin asterism is Ptolemy's asterism Argo's Ship (see above). It is a reference to the Egyptian God Osiris, who sails across the sky.

R. H. Allen writes in his *Star Names* in 1899 that English essayist J. F. Hewitt (1835 – 1908) identifies the IAU constellation Lepus as the Boat of Osiris. This constellation is next to the asterism Argo's Ship (see above).

'**Osleki**:

This Kaykavian asterism is the IAU constellation Cancer.

Osprey:

This Latin asterism "Aquila Marina" (literally "sea eagle") is the IAU constellation Lyra. Johann Bayer's *Uranometria* (1603) lists the names "Marina" and "Aquila Marina" for this constellation.

This Greek asterism is the IAU constellation Lyra as described by the Greek poet Aratus (315 – 240 B.C.E).

Ostrich:

There are three Arabic stars named "al-ẓalīm" (ظَلِيم) or "Al Thalim":

- One is the star Alpha (α) Piscis Austrini (Fomalhaut) in the IAU constellation Piscis Austrinus.
- The star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003) lists "al-zalīm" for Theta (θ) Eridani in the IAU constellation Eridanus:
    - Persian astronomer Ulugh Beg Mirza (1394 – 1449) lists this star as "al-ẓalīm".
- In his *Geography of the Heavens* in 1833, American uranographer Elijah Burritt transferred the latinized name "Dalim" to the star Alpha (α) Fornacis in the IAU constellation Fornax and gave it the additional name "Fornacis".
    - In 2017 the IAU approved the name Dalim for Alpha (α) Fornacis A.

A Piemontese (Chaco region, Argentina) asterism, "el avestruz", is the dark nebulosity in the Milky Way stretching from its "head" in the Coal Sack Nebula (see Coal Sack Nebula, above), with the "body" extending to the IAU constellation Scorpius and the legs reaching the IAU constellation Sagittarius. Compare this to Rhea (below).

Ostrich Chicks:

This Arabic star "Zibal" is Zeta (ζ) Eridani in the IAU constellation Eridanus. Zibal is an old misinterpretation of "ri'al" (رئل). It was applied to a number of stars near Omicron (ο) 1 Eridani (Beid) and 40 Eridani (Keid). The IAU approved the name Zibal for the star Zeta (ζ) Eridani Aa.

Ostrich Eggs:

This /Xam asterism is the Magellanic Clouds (Alcock 2014).

Ostrich Nest:

There are three Arabic asterisms with this name:

- One, "ʾudḥiyy (an-naʿām)" (أدحي النعام), listed by Persian astronomer Zakariya al-Qazwini (1203 – 1283) and listed as "Āshiyānah" (اشيانه) is a curve of stars in the IAU constellations Cetus and Eridanus starting with the Star Gamma (γ) Eridani and runs through Tau (τ) 5, 3, 2 and 1 Eridani, and Pi (π) Ceti and ends at Eta (η) Eridani:

    - This was later latinized to “Ashiyane” and miscopied as “Azha” (أرحى) in medieval manuscripts:
    - NOTE: The stars in this curve are called “The Eggs and Egg Shells” and their asterism Hen Ostriches (see above) is nearby.
    - English Admiral Henry William Smyth lists it as “Udh-ha, a little nest” and elsewhere as “udh-hi” and mentions the miscopied “Az-ha” in his *Bedford Catalogue* in 1844.
    - The name Azha was approved for the star Eta (η) Eridani by the IAU.
- One, “al-udḥā al-naʿām”, later latinized to “Aludhi” (I, II, and III) was listed by Persian astronomer Zakariya al-Qazwini (1203 – 1283) and is the stars Rho (ρ) 1, 2, and 3 Eridani in the IAU constellation Eridanus.
- One, “Al Udḥiyy” or “al-udhi”, is the curve of stars in the IAU constellation Sagittarius: Xi (ξ), Omicron (ο), Pi (π), 43, Rho (ρ) 1, and Upsilon (υ) Sagittarii (Adams 2016). R. H. Allen lists this as in his *Star Names* in 1899 as the stars Nu (ν) 1 and 2 Sagittarii, Tau (τ) Sagittarii, Psi (ψ) Sagittarii, Omega (ω) Sagittarii, 60 Sagittarii, and Zeta (ζ) Sagittarii.

This Persians asterism Ôshyôneh is identical to the Arabic asterism Ashiyanah.

NOTE: John Hill lists this as a name for the IAU constellation Corona Borealis in his *Urania* in 1754. He gives the name “Ae’ha Al Naam”, which indicates that he is mistaking this for “al-udḥā al-naʿām”, which is made up of stars of the IAU constellation Eridanus (above). Kemp et al (2022) list this as an Arabic name for Corona Borealis.

Ostriches:

This Arabic and Bedouin manzil “Al-Naayem”, “Al-Naʿāyem” (النعايم), or “ʾAn-Naʿāʾam” (ٱلنَّعَائِم) or “an-na’a’im”, is in the IAU constellation Sagittarius and is the stars Zeta (ζ) Sagittarii (Ascella), Phi (ϕ) Sagittarii, Delta (δ) Sagittarii (Kaus Media) and Epsilon (ε) Sagittarii (Kaus Australis):

- Dorn (1829) translates this as “Camels going to pasture” and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists this as “al-na’ámát, the ostriches”.
- W. Brennand lists this as “Al-Naaim” in his *Hindu Astronomy* in 1896. There are three other versions of this Arabic asterism:
- One version of this is the Teapot of Sagittarius asterism (see Teapot below) with the star Eta (η) Sagittarii added. The “handle” of the “teapot” they call “al-Naʿām al-Ṣādir” (see Returning Ostriches, below) and the “spout” of the “teapot” (plus Eta (η) Sagittarii) is “al Naʿāma al Wārida” (see Drinking Ostriches, above), the “river” being the Milky Way.
- The poems of Muhammad al-Mukri and Mohammed al-Qadhi include the star Lambda (λ) Sagittarii.

The Bedouin asterism “al-Dawāsir and Yām” or “Al-Naʿāyem” is the stars Alpha (α) Centauri (Rigil Kentaurus) and Beta (β) Centauri (Hadar) in the IAU constellation Centaurus.

Compare this to Hen Ostriches (see above).

This Yemeni manzil “Na’ā’im” is made up of stars in the IAU constellation Sagittarius (Varisco 1995): Zeta (ζ) Sagittarii, Tau (τ) Sagittarii, Gamma (γ) Sagittarii, Phi (ϕ) Sagittarii, Delta (δ) Sagittarii, Eta (η) Sagittarii

and Epsilon (ε) Sagittarii. This appears in the *Kitāb al-Tabṣira Fī'ilm al-Nujūm* of 13th century Rasulid ruler al-Malik al-Ashraf 'Umar ibn Yūsuf (d 1296).

Otehocut:

This Boorong asterism is the IAU constellation Delphinus (Hamacher 2011).

Otter:

This Tukano asterism "Diayo" or "Lontra" is from the Tiquié river region, where Tukanos describe this as the IAU constellation Crux (Cardoso 2007). Other Tukanos associate it with the star Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major.

The stars of this Kogi asterism "Nebbi-yéldyi" are currently unidentified (Kelley & Milone 2011).

This Ainu Nociw ("asterism") is made up of stars of the IAU constellation Boötes. The star Alpha (α) Boötis (Arcturus) is the otter's neck and the star Epsilon (ε) Boötis is its hindquarters, with Sigma (σ) and Rho (ρ) Boötis forming a tail. It is depicted holding a paddle in its mouth.

This Carib asterism "Awarepuyayuman" or "Awarepuya" represents the otter (Lutra brasiliensis). Its present location is unknown (Magaña, and Jara, 1982).

This Arawak asterism "Silelekuya" or "Sileleyuman" represents the otter (Lutra brasiliensis). Its present location is unknown (Magaña, and Jara, 1982).

Otter and Ball:

This **telescopic** asterism is the open cluster NGC 6633, discovered by Swiss astronomer Jean-Philippe Loys de Chéseaux in 1745-6 in the IAU constellation Ophiuchus. English astronomer Caroline Herschel rediscovered it in 1783 and her brother William Herschel listed it as VIII 72. It is GC 4410 in the *General Catalogue* of 1864. It was given this name by American astronomer Wayne Schmidt, who describes it as 30 arc minute tall sea otter reaching for a ball. It is also known as the Tweedledum Cluster (see below), the Captain Hook Cluster (see above), and "Kermit the Tadpole" (see above).

Otter's Rack:

This Barasana asterism "Timia Ya Kasabo" is the Hyades cluster in the IAU constellation Taurus (Hugh-Jones 2006). It is also known as "Wai Kasabo" (see Fish Grill, above) and "Masu Ya Kasabo" (see Man's Rack, above).

Our Lady's Wand:

This Catholic asterism is the belt of Orion in the IAU constellation Orion as listed in English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and R. H. Allen's *Star Names* in 1899. Smyth and Allen only identify the source as "Catholics".

Our Riddle:

See Test, below.

Our Star:

This **telescopic** Nias star "Dofida" is HIP 66047 (HD 117618) in the IAU constellation Centaurus (magnitude 7.17). It was given the name Dofida in the IAU NameExoWorlds campaign. It has an exoplanet named Noifasui ("revolve around").

Outer Fence:

This Chinese xing guan “Wàipíng” (外屏) is made up of a line of stars in the IAU constellation Pisces: the binary star Alpha (α) Piscium (Alrescha), Xi (ξ) Piscium, Nu (ν) Piscium, Mu (μ) Piscium, Zeta (ζ) Piscium, Epsilon (ε) Piscium, and Delta (δ) Piscium. This xing guan was used in the Three Kingdoms to Ming Dynasty period and remained unchanged in later Chinese sky lore. The Korean asterism “Outer Folding Screen” (see below) has one more star but is otherwise identical.

This Chinese Chenzhuo xing guan “Wàipíng” is a line of stars in the IAU constellation Pisces: Delta (δ) Piscium, Epsilon (ε) Piscium, Mu (μ) Piscium, Nu (ν) Piscium, Xi (ξ) Piscium and 113 Piscium.

Outer Folding Screen:

This Korean asterism “Oebu Byeongpung” (외부 병풍) is made up of a line of stars in the IAU constellation Pisces: the binary star Alpha (α) Piscium (Alrescha), Xi (ξ) Piscium, Nu (ν) Piscium, Mu (μ) Piscium, Zeta (ζ) Piscium, Epsilon (ε) Piscium, Delta (δ) Piscium, and 51 Piscium. The Chinese xing guan “Outer Fence” (see above) has one less star but is otherwise identical.

Outer Kitchen:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is an oval of stars in the IAU constellation Hydra: Starting at the determinative star C Hydrae, the line runs through 3 Hydrae, F Hydrae, 14 Hydrae, HIP 43142 and HIP 42028.

This Chinese xing guan “Wàichú” (外厨) is a bent triangle of stars in the IAU constellations Hydra and Monoceros: HIP 43142, 14 Hydrae, 30 Monocerotis and 31 Monocerotis.

This Chinese Chenzhuo xing guan “Wàichú” is a loop of stars in the IAU constellations Hydra and Monoceros: 31 Monocerotis, 14 Hydrae, HIP 43142, HIP 42028, 30 Monocerotis, and 3 Hydrae.

This Korean asterism “Oebu Jubang” (외부 주방) is a curve of stars in the IAU constellations Hydra and Monoceros: 30 Hydrae, Zeta (ζ) Monocerotis, 27 Monocerotis, HIP 38474B, HIP 37901 and Alpha (α) Monocerotis.

Outer Limits Galaxy:

This **telescopic** asterism NGC 891 (Caldwell 23) is an edge-on spiral galaxy in the IAU constellation Andromeda with a prominent dust lane. It is also known as the Silver Sliver (see below). It was discovered by English astronomer William Herschel in October 1784 who listed it as “V 19). It is listed as GC 527 in the *General Catalogue* of 1864. The name is probably a reference to the TV show Outer Limits which first appeared between 1963 – 1965 and then again between 1995 – 2002. It is also known as “Surrounded by Dust” (see below).

Outer Pestle:

This Korean asterism “Oebu Yubong” (외부 유봉) is a line of four stars in the IAU constellation Telescopium: Zeta (ζ) and Delta (δ) 1 and 2 Telescopii and HIP 90414.

Outline Face:

This **telescopic** asterism is in the IAU constellation Lynx and was listed by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 1752. Size 75’ 25’. Corder describes this as a “curving chain of about 12 stars… magnitudes 4.5 to 9.5… elongated in a NE/SW direction.

Outpouring:

This Greek star "εκχυσις" or "Ekkhysis" is Lambda (λ) Aquarii in the IAU constellation Aquarius and is listed in R. H. Allen's *Star Names* in 1899.

Outpouring of Wine:

This star is "Οινοχοεία" or "Oinochoeía" Kappa (κ) Aquarii in the IAU constellation Aquarius as listed by Theon of Alexandria (335 – 405 C.E.) R. H. Allen in *Star Names* in 1899. Allen translates this as "outpouring of wine".

Outstretched Paw:

There are two Arabic asterisms by this name:

- One, "adh-Dhirāʿu l-Mabsūṭah" (الذّراع المبسوطه) is the stars Epsilon (ε) and Zeta (ζ) Geminorum in the IAU constellation Gemini:
    - This was later latinized to "Mebsuta", "Meboula" (by American astronomer Charles Augustus Young), "Menita", "Mesoula", "Mibwala" or "Mekbuda".
    - American uranographer Elijah Burritt (1794 – 1838) listed the names "Melucta" and "Mebusta".
    - English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Mebsuta, from al dhirä al mebsúta, the outstretched arm", though he identifies the two stars involved as Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux).
    - The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) list "Mebsuta" for Epsilon (ε) Geminorum.
    - English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists Epsilon (ε) Geminorum as "Mebsuta".
    - The IAU approved the name Mebsuta for Epsilon (ε) Geminorum and Mekbuda for Zeta (ζ) Geminorum Aa.
- One, "al-mabsūtah" (المبسوطة), later latinized to "Mabsuthat" is the star 31 Lyncis in the IAU constellation Lynx. NOTE: Hafez (2010) gives this as a name for 35 Ursae Majoris.

Owl:

This Mayan asterism "Kulte" is made up of the stars of the IAU constellations Taurus and Orion:

- The "head" of the owl is the Hyades cluster,
- Its "wingtips" are the stars 1 Orionis and Epsilon (ε) Tauri, and
- One side of the "tail" runs out to Lambda (λ) Tauri, and the other out to Nu (ν) Tauri.

There are four **telescopic** "owl" asterisms:

- One, also known as the Kachina Doll Cluster, Dragonfly Cluster, Massed Jewels, and the E.T. Cluster, is open cluster NGC 457 (Caldwell 13) in the IAU constellation Cassiopeia. It was discovered by the English astronomer William Herschel in 1787 who labeled it "VII 42" in his catalogue. It is GC 256 in the General Catalogue of 1864. Two bright stars (HIP 6229 and Phi (ϕ) Cassiopeiae) are the eyes. Size 13' X 13'. Both Phil Harrington and Tom Lorenzin refer to this as the "Owl".
- One is the planetary nebula Messier 97 (NGC 3587) in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781. It is listed in the General Catalogue of

1864 as GC 2343 and in John Herschel's catalogue as h 838. English astronomer William Parsons, 3rd Earl of Rosse, drew an illustration of this nebula in 1848 that resembled an owl's head, which is where this name comes from.
    - English astronomer William Denning's *Telescopic Work for Starlight Evenings* (1891) lists this as the "Owl Nebula".
    - German astronomer Hermann Joseph Klein (1844 – 1914) lists the "Owl Nebula" in his *Star Atlas* (1893).
    - The 1st edition (1910) and 14th edition (1959) of British schoolmaster Arthur P. Norton's *A Star Atlas* lists this as the "Owl Nebula".
    - *1001 Wonders as Observed with Home Built Instruments*, 3rd edition (1931), by American astronomer Charles Howard Barns lists the name "Owl Nebula" for this asterism.
    - *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists the name "Owl Nebula" for this nebula.
- One, the "Soaring Owl", is in the IAU constellation Ursa Minor and is on the observing lists of John A. Chiravalle. Jeffrey Corder lists it as Corder 2955. A "wing" extends from the central star HIP 78392 to a "wing tip" at HIP 77176. A group of 8th – 9th magnitude stars forms the owl's "head".
- One is the supernova remnant NGC 6992 in the East Veil Nebula in the IAU constellation Cygnus. William Herschel recorded this as "V 14". John Herschel listed it as h 2092 and later as GC 4616 in his *General Catalogue* in 1864.

Owl Eyes Flicking:

This Wardaman asterism "Ya-jungin" is the star Alpha (α) Orionis (Betelgeuse) in the IAU constellation Orion (Cairns and Harney 2003). Ya jungin is watching the ceremonies of Unumburrgu (see Red Kangaroo Leader, above).

Owl Galaxy:

One is the galaxy NGC 3758 in the IAU constellation Leo. It was found by Ralph Copeland in March 1874. Professor Bill Keel gave it this name in 1993 in *Mercury Magazine*. It is also known as the Smiley Face.

Owlet Nightjar:

This Boorong asterism **"**Yerrerdetkurrk" is in the IAU constellation Eridanus as listed by Stanbridge (1857), Morieson (1999), and Hamacher and Frew (2010) and is the owlet nightjar (Aegotheles cristatus). The "body" of the bird is the star Alpha (α) Eridani (Achernar). The "wingtips" are the stars p Eridani and HIP 7506. This is the mother-in-law of Totyarguil's wives (see Wives of Totyarguil, below).

This Kokatha and Ngalea star "Joor-Joor" or "Jurr-jurr" is the star Alpha (α) Carinae (Canopus) in the IAU constellation Carina (Leaman and Hamacher 2014, Leaman, Hamacher, and Carter 2016).

NOTE: this is a reference to the Australian owlet nightjar (Aegotheles cristatus).

This Wotjobaluk koori star **"**Yerrerdet-kurrk" is the star Beta (β) Orionis (Rigel) in the IAU constellation Orion (Massola 1968, Hamacher 2011). They saw it as the mother-in-law of Totyerquil (Altair).

Owl's Neighbour of Ursa Major:

This **telescopic** asterism "Strigivicínus Úrsae Majóris" is the barred spiral galaxy Messier 108 (NGC 3556) in the IAU constellation Ursa Major. It was discovered by French astronomer Pierre Méchain in 1781 or

1782. English astronomer William Herschel listed it as “V 46” in his catalogue. It is GC 2318 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): they called it this as it is near Messier 97, the Owl Nebula.

Ox:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a narrow quadrilateral of stars with two lines running off one end in the IAU constellation Capricornus:

- The quadrilateral is the determinative star Beta (β) Capricorni (Dabih) with 10 Capricorni, Omicron (ο) Capricorni, and Rho (ρ) Capricorni.
- From Beta (β) Capricorni two lines run out:
    - One to the star Nu (ν) Capricorni, and
    - One to the stars Alpha (α) 1 and 2 Capricorni (Algedi).

This Chinese xiù (lunar mansion) “Niúxiù” (牛宿) is a bent line of stars with a triangle at the end in the IAU constellation Capricornus. The line starts at Xi (ξ) Capricorni, takes a bend at the optical double star Alpha (α) 1 and 2 Capricorni (Algedi), then runs through Beta (β) Capricorni (Dabih) to a triangle of three stars: Eta (η), Rho (ρ), and Omicron (ο) Capricorni. In the *Han shu*, a history of the early Han dynasty that was finished in 111 C.E. this xiù “Qian Niu” (牽牛) was associated to matters concerning the Yangzhou territory. This appears in the Tang Dynasty (618 – 907 C.E.) as “Niú” (牛) as listed by Kotyk (2017): Kotyk writes that it was compared to the Vedic nakshatra Abhijit (see Victorious, below) which is in Lyra and nowhere near this lunar mansion.

This Greek lunar mansion is listed in the *Magical Papyrus 121*, preserved in the British Museum, and dated to the 3rd century C.E. (Mosenkis, date n/k). The stars have not been identified.

This Latin asterism “Bos” is the IAU constellation Taurus as listed by Roman general Germanicus (15 B.C.E. – 19 C.E.). Johann Bayer’s *Uranometria* (1603) lists “Bos” as a name for this constellation.

This Italian asterism is the IAU constellation Taurus as listed by Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?), who saw it as the ox that stood in the manger at the Nativity.

“Volarica” or “Volujara” is a Serbian name for Alpha (α) Canis Majoris (Sirius).

Ox and Wolf:

This Estonian asterism is the IAU constellation Orion (Kuperjanov 2006). It was first recorded by Robert Livländer in 1923.

Ox Eyed of Boötes:

This **telescopic** asterism “Bóöps Boótis” is the intermediate spiral galaxy NGC 5248 (Caldwell 45) in the IAU constellation Boötes. It was discovered by English astronomer William Herschel in 1784 who listed it as “I 34”. It is GC 3615 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the apparent resemblance of this galaxy with a big eye”. It is also known as the Black Eye (see above).

Ox Thief:

This Basque asterism “Itohoin” is the Big Dipper asterism in the IAU constellation Ursa Major (Knörr 1999, Frank 2021).

Ox Thigh:

This Egyptian Dendera asterism (Hoffman 2017) is basically the earlier Egyptian asterism Bull’s Foreleg (see above) and includes the Babylonian asterism Lahru (see Ewe, above) and MUL.KA.A (see Fox, above).

Ox Wain:

This Estonian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006). Eta (η) Ursae Majoris is a man leading an ox represented by Zeta (ζ) and Epsilon (ε) Ursae Majoris which is pulling a wain represented by Alpha (α) Ursae Majoris (Dubhe), Beta (β) Ursae Majoris (Mirak), Gamma (γ) Ursae Majoris, and Delta (δ) Ursae Majoris. 80 Ursae Majoris (Alcor) is a “wolf” (see Wolf Beside the Ox, below).

This Slovenian asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Kuperjanov 2006). It is identical to the Estonian version (above).

Oxen:

This Arabic asterism “al-Baqar” is the Large Magellanic Cloud (Hafez 2010). It was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 as a name used by “the people of Tehāma (an area in Northern Arabia).

This Serbian asterism “Volovi” is probably the belt of Orion in the IAU constellation Orion. Compare this to Plough with Oxen (see below).

Oxherd:

This Chinese star is Alpha (α) Aquilae (Altair) in the IAU constellation Aquila and is found in records of the Shang Dynasty (1600 – 1027 B.C.E.).

There are two Basque asterisms “Itzain” (Knörr 1999, Frank 2021):

- One is the Big Dipper asterism in the IAU constellation Ursa Major (see Big Dipper, above).
- One is the IAU constellation Boötes.

Oyaninai Boshi:

There are three Japanese asterisms of three stars with this name (Renshaw and Ihara 2001):

- One is their lunar mansion Nakago Boshi (see above).
- One is their lunar mansion “Oyakoukou Boshi” (see Filial Duty Stars, above)
- One is the three stars Alpha (α) Aquilae (Altair), Beta (β) Aquilae (Alshain) and Gamma (γ) Aquilae in the IAU constellation Aquila.

These groups of three stars represent a child being supported on either side by parents.

Oyster Nebula:

This **telescopic** asterism is planetary nebula NGC 1501 in the IAU constellation Ophiuchus. This was discovered in 1787 by English astronomer William Herschel who listed it in his catalogue as “IV 53”. It is GC 801 in the *General Catalogue* of 1864. Astronomer Stephen James O’Meara’s *Hidden Treasures*

Catalogue (2007) lists it as O'Meara 21 and lists the name "Oyster Nebula". It is also known as the Camel's Eye (see above).

Oyster (with Mignonette Dressing):

This asterism is the emission nebula and HII region Messier 8 (NGC 6523), discovered by Italian astronomer Giovanni Hodierna before 1654 in the IAU constellation Sagittarius. It is also known as the Lagoon Nebula (see above), the Hourglass Nebula (see above), the Dragon Nebula (see above).

Pabilsag:

This complex Babylonian asterism in the MUL.APIN tablets "MUL.PA.BIL.SAG" (Bartel van der Waerden 1974, Hunger 1992, Parpola 1993), "PA.BIL.SAG", "dPA.BIL.SAG" or "Pabilsag" (Hunger 1992) represents their God Pabilsag (whose name means "forefather", "chief ancestor", or "presbyter") and is made up of stars the IAU constellations Ara, Sagittarius, and Telescopium. The *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) lists it as "dPA.BIL.SAG" and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as "mul pa.bil.sag" (Koch-Westenholz 1995) , the list of Lumasi stars from the Persian (Achaemenid) Period (539 – 331 B.C.E.) lists it as "PA.BIL.SAG" and the BM 78161 tablets as "pa-bil-sag". Boutet (2014) lists it as "archer". It consists of the following stars:

- The "body" is a bent pentangle of stars starting at Mu (μ) Sagittarii and running through Eta (η) Sagittarii, HIP 91918, HIP 95865A, 52 Sagittarii, Chi (χ) Sagittarii, Psi (ψ) Sagittarii, Sigma (σ) Sagittarii, and Phi (ϕ) Sagittarii. Six lines of stars run off from around the edge of the "body":
    - One runs from Eta (η) Sagittarii through Epsilon (ε) Telescopii to Theta (θ) Arae,
    - One runs from HIP 91918 through Alpha (α) Telescopii to Zeta (ζ) Telescopii,
    - Two lines run from HIP 95865A:
        - One to Iota (ι) Sagittarii, and
        - One through Omega (ω) Sagittarii to 62 Sagittarii,
    - One is a bending line running from Sigma (σ) Sagittarii through Xi (ξ) 2 Sagittarii, Omicron (ο) Sagittarii, and 41 Sagittarii, to Tau (τ) Sagittarii.
- In the middle of the "body" is a bent cross of stars with the central star being Delta (δ) Sagittarii with lines running out to Epsilon (ε) Sagittarii, Zeta (ζ) Sagittarii, Lambda (λ) Sagittarii, and Gamma (γ) Sagittarii.

This Babylonian asterism "PA.BIL.SAG" as listed in Anthony Hope's *A Guide to Ancient Near Eastern Astronomy* in 1996 is the IAU constellation Sagittarius.

This Akkadian asterism "Pabilsaĝ" or "Pabilsag" from the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) or "mi-ši-iḫ dPa-bil-sag" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism PA.BIL.SAG above.

This Sumerian asterism "mulin-um an-na" from the Ura =hubulla XXII lists (Yigal, Block and Wayne Horowitz 2015) is identical to the Babylonian asterism PA.BIL.SAG above.

This Persian asterism "pa.bil.sag" from the list of Lumasi stars in the lists K 250 and VAT 9418 (Boll 1918) and "PA" in the list of Zodiacal Signs in VAT 4956 (Bartel van der Waerden 1974) from the Persian (Achaemenid) Period (539 – 331 B.C.E.) is identical to the Babylonian asterism PA.BIL.SAG above (Jeremias 1929, Weidner 1971).

This Seleucid asterism “PA” or “Dir.x.x?” from tablet SBTU II No 43 (W 22646) from the Seleucid (Hellenistic) period (275 B.C.E. – 116 C.E.) is the IAU constellation Sagittarius (Foxvog 1993).

This Egyptian Dendera asterism (Hoffman 2017) is basically the earlier Babylonian asterism MUL.PA.BIL.SAG (see Pablisag).

Pac Man:

There are two **telescopic** “Pac Man” asterisms:

- One, also known as the King Cobra Cluster and the Golden Eye Cluster, is the open cluster Messier 67 (NGC 2682) in the IAU constellation Cancer. It was discovered by German astronomer Johann Gottfried Koehler in 1779. The 1864 General Catalogue lists it as GC 2682 and John Herschel’s catalogue as h 531.
- One is emission nebula NGC 281 (SH 2-184, LBN 616, Ced 3) in the IAU constellation Cassiopeia. It was discovered in 1883 by American astronomer Edward Emerson Barnard. Size 35’ X 35’. It is number 3 in astronomer Stephen James O’Meara’s *Hidden Treasures Catalogue* (2007). It is also known as “Lafitte’s Grand Isle”.

NOTE: The Pac Man game appeared out of Japan in May 1980, so this name can’t predate this.

Pacariqtambo

This Inca asterism Pacariqtambo is the IAU constellation Corona Australis (Urton 2005, Kemp et al 2022). Paraciqtambo is a cave from which the Inca are said to have emerged. It is also known as Manco Cápac.

Pack Horse:

This Arabic asterism “Birdun” is the IAU constellation Centaurus as described by Persian astronomer Abu Ma’shar (Albumasar- 787 – 886). German poet Philipp von Zesen (1619 – 1689) listed this as “Bridemif” and associated it with the constellation Lupus next to Centaurus.

Pack of Dogs:

This Sami asterism is the Pleiades cluster in the IAU constellation Taurus (Lundmark 1982).

Packer:

This Bedouin star “Al-Mirzam” (المرزم), or “Mirzam of the Crossing Shi’ra” is Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major. NOTE the name approved for the star Beta (β) Canis Majoris in the IAU constellation Canis Major today is Mirzam.

PackPuppy:

This Canadian asterism is made up of stars of the IAU constellations Boötes, Corona Borealis, Hercules, and Serpens:

- The “brow” runs from the star Xi (ξ) Coronae Borealis and runs through Nu (ν) 1 and 2 Coronae Borealis, Sigma (σ) Coronae Borealis, Rho (ρ) Coronae Borealis, Kappa (κ) Coronae Borealis, Zeta (ζ) Coronae Borealis, and Mu (μ) Coronae Borealis, to Mu (μ) Boötis.
- The “left ear” runs from Nu (ν) 1 and 2 Coronae Borealis through 25 Herculis to HIP 80008,
- The “right ear” runs from Mu (μ) Coronae Borealis through Chi (χ) Herculis to Phi (ϕ) Herculis,
- The “nose ring” is the arc of stars which is Corona Borealis,

- The “collar” is the line of stars from Pi (π) Serpentis through Rho (ρ) Serpentis, Iota (ι) Serpentis, and HIP 75535, to HIP 74896, and
- The “bone” is the four stars 5 Herculis, Kappa (κ) Serpentis, Beta (β) Serpentis (Chow), and Gamma (γ) Serpentis.

This asterism was created by Vancouver RASC member Bryon M. “PackPuppy” Elliott on 16 December 2024 to celebrate the “Puppies” community.

There are two **telescopic** “PackPuppy” asterisms:

- One is Ennis 5 in the IAU constellation Cassiopeia, listed by Canadian astronomer Charles Ennis. Ennis observed it while looking for the cluster Simonic 47. A triangle of 10^{th} – 11^{th} magnitude stars form the “head”, with the “nose” at one apex being a double star. Six 8^{th} – 9^{th} magnitude stars form the “body”, with a 10^{th} magnitude star forming the “neck”. This is within 3’ of 48 Cassiopeiae. This was created in November 2024 to honor his friend and fellow RASC astronomer Bryon Elliott.
- One is the galaxy PGC 33487 (Arp 21) in the IAU constellation Leo Minor. This asterism was created on 16 December 2024 by Vancouver RASC member Bryon M. “PackPuppy” Elliott to celebrate the “Puppies” community.

Paddler Gods:

This Mayan asterism is the path of stars in the Milky Way running towards Alpha (α) Canis Majoris (Sirius) in the IAU constellation Canis Major from the star Alpha (α) Crucis (Acrux) in the IAU constellation Crux. The Paddler Gods (Stingray and Jaguar) are paddling the Maize god to “Oxib’ Xk’ub’” (see Primordial Fire, below). Jaguar is also associated with the Moon (see the entries in the Solar System Handbook).

Padus:

This Latin asterism is the IAU constellation Eridanus. Padus is the Po River in Italy:

- Johann Bayer’s *Uranometria* (1603) lists “Padus” for this constellation.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Padus”.
- “Padus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.
- Edward Sherburne lists “Padus” in his *Sphere of Marcus Manilius* in 1675.

Pae:

This Samoan asterism is the globular cluster Messier 80 in the IAU constellation Scorpius (Fitisemanu 2022). Pae and Suga are a pair of hunters pursuing Toloa (see Wild Duck, below and Pae, above).

Paepae-poto:

This Māori star is Alpha (α) Carinae (Canopus) in the IAU constellation Carina.

Pagasaea Keel:

The Roman poet Ovid (b. 43 B.C.E.) called Ptolemy’s asterism Argo’s Ship (see above) “Pagasaea Carina” after the Thessalian seaport where Jason’s ship was built.

Pagasaea Poop Deck:

The Roman poet Ovid (b. 43 B.C.E.) called Ptolemy's asterism Argo's Ship (see above) "Pagasaea Puppis" (puppis being the Latin word for "poop deck" or "stern") after the Thessalian seaport where Jason's ship was built.

Paikauhale:

See Vagabond, below.

Painted with Shadows of Virgo:

This **telescopic** asterism "Sciagráphicus Vírginis" is the lenticular galaxy NGC 4691 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "II 182". It became GC 3221 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the dark features, caused by dust in the central region".

Painter:

This Italian asterism "Pittore" is the IAU constellation Pictor.

Painter's Desk:

This German asterism "Pluteum Pictoris" is the IAU constellation Pictor (see below), and this is the name German astronomer Johann Bode listed in 1803 in his stellar charts.

Pair of Bulls:

This Finnish asterism "Härkäpari" is the Belt of Orion asterism in the IAU constellation Orion.

Pair of Puma's Friends:

This Inca asterism "Puma Yunta" is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini (Gamarra & Gamarra 2009).

Pair of Stars:

This ancient Egyptian asterism "Sebawy" is found in the Ramesside star charts on the ceiling of three tombs in the Valley of the Kings (New Kingdom, 20th Dynasty) and is the stars Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux) in the IAU constellation Gemini. The Temple of Khnum at Esna has a Latopolitan zodiac on the ceiling of the pronaos dating to the age of Ptolemy II Euergetes (246 – 221 B.C.E.) depicts Seb (Sebek, Sobek) holding hands with a twin-like figure (Bullinger 1882, Seiss 1882).

Pakiza:

This asterism is the IAU constellation Virgo as listed in John Hill's *Urania* in 1754. Hill does not identify the source.

Palace:

This asterism "Palasin" was created of the stars of the IAU constellation Andromeda by German astronomer Erhard Weigel (1625 – 99) who produced his *Astrocopium Orbi Europaeo Sacrum* chart in 1661, 1681 and 1688 in which he tried to replace existing constellations a new system based upon the

heraldry of the nation states and principalities of seventeenth century Europe, as well as of its principal hierarchies and social classes. It is depicted as an open brass bound chest into which gold coins are being poured from a cornucopia.

Palace Gate:

This Chinese asterism “Quèqiū” (阙丘) is a line of two stars in the IAU constellation Monoceros: 18 and Delta (δ) Monocerotis.

This Chinese Chenzhuo xing guan “Quèqiū” is a line of stars in the IAU constellations Canis Minor, Monoceros, and Puppis: 13 Puppis, 14 Canis Minoris, Zeta (ζ) Canis Minoris, HIP 35712, and Delta (δ) Monocerotis.

Palace Guard:

This Chinese xing guan “Yǔlínjūn” (羽林军) is a complex of fifteen lines or triangles of stars in the IAU constellations Aquarius, Cetus, and Piscis Austrinus, alongside the xing guan “Line of Ramparts” (see above):

- One is a triangle of 3 Ceti, Iota (ι) Ceti, and AD Ceti,
- One is a shallow triangle of HIP 117541, 117314, and 117567,
- One is a triangle of Omega (ω) 1 and 2 Aquarii and HIP 116957,
- One is a shallow triangle of 108 Aquarii, 107 Aquarii and 104 Aquarii,
- One is a triangle of HIP 116591, 115839, and 94 Aquarii A,
- One is the triangle Chi (χ) Aquarii and Psi (ψ) 1 and 2Aquarii,
- One is a shallow triangle of 98 Aquarii, 99 Aquarii, and 101 Aquarii,
- One is the triangle of 88 Aquarii, 89 Aquarii, and 86 Aquarii,
- One is the triangle HIP 113080, Delta (δ) Aquarii, and HIP 113998,
- One is the triangle Tau (τ) Aquarii, 74 Aquarii, and HIP 113531,
- One is the triangle 66 Aquarii, 68 Aquarii, 59 Aquarii,
- One is the triangle 53 Aquarii, 56 Aquarii, and 61 Aquarii,
- One is the triangle 39 Aquarii, 42 Aquarii, and 50 Aquarii,
- One is the triangle Epsilon (ε) Piscis Austrini, Zeta (ζ) Piscis Austrini, and HIP 111515, and
- One is the triangle HIP 107901, 108784, and 107797

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellations Canis Minoris and Monoceros: Delta (δ) Monocerotis (the determinative star) and Delta (δ) 1 Canis Minoris.

This Chinese xing guan “Yǔlínjūn” (羽林军) is a complex of ten lines or triangles of stars in the IAU constellations Aquarius and Piscis Austrinus, alongside the xing guan “Line of Ramparts” (see above):

- One line is the stars Chi (χ), and Omega (ω) 1 and 2 Aquarii,
- One line is the stars Delta (δ) and Tau (τ) 1 Aquarii,
- One line is the stars Tau (τ), 74, and 70 Aquarii,
- One is a triangle of stars: Psi (ψ) 1, 2, and 3 Aquarii,
- Another tiny triangle of stars is 83, 85, and 87 Aquarii,
- One line is 94, 97, and 98 Aquarii,
- One line is 45, 50, and 56 Aquarii,
- One line is 53, 61, and 66 Aquarii,

- One triangle is Upsilon (υ) and 68 Aquarii and 20 Piscis Austrini, and
- One line is 86, 88, and 89 Aquarii.

This complex Chinese Chenzhuo xing guan "Yǔlínjūn" is three branching lines of stars in the IAU constellations Aquarius, Cetus, and Pisces: The central star is 3 Ceti. From 3 Ceti three branches run out:

- One runs through 6 Ceti, 2 Ceti, and HIP 983 to 7 Ceti,
- One runs through HIP 117567 to Omega (ω) 2 Aquarii, where it splits into two branches:
    - One runs through Omega (ω) 2 Aquarii, HIP 116591, HIP 116853, and HIP 117314 to HIP 117756,
    - One runs through HIP 116957, 104 Aquarii, 106 Aquarii, and 107 Aquarii to 108 Aquarii.
- One runs through HIP 1191 to HIP 1158 where it splits:
    - One line runs to Iota (ι) Ceti,
    - One line runs through HIP 671 to 33 Piscium, where it splits into three lines:
        - One runs to HIP 840,
        - One runs to 30 Piscium, and
        - One runs to 29 Piscium, where it splits into two lines:
            - runs to 27 Piscium, and
            - One runs to 5 Ceti.

Palace of Darkness:

See Yingshi, below.

Palace of Emperor:

This Korean lunar mansion "Shil" consists of a group of stars in the IAU constellation Pegasus. The central star is Beta (β) Pegasi (Algol), and from this star four lines run out:

- One goes to Eta (η) and Omicron (ο) Pegasi,
- One goes to Tau (τ) and Upsilon (υ) Pegasi,
- One goes to Mu (μ) and Lambda (λ) Pegasi, and
- One goes to Alpha (α) Pegasi (Markab).

Palace of the White Ram:

This Japanese zodiac constellation is the IAU constellation Aries in the Genzu mandara (Kotyk 2018).

Palatine Lion:

This German asterism "Leo Palatinus" was created of the stars between the IAU constellation Aquarius and the obsolete constellation Antinous (see above) in 1785 by Jesuit court astronomer Karl-Joseph König (1751 – 1809) to honor his patrons, Karl Theodor, Prince-Elector, Count Palatine and Duke of Bavaria (1724 – 1799) and his wife, Countess Palatine Elisabeth Auguste. The central star is 71 Aquilae.

Pale One:

This Portuguese star "Pálida" is Delta (δ) Crucis in the IAU constellation Crux.

Pale Cloud:

This Samoan asterism “Aotea” is the Large Magellanic Cloud in the IAU constellation Dorado (Fitisemanu 2022).

Paliyama:

This Sama asterism is made up of parts of the IAU constellation Aquila (Ambrosio 2008).

Palm:

This Arabic star “al-Kaff ul-Khaḍib” (الكف الخضيب) meaning “palm of the hand” is the star Beta (β) Cassiopeiae in the IAU constellation Cassiopeia:

- “al-Kaff al-Khadīb” was listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This is listed as “[Al-] kaff al-khadīb” on the astrolabe of Diyā al-Dīn Muhamman, which was in use between 1060 and 1650 (Savage-Smith 1992): Savage-Smith translates this as “the dyed hand”.
- The star list of Abraham Bar Hiyya in 1104 (Goldstein 1985) lists the Arabic name “al-kaff al-khadib” but for the star Alpha (α) Andromedae (Alpheratz) and gives the Hebrew name as “ha-yad ha-sevua”.
- “kaff al-Khadiīb” appears on the star list of the *Zrj al-Musaffarī* of 13th century Yemeni astronomer Muhammad ibn Abī Bakr al-Fārisī (Kunitzsch & Langermann 2003)”: They translate this as “the hand dyed [with henna]”.
- Dorn (1829) also lists this as the “dyed hand” as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya’ al-Qazwini (1203 – 1283).
- This was later latinized to “Caph”, “Kaff”, “Ceph”, or “Chaph” and is part of their asterism “Yad Mulawana” (see Tinted Hand, below).
- The 15th century *Alfonsine Tables* and later translations of the *Almagest* list “habens palmam delibutam” (“having palm oiled”).
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Caph” and “Kaff-al-Khadib” and translates this as “stained hand”.
- *Popular Astronomy* (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this star as “Caph”.
- In his *Star Names* in 1899 R. H. Allen gives the name “Kaff al Ḥadib”.
- Steiner (2016) lists the Bedouin spelling “Khaf al Habib”.
- Joseph Jérôme Lefrançois de Lalande (1732 – 1807) listed it as “Siliquastrum”, which is a reference to the Sycamine Tree (see below) and meant to be a branch in Cassiopeia’s hand.
- This is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852 as “Chaph”: The author is unknown, but it is based on the Celestial Atlas of Alexander Jamieson, published in 1822.
- English astronomer Richard A. Proctor’s *A New Star Atlas* (1887) lists this star as “Chaph”.
- American astronomer Winslow Upton’s *Star Atlas* (1896) lists this star as “Caph” and describes it as the “palm of the hand”.
- R. H. Allen’s *Star Names* in 1899 translates as “Holding the Consecrated Palm”.
- The 1st edition of British schoolmaster Arthur P. Norton’s *A Star Atlas and Telescopic Handbook* (1910) lists the names “Caph” and “Chaph” for this star, but his 14th edition (1959) only lists “Caph” for this star.

- *The Facts of File Dictionary of Astronomy, 2nd edition*, 1985, by Valerie Illingworth, ed., lists "Caph" for this star.
- NOTE: The Arabs see this as "khamsa", the hand of Fatima, the daughter of Muhammad (Kunitzsch 1959).
- The IAU approved the name Caph for Beta (β) Cassiopeiae A.

Palm Branches:

This Arabic asterism "Al Shamārīẖ" is made up of stars in the IAU constellation Centaurus and Lupus and represents branches of a date palm held in the hand of the centaur:

- "al-Shamārīkh" is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This asterism is described by Persian astronomer Zakariyya' al-Qazwini (1203 – 1283) in his *Wonders of the Creation and Unique of the Existence*. This is later latinized to "Asemarik".
- Dorn (1829) lists it as "branches or clusters of dates" and describes it as appearing on a globe made by Mohammed ben Helal in 1275 in Mosul, based on the work of Persian cosmographer Zakariyya' al-Qazwini (1203 – 1283).
- German astronomer Johann Bayer (1572-1625) lists it as "Asmeat", Albeze", and "Albizze".
- John Hill lists asterism as "Alshamarik" and translates it as "Centaur and the Wolf" in his *Urania* in 1754, giving the alternate names "Albez" and "Asmeat".
- Compare this to the Arabic asterism Vine Branch (below).

Palm Fan:

This Netwar asterism "Kilil" ("traditional palm fan") is made up of stars in the IAU constellation Orion (Ramik 2019): Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis (Bellatrix), Delta (δ) Orionis (Mintaka), Beta (β) Orionis (Rigel), Kappa (κ) Orionis (Saiph), and Zeta (ζ) Orionis (Alnitak). Compare this to the Nahwal asterism "Kelel" (see Fan above).

Palm of al Awwa:

This Arabic star "Muqaddim Yad ul-Ḥawwā'" (مقدّم يد الحوّاء) is Delta (δ) Ophiuchi in the IAU constellation Ophiuchus:

- It was later latinized to "Yed Prior".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) and his 14th edition (1959) lists this star as "Yed".
- The IAU approved the name Yed Prior for Delta (δ) Ophiuchi. This is part of their asterism Howling Dogs (see above).

Palm of the Supporter:

This Arabic star "Kaff al-nasīr" is Alpha (α) Andromedae (Alpheratz) in the IAU constellation Andromeda as listed in an anonymous Hebrew star list from 1392 (Goldstein 1985). This list gives the Hebrew name "ha-yad ha-sevu'a" ("she is the hand of God").

Palm Sander:

This **telescopic** asterism is in the IAU constellation Cassiopeia and was listed in *Pattern Asterisms* by American astronomer John A. Chiravalle. Jeffrey Corder lists it as Corder 317. The "base" of the sander is

a line of stars including HIP 9312 and 52 Cassiopeiae. The "top" of the sander is 53 Cassiopeiae, HIP 9635, 9765, and 9720A. Size 60'.

Palm Tree:

The stars of this Tupi Guarani asterism are unidentified at this time (Lima and De M. Figueirôa, 2007). They have another asterism nearby, Monkeys (see above), which are eating the fruit.

This asterism "Habens palmam delibutam" ("having a palm tree") is the IAU constellation Cassiopeia. This name is listed in Johann Bayer's *Uranometria* (1603).

Pan:

This Greek asterism "Πάν" ("Pán") or "Ἀιγι-Πᾶν" ("Aigi Pán") is the IAU constellation Capricornus as listed by Eratosthenes (d.194 B.C.E.). Pan was a goat-footed demigod in Greek mythology. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Pan" as a name for Capricornus.

This asterism is the IAU constellation Capricornus.

- Johann Bayer's *Uranometria* (1603) lists "Pan" as a name for Capricornus.
- "Ancient Zodiac of Egypt" in *Hindu Astronomy* by W. Brennand in 1896 labelled this illustration "from the Barberini Museum", which is probably a reference to the 17th century Palazzo Barberini, which is now the Galleria Nazionale d'Arte Antica. This depicts a dog headed man with a staff in his left hand and a leash in his right hand to which is attached a goat headed fish and also gives the name "Hanumat" (see Hanumat, above). A dog or jackal headed figure is used in Egyptian hieroglyphics to represent their God Anubis, which they related to the stars of Canis Major, not Capricornus. There was no Hanumat in Egyptian mythology. Eratosthenes (d.194 B.C.E.) used the name Pan for Capricornus (see Pan above) and another Greek name for this constellation was Egipan (see above) which is a part human part goat rural deity. Brennan attributes this name for this constellation to the 5th century Roman Macrobius Ambrosius Theodosius, who believed that the Egyptians created the signs of the zodiac and that they were later adopted by the Greeks. Brennand writes that "Capricorn was Mendes, the Egyptian Pan". Mendes is the name of a city in Egypt and not the name of any Egyptian deity. The Egyptian god Set is depicted as a red beast with cloven hooves and a forked tail, but he is a God of war and chaos later associated with the Christian Devil, not Pan.

This French asterism is the Big Dipper asterism in the IAU constellation Ursa Major (Ottescu 2009) as it resembled a frying pan.

This **telescopic** asterism is in the IAU constellation Sagittarius and is Corder 3617 on the observing list of American astronomer Jeffrey Corder. Size 20'. This is six 7th – 9th magnitude stars including HIP 91558 and 91504 and the double star HIP 91607.

Pan of Indus:

This **telescopic** asterism "Pan Índi" is the intermediate spiral galaxy NGC 7038 in the IAU constellation Indus. It was discovered in 1834 by John Herschel who listed it as h 3858 and later as GC 4644 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by

astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “with a little bit of imagination one recognizes the face of the two-horned bearded Greek God Pan”.

Panama Hat:

This **telescopic** asterism is in the IAU constellation Pegasus and is Ennis 85 on the observing list of Canadian astronomer Charles Ennis. Size 70’ X 25’. This is six 6^{th} – 8^{th} magnitude stars. The “brim” is the double star HIP 111974, HD 214892, HIP 112067, Gaia DR3 2732310103243295488, HIP 112275, and HD 215429. The top of the hat is the stars HIP 112253, SAO 108136, HIP 112163 and HD 215042. This includes stars of Corder 4738.

Panauna Graz:

This Kala Lagaw Ya star is Alpha (α) Piscis Austrini in the IAU constellation Piscis Austrinus.

Pancake Galaxy:

This **telescopic** asterism is NGC 2685, a lenticular and polar ring galaxy in the IAU constellation Ursa Major. It is also known as the Helix Galaxy (see above).

Pandora’s Cluster:

This **telescopic** asterism, known as “Pandora’s Cluster” or “Pandora’s Box” is Abell 2744, a group of approximately 500 galaxies in the IAU constellation Sculptor.

Pangolin:

This English asterism “Manis” was created in 1754 by British botanist and natural philosopher John Hill and published in his *Urania: Or a Complete View of the Heavens* and is made up of stars in the IAU constellations Andromeda, Lacerta, and Cygnus: Lambda (λ) Andromedae, Alpha (α) and Beta (β) Lacertae, Pi (π) 1 and 2 Cygni and Rho (ρ) Cygni. Compare this to the asterism Frederick’s Glory (see above).

NOTE: A pangolin is a scaly anteater of the order Pholidota.

Pansy Nebula:

See Crystal Ball Nebula, above.

Panther:

This asterism shows up in the *Astrological Reports to the Kings* of the late Assyrian period (~900 – 600 B.C.E.) as “Nimru” (Hunger 1992, Parpola 1993) and in Babylonian as “MUL.UD.KA.DUA” (Hunger 1992), “UD.KA.DUH.A” (Bartel van der Waerden 1974, Parpola 1993), or “UD.KA.DU.A” (Anthony 1996) and in the *Great Star List* (626 – 539 B.C.E.) of the Neo-Babylonian (Chaldean) period as “mul ud.ka.duh.a” (Koch-Westenholz 1995) and is identified as the constellation Cygnus. Anthony adds “part of Cepheus” and translates the name as “demon with the gaping mouth”.

This Persian (Achaemenid, 539 – 331 B.C.E.) asterism “mu-ka-du-a” as listed in Ernst Weidner’s *Fixsterne* in 1971 and “Nimru” in Franz Boll’s *Ancient Observations of Coloured Stars* in 1918 is made up of stars of the IAU constellations Cepheus and Cygnus.

The later Seleucid version of this asterism is in the IAU constellations Andromeda, Cepheus, Cygnus, and Lacerta:

- The “head” is a triangle of stars: Omicron (ο) 1, Delta (δ) and Theta (θ) Cygni,
- The “body” is another triangle of stars: Omicron (ο) 1, Gamma (γ), and Alpha (α) Cygni (Deneb), and Zeta (ζ) Cephei,
- The back “leg” runs from Zeta (ζ) Cephei through a “knee” at Alpha (α) Lacertae to Lambda (λ) Andromedae, and
- The front “leg” runs from Gamma (γ) Cygni through a “knee” at Epsilon (ε) Cygni to Zeta (ζ) Cygni.

This Arabic asterism “Al Fhad” is the IAU constellation Lupus.

- Johann Bayer’s *Uranometria* (1603) lists “Panthera” and attributes it to 5th century writer Martianus Capella.
- This Roman asterism “Panthera” is the IAU constellation Lupus as described by 5th century writer Martianus Capella.
- The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) lists “Martiano Panthera” as an alternate name for Lupus.
- John Hill lists it as “Phed” in his *Urania* in 1754. Hill lists it as an Arabic name which he translates as “panther”.

Paper Clip of Antlia:

This **telescopic** asterism “Chartivínculum Ántliae” is the intermediate spiral galaxy NGC 3137 in the IAU constellation Antlia. It was discovered in 1837 by John Herschel who listed it as h 3230 and later as GC 2021 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Paperbark Basket:

This Yolgnu asterism is a dark patch in the Milky Way (Clarke 2014). This basket was placed there by a Crow ancestor.

Papillon:

See Butterfly, above.

Papsukkal:

This Chaldean star “dpap.sukkal” is listed in the *Great Star List* (Koch-Westenholz 1995). but the stars have not been identified. Papsukkal was a Mesopotamian attendant to the God Anu and his wife Antu.

Parabola:

This **telescopic** asterism is a tiny arc of four stars of the IAU constellation Antlia discovered by South African astronomer Magda Streicher, including HIP 50103 and 50122. Size 3’.

Parachutist:

This **telescopic** asterism Zürn 1 is in the IAU constellation Perseus. It was discovered by German astronomer Katharina Zürn in the middle of the open cluster NGC 869, which is part of the Double Cluster (see above). Robert Zebahl lists it on his *Faint Fuzzies* website and writes: "In the center of this cluster a small, fine star pattern is visible. Around the 6m5 bright star V520 Per five stars with

magnitudes from 8 mag form a narrow, outward (resp. southeast) curved arc. With some imagination the arc looks like a parachute and V520 Per is the guy hanging from the parachute." Size 1.1' X 0.5'. This is also known as the Laughing Cyclops (see above).

Parallel One:

This Bedouin star "al-Mbarī" (المباري) is Alpha (α) Aurigae (Capella) in the IAU constellation Auriga.

Paramecium Galaxy:

This **telescopic** asterism is the galaxy NGC 7448 (Arp 13, UGC 12294) in the IAU constellation Pegasus. This name was posted on the *Deep Sky Forum* in October 2016 by American astronomer Mark Friedman.

Paramecium of Virgo:

This **telescopic** asterism "Paramécium Vírginis" is the spiral galaxy NGC 4666 in the IAU constellation Virgo. It was discovered in 1784 by William Herschel who listed it as "I 15". It became GC 3198 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). It is also known as the Superwind Galaxy (see below).

Parent of Ursa Major:

This **telescopic** asterism "Párens Úrsae Majóris" is the barred spiral galaxy NGC 3769 (Arp 280) in the IAU constellation Ursa Major. It was discovered in 1788 by William Herschel who listed it as "II 731". It became GC 2471 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as it forms a pair with the smaller NGC 3769A, which "bring to mind a parent and his or her child".

Parents:

This Wichi asterism is two as yet unidentified stars in the IAU constellation Sagittarius (Mariani et al 2017).

Parilicium:

This Latin star "Parilicium" is the is Alpha (α) Tauri (Aldebaran) in the IAU constellation Taurus:

- This star is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch with the alternate name "Parilicium".
- R. H. Allen adds the name "Palilicium" in his *Star Names* in 1899 and attributes it to Pliny the Elder (24 – 79), assigning the names to the entire Hyades cluster. The meaning is uncertain.

Parka Nebula:

See Clown Face Nebula, above.

Parrhasian Stars:

This Latin asterism "Parrhasides Stellae" is the IAU constellation Ursa Major and is a reference to a region in southern Arcadia. Johann Bayer's *Uranometria* (1603) lists "Parrhasis" as a name Ursa Major.

Parrhasian Yoke:

This Latin asterism “Parrhasium Jugum” is the Big Dipper asterism in the IAU constellation Ursa Major as listed by Roman poet Marcus Valerius Martialis (b. 40 C.E.) and R. H. Allen in his *Star Names* in 1899. The name is a reference to a region in southern Arcadia. Compare this to his asterism Threshing Oxen, above.

Parrot:

This Carib asterism “Kurewakoyuman” or “Kurewako” represents the parrot (Psittasidae) and rises in February or March when the young parrots are big enough to leave their nests. It is supposed to represent a male and female parrot side by side, but its present location is unknown (Magaña, and Jara, 1982).

Parrot Fish:

This Kiribati asterism “Inai” or “te itua n inai” is the belt of Orion in the IAU constellation Orion (Trussel and Groves 1978).

Parrot Nebula:

This **telescopic** asterism is reflection nebula NGC 2327 in the IAU constellation Canis Major. This was discovered by English astronomer William Herschel in 1785 who listed it as “IV 25” in his catalogue. It is GC 1487 in the *General Catalogue* of 1864.

Parrot’s Head Nebula:

This **telescopic** asterism is dark nebula Barnard 87 in the IAU constellation Sagittarius.

Part of the Horse:

This Arabic star “Qiṭʿat al-Faras” (قطعة الفرس) or “Juz' Min Alhisan” (جزء من الحصان) is Alpha (α) Equulei in the IAU constellation Equuleus:

- “Qut’at al-Faras” is listed by Persian astronomer 'Abd al-Rahman al-Sufi (903 – 986) as a name for Equuleus in his *Book of the Fixed Stars* in 964 (Hafez 2010).
- This was later latinized to “Kitalpha”.
- Ptolemy’s original constellation Equuleus was Bust of a Horse (see above).
- Italian astronomer Giovanni Battista Riccioli (1598 – 1671) lists “Elmac Alcheras”.
- American uranographer Elijah Burritt (1794 – 1838) listed it as “Kitel Phard”.
- German uranographer Adolf Stieler (1775 – 1836) listed “Kitalphar”.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “’Kit ‘at al-faras, a portion of the horse” and “Kitalpha”.
- R. H. Allen lists “Al Kiṭʿah al Faras” in his *Star Names* in 1899 and interprets this as the name of the entire constellation.
- John Chilmead (1899) lists it as “Kataat Alfaras”, which he derived from Robert Hues’ *A Learned Treatise of Globes* in 1659.
- The IAU approved the name Kitalpha for Alpha (α) Equulei A.

Partridge:

This Arabic asterism “Al Kaṭāt” is the IAU constellation Cygnus as described by 'Abd al-Rahman al-Sufi (903 – 986):

- John Hill gives it the “Arabic” name Katha in his *Urania* in 1754.
- English Admiral Henry William Smyth’s *Bedford Catalogue* in 1844 lists “Kaetha” or “Kata” for this constellation and translates this as “waterfowl”.
- “Al Katat” is listed by R. H. Allen in his *Star Names* in 1899. Allen describes this bird as “perhaps the mottled partridge”.

Partridge Cross:

This Quechua (Chumbivilcas) asterism “Yutucruz” is the IAU constellation Crux (Urton 1980 & 1981). It is probably called this as it is next to their asterism “Yutu” (see Tinamou, below), which represents a ground partridge.

Party:

This asterism is the IAU constellation Gemini as renamed by the Unitarian Universalist Hysterical Society in 2024 on their Facebook page.

Party Balloon:

This **telescopic** asterism is made up of eight 5th to 8th magnitude stars in the IAU constellation Cassiopeia 40 arcminutes northwest of open cluster Messier 52:

- Five 5th to 6th magnitude stars with some dimmer stars form the “Balloon”: 4 Cassiopeiae, HIP 115218, HIP 115245, HIP 115141 and HIP 114904A, and
- A line of stars forms the “string”, including HIP 114307, 114070, 113947, and 113793.

This is also known as the “Airplane” (see above) and Arrow Cluster (see above). Jeffrey Corder lists this as Corder 4879 and attributes the name “Party Balloon” to John Chiravalle.

Parumleo:

See Little Lion, above.

Paschal Lamb:

This German asterism is the IAU constellation Canis Minor and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the “pagan” names of constellations with Biblical and early Christian figures. This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as “Agnus Paschalis”. The Paschal Lamb is listed in Edward Sherburne’s Sphere of Marcus Manilius in 1675 and in John Hill’s *Urania* in 1754.

Pašoglàvi:

This Chakavian asterism is the IAU constellations Canis Minor and Canis Major.

Passenger Pidgeon:

This Mi’kmaq star “Ples” is Gamma (γ) Boötis (Seginus) in the IAU constellation Boötes. It is part of their asterism Muin and the Seven Hunters (see above).

Pataecus:

This Greek asterism “Pataecus” or “Epipataecus” is the IAU constellation Hercules and is listed in R. H. Allen’s *Star Names* in 1899.

Patari-rangi:

This Māori asterism is the Large Magellanic Cloud (Orchiston 2017).

Patari-kaihau:

This Māori asterism is the Small Magellanic Cloud (Orchiston 2017).

Patch of Fish:

This Latin star “Commissura Piscium” is Alpha (α) Piscium (Alrescha) in the IAU constellation Pisces as listed by Pliny the Elder (23 – 79 C.E.) in his *Naturalis Historia*.

Patchy of Coma Berenices:

This **telescopic** asterism “Respérsus Cómae Bereníces” is the barred spiral galaxy NGC 4571 in the IAU constellation Coma Berenices. This was discovered by English astronomer William Herschel in 1784: He originally thought he was looking at Messier 91: He listed it as “III 602”. John Herschel listed it as h 1364 and later as GC 3112 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of “the patchiness of this galaxy”.

Path of Three:

This Anutan asterism “Ara Toru” is the three stars of Orion’s belt in the IAU constellation Orion.

Patriarchal Clan:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is a line of two stars in the IAU constellation Ophiuchus: 72 Ophiuchi (the determinative star) and 71 Ophiuchi.

This Chinese xing guan “Zōng” (宗) is a line of two stars in the IAU constellation Hercules: 110 and 111 Herculis.

This Chinese Chenzhuo xing guan “Zōng” is two stars in the IAU constellation Ophiuchus: 71 and 72 Ophiuchi.

Patriarchal Clan of the Empress Consort:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Shaomin” is the star Rho (ρ) Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

This Chinese Chenzhuo xing guan “Shaomin” is the star Rho (ρ) Leonis in the IAU constellation Leo.

Patriarchal Clan of the Empress Dowager:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty “Damin” is the star Omicron (ο) Leonis in the IAU constellation Leo and is part of their asterism Xuanyuan (see below).

This Chinese Chenzhuo xing guan “Taimin” is the star Omicron (ο) Leonis in the IAU constellation Leo.

Patrick Starfish:

See Starfish (below).

Paul:

This German asterism "Paul" or "Saint Paul the Apostle" is the IAU constellation Perseus and appears in the star atlas *Coelum Stellatum Christianum* by German uranographer Julius Schiller (c. 1580 – 1627) who replaced the "pagan" names of constellations with Biblical and early Christian figures (Stevenson 1921). This is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 as "S. Paulus Al Perseus". Edward Sherburne lists this in his *Sphere of Marcus Manilius* in 1675. John Hill lists it in his *Urania* in 1754, and R. H. Allen also lists it in his *Star Names* in 1899.

Paul and the Viper:

This German asterism is the IAU constellations Ophiuchus and Serpens as listed by German astronomer Wilhelm Schickard (1592 – 1635) and as listed by Italian humanist and poet Ambrogio Fracco, also known as Novidius (1480 - ?). This asterism "Paulus cum vipera" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and attributed to Schickard. Edward Sherburne lists it in his Sphere of Marcus Manilius as "Saint Paul and the Viper", and John Hill lists "Paul and the Viper" in his *Urania* in 1754, as does R. H. Allen in his *Star Names* in 1899. English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "St. Paul and the Maltese viper".

Paulus:

This German asterism "Paulus" is the IAU constellation Ophiuchus as listed in the charts of the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

Pavo:

The brightest star in Pavo is 3rd magnitude Alpha (α) Pavonis which is the 44th brightest star on the list of 90 brightest stars. It is known to the Italians as "Pavone". The stars of this constellation only show up in 63 asterisms in this handbook.

This IAU constellation "the Peacock" (IAU abbreviation Pav) was created by Flemish astronomer Petrus Plancius (1552 - 1622) in 1598 from observations of Dutch uranographer Peiter Dirkszoon Keyser (1540 – 1596) and Dutch navigator Frederick de Houtman (1571 – 1627). It originally appeared under its Dutch names, "De Pauw" ("the peacock") but was latinized to the current name. Dutch historian Paulus Merula (1558 – 1607) lists it as "Pavus".

Flemish cartographer Jodocus Hondius (1563 – 1612) included it on his globes between 1598 – 1603 as both "Pau" and "Pavo".

Dutch uranographer Willem Blaeu (1571 – 1638) listed it as Pavo in 1603 as a peacock.

German uranographer Johann Bayer (1572 – 1603) depicts "Pavo" in his *Uranometria* in 1603.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts "Pauo" as a peacock facing to our right.

"Pavo" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the name "Pavo" for this constellation.

"Pavo" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as a peacock.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Pavo" as a peacock walking to our right.

Pavo is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Pavo as a peacock.

Edward Sherburne lists it in his *Sphere of Marcus Manilius* in 1675.

Pavo is listed by English astronomer Edmond Halley in his *Catalogus Stellarum Australium* in 1679.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Pavo" as a peacock walking to our right. Hevelius' *Firmamentum Sobiescianum sive Uranographia* (1690) depicts "Pavo" as a peacock and it consists of these star lines:

- Its "head" is the star Alpha (α) Pavonis (Peacock),
- Its "neck" runs from Alpha (α) Pavonis to a bend at Gamma (γ) Pavonis and then through Beta (β) Pavonis to Delta (δ) Pavonis,
- Its "body" is a line from Delta (δ) Pavonis to Kappa (κ) Pavonis,
- Its "legs" is a line from Delta (δ) Pavonis to Epsilon (ε) Pavonis, and
- The "tail" is a series of lines running out from Kappa (κ) Pavonis to five stars to form a fan-shaped series of triangles, these five stars being Zeta (ζ), Eta (η), Pi (π), Xi (ξ), and Lambda (λ) Pavonis.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli depicts Pavo as a peacock facing to our right.

Dutch uranographer Carel Allard's *Planisphaerii Coelestis Hemisphaerium Meridionale* (1709) depicts "Pavo" as a peacock.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley's pirated catalogue of Flamsteed's observations of 1712, depicts Pavo as a bird of paradise.

Pavo is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts "Pavo" as a peacock facing to the left.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Pavo as a peacock.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Pavo as a peacock walking to our left.

French astronomer Abbé Nicolas Louis de Lacaille's *Planisphère des Étoiles Ausralea* (1756) depicts "la Paon" as a peacock.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Le Paon" as a peacock.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts "Pavo" as a peacock walking to our left.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts "Pavo" as a peacock facing right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "le Paon" as a peacock, as does the 1778 edition.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Pfau" and depicts it as a peacock.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Pavo" as a peacock.

Pavo is listed in the *Planisphaerum Colestum* (1798) of Dutch uranographer Gerard Hulst van Keulen (1733 – 1801) as "Paauw": It is depicted as a peacock.

American uranographer William Croswell (1760 – 1834) depicts "Pavo the Peacock" on his *Mercator Map of the Starry Heavens* in 1810 as a peacock.

Scottish uranographer Alexander Jamieson (1782 – 1850) Lists "Pavo" in his *Celestial Atlas* in 1822.

American uranographer Elijah Burritt's *Southern Circumpolar Map for each Month in the Year* (1835) depicts "Pavo the Peacock" as a peacock walking.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Pavo" as a peacock riding to our right.

Popular Astronomy (1884, revised by Mabel Loomis Todd 1899) by American educator Joel Dorman Steele (1836 – 1886) lists this constellation on the charts simply as "Peacock".

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Pavo, The Peacock" as an official constellation "recognized in the catalogue of the British Association".

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Pavo" and describes it as a "Peacock", incorrectly attributing it to Bayer.

Pavo is depicted on standard IAU charts as follows:

- His "head" is the triangle of stars Lambda (λ) Pavonis, Xi (ξ) Pavonis, and Pi (π) Pavonis, with a line running from Pi (π) Pavonis to Eta (η) Pavonis becoming the "beak" and a line from Lambda (λ) Pavonis to Kappa (κ) Pavonis the "neck",
- His "body" is the quadrilateral of the stars Kappa (κ), Zeta (ζ), Epsilon (ε), and Delta (δ) Pavonis, and
- His "tail" is the triangle made up of the stars Delta (δ) Pavonis, Beta (β) Pavonis, Gamma (γ) Pavonis, and Alpha (α) Pavonis (Peacock).

Czech astronomers Horovka Hlad and Weiselová Polechová (1988) depict Pavo in their *Hvězdná obloha 2000.0. Praha: Geodetický a kartografický podnik* as a roughly oval shape of the stars Beta (β), Delta (δ), Lambda (λ), Xi (ξ), Eta (η), Zeta (ζ), and Epsilon (ε) Pavonis with two lines running out from Beta (β) Pavonis:

- One to Alpha (α) Pavonis (Peacock), and
- One to Gamma (γ) Pavonis.

Sky and Telescope Magazine, founded in 1941, depicts Pavo in their magazine and publications with the central star Delta () Pavonis from which the following lines emerge:

- From Delta (δ) Pavonis a triangle extends through Beta (β) Pavonis, Gamma (γ) Pavonis, and Alpha (α) Pavonis (Peacock),
- One line runs to Epsilon (ε) Pavonis,
- One line runs to Zeta (ζ) Pavonis,
- A pentagonal shape includes the stars Delta (δ) Pavonis through Lamba (λ), Xi (ξ), Pi (π), and Kappa ()κ Pavonis with a single line running from Pi (π) Pavonis to Eta (η) Pavonis.

Pax:

This Latin asterism "Pax" is the IAU constellation Virgo. Pax was the Roman Goddess of peace.

- Johann Bayer's *Uranometria* (1603) lists "Pax" as a name for Virgo.
- "Pax" appears as an alternate name for Virgo on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638).
- "Pax" is listed as a name for Virgo in R. H. Allen's *Star Names* in 1899.

Pazmino's Cluster:

This **telescopic** asterism is open cluster is St 23 in the IAU constellation Camelopardalis. It is named for American astronomer John Pazmino who wrote about it in *Sky and Telescope* in March 1978. Size 15' X 15'.

Pea Pods:

This Estonian asterism "Erne Kahlad" or "Hernekahlud" ("pea pods" or "bunch of peas") is stars of the IAU constellations Canes Venatici and Coma Berenices and appears in the *Sky of Ests (Chudes)* by Aleksander Heintalu (Sass of Vigala) (Kuperjanov 2006).

Peace:

This **telescopic** Sinhalese star "Sāmaya" is HIP 106824 (HD 205739) in the IAU constellation Piscis Austrinus (magnitude 8.54). It was given this name in the IAU NameExoWorlds campaign. It has an exoplanet named Samagiya ("togetherness").

This **telescopic** Lithuanian star "Taika" is HAT-P-40 in the IAU constellation Lacerta (magnitude 11.7). It received this name in the IAU NameExoWorlds Campaign. It has an exoplanet named Vytis, which is the symbol of the Lithuanian coat of arms.

Peach of Eridanus:

This **telescopic** asterism "Pérsica Erídani" is the elliptical galaxy IC 2006 in the IAU constellation Eridanus. It was discovered by Lewis Swift in 1897. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "with its round form and reddish colour… it has the outward appearance of a peach."

Peacock:

This Kolam asterism "Namli" is made up of stars of the IAU constellations Centaurus and Circinus (Vahia 2014). The Kolam used the brightness of these stars, each of which represented a different animal, to determine the intensity of the approaching monsoon. The animals included a peacock, a buffalo, a frog, a deer, a horse, and in some regions, a pig.

This Dutch asterism "De Pauww" is the IAU constellation Pavo. This is the original name for this constellation (see Pavo, above).

There are two English asterisms by this name:

- One is the IAU constellation Pavo as listed in Robert Hues' *A Learned Treatise of Globes* in 1659.
- One is the star Alpha (α) Pavonis in the IAU constellation Pavo. This name was assigned to the star by HM Nautical Almanac Office in the late 1930s during the creation of *The Air Almanac* for the Royal Air Force. The IAU approved the name Peacock for Alpha (α) Pavonis Aa.

One Roman zodiac lists the IAU constellation Aquarius as a Peacock, a symbol of the Goddess Juno. The sun was in this sign in January and February which was their month Gamelion, which was sacred to her.

Peacock Fan:

This **telescopic** asterism is in the IAU constellation Pavo. It is Lorenzin 11 on Tom Lorenzin's list. The base of the fan is Pi (π) Pavonis, and the edge of the fan is the line of stars starting at HIP 89200 and running through SAO 254166, SAO 254171, HIP 89258, to Gaia 6630643289792352512.

Peacock Head of Pegasus:

This **telescopic** asterism "Taónius Pégasi" is the spiral galaxy UGC 12812 (Markarian 331) in the IAU constellation Pegasus. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this as "the blue colour… and slender shape make this galaxy look like the neck and head of a peacock".

Peacocks:

This Latin asterism "Duo Pavones" or "Pavones" is the IAU constellation Gemini as listed in John Hill's *Urania* in 1754 and Hill claims that this is "one of the Arabian constellations". English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 and R. H. Allen in his *Star Names* in 1899 both list this as an Arabic asterism. NOTE: The stars of Gemini were part of the Arabic asterism Lion (see Extended Forearm, above). The Arabs did not have a Peacock asterism.

Peafowl:

This Chinese xing guan "Kǒngquè" (孔雀) is the IAU constellation Pavo.

Peanut Nebula:

This **telescopic** asterism is planetary nebula NGC 2371-2 in the IAU constellation Gemini. It was discovered by English astronomer William Herschel in 1785, who described it as "Two. Sp-nf, distance 1', chevelure mixed. Both faint, small, equal, having a nucleus". Herschel listed it as "II 316 and II 317" in his catalogue. It is GC 1519 and 1520 in the *General Catalogue* of 1864. It seemed to English astronomer John Louis Emil Dreyer (1852 – 1926) to be two objects and so was entered as NGC 2371 and 2372 in the *New General Catalogue*. It is actually a single planetary nebula. It is also known as the Double Bubble Nebula, the Ant Nebula, the Mini Dumbbell, the Doughnut (Cut in Half), a Figure Eight, or the Gemini Nebula. Size 1' X 1'. NOTE: The Double Bubble name is a reference to the "Dubble Bubble" gum created in 1928 by the Fleer Candy Company which featured a comic strip featuring the brothers Dub and Bub (replaced in 1950 by Pud). If this is the case, then the name "Double Bubble" for this nebula can't predate this.

Pear:

This English asterism is the intermediate spiral galaxy Messier 106 (NGC 4258) in the IAU constellation Canes Venatici. It was discovered by French astronomer Pierre Méchain in 1781. English astronomer William Herschel listed it as "V 43". It is GC 2841 in the *General Catalogue* of 1864. In the 14th edition of British schoolmaster Arthur P. Norton's *A Star Atlas* (1959), Norton describes this as "pear shaped". It is also known as the "Splendid One of Canes Venatici" (see below).

Pearce's Star:

This **telescopic** double, rotating variable star is AO Cassiopeiae (HIP 1415, HD 1337) in the IAU constellation Cassiopeia (magnitude 6.14). This is an eclipsing binary star system named for Canadian astrophysicist Joseph Algernon Pearce (1893 – 1988).

Pearl:

See Bright One, above.

Pearl Bearer of Ursa Major:

This **telescopic** asterism "Margarítifer Úrsae Majóris" is the edge-on barred spiral galaxy NGC 4013 in the IAU constellation Ursa Major. William Herschel listed this as "II 733". John Herschel listed it as h 1041 and later as GC 2652 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "the pearl… is the foreground star, located on the dust lane of this shell-shaped galaxy".

Pearl Cluster:

There are two **telescopic** "Pearl Cluster" asterisms:

- One is the open cluster NGC 3766 (Caldwell 97) in the IAU constellation Centaurus. It was discovered by French astronomer Nicolas Louis de Lacaille in 1751-2 who listed it as "III 7" in his catalogue. It is GC 2468 in the *General Catalogue* of 1864. It is also known as the Rich Man's Jewel Box, "B", the Eye, and Hilda's Cluster. South African astronomer Carol Botha (2007) notes that the central star "is commonly seen as a pearl, hence the name Pearl Cluster".
- One is the open cluster NGC 2244 in the Rosette Nebula (Caldwell 49) in the IAU constellation Monoceros. English astronomer William Herschel discovered this open cluster (NGC 2244) in 1784 and listed it as "VII 2" in his catalogue, and it is listed as GC 1424 in the *General Catalogue* of 1864. It is also known as the Satellite Cluster, and the Harp Cluster. *1001 Wonders as*

Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists the name "Pearl Cluster". This is also known as Girl With a Ponytail.

Pearl Necklace:

This **telescopic** asterism is Arp 322 (PGC 35609), a group of interacting galaxies in the IAU constellation Ursa Major.

Pearl of Coma Berenices:

This **telescopic** asterism "Margarita Cómae Bereníces" is the lenticular galaxy NGC 4203 in the IAU constellation Coma Berenices. It was discovered in 1787 by William Herschel who listed it as "I 175". It became GC 2796 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010). They called it this because of "the almost perfect round shape".

Pearl of the Crown:

This Latin star "Margarita Coronae" Alpha (α) Coronae Borealis (Alphecca) in the IAU constellation Corona Borealis.

Pearls:

There are two Arabic asterisms with the name "al-ʿuqūd", later latinized to "Al Ukud":

- One is the stars Alpha (α) Delphini (Sualocin), Beta (β) Delphini (Rotanev), Gamma (γ) Delphini, and Delta (δ) Delphini in the IAU constellation Delphinus.
- One is the star Delta (δ) Delphini in the IAU constellation Delphinus.

Pearls on Ladies' Wear:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty"Lízhū" (离珠) is a bent line of stars in the IAU constellations Aquila and Aquarius: 1 Aquarii and 68, 69, 70, and 71 Aquilae (this last star being the determinative star).

This Chinese xing guan "Lízhū" (离珠) is a bent line of stars in the IAU constellations Aquila and Aquarius: 1 Aquarii and 69, 70, and 71 Aquilae.

This Chinese Chenzhuo xing guan "Lízhū" is a bent line of five stars in the IAU constellation Aquarius and Aquila: 1 Aquarii, 71 Aquilae, 70 Aquilae, HIP 102561, and HIP 102770.

Peasant:

This Chinese xing guan from the Three Kingdoms to the Ming Dynasty is the star HIP 900763A in the IAU constellation Sagittarius.

This Chinese xing guan "Nóngzhàngrén" (农丈人) is the star HIP 91918 in the IAU constellation Corona Australis.

This Chinese Chenzhuo xing guan "Nongzhangren" is the star HIP 90763 in the IAU constellation Sagittarius.

Pebble of Pavo:

This **telescopic** asterism “Lapíllus Pavónis” is the irregular galaxy IC 4662 in the IAU constellation Pavo. It was discovered by Robert T. A. Innes in 1901. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Peccary:

This postclassic Mayan asterism from the Paris Codex is the IAU constellation Leo.

This Lacandón asterism “Puerco de la Montaña” or “Kitam” or “Kitan” is the belt of Orion in the IAU constellation Orion (Milbrath 1999). The sword of Orion is their piglets.

NOTE: The Mayan word “Ac” in early dictionaries is applied to both the turtle and the peccary, which leads to some confusion.

Peccaries:

This Mayan asterism is made up of two stars from the IAU constellation Gemini: Alpha (α) Geminorum (Castor) and Beta (β) Geminorum (Pollux). These two stars were also called the Two Brilliant Ones (see below). These are depicted on a ceiling at Bonampak, the Nunnery Façade at Chichén Itzá and the West Court at Palenque.

Peek a Boo Galaxy:

This telescopic asterism is the irregular blue compact dwarf galaxy HIPASS J1131-31 (PGC 5060432) in the IAU constellation Hydra. It was discovered by German astronomer Bärbel Silvia Koribalski at Australia’s Telescope National Facility (ATNF). It got this name as it was hidden behind a relatively fast-moving foreground star (TYC 7215-199-1).

Peek a Boo Nebula:

This **telescopic** asterism is the planetary nebula NGC 7048 in the IAU constellation Cygnus. It was discovered by French astronomer Édouard Stephan in 1878. It is also described as a “Y” (see below).

Peg:

This Sasanian star “Mex ī Gāh” is Alpha (α) Ursae Minoris (Polaris) in the IAU constellation Ursa Minor (Panaino 1999).

Peg of Pavo:

This **telescopic** asterism “Pássalus Pavónis” is the edge-on barred spiral galaxy IC 5052 in the IAU constellation Pavo. It was discovered by DeLisle Stewart in 1900. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because “the open spiral arms make this galaxy look like a rotating fountain.”

Pegasus:

The stars of Pegasus show up in 324 of the sky cultures listed in this handbook.

The IAU constellation Pegasus for which this asterism is named (IAU abbreviation Peg) is one of Ptolemy’s 48 original constellations: Ptolemy (c.100 – c.170) called it “΄Ιππος” (“΄Ippos”) in his *Almagest* (see Horse, above) and mentioned that it had wings. Aratus (315 – 240 B.C.E) called it the “divine horse” and Eratosthenes (d.194 B.C.E.) listed it as “Πήγασος” (“Pígasos”): Robert Burnham (1978) suggests that this comes from “’Pegae’, the ‘Springs of the Ocean’ in the place of his birth”. Geminus of Rhodes (1st

century B.C.E.) described it as the "fore part of a horse according to Hipparchus". It was often referred to in the earliest texts as cut in two or incomplete with adjectives such as "Dimidiatus" ("halved") and 5th century Greek poet Nonnus referred to it as the "half visible Libyan horse". Danish astronomer Tycho Brahe described it as "Equi Sectio" ("horse's section"). There are at least two Greek myths relating to this winged horse. Adjectives attached to the name included "Gorgoneus" and "Medusaeus", both references to the Greek myth that described this horse being created from the blood of Medusa: Johann Bayer's *Uranometria* (1603) lists "Gorgoneus" and "Medusaeus".

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts Pegasus as a horse with no wings, which indicates the influence of the Catasterismes of Eratosthenes.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts the front half of a winged Pegasus.

The globe of the 2nd century Farnese Atlas depicts "Pegasus" as the front half of a winged horse (Stevenson 1921).

Pegasus appears in the Leiden *Aratea* (816) as the front half of a winged horse flying to our right.

This constellation appears in the *Revised Aratus Latinus*:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C. 6) Pegasus is depicted as the front half of a winged horse,
- In the Munich 560 edition the rear end of the horse is tapered,
- In the Vat Reg lat 1342 edition Pegasus has his front legs crossed.

The *De ordine ac positione stellarum in signis* ("*On the order and position of the stars in the signs*") in the Salzburg compilation (810 – 818) of Abbot Arno of Salzburg (785 – 821) lists Pegasus as "Equus".

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts the front half of a winged horse. One page shows a right profile and the other a left profile.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts Pegasus as the front half of a winged horse flying to our right.

The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of the 11th century *De signis caeli* list "Pegasus" and "Equus" and depict the front half of a horse flying to the right. The Paris BN 5543 manuscript shows wings, the Paris 5239 manuscript replaces the wings with two parallel lines, and the Vat lat 643, Klosterneuberg 685 and Zwettl 296 manuscripts the wings have disappeared and the horse is eating out of a bowl. The Durham Hunter 100 manuscript of *De signis caeli* depicts "Equus" flying to the right out of an aureole.

The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of the 11th century *De signis caeli ("of the signs of heaven*") depict Pegasus as a winged horse moving to the left while looking back over his right shoulder: The first two editions show half a horse but in the Venice edition someone has added the rear of the horse.

The Doha manuscript (1125) of al-Sufi's *Book of Fixed Stars* depicts Pegasus as the front half of a winged horse. The horse is bridled and has reins.

An Islamic celestial globe dated 1275-76 in the British Museum depicts Pegasus as the front half of a winged horse flying to our right.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Pegasus as the front half of a winged horse flying to our right.

14th century Greek geographer and astronomer Georgius Chrysococcas gave the Greek name "Πήγασος" ("Pigasos") to the star Gamma (γ) Pegasi.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Pegasus as the front half of a winged horse flying to our left.

The mid 15th century Wein, Osesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts this as the front half of a winged horse flying to our right. The label is hard to make out but appears to read "Equus Volans".

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Pegasus as a winged four-legged animal facing to our right. It is not labelled and poorly drawn, looking more like a winged cow than a horse. Its rear legs are overlapped by Andromeda.

The *Germanicus Aratea* (Siciliensis, c. 1469) and the *Germanicus Aratea* with scholia Strozziana (c. 1475) depict Pegasus as the front half of a winged horse flying to our right.

The 15th century *Alfonsine Tables* added the adjective "Alatus" ("winged"). The 1551 edition of the *Almagest* listed it as "Equus Pegasus" ("the horse Pegasus"), which in the 17th century became "Pegasus Equus Alatus" ("winged horse Pegasus"). German uranographers Albrecht Dürer, Conrad Heinvogel and Johann Stabius depicted this constellation on their 1515 map as the front part of a winged horse emerging from a cloudy ring.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Pegasus as the front half of a winged horse flying to our right. It is not labelled.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Pegasus as a complete horse with wings on its back and on its feet, galloping to our left.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This labels the constellation "Equus" and depicts it as the front half of a winged horse emerging from a cloud.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) labels this constellation "EQV(VS) Z […] ALAT(VS)" and depicts it as the front half of a winged horse.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Pegasus as the front half of a winged horse flying to our right. It is not labelled. The Real Academia de Historia manuscript D-97, f.104v – 105r depicts it facing to our left.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, labels this "Equus Pegasus" and depicts it as the front half of a winged horse flying to our right.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* (“images of the northern sky with twelve images of the zodiac”), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius labels this “Pegasus” and depicts it as the front half of a winged horse flying to our right emerging from a cloud.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts Pegasus as the front half of a winged horse.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts Pegasus as the front half of a winged horse with harness. It is galloping to our left.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Pegasus in the same manner as Dürer et al.

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515 LIST “Equus Pegasus”, but those from 1534 and 1535 simply list “Pegasus” (Dekker & Lippincott, 1999). Celestial globe gores (1517) of Schöner depicts “Equus Pegasus” as the front half of a winged horse flying to our right.

The celestial globe depicted in Hans Holbein’s *Double Portrait of Jean de Dinteville, the Bailly of Troyes, and Georges de Selve, Bishop of Lavaux* (more commonly known as “*The Ambassadors*”) from 1533 lists “EQVVS PEGASVS” (Dekker & Lippincott, 1999). A celestial globe atop a planetary clock modified by Oronce Fine in 1553 (the “Paris Globe”) lists “EQVVS PEGASVS” (Dekker & Lippincott, 1999).

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts “Pegasus” as the front half of a winged horse emerging from a cloud to our left.

Dele Stelle Fisse (“Of the Fixed Stars”) by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as “Del cavallo alato” (“the winged horse”). The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus both as the “Winged Horse” and as ”Pegasus”.

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Pegasus as the front half of a winged horse flying to our right out of a cloud.

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists this constellation as “Equus Alatus, sev Pegasus” in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts “Pegasus” as the front half of a winged horse emerging from a cloud.

In his *Theatrum Mundi, et Temporis* (1588) Giovanni Paolo Gallucci (1538 – 1621) depicted “Equus alatus seu Pegasus” as the front half of a winged horse facing to our right.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts “Pegase” as the front half of a winged horse emerging to our left from a cloud.

The *Orbis terrarium typus de integro multis in locis emedatus* (1594) of Flemish astronomer Petrus Plancius depicts “Pegasus” as the front half of a winged horse flying to our right out of a cloud.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts “Pegasus” as the front half of a winged horse emerging from a cloud to our right.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) labels Pegasus “Equus” and depicts it as the front half of a winged horse facing to our right emerging from a cloud.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Pegasus as the front half of a winged horse emerging from clouds.

Danish astronomer Tycho Brahe’s *Astronomiae Instauratae Progymnasmata* (1602) lists this constellation as “Pegasus, Equus Alatus”.

German Uranographer Johann Bayer (1572 – 1625) depicts it in the charts in his *Uranometria* in 1603 as the front half of a winged horse emerging from a cloud. Bayer lists these names for Pegasus in the *Uranometria*: “Gorgoneus, Medusaeus, Equus, Equus Major, Equus Secundus, Equus Posterior, Equus Volans, Equus Aerus, Equus Dimidiatus, Sagmarius Caballus, Menalippe, Theano, Alpheras, Bellerophon, Bellerophontes”.

The *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) depicts “Pegasus” as the front half of a winged horse emerging from a cloud.

“Pegasus” is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as the front half of a winged horse emerging from a cloud flying to the left.

Giovanni Paolo Gallucci’s *Theatrum Mundi, et Temporis* (1614) labels this constellation “Pegaso o Equus Allatus” (“Equus or Winged Equus”) and depicts it as the front half of a winged horse galloping to our right.

The *Tabulae Rudolphinae* (1627) of Johannes Kepler (1571 – 1630) lists the names “Pegasus” and “Equus Alatus”.

The *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) depicts Pegasus as the front half of a winged horse emerging from a cloud, heading to our left. NOTE: This is not labelled, but Equuleus next to this constellation is labelled “Equus Minor”.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts “Pegasus” as the front half of a winged horse.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world’s first planetariums, depicts Pegasus as the front half of a winged horse flying to our left and emerging from a cloud.

Pegasus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as the front half of a winged horse.

Dutch cartographer Frederik de Wit’s *Planisphaerium Coeleste* (1670) depicts Pegasus as the front half of a white winged horse emerging from a cloud: This horse has multi coloured feathers.

German poet Philipp von Zesen (1619 – 1689) named it “Pegasides”.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts Pegasus as the front half of a winged horse emerging from a cloud.

English uranographer John Seller’s *A coelestiall planisphere* (1678) depicts “Pegasus” as the front half of a winged horse emerging from a cloud.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts “Pegasus” as the front half of a winged horse.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this “Pegase”, “Pegasus” and “΄Ιππος” and depicts it as the front half of a winged horse flying to our right.

French astronomer Jérôme Lalande (1732 – 1807) added the adjective “Ephippiatus” (“caparisoned”), and others added “Cornipes” (“horn footed”), “Volans” (“flying”), “Aëreus” (“airy”), and “Sonipes” or “Sonipes Ales” (“noisy footed”).

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts “Pegasus” as the front half of a winged horse flying to the right.

The 1721/22 planispheres of English uranographer John Senex (1678 – 1740), who was using Edmond Halley’s pirated catalogue of Flamsteed’s observations of 1712, depicts Pegasus as the front half of a winged horse.

Pegasus is listed in English astronomer John Flamsteed’s *Atlas Coelestis* in 1729: It is depicted as the front half of a winged horse.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depics “Pegasus” as the front half of a winged horse flying to our left.

The *Atlas Coelestis* of German astronomer Johann Gabriel Doppelmayr (1742) depicts “Pegasus” as the front half of a winged horse emerging from a cloud to our left.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Pegasus as the front half of a winged horse flying to our left. It is emerging from a cloud.

French uranographer Gabriel Phillipe de la Hire’s *Planisphere Celeste* (1760) depicts “Pegase” as the front half of a winged horse emerging from a cloud.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts “Pegasus” as the front half of a winged horse running to our right.

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts “Pegase” as the front half of a winged horse, as does the 1778 edition.

Johann Elert Bode’s *Vorstellung Der Gestirne* (1782) lists this constellation as “der Pegasus” in the text and “Pegasus“ on the charts, where it is depicted as the front half of a winged horse.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Pegaso" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Pegasus" as the front half of a winged horse emerging from a cloud.

German astronomer Johann Elert Bode's *Nachtrag zu Seiner Unleitung zur Renntnik des Gestrirnten Himmel* (1818 – 1820) lists this constellation as "Pegasus" and depicts it as the front half of a winged horse.

American uranographer William Croswell (1760 – 1834) depicts "Pegasus the Flying Horse" on his *Mercator Map of the Starry Heavens* in 1810 as the front half of a winged horse.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Pegasus it in his *Celestial Atlas* and his *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822): Pegasus is depicted as the front half of a winged horse.

"Pegasus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as the front half of a winged horse emerging from a cloud.

English Admiral Henry William Smyth's *Bedford Catalogue* in 1844 lists "Equus alatus".

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts "Pegasus" as the front half of a winged horse flying to our right.

An Improved Moveable Planisphere (c. 1850) by Jehoshaphat, Aspin and Griffith and James Grant Wyld, depicts "Pegasus" as the front half of a winged horse.

Pegasus is listed in a boxed set of 32 constellation cards called *Urania's Mirror* in 1852: The author is unknown, but it is based on Jamieson's *Celestial Atlas*. Pegasus is depicted as the front half of a winged horse.

"Pegasus" is listed in the *Atlas Coelestis Novus* (1872) of German mathematician and astronomer Eduard Heis (1806 – 1877): It is depicted as the front half of a winged horse.

English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists "Pegasus, The Winged Horse" as an official constellation "recognized in the catalogue of the British Association".

Astronomy With an Opera Glass (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), lists this constellation as "Pegasus, the Winged Horse".

German astronomer Hermann Joseph Klein (1844 – 1914) lists "Pegasus" in his *Star Atlas* (1893).

American astronomer Winslow Upton's *Star Atlas* (1896) lists this constellation as "Pegasus" and describes it as a "Winged horse".

1001 Wonders as Observed with Home Built Instruments, 3rd edition (1931), by American astronomer Charles Howard Barns lists "Pegasus".

American artist and illustrator Hans Augusto Reyersbach (H. A. Rey, 1898-1977), best known for his children's book *Curious George* (1941) radically redesigned the lines of Pegasus in his book *The Stars - A New Way to See Them* (1952). The standard IAU constellation is formed around the Square of Pegasus,

with lines running out from the corners, one being connected to Andromeda. Rey's version eliminates the Square of Pegasus entirely:

- His "body" becomes the quadrilateral of stars Alpha (α) Pegasi (Markab), Lambda (λ) Pegasi, Iota (ι) Pegasi, and Xi (ξ) Pegasi,
- His "wing" is the triangle of stars Markab, Beta (β) Pegasi (Scheat), and Gamma (γ) Pegasi,
- His "head" is a line of stars from Lambda (λ) Pegasi through Mu (μ) and Eta (η) Pegasi to Pi (π) Pegasi,
- Two lines run out from Iota (ι) Pegasi to form "front legs":
    - One to 9 Pegasi,
    - One through Kappa (κ) Pegasi to 1 Pegasi,
- Two lines run out from Zeta (ζ) Pegasi to form "back legs:
    - One to Theta (θ) Pegasi, and
    - One to Epsilon (ε) Pegasi,
- Two lines of stars run out from Markab to form a "tail":
    - One to 55 Pegasi, and
    - One to 59 Pegasi.

Pegasus is known to the French as "Pégase" and to the Italians as "Pegaso".

Pegasus Dwarf:

This **telescopic** asterism is the dwarf galaxy UGC 12613 in the IAU constellation Pegasus. It was discovered by A. G. Wilson in the 1950s. It is also known as the "Foal of Pegasus" (see above).

Pehui-tchat:

This Egyptian decan "Pehui-tchat" was in the IAU constellation Leo. In later Hellenistic texts it was named "ϕογτητ" ("Phu-tet"). In the Testament of Solomon, it became "Soubetti", Aristobulus of Paneas called it "Hayas", in Greek Hermeticism it became "Pahtiti", in Latin Hermeticism "Frich", 4th century Roman astrologer Julius Firmicus Maternus called it "Futile" or "Eisie", Cosmas of Maiuma (d. 760) called it "Sarapis", French scholar Joseph Justus Scaliger (1540 - 1609) called it "Phuonisie", and German Jesuit astronomer Athanasius Kircher (1602 – 1680) called it "ⲛⲉϕⲑⲏ" ("Nephthe"). Variations include "Phatiti". It has been depicted as a wild faced man with one hand up in greeting and one holding a flask.

Peixi Boi:

R. H. Allen lists this as "a dark spot in the sky near Orion" in his *Star Names* in 1899 and that the star Alpha (α) Orionis (which he calls "Betelgeuze") is an old man chasing it. Allen only identifies this as an "Amazon River myth" without naming the precise culture or source.

Peittyn:

This Chukchi asterism "Peittyn" is the stars Alpha (α) Aquilae (Altair) and Gamma (γ) Aquilae (Tarazed) in the IAU constellation Aquila. The rising of this asterism marks the winter solstice and new year.

Peka:

This Polynesian asterism is the IAU constellation Crux.

Pekehawani:

This Māori star is nearby their star Rehua, Alpha (α) Scorpii (Antares) in the IAU constellation Scorpius. Rehua is seen as a bird with one wing broken who mates with Pekehawani or Ruhi-te-rangi (a star close by). The other star close by, Whaka-onge-kai ("she who makes food scarce before the new crops can be harvested") is his other mate. It is not certain precisely which stars these are.

Pelenor:

This Latin asterism is the IAU constellation Centaurus, also known as "Pelethronius". This is a reference to the mountain home of the Centaurs in Thessaly.

Pelethronius:

This Greek asterism "Pelethronius" is the IAU constellation Auriga. Pelethronius was believed by the Greeks to be the inventor of the bridle and saddle.

Pelican:

This Ikoots asterism "Šikip" is the Pleiades cluster in the IAU constellation Taurus.

Pelican Hat:

This **telescopic** asterism is RGS2011 in the IAU constellation Cygnus inside the HII region IC 5070 (see Pelican Nebula, below) . It is listed on Brazillian astronomer Bruno Alessi's BDCC 7.6 list.

Pelican Nebula:

This **telescopic** asterism is HII region IC 5070 (LBN 350, Ced 183c) and IC 5067 (LBN 353, Ced 183a) in the IAU constellation Cygnus near Alpha (α) Cygni (Deneb). This was discovered by English astronomer Reverend Thomas Henry Espinell Compton Espin (1858 – 1934) along with IC 5068.

Pen of Leo:

This **telescopic** asterism "Arátrum Leónis" is the edge on spiral galaxy NGC 3279 (IC 622) in the IAU constellation Leo. It was discovered by American astronomer David Peck Todd in 1878. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010).

Penalty:

This Korean asterism "Paeneolti" (패널티) is a line of three stars in the IAU constellation Scorpius: HIP 79788, 79599, and 79524.

Pencil:

There are two **telescopic** "Pencil" asterisms:

- One, the Pencil Nebula, is NGC 2736 (RCW 35), a part of the Vela Supernova Remnant in the IAU constellation Vela. It was recorded by English astronomer John Herschel in 1835 and listed it as h 3145. It is GC 1745 in the *General Catalogue* of 1864. It is also known as Herschel's Ray (see above). Next to it is an asterism called the "Pincers".
- One is the galaxy NGC 55 (Caldwell 72) in the IAU constellation Sculptor. It was discovered by Scottish astronomer James Dunlop in 1827. It is GC 27 in John Herschel's 1864 *General Catalogue*. John Dreyer describes it in the 1888 *New General Catalogue* as "trinuclear". South

African astronomer Magda Streicher describes its pencil shape in her observations starting in 1997. It is also known as the String of Pearls (see below).

Penguin:

This **telescopic** asterism NGC 2936 (Arp 142) is an elliptical galaxy in the IAU constellation Hydra. It is interacting with the spiral galaxy NGC 2937, which is known as the Egg Galaxy (see above). They were both discovered by German astronomer Albert Marth in 1864, becoming 175 and 176 on his list. It is GC 5497 in the General Catalogue of 1864. It is also known as the Porpoise (see below).

Pentagon:

This Estonian asterism is made up of stars in the IAU constellation Pisces (Kuperjanov 2006): Gamma (γ), Kappa (κ), Lambda (λ), Iota (ι), and Theta (θ) Piscium.

There are three **telescopic** "pentagon" asterisms:

- One is NGC 6776, an elliptical galaxy in the IAU constellation Pavo. This was discovered in 1847 by English astronomer John Herschel who listed it as h 3787 and later as GC 4483 in the *General Catalogue* of 1864.
- One is Sánta 98, listed in 2007 by Hungarian astronomer Sánta Gábor, is a pentagon of six stars of magnitude 8 – 11.5 in the IAU constellation Eridanus.
- One is made up of stars of the IAU constellations Scorpius. *Astronomy With an Opera Glass* (1890) by American Astronomer Garrett P. Serviss (1851 – 1929), describes it this way: "A little close inspection with the naked eye will show three fifth or sixth magnitude stars above Antares and Sigma (σ), which form, with those stars, the figure of an irregular pentagon." He goes on to identify another of these stars as "number 22" and another (incorrectly) as "Rho in Ophiuchus". The pentagon is actually the stars Alpha (α) Scorpii (Antares), Sigma (σ) Scorpii, Omicron (ο) Scorpii, 22 Scorpii, and Rho (ρ) Scorpii.

People in a Boat:

This Wiyot asterism is the Pleiades cluster in the IAU constellation Taurus.

People Sitting Around a Fire:

This Khoikhoi asterism is the IAU constellation Corona Australis (Kemp et al 2022).

People Working:

This Salish asterism Esʔsḱʷúʔuì̀ms ("people working") also known as ƛiyéʔ ("bark canoe"- see above) is the IAU constellation Orion (Pete 2023). The story tells of who were sent into the sky by Blue Jay (Stellers Jay - Qʷásqʷiʔ) to protect them from Storm who sought to drown them:

- The three stars of the belt of Orion asterism are the canoe.
- Alpha (α) Orionis (Betelgeuse), Gamma (γ) Orionis, Kappa (κ) Orionis, Beta (β) Orionis (Rigel), and the sword of Orion asterism are the five young men.

Perch:

This Wardaman star "Narong" or "Ngorrong" is Theta (θ) Tauri in the IAU constellation Taurus as listed by Cairns and Harney in 2003 and one of the stars in their asterism "Little Fishes" (see above).

Peregrine Falcon:

This Perso-Arabic star "aš-šāhīn" (الشاهين) is Beta (β) Aquilae in the IAU constellation Aquila:

- This was later latinized to "Alshain".
- English Admiral Henry William Smyth's *Prolegomena* of 1844 lists "Alshain" and his *Bedford Catalogue* in 1844 lists "al sháhin, the falcon, which, though used as an Arabic word, is Persian".
- English astronomer Richard A. Proctor's *A New Star Atlas* (1887) lists this star as "Alshain".
- The 1st edition of British schoolmaster Arthur P. Norton's *A Star Atlas and Telescopic Handbook* (1910) lists both "Alshain" and "Alshairn" for this star, but the 14th edition (1959) only lists "Alshain" for this star.
- The IAU has approved the name Alshain for Beta (β) Aquilae A.

Perfect of Indus:

This **telescopic** asterism "Télea Índi" is the grand design spiral galaxy NGC 7096 in the IAU constellation Indus. It was discovered in 1836 by John Herschel who listed it as h 3874 and later as GC 4684 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because "this galaxy is one of the most regular spirals in the sky."

Perfect Spiral Galaxy:

See Phantom Galaxy, below.

Perimeter:

This Greek star "περίγειος" or "perigeios" is Alpha (α) Carinae (Canopus) in the IAU constellation Carina as described by Eratosthenes (d.194 B.C.E.).

Perpendicular One of Ursa Major:

There are two **telescopic** "Perpendicular One of Ursa Major" asterisms:

- One, "Orthogónia Úrsae Majóris", is the lenticular and polar ring galaxy NGC 2685 (Arp 336) in the IAU constellation Ursa Major. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They gave it this name because of "the polar rings perpendicular to the plane of the galaxy". It is also known as the "Pancake Galaxy" (see above) and the Helix (see above).
- One, "Perpendiculáris Úrsae Majóris" is the spiral galaxy NGC 3788 (Arp 294) in the IAU constellation Ursa Major. It was discovered in 1827 by John Herschel who listed it as h 932 and later as GC 2480 in his *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by astronomers Gerard Bodifee and Michel Berger (2010): They called it this because of "the major axis of NGC 3788 forms a right angle with the major axis of its companion NGC 3786".

Persea:

This asterism is the IAU constellation Andromeda. Johann Bayer's *Uranometria* (1603) lists the name "Persea". English Admiral Henry William Smyth lists this name in his *Bedford Catalogue* in 1844. Compare to Persea Tree (below).

Persea Tree:

This proposed Egyptian asterism "išd" from the Old Kingdom (3100 B.C.E.) is an unidentified sacred tree that was guarded by Ra in his cat form and is the IAU constellation Perseus and is related to their 13th nome (district) "nḏft-ḫntt" in Upper Egypt (Berio 2014). Compare this to the proposed asterism Min (see Tree, below).

Persephone:

This Greek asterism is the IAU constellation Virgo as listed in R. H. Allen's *Star Names* in 1899. Persephone is the Greek Goddess of the Underworld, known to the Romans as Proserpine.

Persephone of Cetus:

This **telescopic** asterism "Perséphone Céti" is the lenticular galaxy NGC 547 (Arp 308) in the IAU constellation Cetus. It was discovered in 1785 by English astronomer William Herschel who listed it as "II 449". It became GC 323 in the *General Catalogue* of 1864. This name appears in *The Catalogue of One Thousand Named Galaxies* by Belgian astronomers Gerard Bodifee and Michel Berger (2010). This galaxy is near NGC 545, which they named "Demeter of Cetus".

Perseus:

The brightest star in Perseus is the 2nd magnitude Alpha (α) Persei (Mirfak) which is the 35th brightest star on the list of 90 brightest stars, and the second brightest is Beta (β) Persei (Algol), a variable star that is 61st on the list. The stars of this constellation appear in 229 of the asterisms in this handbook.

This IAU constellation (IAU abbreviation Per) was first mentioned in Aratus' poem *Phaenomena* (270 B.C.E.) and in the 2nd century became one of Ptolemy's 48 original constellations "Περσεύς" ("Perséfs"). It is named for the hero in Greek myth who killed the Gorgon and therefore had the Latin name "Perseus et Caput Medusae" ("Perseus and the Head of Medusa"). The myths of Perseus are related to myths regarding Andromeda and Pegasus. It originated in the Babylonian asterism "SI.GU" (see Old Man, above). It may have been influenced by the proposed Egyptian asterism Persea Tree (see above).

Ptolemy's version of this constellation looked like this:

- The "body" had the stars 36 Persei and Delta (δ) Persei as the "hips" and Gamma (γ) Persei and Theta (θ) Persei as the "shoulders" with Iota (ι) Persei as the "base of the neck". Note: Alpha (α) Persei (Mirfak) was listed as "the bright star in the right side".
- His "head" was Tau (τ) Persei.
- One "arm" ran from Gamma (γ) Persei to an "elbow" at Eta (η) Persei and a "hand" at the star HIP 11020.
- The other "arm" ran from Theta (θ) Persei to an "elbow" at Kappa (κ) Persei to "Medusa's head", which was a pentagon of the stars Beta (β) Persei (Algol), HIP 13949, 22 Persei, Rho (ρ) Persei, and Omega (ω) Persei.

The oldest known celestial globe, the Kugel Globe (2nd century B.C.E.) depicts this constellation as a nude male wearing a winged helmet with a sword raised in his left hand and holding a head in his right hand.

The Mainz Globe from the eastern end of the Roman empire (c. 150 – 220 C.E.) depicts Perseus as a nude male walking away from us to the left carrying a head in his left hand.

Perseus appears in the Leiden *Aratea* (816) as a nude male with winged feet running to our left: He is wearing a cape and helmet, has a sword raised in his right hand, and is carrying Medusa's head in his left hand.

Editions of the 8th century *Revised Aratus Latinus* depict Perseus in various ways:

- In several editions (Dresden DC 183, Paris BN 12957, Prague IX. C) he is shown wearing a long cloak and hat
- Perseus is facing away from us in all the manuscripts except the Dresden DC 183 and Paris BN n.a. 1614 manuscripts,
- In several editions (St Gall 250, St Gall 902, Ps Bede DSC, Montecassino 3) he has a striped cloak and appears to be holding a palm leaf rather than a knife.
- In the Vat Reg lat 1324 and Cologne 83 II editions he is nude.
- In the Cologne 83 II edition he is rushing to the left holding a long weapon behind him,
- Two editions (Gottweig 7 (146), Siena L. IV. 25) depict Perseus with winged ankles,
- In the Paris BN 12597 edition his left ankle has wings.

The 9th century Berlin 130, Madrid 3307, Monza F.9/176 and Vat lat 645 manuscripts of the *De ordine ac positione stellarum in signis* depict Perseus nude, rushing to the right holding the head of the Medusa. The Munich 210 and Vienna ÖNB 387 manuscripts of the *De ordine ac positione stellarum in signis* depict Perseus with Medusa's head in his left hand and a palm frond on his right shoulder. The Austin, TX, Ransom Ms 29 and St. Petersburg, Q.V. IX, no.2 manuscripts of the *De ordine ac positione stellarum in signis* depict Perseus holding his club in front of him and Medusa's head behind him, but the Paris BN n.a. 1614 manuscript has Perseus wearing a helmet and holding a straight sword and a disc with a female head in front of him. The Paris BN, 12117 and Vat Reg lat 309 manuscripts of the *De ordine ac positione stellarum in signis* depict Perseus running to the left with a cloak billowing behind him, holding a sword aloft in his left hand and Medusa's head behind him in his right hand. The Paris BN lat 8663 manuscript of the *De ordine ac positione stellarum in signis* depicts Perseus with winged feet, wearing a loin cloth, carrying a scimitar in his upraised left hand and Medusa's head in his right hand. The Los Angeles, Getty Ludwig XII manuscript of the *De ordine ac positione stellarum in signis* depicts a nude Perseus wearing a cap, carrying a club in his right hand and Medusa's head in his left.

The Bodleian manuscript of the *Book of Fixed Stars* by 'Abd al-Rahman al-Sufi (903 – 986) Marsh 144 (1009/10) which was copied by al-Sufi's son depicts Perseus as a clean-shaven male with short hair, looking over his shoulder to his left, wearing a knee-length robe and pangs. He does not have winged feet. On one page he is holding a severed demon's head in his left hand and is brandishing a straight bladed sword over his head with his right hand. On the other page he is holding a severed demon's head in his right hand and is brandishing a straight bladed sword over his head with his left hand.

The oldest known Islamic celestial glove, made between 1080 – 1085 by Ibrahim ibn Sa'id al-Wazzan and his son Mohammad, depicts Perseus as a nude male striding to our right with his body turned so that we see him from behind. He is holding some sort of scimitar over his head in his right hand and is carrying Medusa's severed head in his left hand. It does not show wings on his feet.

The 11th century *De signis caeli ("of the signs of heaven*") lists "Perseus, qui fertur tenere capud Gorgonis" ("Perseus, who is brought to hold the head of the Gorgon"). The Oxford Laud 644, Padua 27 and Venice VIII 22 manuscripts of *De signis caeli* depict him nude with a flowing cloak, walking to the

left with winged feet. He is carrying Medusa's head in one hand and holding a harpë (a type of sword) in the other hand behind his head. The Dijon 448 manuscript of *De signis caeli ("of the signs of heaven*") does not show wings on his feet. The Klosterneuberg 685, Paris BN 5239, Paris BN 5543, Vat lat 643, and Zwettl 296 manuscripts of *De signis caeli* depict wings on his feet: All but the Klosterneuberg manuscript show Medusa with hair, the Klosterneuberg version replacing the hair with snakes. The Durham Hunter 100 manuscript of *De signis caeli* depicts Perseus with no wings on his feet and wearing a peculiar cap. The Montecassino 3 manuscript of *De signis caeli* depicts him without winged feet carrying a club in his right hand.

The 12th century Vienna ÖNB Vindob 12600 manuscript of the *De ordine ac positione stellarum in signis* depicts Perseus with a sickle in his left hand.

Shams al-Dīn Muhammad B. Mu'ayyad al-'Urdī's inlaid celestial globe (1288) depicts Perseus as a male in a knee length tunic running to our right. He is brandishing a straight bladed sword over his head in his left hand and is holding Medusa's severed head in his right hand. It is labelled "hāmil ra's al-ghūl" ("the one who holds the demon's head").

The Cusanus celestial globe of Cardinal Nicholas Cusa (1414) depicts Perseus as a nude male wearing a full-face helmet of the sort that appeared after the end of the thirteenth century, covering the wearer's entire face with a vision slot on the front. He is facing to our right, brandishing a sickle with a saw tooth edge over his head with his left hand and holding a severed female head in his right hand.

The mid 15th century Wein, Oesterr. National Bibl., manuscript Lat 5415, ff.168v-169r depicts "Perseus" as a nude male viewed from the rear as he runs to our right. He is holding the severed head of Medusa in his left hand and is brandishing a scimitar over his head with his right hand.

The mid 15th century Munchen, Bayer. Stadts. Blbl., manuscript CLM 14583, ff.71v-72r depicts Perseus as a nude figure striding to the right as viewed from behind. A poorly drawn head is in this figure's left hand and this figure is brandishing a scimitar above its head. It is not labelled.

The 15th century astrolabe in the Museo Astronomico e Copernicano, Albion, depicts Perseus as a nude figure with winged feet turned to our right. The figure is holding a severed head in his left hand and is brandishing a scimitar over his head. It is not labelled.

The early 15th century Northern Italian Sufi Latinus manuscript Gotha Forschungsbiblithek, Membr II 141 depicts Perseus as a bearded male stepping to our right. He is dressed in calf length green robes and has a sort of red toque with a pompom on his head. He is holding longsword over his head in his left hand and holding a severed head in his right hand. This head is completely covered in black hair.

The vault of the Old Sacristy of the Basilica di S. Lorenzo in Firenze, Italy (1442) depicts Perseus as an armoured male turned slightly to our left. He is holding a severed head in his left hand and is brandishing a scimitar over his head.

A translation of The *Liber Introductorius* of Scottish polyglot Michael Scot (1175 – c.1232), dated c.1450, Berlin Staatsbibliothek, Ms germ fol 244, depicts Perseus as a nude male facing away from us to our left. He has a cape on his shoulders and is wearing a pointed hat. On his left arm is a shield with a dragon design and in his left hand he is holding the severed head of Medusa. He is brandishing an axe over his head in his right hand.

The *Germanicus Aratea* (Siciliensis, c. 1469) depicts Perseus as a nude male pe walking to our left with a drapery over his head and shoulders. He is holding a bill hook in his left hand and Medusa's severed head in his right hand.

De Astronomica ("the astronomy"), also known as *Poeticon Astronomicon*, is illustrated stories attributed to the 1st century Roman historian Gaius Julius Hyginus, (though the true authorship is disputed). The first known printing was 1475, with a formal publication in 1482 by Erhard Ratdolt. This depicts "Perseus" as a bearded male with winged feet with a cloth draped loosely over him. He is walking and looking over his left shoulder and has a scimitar in his right hand and a severed head "Gorgona" in his left hand.

The *Germanicus Aratea* with scholia Strozziana (c. 1475) depicts Perseus as a nude male facing to our left with a drapery wrapped over his head and shoulders. He is holding a spear in his right hand and Medusa's severed head in his left hand.

The Constance Celestial Globe (1493) of German astronomer Johann Stöffler (1452 – 1531) depicts "Perseus" as a male with winged feet wearing a loincloth as seen from behind. He is holding a scimitar over his head in his right hand and holding Medusa's severed head in his left hand.

The early 16th century Real Academia de Historia, manuscript D-97, f.101v depicts Perseus as a nude male facing us. In his raised right hand, he holds a severed head and he is brandishing a straight sword over his head in his left hand. It is not labelled. Real Academia de Historia, manuscript D-97, f.104v – 105r depicts him reversed, holding that sword over his head in his right hand and a severed head in his left hand.

The "Nuremburg Maps" *(Die Karte des Nördlichen Sternenhimmels* inv.-Nr. Hz 5576), a pair of celestial hemispheres made in 1503 by Conrad Heinfogel, depicts "Perseus" as a nude bearded male with winged feet as viewed from behind. He is brandishing a scimitar above his head in his right hand and holding "CAPVT ALGOL" at his side in his left hand.

The *imagines coeli septentrionales cum duodecint imaginibus zodiaci* ("images of the northern sky with twelve images of the zodiac"), commonly known as the *Northern Celestial Hemisphere* chart of 1515 by Albrecht Dūrer, Conrad Heinfogel, and Johann Stabius depicts "Perseus" as a nude bearded male with winged feet as viewed from behind. He is brandishing a scimitar above his head in his right hand and holding "Caput Meduse" at his side in his left hand (Dekker & Lippincott, 1999).

Gores for a celestial globe by German polymath Johann Schöner (1477 – 1547) from 1515, 1534, and 1535, do not depict Perseus holding Medusa's head. The 1515 gores list "Perseus" but the later gores list "PERSEVS". Celestial globe gores (1517) of Schöner depicts "Perseus" as a male in full steel armour walking away from us to our right. His empty right hand is raised skyward and he is carrying Medusa's severed head in his left hand. A celestial globe (1522) of Schöner depicts Perseus as a nude male with winged feet with his back to us. He is holding Medusa's severed head in his left hand and is brandishing a scimitar over his head in his right hand.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "PERSEVS: as a male facing away from us with the severed head of Medusa in his left hand and a sword raised over his head in his right hand: Other details are hard to make out due to damage on the globe.

The *Himmelsglobus* (1532) of Cologne cartographer and instrument maker Caspar Vopel (1511 – 1561) depicts "Perseus" as a nude male facing away from us holding the head of Medusa: Details are hard to make out due to damage to the globe.

The *Horoscopion generale* (1533) of Petrus Apianus (1495 – 1552) depicts the severed head of Medusa, but NOT Perseus.

The *Kölner Almagest-Teilusgabe* of Johannes Noviomagus (1537) was derived from the charts of Dürer et al and depicts Perseus in the same manner as Dürer et al.

The *Astronomicum Caesarium* (1540) of Petrus Apianus (1495 – 1552) depicts "Perseus" as a nude male with winged feet striding away from us. He is holding a scimitar over his head with his right hand and his left hand is holding Medusa's severed head.

Dele Stelle Fisse ("Of the Fixed Stars") by Tuscan mathematician and astronomer Paolo dal Pozzo Toscanelli (1397 – 10 May 1482), published in Venice in 1542 lists this constellation as "Di Perseo". The charts in *Dele Stelle Fisse* only depict the star patterns and magnitudes and do not illustrate the constellation.

This constellation appears in *De Revolutionibus Orbium Cœlestium*, Libri VI (1543) of Nicholaus Copernicus as "Perseus".

The Northern Hemisphere *Creation of Heaven* (C 1550) painted on the ceiling at Palazo Besta in Teglio depicts Perseus as a nude male with his back to us, running to our right. He is brandishing a curved sword over his head in his right hand and is holding a severed head at his side with his left hand.

A celestial globe atop a planetary clock modified by Oronce Fine in 1553 (the "Paris Globe") lists "PERSEVS" (Dekker & Lippincott, 1999).

Jesuit German mathematician Christopher Clavius (1538 – 1612) lists Perseus in his *In Sphaeram Ioannis de Sacro Bosco Commentarius* (1572).

The *Globus Coelestis* chart (1584) of Swiss-German artist Jost Amman (1539 – 1591) depicts "Perseus" as a male in tunic and tall winged boots holding a sword over his head in his left hand and Medusa's head in his right hand.

The *Globe Celeste* celestial chart (1592) by pedagogue Simon Girault (1552 – 1613) depicts "Perseus" as a male with winged feet facing to our right, brandishing a scimitar over his helmeted head in his right hand and holding the head of Medusa in his left hand.

English Astronomer John Blagrave (~1563 – 1611) in his *Astrolabium uranicum General* (1596) depicts "Perseus" as a nude male with winged feet as viewed from the rear. He is holding Medusa's severed head in his left hand and is brandishing a scimitar over his head.

The *Syntagma Arateorum Opus Poeticae et Astronomiae* (1600) of Dutch diplomat Hugo Grotius (1583 - 1645) depicts "Perseus" as a younger nude male with winged feet facing away from us. He has a hook in his raised right hand and a severed head in his left hand. He is wearing a pointed cap and has drapery over his left shoulder.

The *Hemelglobe* (1600) of Dutch uranographer Jodocus Hondius (Joost de Hondt 1563 – 1612) depicts Perseus from behind carrying Medusa's head in his right hand.

Perseus is listed in Danish astronomer Tycho Brahe's *Astronomiae Instauratae Progymnasmata* (1602).

German Uranographer Johann Bayer (1572 – 1625) depicts this in his *Uranometria* in 1603 as a man with winged feet holding aloft a sword in his left hand and holding a head in his right hand: He has a shield on his right arm and a helmet on his head and is walking away from us. Bayer lists these names for this constellation: "Perseus, Cyllenius, Deferens cathenam, caput Algol, Aloue, Cacodaemonis, Medusae, Gorgonisue, Inachides, Cheleub sue Chelub, Canis".

"Perseus" is listed on the *Hemelglobe* (1603) of Dutch uranographer Willem Janszoon Blaeu (1571 – 1638) and depicted as an armoured male viewed from behind. He has winged boots and has a sword raised above his head in his right hand, and his holding Medusa's head in his left hand.

"Perseus" is listed in the *Planisphaerium Stellatum* (1613) of German astronomer Jacob Bartsch and depicted as a male wearing a thigh length tunic, winged boots, and helmet, with a sword raised over his head in his right hand and a round shield on his left arm: He is holding Medusa's head in his left hand.

Giovanni Paolo Gallucci's *Theatrum Mundi, et Temporis* (1614) depicts "Perseo" as a bearded male viewed from behind, wearing winged sandals, with a cloth wrapped around his waist. He "flying" and looking to our right, brandishing a scimitar over his head, and holding the severed head of Medusa in his left hand.

The *Tabulae Rudolphinae* 1627) of Johannes Kepler (1571 – 1630) lists the name "Perseus" for this constellation.

"Perse" is listed on the *Planiglobium celeste universal* (1628) of French uranographer Isaac Habrecht II (1589 – 1633) and depicted as an armoured male with winged feet with his right hand holding a scimitar over his head and this left hand holding the head of Medusa.

A Persian translation of the Almagest by Hasan ibn Sa'd al-Qā'īnī depicts Perseus as a bearded male wearing a turban decorated with a feather. He has boots but they are not winged. He is holding a dagger over his head in his left hand and is holding a severed head by its ponytail in his right hand.

Gores for a celestial globe Bibliothèque Nationale de France, Départment Carte set plans, GE D-12623 (1649) based on the work of Petrus Plancius depicts "Perseus" as a male in a toga with is back to us, running to our right, looking over his left shoulder. He is brandishing a sword over his head in his right hand and is holding the severed head of "Caput Meduse" in his left hand.

The huge *Gottorf Globe* (c1650) made for the Duke of Holstein, Frederick III, one of the world's first planetariums, depicts Perseus as a male in Roman style armor as viewed from behind, slightly turned to our left. He has winged sandals. He is brandishing a scimitar over his head in his left hand and is holding a severed head in his right hand.

Perseus is listed in the *Harmonia Macroscosmica* of Dutch uranographer Andreas Cellarius in 1661 and depicted as a male with winged feet: He is dressed in red and green carrying a ghoul's head.

Dutch cartographer Frederik de Wit's *Planisphaerium Coeleste* (1670) depicts Perseus as a male viewed from behind wearing a tunic and pants with winged boots: He is holding a scimitar over his head in his right hand and Medusa's head in his left hand.

The Right Ascensions and declinations of the principal fixed stars in both hemispheres to year 1678 by English uranographer James Clerk depicts "Perseus" as an armoured male viewed from the rear wearing a helmet, brandishing a sword above his head with his left hand and holding Medusa's head in his right hand.

English uranographer John Seller's *A coelestiall planisphere* (1678) depicts "Perseus" as a male with winged feet in a thigh length tunic and helmet with a sword raised over his head in his right hand and a severed head in his left hand.

Polish astronomer Johannes Hevelius (1611 – 1687), in his *Prodromus Astronomiae* (1690) which includes his *Catalogus Stellarum Fixarum*, depicts "Perseus" as a male with winged feet as viewed from the rear, wearing a short-sleeved thigh length tunic and a helmet with a feather, holding aloft a sword in his right hand and holding Medusa's head in his left hand.

The Globe Céleste (1697) of Venetian uranographer Vincenzo Maria Coronelli labels this "Persee", "Perseus", and "Περσεύς" and depicts it as a male with winged feet walking away from us wearing Roman style armour. He is wearing a feathered helmet. He is holding the severed head of Medusa in his left hand and brandishing a scimitar over his head.

A celestial pocket globe created by British uranographer Herman Moll in 1719 depicts "Perseus" as a male viewed from behind who is wearing armour. He has a scimitar raised over his head in his right hand and is holding Medusa's head in his left hand.

Perseus is listed in English astronomer John Flamsteed's *Atlas Coelestis* in 1729: He is depicted as a bearded male wearing a helmet. He has a scimitar raised in his right hand and is carrying Medusa's head in his left hand.

A celestial pocket globe by English uranographer Richard Cushee dated 1731 depicts Peseus as an armoured male wearing a helmet with a sword raised in his right hand and Medusa's severed head in his left hand.

German engraver and cartographer Tobias Conrad Lotter's *Planisphaerium Coeleste* (1750) depicts Perseus as an armoured male with a sword raised aloft in his right hand and a severed head in his left hand.

The *Atlas Coelestis* (1742) of German astronomer Johann Gabriel Doppelmayr (1677 - 1750) depicts Perseus" as an armoured male with winged sandals facing away from us, looking over his right shoulder. He is holding a scimitar over his head in his left hand and carrying Medusa's severed head in his right hand.

The *Uranographia Britannica* (c1750) of English astronomer John Bevis (1695 – 1771) depicts Perseus as a male with winged feet striding away from us to our left. He is holding a scimitar over his head in his left hand and is holding a severed head in his right hand. He has a round shield on his right upper arm.

French uranographer Gabriel Phillipe de la Hire's *Planisphere Celeste* (1760) depicts "Persée" as a bearded male with winged feet viewed from behind, wearing a toga and a helmet: He has a sword raised in his left arm and a round shield on his right arm, with Medusa's head in his right hand. NOTE: On Bode's charts Perseus does not have winged sandals.

A celestial pocket globe circa 1775 whose creator was unknown, but which was clearly influenced by British uranographer Herman Moll, depicts Perseus as a male viewed from the rear, brandishing a scimitar over his head in his right hand and holding Medusa's head in his left hand.

Johann Elert Bode's *Vorstellung Der Gestirne* (1782) lists this constellation as "Perseus" and depicts this as a male in a plumed helmet with drapery around his middle with a scimitar raised above his head in his right hand and Medusa's head in his left hand.

Italian priest, mathematician, and astronomer Giuseppe Piazzi (1746 – 1826) lists this constellation as "Perseo" in his *Della Specola Astronomica De' Regj Studj Di Palermo* (1792).

The French edition, *Atlas Céleste, Seconde Édition* (1776) of the *Atlas Coelestis* of English astronomer John Flamsteed (1646 – 1719) depicts "Persée" and a male with winged sandals wearing armor and a helmet: He has a scimitar raised above his head and is holding "la Téte de Méduse" in his left hand. The 1778 edition adds feathers to his helmet.

American uranographer William Croswell (1760 – 1834) depicts Perseus on his *Mercator Map of the Starry Heavens* in 1810 as a long-haired male with winged feet viewed from behind, wearing a turban. He is brandishing a sword over his head in his right hand and holding Medusa's head in his left.

The *Door dit hemels pleyn wert vertoondt den gehelen loop del helmels der vaste sterren met haer beeltenisse* (1792) by Dutch publisher Jan Barent Elwe and associate Remmet Teunisse Backer depicts "Perseus" as a male with winged feet viewed from behind swinging a sword over his head in his right hand and holding Medusa's head in his left hand.

A celestial pocket globe created by English uranographer Dudley Adams circa 1795 depicts "Perseus" as a male with winged feet facing away from us wearing a sort of kilt. He is holding aloft a sword in his right hand and holding Medusa's severed head in his left hand.

Scottish uranographer Alexander Jamieson (1782 – 1850) lists Perseus it in his *Celestial Atlas* in 1822: He is depicted as a male wearing an armoured breastplate, helmet, and winged sandals, and is holding a scimitar aloft in his right hand and holding Medusa's head in his left hand. Jameison's *Stereographic Projection of the Northern Celestial Planisphere of the Plane of the Equinoctial* (1822) depicts Perseus the same way but labels Medusa's head "Gorgon".

American uranographer Elijah Burritt's *The Constellations for each Month in the Year* (1835) depicts "Perseus" as an armoured male holding a scimitar over his head in his right hand and Medusa's head in his left hand.

"Perseus" is listed in the *Uranometria Nova* catalogue (1843) of German astronomer Friedrich Wilhelm August Argelander (1799-1875) and depicted as a male in a knee length tunic and helmet striding to our left holding a sword over his head in his right hand. He has a round shield on his left shoulder and is carrying Medusa's head in his left hand.

Gores for a celestial globe printed by Bale in 1845 currently stored in the Royal Museum at Greenwich depicts “Perseus” as a male facing left viewed from the rear holding Medusa’s severed head in his left hand.

Perseus is listed in a boxed set of 32 constellation cards called *Urania’s Mirror* in 1852: The author is unknown, but it is based on Jamieson’s *Celestial Atlas*. He is depicted wearing a helmet, armour, and winged sandals, with a scimitar raised in his right hand and holding Medusa’s head in his left.
